IEEE Std 802.11™-2016
(Revision of
IEEE Std 802.11-2012)

**IEEE Standard for Information technology—
Telecommunications and information exchange between systems
Local and metropolitan area networks—
Specific requirements**

**Part 11: Wireless LAN Medium Access Control
(MAC) and Physical Layer (PHY) Specifications**

Prepared by the 802.11 Working Group of the
LAN/MAN Standards Committee
of the
IEEE Computer Society

Approved 7 December 2016
IEEE-SA Standards Board

Abstract: Technical corrections and clarifications to IEEE Std 802.11 for wireless local area networks (WLANs) as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions are specified in this revision. Amendments 1 to 5 published in 2012 and 2013 have also been incorporated into this revision.

Keywords: 2.4 GHz, 256-QAM, 3650 MHz, 4.9 GHz, 5 GHz, 5.9 GHz, 60 GHz, advanced encryption standard, AES, audio, beamforming, carrier sense multiple access/collision avoidance, CCMP, channel switching, clustering, contention based access period, Counter mode with Cipher-block chaining Message authentication code Protocol, confidentiality, CSMA/CA, DFS, direct link, directional multi-gigabit, dynamic allocation of service period, dynamic extension of service period, dynamic frequency selection, dynamic truncation of service period, E911, EDCA, emergency alert system, emergency services, fast session transfer, forwarding, GCMP, generic advertisement service, high throughput, IEEE 802.11™, international roaming, interworking, interworking with external networks, LAN, local area network, MAC, management, measurement, medium access control, media-independent handover, medium access controller, mesh, MIH, millimeter-wave, MIMO, MIMO-OFDM, multi-band operation, multi-hop, multi-user MIMO, multiple input multiple output, network advertisement, network discovery, network management, network selection, noncontiguous frequency segments, OCB, path-selection, personal basic service set, PHY, physical layer, power saving, QoS, quality of service, quality-of-service management frame, radio, radio frequency, RF, radio resource, radio management, relay operation, spatial sharing, SSPN, subscriber service provider, television white spaces, TPC, transmit power control, video, wireless access in vehicular environments, wireless LAN, wireless local area network, WLAN, wireless network management, zero-knowledge proof

Important Notices and Disclaimers Concerning IEEE Standards Documents

IEEE documents are made available for use subject to important notices and legal disclaimers. These notices and disclaimers, or a reference to this page, appear in all standards and may be found under the heading “Important Notices and Disclaimers Concerning IEEE Standards Documents.” They can also be obtained on request from IEEE or viewed at <http://standards.ieee.org/IPR/disclaimers.html>.

Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents

IEEE Standards documents (standards, recommended practices, and guides), both full-use and trial-use, are developed within IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (“IEEE-SA”) Standards Board. IEEE (“the Institute”) develops its standards through a consensus development process, approved by the American National Standards Institute (“ANSI”), which brings together volunteers representing varied viewpoints and interests to achieve the final product. IEEE Standards are documents developed through scientific, academic, and industry-based technical working groups. Volunteers in IEEE working groups are not necessarily members of the Institute and participate without compensation from IEEE. While IEEE administers the process and establishes rules to promote fairness in the consensus development process, IEEE does not independently evaluate, test, or verify the accuracy of any of the information or the soundness of any judgments contained in its standards.

IEEE Standards do not guarantee or ensure safety, security, health, or environmental protection, or ensure against interference with or from other devices or networks. Implementers and users of IEEE Standards documents are responsible for determining and complying with all appropriate safety, security, environmental, health, and interference protection practices and all applicable laws and regulations.

IEEE does not warrant or represent the accuracy or content of the material contained in its standards, and expressly disclaims all warranties (express, implied and statutory) not included in this or any other document relating to the standard, including, but not limited to, the warranties of: merchantability; fitness for a particular purpose; non-infringement; and quality, accuracy, effectiveness, currency, or completeness of material. In addition, IEEE disclaims any and all conditions relating to: results; and workmanlike effort. IEEE standards documents are supplied “AS IS” and “WITH ALL FAULTS.”

Use of an IEEE standard is wholly voluntary. The existence of an IEEE standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard.

In publishing and making its standards available, IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity nor is IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing any IEEE Standards document, should rely upon his or her own independent judgment in the exercise of reasonable care in any given circumstances or, as appropriate, seek the advice of a competent professional in determining the appropriateness of a given IEEE standard.

IN NO EVENT SHALL IEEE BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO: PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE PUBLICATION, USE OF, OR RELIANCE UPON ANY STANDARD, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE AND REGARDLESS OF WHETHER SUCH DAMAGE WAS FORESEEABLE.

Translations

The IEEE consensus development process involves the review of documents in English only. In the event that an IEEE standard is translated, only the English version published by IEEE should be considered the approved IEEE standard.

Official statements

A statement, written or oral, that is not processed in accordance with the IEEE-SA Standards Board Operations Manual shall not be considered or inferred to be the official position of IEEE or any of its committees and shall not be considered to be, or be relied upon as, a formal position of IEEE. At lectures, symposia, seminars, or educational courses, an individual presenting information on IEEE standards shall make it clear that his or her views should be considered the personal views of that individual rather than the formal position of IEEE.

Comments on standards

Comments for revision of IEEE Standards documents are welcome from any interested party, regardless of membership affiliation with IEEE. However, IEEE does not provide consulting information or advice pertaining to IEEE Standards documents. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Since IEEE standards represent a consensus of concerned interests, it is important that any responses to comments and questions also receive the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to comments or questions except in those cases where the matter has previously been addressed. For the same reason, IEEE does not respond to interpretation requests. Any person who would like to participate in revisions to an IEEE standard is welcome to join the relevant IEEE working group.

Comments on standards should be submitted to the following address:

Secretary, IEEE-SA Standards Board
445 Hoes Lane
Piscataway, NJ 08854 USA

Laws and regulations

Users of IEEE Standards documents should consult all applicable laws and regulations. Compliance with the provisions of any IEEE Standards document does not imply compliance to any applicable regulatory requirements. Implementers of the standard are responsible for observing or referring to the applicable regulatory requirements. IEEE does not, by the publication of its standards, intend to urge action that is not in compliance with applicable laws, and these documents may not be construed as doing so.

Copyrights

IEEE draft and approved standards are copyrighted by IEEE under U.S. and international copyright laws. They are made available by IEEE and are adopted for a wide variety of both public and private uses. These include both use, by reference, in laws and regulations, and use in private self-regulation, standardization, and the promotion of engineering practices and methods. By making these documents available for use and adoption by public authorities and private users, IEEE does not waive any rights in copyright to the documents.

Photocopies

Subject to payment of the appropriate fee, IEEE will grant users a limited, non-exclusive license to photocopy portions of any individual standard for company or organizational internal use or individual, non-commercial use only. To arrange for payment of licensing fees, please contact Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923 USA; +1 978 750 8400. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center.

Updating of IEEE Standards documents

Users of IEEE Standards documents should be aware that these documents may be superseded at any time by the issuance of new editions or may be amended from time to time through the issuance of amendments, corrigenda, or errata. An official IEEE document at any point in time consists of the current edition of the document together with any amendments, corrigenda, or errata then in effect.

Every IEEE standard is subjected to review at least every ten years. When a document is more than ten years old and has not undergone a revision process, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE standard.

In order to determine whether a given document is the current edition and whether it has been amended through the issuance of amendments, corrigenda, or errata, visit the IEEE-SA Website at <http://ieeexplore.ieee.org> or contact IEEE at the address listed previously. For more information about the IEEE SA or IEEE's standards development process, visit the IEEE-SA Website at <http://standards.ieee.org>.

Errata

Errata, if any, for all IEEE standards can be accessed on the IEEE-SA Website at the following URL: <http://standards.ieee.org/findstds/errata/index.html>. Users are encouraged to check this URL for errata periodically.

Patents

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken by the IEEE with respect to the existence or validity of any patent rights in connection therewith. If a patent holder or patent applicant has filed a statement of assurance via an Accepted Letter of Assurance, then the statement is listed on the IEEE-SA Website at <http://standards.ieee.org/about/sasb/patcom/patents.html>. Letters of Assurance may indicate whether the Submitter is willing or unwilling to grant licenses under patent rights without compensation or under reasonable rates, with reasonable terms and conditions that are demonstrably free of any unfair discrimination to applicants desiring to obtain such licenses.

Essential Patent Claims may exist for which a Letter of Assurance has not been received. The IEEE is not responsible for identifying Essential Patent Claims for which a license may be required, for conducting inquiries into the legal validity or scope of Patents Claims, or determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory. Users of this standard are expressly advised that determination of the validity of any patent rights, and the risk of infringement of such rights, is entirely their own responsibility. Further information may be obtained from the IEEE Standards Association.

Participants

At the time this revision was sent to sponsor ballot, the IEEE 802.11 Working Group (WG) had the following officers:

Adrian P. Stephens, Chair
Jon W. Rosdahl, 1st Vice Chair
Dorothy V. Stanley, 2nd Vice Chair
Stephen McCann, Secretary

The officers of the WG Task Group mc and the members of the WG ballot group for this revision are as follows:

Dorothy V. Stanley, Chair
Mark A. Hamilton, Vice Chair
Jon W. Rosdahl, Secretary
Adrian P. Stephens, Technical Editor

Introduction

This introduction is not part of IEEE Std 802.11-2016, IEEE Standard for Information technology—Telecommunications and information exchange between systems—Local and metropolitan area network—Specific requirements—Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications.

This revision gives users, in one document, the IEEE 802.11 standard for wireless local area networks (WLANs) with all of the amendments that have been published to date.

Incorporating published amendments

The original standard was published in 1997, revised in 1999 with MIB changes, and reaffirmed in 2003.

A revision was published in 2007, which incorporated into the 1999 edition the following amendments:

- IEEE Std 802.11aTM-1999: High-speed Physical Layer in the 5 GHz Band (Amendment 1)
- IEEE Std 802.11bTM-1999: Higher-Speed Physical Layer Extension in the 2.4 GHz Band (Amendment 2)
- IEEE Std 802.11b-1999/Corrigendum 1-2001: Higher-speed Physical Layer (PHY) extension in the 2.4 GHz band (Corrigendum 1 to Amendment 2)
- IEEE Std 802.11dTM-2001: Specification for operation in additional regulatory domains (Amendment 3)
- IEEE Std 802.11gTM-2003: Further Higher Data Rate Extension in the 2.4 GHz Band (Amendment 4)
- IEEE Std 802.11hTM-2003: Spectrum and Transmit Power Management Extensions in the 5 GHz band in Europe (Amendment 5)
- IEEE Std 802.11iTM-2004: Medium Access Control (MAC) Security Enhancements (Amendment 6)
- IEEE Std 802.11jTM-2004: 4.9 GHz–5 GHz Operation in Japan (Amendment 7)
- IEEE Std 802.11eTM-2005: Medium Access Control (MAC) Quality of Service Enhancements (Amendment 8)

A revision was published in 2012, which incorporated into the 2007 revision the following amendments:

- IEEE Std 802.11kTM-2008: Radio Resource Measurement of Wireless LANs (Amendment 1)
- IEEE Std 802.11rTM-2008: Fast Basic Service Set (BSS) Transition (Amendment 2)
- IEEE Std 802.11yTM-2008: 3650–3700 MHz Operation in USA (Amendment 3)
- IEEE Std 802.11wTM-2009: Protected Management Frames (Amendment 4)
- IEEE Std 802.11nTM-2009: Enhancements for Higher Throughput (Amendment 5)
- IEEE Std 802.11pTM-2010: Wireless Access in Vehicular Environments (Amendment 6)
- IEEE Std 802.11zTM-2010: Extensions to Direct-Link Setup (DLS) (Amendment 7)
- IEEE Std 802.11vTM-2011: Wireless Network Management (Amendment 8)
- IEEE Std 802.11uTM-2011: Interworking with External Networks (Amendment 9)
- IEEE Std 802.11sTM-2011: Mesh Networking (Amendment 10)

This revision is based on IEEE Std 802.11-2012, into which the following amendments have been incorporated:

- IEEE Std 802.11aeTM-2012: Prioritization of Management Frames (Amendment 1)
- IEEE Std 802.11aaTM-2012: MAC Enhancements for Robust Audio Video Streaming (Amendment 2)

- IEEE Std 802.11adTM-2012: Enhancements for Very High Throughput in the 60 GHz Band (Amendment 3)
- IEEE Std 802.11acTM-2013: Enhancements for Very High Throughput for Operation in Bands below 6 GHz (Amendment 4)
- IEEE Std 802.11afTM-2013: Television White Spaces (TVWS) Operation (Amendment 5)

Technical corrections, clarifications, and enhancements

In addition, this revision specifies technical corrections and clarifications to IEEE Std 802.11 as well as enhancements to the existing medium access control (MAC) and physical layer (PHY) functions. In addition, this revision removes some features previously marked as obsolete and adds new indications of other obsolete features.

Renumbering of clauses and annexes

The numbering of certain clauses and annexes has been modified since IEEE Std 802.11-2012.

The evolution of this numbering is shown in Figure i.

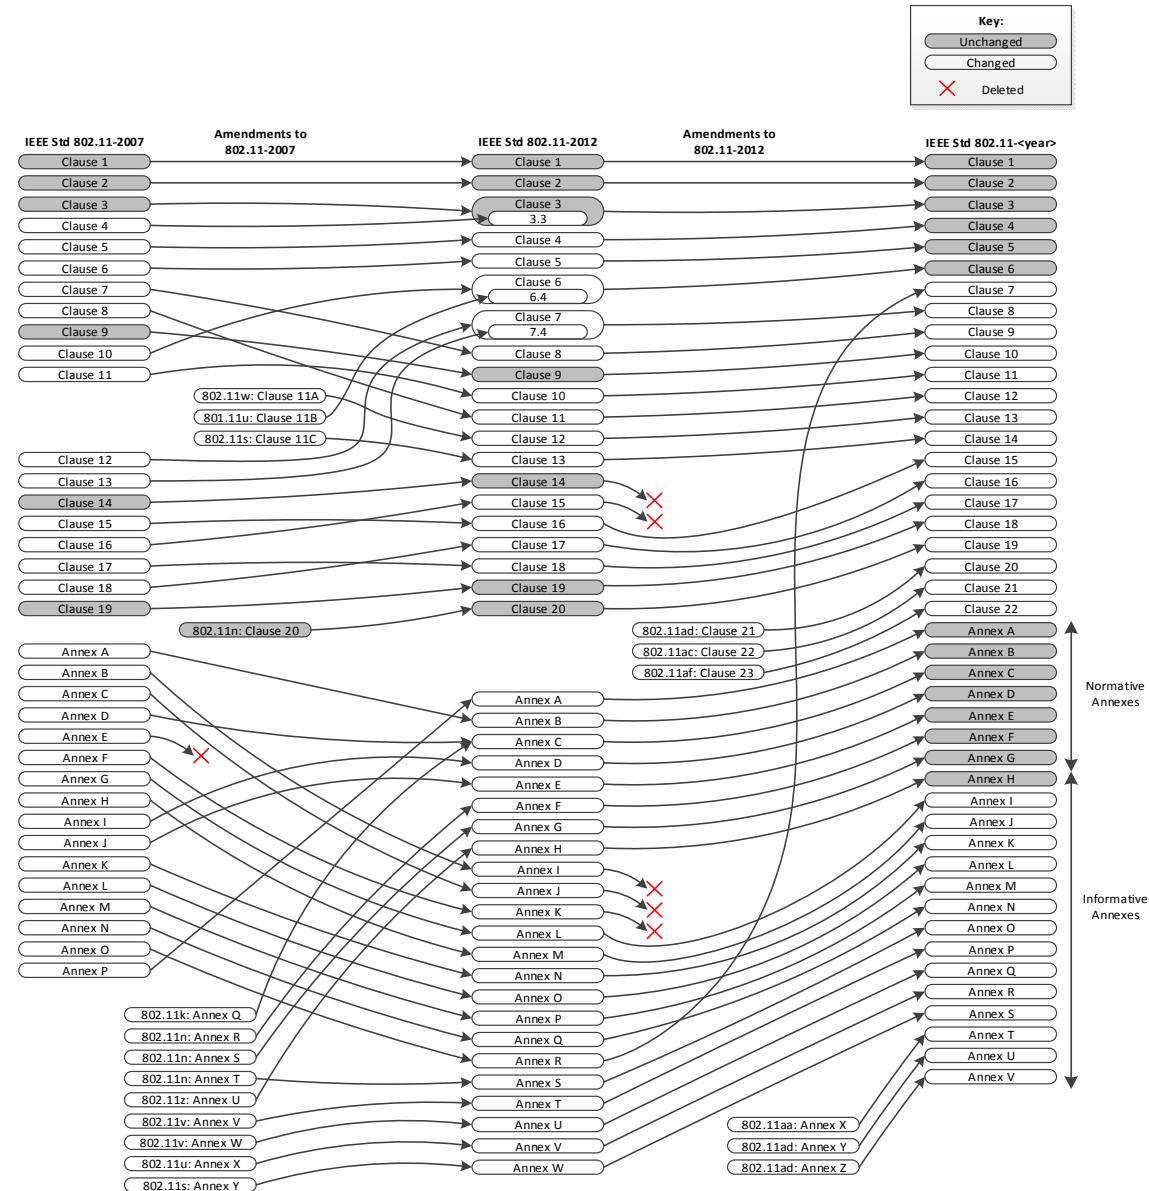

Figure i—The evolution of numbering in IEEE Std 802.11

| J.11.1 | Test vector | 3430 |
| J.11.2 | Example of encryption C code | 3433 |
| Annex K (informative) TSPECs and Admission control..... | | 3446 |
| K.1 | Example use of TSPEC for admission control | 3446 |
| K.2 | Recommendation for implementation of contention based admission control..... | 3447 |
| K.2.1 | Use of ACM (admission control mandatory) subfield | 3447 |
| K.2.2 | Deriving medium time | 3447 |
| K.3 | Guidelines and reference design for sample scheduler and admission control unit | 3449 |
| K.3.1 | Guidelines for deriving service schedule parameters..... | 3449 |
| K.3.2 | Reference design for sample scheduler and admission control unit | 3450 |
| K.4 | TSPEC construction..... | 3452 |
| K.4.1 | Surplus Bandwidth Allocation | 3453 |
| K.4.2 | Minimum and Maximum Service Interval | 3457 |
| K.4.3 | Minimum, Mean, and Peak Data Rate | 3458 |
| Annex L (informative) Examples and sample code for encoding a TIM Partial Virtual Bitmap..... | | 3459 |
| L.1 | Introduction..... | 3459 |
| L.2 | Examples..... | 3459 |
| L.3 | Sample C code | 3462 |
| Annex M (informative) Integration function | | 3468 |
| M.1 | Introduction..... | 3468 |
| M.2 | Ethernet V2.0/IEEE 802.3 LAN integration function | 3468 |
| M.3 | Example | 3468 |
| M.4 | Integration service versus bridging..... | 3470 |
| Annex N (informative) AP functional description | | 3471 |
| N.1 | Introduction..... | 3471 |
| N.2 | Terminology..... | 3471 |
| N.3 | Primary ACM_STA functions | 3475 |
| N.4 | Primary AP functions..... | 3475 |
| N.5 | Primary DS functions..... | 3477 |
| N.6 | Primary portal function | 3477 |
| Annex O (informative) Additional VHT and HT information | | 3478 |
| O.1 | VHT and HT waveform generator tool..... | 3478 |
| O.2 | A-MPDU deaggregation | 3478 |
| O.3 | Example of an RD exchange sequence | 3480 |
| O.4 | Illustration of determination of NDP addresses..... | 3481 |
| O.5 | 20/40 MHz BSS establishment and maintenance | 3482 |
| O.5.1 | Signaling 20/40 MHz BSS capability and operation | 3482 |
| O.5.2 | Establishing a 20/40 MHz BSS | 3482 |
| O.5.3 | Monitoring channels for other BSS operation..... | 3483 |
| Annex P (informative) Location and Time Difference accuracy test | | 3485 |
| P.1 | Location via Time Difference of arrival | 3485 |

| | | |
|---|---|------|
| P.2 | Time Difference of departure accuracy test..... | 3485 |
| P.3 | Differential Distance Computation using Fine Timing Measurement frames..... | 3487 |
| Annex Q (informative) Example use of the Destination URI for Event and Diagnostic Reports | | 3489 |
| Q.1 | Destination URI payload | 3489 |
| Q.2 | Use of HTTP (or HTTPS) for Destination URI of Event and Diagnostic Reports | 3489 |
| Annex R (informative) Interworking with external networks | | 3491 |
| R.1 | General..... | 3491 |
| R.2 | Network discovery and selection..... | 3491 |
| R.2.1 | General | 3491 |
| R.2.2 | Airport | 3491 |
| R.2.3 | Shopping..... | 3492 |
| R.2.4 | Sales meeting..... | 3493 |
| R.2.5 | Museum..... | 3493 |
| R.2.6 | Emergency call..... | 3494 |
| R.2.7 | Emergency alert..... | 3495 |
| R.3 | QoS mapping guidelines for interworking with external networks | 3495 |
| R.3.1 | General | 3495 |
| R.3.2 | Determination of the mapping for a STA..... | 3496 |
| R.3.3 | Example of QoS mapping from different networks | 3496 |
| R.4 | Interworking and SSPN interface support | 3498 |
| R.4.1 | General | 3498 |
| R.4.2 | SSPN interface parameters..... | 3499 |
| R.5 | Interworking with external networks and emergency call support..... | 3503 |
| R.5.1 | General | 3503 |
| R.5.2 | Background on emergency call support over IEEE 802.11 infrastructure..... | 3503 |
| R.5.3 | System aspects for emergency call support..... | 3504 |
| R.5.4 | Description of the Expedited Bandwidth Request element..... | 3505 |
| R.5.5 | Access to emergency services in an RSN | 3506 |
| R.6 | Peer information | 3507 |
| R.7 | Calculating Estimated Throughput | 3507 |
| Annex S (informative) Mesh BSS operation | | 3510 |
| S.1 | Clarification of mesh Data frame format | 3510 |
| S.2 | Operational considerations for interworking | 3510 |
| S.2.1 | Formation and maintenance of the IEEE 802.1D spanning tree | 3510 |
| S.3 | Power save parameters selection | 3511 |
| S.3.1 | General | 3511 |
| S.3.2 | Selecting the mesh power management mode based on traffic load..... | 3511 |
| S.3.3 | Scanning of mesh BSSs..... | 3511 |
| S.3.4 | Default parameters | 3512 |
| S.3.5 | MSDU forwarding in an MBSS containing mesh STAs in light or deep sleep mode..... | 3512 |
| S.3.6 | Synchronization maintenance of mesh STAs in deep sleep mode | 3512 |
| S.4 | SIV key wrapping test vector..... | 3513 |
| S.5 | Airtime link metric usage example | 3514 |
| S.6 | Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP | 3514 |
| S.6.1 | General | 3514 |
| S.6.2 | Additions to forwarding information | 3515 |

| | | |
|---|---|------|
| S.6.3 | Actions when sending Data frames as source mesh STA | 3515 |
| S.6.4 | Actions on receipt of a proactive PREQ element..... | 3515 |
| S.6.5 | Generation of proactive PREP elements | 3515 |
| S.7 | Generation of PREQ elements in proactive RANN mechanism of HWMP..... | 3516 |
| S.7.1 | General | 3516 |
| S.7.2 | Additions to forwarding information | 3516 |
| S.7.3 | Actions when sending Data frames as source mesh STA | 3516 |
| S.7.4 | Actions on receipt of proactive RANN element | 3516 |
| S.7.5 | Actions on receipt of a PREP element | 3517 |
| Annex T (informative) Overlapping BSS (OBSS) management | | 3518 |
| T.1 | Introduction..... | 3518 |
| T.2 | QLoad Report element..... | 3518 |
| T.2.1 | General | 3518 |
| T.2.2 | Calculating medium time | 3519 |
| T.2.3 | Calculation of potential traffic self..... | 3519 |
| T.2.4 | Calculation of allocated traffic self..... | 3521 |
| T.2.5 | Calculation of allocated traffic shared..... | 3522 |
| T.2.6 | Calculation of EDCA Access Factor..... | 3522 |
| T.2.7 | EDCA Overhead Factor | 3523 |
| T.2.8 | Calculation of HCCA Access Factor | 3524 |
| T.3 | Channel selection using QLoad report..... | 3524 |
| T.3.1 | General | 3524 |
| T.3.2 | AP with admission control mandatory | 3524 |
| T.3.3 | AP with an HC | 3525 |
| T.3.4 | Channel selection procedures | 3525 |
| T.4 | Sharing in an OBSS situation | 3526 |
| T.4.1 | General | 3526 |
| T.4.2 | Sharing schemes | 3527 |
| T.5 | Mitigating consequences of OBSS sharing in presence of noncollaborating devices ... | 3529 |
| Annex U (informative) Functions of the centralized coordination service root (CCSR) | | 3530 |
| Annex V (informative) TSPEC aggregation for DMG BSSs | | 3531 |

**IEEE Standard for Information technology—
Telecommunications and information exchange between systems
Local and metropolitan area networks—
Specific requirements**

Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications

1. Overview

1.1 Scope

The scope of this standard is to define one medium access control (MAC) and several physical layer (PHY) specifications for wireless connectivity for fixed, portable, and moving stations (STAs) within a local area.

1.2 Purpose

The purpose of this standard is to provide wireless connectivity for fixed, portable, and moving stations within a local area. This standard also offers regulatory bodies a means of standardizing access to one or more frequency bands for the purpose of local area communication.

1.3 Supplementary information on purpose

Specifically, in the context of IEEE 802.11™-compliant devices, this standard

- Describes the functions and services required by a device to operate within independent, personal, and infrastructure networks as well as the aspects of device mobility (transition) within those networks.
- Describes the functions and services that allow a device to communicate directly with another such device outside of an independent or infrastructure network.
- Defines the MAC procedures to support the MAC service data unit (MSDU) delivery services.
- Defines several PHY signaling techniques and interface functions that are controlled by the MAC.
- Permits the operation of a device within a wireless local area network (WLAN) that coexists with multiple overlapping IEEE 802.11 WLANs.
- Describes the requirements and procedures to provide data confidentiality of user information and MAC management information being transferred over the wireless medium (WM) and authentication of devices.
- Defines mechanisms for dynamic frequency selection (DFS) and transmit power control (TPC) that may be used to satisfy regulatory requirements for operation in any band.

- Defines the MAC procedures to support local area network (LAN) applications with quality-of-service (QoS) requirements, including the transport of voice, audio, and video.
- Defines mechanisms and services for wireless network management of devices that include BSS transition management, channel usage and coexistence, collocated interference reporting, diagnostic, multicast diagnostic and event reporting, flexible multicast, efficient beacon mechanisms, proxy ARP advertisement, location, timing measurement, directed multicast, extended sleep modes, traffic filtering, and management notification.
- Defines functions and procedures aiding network discovery and selection by devices, information transfer from external networks using QoS mapping, and a general mechanism for the provision of emergency services.
- Defines the MAC procedures that are necessary for wireless multi-hop communication to support wireless LAN mesh topologies.
- Defines medium access control mechanisms to support the prioritization of Management frames.
- Defines mechanisms to improve audio video (AV) streaming QoS while maintaining data and voice performance.
- Defines the PHY signaling, MAC, and beamforming procedures required for operation with directional antenna patterns.

1.4 Word usage

In this document, the word *shall* is used to indicate a mandatory requirement. The word *should* is used to indicate a recommendation. The word *may* is used to indicate a permissible action. The word *can* is used for statements of possibility and capability.

The construction “*x* to *y*” or “*x-y*” represents an inclusive range (i.e., the range includes both values *x* and *y*).

The construction “up to *y*” represents an inclusive upper bound (i.e., the range includes the value *y*).

Any action specified as relating to a SAP primitive is to be interpreted as an action on an invocation or instance of that primitive.

If <*x*> represents a scalar field, scalar subfield, scalar parameter or scalar MIB attribute:

- if “<*x*> is” is used in a context that relates to the testing or setting the value of “<*x*>” this usage is to be interpreted as though written “the value of <*x*> is”
- “<*x*> indicate(s)” is to be interpreted as though written “the value of <*x*> indicate(s)”
- “indicated by <*x*>” is to be interpreted as though written “indicated by the value of <*x*>”
- “<*x*> that indicate” is to be interpreted as though written “<*x*> whose value indicates”

If <*x*> represents a frame, element, subelement, structured field, structured subfield, structured parameter or structured MIB attribute:

- “<*x*> indicate(s)” is to be interpreted as though written “the contents of <*x*> indicate”
- “indicated by <*x*>” is to be interpreted as though written “indicated by the contents of <*x*>”
- “<*x*> that indicate” is to be interpreted as though written “<*x*> whose contents indicate”

If <*x*> represents a SAP primitive:

- “<*x*> indicate(s)” is to be interpreted as though written “the (or an) invocation of <*x*> indicates”
- “indicated by <*x*>” is to be interpreted as though written “indicated by the (or an) invocation of <*x*>”

The construction of descriptions for uses of the SHA family of hash functions [HMAC-]SHA-<1,256,384>[-*n*] is used to refer to hash functions/HMACs where square brackets indicate optional information, and *n* is an integer indicating the length, in bits, of the output when truncating.

1.5 Terminology for mathematical, logical, and bit operations

Floor (*x*), also written as $\lfloor x \rfloor$, is the largest integer smaller than or equal to *x*. For example, Floor (2.3) is 2 and Floor (-2.3) is -3. The two parameter form, Floor (*x*, *y*), is the largest multiple of *y* smaller than or equal to *x*; this operator is not used in this standard if *y* is negative. For example, Floor (3.3, 2) is 2 and Floor (-3.3, 2) is -4.

Ceil (*x*), also written as $\lceil x \rceil$ is the smallest integer larger than or equal to *x*. For example, Ceil (2.3) is 3 and Ceil (-2.3) is -2. The two parameter form, Ceil (*x*, *y*), is the smallest multiple of *y* larger than or equal to *x*; this operator is not used in this standard if *y* is negative. For example, Ceil (2.3, 2) is 4 and Ceil (-2.3, 2) is -2.

Round (*x*) is the integer closest to *x*, rounding values with a fractional part of 0.5 away from zero. For example, Round (2.3) is 2, Round (2.5) is 3, Round (-2.3) is -2 and Round (-2.5) is -3.

x mod y is the remainder when *x* is divided by *y*; this operator is not used in this standard if *y* is negative; the result is positive even if *x* is negative. For example, 5 mod 3 is 2 and -5 mod 3 is 1.

The symbol \oplus represents bitwise exclusive OR (XOR).

$\log_2(x)$ is the logarithm of *x* to the base 2. For example, $\log_2(32)$ is 5.

$\text{Re}(z)$ is the real part of complex number *z*. $\text{Im}(z)$ is the imaginary part of complex number *z* (not including the factor *i*). For example, $\text{Re}(1 - 2i)$ is 1 and $\text{Im}(1 - 2i)$ is -2.

x && y is the short-circuiting Boolean AND.

x || y is the concatenation of *x* and *y*, except in code, where it sometimes is the short-circuiting Boolean OR (as determined by the context).

$!x$ is the Boolean NOT.

$x \gg y$ is *x* logically shifted right (i.e., zeros are inserted at the most significant end) by *y*; this operator is not used in this standard if *y* is negative.

$x \ll y$ is *x* shifted left (i.e., zeros are inserted at the least significant end) by *y*; this operator is not used in this standard if *y* is negative.

$x == y$ is Boolean equality.

$x != y$ Boolean inequality.

$x \& y$, where *x* and *y* are numbers, is the bitwise AND of *x* and *y*.

$x | y$, where *x* and *y* are numbers, is the bitwise OR of *x* and *y*.

0x introduces a hexadecimal number. For example, 0x12 is 18 decimal.

$L(S, F, N)$ is bits F to $F+N-1$ of the bit string S starting from the left, using the IEEE 802.11 bit conventions from 9.2.2.

$\text{Truncate-}N(S)$ is bits 0 to $N-1$ of the bit string S starting from the left, using the IEEE 802.11 bit conventions from 9.2.2). Other bits are irretrievably deleted.

$\exp(x)$ is e to the power x , where e is the base of natural logarithms.

2. Normative references

The following referenced documents are indispensable for the application of this standard (i.e., they must be understood and used; therefore, each referenced document is cited in the text and its relationship to this document is explained). For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments or corrigenda) at the time of publication of this standard applies.

3. Definitions, acronyms, and abbreviations

3.1 Definitions

For the purposes of this standard, the following terms and definitions apply. IEEE Standards Dictionary Online should be referenced for terms not defined in this clause.¹³

access control: The prevention of unauthorized usage of resources.

access point (AP): An entity that contains one station (STA) and provides access to the distribution services, via the wireless medium (WM) for associated STAs. An AP comprises a STA and a distribution system access function (DSAF).

access point (AP) reachability: An AP is reachable by a station (STA) if preauthentication messages can be exchanged between the STA and the target AP via the distribution system (DS).

NOTE—Preauthentication is defined in 12.6.10.2.¹⁴

additional authentication data (AAD): Data that are not encrypted, but are cryptographically protected.

admission control: An algorithm intended to prevent the violation of parameterized service commitments made by the network to admitted flows by controlling the admittance of a new flow into a resource constrained network.

aggregate medium access control (MAC) protocol data unit (A-MPDU): A structure that contains one or more MPDUs and is transported by a physical layer (PHY) as a single PHY service data unit (PSDU).

¹⁰ITU publications are available from the International Telecommunications Union (<http://www.itu.int/>).

¹¹NIST publications are available from the National Institute of Standards and Technology (<http://csrc.nist.gov/>).

¹²OMA publications are available from the Open Mobile Alliance (<http://openmobilealliance.org/>).

¹³IEEE Standards Dictionary Online is available at <http://ieeexplore.ieee.org/xpls/dictionary.jsp>.

¹⁴ Notes in text, tables, and figures of a standard are given for information only and do not contain requirements needed to implement the standard.

aggregate medium access control (MAC) protocol data unit (A-MPDU) subframe: A portion of an A-MPDU that contains a delimiter and optionally contains an MPDU plus any necessary padding.

aggregate medium access control (MAC) service data unit (A-MSDU): A structure that contains one or more MSDUs and is transported within a single (unfragmented) data medium access control (MAC) protocol data unit (MPDU).

aggregate medium access control (MAC) service data unit (A-MSDU) subframe: A portion of an A-MSDU that contains a header and associated MSDU.

antenna connector: The measurement point of reference for radio frequency (RF) measurements in a station (STA). The antenna connector is the point in the STA architecture representing the input of the receiver (output of the antenna) for radio reception and the input of the antenna (output of the transmitter) for radio transmission. In systems using multiple antennas or antenna arrays, the antenna connector is a virtual point representing the aggregate output of (or input to) the multiple antennas. In systems using active antenna arrays with processing, the antenna connector is the output of the active array, which includes any processing gain of the active antenna subsystem.

antenna selection (ASEL) receiver: A station (STA) that performs receive ASEL.

antenna selection (ASEL) transmitter: A station (STA) that performs transmit ASEL.

antenna weight vector (AWV): A vector of weights describing the excitation (amplitude and phase) for each element of an antenna array.

association: The service used to establish access point/station (AP/STA) mapping and enable STA invocation of the distribution system services (DSSs).

authentication: The service used to establish the identity of one station (STA) as a member of the set of STAs authorized to associate with another STA.

Authentication Server (AS): An entity that provides an authentication service to an Authenticator. This service determines, from the credentials provided by the Supplicant, whether the Supplicant is authorized to access the services provided by the Authenticator. (IEEE Std 802.1X-2010¹⁵)

Authenticator: An entity at one end of a point-to-point LAN segment that facilitates authentication of the entity attached to the other end of that link. (IEEE Std 802.1X-2010)

authenticator address (AA): The medium access control (MAC) address of the IEEE 802.1X Authenticator.

authorization: The act of determining whether a particular right, such as access to a resource, is granted to an entity.

NOTE—See IETF RFC 2903 [B35].

authorized: To be explicitly allowed.

average noise plus interference power indicator (ANIPSI): A medium access control (MAC) indication of the average noise plus interference power measured on a channel that meets the two simultaneous conditions: 1) the station (STA) is not transmitting a frame, and 2) the station (STA) is not receiving a frame addressed to itself.

¹⁵Information on references can be found in Clause 2.

azimuth: The horizontal orientation of the front surface of a station or of a radio antenna system's main lobe measured clockwise from true north.

basic service area (BSA): The area containing the members of a basic service set (BSS). It might contain members of other BSSs.

basic service set (BSS): A set of stations (STAs) that have successfully synchronized using the JOIN service primitives¹⁶ and one STA that has used the START primitive. Alternatively, a set of STAs that have used the START primitive specifying matching mesh profiles where the match of the mesh profiles has been verified via the scanning procedure. Membership in a BSS does not imply that wireless communication with all other members of the BSS is possible.

basic service set (BSS) max idle period: A time period during which the access point (AP) does not disassociate a station (STA) due to nonreceipt of frames from that STA.

basic service set (BSS) transition: Change of association by a station (STA) from one BSS to another BSS in the same extended service set (ESS).

beamformee: A station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix.

beamformer: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

beamforming: A spatial filtering mechanism used at a transmitter to improve the received signal power or signal-to-noise ratio (SNR) at an intended receiver. *Syn: beam steering.*

beamforming steering matrix: A matrix determined using knowledge of the channel between a transmitter and an intended receiver that maps from space-time streams to transmit antennas with the goal of improving the signal power or signal-to-noise ratio (SNR) at the intended receiver.

big endian: The concept that, for a given multi-octet numeric representation, the most significant octet has the lowest address.

broadcast address: A unique group address that specifies all stations (STAs).

calibration initiator: A station (STA) that initiates a calibration sequence.

calibration responder: A station (STA) that transmits during a calibration sequence in response to a transmission by a calibration initiator.

candidate peer mesh station (STA): A neighbor mesh STA to which a mesh peering has not been established but meets eligibility requirements to become a peer mesh STA.

channel: An instance of wireless medium (WM) use for the purpose of passing physical layer (PHY) protocol data units (PDUs) between two or more stations (STAs).

channel spacing: The difference between the center frequencies of two nonoverlapping and adjacent channels of the radio transmitter.

cipher suite: A set of one or more algorithms, designed to provide data confidentiality, data authenticity or integrity, and/or replay protection.

¹⁶Description of these primitives can be found in 6.3.4.

clear channel assessment (CCA) function: The logical function in the physical layer (PHY) that determines the current state of use of the wireless medium (WM).

collocated interference: Interference that is caused by another radio or station (STA) emitting radio energy located in the same physical device as the reporting STA, where the reported characteristics of the interference are known a priori without interference detection, measurement, or characterization by the reporting STA.

collocated radio: A radio capable of emitting radio-frequency energy located in the same physical device as the reporting station (STA), where the radio's type and some link characteristics are known without signal detection or measurement by the reporting STA.

configuration profile: A collection of parameters identified by a profile identifier (ID) that represent a current or available configuration of a station (STA).

contiguous transmission: A transmission that uses only one frequency segment.

coordination function: The logical function that determines when a station (STA) is permitted to transmit protocol data units (PDUs) via the wireless medium (WM).

Counter mode with Cipher-block chaining Message authentication code (CCM): A symmetric key block cipher mode providing confidentiality using counter mode (CTR) and data origin authenticity using cipher-block chaining message authentication code (CBC-MAC).

NOTE—See IETF RFC 3610.

cryptographic encapsulation: The process of generating the cryptographic payload from the plaintext data. This comprises the cipher text as well as any associated cryptographic state required by the receiver of the data, e.g., initialization vectors (IVs), sequence numbers, message integrity codes (MICs), key identifiers.

data confidentiality: A property of information that prevents disclosure to unauthorized individuals, entities, or processes.

deauthentication service: The service that voids an existing authentication relationship.

decapsulate: To recover an unprotected frame from a protected one.

decapsulation: The process of generating plaintext data by decapsulating an encapsulated frame.

dependent station (STA): A STA that is not registered and whose operational parameters are dictated by messages it receives from an enabling STA. Once enabled by the dynamic STA enablement (DSE) process, a dependent STA's continued operation becomes contingent upon being able to receive messages from its enabling STA over the wireless medium (WM).

destination mesh station (STA): A mesh STA that is the final destination of a MAC service data unit (MSDU). This mesh STA might reside in a proxy mesh gate that might forward the MSDU to a STA outside of the mesh basic service set (MBSS). A destination mesh STA might be an end station as defined in IEEE Std 802.

direct link: A bidirectional link from one quality-of-service (QoS) station (STA) to another QoS STA operating in the same infrastructure QoS basic service set (BSS) that does not pass through a QoS access point (AP). Once a direct link has been set up, all frames between the two QoS STAs are exchanged directly.

directed frame: *See: individually addressed.*

directed multicast service (DMS): A service in which the access point (AP) transmits group addressed frames as individually addressed frames to the requesting non-AP station (STA).

disassociation service: The service that removes an existing association.

distributed coordination function (DCF): A class of coordination function where the same coordination function logic is active in every station (STA) in the basic service set (BSS) whenever the network is in operation.

distribution service: The service that, by using association information, delivers medium access control (MAC) service tuples within the distribution system (DS).

distribution system (DS): A system used to interconnect a set of basic service sets (BSSs) and integrated local area networks (LANs) to create an extended service set (ESS).

distribution system access function (DSAF): A function within an access point (AP) or mesh gate that uses the medium access control (MAC) service and distribution system service (DSS) to provide access between the distribution system (DS) and the wireless medium (WM).

distribution system medium (DSM): The medium or set of media used by a distribution system (DS) for communications between access points (APs), mesh gates, and the portal of an extended service set (ESS).

distribution system service (DSS): The set of services provided by the distribution system (DS) that enable the medium access control (MAC) to transport MAC service tuples between stations (STAs) that are not in direct communication with each other over a single instance of the wireless medium (WM).

NOTE 1—These services include transport of MAC service tuples between the access points (APs) of basic service sets (BSSs) within an extended service set (ESS), transport of MAC service tuples between the portal and BSSs within an ESS, transport of MAC service tuples between mesh gates in the same or different mesh basic service sets (MBSSs), transport of MAC service tuples between mesh gates and APs, transport of MAC service tuples between mesh gates and a portal, and transport of MAC service tuples between STAs in the same BSS when the MAC service tuples has a group destination address or the destination is an individual address and the STA is associated with an AP.

NOTE 2—DSSs are provided between pairs of MACs not on the same instance of the WM.

dynamic frequency selection (DFS): Facilities mandated to satisfy requirements in some regulatory domains for radar detection and uniform channel spreading in the 5 GHz band. These facilities might also be used for other purposes, such as automatic frequency planning.

dynamic station (STA) enablement (DSE): The process by which an enabling STA grants permission and dictates operational procedures to STAs that are subject to its control.

effective isotropic radiated power (EIRP): The equivalent power of a transmitted signal in terms of an isotropic (omnidirectional) radiator. The EIRP equals the product of the transmitter power and the antenna gain (reduced by any coupling losses between the transmitter and antenna).

emergency alert system (EAS): A U.S. national public warning system.

enabling station (STA): A registered STA that has the authority to control when and how a dependent STA can operate. An enabling STA communicates an enabling signal to its dependents over the wireless medium (WM). An enabling STA chooses whether other dynamic STA enablement (DSE) messages are exchanged over the air, over the distribution system (DS), or by mechanisms that rely on transport via higher layers.

encapsulate: To construct a protected frame from an unprotected frame.

encapsulation: The process of generating a protected frame by encapsulating plaintext data.

extended service area (ESA): The area within which members of an extended service set (ESS) can communicate. An ESA is larger than or equal to a basic service area (BSA) and might involve several basic service sets (BSSs) in overlapping, disjointed, or both configurations.

extended service set (ESS): A set of one or more interconnected basic service sets (BSSs) that appears as a single BSS to the logical link control (LLC) layer at any station (STA) associated with one of those BSSs.

extended service set (ESS) transition: Change of association by a station (STA) from one basic service set (BSS) in one ESS to another BSS in a different ESS.

fast basic service set (BSS) transition: Change of association by a station (STA) that is from one BSS in one extended service set (ESS) to another BSS in the same ESS and that minimizes the amount of time that the data connectivity is lost between the STA and the distribution system (DS).

fast session transfer (FST): The transfer of a session from a channel to another channel, in the same or different frequency bands. The term “session” refers to non-physical layer state information kept by a pair of stations (STAs) that communicate directly (i.e., excludes forwarding).

fixed station (STA): A STA that is physically attached to a specific location. In licensed bands, a fixed STA might be authorized to operate only at a specific location.

forwarding information: The information maintained by a mesh station (STA) that allows the mesh STA to perform its path selection and forwarding functions.

frame: A unit of data exchanged between peer protocol entities.

frequency segment: A contiguous block of spectrum used by a transmission.

frame exchange sequence: A sequence of frames specified by Annex G.

Gaussian frequency shift keying (GFSK): A modulation scheme in which the data are first filtered by a Gaussian filter in the baseband and then modulated with a simple frequency modulation.

geolocation: A location within an earth-centric frame of reference.

group: The entities in a wireless network, e.g., an access point (AP) and its associated stations (STAs), or all of the STAs in an independent basic service set (IBSS) network.

group address: A medium access control (MAC) address that has the group bit equal to 1. *Syn: multicast address.*

group addressed: A group addressed medium access control (MAC) service data unit (MSDU) is an MSDU that has a group address as its destination address (DA). A group addressed MAC protocol data unit (MPDU) is an MPDU that has a group address in its Address 1 field. *Syn: multicast.*

group master key (GMK): An auxiliary key that might be used to derive a group temporal key (GTK).

group temporal key (GTK): A random value, assigned by the group source, which is used to protect group addressed medium access control (MAC) protocol data units (MPDUs) from that source. The GTK might be derived from a group master key (GMK).

hidden station (STA): A STA whose transmissions are not detected using carrier sense (CS) by a second STA, but whose transmissions interfere with transmissions from the second STA to a third STA

homogenous extended service set (ESS): A collection of basic service sets (BSSs), within the same extended service set (ESS), in which every subscription service provider network (SSPN) or other external network reachable at one BSS is reachable at all of them.

idle power indicator (IPI): A physical layer (PHY) indication of the total channel power (noise and interference) as measured in the channel at the receiving antenna connector while the station (STA) is idle, i.e., neither transmitting nor receiving a frame.

IEEE 802.1X authentication: Extensible Authentication Protocol (EAP) authentication transported by the IEEE 802.1X protocol.

independent basic service set (IBSS): A basic service set (BSS) that forms a self-contained network, and in which no access to a distribution system (DS) is available.

individual address: A medium access control (MAC) address in which the group bit is 0. *Syn: directed address, unicast address.*

individually addressed: When applied to a medium access control (MAC) service data unit (MSDU), it is an MSDU with an individual address as the destination address (DA). When applied to a MAC protocol data unit (MPDU), it is an MPDU with an individual address in the Address 1 field. *Syn: directed, unicast.*

infrastructure: An infrastructure comprises a distribution system (DS), one or more APs, zero or one portal, and zero or more mesh gates. It is also the logical location of distribution and integration service functions of an extended service set (ESS).

infrastructure authorization information: The information that specifies the access rights of the user of a non-access-point (non-AP) station (STA). This information might include the rules for routing the user traffic, a set of permissions about services that a user is allowed to access, quality-of-service (QoS) configuration information, or the accounting policy to be applied by the infrastructure.

integration service: The service that enables delivery of medium access control (MAC) service data units (MSDUs) between the distribution system (DS) and a local area network (LAN) (via a portal).

integrity group temporal key (IGTK): A random value, assigned by the broadcast/multicast source station (STA), which is used to protect group addressed medium access control (MAC) management protocol data units (MMPDUs) from that source STA.

link margin: Ratio of the received signal power to the minimum required by the station (STA). The STA might incorporate rate information and channel conditions, including interference, into its computation of link margin. The specific algorithm for computing the link margin is implementation dependent.

link metric: A criterion used to characterize the performance, quality, and eligibility of a link.

little endian: The concept that, for a given multi-octet numeric representation, the least significant octet has the lowest address.

liveness: A demonstration that the peer is actually participating in this instance of communication.

location subject local: The term used when a location request is for the location of the requesting STA, i.e., when the requesting STA asks, “Where am I?”

location subject remote: The term used when a location request is for the location of the reporting STA, i.e., when the requesting STA asks, “Where are you?”

location subject third party: The term used when the location request is for the location of a station (STA) other than the requesting STA or the requested STA, (i.e., when the requesting STA asks, “Where is he/she?”)

master session key (MSK): Keying material that is derived between the Extensible Authentication Protocol (EAP) peer and exported by the EAP method to the Authentication Server (AS).

NOTE—In this standard, this key is at least 64 octets in length.

medium access control (MAC) frame: The unit of data exchanged between MAC entities. *Syn: medium access control (MAC) protocol data unit (MPDU).*

NOTE—In contexts in which the MAC is clearly the subject, “frame” is an implicit reference to a MAC frame.

medium access control (MAC) protocol data unit (MPDU): The unit of data exchanged between two peer MAC entities using the services of the physical layer (PHY). *Syn: medium access control (MAC) frame.*

medium access control (MAC) service data unit (MSDU): Information that is delivered as a unit between MAC service access points (SAPs).

medium access control (MAC) service tuple: The collection of a MAC service data unit (MSDU) along with the source address, destination addresses, priority, and service class associated with the MSDU, which are passed as parameters across the MAC service access point (SAP) and are delivered across the distribution system between access points (APs), mesh gates, and the portal of an extended service set (ESS).

mesh basic service set (MBSS): A basic service set (BSS) that forms a self-contained network of mesh stations (STAs) that use the same mesh profile. An MBSS contains zero or more mesh gates, and can be formed from mesh STAs that are not in direct communication.

mesh facility: The set of enhanced functions, channel access rules, frame formats, mutual authentication methods, and managed objects used to provide data transfer among autonomously operating stations (STAs) that might not be in direct communication with each other over a single instance of the wireless medium. Communication between STAs using the mesh facility takes place using only the wireless medium. The mesh facility transports an MSDU between source and destination STAs over potentially multiple hops of the wireless medium without transiting the MAC SAP at intermediate STAs.

mesh gate: Any entity that has a mesh station (STA) function and a distribution system access function (DSAF) to provide access to a single distribution system for the mesh basic service set (MBSS).

mesh link: A link from one mesh station (STA) to a neighbor mesh STA that have a mesh peering with each other.

mesh neighborhood: The set of all neighbor mesh stations (STAs) of a particular mesh STA.

mesh path: A concatenated set of mesh links from a source mesh station (STA) to a destination mesh STA.

mesh path selection: The process of selecting a mesh path.

mesh peering: A relationship between two mesh stations (STAs) that is required for direct communication over a single instance of the wireless medium (WM). A mesh peering is established with a mesh peering protocol.

mesh profile: A set of values of parameters that identifies the attributes of the mesh basic service set (MBSS) and that is used in a single MBSS.

NOTE—The mesh profile consists of the identifiers that are the values for the parameters: mesh ID, active path selection protocol, active path selection metric, congestion control mode, synchronization method, and authentication protocol.

mesh services: The set of services that enable the creation and operation of a mesh basic service set (MBSS).

mesh station (STA): A quality-of-service (QoS) STA that implements the mesh facility.

message integrity code (MIC): A value generated by a cryptographic function. If the input data are changed, a new value cannot be correctly computed without knowledge of the cryptographic key(s) used by the cryptographic function.

NOTE—This is traditionally called a *message authentication code* (MAC), but the acronym MAC is already reserved for another meaning in this standard.

mobile station (STA): A type of STA that uses network communications while in motion.

mobility domain: A set of basic service sets (BSSs), within the same extended service set (ESS), that support fast BSS transitions between themselves and that are identified by the set's mobility domain identifier (MDID).

mobility domain identifier (MDID): An identifier that names a mobility domain.

multi-level precedence and preemption (MLPP): A framework used with admission control for the treatment of traffic streams based on precedence, which supports the preemption of an active traffic stream by a higher precedence traffic stream when resources are limited. Preemption is the act of forcibly removing a traffic stream in progress in order to free up resources for another higher precedence traffic stream.

multi-user multiple input, multiple output (MU-MIMO): A technique by which multiple stations (STAs), each with one or more antennas, either simultaneously transmit to a single STA or simultaneously receive from a single STA independent data streams over the same radio frequencies.

NOTE—IEEE Std 802.11 supports only downlink (DL) MU-MIMO. See **downlink multi-user multiple input, multiple output (DL-MU-MIMO)** (in 3.2).

multicast: *See: group addressed.*

multicast address: *See: group address.*

multicast-group address: A medium access control (MAC) address associated by higher level convention with a group of logically related stations (STAs).

multiple basic service set identifier (BSSID) capability: The capability to advertise information for multiple BSSIDs using a single Beacon or Probe Response frame instead of using multiple Beacon or Probe Response frames, each corresponding to a single BSSID, and the capability to indicate buffered frames for these multiple BSSIDs using a single traffic indication map (TIM) element in a single Beacon.

multiple input, multiple output (MIMO): A physical layer (PHY) configuration in which both transmitter and receiver use multiple antennas.

multiple medium access control (MAC) station management entity (SME) (MM-SME): Component of station management that manages multiple cooperating stations (STAs).

neighbor access point (AP): Any AP that is a potential service set transition candidate.

neighbor station (STA): A STA in the following relationship: STA A is a neighbor to STA B if STA A can both directly transmit to and receive from STA B over the wireless medium.

network access identifier (NAI): The user identity submitted by the Supplicant during IEEE 802.1X authentication.

NOTE—See IETF RFC 4282.

network access server (NAS) client: The client component of a NAS that communicates with the Authentication Server (AS).

network allocation vector (NAV): An indicator, maintained by each station (STA), of time periods when transmission onto the wireless medium (WM) is not initiated by the STA regardless of whether the STA's clear channel assessment (CCA) function senses that the WM is busy.

next-hop mesh station (STA): The next peer mesh STA on the mesh path to the destination mesh STA.

non-access-point (non-AP) station (STA): A STA that is not contained within an access point (AP).

nonce: A numerical value, used in cryptographic operations associated with a given cryptographic key, that is not to be reused with that key, including over all reinitializations of the system through all time.

noncontiguous transmission: A transmission that uses nonadjacent frequency segments.

nonoperating channel: A channel that is not the operating channel of the basic service set (BSS) of which the station (STA) is a member.

non-quality-of-service (non-QoS) access point (AP): An AP that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) basic service set (BSS): A BSS that does not support the quality-of-service (QoS) facility.

non-quality-of-service (non-QoS) station (STA): A STA that does not support the quality-of-service (QoS) facility.

operating channel: The operating channel is the channel in which beacons are transmitted.

NOTE—In IEEE Std 802.11, the serving access point (AP) of an infrastructure basic service set (BSS) or the dynamic frequency selection (DFS) owner of an independent basic service set (IBSS) transmits beacons.

operating channel width: The channel width in which the station (STA) is currently able to receive.

overlapping basic service set (OBSS): A basic service set (BSS) operating on the same channel as the station's (STA's) BSS and within (either partly or wholly) its basic service area (BSA).

over-the-air fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates over a wireless medium (WM) link to the target access point (AP).

over-the-DS (distribution system) fast basic service set (BSS) transition (FT): An FT method in which the station (STA) communicates with the target access point (AP) via the current AP.

pairwise: Referring to, or an attribute of, two entities that are associated with each other, e.g., an access point (AP) and an associated station (STA), or two STAs in an independent basic service set (IBSS) network. This term is used to refer to a type of encryption key hierarchy pertaining to keys shared by only two entities.

pass-phrase: A secret text string employed to corroborate the user's identity.

password: A shared, secret, and potentially low-entropy word, phrase, code, or key used as a credential for authentication purposes.

NOTE—The method of distribution of a password to the units in the system is outside the scope of this standard.

path metric: An aggregate multi-hop criterion used to characterize the performance, quality, and eligibility of a mesh path.

peer mesh station (STA): A mesh STA to which a mesh peering has been established.

peer-to-peer link: A direct link within a quality-of-service (QoS) basic service set (BSS), a tunneled direct-link setup (TDLS) link, or a STA-to-STA communication in an independent basic service set (IBSS).

peer-to-peer traffic specification (PTP TSPEC): The quality-of-service (QoS) characteristics of a data flow between non-access point (non-AP) QoS stations (STAs).

per-frame encryption key: A unique encryption key constructed for each medium access control (MAC) protocol data unit (MPDU).

physical layer (PHY) frame: The unit of data exchanged between PHY entities. *Syn: physical layer (PHY) protocol data unit (PPDU).*

NOTE—In contexts in which the PHY is clearly the subject, “frame” is an implicit reference to a PHY frame.

physical layer (PHY) protocol data unit (PPDU): The unit of data exchanged between two peer PHY entities to provide the PHY data service.

piggyback: The overloading of data with an acknowledgment of a previously received frame to the station (STA) to which the data is directed.

portable station (STA): A type of station (STA) that might be moved from location to location, but that only uses network communications while at a fixed location.

portal: The logical point at which the integration service is provided.

NOTE—For the purposes of this Standard, there is at most one portal in a given ESS's infrastructure. In an implementation, a single logical portal function may be provided by multiple devices that provide integration services for the ESS. How such multiple devices coordinate to appear as a single logical portal is implementation dependent.

precursor mesh station (STA): A neighbor peer mesh STA on the mesh path to the destination mesh STA, that identifies the mesh STA as the next-hop mesh STA.

preshared key (PSK): A static key that is distributed to the units in the system by some out-of-band means.

primary channel: The common channel of operation for all stations (STAs) that are members of the basic service set (BSS).

prioritized quality of service (QoS): The provisioning of service in which the medium access control (MAC) protocol data units (MPDUs) with higher priority are given a preferential treatment over MPDUs with a lower priority.

NOTE—Prioritized QoS is provided through the enhanced distributed channel access (EDCA) mechanism.

protection mechanism: Any procedure that attempts to update the network allocation vector (NAV) of all receiving stations (STAs) prior to the transmission of a frame that might or might not be detected as valid network activity by the physical layer (PHY) entities at those receiving STAs.

protection mechanism frame: Any frame that is sent as part of a protection mechanism procedure.

protocol instance: An execution of a particular protocol that consists of the state of the communicating parties as well as the messages exchanged.

proxy mesh gate: A mesh gate acting as an intermediary for IEEE 802 stations (STAs) outside the mesh basic service set (MBSS).

pseudorandom function (PRF): A function that hashes various inputs to derive a pseudorandom value. In order to ensure liveness of a communication in which a pseudorandom value is used, a nonce is used as one of the inputs to the function.

public safety answering point (PSAP): A physical location where emergency calls are received and routed to the appropriate emergency service dispatch center.

NOTE—See NENA 08-002 [B56].

quadrature binary phase shift keying (QBPSK): A binary phase shift keying modulation in which the binary data is mapped onto the imaginary (Q) axis.

quality-of-service (QoS) access point (AP): An AP that supports the QoS facility.

NOTE—In IEEE Std 802.11, the functions of a QoS AP are a superset of the functions of a non-QoS AP, and thus a QoS AP is able to function as a non-QoS AP to non-QoS stations (STAs).

quality-of-service (QoS) basic service set (BSS): A BSS that provides the QoS facility. An infrastructure QoS BSS contains a QoS access point (AP).

quality-of-service (QoS) facility: The set of enhanced functions, channel access rules, frame formats, frame exchange sequences and managed objects used to provide parameterized and prioritized QoS.

quality-of-service (QoS) independent basic service set (IBSS): An IBSS in which one or more of its stations (STAs) support the QoS facility.

quality-of-service (QoS) station (STA): A STA that implements the QoS facility.

NOTE—A QoS STA acts as a non-QoS STA when associated in a non-QoS basic service set (BSS).

radio frequency (RF) chain: The physical entity that is able to act as a receive chain or transmit chain, or both.

reassociation service: The service that enables an established association [between access point (AP) and station (STA)] to be transferred from one AP to another (or the same) AP.

receive chain: The physical entity that implements any necessary signal processing to provide the received signal to the digital baseband. Such signal processing includes filtering, amplification, down-conversion, and sampling.

receive power: Mean power measured at the antenna connector.

received channel power indicator (RCPI): An indication of the total channel power (signal, noise, and interference) of a received frame measured on the channel and at the antenna connector used to receive the frame.

received power indicator (RPI): A quantized measure of the received power level as seen at the antenna connector.

registered location: The geolocation of a station (STA) registered in accordance with the requirements for the regulatory domain.

registered location query protocol (RLQP): The query protocol for registered location information that is received and transported by generic advertisement service (GAS) Public Action frames.

registered location secure server (RLSS): An entity that accesses and manages a database that organizes storage of information by geographic location and securely holds the location and some operating parameters of one or more basic service sets (BSSs).

registered station (STA): A STA for which information needs to be submitted to an appropriate regulatory or coordination authority before it is allowed to transmit.

remote request broker (RRB): The component of the station management entity (SME) of an access point (AP) that supports fast basic service set (BSS) transitions over the distribution system (DS).

roaming consortium: A group of subscription service providers (SSPs) having inter-SSP roaming agreements.

service set transition: A station (STA) movement from one basic service set (BSS) to another BSS, i.e., either a BSS transition or an extended service set (ESS) transition.

serving access point (AP): The AP to which the station (STA) is associated.

single-user (SU) physical layer (PHY) protocol data unit (PPDU): A PPDU with a format that is capable of carrying only a single PHY service data unit (PSDU), or no PSDU.

sounding: The use of preamble training fields to measure the channel for purposes other than demodulation of the Data portion of the physical layer (PHY) protocol data unit (PPDU) containing the training fields.

NOTE—These uses include calculation of transmit steering, calculation of recommended modulation and coding scheme (MCS), and calculation of calibration parameters.

source mesh station (STA): A mesh STA from which a medium access control (MAC) service data unit (MSDU) enters the mesh basic service set (MBSS). A source mesh STA is either a mesh STA that is the source of an MSDU or a proxy mesh gate that receives an MSDU from a STA outside of the MBSS and forwards the MSDU on a mesh path.

space-time streams: Streams of modulation symbols created by applying a combination of spatial and temporal processing to one or more spatial streams of modulation symbols.

spatial multiplexing (SM): A transmission technique in which data streams are transmitted on multiple spatial channels that are provided through the use of multiple antennas at the transmitter and the receiver.

spatial stream: One of several streams of bits or modulation symbols that might be transmitted over multiple spatial dimensions that are created by the use of multiple antennas at both ends of a communications link.

station (STA): A logical entity that is a singly addressable instance of a medium access control (MAC) and physical layer (PHY) interface to the wireless medium (WM).

NOTE—For IEEE 802.11 purposes, a station is any MAC/PHY entity providing the IEEE 802.11 MAC services. This differs from the IEEE 802 definition of ‘station,’ which includes bridges (or ‘end stations’) that are endpoints of link layer data traffic.

station service (SS): The set of services that support transport of medium access control (MAC) service data units (MSDUs) between stations (STAs) within a basic service set (BSS).

subscription service provider (SSP): An organization (operator) offering connection to network services, perhaps for a fee.

subscription service provider network (SSPN): The network controlled by a subscription service provider (SSP). The network maintains user subscription information.

Supplicant: An entity at one end of a point-to-point LAN segment that is being authenticated by an Authenticator attached to the other end of that link. (IEEE Std 802.1X-2010)

Supplicant address (SPA): The medium access control (MAC) address of the IEEE 802.1X Supplicant.

television white spaces (TVWS): The opportunistic use of allocated but not assigned spectrum—spectrum allocated for broadcast television, but with no assignment at a particular location.

time unit (TU): A measurement of time equal to 1024 µs.

traffic category (TC): A label for medium access control (MAC) service data units (MSDUs) that have a distinct user priority (UP), as viewed by higher layer entities, relative to other MSDUs provided for delivery over the same link. Traffic categories are meaningful only to MAC entities that support quality of service (QoS) within the MAC data service. These MAC entities determine the UP for MSDUs belonging to a particular traffic category using the priority value provided with those MSDUs at the MAC service access point (MAC SAP).

traffic classification (TCLAS): The specification of certain parameter values to identify a protocol data unit (PDU) or a medium access control (MAC) service data unit (MSDU). The classification process is performed above the MAC service access point (MAC SAP), within the MLME, or within the MAC, based on the type of classification.

traffic filter: A set of traffic specifications defined by the use of traffic classification (TCLAS) elements that are utilized by the traffic filtering service (TFS) to identify specific allowed frames.

traffic filtering service (TFS): A service provided by an access point (AP) to a non-AP station (STA) to reduce the number of frames sent to the non-AP STA by not forwarding individually addressed frames addressed to the non-AP STA that do not match traffic filters specified by the non-AP STA.

traffic identifier (TID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities that support quality of service (QoS) within the MAC data service.

NOTE—There are 16 possible TID values; eight identify traffic categories (TCs), and the other eight identify parameterized traffic streams (TSs). The TID is assigned to an MSDU in the layers above the MAC.

traffic specification (TSPEC): The quality-of-service (QoS) characteristics of a data flow to and from a QoS station (STA).

traffic stream (TS): A set of medium access control (MAC) service data units (MSDUs) to be delivered subject to the quality-of-service (QoS) parameter values provided to the MAC in a particular traffic specification (TSPEC). TSs are meaningful only to MAC entities that support QoS within the MAC data service. These MAC entities determine the TSPEC applicable for delivery of MSDUs belonging to a particular TS using the priority parameter provided with those MSDUs at the MAC service access point (MAC SAP).

transmission opportunity (TXOP): An interval of time during which a particular quality-of-service (QoS) station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM).

NOTE—A TXOP is defined by a starting time and a maximum duration.

transmit chain: The physical entity that implements any necessary signal processing to generate the transmit signal from the digital baseband. Such signal processing includes digital to analog conversion, filtering, amplification and up-conversion.

type/length/value (TLV): A format that consists of a type, a length, and a value.

unauthorized disclosure: The process of making information available to unauthorized individuals, entities, or processes.

unauthorized resource use: The use of a resource not consistent with the defined security policy.

unicast: *See: individually addressed.*

unicast address: *See: individual address.*

uniform spreading: A regulatory requirement for a channel selection mechanism that provides uniform usage across a minimum set of channels in the regulatory domain.

unreachable destination: A destination mesh station (STA) for which the link to the next hop of the mesh path to this destination mesh STA is no longer usable.

user priority (UP): A value associated with a medium access control (MAC) service data unit (MSDU) that indicates how the MSDU is to be handled. The UP is assigned to an MSDU in the layers above the MAC.

validated AP: An AP that has either been explicitly configured as a neighbor or learned through a mechanism such as the Beacon report.

wildcard BSSID: A BSSID value used to represent all BSSIDs.

NOTE—In IEEE Std 802.11, this is represented by all binary 1s.

wildcard SSID: A SSID value used to represent all SSIDs.

NOTE—In IEEE Std 802.11, this is represented by the value “null”.

wireless medium (WM): The medium used to implement the transfer of protocol data units (PDUs) between peer physical layer (PHY) entities of a wireless local area network (LAN).

3.2 Definitions specific to IEEE Std 802.11

The following terms and definitions are specific to terms or references in this standard and are not appropriate for inclusion in the *IEEE Standards Dictionary: Glossary of Terms & Definitions*.

20 MHz basic service set (BSS): A BSS in which the Secondary Channel Offset field is equal to no secondary channel (SCN).

20 MHz high-throughput (HT): A Clause 19 transmission with TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20.

20 MHz mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 17 PPDU transmitted using the 20 MHz transmit spectral mask defined in Clause 17.
- b) A Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU transmitted using the transmit spectral mask defined in Clause 18.
- c) A high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted using the 20 MHz transmit spectral mask defined in Clause 19.
- d) A very high throughput (VHT) PPDU with TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 20 MHz transmit spectral mask defined in Clause 21.
- e) A Clause 17 PPDU transmitted by a VHT STA using the transmit spectral mask defined in Clause 21.
- f) An HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to CH_OFF_20 transmitted by a VHT STA using the 20 MHz transmit spectral mask defined in Clause 21.

20 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 15 PPDU, Clause 17 PPDU (when using 20 MHz channel spacing), Clause 16 PPDU, Clause 18 orthogonal frequency division multiplexing (OFDM) PPDU, Clause 19 20 MHz high-throughput (HT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20, or Clause 21 20 MHz very high throughput (VHT) PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20.

20/40 MHz basic service set (BSS): A BSS in which the supported channel width of the access point (AP) or dynamic frequency selection (DFS) owner (DO) station (STA) is 20 MHz and 40 MHz (Channel Width field is equal to 1) and the Secondary Channel Offset field is equal to a value of secondary channel above (SCA) or secondary channel below (SCB).

40-MHz-capable (40MC) high-throughput (HT) access point (AP): An HT AP that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high-throughput (HT) access point (AP) 2G4: An HT AP 2G4 that is also a 40MC HT AP.

40-MHz-capable (40MC) high-throughput (HT) access point (AP) 5G: An HT AP 5G that is also a 40MC HT AP.

40-MHz-capable (40MC) high-throughput (HT) station (STA): An HT STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element.

40-MHz-capable (40MC) high-throughput (HT) station (STA) 2G4: An HT STA 2G4 that is also a 40MC HT STA.

40-MHz-capable (40MC) high-throughput (HT) station (STA) 5G: An HT STA 5G that is also a 40MC HT STA.

40 MHz high-throughput (HT): A Clause 19 transmission with TXVECTOR parameter FORMAT equal to HT_MF or HT_GF and TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40.

40 MHz mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDU:

- a) A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.
- b) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40) transmitted by a non-very high throughput (non-VHT) STA using the 40 MHz transmit spectral mask defined in Clause 19.
- c) A 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40) transmitted by a very high throughput (VHT) STA using the 40 MHz transmit spectral mask defined in Clause 21.
- d) A 20 MHz HT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 and the CH_OFFSET parameter equal to either CH_OFF_20U or CH_OFF_20L transmitted using the 40 MHz transmit spectral mask defined in Clause 19.
- e) A 20 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW20 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.
- f) A 40 MHz VHT PPDU with the TXVECTOR parameter CH_BANDWIDTH equal to CBW40 transmitted using the 40 MHz transmit spectral mask defined in Clause 21.
- g) A 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.
- h) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted using the 40 MHz transmit spectral mask defined in Clause 19.
- i) A 20 MHz non-HT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20) transmitted by a VHT STA using the 40 MHz transmit spectral mask defined in Clause 21.

40 MHz physical layer (PHY) protocol data unit (PPDU): A 40 MHz high-throughput (HT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40), or a 40 MHz non-HT duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to NON_HT_CBW40 or TXVECTOR parameter CH_BANDWIDTH equal to CBW40), or a 40 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40).

4-way handshake: A pairwise key management protocol defined by this standard. This handshake confirms mutual possession of a pairwise master key (PMK) by two parties and distributes a group temporal key (GTK).

4-way station-to-station link (STSL) transient key (STK) handshake: A key management protocol between two parties that confirms mutual possession of an STSL master key (SMK) and distributes an STK.

80 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 80 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

- a) An 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80)
- b) An 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80)

- c) A 20 MHz non-HT, high-throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20)
- d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40)

80 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80) or a Clause 21 80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80).

160 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 160 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

- a) A 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160)
- b) A 160 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160)
- c) A 20 MHz non-HT, high-throughput (HT), or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW20)
- d) A 40 MHz non-HT duplicate, HT, or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW40)
- e) An 80 MHz non-HT duplicate or VHT PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80)

160 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 160 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160) or a Clause 21 160 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW160).

80+80 MHz mask physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted using the 80+80 MHz transmit spectral mask defined in Clause 21 and that is one of the following:

- a) An 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80)
- b) An 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80)

80+80 MHz physical layer (PHY) protocol data unit (PPDU): A Clause 21 80+80 MHz very high throughput (VHT) PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80) or a Clause 21 80+80 MHz non-high-throughput (non-HT) duplicate PPDU (TXVECTOR parameter CH_BANDWIDTH equal to CBW80+80).

access category (AC): A label for the common set of enhanced distributed channel access (EDCA) parameters that are used by a quality-of-service (QoS) station (STA) to contend for the channel in order to transmit medium access control (MAC) service data units (MSDUs) with certain priorities.

access network query protocol (ANQP): The query protocol for access network information retrieval transported by generic advertisement service (GAS) Public Action frames.

access period: A time period during a beacon interval established in a directional multi-gigabit (DMG) basic service set (BSS).

access point (AP) path: Path between two tunneled direct-link setup (TDLS) peer stations (STAs) via the AP with which the STAs are currently associated.

active mode: A power management mode in which a nonmesh station (STA) remains in the awake state, and a mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station remains in the awake state and is expected to receive frames from this neighbor peer mesh STA.

advanced groupcast with retries (GCR): A set of features comprising the GCR block acknowledgment retransmission policy and the GCR service period (GCR-SP) delivery method.

advertisement protocol: Access network query protocol (ANQP) and higher layer protocols defined external to this standard that are used for network and service discovery.

advertisement server: A logical server that provides the information repository for a specific advertisement protocol. The location of the physical server that instantiates the advertisement server is outside the scope of this standard.

aggregated schedule: The aggregation of delivery and/or poll schedules by the quality-of-service (QoS) access point (AP) for a particular QoS station (STA) into a single service period (SP).

authentication and key management (AKM) suite: A set of one or more algorithms designed to provide authentication and key management, either individually or in combination with higher layer authentication and key management algorithms outside the scope of this standard.

average noise power indicator (ANPI): A medium access control (MAC) indication of the average noise plus interference power measured when the channel is idle as defined by three simultaneous conditions: 1) the virtual carrier sense (CS) mechanism indicates idle channel, 2) the station (STA) is not transmitting a frame, and 3) the STA is not receiving a frame.

bandwidth signaling transmitter address (TA): A TA that is used by a very high throughput (VHT) station (STA) to indicate the presence of additional signaling related to the bandwidth to be used in subsequent transmission in an enhanced distributed channel access (EDCA) transmission opportunity (TXOP). It is represented by the IEEE medium access control (MAC) individual address of the transmitting VHT STA but with the Individual/Group bit set to 1.

base channel: Channel on which the tunneled direct-link setup (TDLS) peer station (STA) is associated with an access point (AP).

basic channel unit (BCU): For television very high throughput (TVHT) operation, 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain.

basic modulation and coding scheme (MCS) set: The set of MCS values that are supported by all high-throughput (HT) stations (STAs) that are members of an HT basic service set (BSS).

basic space-time block coding (STBC) modulation and coding scheme (MCS): An MCS value and STBC encoder specification used in the transmission of STBC-encoded Control frames and STBC-encoded group addressed frames.

beacon header interval (BHI): The period of time that starts at the target beacon transmission time (TBTT) of a beacon interval of a directional multi-gigabit (DMG) basic service set (BSS) and that ends no later than the beginning of the data transfer interval (DTI) of the beacon interval.

beacon transmission interval (BTI): The time interval between the start of the first Directional Multi-gigabit (DMG) Beacon frame transmission by a DMG station (STA) in a beacon interval to the end of the last DMG Beacon frame transmission by the STA in the same beacon interval.

bufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is eligible to be queued for delivery using a power-saving mechanism (see Table 11-1).

bufferable unit (BU): A medium access control (MAC) service data unit (MSDU), aggregate MAC service data unit (A-MSDU) [high-throughput (HT) stations (STAs) and directional multi-gigabit (DMG) STAs only], or bufferable MAC management protocol data unit (MMPDU).

centralized coordination service root (CCSR): An entity that provides synchronization and configuration services to synchronization access points (S-APs).

centralized coordination service set (CCSS): The collection of one centralized coordination service root (CCSR) and a set of one or more synchronization access points (S-APs) that are stationary with respect to their local environment while operating and are connected to the CCSR.

concealed groupcast with retries (GCR) frame: A group addressed frame that is transmitted using the aggregate medium access control (MAC) service data unit (A-MSDU) frame format with the destination address (DA) field set to the GCR concealment address.

contention based access period (CBAP): The time period in the data transfer interval (DTI) of a directional multi-gigabit (DMG) basic service set (BSS) during which enhanced distributed channel access (EDCA) is used.

contention free (CF) pollable: A station (STA) that is able to respond to a CF poll with a Data frame if such a frame is queued and able to be generated.

contention free period (CFP): The time period during the operation of a point coordination function (PCF) when the right to transmit is assigned to stations (STAs) solely by a point coordinator (PC), allowing frame exchanges to occur between members of the basic service set (BSS) without contention for the wireless medium (WM).

contention period (CP): The time period outside of the contention free period (CFP) in a point-coordinated basic service set (BSS). In a BSS where there is no point coordinator (PC), this corresponds to the entire time of operation of the BSS.

controlled access phase (CAP): A time period during which the hybrid coordinator (HC) maintains control of the medium, after gaining medium access by sensing the channel to be idle for a point coordination function (PCF) interframe space (PIFS) duration. It might span multiple consecutive transmission opportunities (TXOPs) and can contain polled TXOPs.

deep sleep mode: A mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station (STA) alternates between awake and doze states and is not expected to receive beacons from this neighbor peer mesh STA.

delivery-enabled access category (AC): A quality-of-service (QoS) access point (AP) AC where the AP is allowed to use enhanced distributed channel access (EDCA) to deliver traffic from the AC to a QoS station (STA) in an unscheduled service period (SP) triggered by the STA.

delivery traffic indication map (DTIM) interval: The interval between the consecutive target beacon transmission times (TBTTs) of beacons containing a DTIM. The value, expressed in time units, is equal to the product of the value in the Beacon Interval field and the value in the DTIM Period subfield in the TIM element in Beacon frames.

destination directional multi-gigabit (DMG) station (STA): A DMG STA identified by the destination association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or a contention based access period (CBAP).

direct sequence spread spectrum/complementary code keying (DSSS/CCK): A Clause 15 or Clause 16 transmission.

directional multi-gigabit (DMG): Pertaining to operation in a frequency band containing a channel with the channel starting frequency above 45 GHz.

NOTE—The channel starting frequency for IEEE 802.11 stations (STAs) is defined in Annex E.

directional multi-gigabit (DMG) access point (AP): An AP whose radio transmitter is capable of transmitting and receiving DMG physical layer (PHY) protocol data units (PPDUs).

directional multi-gigabit (DMG) antenna: A DMG antenna is a phased array, a single element antenna, or a set of switched beam antennas covered by a quasi-omni antenna pattern.

directional multi-gigabit (DMG) basic service set (BSS): A BSS in which DMG Beacon frames are transmitted by DMG stations (STAs).

directional multi-gigabit (DMG) frame: A frame transmitted or received within a DMG physical layer (PHY) protocol data unit (PPDU).

directional multi-gigabit (DMG) physical layer (PHY) protocol data unit (PPDU): A Clause 20 PPDU.

directional multi-gigabit (DMG) station (STA): A STA whose radio transmitter is capable of transmitting and receiving DMG physical layer (PHY) protocol data units (PPDUs).

directional transmission: A transmission that does not use an omnidirectional antenna pattern or quasi-omni antenna pattern.

downlink: A unidirectional link from an access point (AP) to one or more non-AP stations (STAs) or a unidirectional link from a non-AP destination directional multi-gigabit (DMG) STA to a non-AP source DMG STA.

downlink multi-user multiple input, multiple output (DL-MU-MIMO): A technique by which an access point (AP) with more than one antenna transmits a physical layer (PHY) protocol data unit (PPDU) to multiple receiving non-AP stations (STAs) over the same radio frequencies, wherein each non-AP STA simultaneously receives one or more distinct space-time streams.

dynamic bandwidth operation: A feature of a very high throughput (VHT) station (STA) in which the request-to-send/clear-to-send (RTS/CTS) exchange, using non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data units (PPDUs), negotiates a potentially reduced channel width (compared to the channel width indicated by the RTS) for subsequent transmissions within the current transmission opportunity (TXOP).

dynamic frequency selection (DFS) owner: A station (STA) in an independent basic service set (IBSS) or off-channel tunneled direct link setup (TDLS) direct link that takes responsibility for selecting the next channel after radar is detected operating in a channel. Due to the nature of IBSSs, it cannot be guaranteed that there is a single DFS owner at any particular time and the protocol is robust to this situation.

EAPOL-Key confirmation key (KCK): A key used to integrity-check an EAPOL-Key frame.

EAPOL-Key encryption key (KEK): A key used to encrypt the Key Data field in an EAPOL-Key frame.

EAPOL-Key frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL PDU of type EAPOL-Key.

EAPOL-Key request frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL-Key protocol data unit (PDU) with the Request bit in the Key Information field in the IEEE 802.11 key descriptor set to 1.

EAPOL-Start frame: A Data frame that carries all or part of an IEEE 802.1X EAPOL PDU of type EAPOL-Start.

emergency services association: A robust security network association (RSNA) between an access point (AP) and a non-AP station (STA) without security credentials; the non-AP STA is granted access to emergency services using unprotected frames via this association.

enhanced distributed channel access (EDCA): The prioritized carrier sense multiple access with collision avoidance (CSMA/CA) access mechanism used by quality-of-service (QoS) stations (STAs) in a QoS basic service set (BSS) and STAs operating outside the context of a BSS. This access mechanism is also used by the QoS access point (AP) and operates concurrently with hybrid coordination function (HCF) controlled channel access (HCCA).

enhanced distributed channel access function (EDCAF): A logical function in a quality-of-service (QoS) station (STA) that determines, using enhanced distributed channel access (EDCA), when a frame in the transmit queue with the associated access category (AC) is permitted to be transmitted via the wireless medium (WM). There is one EDCAF per AC.

extended centralized access point (AP) or personal basic service set (PBSS) control point (PCP) cluster (ECAPC): The collection of 1) a single centralized coordination service set (CCSS), 2) the set of centralized AP or PCP clusters such that each synchronization AP (S-AP) of a centralized AP or PCP cluster is within the CCSS, and 3) all stations (STAs) within the basic service sets (BSSs) of the S-APs and member APs and PCPs of the centralized AP or PCP clusters.

extended channel switching (ECS): A procedure that is used to announce a pending change of operating channel, operating class, or both.

extended rate physical layer (ERP): A physical layer (PHY) compliant with Clause 18.

extended rate physical layer (PHY) using complementary code keying (CCK) modulation (ERP-CCK): A mode of operation of a PHY operating under Clause 18 rules, where MODULATION=ERP-CCK.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) modulation (ERP-DSSS): A PHY operating under Clause 18 rules, where MODULATION=ERP-DSSS.

extended rate physical layer (PHY) using direct sequence spread spectrum (DSSS) or complementary code keying (CCK) modulation (ERP-DSSS/CCK): A PHY operating under Clause 18 rules, where MODULATION=ERP-CCK or MODULATION=ERP-DSSS.

extended rate physical layer (PHY) using orthogonal frequency division multiplexing (OFDM) modulation (ERP-OFDM): A mode of operation of a PHY operating under Clause 18 rules, where MODULATION=ERP-OFDM.

extended service set (ESS) link: In the context of an IEEE 802.11 medium access control (MAC) entity, a connection path through the wireless medium between a non-access-point (non-AP) station (STA) and one of the APs that is a member of the ESS.

fast basic service set (BSS) transition (FT) 4-way handshake: A pairwise key management protocol used during FT initial mobility domain association. This handshake confirms mutual possession of a pairwise master key, the PMK-R1, by two parties and distributes a group temporal key (GTK).

fast basic service set (BSS) transition (FT) initial mobility domain association: The first association or first reassociation procedure within a mobility domain, during which a station (STA) indicates its intention to use the FT procedures.

fast basic service set (BSS) transition (FT) originator: A station (STA) that initiates the FT protocol by sending an FT Request frame or an Authentication frame with Authentication Algorithm Number field equal to Fast BSS Transition.

fine timing measurement (FTM) procedure: A procedure that allows a station (STA) to determine its distance from another STA.

flexible multicast service (FMS): A service that enables a non-access-point (non-AP) station (STA) to request a multicast delivery interval longer than the delivery traffic indication map (DTIM) interval for the purposes of lengthening the period of time a STA can be in a power save state.

flexible multicast service (FMS) stream: A succession of frames transmitted by the access point (AP) that correspond to a single flexible multicast stream identifier (FMSID).

flexible multicast service (FMS) stream set: A collection of FMS streams identified by the value of the FMS Token field, used during the FMS Request procedure.

flexible multicast stream identifier (FMSID): An identifier assigned by the access point (AP) to a particular group addressed stream subsequent to a successful FMS Request.

fragmentation: The process of partitioning a medium access control (MAC) service data unit (MSDU) or MAC management protocol data unit (MMPDU) into a sequence of smaller MAC protocol data units (MPDUs) prior to transmission. The process of recombining a set of fragment MPDUs into an MSDU or MMPDU is known as defragmentation. These processes are described in 5.8.1.9 of ISO/IEC 7498-1:1994.

future channel guidance: future channel guidance communicates likely future channel information so that STAs can efficiently move their activity when the absence of Beacon frames is noticed.

geolocation database (GDB): A database whose operation is mandated or authorized by a regulatory authority and that organizes storage of information by geographic location.

geolocation database dependent (GDD): A modifier describing when station (STA) operation is dependent on information received from a geolocation database (GDB).

geolocation database dependent (GDD) access point (AP): A station (STA) dependent on information received from a geolocation database (GDB) in order to initiate and maintain a network.

geolocation database dependent (GDD) dependent station (STA): A STA that is under the control of a GDD enabling STA.

geolocation database dependent (GDD) enabling station (STA): A STA that has the authority to control the operation of GDD dependent STAs after obtaining available spectrum for use at its own location.

geolocation database dependent (GDD) fixed station (STA): A STA whose geographical location information is fixed and maintained in a geolocation database (GDB) and whose operation depends on information received from that database.

geolocation database dependent (GDD) geolocated non-access point (non-AP) station (STA): A STA that is not an AP and is authorized by a geolocation database (GDB) to operate at its current location.

geolocation database dependent (GDD) non-access point (non-AP) station (STA): A STA that is not an AP but operates under the control of a GDD enabling STA.

generic advertisement service (GAS): An over-the-air transportation service that provides over-the-air transportation for frames of higher layer advertisements between stations (STAs) or between an advertisement server and a non-access-point (non-AP) STA. The protocol(s) used to relay frames between an AP, portal, and advertisement server is outside the scope of this standard. GAS supports higher layer protocols that employ a query/response mechanism.

global operating class: An operating class value that is any of the non-reserved values in Table E-4.

group addressed bufferable unit (BU): A group addressed medium access control (MAC) service data unit (MSDU) or group addressed bufferable MAC management protocol data unit (MMPDU).

group addressed quality-of-service management frame (GQMF): A group addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

group addressed transmission service (GATS): A mechanism comprising directed multicast service (DMS) and groupcast with retries (GCR), for delivery of group addressed frames.

group key handshake: A group key management protocol defined by this standard. It is used only to issue a new group temporal key (GTK) to peers with whom the local station (STA) has already formed security associations.

group temporal key security association (GTKSA): The context resulting from a successful group temporal key (GTK) distribution exchange via either a group key handshake or a 4-way handshake.

groupcast with retries (GCR) active (GCR-A) delivery: A delivery method for a group addressed stream subject to a GCR agreement wherein the frames are transmitted without regard to the power state of non-access-point (non-AP) stations (STAs).

groupcast with retries (GCR) concealment address: A medium access control (MAC) address that is used to prevent group addressed frames transmitted via the GCR unsolicited retry or GCR block ack retransmission policies from being passed up the medium access control service access point (MAC SAP) of GCR-incapable stations (STAs).

groupcast with retries (GCR) frame: A group addressed frame subject to a GCR agreement between the access point (AP) and at least one station (STA) within the infrastructure basic service set (BSS) or between peer mesh STAs in a mesh BSS.

groupcast with retries (GCR) group address: A group address subject to a GCR agreement between the access point (AP) and at least one station (STA) within the basic service set (BSS) or between peer mesh STAs in a mesh BSS.

groupcast with retries (GCR) service: A means for transmission and retransmission of medium access control (MAC) service data units (MSDUs) to a destination that is a group address. The GCR service provides greater reliability by using group addressed retransmissions, concealed from GCR-incapable stations (STAs).

groupcast with retries (GCR) service period (GCR-SP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) service period (GCR-SP) frame: A frame subject to the GCR service when the delivery method is GCR-SP.

groupcast with retries (GCR) service period (GCR-SP) medium access control (MAC) service data unit (MSDU): An MSDU subject to the GCR service with the delivery method equal to GCR-SP.

groupcast with retries (GCR) transmission opportunity (TXOP): An interval of time during which an access point (AP) or a mesh station (STA) has the right to initiate frame exchange sequences onto the wireless medium (WM) for the purpose of transmitting multiple frames that are subject to the GCR service.

high-throughput (HT) basic service set (BSS): A BSS in which Beacon frames transmitted by an HT station (STA) include the HT Capabilities element.

high-throughput (HT) beamformee: An HT station (STA) that receives an HT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports an HT transmit beamforming feedback mechanism.

high-throughput (HT) beamformer: An HT station (STA) that transmits an HT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

high-throughput (HT) delayed (HT-delayed) block acknowledgment (Ack): A delayed block ack mechanism that requires the use of the compressed BlockAck frame and the No Acknowledgment ack policy setting within both BlockAckReq and BlockAck frames. This block ack scheme is negotiated between two HT stations (STAs) that both support HT-delayed block ack.

high-throughput (HT) greenfield (HT-greenfield) format: A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-greenfield format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_GF.

high-throughput (HT) immediate (HT-immediate) block acknowledgment (Ack): An immediate block ack mechanism that requires the use of the compressed BlockAck frame and an implicit block ack request and allows partial-state operation at the recipient. This block ack scheme is negotiated between two HT or directional multi-gigabit (DMG) stations (STAs).

high-throughput (HT) mixed (HT-mixed) format: A physical layer (PHY) protocol data unit (PPDU) format of the HT PHY using the HT-mixed format preamble. This format is represented at the PHY data service access point (SAP) by the TXVECTOR/RXVECTOR FORMAT parameter being equal to HT_MF.

high-throughput (HT) modulation and coding scheme (HT-MCS): A specification of the HT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and number of spatial streams (NSS) and that is used in an HT PHY protocol data unit (PPDU).

high-throughput (HT) null data packet (NDP) announcement: A physical layer (PHY) protocol data unit (PPDU) that contains one or more +HTC frames (i.e., frames with an HT Control field) that have the HT NDP Announcement subfield equal to 1.

high-throughput (HT) physical layer (PHY) protocol data unit (PPDU): A Clause 19 PPDU with the TXVECTOR FORMAT parameter equal to HT_MF or HT_GF.

high-throughput (HT) station (STA) 2G4: An HT STA that is also a STA 2G4.

high-throughput (HT) station (STA) 5G: An HT STA that is also a STA 5G.

hybrid coordination function (HCF): A coordination function that combines and enhances aspects of the contention based and contention free access methods to provide quality-of-service (QoS) stations (STAs) with prioritized and parameterized QoS access to the wireless medium (WM), while continuing to support non-QoS STAs for best-effort transfer. The HCF includes the functionality provided by both enhanced distributed channel access (EDCA) and HCF controlled channel access (HCCA).

hybrid coordination function (HCF) controlled channel access (HCCA): The channel access mechanism utilized by the hybrid coordinator (HC) to coordinate contention free media use by quality-of-service (QoS) stations (STAs) for downlink individually addressed, uplink, and direct-link transmissions.

hybrid coordinator (HC): A type of coordinator, defined as part of the quality-of-service (QoS) facility, that implements the frame exchange sequences and medium access control (MAC) service data unit (MSDU) handling rules defined by the hybrid coordination function (HCF).

IEEE 802.11 station (STA): Any station that is compliant with IEEE Std 802.11. Any reference to the term station (STA) in this standard that is not qualified by the term *IEEE 802.11* implicitly refers to an IEEE 802.11 station.

individually addressed bufferable unit (BU): An individually addressed medium access control (MAC) service data unit (MSDU), individually addressed aggregate MAC service data unit (A-MSDU) [high-throughput (HT) stations (STAs) and directional multi-gigabit (DMG) STAs only], or individually addressed bufferable MAC management protocol data unit (MMPDU).

individually addressed quality-of-service management frame (IQMF): An individually addressed Management frame that is transmitted using the quality-of-service management frame (QMF) service.

interworking service: A service that supports use of an IEEE 802.11 network with non-IEEE-802.11 networks. Functions of the interworking service assist non-access-point (non-AP) stations (STAs) in discovering and selecting IEEE 802.11 networks, in using appropriate quality-of-service (QoS) settings for transmissions, in accessing emergency services, and in connecting to subscription service providers (SSPs).

key counter: A 256-bit (32-octet) counter that is used in the pseudorandom function (PRF) to generate initialization vectors (IVs). There is a single key counter per station (STA) that is global to that STA.

key data encapsulation (KDE): A format for data other than elements in the EAPOL-Key Data field.

key management service: A service to distribute and manage cryptographic keys within a robust security network (RSN).

light sleep mode: A mesh power management mode with respect to a neighbor peer mesh STA in which a mesh station (STA) alternates between awake and doze states and is expected to receive beacons from this neighbor peer mesh STA.

link: In the context of an IEEE 802.11 medium access control (MAC) entity, a physical path consisting of exactly one traversal of the wireless medium (WM) that is usable to transfer MAC service data units (MSDUs) between two stations (STAs).

location configuration information (LCI): As defined in IETF RFC 6225: includes latitude, longitude, and altitude, with uncertainty indicators for each.

medium access control (MAC) management protocol data unit (MMPDU): The unit of data exchanged between two peer MAC entities, using services of the physical layer (PHY), to implement the MAC management protocol. The MMPDU is transported in one or more Management frames. The MMPDU might include a Mesh Control field or management message integrity code element (Management MIC element), but does not include a MAC header, a frame check sequence (FCS), or any other security encapsulation overhead.

NOTE—The MMPDU occupies a position in the management plane similar to that of the MAC service data unit (MSDU) in the data plane. An MSDU or MMPDU is transmitted in one or more MAC protocol data units (MPDUs) (with the Type field set to Data or Management, respectively). An MSDU can be carried in an aggregate MAC service data unit (A-MSDU). An A-MSDU is transmitted in one MPDU. An MSDU, A-MSDU, or MMPDU can be carried (in an MPDU) in an A-MPDU.

mesh awake window: A period of time during which the mesh station (STA) operates in awake state after its Beacon or Probe Response frame transmission that contained the Mesh Awake Window element.

mesh coordination function (MCF): A coordination function that combines aspects of the contention based and scheduled access methods. The MCF includes the functionality provided by both enhanced distributed channel access (EDCA) and MCF controlled channel access (MCCA).

mesh coordination function (MCF) controlled channel access (MCCA): A coordination function for the mesh basic service set (MBSS).

mesh coordination function (MCF) controlled channel access opportunity (MCCAOP): A period of time scheduled for frame transmissions between mesh stations (STAs) using MCF controlled channel access (MCCA).

mesh Data frame: A Data frame that is transmitted by a mesh station (STA).

mesh peer service period: A period of time during which one or more individually addressed frames are transmitted between two peer mesh stations (STAs) with at least one of those mesh STAs operating in light sleep or deep sleep mode. A mesh peer service period is directional and might contain one or more transmission opportunities (TXOPs).

mesh peer service period owner: A mesh station (STA) that obtains transmission opportunities (TXOPs), transmits individually addressed frames to the recipient mesh STA in the mesh peer service period, and terminates the mesh peer service period.

mesh peering management: A group of protocols to facilitate mesh peering establishment and closure.

mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering or for nonpeer neighbor STAs. A lower activity level enables a mesh STA to reduce its power consumption.

mesh power management mode tracking: Operation to observe the peering-specific mesh power management modes from the peer mesh STAs and to maintain the peering-specific mesh power management modes for each peer mesh STA.

message integrity code (MIC) key: TKIP only: The portion of a transient key used to validate the integrity of medium access control (MAC) service data units (MSDUs) or MAC protocol data units (MPDUs).

michael: The message integrity code (MIC) for the temporal key integrity protocol (TKIP).

minimum downlink transmission time (DTT) to uplink transmission time (UTT) [DTT2UTT] spacing: The minimum time within a power save multi-poll (PSMP) sequence between the end of a station's (STA's) PSMP-DTT and the start of its PSMP-UTT.

modulation and coding scheme (MCS): A specification of the physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, and 256-QAM), forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6), and, depending on the context, the number of space-time streams.

modulation and coding scheme 32 (MCS 32) format: A physical layer (PHY) protocol data unit (PPDU) format of the high-throughput (HT) PHY in which signals in two halves of the occupied channel width contain the same information. This HT PPDU format supports the lowest rate.

modulation and coding scheme (MCS) feedback (MFB) requester: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

modulation and coding scheme (MCS) feedback (MFB) responder: A station (STA) that transmits a physical layer (PHY) protocol data unit (PPDU) containing an HT Control field with the MFB field containing an MCS index or the value 127 in response to a PPDU containing an HT Control field in which the MCS request (MRQ) subfield is equal to 1.

multiple basic service set identifier (BSSID) set: A collection of cooperating access points (APs), such that all of the APs use a common operating class, channel, and antenna connector.

multiple medium access control (MAC) sublayers link (MMSL): A link between two stations (STAs), wherein one of the STAs is coordinated by a multiple MAC station management entity (MM-SME) that delivered a Multiple MAC Sublayers (MMS) element to the peer STA.

multiple medium access control (MAC) sublayers link (MMSL) cluster: The set of all MMSLs between a pair of stations (STAs).

multi-user (MU) beamformee: A non-access-point (non-AP) station (STA) that receives a physical layer (PHY) protocol data unit (PPDU) that was transmitted using a multi-user beamforming steering matrix and that supports the very high throughput (VHT) transmit beamforming feedback mechanism with a VHT null data packet (NDP) Announcement frame that includes more than one STA Info field.

multi-user (MU) beamformer: An access point (AP) that transmits a physical layer (PHY) protocol data unit (PPDU) using a multi-user beamforming steering matrix.

multi-user (MU) physical layer (PHY) protocol data unit (PPDU): A PPDU that carries one or more PHY service data units (PSDUs) for one or more stations (STAs) using the downlink multi-user multiple input, multiple output (DL-MU-MIMO) technique.

no acknowledgment/no retry (No-Ack/No-Retry): A retransmission policy for group addressed frames in which each frame is transmitted once and without acknowledgment.

non-40-MHz-capable (non-40MC) high-throughput (HT) station (STA): A STA that is not a 40-MHz-capable (40MC) HT STA.

nonaggregate medium access control (MAC) protocol data unit (non-A-MPDU) frame: A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) with the TXVECTOR AGGREGATION parameter either absent or equal to NOT_AGGREGATED.

nonbandwidth signaling transmitter address (TA): An address in the TA field of an medium access control (MAC) protocol data unit (MPDU) in which the Individual/Group bit has the value 0.

nonbufferable medium access control (MAC) management protocol data unit (MMPDU): An MMPDU that is not a bufferable MMPDU.

nonconcealed groupcast with retries (GCR) frame: A group addressed frame that is not transmitted to the GCR concealment address.

nonextended rate physical layer (NonERP): A physical layer (PHY) compliant with Clause 15 or Clause 16, but not with Clause 18.

nongroupcast with retries (non-GCR): A method for delivering group addressed frames without using the groupcast with retries (GCR) unsolicited retry retransmission policy, the GCR block acknowledgment retransmission policy, or the GCR service period (GCR-SP) delivery method.

nongroupcast with retries service period (non-GCR-SP): A method for the delivery of group addressed frames without the use of a groupcast with retries service period (GCR-SP).

non-high-throughput (non-HT): A modifier meaning neither high throughput (HT) nor very high throughput (VHT).

non-high-throughput (non-HT) duplicate: A transmission format of the physical layer (PHY) that duplicates a 20 MHz non-HT transmission in two or more 20 MHz channels and allows a station (STA) in a non-HT basic service set (BSS) on any one of the 20 MHz channels to receive the transmission. A non-HT duplicate format is one of the following:

- a) 40 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two adjacent 20 MHz channels.
- b) 80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in four adjacent 20 MHz channels.
- c) 160 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in eight adjacent 20 MHz channels.
- d) 80+80 MHz non-HT duplicate: A transmission format of the PHY that replicates a 20 MHz non-HT transmission in two frequency segments of four adjacent 20 MHz channels where the two frequency segments of channels are not adjacent.

non-high-throughput (non-HT) duplicate frame: A frame transmitted in a non-HT duplicate physical layer (PHY) protocol data unit (PPDU).

non-high-throughput (non-HT) duplicate in television white spaces (TVWS) band: A transmission format of the physical layer (PHY) that duplicates a single basic channel unit (BCU) non-HT transmission in two or more BCUs and allows a station (STA) in a non-HT basic service set (BSS) on any one BCU to receive the transmission. A non-HT duplicate format is one of the following:

- a) TVHT_W non-HT duplicate: A PHY transmission that replicates a non-HT PHY protocol data unit (PPDU) two times in a single BCU
- b) TVHT_2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in two contiguous BCUs
- c) TVHT_4W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU eight times in four contiguous BCUs
- d) TVHT_W+W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU two times in each single BCU
- e) TVHT_2W+2W non-HT duplicate: A PHY transmission that replicates a non-HT PPDU four times in each of two contiguous BCUs

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU): A PPDU transmitted by a Clause 19 or Clause 21 PHY with the TXVECTOR FORMAT parameter equal to NON_HT and the CH_BANDWIDTH parameter equal to NON_HT_CBW40, CBW40, CBW80, CBW160, or CBW80+80.

non-high-throughput (non-HT) duplicate physical layer (PHY) protocol data unit (PPDU) in television white spaces (TVWS) band: A PPDU transmitted by a Clause 22 PHY with the TXVECTOR parameter FORMAT set to NON_HT and the TXVECTOR parameter CH_BANDWIDTH set to TVHT_W, TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W.

non-high-throughput (non-HT) physical layer (PHY) protocol data unit (PPDU): A PPDU that is transmitted by Clause 15, Clause 16, Clause 17, or Clause 18 PHY, or not using a TXVECTOR FORMAT parameter equal to HT_MF, HT_GF or VHT.

non-high-throughput (non-HT) SIGNAL field (L-SIG) transmit opportunity (TXOP) protection: A protection mechanism in which protection is established by the non-HT SIG Length and Rate fields indicating a duration that is longer than the duration of the PPDU itself.

nonpeer mesh power management mode: The activity level identifier of a mesh station (STA) toward nonpeer neighbor mesh STAs. Two nonpeer mesh power management modes are defined: active mode and deep sleep mode.

non-personal basic service set (BSS) control point (non-PCP) station (STA): A STA that is not a personal BSS control point (PCP).

non-phased-coexistence-operation-capable (non-PCO-capable) 20/40 station (STA): A high-throughput (HT) STA that included a value of 1 in the Supported Channel Width Set subfield (indicating its capability to operate on a 40 MHz channel) of its most recent transmission of a frame containing an HT Capabilities element and that sets the PCO field in the HT Extended Capabilities field to 0.

nonprimary channel: In a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz very high throughput (VHT) basic service set (BSS), any 20 MHz channel other than the primary 20 MHz channel.

non-quality-of-service management frame (non-QMF) access point (AP): An AP that does not implement the quality-of-service management frame (QMF) service.

non-quality-of-service management frame (non-QMF) station (STA): A STA that does not implement the quality-of-service management frame (QMF) service.

non-space-time-block-coding (non-STBC) frame: A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has the TXVECTOR STBC parameter equal to 0, or a frame that is received in a PPDU that has the RXVECTOR STBC parameter equal to 0.

nontransmitted basic service set (BSS) identifier (BSSID): A BSSID that is not transmitted explicitly, but that can be derived from the information encoded in Probe Response, Beacon and directional multi-gigabit (DMG) Beacon frames and Neighbor reports.

null data packet (NDP): A physical layer (PHY) protocol data unit (PPDU) that carries no Data field.

off-channel: A channel used by a tunneled direct link setup (TDLS) station (STA) that does not overlap the channel(s) used by the access point (AP) with which the TDLS STA is associated.

operating class: An E.1 index into a set of values for radio operation in a regulatory domain.

operational rate set: The set of data rates that a station (STA) is capable of receiving. The operational rate set is defined locally by the OperationalRateSet parameter of the MLME-START.request or MLME-JOIN.request primitive. The operational rate set of a peer is defined by the data rates (i.e., excluding the MSB of each octet of the (Extended) Supported Rates field) from the peer’s Supported Rates and BSS Membership Selectors element and, if present, the Extended Supported Rates and BSS Membership Selectors element.

outside the context of a basic service set (BSS) (OCB): A mode of operation in which a STA is not a member of a BSS and does not utilize IEEE 802.11 authentication, association, or data confidentiality services.

pairwise master key (PMK): The key derived from a key generated by an Extensible Authentication Protocol (EAP) method or obtained directly from a preshared key (PSK).

pairwise master key (PMK) R0 key holder (R0KH): The component of robust security network association (RSNA) key management of the Authenticator that is authorized to derive and hold the PMK-R0, derive the PMK-R1s, and distribute the PMK-R1s to the R1KHS.

pairwise master key (PMK) R0 key holder identifier (R0KH-ID): An identifier that names the holder of the PMK-R0 in the Authenticator.

pairwise master key (PMK) R0 name (PMKR0Name): An identifier that names the PMK-R0.

pairwise master key (PMK) R0 (PMK-R0): The key at the first level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) R1 key holder (R1KH): The component of robust security network association (RSNA) key management of the Authenticator that receives a PMK-R1 from the R0KH, holds the PMK-R1, and derives the pairwise transient keys (PTKs).

pairwise master key (PMK) R1 key holder identifier (R1KH-ID): An identifier that names the holder of a PMK-R1 in the Authenticator.

pairwise master key (PMK) R1 name (PMKR1Name): An identifier that names a PMK-R1.

pairwise master key (PMK) R1 (PMK-R1): A key at the second level of the fast basic service set (BSS) transition (FT) key hierarchy.

pairwise master key (PMK) S0 key holder (S0KH): The component of robust security network association (RSNA) key management of the Supplicant that derives and holds the PMK-R0, derives the PMK-R1s, and provides the PMK-R1s to the S1KH.

pairwise master key (PMK) S0 key holder identifier (S0KH-ID): An identifier that names the holder of the PMK-R0 in the Supplicant.

pairwise master key (PMK) S1 key holder (S1KH): The component of robust security network association (RSNA) key management in the Supplicant that receives a PMK-R1 from the S0KH, holds the PMK-R1, and derives the pairwise transient keys (PTKs).

pairwise master key (PMK) S1 key holder identifier (S1KH-ID): An identifier that names the holder of the PMK-R1 in the Supplicant.

pairwise master key security association (PMKSA): The context resulting from a successful IEEE 802.1X authentication exchange between the peer and Authentication Server (AS) or from a preshared key (PSK).

pairwise transient key (PTK): A concatenation of session keys derived from the pairwise master key (PMK) or from the PMK-R1. Its components are a key confirmation key (KCK), a key encryption key (KEK), and a temporal key (TK), which is used to protect information exchanged over the link.

pairwise transient key (PTK) name (PTKName): An identifier that names the PTK.

pairwise transient key security association (PTKSA): The context resulting from a successful 4-way handshake between a peer and Authenticator.

parameterized quality of service (QoS): The treatment of the medium access control (MAC) protocol data units (MPDUs) depends on the parameters associated with the MPDU. Parameterized QoS is primarily provided through the hybrid coordination function (HCF) controlled channel access (HCCA) mechanism, but is also provided by the enhanced distributed channel access (EDCA) mechanism when used with a traffic specification (TSPEC) for admission control.

payload protected (PP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with counter mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP) but does not include the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

peer trigger frame: A Mesh Data or quality-of-service (QoS) Null frame that initiates a mesh peer service period.

PeerKey handshake: A key management protocol composed of the station-to-station link (STSL) master key (SMK) handshake and the 4-way STSL transient key (STK) handshake. This is used to create new SMK security associations (SMKSAs) and STK security associations (STKSAs) to secure the STSLs.

peer-specific mesh power management mode: The activity level identifier of a mesh station (STA) set per mesh peering. Three peer-specific mesh power management modes are defined: active mode, light sleep mode, and deep sleep mode.

per-frame sequence counter: For temporal key integrity protocol (TKIP), the counter that is used as the nonce in the derivation of the per-frame encryption key. For counter mode with cipher-block chaining message authentication code protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP), the per-frame initialization vector (IV).

personal basic service set (PBSS): A directional multi-gigabit (DMG) basic service set (BSS) that includes one STA that is in a PBSS control point (PCP), and in which access to a distribution system (DS) is not present.

personal basic service set (PBSS) control point (PCP): An entity that contains one station (STA) and coordinates access to the wireless medium (WM) by STAs that are members of a PBSS.

personal basic service set (PBSS) control point (PCP) or access point (AP) cluster: A single directional multi-gigabit (DMG) synchronization AP or synchronization PCP, plus zero or more neighboring DMG APs or PCPs (or a mixture of both) that join as member APs and PCPs to the synchronization AP or synchronization PCP.

phased coexistence operation (PCO): A basic service set (BSS) mode with alternating 20 MHz and 40 MHz phases controlled by an access point (AP).

phased coexistence operation (PCO) active access point (AP): A high-throughput (HT) AP that is operating PCO.

phased coexistence operation (PCO) active basic service set (BSS): A BSS in which a PCO active access point (AP) has the PCO Active field in the HT Operation element equal to 1.

phased coexistence operation (PCO) active non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that is associated with a PCO basic service set (BSS) and following PCO.

phased coexistence operation (PCO) active station (STA): A STA that is either a PCO active access point (AP) or a PCO active non-AP STA.

phased coexistence operation (PCO) capable (PCO-capable) access point (AP): A high-throughput (HT) AP that sets the PCO field in the HT Extended Capabilities field to 1.

phased coexistence operation (PCO) capable (PCO-capable) non-access-point (non-AP) station (STA): A high-throughput (HT) non-AP STA that sets the PCO field in the HT Extended Capabilities field to 1.

phased coexistence operation (PCO) capable (PCO-capable) station (STA): A STA that is either a PCO capable access point (AP) or a PCO capable non-AP STA.

phased coexistence operation (PCO) inactive basic service set (BSS): A 20/40 MHz BSS in which an access point (AP) has the PCO Active field in the HT Operation element equal to 0.

point coordination function (PCF): A class of possible coordination functions in which the coordination function logic is active in only one station (STA) in a basic service set (BSS) at any given time that the network is in operation.

point coordinator (PC): The entity within the STA in an AP that performs the point coordination function.

power save (PS) mode: A power management mode in which a nonmesh station (STA) alternates between awake and doze states.

power save multi-poll (PSMP): A mechanism that provides a time schedule that is used by an access point (AP) and its stations (STAs) to access the wireless medium. The mechanism is controlled using the PSMP frame.

power save multi-poll (PSMP) burst: A series of one or more PSMP sequences, separated by short interframe space (SIFS).

power save multi-poll downlink transmission time (PSMP-DTT): A period of time described by a PSMP frame during which the access point (AP) transmits.

power save multi-poll (PSMP) sequence: A sequence of frames in which the first frame is a PSMP frame that is followed by transmissions in zero or more power save multi-poll downlink transmission times (PSMP-DTTs) and then by transmissions in zero or more power save multi-poll uplink transmission times (PSMP-UTTs). The schedule of the PSMP-DTTs and PSMP-UTTs is defined in the PSMP frame.

power save multi-poll (PSMP) session: The relationship between an AP and one or more STAs that exists while any TS exists that uses the PSMP mechanism with the same service period.

power save multi-poll uplink transmission time (PSMP-UTT): A period of time described by a PSMP frame during which a non-access-point (non-AP) station (STA) can transmit.

power save multi-poll uplink transmission time (PSMP-UTT) spacing: The period of time between the end of one PSMP-UTT and the start of the following PSMP-UTT within the same PSMP sequence.

power save (PS) station (STA): A station that is in power save mode.

pre-robust security network association (pre-RSNA): The type of association used by a pair of stations (STAs) if the procedure for establishing authentication or association between them did not include the 4-way handshake.

pre-robust security network association (pre-RSNA) STA: A STA that is not able to create robust security network associations (RSNAs).

primary 20 MHz channel: In a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 20 MHz channel that is used to transmit 20 MHz physical layer (PHY) protocol data units (PPDUs). In a VHT BSS, the primary 20 MHz channel is also the primary channel.

primary 40 MHz channel: In an 80 MHz, 160 MHz, or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 40 MHz channel that is used to transmit 40 MHz physical layer (PHY) protocol data units (PPDUs).

primary 80 MHz channel: In a 160 MHz or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 80 MHz channel that is used to transmit 80 MHz physical layer (PHY) protocol data units (PPDUs).

primary access category (AC): The AC associated with the enhanced distributed channel access function (EDCAF) that gains channel access.

Protected Dual of Public Action frame: An Action frame with the category value specified in 9.4.1.11 (Table 9-47). For each Protected Dual of Public Action frame, there is a dual Action frame in a category that is specified with “No” in the “Robust” column of Table 9-47.

quality-of-service management frame (QMF): A Management frame that is transmitted using the QMF service.

quality-of-service management frame (QMF) access point (AP): A quality-of-service AP that implements the QMF service.

quality-of-service management frame (QMF) policy: A policy defining the access category of Management frames. QMF stations (STAs) transmit their Management frames using the access category defined by the policy.

quality-of-service management frame (QMF) service: A service in which the enhanced distributed channel access (EDCA) access category with which a Management frame is sent is determined according to a configured policy.

quality-of-service management frame (QMF) station (STA): A quality-of-service STA that implements the QMF service.

quality-of-service (QoS) frame: A frame containing the QoS Control field.

quasi-omni antenna pattern: A directional multi-gigabit (DMG) antenna operating mode with the widest beamwidth attainable.

receive sector sweep (RXSS): Reception of Sector Sweep (SSW) frames via different sectors, in which a sweep is performed between consecutive receptions.

received signal-to-noise indicator (RSNI): An indication of the signal-to-noise plus interference ratio of a received frame.

resource information container (RIC): A sequence of elements that include resource request and response parameters.

reverse direction (RD) initiator: A station (STA) that is a transmit opportunity (TXOP) holder that transmits a medium access control (MAC) protocol data unit (MPDU) in which the reverse direction grant/more physical layer protocol data unit (RDG/More PPDU) subfield is equal to 1.

reverse direction (RD) responder: A station (STA) that is not the RD initiator and whose medium access control (MAC) address matches the value of the Address 1 field of a received MAC protocol data unit (MPDU) in which the RDG/More PPDU subfield is equal to 1.

robust Action frame: An Action frame with a category value specified in 9.4.1.11 (Table 9-47 with “Yes” in the “Robust” column).

robust Management frame: A Management frame that is eligible for protection.

robust security network association (RSNA): The type of association used by a pair of stations (STAs) if the procedure to establish authentication or association between them includes the 4-way handshake or FT protocol. Note that existence of an RSNA between two STAs does not of itself provide robust security. Robust security is provided when all STAs in the network use RSNAs.

robust security network association (RSNA) capable (RSNA-capable): Pertains to a station (STA) that is able to create RSNAs.

robust security network association (RSNA) key management: Key management that includes the 4-way handshake, the group key handshake, authenticated mesh peering exchange, mesh group key handshake, and the PeerKey handshake. If fast basic service set (BSS) transition (FT) is enabled, the FT 4-way handshake and FT authentication sequence are also included.

robust security network (RSN): A security network that allows only the creation of robust security network associations (RSNAs). An RSN can be identified by the indication in the RSN element (RSNE) of Beacon frames that the group cipher suite specified is not wired equivalent privacy (WEP).

scheduled service period (SP): An SP that is scheduled by a quality-of-service (QoS) access point (AP) or a personal basic service set (PBSS) control point (PCP).

secondary 20 MHz channel: In a 40 MHz very high throughput (VHT) basic service set (BSS), the 20 MHz channel adjacent to the primary 20 MHz channel that together form the 40 MHz channel of the 40 MHz VHT BSS. In an 80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 20 MHz channel adjacent to the primary 20 MHz channel that together form the primary 40 MHz channel of the 160 MHz or 80+80 MHz VHT BSS. In a VHT BSS, the secondary 20 MHz channel is also the secondary channel.

secondary 40 MHz channel: In an 80 MHz very high throughput (VHT) basic service set (BSS), the 40 MHz channel adjacent to the primary 40 MHz channel that together form the 80 MHz channel of the 80 MHz VHT BSS. In a 160 MHz or 80+80 MHz VHT BSS, the 40 MHz channel adjacent to the primary 40 MHz channel that together form the primary 80 MHz channel.

secondary 80 MHz channel: In a 160 MHz or 80+80 MHz very high throughput (VHT) basic service set (BSS), the 80 MHz channel not including the primary 20 MHz channel, that together with the primary 80 MHz channel form the 160 MHz or 80+80 MHz channel of the 160 MHz or 80+80 MHz VHT BSS.

secondary access category (AC): An AC that is not associated with the enhanced distributed channel access function (EDCAF) that gains channel access.

NOTE—Traffic associated with a secondary AC can be included in a multi-user (MU) physical layer (PHY) protocol data unit (MU PPDU) that includes traffic associated with the primary AC. There could be multiple secondary ACs at a given time.

secondary channel: A 20 MHz channel associated with a primary channel used by high-throughput (HT) stations (STAs) for the purpose of creating a 40 MHz channel or used by very high throughput (VHT) STAs for the purpose of creating the primary 40 MHz channel.

sector: A transmit or receive antenna pattern corresponding to a sector identifier (ID).

security network: A basic service set (BSS) in which the station (STA) starting the BSS provides information about the security capabilities and configuration of the BSS by including the robust security network element (RSNE) in Beacon frames.

self-protected action frame: An Action frame that is not eligible for protection by the robust management frame service. The protection on each Self-protected Action frame is provided by the protocol that uses the frame.

service interval (SI): The interval between the starts of two successive scheduled service periods (SPs).

service period (SP): A period of time during which one or more downlink individually addressed frames are transmitted to a quality-of-service (QoS) station (STA) and/or one or more transmission opportunities (TXOPs) are granted to the same STA. SPs are either scheduled or unscheduled.

NOTE—A non-access-point (non-AP) STA can have at most one nongroupcast with retries SP (non-GCR-SP) active at any time.

shared bands: Radio frequency bands in which dissimilar services are permitted.

signaling and payload protected (SPP) aggregate medium access control (MAC) service data unit (A-MSDU): An A-MSDU that is protected with counter mode (CTR) with cipher-block chaining message authentication code (CBC-MAC) protocol (CCMP) or Galois/counter mode (GCM) protocol (GCMP) and that includes the A-MSDU Present field (bit 7 of the QoS Control field) in the construction of the additional authentication data (AAD).

sounding physical layer (PHY) protocol data unit (PPDU): A PPDU that is intended by the transmitting station (STA) to enable the receiving STA to estimate the channel between the transmitting STA and the receiving STA. The Not Sounding field in the High Throughput SIGNAL field (HT-SIG) is equal to 0 in sounding PPDUs.

source directional multi-gigabit (DMG) station (STA): A DMG STA identified by the source association identifier (AID) field contained in a Grant frame or Extended Schedule element that caused the allocation of a service period (SP) or contention based access period (CBAP).

space-time block coding (STBC) beacon: A beacon that is transmitted using the basic STBC modulation and coding scheme (MCS) to enable discovery of the basic service set (BSS) by high-throughput (HT) stations (STAs) that support the HT STBC feature in order to extend the range of the BSS.

space-time block coding (STBC) delivery traffic indication map (DTIM): An STBC beacon transmission that is a DTIM Beacon frame.

space-time block coding (STBC) frame: A frame that is transmitted in a physical layer (PHY) protocol data unit (PPDU) that has a nonzero value of the TXVECTOR STBC parameter, or a frame that is received in a PPDU that has a nonzero value of the RXVECTOR STBC parameter.

spatial sharing (SPSH): Use of a frequency channel by multiple stations (STAs) that are located in the same vicinity, and whose directional transmissions might overlap in time.

staggered preamble: A physical layer (PHY) preamble in a sounding PHY protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

staggered sounding: The use of a sounding physical layer (PHY) protocol data unit (PPDU) that is not a null data packet (NDP) and that includes one or more Data Long Training fields (DLTFs) and one or more Extension Long Training fields (ELTFs).

station (STA) 2G4: A STA that is operating on a channel that belongs to any operating class that has a value of 25 or 40 for the entry in the “Channel spacing” column and that has a value of 2.407 or 2.414 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station (STA) 5G: A STA that is operating on a channel that belongs to any operating class that has a value of 20 or 40 for the entry in the “Channel spacing” column and that has a value of 5 for the entry in the “Channel starting frequency” column of any of the tables found in E.1.

station-to-station link (STSL): A direct link established between two non-access-point (non-AP) stations (STAs) while associated to a common access point (AP), that was not established using tunneled direct-link setup (TDLS).

station-to-station link (STSL) master key security association (SMKSA): The context resulting from a successful STSL master key (SMK) handshake.

station-to-station link (STSL) master key (SMK): A random value generated by an access point (AP) during an SMK handshake. It is used for deriving an STSL transient key (STK).

station-to-station link (STSL) master key (SMK) handshake: A key management protocol between two parties that creates a new SMK.

station-to-station link (STSL) transient key security association (STKSA): The context resulting from a successful 4-way STSL transient key (STK) exchange.

station-to-station link (STSL) transient key (STK): A concatenation of session keys derived from the STSL master key (SMK). Its components are an STSL key confirmation key (SKCK), an STSL key encryption key (SKEK), and a temporal key (TK), which is used to protect information exchanged over the link.

subscription service provider (SSP) roaming: The act when a station (STA) uses an SSP’s IEEE 802.11 infrastructure, with which the terminal has no direct agreement, based on a subscription and formal agreement with the STA’s own SSP.

successful transmission: A transmission and the reception of its expected acknowledgment or a transmission for which no acknowledgment is expected.

sweep: A sequence of transmissions, separated by a short beamforming interframe space (SBIFS) interval, in which the antenna configuration at the transmitter or receiver is changed between transmissions.

synchronization access point (AP) (S-AP): An AP that provides synchronization and other services to an AP cluster or personal basic service set (PBSS) control point (PCP).

synchronization personal basic service set (PBSS) control point (PCP) (S-PCP): A PCP that provides synchronization and other services to an access point (AP) cluster or PCP cluster.

television very high throughput 2W (TVHT_2W): Two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 2W+2W (TVHT_2W+2W): Two noncontiguous frequency segments, each of which comprises two contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput 4W (TVHT_4W): Four contiguous basic channel units (BCUs) in television white spaces (TVWS).

television very high throughput (TVHT) basic service set (BSS): A set of stations (STAs) that consists of a geolocation database dependent (GDD) enabling STA operating in television white spaces (TVWS) and one or more of its GDD STAs.

television very high throughput W (TVHT_W): One basic channel unit in television white spaces (TVWS).

television very high throughput W+W (TVHT_W+W): Two noncontiguous basic channel units (BCUs) in television white spaces (TVWS).

temporal encryption key: The portion of a pairwise transient key (PTK) or group temporal key (GTK) used directly or indirectly to encrypt data in medium access control (MAC) protocol data units (MPDUs).

temporal key (TK): Temporal key integrity protocol (TKIP) only: The combination of temporal encryption key and a message integrity code (MIC) key. Non-TKIP only: A temporal encryption key.

time priority Management frame: a Management frame that is transmitted using specific frame type channel access rules.

traffic indication map (TIM) broadcast: A service that enables a non-access-point (non-AP) station (STA) to request periodic transmission of a TIM frame by the AP. TIM frames have shorter duration than Beacon frames and can be transmitted at a higher physical layer (PHY) rate, which allows the STA to save additional power while periodically checking for buffered traffic in standby mode, relative to the power consumed if the station (STA) were to periodically wake up to receive a Beacon frame.

traffic stream identifier (TSID): Any of the identifiers usable by higher layer entities to distinguish medium access control (MAC) service data units (MSDUs) to MAC entities for parameterized quality of service (QoS) [i.e., the traffic stream (TS) with a particular traffic specification (TSPEC)] within the MAC data service. The TSID is assigned to an MSDU in the layers above the MAC.

transition security network (TSN): A security network that allows the creation of pre-robust security network associations (pre-RSNAs) as well as RSNAs. A TSN is identified by the indication in the robust

security network element (RSNE) of Beacon frames that the group cipher suite in use is wired equivalent privacy (WEP).

transmission opportunity (TXOP) holder: A quality-of-service (QoS) station (STA) that has either been granted a TXOP by the hybrid coordinator (HC) or successfully contended for a TXOP.

transmission opportunity (TXOP) responder: A station (STA) that transmits a frame in response to a frame received from a TXOP holder during a frame exchange sequence, but that does not acquire a TXOP in the process.

transmit power: The effective isotropic radiated power (EIRP) when referring to the operation of an orthogonal frequency division multiplexing (OFDM) physical layer (PHY) in a country where so regulated.

transmit sector sweep (TXSS): Transmission of multiple sector sweep (SSW) or directional multi-gigabit (DMG) Beacon frames via different sectors, in which a sweep is performed between consecutive transmissions.

transmit sector sweep (TXSS) contention based access period (CBAP): A CBAP that is available to all stations (STAs) in an extended centralized personal basic service set (PBSS) control point (PCP) or access point (AP) cluster outside which TXSSs in the data transfer interval (DTI) can be prohibited.

transmitted basic service set identifier (BSSID): The BSSID included in the medium access control (MAC) header transmitter address field of a Beacon frame when the multiple BSSID capability is supported.

trigger-enabled access category (AC): A quality-of-service (QoS) station (STA) AC where frames of subtype QoS Data and QoS Null from the STA that map to the AC trigger an unscheduled service period (SP) if one is not in progress.

tunneled direct-link setup (TDLS): A protocol that uses a specific Ethertype encapsulation to TDLS frames through an access point (AP) to establish a TDLS direct link.

tunneled direct-link setup (TDLS) direct link: Direct link between two non-access-point (non-AP) stations (STAs) that has been established using the TDLS protocol.

tunneled direct-link setup (TDLS) initiator station (STA): A STA that transmits a TDLS Setup Request frame or a TDLS Discovery Request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM): A PSM that is based on periodically scheduled service periods (SPs), which can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer power save mode (PSM) initiator: A station (STA) that transmits a TDLS Peer PSM Request frame.

tunneled direct-link setup (TDLS) peer power save mode (PSM) responder: A station (STA) that transmits a TDLS Peer PSM Response frame.

tunneled direct-link setup (TDLS) peer station (STA): A STA with a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU):] A power save mode based on unscheduled service periods that can be used between two stations (STAs) that have set up a TDLS direct link.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] buffer station (STA): A TDLS peer STA that buffers traffic for a TPU sleep STA.

tunneled direct-link setup (TDLS) peer unscheduled automatic power save delivery (U-APSD) [TDLS peer U-APSD (TPU)] sleep station (STA): A TDLS STA that entered power save mode on a TDLS direct link and that is using TPU for the delivery of buffered traffic.

tunneled direct-link setup (TDLS) power save mode (PSM): TDLS peer PSM or peer unscheduled automatic power save delivery (U-APSD).

tunneled direct-link setup (TDLS) responder station (STA): A STA that receives or is the intended recipient of a TDLS Setup Request frame or TDLS Discovery Request frame.

TVHT_2W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 22 TVHT_2W very high throughput (VHT) PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1
- b) A Clause 22 TVHT_2W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1
- c) A Clause 22 TVHT_W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1
- d) A Clause 22 TVHT_W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W transmit spectral mask defined in 22.3.17.1

TVHT_2W+2W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 22 TVHT_2W+2W very high throughput (VHT) PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1
- b) A Clause 22 TVHT_2W+2W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W+2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1
- c) A Clause 22 TVHT_2W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1
- d) A Clause 22 TVHT_2W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1
- e) A Clause 22 TVHT_W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1
- f) A Clause 22 TVHT_W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_2W+2W transmit spectral mask defined in 22.3.17.1

TVHT_4W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 22 TVHT_4W very high throughput (VHT) PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_4W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1
- b) A Clause 22 TVHT_4W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_4W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1
- c) A Clause 22 TVHT_2W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1
- d) A Clause 22 TVHT_2W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_2W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1
- e) A Clause 22 TVHT_W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1
- f) A Clause 22 TVHT_W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_4W transmit spectral mask defined in 22.3.17.1

TVHT_MODE_1 physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_W VHT PPDU or TVHT_W NON_HT PPDU.

TVHT_MODE_2C physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_2W VHT PPDU or TVHT_2W NON_HT PPDU.

TVHT_MODE_2N physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_W+W VHT PPDU or TVHT_W+W NON_HT PPDU.

TVHT_MODE_4C physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_4W VHT PPDU or TVHT_4W NON_HT PPDU.

TVHT_MODE_4N physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs: A Clause 22 TVHT_2W+2W VHT PPDU or TVHT_2W+2W NON_HT PPDU.

TVHT_W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 22 TVHT_W very high throughput (VHT) PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W transmit spectral mask defined in 22.3.17.1
- b) A Clause 22 TVHT_W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W transmit spectral mask defined in 22.3.17.1

TVHT_W+W mask physical layer (PHY) protocol data unit (PPDU): One of the following PPDUs:

- a) A Clause 22 TVHT_W+W very high throughput (VHT) PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W+W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1

- b) A Clause 22 TVHT_W+W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W+W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1
- c) A Clause 22 TVHT_W VHT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W and TXVECTOR parameter FORMAT set to VHT) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1
- d) A Clause 22 TVHT_W NON_HT PPDU (TX_VECTOR parameter CH_BANDWIDTH set to TVHT_W, TXVECTOR parameter FORMAT set to NON_HT, and TXVECTOR parameter NON_HT_MODULATION set to NON_HT_DUP_OFDM) transmitted using the TVHT_W+W transmit spectral mask defined in 22.3.17.1

unscheduled service period (SP): The period that is started when a quality-of-service (QoS) station (STA) transmits a trigger frame to the QoS access point (AP).

uplink: A unidirectional link from a non-access point (non-AP) station (STA) to an access point (AP) or a unidirectional link from a non-AP source directional multi-gigabit (DMG) STA to a non-AP destination DMG STA.

user: An individual station or group of stations (STAs) identified by a single receive address (RA) in the context of single-user multiple input, multiple output (SU-MIMO) or multi-user multiple input, multiple output (MU-MIMO).

vendor organizationally unique identifier (OUI): An OUI that is not the IEEE 802.11 OUI (00-0F-AC)

very high throughput (VHT) basic service set (BSS): A BSS in which a Beacon frame transmitted by a VHT station (STA) includes the VHT Operation element.

very high throughput (VHT) beamformee: A VHT station (STA) that receives a VHT physical layer (PHY) protocol data unit (PPDU) that was transmitted using a beamforming steering matrix and that supports the VHT transmit beamforming feedback mechanism.

very high throughput (VHT) beamformer: A VHT station (STA) that transmits a VHT physical layer (PHY) protocol data unit (PPDU) using a beamforming steering matrix.

very high throughput (VHT) modulation and coding scheme (VHT-MCS): A specification of the VHT physical layer (PHY) parameters that consists of modulation order (e.g., BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM) and forward error correction (FEC) coding rate (e.g., 1/2, 2/3, 3/4, 5/6) and that is used in a VHT PHY protocol data unit (PPDU).

very high throughput (VHT) multi-user (MU) physical layer (PHY) protocol data unit (PPDU): A VHT PPDU with a format that is capable of carrying up to four PHY service data units (PSDUs) for up to four users and is transmitted using the downlink multi-user multiple input, multiple output (DL-MU-MIMO) technique.

very high throughput (VHT) physical layer (PHY) protocol data unit (PPDU): A PPDU transmitted with the TXVECTOR parameter FORMAT equal to VHT.

very high throughput (VHT) single medium access control (MAC) protocol data unit (VHT single MPDU): An MPDU that is the only MPDU in an aggregate MPDU (A-MPDU) carried in a VHT physical layer (PHY) protocol data unit (PPDU) and that is carried in an A-MPDU subframe with the EOF subfield of the MPDU delimiter field equal to 1.

very high throughput (VHT) single-user-only (SU-only) beamformee: A VHT beamformee that does not receive VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

very high throughput (VHT) single-user-only (SU-only) beamformer: A VHT beamformer that does not transmit VHT multi-user (MU) physical layer (PHY) protocol data units (PPDUs).

very high throughput (VHT) single-user (SU) physical layer (PHY) protocol data unit (PPDU): A VHT PPDUs transmitted with the TXVECTOR parameters FORMAT equal to VHT and GROUP_ID equal to 0 or 63.

white space map (WSM): Information on identified available frequencies that is obtained from a geolocation database (GDB) and that is used by IEEE 802.11 stations (STAs).

wired equivalent privacy (WEP): A deprecated cryptographic data confidentiality algorithm specified by this standard.

wireless network management (WNM) sleep mode: An extended power save mode for non-access-point (non-AP) stations (STAs) whereby a non-AP STA need not listen for every delivery traffic indication map (DTIM) Beacon frame and does not perform group temporal key/integrity group temporal key (GTK/IGTK) updates.

3.3 Definitions specific to IEEE 802.11 operation in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each definition that has clear attribution to a regulatory domain.

contact verification signal (CVS): A signal sent by a geolocation database dependent (GDD) enabling station (STA) to validate the list of available frequencies and to verify that the receiving GDD STA is within reception range of the master white space device (WSD) [US].

personal/portable station (STA): A STA that uses network communications at unspecified locations [US].

television band device (TVBD): An intentional radiator that operates on an unlicensed basis on available channels in the broadcast television frequency bands [US].

white space device (WSD): An entity that employs cognitive facilities to use white space spectrum without causing harmful interference to protected services [EU].

3.4 Abbreviations and acronyms

| | |
|-----------|---|
| 3GPP | 3rd Generation Partnership Project |
| 40MC | forty MHz capable |
| 802.x LAN | IEEE 802-based local area networks such as IEEE Std 802.3 and IEEE Std 802.11 |
| AA | authenticator address |
| AAA | authentication, authorization, and accounting |
| AAD | additional authentication data |
| A-BFT | association beamforming training |
| AC | access category |
| ACI | access category index |
| Ack | acknowledgment |
| ACM | admission control mandatory |

| | |
|--------------|--|
| ACU | admission control unit |
| ADDBA | add block acknowledgment |
| ADDS | add traffic stream |
| AES | advanced encryption standard |
| AES-128-CMAC | advanced encryption standard (with 128-bit key) cipher-based message authentication code |
| AFC | automatic frequency control |
| AGC | automatic gain control |
| AID | association identifier |
| AIFS | arbitration interframe space |
| AIFSN | arbitration interframe space number |
| AKM | authentication and key management |
| AKMP | authentication and key management protocol |
| A-MPDU | aggregate MAC protocol data unit |
| AMPE | authenticated mesh peering exchange |
| A-MSDU | aggregate MAC service data unit |
| ANIPI | average noise plus interference power indicator |
| ANonce | authenticator nonce |
| ANPI | average noise power indicator |
| ANQP | access network query protocol |
| AP | access point |
| APSD | automatic power save delivery |
| ARP | Address Resolution Protocol |
| AS | authentication server |
| ASEL | antenna selection |
| ASN.1 | Abstract Syntax Notation One |
| ASRA | additional step required for access |
| ATI | announcement transmission interval |
| ATIM | announcement traffic indication message |
| AV | audio video |
| AWV | antenna weight vector |
| BA | block acknowledgment |
| BAR | block acknowledgment request |
| BC | beam combining |
| BCC | binary convolutional code |
| BCU | basic channel unit |
| BF | beamforming |
| BHI | beacon header interval |
| BIP | broadcast/multicast integrity protocol |
| BPSK | binary phase shift keying |
| BRP | beam refinement protocol |
| BRPIFS | beam refinement protocol interframe space |
| BSA | basic service area |
| BSS | basic service set |
| BSSID | basic service set identifier |
| BT | bit time |

| | |
|------------|--|
| BTI | beacon transmission interval |
| BU | bufferable unit |
| BW | bandwidth |
| CAP | controlled access phase |
| CAQ | channel availability query |
| CBAP | contention based access period |
| CBC | cipher-block chaining |
| CBC-MAC | cipher-block chaining message authentication code |
| CBP | contention based protocol |
| CCA | clear channel assessment |
| CCK | complementary code keying |
| CCM | CTR with CBC-MAC |
| CCMP | CTR with CBC-MAC Protocol |
| CCSR | centralized coordination service root |
| CCSS | centralized coordination service set |
| CF | contention free |
| CFP | contention free period |
| CID | Company ID |
| C-MPDU | coded MPDU |
| CP | contention period |
| C-PSDU | coded PSDU |
| CRC | cyclic redundancy code |
| CS | carrier sense |
| CSD | cyclic shift diversity |
| CSI | channel state information |
| CSM | channel schedule management |
| CSMA/CA | carrier sense multiple access with collision avoidance |
| CTR | counter mode |
| CTS | clear to send |
| CTS1 | clear to send 1 |
| CTS2 | clear to send 2 |
| CVS | contact verification signal |
| CW | contention window |
| DA | destination address |
| DBPSK | differential binary phase shift keying |
| DCF | distributed coordination function |
| DCLA | dc level adjustment |
| DEI | drop eligibility indicator |
| DELBA | delete block acknowledgment |
| DELTS | delete traffic stream |
| DFS | dynamic frequency selection |
| DFT | discrete Fourier transform |
| DIFS | distributed (coordination function) interframe space |
| DLL | data link layer |
| DL-MU-MIMO | downlink multi-user multiple input, multiple output |
| DLS | direct-link setup |

| | |
|--------------|---|
| DLTF | Data Long Training field |
| DMG | directional multi-gigabit |
| DMS | directed multicast service |
| DMSID | directed multicast service identifier |
| DN | destination network |
| DO | DFS owner |
| Dp | desensitization |
| DQPSK | differential quadrature phase shift keying |
| DR | data rate |
| DS | distribution system |
| DSAFA | distribution system access function |
| DSCP | differentiated services code point |
| DSE | dynamic station enablement |
| DSM | distribution system medium |
| DSS | distribution system service |
| DSSS | direct sequence spread spectrum |
| DST | daylight saving time |
| DTI | data transfer interval |
| DTIM | delivery traffic indication map |
| DTP | dynamic tone pairing |
| EAP | Extensible Authentication Protocol (IETF RFC 3748 [B42]) |
| EAPOL | Extensible Authentication Protocol over LANs (IEEE Std 802.1X-2010) |
| EAS | emergency alert system |
| EBR | expedited bandwidth request |
| ECAPC | extended centralized AP or PCP cluster |
| ECS | extended channel switching |
| ED | energy detection |
| EDCA | enhanced distributed channel access |
| EDCAF | enhanced distributed channel access function |
| EDT | eastern daylight time |
| EHCC | extended hyperbolic congruence code |
| EIFS | extended interframe space |
| EIRP | equivalent isotropically radiated power |
| ELTF | Extension Long Training field |
| EOF | end-of-frame |
| EOSP | end of service period |
| EPD | EtherType Protocol Discrimination (IEEE Std 802-2014) |
| ERP | extended rate PHY |
| ERP-CCK | extended rate PHY using CCK modulation |
| ERP-DSSS | extended rate PHY using DSSS modulation |
| ERP-DSSS/CCK | extended rate PHY using DSSS or CCK modulation |
| ERP-OFDM | extended rate PHY using OFDM modulation |
| ESA | extended service area |
| ESP | estimated service parameters |
| ESR | emergency services reachable |
| ESS | extended service set |

| | |
|--------|---|
| EST | eastern standard time |
| EVM | error vector magnitude |
| FCS | frame check sequence |
| FD-AF | full-duplex amplify-and-forward |
| FEC | forward error correction |
| FER | frame error ratio |
| FFC | finite field cryptography |
| FFE | finite field element |
| FFT | Fast Fourier Transform |
| FIFO | first in first out |
| FMS | flexible multicast service |
| FMSID | flexible multicast stream identifier |
| FOV | field of view |
| FSM | finite state machine |
| FST | fast session transfer |
| FSTS | fast session transfer session |
| FT | fast BSS transition |
| FTAA | fast BSS transition authentication algorithm |
| FTE | fast BSS transition element |
| FTM | fine timing measurement |
| FTO | fast BSS transition originator |
| GANN | gate announcement |
| GAS | generic advertisement service |
| GATS | group addressed transmission service |
| GCM | Galois/counter mode |
| GCMP | Galois/Counter Mode Protocol |
| GCR | groupcast with retries |
| GCR-A | groupcast with retries active |
| GCR-SP | groupcast with retries service period |
| GDB | geolocation database |
| GDD | geolocation database dependent |
| GFSK | Gaussian frequency shift key or keying |
| GI | guard interval |
| GID | group identifier |
| GMK | group master key |
| GNonce | group nonce |
| GP | grant period |
| GPRS | general packet radio service |
| GPS | Global Positioning System |
| GQMF | group addressed quality-of-service Management frame |
| GTK | group temporal key |
| GTKSA | group temporal key security association |
| HC | hybrid coordinator |
| HCC | hyperbolic congruence code |
| HCCA | HCF controlled channel access |
| HCF | hybrid coordination function |

| | |
|---------------|---|
| HD-DF | half-duplex decode-and-forward |
| HEC | header error check |
| HELD | HTTP-enabled location delivery |
| HEMM | HCCA, EDCA mixed mode |
| HESSID | homogenous extended service set identifier |
| HIPERLAN | high-performance radio local area network |
| HPA | high power amplifier |
| HR/DSSS | high rate direct sequence spread spectrum using the long preamble and header |
| HR/DSSS/short | high rate direct sequence spread spectrum using the optional short preamble and header mode |
| HT | high-throughput |
| HTC | high-throughput control |
| HT-GF-STF | high-throughput Greenfield Short Training field |
| HT-SIG | high-throughput SIGNAL field |
| HT-STF | high-throughput Short Training field |
| HTTP | hypertext transfer protocol |
| HTTPS | hypertext transfer protocol secure |
| HWMP | hybrid wireless mesh protocol |
| HWMP SN | hybrid wireless mesh protocol sequence number |
| IBSS | independent basic service set |
| ICMP | Internet Control Message Protocol |
| ICV | integrity check value |
| IDFT | inverse discrete Fourier transform |
| IFFT | inverse Fast Fourier Transform |
| IFS | interframe space |
| IGTK | integrity group temporal key |
| IGTKSA | integrity group temporal key security association |
| IMp | intermodulation protection |
| INonce | initiator nonce |
| IPI | idle power indicator |
| IPN | IGTK packet number |
| IQMF | individually addressed quality-of-service Management frame |
| I/Q | in phase and quadrature |
| ISM | industrial, scientific, and medical |
| ISS | initiator sector sweep |
| IUT | implementation under test |
| IV | initialization vector |
| KCK | EAPOL-Key confirmation key |
| KDE | key data encapsulation |
| KDF | key derivation function |
| KEK | EAPOL-Key encryption key |
| LAN | local area network |
| LBIFS | long beamforming interframe space |
| LCI | location configuration information |
| LDPC | low-density parity check |
| LFSR | linear feedback shift register |

| | |

3.5 Abbreviations and acronyms in some regulatory domains

ISO 3166-1 defines the international two-letter designation for country names, and these designations are included [in square brackets] at the end of each abbreviation that has clear attribution to a regulatory domain.

| | |
|----------|---|
| PLMR/CRS | private land mobile radio/cellular radio service [US] |
| TVBD | television band device [US] |
| WSD | white space device [EU] |

4. General description

4.1 General description of the architecture

This clause presents the concepts and terminology used within this standard. Specific terms are defined in Clause 3. Illustrations convey key IEEE 802.11 concepts and the interrelationships of the architectural components. IEEE Std 802.11 uses an architecture to describe functional components of an IEEE 802.11 LAN. The architectural descriptions are not intended to represent any specific physical implementation of IEEE Std 802.11.

4.2 How wireless local area networks (WLANs) are different

4.2.1 Introduction

Wireless networks have fundamental characteristics that make them significantly different from traditional wired LANs.

4.2.2 Wireless station (STA)

In the design of wired LANs it is implicitly assumed that an address is equivalent to a physical location. In wireless networks, this is not always the case. In IEEE Std 802.11, the addressable unit is a station (STA). Physical and operational characteristics are defined by modifiers that are placed in front of the term STA. For example, in the case of location and mobility, the addressable units are the fixed STA, the portable STA, and the mobile STA. The STA is an addressable destination, but not (in general) a fixed location.

A STA might take on multiple distinct characteristics, each of which shape its function. For example, a single addressable unit might simultaneously be a portable STA, a quality-of-service (QoS) STA, a dependent STA, and a hidden STA.

4.2.3 Media impact on design and performance

The PHYs used in IEEE Std 802.11 are fundamentally different from wired media. Thus IEEE 802.11 PHYs:

- a) Use a medium that has neither absolute nor readily observable boundaries outside of which STAs with PHY transceivers are known to be unable to receive network frames
- b) Are unprotected from other signals that are sharing the medium
- c) Communicate over a medium significantly less reliable than wired PHYs
- d) Have dynamic topologies
- e) Lack full connectivity, and therefore the assumption normally made that every STA can hear every other STA is invalid (i.e., STAs might be “hidden” from each other)
- f) Have time-varying and asymmetric propagation properties
- g) Might experience interference from logically disjoint IEEE 802.11 networks operating in overlapping areas

Because of limitations on wireless PHY ranges, WLANs intended to cover reasonable geographic distances can be built from basic coverage building blocks. When providing QoS services, the MAC endeavors to provide QoS “service guarantees” within the limitations of the medium properties identified above. In other words, particularly in unlicensed spectrum, true guarantees are often not possible. However, gradations of service are always possible; and in sufficiently controlled environments, QoS guarantees are possible.

4.2.4 The impact of handling mobile STAs

One of the requirements of IEEE Std 802.11 is to handle *mobile* as well as *portable* STAs. A *portable* STA is one that is moved from location to location, but that is used only while at a fixed location. *Mobile* STAs actually access the LAN while in motion.

For technical reasons, it is not sufficient to handle only portable STAs. Propagation effects blur the distinction between portable and mobile STAs; stationary STAs often appear to be mobile due to propagation effects.

Mobile STAs typically are battery powered. Hence power management is an important consideration. For example, it cannot be presumed that a STA's receiver is always powered on.

4.2.5 Interaction with other IEEE 802[®] layers

IEEE Std 802.11 is required to appear to higher layers [logical link control (LLC)] as a general-purpose IEEE 802 LAN. This requires that the IEEE 802.11 network handle STA mobility within the MAC sublayer. To meet reliability assumptions (that LLC makes about lower layers), it is necessary for IEEE Std 802.11 to incorporate functionality that is untraditional for MAC sublayers.

In a robust security network association (RSNA), IEEE Std 802.11 provides functions to protect Data frames, IEEE Std 802.1X-2010 provides authentication and a Controlled Port, and IEEE Std 802.11 and IEEE Std 802.1X-2010 collaborate to provide key management. All STAs in an RSNA have a corresponding IEEE 802.1X™ entity that handles these services. This standard defines how an RSNA utilizes IEEE Std 802.1X-2010 to access these services. Within IEEE Std 802.11, EAPOL PDUs are carried as MSDUs within one or more Data frames, as described in IEEE Std 802.1X-2010, Clause 12. Within this standard, Data frames used for this purpose are generally referred to as *EAPOL-Key frames*, *EAPOL-Key request frames*, and *EAPOL-Start frames*.

When used to support applications that have QoS requirements, each IEEE 802.11 LAN provides a link within an end-to-end QoS environment that can be established between, and managed by, higher layer entities. To handle QoS traffic in a manner comparable to other IEEE 802 LANs, the IEEE 802.11 QoS facility requires the IEEE 802.11 MAC sublayers to incorporate functionality that is not traditional for MAC sublayers. In addition, it might be necessary for certain higher layer management entities to be “WLAN aware” at least to the extent of understanding that the available bandwidth and other QoS characteristics of a WLAN are subject to frequent, and sometimes substantial, dynamic changes due to causes other than traffic load and are outside the direct control of network management entities.

4.2.6 Interaction with non-IEEE-802 protocols

An RSNA utilizes non-IEEE-802 protocols for its authentication and key management (AKM) services. Some of these protocols are defined by other standards organizations, such as the Internet Engineering Task Force (IETF).

4.3 Components of the IEEE 802.11 architecture

4.3.1 General

The IEEE 802.11 architecture consists of several components that interact to provide a WLAN that supports STA mobility transparently to upper layers.

The basic service set (BSS) is the basic building block of an IEEE 802.11 LAN. Figure 4-1 shows two BSSs, each of which has two STAs that are members of the BSS.

It is useful to think of each oval depicting a BSS as the coverage area within which the member STAs of the BSS can remain in communication. In the case of transmissions such as in a directional multi-gigabit (DMG) BSS, the individual coverage area of a transmission from one member STA to another can be thought of as a cone and hence is referred to as a *directional transmission*. The collection of all possible directional transmissions by a member STA defines the coverage area. (The concept of area, while not precise, is often good enough.) This area is called the *Basic Service Area (BSA)*. If a STA moves out of its BSA, it can no longer directly communicate with other STAs present in the BSA.

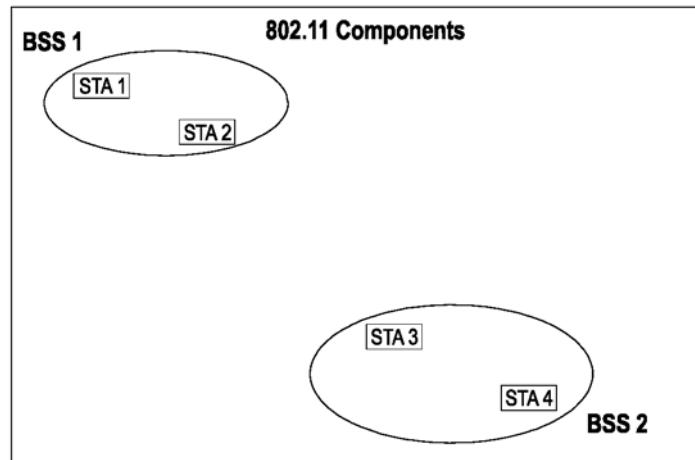

Figure 4-1—BSSs

4.3.2 The independent BSS (IBSS)

The IBSS is the most basic type of IEEE 802.11 LAN. Since the BSSs shown in Figure 4-1 are simple and lack other components (contrast this with Figure 4-2), the two can be taken to be representative of two IBSSs.

This mode of operation is possible when IEEE 802.11 STAs are able to communicate directly. Because this type of IEEE 802.11 LAN is often formed without preplanning, for only as long as the LAN is needed.

4.3.3 The personal BSS (PBSS)

Similar to the IBSS, the PBSS is a type of IEEE 802.11 LAN in which STAs communicate directly with each other.

In contrast to the IBSS, in the PBSS one STA assumes the role of the PBSS control point (PCP). The PCP provides the basic timing for the PBSS through DMG Beacon and Announce frames as well as allocation of service periods and contention based access periods.

A PBSS can be established only by DMG STAs. Not every DMG BSS is a PBSS. A DMG BSS can be a PBSS, an infrastructure BSS, or an IBSS.

4.3.4 STA membership in a BSS is dynamic

A STA's membership in a BSS is dynamic (STAs turn on, turn off, come within range, and go out of range). To become a member of an infrastructure BSS or an IBSS, a STA joins the BSS using the synchronization procedure described in 11.1.4.5. To start a new mesh BSS or to become a member of a mesh BSS, a STA starts the transmission of Beacons and performs the synchronization maintenance procedure described in 14.13. To access all of the services of an infrastructure BSS, a STA becomes “associated.” These

associations are dynamic and involve the use of the distribution system service (DSS), which is described in 4.4.4. A mesh STA does not become associated as there is no central entity in a mesh BSS (MBSS). Instead, a mesh STA peers with other mesh STAs.

4.3.5 Distribution system (DS) concepts

4.3.5.1 Overview

PHY limitations determine the direct station-to-station distance that is supported. For some networks this distance is sufficient; for other networks, increased coverage is required.

Instead of existing independently, an infrastructure BSS might also form a component of an extended form of network that is built with multiple BSSs. The architectural component used to interconnect infrastructure BSSs is the DS.

IEEE Std 802.11 logically separates the WM from the distribution system medium (DSM). Each logical medium is used for different purposes, by a different component of the architecture. The IEEE 802.11 definitions neither preclude, nor demand, that the multiple media be either the same or different.

Recognizing that the multiple media are *logically* different is key to understanding the flexibility of the architecture. The IEEE 802.11 LAN architecture is specified independently of the physical characteristics of any specific implementation.

The DS enables mobile device support by providing the logical services necessary to handle address to destination mapping and seamless integration of multiple BSSs.

An access point (AP) is any entity that has STA functionality and a distribution system access function (DSAF), which enables access to the DS, via the WM for associated STAs.

Figure 4-2 adds the DS, DSM and AP components to the IEEE 802.11 architecture picture.

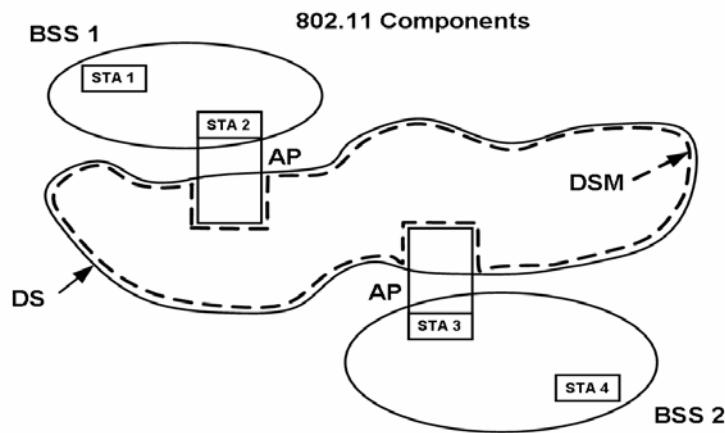

Figure 4-2—DSs and APs

Data move between a BSS and the DS via the DSAF in an AP. An AP contains a STA and is addressable on the WM using its STA address. The addresses used by an AP for communication on the WM and on the DSM are not necessarily the same.

Data sent to the AP's STA address by one of the STAs associated with it are always received at the uncontrolled port for processing by the IEEE 802.1X port access entity. In addition, if the controlled port is authorized, these frames conceptually transit the DS.

4.3.5.2 Extended service set (ESS): the large coverage network

The DS and infrastructure BSSs allow IEEE Std 802.11 to create a wireless network of arbitrary size and complexity. IEEE Std 802.11 refers to this type of network as the ESS. An ESS is the union of the infrastructure BSSs with the same SSID connected by a DS. The ESS does not include the DS.

The key concept is that the ESS appears the same to an LLC layer as an IBSS. STAs within an ESS can communicate and mobile STAs might move from one BSS to another (within the same ESS) transparently to LLC.

Owing to its distributed nature, a mesh BSS (MBSS) has no central entity like the AP of an infrastructure BSS. Instead, an MBSS forms a single set of independent mesh STAs. This set is indivisible and cannot be further unified. The ESS concept does not apply to the MBSS. However, it is possible to use a Mesh BSS as all or part of the DS that connects an ESS.

Nothing is assumed by IEEE Std 802.11 about the relative physical locations of the BSSs in Figure 4-3.

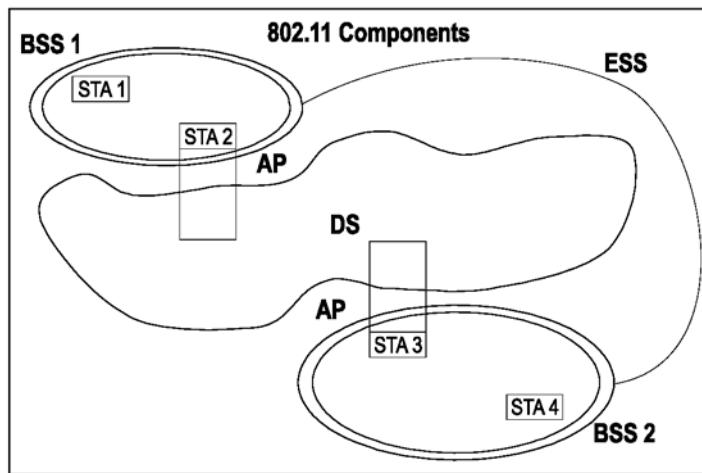

Figure 4-3—ESS

All of the following are possible

- The BSSs partially overlap. This is commonly used to arrange coverage within a physical volume.
- The BSSs could be physically disjoint. Logically there is no limit to the distance between BSSs.
- The BSSs are physically collocated. This could be done to provide redundancy.
- One (or more) IBSSs or ESSs are physically present in the same location as one (or more) ESSs. This could arise for a number of reasons. Some examples are when an IBSS is operating in a location that also has an ESS, when physically overlapping IEEE 802.11 networks have been set up by different organizations, and when two or more different access and security policies are needed in the same location.

4.3.6 Area concepts

For wireless PHYs, well-defined coverage areas simply do not exist. Propagation characteristics are dynamic and unpredictable. Small changes in position or direction might produce dramatic differences in signal strength. Similar effects occur whether a STA is stationary or mobile (as moving objects might impact station-to-station propagation).

Figure 4-4 shows a signal strength map for a simple square room with a standard metal desk and an open doorway. This figure is a static snapshot; the propagation patterns change dynamically as STAs and objects in the environment move. The dark (solid) blocks in the lower left are a metal desk and there is a doorway at the top right of the figure. The figure indicates relative differences in field strength with different intensities and indicates the variability of field strength even in a static environment. The difference between the greatest signal strength and the least signal strength in this figure is 50 dB.

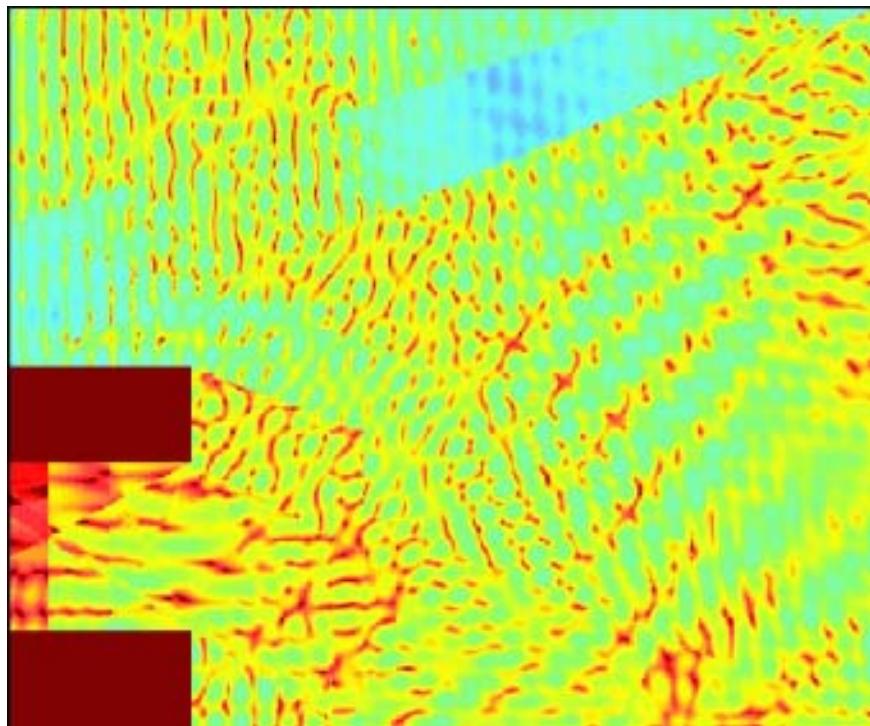

Figure 4-4—A representative signal intensity map

While the architecture diagrams show sharp boundaries for BSSs, this is an artifact of the pictorial representation, not a physical reality. Because dynamic three-dimensional field strength pictures are difficult to draw, well-defined shapes are used by IEEE 802.11 architectural diagrams to represent the coverage of a BSS.

Further description difficulties arise when attempting to describe collocated coverage areas. Consider Figure 4-5, in which STA 6 could belong to BSS 2 or BSS 3.

While the concept of sets of STAs is correct, it is often convenient to talk about areas. For many topics the concept of area is sufficient. *Volume* is a more precise term than area, though still not technically correct. For historical reasons and convenience, this standard uses the common term *area*.

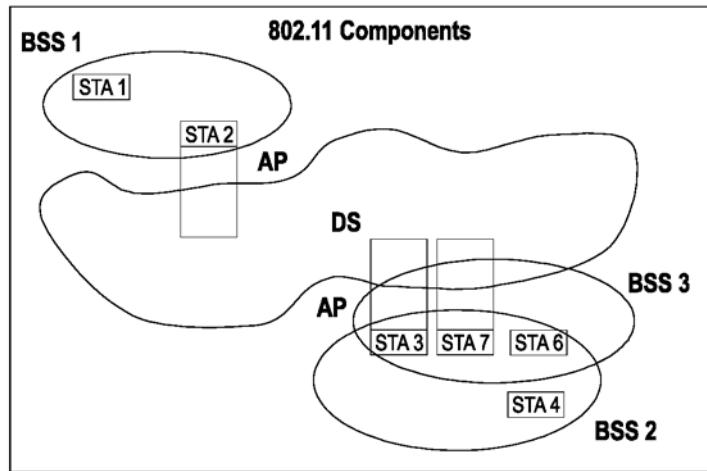

Figure 4-5—Collocated coverage areas

4.3.7 Integration with non-IEEE-802.11 LANs

To integrate the IEEE 802.11 architecture with a non-IEEE-802.11 LAN, including a traditional wired LAN, a final logical architectural component is introduced—a *portal*.

A portal is the logical point at which the integration service is provided. All data from or to non-IEEE-802.11 LANs enter or leave the IEEE 802.11 architecture via a portal. The integration service is responsible for any addressing changes or other logical mappings that might be required when MSDUs pass between the DS and the integrated LAN. It is possible for one device to offer both the functions of an AP and a portal. For example, a portal to a wired IEEE 802 LAN is shown in Figure 4-6.

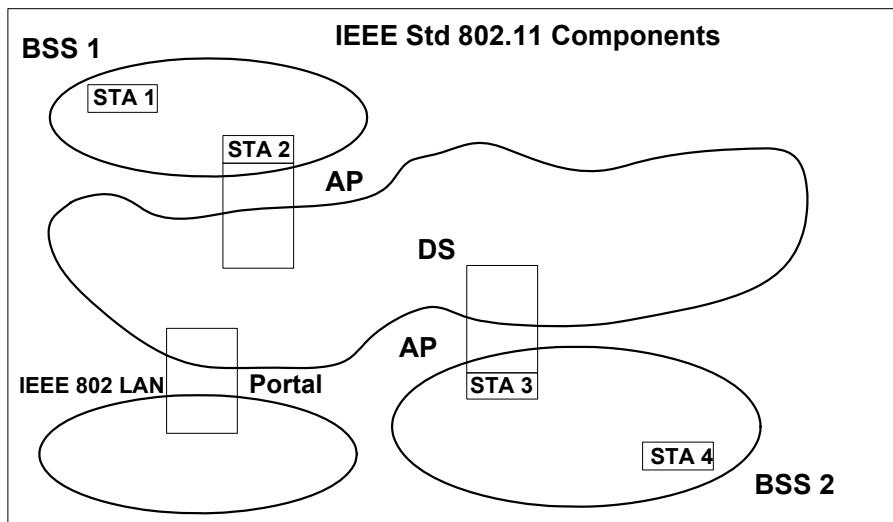

Figure 4-6—Connecting to other IEEE 802 LANs

4.3.8 Robust security network association (RSNA)

The following features are defined for an RSNA:

- Enhanced authentication mechanisms for STAs
- Key management algorithms
- Cryptographic key establishment
- Enhanced data cryptographic encapsulation mechanisms, such as counter mode with cipher-block chaining message authentication code protocol (CCMP), Galois/counter mode protocol (GCMP), and, optionally, temporal key integrity protocol (TKIP).
- Fast basic service set (BSS) transition (FT) mechanism
- Enhanced cryptographic encapsulation mechanisms for robust Management frames

An RSNA might rely on components external to the IEEE 802.11 architecture.

The first component is an IEEE 802.1X port access entity (PAE). PAEs are present on all STAs in an RSNA and control the forwarding of data to and from the medium access control (MAC). An AP always implements the Authenticator PAE and Extensible Authentication Protocol (EAP) Authenticator roles, and a non-AP STA always implements the Supplicant PAE and EAP peer roles. In an IBSS or PBSS, each STA implements both the Authenticator PAE and Supplicant PAE roles and both EAP Authenticator and EAP peer roles.

A second component is the Authentication Server (AS). The AS authenticates the elements of the RSNA itself, i.e., the STAs provide material that the RSNA elements use to authenticate each other. The AS communicates through the IEEE 802.1X Authenticator with the IEEE 802.1X Supplicant on each STA, enabling the STA to be authenticated to the AS and vice versa. An RSNA depends upon the use of an EAP method that supports mutual authentication of the AS and the STA, such as those that meet the requirements in IETF RFC 4017. In certain applications, the AS might be integrated into the same physical device as the AP, or into a STA in an IBSS or PBSS.

In some applications, there is no need for a PAE or AS, and a STA and AP, or two IBSS STAs, or two mesh STAs in an MBSS, might authenticate each other using a password.

An RSNA using fast BSS transition relies on an external protocol to distribute keys between the pairwise master key (PMK) R0 key holder (R0KH) and PMK-R1 key holder (R1KH) Authenticator components. The requirements for this protocol are described in 13.2.2.

4.3.9 Centralized coordination service set (CCSS) and extended centralized AP or PCP clustering (ECAPC)

AP or PBSS control point (PCP) clustering is a protocol between a DMG synchronization AP or DMG synchronization PCP (S-AP or S-PCP) and other APs and PCPs within the cluster, known as member APs and PCPs. This protocol is used to improve spatial sharing and interference mitigation among the DMG BSSs of the S-AP or S-PCP and member APs and PCPs. AP or PCP clustering allows an AP or PCP within a cluster to schedule transmissions in nonoverlapping time periods with respect to other APs and PCPs that are in the same cluster. There are two types of clustering:

- In decentralized AP or PCP clustering, there is a single S-AP or S-PCP in the BSA of the S-AP or S-PCP.
- In centralized AP or PCP clustering, there can be multiple S-APs in the BSA of any one S-AP and all S-APs are coordinated via a single centralized coordination service set (CCSS).

A CCSS comprises a centralized coordination service root (CCSR) and a set of one or more synchronization APs that while operating are stationary with respect to their local environment and are connected to the CCSR via, for instance, one of the following:

- The DS to an AP (or beyond, to a STA associated to the AP)
- A combination of distribution service, portal, and external network

The CCSR provides coordination services for the CCSS, such as selecting the target beacon transmission time of S-APs within the CCSS to minimize interference. The CCSR might logically reside within an S-AP or in another entity as long as it has a globally administered MAC address. A CCSS is suited to an area and a frequency band having the following propagation characteristics:

- The BSAs of the S-APs within the CCSS cover the area, and
- Transmissions within the area are isolated to a high degree.

An extended centralized AP or PCP cluster (ECAPC) comprises a single CCSS and an accompanying set of centralized AP or PCP clusters. Each S-AP of one of the centralized AP or PCP clusters is inside the CCSS. The ECAPC also includes all STAs in the BSSs of the S-APs and member APs and PCPs of the centralized AP or PCP clusters. An example is shown in Figure 4-7, in which:

- STA3a and STA3b are two STAs coordinated by a one MM-SME component.
- STA4a and STA4b are two STAs coordinated by a second MM-SME component.
- The CCSR happens to be located in an external network.

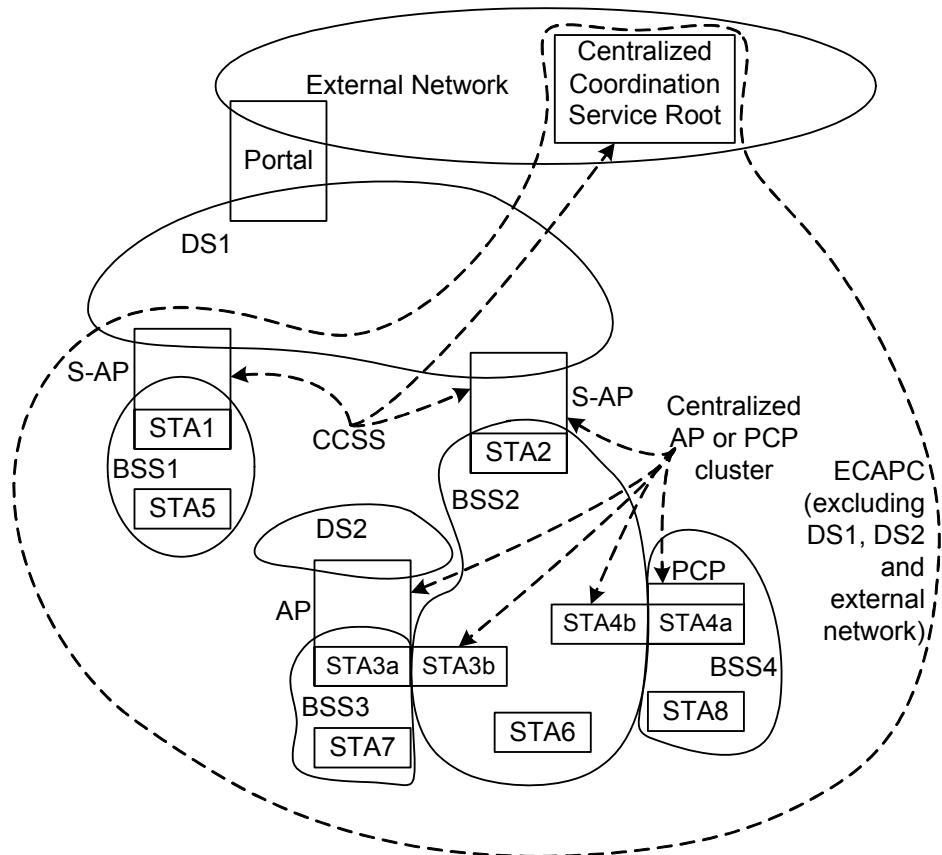

Figure 4-7—CCSS and ECAPC

The CCSS might contain whole ESSs, subsets of ESSs, or some combination of them.

Decentralized AP or PCP clustering can be employed without establishing a CCSS, CCSR, or ECAPC.

4.3.10 QoS BSS

The IEEE 802.11 QoS facility provides MAC enhancements to support LAN applications with QoS requirements. The QoS enhancements are available to QoS STAs associated with a QoS access point or PCP in a QoS BSS. A subset of the QoS enhancements is available for use between STAs that are members of the same QoS IBSS.

Similarly, a subset of the QoS enhancements is available for use between neighbor peer mesh STAs. A mesh BSS is one type of QoS BSS and it is described in 4.3.20.

A QoS STA that is a non-DMG STA might associate with a non-QoS access point in a non-QoS BSS, to provide the non-QoS MAC data service, for example, when there is no QoS BSS with which to associate.

As a mesh STA does not implement the necessary service, the mesh STA does not associate with any access point.

A DMG STA is a QoS STA. A DMG BSS is a QoS BSS.

The enhancements that distinguish QoS STAs from non-QoS STAs and QoS APs from non-QoS APs are collectively termed the *QoS facility*. Which of the QoS-specific mechanisms a QoS STA supports might vary among QoS implementations, as well as between QoS STAs and QoS APs, over ranges specified in subsequent clauses. All service primitives, frame formats, coordination function and frame exchange rules, and management interface functions except for the block acknowledgment (block ack) function, direct-link setup (DLS), and automatic power save delivery (APSD) are part of the core QoS facility. A QoS STA or QoS AP implements those core QoS facility necessary for its QoS functions to interoperate with other QoS STAs. Functions such as the block ack, DLS, and APSD are separate from the core QoS facility; and the presence of these functions is indicated by STAs separately from the core QoS facility.

For infrastructure BSS and IBSS, this standard provides four mechanisms for the support of applications with QoS requirements.

The first mechanism, designated the *enhanced distributed channel access* (EDCA), delivers traffic based on differentiating user priorities (UPs). This differentiation is achieved by varying the following for different UP values:

- Amount of time a STA senses the channel to be idle before backoff or transmission, or
- The length of the contention window to be used for the backoff, or
- The duration a STA transmits after it acquires the channel.

These transmissions might also be subject to certain channel access restrictions in the form of admission control. A DMG STA uses EDCA only within a contention based access period (CBAP). Details of EDCA are provided in 10.22.2 and, for DMG STAs, additional details are provided in 10.36.4, 10.36.5, and 10.36.6.3.

The second mechanism, designated the *hybrid coordination function* (HCF) *controlled channel access* (HCCA), which is not applicable to DMG STAs, allows for the reservation of transmission opportunities (TXOPs) with the hybrid coordinator (HC). A STA requests the HC for TXOPs, both for its own transmissions as well as for transmissions from the AP to itself.¹⁷ The request is initiated by the station

¹⁷ In the case of downlink traffic streams (TSs).

management entity (SME) of the STA. The HC, which is collocated at the AP, either accepts or rejects the request based on an admission control policy. If the request is accepted, the HC schedules TXOPs for both STAs (both the AP and the non-AP STA). For transmissions from the non-AP STA, the HC polls the STA based on the parameters supplied by the STA at the time of its request. For transmissions to the STA, the AP directly obtains TXOPs from the collocated HC and delivers the queued frames to the STA, again based on the parameters supplied by the STA. Details of the mechanism are provided in 10.22.3 and 11.4. This mechanism might be used for applications such as voice and video, which need periodic service from the HC. If the application constraints dictate the use of this mechanism, the application initiates this mechanism by using the management service primitives.

The third mechanism, designated the *service period* (SP) *access* or *service period channel access* (SPCA), is applicable only to DMG STAs and allows for the reservation of channel time by the AP or PCP. A non-AP and non-PCP STA requests SPs from an AP or PCP. These SPs can be used for transmission to any other STA in the BSS. The request is initiated by the SME of the non-AP and non-PCP STA. The AP or PCP either accepts or rejects the request based on an admission control policy. If the request is accepted, the AP or PCP uses the Extended Schedule element to schedule SPs for communication between the source and destination DMG STAs indicated within the request. Details of this mechanism are provided in 10.36.6.2, 10.36.6.4, 10.36.6.6, and 11.4.

The fourth mechanism, designated as *dynamic allocation*, is applicable only to DMG STAs and allows for near-real-time reservation of channel time with an AP or PCP. This type of access is used in addition to the service period and contention based access period mechanisms. An AP or PCP can poll a STA and receive requests for channel time allocation. Based on the received requests, the AP or PCP can accept a request and immediately allocate (within the same beacon interval) channel time for the STA to communicate with another STA by using a Grant frame. Details of this mechanism are provided in 10.36.7, 10.36.8, and 10.36.9.

The AP of a QoS BSS might allow non-QoS STAs to associate. All individually addressed frames that are sent to non-QoS STAs by an AP do not use the frame formats associated with the QoS facility.

A QoS STA associated in a non-QoS BSS acts as a non-QoS STA.

4.3.11 Wireless LAN radio measurements

4.3.11.1 General

Wireless LAN (WLAN) radio measurements enable STAs to understand the radio environment in which they exist. WLAN radio measurements enable STAs to observe and gather data on radio link performance and on the radio environment. A STA can choose to make measurements locally, request a measurement from another STA, or be requested by another STA to make one or more measurements and return the results. Radio measurement data is made available to STA management and upper protocol layers where it might be used for a range of applications. The measurements enable adjustment of STA operation to better suit the radio environment. The radio measurement service includes measurements that extend the capability, reliability, and maintainability of WLANs by providing standard measurements across vendors, and the service provides the resulting measurement data to upper layers in the communications stack.

In addition to featuring standard measurements and delivering measurement information to upper layers, there are applications that require quantifiable radio environment measurements in order to attain the necessary performance levels. These applications include VoIP, video over IP, location based applications, as well as applications requiring mitigation of harsh radio environments (multifamily dwellings, airplanes, factories, municipalities, etc.). Radio measurements address most of the existing issues in using unlicensed radio spectrum to meet the requirements of these emerging technologies.

To address the mobility requirements of technologies, such as VoIP and video streaming, radio measurements, such as Channel Load request/report and the Neighbor request/report, can be used to collect transition information, which can drastically speed up handoffs between BSSs within the same ESS. By accessing and using this information, the STAs (either in APs or in non-AP STAs) can make intelligent decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The request/report measurements are as follows:

- Beacon
- Frame
- Channel Load
- Noise Histogram
- STA Statistics
- LCI (location configuration information)
- Neighbor Report
- Link Measurement
- Transmit Stream/Category Measurement

The request-only mechanism is as follows:

- Measurement Pause

The report-only mechanism is as follows:

- measurement pilot

These measurement mechanisms provide the capability for a STA to manage and query its radio environment, and to make appropriate assessments about its health and efficiency. It is the first step in making WLAN smart and capable of making appropriate decisions for fast transition, for mesh connectivity, and for managing the radio environment for all wireless devices.

4.3.11.2 Beacon

The Beacon request/report pair enables a STA to request from another STA a list of APs whose beacons it can receive on a specified channel or channels. The Beacon report request/response provides a means for a requesting STA to obtain received beacon, probe response, and measurement pilot information from a responding STA.

4.3.11.3 Measurement pilot

The Measurement Pilot frame provides a subset of the information provided in a Beacon frame, is smaller than a Beacon, and is transmitted more often than a Beacon. The purpose of the Measurement Pilot frame is to assist a STA with scanning.

4.3.11.4 Frame

The Frame request/report pair returns a picture of all of the channel traffic and a count of all of the frames received at the measuring STA. For each unique Transmitter Address, the STA reports the Transmitter Address, number of frames received from this transmitter, average power level (RCPI) for these frames, and BSSID of the transmitter.

4.3.11.5 Channel load

The Channel Load request/report pair returns the channel utilization measurement as observed by the measuring STA.

4.3.11.6 Noise histogram

The Noise Histogram request/report pair returns a power histogram measurement of non-IEEE-802.11 noise power by sampling the channel when virtual carrier sense indicates idle and the STA is neither transmitting nor receiving a frame.

4.3.11.7 STA statistics

The STA Statistics request/report pair returns groups of values for STA counters and for BSS Average Access Delay. The STA counter group values include transmitted fragment counts, group addressed transmitted frame counts, failed counts, retry counts, multiple retry counts, frame duplicate counts, Request to Send (RTS) success counts, RTS failure counts, Acknowledgment (Ack) failure counts, received fragment counts, group addressed received frame counts, FCS error counts, and transmitted frame counts. BSS Average Access Delay group values include AP average access delay, average access delay for each access category, associated STA count, and channel utilization.

4.3.11.8 Location

The Location request/report pair returns a requested location in terms of latitude, longitude, and altitude. It includes types of altitude such as floors. A requested location can be the location of the requester (e.g., “Where am I?”) or the location of the reporting STA (e.g., “Where are you?”) or the location of another STA.

4.3.11.9 Measurement pause

The Measurement Pause request is defined, but no report comes back from this request. The measurement pause permits the inclusion of a quantified delay between the execution of individual measurements that are provided in a series within a Measurement Request frame. The measurement pause used as the last measurement in a frame provides control of the measurement period when Measurement Request frames are to be repeated.

4.3.11.10 Neighbor report

The neighbor report request is sent to an AP, which returns a neighbor report containing information about known neighbor APs that are candidates for a service set transition. Neighbor reports contain information from dot11RMNeighborReportTable concerning neighbor APs. This request/report pair enables a STA to gain information about the neighbors of the associated AP to be used as potential roaming candidates.

4.3.11.11 Link measurement

The link measurement request/report exchange provides measurements of the RF characteristics of a STA-to-STA link. This measurement indicates the instantaneous quality of a link.

4.3.11.12 Transmit stream/category measurement

When two QoS STAs have an ongoing traffic stream between them, the Transmit Stream/Category Measurement request/report pair enables either STA to query the other about the conditions of the stream. The transmit stream/category measurement report provides the transmit-side performance metrics for the measured traffic stream. Trigger conditions included in the Transmit Stream/Category Measurement request

can initiate triggered Transmit Stream/Category Measurement reports upon detection of the trigger condition.

4.3.12 Operation in licensed frequency bands

4.3.12.1 General

IEEE 802.11 devices can operate on frequencies that are licensed by national regulatory bodies. Although this standard has been generalized so that it is independent of license type, band, and country of operation, only the bands and associated regulations listed in Annex D have been specifically considered.

4.3.12.2 Dynamic STA enablement (DSE) in licensed bands

The DSE operating procedures are used to automate the channel provisioning and regulatory controls needed for unregistered IEEE 802.11 STAs to operate as dependent STAs in licensed spectrum.¹⁸

4.3.12.3 Contention based protocol (CBP) in nonexclusively licensed bands

The granting of licenses on a nonexclusive, uncoordinated basis in the same area leads to the possibility of overlapping networks. When overlapping networks cause co-channel interference, regulations, such as those governing the 3650 MHz band in the United States, require the use of a CBP “by which a transmitter provides reasonable opportunities for other transmitters to operate.”¹⁹ IEEE 802.11 carrier sense multiple access with collision avoidance (CSMA/CA) is suitable for this purpose in most situations.

4.3.12.4 Using DSE STA identification to resolve interference

When CSMA/CA is not able to sufficiently sense the presence of another licensee’s STA (i.e., a hidden STA) or if a secondary licensee causes inference to a primary licensee, the secondary licensee is obliged to resolve complaints that result from interference caused by any STA under its control (including dependent STAs). In order to facilitate the interference resolution processes, all STAs operating in nonexclusively licensed spectrum use the DSE STA and location information procedures.

The STA identification and location information procedures are tied because, by default, registered STAs broadcast their actual location as their unique identifier. Dependent STAs broadcast the location of the STA that has enabled them as well as a unique code selected by the licensee. This method puts a victim of the interference in contact with the party responsible for rectifying the problem, and, at the same time, it protects the privacy of the dependent STA’s operator.

4.3.12.5 Further coexistence enhancements in nonexclusively licensed bands

While not explicitly required to meet specific rules, a number of optional IEEE 802.11 mechanisms, when used together, are able to meet general requirements for spectrum sharing, incumbent detection, and other cognitive radio functions in licensed bands. The specific mechanisms for each band are detailed in E.2.

4.3.13 High-throughput (HT) STA

The IEEE 802.11 HT STA provides PHY and MAC features that can support a throughput of 100 Mb/s and greater, as measured at the MAC data service access point (SAP). An HT STA supports HT features as

¹⁸In some licensed frequency bands, wireless equipment can be owned and operated by individuals who do not hold a license. In such instances, devices are permitted to operate only if they are either communicating with, or receiving permission to transmit from, a STA that is maintained by a licensed operator. The Japanese 4.9 GHz band and the U.S. 4.94–4.99 GHz public safety band are examples in which IEEE 802.11 STAs operate under such arrangements.

¹⁹Definition of CBP from FCC 05-56, Report and Order and Memorandum Opinion and Order, clause 58.

identified in Clause 10 and Clause 19. An HT STA operating in the 5 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 17. An HT STA operating in the 2.4 GHz band supports transmission and reception of frames that are compliant with mandatory PHY specifications as defined in Clause 16 and Clause 18. An HT STA is also a QoS STA. The HT features are available to HT STAs associated with an HT AP. A subset of the HT features is available for use between two HT STAs that are members of the same IBSS. Similarly, a subset of the HT features is available for use between two HT STAs that have established mesh peering (see 9.4.2.56 for details).

An HT STA has PHY features consisting of the modulation and coding scheme (MCS) set described in 19.3.5 and physical layer (PHY) protocol data unit (PPDU) formats described in 19.1.4. Some PHY features that distinguish an HT STA from a non-HT STA are referred to as *multiple input, multiple output (MIMO)* operation; spatial multiplexing (SM); spatial mapping (including transmit beamforming); space-time block coding (STBC); low-density parity check (LDPC) encoding; and antenna selection (ASEL). The allowed PPDU formats are non-HT format, HT-mixed format, and HT-greenfield format (see 19.1.4). The PPUDUs can be transmitted with 20 MHz bandwidth and might be transmitted with 40 MHz bandwidth.

An HT STA has MAC features that include frame aggregation, some block ack features, power save multi-poll (PSMP) operation, reverse direction (RD), and protection mechanisms supporting coexistence with non-HT STAs.

4.3.14 Very high throughput (VHT) STA

The IEEE 802.11 VHT STA operates in frequency bands below 6 GHz excluding the 2.4 GHz band.

A VHT STA is an HT STA that, in addition to features supported as an HT STA, supports VHT features identified in Clause 9, Clause 10, Clause 11, Clause 14, Clause 17, and Clause 21.

The main PHY features in a VHT STA that are not present in an HT STA are the following:

- Mandatory support for 40 MHz and 80 MHz channel widths
- Mandatory support for VHT single-user (SU) PPUDUs
- Optional support for 160 MHz and 80+80 MHz channel widths
- Optional support for VHT sounding protocol to support beamforming
- Optional support for VHT multi-user (MU) PPUDUs
- Optional support for VHT-MCSs 8 and 9

The main MAC features in a VHT STA that are not present in an HT STA are the following:

- Mandatory support for the A-MPDU padding of a VHT PPDU
- Mandatory support for VHT single MPDU
- Mandatory support for responding to a bandwidth indication (provided by the RXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT) in a non-HT and non-HT duplicate RTS frame
- Optional support for MPDUs of up to 11 454 octets
- Optional support for A-MPDU pre-end-of-frame (pre-EOF) padding (see 9.7.1) of up to 1 048 575 octets
- Optional support for VHT link adaptation

Most VHT features, among other benefits, increase the maximum throughput achievable between two VHT STAs over that achievable using HT features alone. The VHT features are available to VHT STAs associated with a VHT AP. A subset of the VHT features is available for use between two VHT STAs that are members of the same IBSS. Similarly, a subset of the VHT features is available for use between two

VHT STAs that have established mesh peering. A subset of the VHT features is available for use between two VHT STAs that have established a TDLS link.

The support for VHT transmit beamforming sounding and VHT MU PPDUs in a VHT AP and more than one VHT STA within a VHT BSS enables the optional use of downlink MU multiple input, multiple output (DL-MU-MIMO). With DL-MU-MIMO the AP can create up to four A-MPDUs, each carrying MPDUs destined for an associated MU beamformee capable STA. The AP uses group identifiers (GIDs) to signal potential recipient STAs. The AP transmits the A-MPDUs simultaneously in separate space-time streams such that each recipient STA is able to demodulate the space-time streams carrying its A-MPDU. The simultaneous transmission of A-MPDUs in a single VHT MU PPDU provides a means to increase aggregate throughput over that achieved by sending the A-MPDUs in separate SU PPDUs.

The use of certain HT features, such as reduced interframe space (RIFS), is not permitted for VHT STAs.

4.3.15 Television very high throughput (TVHT) STA

The IEEE 802.11 TVHT STA operates in television white spaces (TVWS) bands.

A TVHT STA supports all mandatory features of a VHT STA as mandatory features except for HT-mixed format PPDUs and 20 MHz, 40 MHz, and 80 MHz channel widths. A TVHT STA supports all optional features of a VHT STA as optional features except for HT-greenfield format PPDUs, 160 MHz or 80+80 MHz channel widths, more than 4 spatial streams, and Short GI (which is mandatory).

The 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz channel widths and more than 4 spatial streams are not used in STAs operating as TVHT STAs. The features and behaviors of VHT STAs specified in Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, Clause 14, and Annex G apply to TVHT STAs as well, unless stated otherwise.

For Clause 6, Clause 8, Clause 9, Clause 10, Clause 11, and Clause 14, the following replacements are applied for TVHT STAs:

- “TVHT_W/TVHT_2W” replaces “20/40 MHz”.
- “TVHT_W/TVHT_2W/TVHT_4W” replaces “20/40/80/160 MHz”.
- “TVHT_W”, “TVHT_2W”, and “TVHT_4W” replace “20 MHz”, “40 MHz”, and “80 MHz,” respectively.
- “TVHT_W” replaces “CBW20”.
- “TVHT_2W” replaces “CBW40”.
- “TVHT_4W” replaces “CBW80” and “CBW80+80”.
- “secondaryTVHT_2W” replaces “secondary40”.
- “TVHT STA” replaces “VHT STA”.
- “TVHT AP” replaces “VHT AP”.
- “TVHT BSS” replaces “VHT BSS”.
- “TVHT-MCS” replaces “VHT-MCS”.
- “TVHT Operation” replaces “VHT Operation”.
- “dot11TVHTOptionImplemented” replaces “dot11VHTOptionImplemented”.
- “dot11TVHTControlFieldOptionImplemented” replaces both “dot11VHTControlFieldOptionImplemented” and “dot11HTControlFieldSupported”.
- “dot11TVHTShortGIOptionIn4WActivated” replaces “dot11VHTShortGIOptionIn80Activated”.
- “dot11TVHTSUBeamformerOptionImplemented” replaces “dot11VHTSUBeamformerOptionImplemented”.

- “dot11TVHTSUBeamformeeOptionImplemented” replaces “dot11VHTSUBeamformeeOptionImplemented”.
- “dot11TVHTMUBeamformerOptionImplemented” replaces “dot11VHTMUBeamformerOptionImplemented”.
- “dot11TVHTMUBeamformeeOptionImplemented” replaces “dot11VHTMUBeamformeeOptionImplemented”.
- “dot11TVHTTXOPPowerSaveOptionImplemented” replaces “dot11VHTTXOPPowerSaveOptionImplemented”.
- “dot11TVHTOBSSScanCount” replaces “dot11VHTOBSSScanCount”.
- “dot11TVHTExtendedNSSBWCapable” replaces “dot11VHTExtendedNSSBWCapable”.
- Reference to 9.4.1.50 replaces reference to 9.4.1.49.
- Reference to 9.4.1.52 replaces reference to 9.4.1.51.
- Reference to 9.4.2.172 replaces reference to 9.4.2.159.
- Reference to 11.43 replaces reference to 11.40.1
- Reference to Clause 22 and its subclauses replace reference to Clause 21 and its subclauses.

For Annex G, the following replacements are applied for TVHT STAs:

- “TVHT” replaces “VHT”.
- “tvht” replaces “vht”.

The main PHY features in a TVHT STA that are not present in a VHT STA are the following:

- Mandatory support for TVHT_W channel width.
- Optional support for TVHT_W+W channel width.
- Optional support for TVHT_2W channel width.
- Optional support for TVHT_4W channel width.
- Optional support for TVHT_2W+2W channel width.

These TVHT features are available to TVHT STAs associated with a TVHT AP. A subset of the TVHT features is available for use between two TVHT STAs that are members of the same IBSS.

4.3.16 STA transmission of Data frames outside the context of a BSS

In addition to defining procedures for STA communication within a BSS, this standard also defines procedures for a STA that is not a member of a BSS to transmit Data frames. Such Data frames are defined as being transmitted outside the context of a BSS (OCB). A STA transmits a Data frame outside the context of a BSS only if dot11OCBActivated is true.

NOTE—The specific frame subtypes that a STA is allowed to send when it has dot11OCBActivated true are specified in 11.21.

When dot11OCBActivated is true, a Data frame can be sent to either an individual or a group destination MAC address. This type of communication is possible only between STAs that are able to communicate directly over the wireless medium. It allows immediate communication, avoiding the latency associated with establishing a BSS. When dot11OCBActivated is true, a STA is not a member of a BSS and it does not utilize the IEEE 802.11 authentication, association, or data confidentiality services. This capability is particularly well suited for use in rapidly varying communication environments such as those involving mobile STAs in which the interval over which the communication exchanges take place is of very short duration (e.g., on the order of tens or hundreds of milliseconds). Since IEEE 802.11 MAC sublayer authentication services are not used when dot11OCBActivated is true, any required authentication services

are provided by the station management entity (SME) or by applications outside of the MAC sublayer, such as those described in the IEEE 1609 [B21] family of standards.

A STA whose MIB does not include dot11OCBActivated operates as if the attribute is false.

Communication of Data frames when dot11OCBActivated is true might take place in a frequency band that is dedicated for its use, and such a band might require licensing depending on the regulatory domain (see Annex E). A STA for which dot11OCBActivated is true initially transmits and receives on a channel known in advance, either through regulatory designation or some other out-of-band communication. A STA's SME determines PHY parameters, as well as any changes in the operating channel, e.g., using information obtained via out-of-band communication or over-the-air frame exchange. When dot11OCBActivated is true, a sending STA sets the BSSID field to the wildcard BSSID value (see 9.2.4.3.4).

The Vendor Specific frame (see 9.6.6) provides one means for STAs to exchange management information prior to communicating Data frames outside the context of a BSS.

4.3.17 Tunneled direct-link setup

Tunneled direct-link setup (TDLS) is characterized by the use of signaling frames that are encapsulated in Data frames so that the signaling frames are transmitted through an AP transparently. Therefore, unlike with DLS, the AP does not need to be direct-link aware, nor does it have to support the same set of capabilities that are used on the direct link, in order for TDLS to be used. To allow a STA to enter a TDLS power save mode, TDLS provides two power save mechanisms: TDLS peer unscheduled automatic power save delivery (U-APSD) (TPU) and TDLS peer power save mode (PSM). TDLS allows STAs to use the TDLS PeerKey (TPK) handshake to provide data confidentiality and message authentication. STAs that set up a TDLS direct link remain associated with the AP and transmit frames directly to the other TDLS peer STA.

4.3.18 Wireless network management

4.3.18.1 Overview

Wireless network management (WNM) enables STAs to exchange information for the purpose of improving the overall performance of the wireless network. STAs use WNM protocols to exchange operational data so that each STA is aware of the network conditions, allowing STAs to be more cognizant of the topology and state of the network. WNM protocols provide a means for STAs to be aware of the presence of collocated interference, and enable STAs to manage RF parameters based on network conditions.

In addition to providing information on network conditions, WNM also provides a means to exchange location information, provide support for the multiple BSSID capability on the same wireless infrastructure, support efficient delivery of group addressed frames, and enable a WNM sleep mode in which a STA can sleep for long periods of time without receiving frames from the AP.

The WNM service includes the following:

- BSS max idle period management
- BSS transition management
- Channel usage
- Collocated interference reporting
- Diagnostic reporting
- Directed multicast service (DMS)
- Event reporting
- Flexible multicast service (FMS)

- Location services
- Multicast diagnostic reporting
- Multiple BSSID capability
- Proxy Address Resolution Protocol (ARP)
- QoS traffic capability
- SSID list
- Triggered STA statistics
- TIM broadcast
- Timing measurement
- Traffic filtering service
- U-APSD coexistence
- WNM notification
- WNM sleep mode

4.3.18.2 BSS max idle period management

BSS max idle period management enables an AP to indicate a time period during which the AP does not disassociate a STA due to nonreceipt of frames from the STA. This supports improved STA power saving and AP resource management.

4.3.18.3 BSS transition management

BSS transition management enables an AP to request non-AP STAs to transition to a specific AP, or to indicate to a non-AP STA a set of preferred APs, due to network load balancing or BSS Termination.

4.3.18.4 Channel usage

Channel usage information is provided by the AP to the non-AP STA to recommend channels for BSSs that are not infrastructure BSSs or an off-channel TDLS direct link. The non-AP STAs can use the channel usage information as part of channel selection processing for a BSS that is not an infrastructure BSS or an off-channel TDLS direct link.

4.3.18.5 Collocated interference reporting

Collocated interference reporting enables the requesting STA to obtain information on interference due to collocated radios at the reporting STA. The requesting STA can use that information to schedule its transmissions to minimize the effects of the interference.

4.3.18.6 Diagnostic reporting

Diagnostic requests enable a STA to request a non-AP STA to report information that might be helpful in diagnosing and resolving problems with the WLAN network. Diagnostic reports include information on hardware, configuration, and STA capabilities.

4.3.18.7 Directed multicast service (DMS)

The DMS enables a non-AP STA to request the AP to transmit group addressed frames destined to the requesting STA as individually addressed frames.

4.3.18.8 Event reporting

Event requests enable a STA to request a non-AP STA to send particular real-time event reports. The types of events include transition, RSNA, WNM log, and peer-to-peer link events. A transition event is transmitted after a non-AP STA successfully completes a BSS transition. Transition events are used to diagnose transition performance problems. An RSNA event report describes the type of Authentication used for the RSNA. RSNA events are used to diagnose security and authentication performance problems. A WNM log event report enables a non-AP STA to transmit a set of WNM log event messages to the requesting STA. WNM log event reports are used to access the contents of a STA's WNM log. A peer-to-peer link event report enables a non-AP STA to inform the requesting STA that a peer-to-peer link has been established. peer-to-peer link event reports are used to monitor the use of peer-to-peer links in the network.

4.3.18.9 Flexible multicast service (FMS)

The flexible multicast service enables a non-AP STA to request an alternate delivery traffic indication map (DTIM) delivery interval for one or more sets of group addressed streams that the non-AP STA receives. This enables the non-AP STA to wake up at the alternate DTIM interval rather than every DTIM and enables significant power saving when a non-AP STA receives group addressed traffic. The FMS also enables a STA to establish a data rate and delivery interval for group addressed traffic higher than the minimum data rate available.

Delivery of group addressed data to power saving STAs using a DTIM beacon is described in 11.2.3.4.

4.3.18.10 Location services

Location Configuration Request and Response frames enable STAs to configure a collection of location related parameters for Location Track Notification frames. The AP can indicate that it can provide location data to support applications such as emergency services. Location services also provide the ability for STAs to exchange location information using Radio Measurement Request and Radio Measurement Report frames. The protocol supports exchange-by-value and exchange-by-reference mechanisms. The location value can be exchanged in geospatial (LCI) and civic formats. The location reference is a URL that defines from where the location value is retrieved.

4.3.18.11 Multicast Diagnostic report

Multicast Diagnostic reports enable a non-AP STA to report statistics for multicast traffic it received from a transmitting STA. This can be used by an AP to measure quality of multicast reception by a non-AP STA.

4.3.18.12 Multiple BSSID capability

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single Beacon or Probe Response frame instead of multiple Beacon and Probe Response frames, each corresponding to a single BSSID. The Multiple BSSID capability also enables the indication of buffered frames for multiple BSSIDs using a single TIM element in a single beacon.

4.3.18.13 Proxy ARP

The Proxy ARP capability enables an AP to indicate that the non-AP STA does not receive ARP frames. The Proxy ARP capability enables the non-AP STA to remain in power save for longer periods of time.

4.3.18.14 QoS traffic capability

QoS traffic capability procedures enable the QoS STA to indicate that it is capable of transmitting traffic belonging to the corresponding user priority (UP) from applications that require generation of such traffic.

The QoS Traffic Capability might be used for example as an input to estimate the blocking probability of a voice application based on the number of voice capable non-AP STAs.

4.3.18.15 SSID list

The SSID List element enables the non-AP STA to request information on a list of SSIDs. This is intended to reduce the number of Probe Request frames sent by the non-AP STA.

4.3.18.16 Triggered STA statistics

The Triggered STA Statistics reporting capability enables generation of a STA statistics report (see 4.3.11.9) when the statistics of interest reach a predefined threshold.

4.3.18.17 TIM broadcast

The TIM broadcast protocol defines a mechanism to enable a STA to receive an indication of buffered individually addressed traffic, independent of the Beacon frame, reducing the wake time of the STA.

4.3.18.18 Timing measurement

Timing Measurement frames allow a recipient STA to accurately measure the offset of its clock relative to a clock in the sending STA. With the regular transfer of Timing Measurement frames from one STA to another, it is possible for the recipient STA to track changes in the offset of its clock with respect to the sending STA over time and thus detect and compensate for any drift between the clocks.

4.3.18.19 Fine timing measurement

Fine timing measurement allows a STA to accurately measure the round trip time (RTT) between it and another STA. With the regular transfer of Fine Timing Measurement frames it is possible for the recipient STA to track changes in its relative location with other STAs in the environment.

4.3.18.20 Traffic filtering service

The traffic filtering service enables an AP to determine if MSDUs and Management frames destined for a STA match a specific set of traffic filters that are enabled at the AP per the request of the STA. Individually addressed frames that do not match any of the traffic filters in the set are discarded. Individually addressed frames that do match at least one of the set of the enabled traffic filters are delivered to the STA. The STA can also negotiate to have a notification frame sent prior to the delivery of the frame matching the traffic filter.

4.3.18.21 U-APSD coexistence

The U-APSD coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use of U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received successfully.

4.3.18.22 WNM notification

WNM notification provides a mechanism for a STA to notify another STA of a management event. One event is defined: firmware update notification.

4.3.18.23 WNM sleep mode

WNM sleep mode is an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM Beacon frame, and need not perform GTK/IGTK updates. WNM sleep mode enables a non-AP STA to signal to an AP that it might sleep for a specified length of time. This enables a non-AP STA to reduce power consumption and remain associated while the non-AP STA has no traffic to send to or receive from the AP.

4.3.19 Subscription service provider network (SSPN) interface

An AP can interact with external networks using a SSPN interface for the purpose of authenticating users and provisioning services, as shown in Figure 4-8. The exchange of authentication and provisioning information between the SSPN and the AP passes transparently through the portal. The protocol used to exchange this information is outside the scope of this standard. The logical SSPN interface provides the means for an AP to consult an SSPN for authenticating and authorizing a specific non-AP STA and to report statistics and status information to the SSPN. Authentication and provisioning information for non-AP STAs received from the SSPN are stored in the AP management information base (MIB) and are used to limit layer-2 services provided to that non-AP STA. Detailed interactions describing the SSPN interface are provided in 11.25.5.

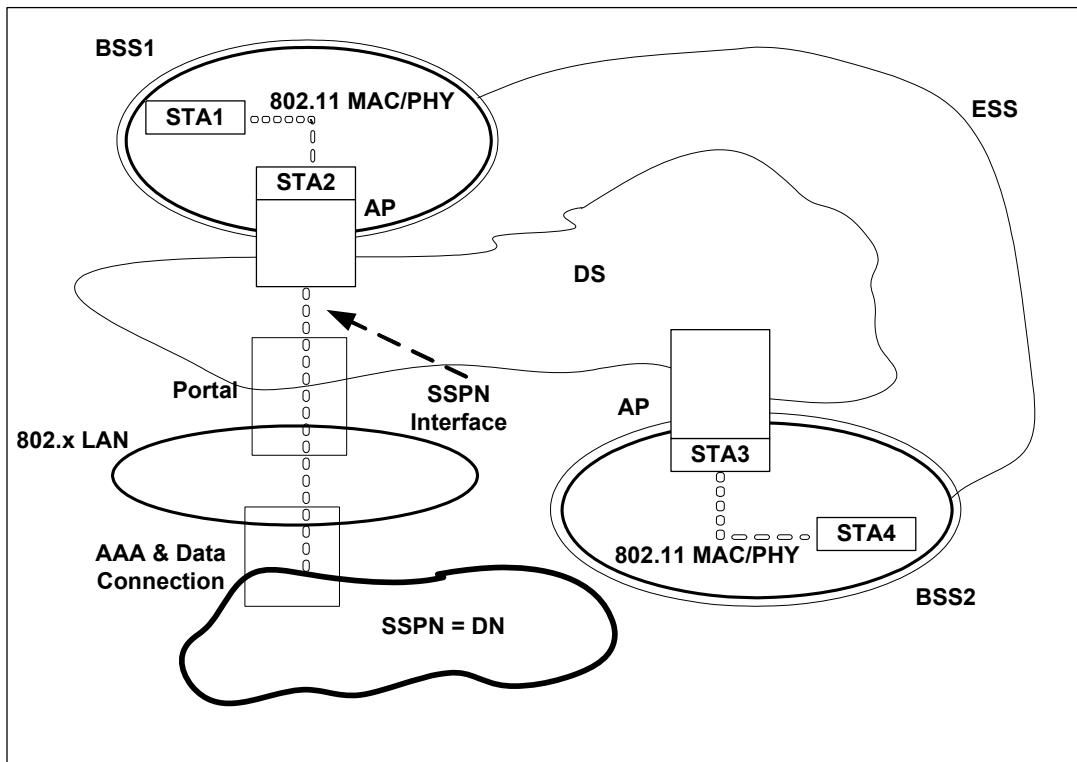

Figure 4-8—SSPN interface service architecture

The SSPN interface provides the non-AP STA access to the services provisioned in the SSPN via the currently associated BSS. Services might include virtual local area network (VLAN) mapping and tunnel establishment that are transparent to the non-AP STA and outside the scope of this standard. The SSPN interface also allows the non-AP STA to access services in destination networks (DNs) other than the SSPN. An example of a DN other than SSPN is the provision of Internet access via the IEEE 802 LAN, or an intermediary network that connects the IEEE 802.11 infrastructure and the SSPN.

NOTE—The SSPN Interface Service is not supported in an IBSS.

4.3.20 Mesh BSS

4.3.20.1 General

The IEEE 802.11 mesh facility provides MAC enhancements to support wireless LAN mesh topologies. The mesh facilities are available to mesh STAs that belong to a mesh BSS (MBSS). Only the mesh discovery service is available to a mesh STA that has not become a member of an MBSS. The enhancements that distinguish mesh STAs from nonmesh STAs are collectively termed the “mesh facility.” The mesh-specific mechanisms vary among implementations.

4.3.20.2 Overview of the mesh BSS

A mesh BSS is an IEEE 802.11 LAN consisting of autonomous STAs. Inside the mesh BSS, all STAs establish wireless links with neighbor STAs to mutually exchange MSDUs. Further, using the multi-hop capability, MSDUs and Management frames can be transferred between STAs that are not in direct communication with each other over a single instance of the wireless medium. From the data delivery point of view, it appears as if all STAs in a mesh BSS are directly connected at the MAC layer even if the STAs are not within range of each other. The multi-hop capability enhances the range of the STAs and benefits wireless LAN deployments.

STAs in a mesh BSS might be sources, sinks, or propagators of traffic; some mesh STAs might propagate traffic for other STAs, but do not act as a source or sink of traffic. As described in 4.3.20.4, a mesh BSS might have interfaces to external networks and can be a DSM for infrastructure BSSs.

Within a mesh BSS, STAs utilize the mesh coordination function (MCF) to access the channel. MCF is based on the core QoS facility described in 4.3.10, and a mesh BSS is categorized as one type of QoS BSS. MCF is specified in 10.23.

4.3.20.3 Mesh STA

A STA that belongs to a mesh BSS is termed a “mesh station” (mesh STA). Mesh STAs are QoS STAs that support mesh services, i.e., they participate in formation and operation of a mesh basic service set (MBSS). A mesh STA implements a subset of the QoS functionality:

- Use of QoS frame format
- EDCA (as a part of MCF)
- Block acknowledgment (optional)
- No acknowledgment (optional)
- Use of TSPEC, TCLAS, and TCLAS Processing elements to establish DMS or GCR agreements (optional)

A mesh BSS does not incorporate the full hybrid coordinator (HC) and BSS QoS functionality. MBSSs do not incorporate the following:

- HCCA
- Traffic stream (TS) management
- Admission control
- Automatic power save delivery (APSD)
- Direct-link setup (DLS)
- Tunneled direct-link setup (TDLS)

4.3.20.4 IEEE 802.11 components and mesh BSS

Example mesh and infrastructure BSSs are illustrated in Figure 4-9. Only mesh STAs participate in mesh functionalities such as formation of the mesh BSS, path selection, and forwarding. Accordingly, a mesh STA is not a member of an IBSS or an infrastructure BSS. Consequently, mesh STAs do not communicate with nonmesh STAs.

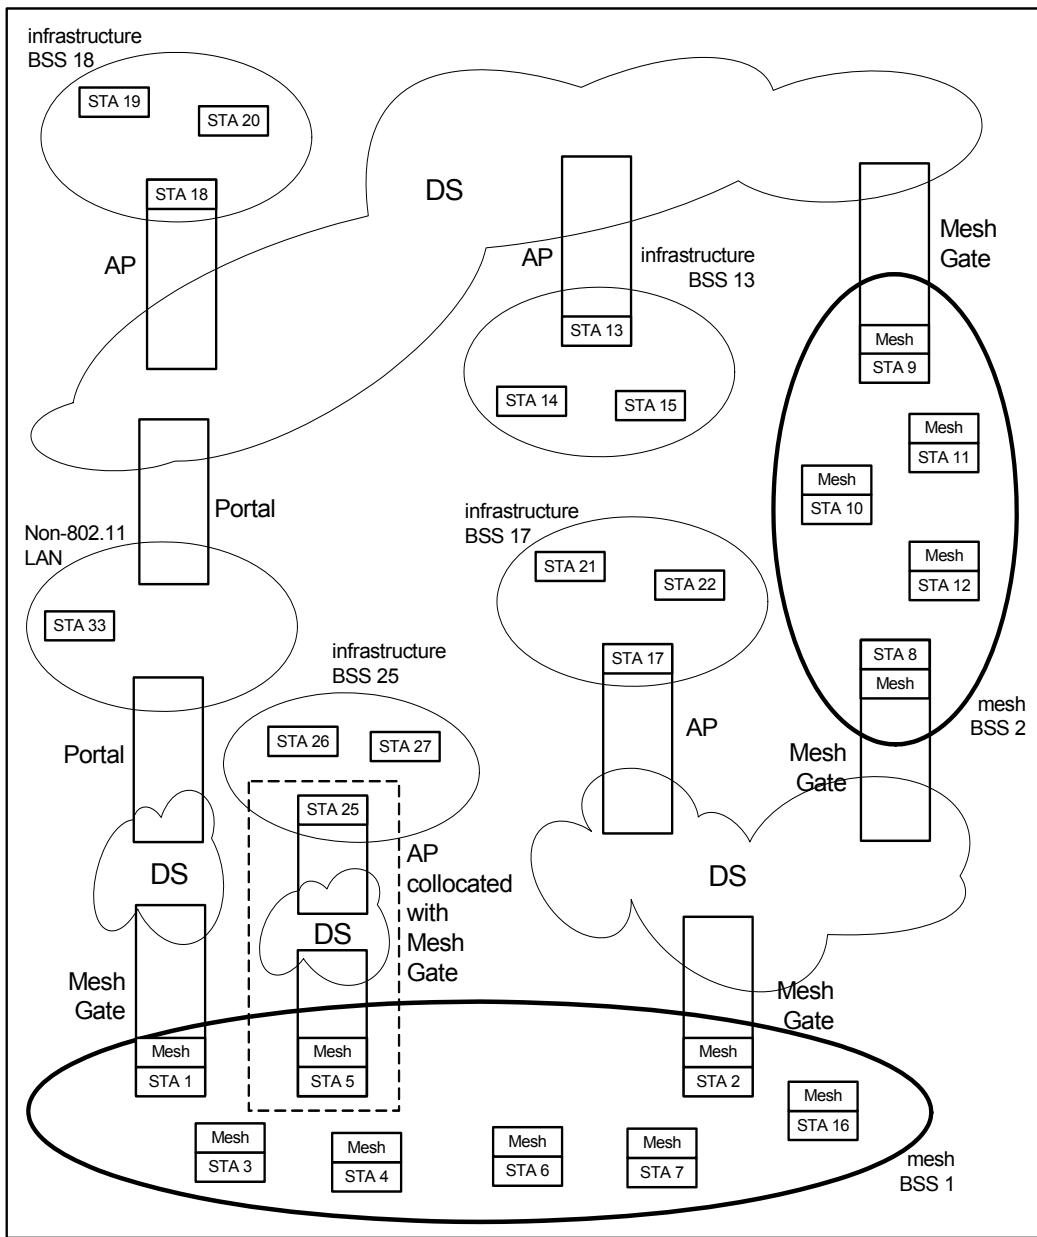

Figure 4-9—Example MBSS containing mesh STAs, mesh gates, APs, and portals

However, instead of existing independently, an MBSS might also access the distribution system (DS). The MBSS interconnects with other BSSs through the DS. Then, mesh STAs can communicate with nonmesh STAs. Therefore, a logical architectural component is introduced in order to integrate the MBSS with the DS—the mesh gate. Data move between an MBSS and the DS via one or more mesh gates. Thus, the mesh gate is the logical point at which MSDUs from an MBSS enter the IEEE 802.11 DS, via the DSAF. Once an

MBSS contains a mesh gate that connects it to the IEEE 802.11 DS, the MBSS can be integrated with other infrastructure BSSs too, given that their APs connect to the same DS. Several mesh gates are shown in Figure 4-9 connecting different MBSSs to the DS.

When an MBSS accesses the IEEE 802.11 DS through its mesh gate, the MBSS can be integrated with a non-IEEE-802.11 LAN. To integrate the IEEE 802.11 DS to which this MBSS connects, the DS needs to contain a portal. See 4.3.7. Consequently, mesh gate and portal are different entities. The portal integrates the IEEE 802.11 architecture with a non-IEEE-802.11 LAN (e.g., a traditional wired LAN), whereas the mesh gate integrates the MBSS with the IEEE 802.11 DS.

It is possible for one device to offer any combination of the functions of an AP, a portal, and a mesh gate; see 14.11.5. An example device combining the functions of an AP and a mesh gate is shown in Figure 4-10. The implementation of such collocated entities is beyond the scope of this standard. The configuration of a mesh gate that is collocated with an access point allows the utilization of the mesh BSS as a distribution system medium. In this case, two different entities (mesh STA and access point) exist in the collocated device and the mesh BSS is hidden to STAs that associate to the access point. The mesh STA collocation is outlined in 14.11.5, which states that the usage of a distinct MAC address for each collocated STA avoids ambiguities.

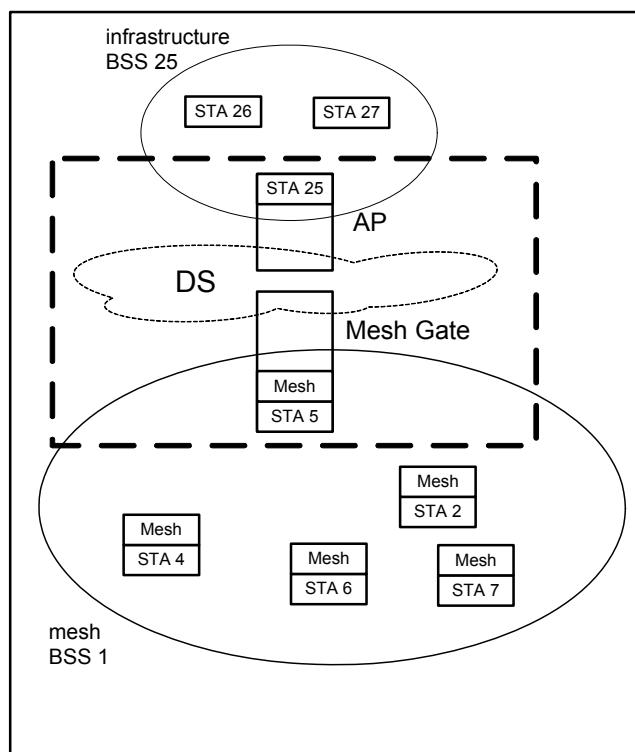

Figure 4-10—Example device consisting of mesh STA and AP STA to connect an MBSS and an infrastructure BSS

4.3.20.5 Introduction to mesh functions

4.3.20.5.1 General

A mesh BSS is formed and operated by the set of services called *mesh services*. Mesh services are provided by the following major mesh facilities:

- Mesh discovery
- Mesh peering management

- Mesh security
- Mesh beaconing and synchronization
- Mesh coordination function
- Mesh power management
- Mesh channel switching
- Three address, four address, and extended address frame formats
- Mesh path selection and forwarding
- Interworking with external networks
- Intra-mesh congestion control
- Emergency service support in mesh BSS

4.3.20.5.2 Mesh discovery

A mesh STA performs either active scanning or passive scanning to discover an operating mesh BSS. Each mesh STA transmits Beacon frames periodically and responds with Probe Response frames when a Probe Request frame is received, so that neighbor mesh STAs can perform mesh discovery appropriately. The identification of the mesh BSS is given by the Mesh ID element contained in the Beacon and the Probe Response frames. The details for the mesh discovery facility are described in 14.2.

4.3.20.5.3 Mesh peering management (MPM)

Within a mesh BSS, direct communication between neighbor mesh STAs is allowed only when they are peer mesh STAs. After mesh discovery, two neighbor mesh STAs agree to establish a mesh peering to each other, and, after successfully establishing the mesh peering, they become peer mesh STAs. A mesh STA can establish a mesh peering with multiple neighbor mesh STAs. The mesh peering management (MPM) facilitates the mesh peering establishment and closure of the mesh peerings. The details of MPM are described in 14.3.

4.3.20.5.4 Mesh security

In an MBSS, mesh link security protocols are used to authenticate a pair of mesh STAs and to establish session keys between them. Mesh authentication protocols establish a shared, common pairwise master key (PMK), and authenticate a peer mesh STA. The authenticated mesh peering exchange protocol relies on the existence of the PMK between the two mesh STAs to establish an authenticated peering and derive session keys. The details of mesh security are described in 12.4, 14.3.3, 14.5, and 14.6.

4.3.20.5.5 Mesh beaconing and synchronization

In order to assist mesh discovery, mesh power management, and synchronization in a mesh BSS, all mesh STAs periodically transmit Beacon frames. Synchronization in a mesh BSS is maintained by the MBSS's active synchronization method. The default synchronization method is the neighbor offset synchronization method. Mesh beacon collision avoidance (MBCA) mitigates collisions of Beacon frames among hidden nodes. The details of mesh beaconing and synchronization are described in 14.13.

4.3.20.5.6 Mesh coordination function (MCF)

A mesh STA uses the mesh coordination function (MCF) for channel access. MCF consists of EDCA (contention based channel access defined in 10.23.2) and MCCA (controlled channel access defined in 10.23.3). MCCA is a reservation based channel access method and aims to optimize the efficiency of frame exchanges in a mesh BSS.

4.3.20.5.7 Mesh power management

A mesh STA can manage the activity level of its links per mesh peering. A mesh STA sets the activity level of each of its mesh peerings to either active mode, light sleep mode, or deep sleep mode. The mesh STA performs mesh power management mode tracking for each of its neighbor peer mesh STAs, and delivers the frames based on the rules defined in 14.14.

4.3.20.5.8 Mesh channel switching

When a mesh STA switches the operating channel, it uses the channel switching protocol defined in 11.9.8 and 11.10. The channel switching protocol enables the propagation of channel switch notifications throughout the mesh BSS, prior to the channel switch execution.

4.3.20.5.9 Frame addressing in an MBSS

Three address, four address, and extended address frame formats enable the distribution of MSDUs over multiple instances of the wireless medium within a mesh BSS and integration to the ESS. Frame format details are described in Clause 9 and 9.3.5.

4.3.20.5.10 Mesh path selection and forwarding

Mesh path selection enables path discovery over multiple instances of the wireless medium within a mesh BSS. The overview of the mesh path selection framework is described in 14.8. The hybrid wireless mesh protocol (HWMP) is defined as the default path selection protocol for the mesh BSS. HWMP provides both proactive path selection and reactive path selection. The details of HWMP are described in 14.10. The path selection protocol uses link metrics in the assessment of a mesh path to the destination. The airtime link metric is the default link metric. It is defined in 14.9.

Once the mesh path of a particular pair of the source mesh STA and the destination mesh STA is found through the mesh path selection function, mesh STAs propagate the data by the forwarding function. The details of the forwarding function are described in 10.35.

As a result of the mesh path selection and forwarding, MSDUs are transmitted among all of the mesh STAs in a mesh BSS, even if the mesh STAs are not neighbor STAs of each other. Figure 4-11 depicts the MSDU transfer within a mesh BSS.

4.3.20.5.11 Interworking with the DS

A mesh BSS might contain one or more mesh gates that connect to one or more distribution systems. A mesh gate can announce its presence in the mesh BSS by sending Gate Announcement frames. Alternatively a mesh gate can announce its presence in the mesh BSS by sending HWMP Path Selection frames with the RANN element or the PREQ element indicating mesh gate announcement, when it is configured as a root mesh STA. Typically a mesh gate announces its presence when it is collocated with a portal or it has access to a portal. Gate announcements allow mesh STAs to select the appropriate mesh gate and build a path toward it. Note that, when multiple mesh gates that have access to the same DS are present in the mesh BSS, proper configuration is necessary.

When a mesh gate has access to IEEE 802 STAs outside the mesh BSS, the mesh gate acts as a proxy for the IEEE 802 STAs outside the MBSS. Such a mesh gate is called a *proxy mesh gate*. The details of the proxy functionality are described in 14.11.3.

The details of the mesh BSS interworking are described in 14.11.

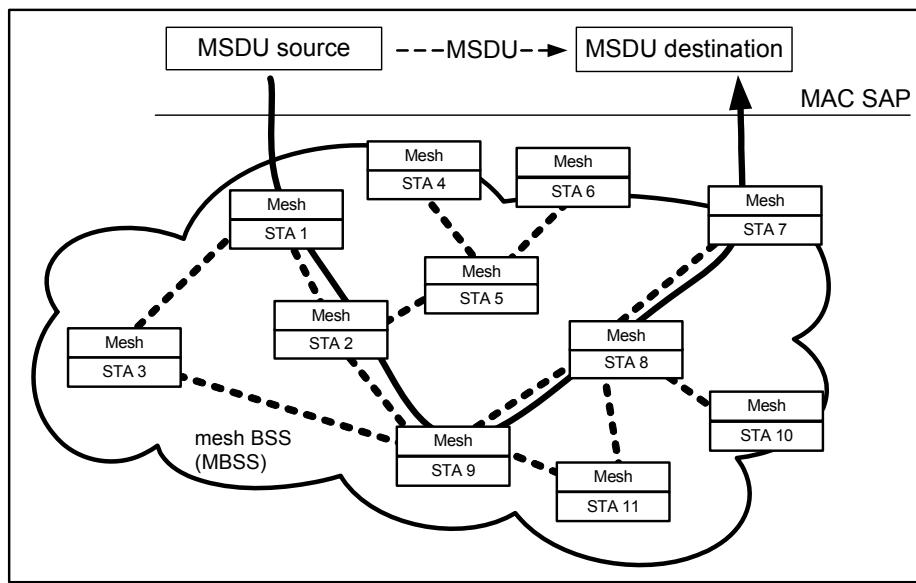

Figure 4-11—MAC data transport over an MBSS

4.3.20.5.12 Intra-mesh congestion control

Intra-mesh congestion control is used to provide flow control over the multi-hop communication. Intra-mesh congestion control is useful to mitigate wasteful wireless medium utilization caused by buffer overflow at mesh STAs. Intra-mesh congestion control consists of three main mechanisms: local congestion monitoring and congestion detection, congestion control signaling, and local rate control. The details of the intra-mesh congestion control are described in 14.12.

4.3.20.5.13 Emergency service support in mesh BSS

Depending on regulations, emergency services support might be mandated over the mesh network. In this case the Beacon and Probe Response frames inform whether a mesh STA supports emergency services, advertising to other mesh STAs that mesh peering for emergency services is possible. If a mesh STA subsequently requires emergency services, an emergency indication is then set within the Mesh Peering Open frame. Mesh STAs that support emergency services, accept peering from other mesh STAs requiring emergency services, transferring frames to an emergency server (such as a PSAP).

4.3.21 DMG STA

The IEEE 802.11 DMG STA provides PHY and MAC features that can support a throughput of 1 Gb/s and greater, as measured at the MAC data service access point (SAP). A DMG STA supports DMG features as identified in Clause 10, Clause 11, and Clause 20. A DMG STA operates in a DMG BSS and supports transmission and reception of frames that are compliant with PHY specifications as defined in Clause 20. A DMG STA is also a QoS STA. The basic channel access of a DMG STA (see 10.36) allows it to operate in an Infrastructure BSS, in an IBSS, and in a PBSS. Certain DMG features such as service period allocation are available only to DMG STAs that are associated with an AP or with a PCP, while other DMG features such as EDCA operation in a PBSS do not require association. A DMG STA supports beamforming (BF) as described in 10.38 and 20.10 and GCM encryption as described in 12.5.5.

A DMG STA supports the PHY signaling as described in 20.4, 20.5, 20.6, and 20.7. At a minimum, a DMG STA supports the mandatory modulation and coding scheme (MCS) and PHY protocol data unit (PPDU) formats described in 20.4 and 20.6. A DMG STA has PHY features that include a low-density parity check

(LDPC) encoding, a preamble making use of Golay sequences, and beamforming. The PPDUs are always transmitted with the same channel spacing as described in Annex E.

A DMG STA supports MAC features that provide channel access in an environment in which transmissions use a directional antenna pattern. A DMG STA has MAC features that include frame aggregation, block ack features, service periods, contention based access periods, DMG protected period, AP or PCP clustering, dynamic channel time management, reverse direction, spatial sharing, beamforming, and operation (fast session transfer) in a multi-band device. A DMG STA is not a mesh STA. A DMG STA does not use any of the following: HCCA, power save multi-poll (PSMP), DLS, TDLS, HT-delayed block ack, GCR.

4.3.22 DMG relay

The IEEE 802.11 DMG relay function allows a source relay endpoint DMG STA (REDS) to transmit frames to a destination REDS with the assistance of another DMG STA, the relay DMG STA (RDS), as shown in Figure 4-12. Relaying can improve the reliability of communication in a DMG BSS in the case the direct link between the source REDS and the destination REDS has poor quality or is disrupted. Following the DMG relay setup procedures, a source REDS can discover and select an appropriate RDS to act as the relay for a particular destination REDS, prior to Data frame transmission using the relay. A relay operating as a link switching type of relay uses the RDS to forward frames between the source and destination REDS if the direct link between the REDS is disrupted. In a link cooperation of relay operation, the RDS simultaneously repeats the transmission of frames between the source and destination REDS, which can possibly increase the signal quality received at the destination REDS.

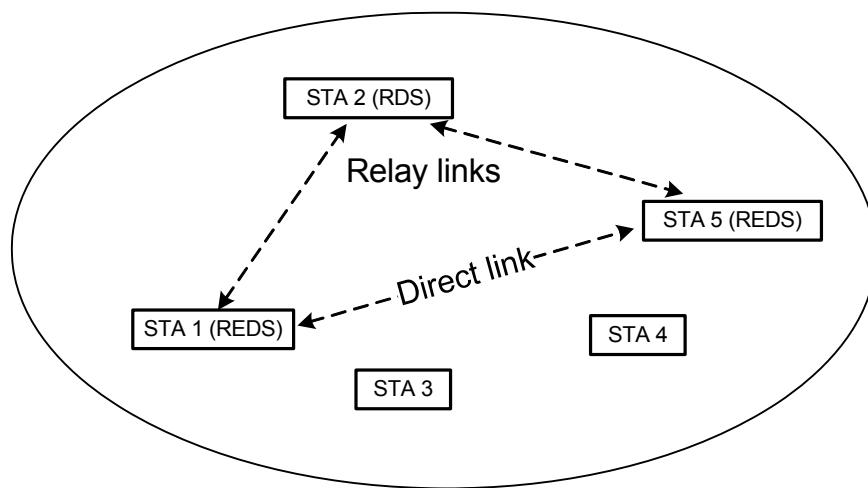

Figure 4-12—DMG relay in a DMG BSS

4.3.23 Robust audio video (AV) streaming

Robust AV streaming improves AV streaming performance when using IEEE Std 802.11 for consumer and enterprise applications.

4.3.23.1 Groupcast with retries (GCR)

The GCR service allows a STA to request greater reliability for one or more group addressed streams that the STA receives. Greater reliability is provided via unsolicited retries or the block ack mechanism. A non-AP STA can request delivery so that the AP transmits the frames via EDCA within GCR service periods when all associated non-AP STAs are in active mode or the awake state of the PS mode.

4.3.23.2 Stream classification service (SCS)

SCS enables the establishment of a classification using layer 2 and/or layer 3 signaling to match incoming unicast MSDUs. Once classified, unicast MSDUs matching the classification are assigned to an access category and are tagged with their drop eligibility. When intra-access category prioritization is enabled (see 4.3.23.5), SCS allows MSDUs matching the classification to be assigned to the primary or alternate transmit queues so that finer grained prioritization can be applied.

4.3.23.3 Overlapping BSS (OBSS) management

The objective of OBSS management is to facilitate cooperative sharing of the medium between APs that operate in the same channel and that are able to receive or obtain frames from each other, including Beacon frames. These frames might be received directly or via associated STAs that support the Beacon request capability (see 11.11.10).

OBSS management provides the means to

- Provide additional information for channel selection
- Extend the admission control mechanism to a distributed environment
- Enable the coordination of scheduled TXOPs between OBSSs

OBSS management enables stationary and portable APs to provide to neighboring APs information for the selection of a channel and for the cooperative sharing of that channel. The main component of OBSS management is the QLoad report that provides information on

- The reporting AP's overlap situation
- The reporting AP's QoS traffic load
- The total QoS traffic load of BSSs directly overlapping the reporting AP's BSS

This information might be used to aid an AP when searching for a channel and also when sharing a channel in an overlap situation.

To coordinate the TXOPs of overlapping HCCA APs, OBSS management provides a means for an AP to advertise its TXOP allocations so another AP might schedule its own TXOPs to avoid those already scheduled.

4.3.23.4 Interworking with IEEE 802.1Q™ Stream Reservation Protocol (SRP)

Support for SRP from IEEE Std 802.1Q enables integration of the TSPEC ADDTS request/response protocol with IEEE 802.1Q SRP to enable end-to-end SRP reservations when one or more IEEE 802.11 links are part of a path from IEEE 802.1Q Talker to IEEE 802.1Q Listener.

4.3.23.5 Intra-access category prioritization

Intra-access category prioritization provides six transmit queues that map to four enhanced distributed channel access functions (EDCAFs) to enable differentiation between traffic streams that are in the same access category in order for finer grained prioritization to be applied between individual AV streams or voice streams.

4.3.24 Operation under geolocation database (GDB) control

Regulators designate television broadcast bands for the deployment of dynamic sharing technologies. Different schemes result in different times that elapse from the moment an authorized database is told to change access to a particular slice of spectrum and the time that sharing radios are required to change their operations.

One current system design allows the GDBs to utilize a fully populated map of all protected services, and the databases have precalculated maps that are effective on timescales of one to two days.

Another system design allows the protected services to negotiate with controllers of unlicensed devices so that both can share available broadcast channels and facilitate response times of less than an hour where necessary and even within minutes if desired.

Another system design has the GDB fully control all white space devices by requiring them to tell the database their intended location and emissions footprint and receive permission before any broadcast band transmission starts. Any change of intended frequencies or powers is told to the database, and permission is received before the change takes place.

The architectural role of components depends on the security and timeliness requirements in particular regulatory domains. Figure 4-13 shows two infrastructure BSSs in which APs are geolocation database dependent (GDD) enabling STAs and the other STAs are GDD dependent STAs.

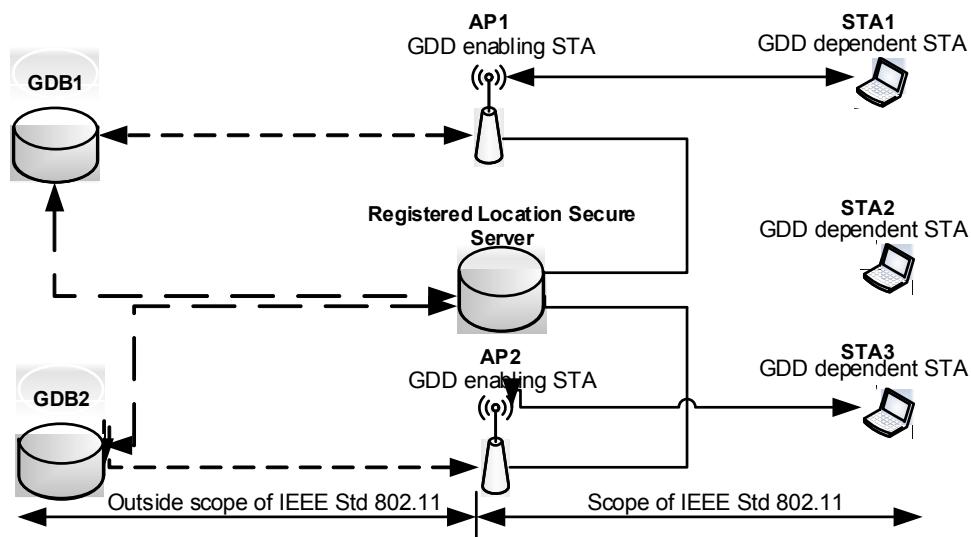

Figure 4-13—Multiple APs and multiple GDBs

In most regulatory domains, GDD enabling STAs are required to

- Securely communicate with GDBs
- Maintain the white space maps (WSMs) and other information received from GDBs
- Create and transmit a contact verification signal to inform GDD dependent STAs that the map they received is still valid

A registered location query protocol (RLQP) is provided to share the WSMs and current channel use among GDD enabling STAs in a neighborhood. GDD dependent STAs can query both their GDD enabling STA and the registered location secure server (RLSS) about WSMs and channel utilization. In some regulatory domains, a RLSS can provide GDBs with the current channel use information for all of the BSSs and IBSSs that communicate with it. In some regulatory domains, the RLSS communicates with controllers of other white space systems to coordinate emissions footprints of their services. By accessing and using this information, the STAs can make intelligent decisions about the most effective way to utilize the available spectrum, power, and bandwidth for their communications.

The specific mechanisms are as follows:

- Channel availability query, used to obtain one or more WSMs of available channels for an area or a geolocation
- Channel schedule management, used to obtain start and ending times for each available white space channel
- Contact verification signal, used by a GDD dependent STA to verify it is still receiving frames from its GDD enabling STA
- GDD enablement, the procedure where a GDD enabling STA forms a network and maintains the network under the control of a GDB
- Network channel control, used to inform a local channel controller that has a view of nearby transmitters and their emissions footprints
- WSM, used to retrieve the available white space channels and their transmit power restrictions

The use of the mechanisms in a particular regulatory domain depends on the specific regulatory requirements. Table 4-1 gives a view of the use of specific mechanisms to meet regulatory requirements in terms of daily, hourly, and minute timescales. Implementers are referred to the regulatory sources in Table D.1 for further information. Operation in countries within defined regional regulatory domains might be subject to additional or alternative national regulations.

Table 4-1—GDD mechanisms and timescales

| Mechanism | Daily consultation required | Hourly consultation required | Minute responsiveness |
|-----------------------------|--|--|--|
| Channel availability query | Informative | Informative | Not applicable |
| Channel schedule management | Informative | Informative | Not applicable |
| Contact verification signal | Required to be secure | Might be secure | Loss of consecutive signals requires action |
| GDD enablement | Required | Required | Required |
| Network channel control | Informative | Informative | Not applicable |
| WSM | Required for GDD enabling STA, might be translated for GDD dependent STA | Required for GDD enabling STA, might be translated for GDD dependent STA | Required for GDD enabling STA, might be translated for GDD dependent STA |

These mechanisms allow a BSS to manage and query its radio environment and a GDB to control the radio environment for all wireless services.

4.4 Logical service interfaces

4.4.1 General

IEEE Std 802.11 explicitly does not specify the details of implementations. Instead, IEEE Std 802.11 specifies services to aid understanding how the architectural components are logically organized. The services are associated with different components of the architecture. There are three categories of IEEE 802.11 service—the station service (SS), the PCP service (PCPS), and the distribution system service (DSS). These categories of service are used by the IEEE 802.11 MAC sublayer.

The complete set of IEEE 802.11 architectural services are as follows:

- a) Authentication
- b) Association
- c) Deauthentication
- d) Disassociation
- e) Distribution
- f) Integration
- g) Data confidentiality
- h) Reassociation
- i) MSDU delivery
- j) DFS
- k) TPC
- l) Higher layer timer synchronization (QoS facility only)
- m) QoS traffic scheduling (QoS facility only)
- n) Radio measurement
- o) DSE

This set of services is divided into three groups: the SS, the PCPS, and the DSS. The SS is part of every STA. The PCPS is provided by the PCP of a PBSS. The DSS is provided by the DS.

4.4.2 SS

The service provided by STAs is known as the SS.

The SS is present in every IEEE 802.11 STA (including APs, as APs include STA functionality). The SS is specified for use by MAC sublayer entities. All STAs provide the SS.

The SS is as follows:

- a) Authentication (not used when dot11OCBActivated is true)
- b) Deauthentication (not used when dot11OCBActivated is true)
- c) Data confidentiality (not used when dot11OCBActivated is true)
- d) MSDU delivery
- e) DFS
- f) TPC
- g) Higher layer timer synchronization (QoS facility only)
- h) QoS traffic scheduling (QoS facility only)

- i) Radio measurement
- j) DSE

4.4.3 PBSS control point service (PCPS)

The service provided by the PCP of a PBSS is known as the PCPS. Since each STA within a PBSS can operate as a PCP, each STA in the PBSS is capable of providing the PCPS, if it becomes the PCP of the PBSS. Non-PCP STAs do not provide the PCPS.

The services that comprise the PCPSs are the following:

- a) Association
- b) Disassociation
- c) Reassociation
- d) QoS traffic scheduling

The PCPS is specified for use by MAC sublayer entities.

4.4.4 DSS

The service provided by the DS is known as the DSS. IEEE Std 802.11 explicitly does not specify the details of DS implementation structure. Instead, IEEE Std 802.11 specifies the services that are provided by a DS implementation. A DS can be created from many different technologies including current IEEE 802 wired LANs. IEEE Std 802.11 does not constrain the DS to be either data link or network layer based. Nor does IEEE Std 802.11 constrain a DS to be either centralized or distributed in nature.

This service is represented in the IEEE 802.11 architecture by arrows within APs and mesh gates, indicating that the service is used to cross media and possibly address space logical boundaries. An AP and a mesh gate are logical entities, and the functions described might be shared by one or more physical entities.

The services that comprise the DSS are as follows:

- a) Association (not mesh facility)
- b) Disassociation (not mesh facility)
- c) Distribution
- d) Integration
- e) Reassociation (not mesh facility)
- f) QoS traffic scheduling (QoS facility only)
- g) DSE
- h) Interworking with the DS (mesh facility only)

DSSs are specified for use by MAC sublayer entities.

Figure 4-14 combines the components from previous figures with the three types of services to show the IEEE 802.11 architecture for infrastructure BSS and PBSS.

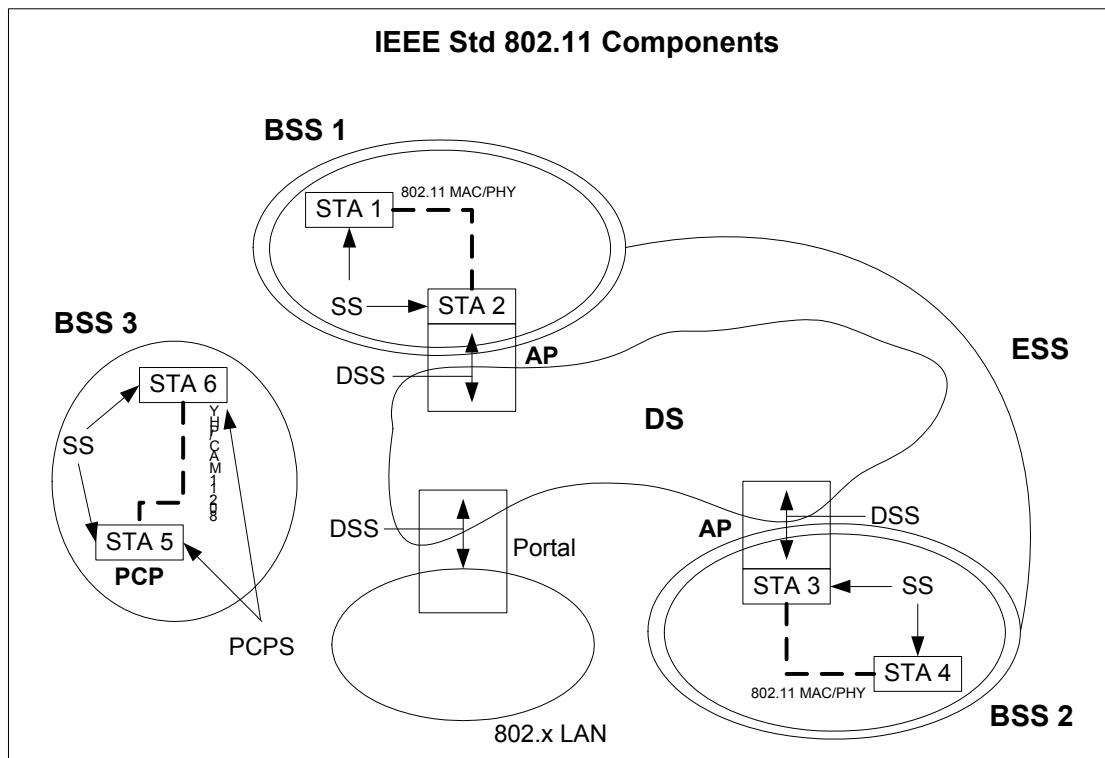

Figure 4-14—IEEE 802.11 architecture for infrastructure BSS and PBSS

4.5 Overview of the services

4.5.1 General

There are many services specified by IEEE Std 802.11. Six of the services are used to support medium access control (MAC) service data unit (MSDU) delivery between STAs. Three of the services are used to control IEEE 802.11 LAN access and confidentiality. Two of the services are used to provide spectrum management. One of the services provides support for LAN applications with QoS requirements. Another of the services provides support for higher layer timer synchronization. One of the services is used for radio measurement.

This subclause presents the services, an overview of how each service is used, and a description of how each service relates to other services and the IEEE 802.11 architecture. The services are presented in an order designed to help build an understanding of the operation of an IEEE 802.11 network. As a result, the services that comprise the SS and DSS are intermixed in order (rather than being grouped by category). The services that comprise the PCPS are a subset of the services provided by the SS and DSS.

Each of the services is supported by one or more MAC frame types. Some of the services are supported by MAC management PDUs, which are transported in MAC Management frames. The MSDU delivery service is supported by MAC Data frames. All of these frames gain access to the WM via the IEEE 802.11 MAC sublayer medium access method specified in Clause 10.

The IEEE 802.11 MAC sublayer uses four types of frame—*Data*, *Management*, *Extension*, and *Control* (see Clause 9). Data frames are handled by the MAC data plane (see Figure 5-1).

MAC Management frames and MAC Extension frames (see 9.3.4) are handled via the MAC management plane.

MAC Control frames are used to support the delivery of IEEE 802.11 Data, Management, and Extension frames.

The examples here assume an ESS environment. The differences among the ESS, the PBSS, and the IBSS environments are discussed separately in 4.7.

4.5.2 Distribution of MSDUs within a DS

4.5.2.1 Distribution

This is the primary service used by IEEE 802.11 STAs. It is conceptually invoked by every data message to or from an IEEE 802.11 STA operating in an ESS (when the frame is sent via the DS). Distribution is via the DSS.

Refer to the ESS in Figure 4-15 and consider an MSDU being sent from STA 1 to STA 4. One or more frames containing the MSDU are sent from STA 1 and received by STA 2 (the “input” AP). The AP gives a MAC service tuple containing the MSDU to the DSS. It is the job of the distribution service to deliver the MAC service tuple within the DS in such a way that it arrives at the appropriate DS destination for the intended recipient. In this example, the MAC service tuple is distributed to STA 3 (the “output” AP) and STA 3 accesses the WM to send one or more frames containing the MSDU to STA 4 (the intended destination).

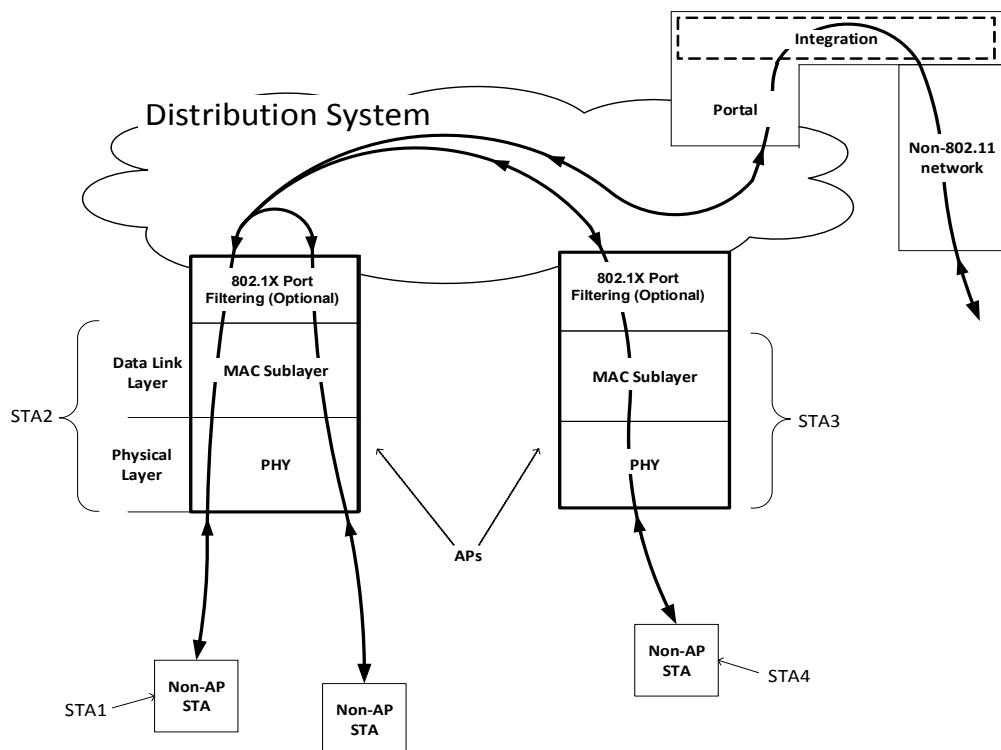

Figure 4-15—IEEE 802.11 Infrastructure model

The previous example was a case in which the AP that invoked the distribution service was different from the AP that received the distributed MAC service tuple. If the MSDU had been intended for a STA that was a member of the same BSS as the sending STA, then the “input” and “output” APs for the MAC service tuple would have been the same.

If a MAC service tuple with a group addressed destination is provided to the DS, the DS is responsible for delivering that MAC service tuple to all appropriate APs in the ESS, including the “input” AP, to allow the AP to send frame(s) containing the MSDU to other associated non-AP STAs in its BSS. Generally, the DS will deliver the MAC service tuple to all the APs in the ESS. Optionally, an implementation-specific or higher layer filtering may be applied to restrict the delivery to a known subset of the APs in the ESS; such filtering is beyond the scope of this standard.

How the MAC service tuple is distributed within the DS is not specified by IEEE Std 802.11. All IEEE Std 802.11 is required to do is to provide the DS with enough information for the DS to be able to determine the “output” point that corresponds to the intended recipient. The necessary information is provided to the DS by the three association related services (association, reassociation, and disassociation).

In all the examples above, the distribution service was logically invoked. Whether the MAC service tuple actually had to traverse the physical DSM or not is a DS implementation matter and is not specified by this standard.

While IEEE Std 802.11 does not specify DS implementations, it does recognize and support the use of the WM as one possible DSM. This is specifically supported by the IEEE 802.11 frame formats. (Refer to Clause 9 for details.) A mesh BSS might form an entire DS or a part of a DS using the WM, as shown in Figure 4-9. Mesh services are used to form a mesh BSS and distribute MSDUs. Clause 14 defines how mesh BSSs are formed and how MSDUs are distributed through a mesh BSS.

4.5.2.2 Integration

When the distribution service determines that the intended recipient of an MSDU is a member of an integrated LAN, the “output” point of the DS is a portal instead of an AP.

MAC service tuples that are distributed to a portal cause the DS to invoke the Integration function (conceptually after the distribution service). The Integration function is responsible for accomplishing whatever is needed to deliver a MAC service tuple from the DSM to the integrated LAN media (including any required media or address space translations). Integration is one of the services in the DSS.

MSDUs received from an integrated LAN (via a portal) by the DS for an IEEE 802.11 STA invoke the Integration function before the MAC service tuple is distributed by the distribution service.

The details of an Integration function are dependent on a specific DS implementation and are outside the scope of this standard.

4.5.2.3 QoS traffic scheduling

QoS traffic scheduling provides intra-BSS QoS frame transfers under the HCF, using either contention based or controlled channel access. At each TXOP, a traffic scheduling entity at the STA selects a frame for transmission, from the set of frames at the heads of a plurality of traffic queues, based on requested UP and/or parameter values in the traffic specification (TSPEC) for the requested MSDU. Additional information is available in 10.22.

4.5.3 Services that support the distribution service and the PCP service

4.5.3.1 General

The primary purpose of a MAC sublayer is to transfer MSDUs between MAC sublayer entities. The information required for the distribution service to operate is provided by the association services. Before an MSDU can be handled by the distribution service, a STA is “associated.”

To understand the concept of association, it is necessary first to understand the concept of mobility.

4.5.3.2 Mobility types

The three transition types of significance to this standard that describe the mobility of STAs within a network are as follows:

- a) **No-transition:** In this type, two subclasses that are usually indistinguishable are identified:
 - 1) Static—no motion.
 - 2) Local movement—movement within the PHY range of the communicating STAs, i.e., movement within a basic service area (BSA).
- b) **BSS-transition:** This type is defined as a STA movement from one BSS in one ESS to another BSS within the same ESS. A fast BSS transition is a BSS transition that establishes the state necessary for data connectivity before the reassociation rather than after the reassociation.
- c) **ESS-transition:** This type is defined as STA movement from a BSS in one ESS to a BSS in a different ESS. This case is supported only in the sense that the STA might move. Maintenance of upper-layer connections cannot be guaranteed by IEEE Std 802.11; in fact, disruption of service is likely to occur.

The FT protocol provides a mechanism for a STA to perform a BSS transition between access points (APs) in a robust security network (RSN) or when quality-of-service (QoS) admission control is enabled in the ESS.

The different association services support the different categories of mobility.

4.5.3.3 Association

To deliver an MSDU within a DS, the distribution service needs to know which AP to access for the given IEEE 802.11 STA. This information is provided to the DS by the concept of association. Association is necessary, but not sufficient, to support BSS-transition mobility. Association is sufficient to support no-transition mobility. Association is one of the services in the DSS.

Before a STA is allowed to send an MSDU via an AP, it first becomes associated with the AP. The act of becoming associated invokes the association service, which provides the STA to AP mapping to the DS. How the information provided by the association service is stored and managed within the DS is not specified by this standard.

Within a robust security network (RSN), association is handled differently. In an RSNA, the IEEE 802.1X Port determines when to allow data traffic across an IEEE 802.11 link. A single IEEE 802.1X Port maps to one association, and each association maps to an IEEE 802.1X Port. An IEEE 802.1X Port consists of an IEEE 802.1X Controlled Port and an IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. Once the AKM completes successfully, data protection is enabled to prevent unauthorized access, and the IEEE 802.1X Controlled Port unblocks to allow protected data traffic. IEEE 802.1X Suplicants and Authenticators exchange protocol information via

the IEEE 802.1X Uncontrolled Port. It is expected that most other protocol exchanges use the IEEE 802.1X Controlled Ports. However, a given protocol might need to bypass the authorization function and make use of the IEEE 802.1X Uncontrolled Port.

NOTE—See IEEE Std 802.1X-2010 for a discussion of Controlled Port and Uncontrolled Port.

At any given instant, a STA is associated with no more than one AP. This allows the DS to determine a unique answer to the question, “Which AP is serving STA X?” Once an association is completed, a STA can make full use of a DS (via the AP) to communicate. Association is always initiated by the non-AP STA, not the AP.

An AP might be associated with many STAs at the same time.

A STA learns what APs are present and what operational capabilities are available from each of those APs and then invokes the association service to establish an association. For details of how a STA learns about what APs are present, see 11.1.4.

4.5.3.4 Reassociation

Association is sufficient for no-transition MSDU delivery between IEEE 802.11 STAs. Additional functionality is needed to support BSS-transition mobility. The additional required functionality is provided by the reassociation service. Reassociation is one of the services in the DSS.

The reassociation service is invoked to “move” a current association from one AP to another. This keeps the DS informed of the current mapping between AP and STA as the STA moves from BSS to BSS within an ESS. Reassociation also enables changing association attributes of an established association while the STA remains associated with the same AP. Reassociation is always initiated by the non-AP STA.

Only the fast BSS transition facility can move an RSNA during reassociation. Therefore, if FT is not used, the old RSNA is deleted and a new RSNA is constructed.

4.5.3.5 Disassociation

The disassociation service is invoked when an existing association is to be terminated. Disassociation is one of the services in the DSS.

In an ESS, this tells the DS to void existing association information. Attempts to send MSDUs via the DS to a disassociated STA will be unsuccessful.

The disassociation service can be invoked by either party in an association (non-AP STA or AP). Disassociation is a notification, not a request. Disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

An AP can disassociate STAs to enable the AP to be removed from a network for service or for other reasons.

STAs attempt to disassociate when they leave a network. However, the MAC protocol does not depend on STAs invoking the disassociation service. (MAC management is designed to accommodate loss of communication with an associated STA.)

4.5.4 Access control and data confidentiality services

4.5.4.1 General

Two services are required for IEEE Std 802.11 to provide functionality equivalent to that which is inherent to wired LANs. The design of wired LANs assumes the physical attributes of wire. In particular, wired LAN design assumes the physically closed and controlled nature of wired media. The physically open medium nature of an IEEE 802.11 LAN violates those assumptions.

In a WLAN that does not support RSNA, two services, authentication and data confidentiality, are defined. IEEE 802.11 authentication is used instead of the wired media physical connection. WEP encryption was defined to provide the data confidentiality aspects of closed wired media.

An RSNA uses the IEEE 802.1X authentication service along with enhanced data cryptographic encapsulation mechanisms, such as TKIP, CCMP, and GCMP, to provide access control. The IEEE 802.11 station management entity (SME) provides key management via an exchange of EAPOL-Key frames. Data confidentiality and data integrity are provided by RSN key management together with the enhanced data cryptographic encapsulation mechanisms.

4.5.4.2 Authentication

IEEE 802.11 authentication operates at the link level between IEEE 802.11 STAs. IEEE Std 802.11 does not provide either end-to-end (MSDU origin to MSDU destination) or user-to-user authentication.

IEEE Std 802.11 attempts to control LAN access via the authentication service. IEEE 802.11 authentication is an SS. This service might be used by all STAs to establish their identity to STAs with which they communicate, in both ESSs and IBSSs. If a mutually acceptable level of authentication has not been established between two STAs, an association is not established.

IEEE Std 802.11 defines four IEEE 802.11 authentication methods: Open System authentication, Shared Key authentication, FT authentication, and simultaneous authentication of equals (SAE). Open System authentication admits any STA to the DS. Shared Key authentication relies on WEP to demonstrate knowledge of a WEP encryption key. FT authentication relies on keys derived during the initial mobility domain association to authenticate the stations as defined in Clause 13. SAE authentication uses finite field cryptography to prove knowledge of a shared password. The IEEE 802.11 authentication mechanism also allows definition of new authentication methods.

An RSNA might support SAE authentication. An RSNA also supports authentication based on IEEE Std 802.1X-2010, or preshared keys (PSKs) after Open System authentication. IEEE 802.1X authentication utilizes the EAP to authenticate STAs and the AS with one another. This standard does not specify an EAP method that is mandatory to implement. See 12.6.5 for a description of the IEEE 802.1X authentication and PSK usage within an IEEE 802.11 IBSS.

In an RSNA, IEEE 802.1X Suplicants and Authenticators exchange protocol information via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port.

SAE authentication or Open System IEEE 802.11 authentication is used by non-DMG STAs in an RSN for infrastructure BSS. SAE authentication, Open System IEEE 802.11 authentication, or no IEEE 802.11 authentication is used in an RSN for IBSS. SAE authentication is used in an MBSS. An RSNA disallows the use of Shared Key IEEE 802.11 authentication. In an RSN for DMG BSS, Open System IEEE 802.11 authentication is not used (12.2.4).

A STA might be authenticated with many other STAs at the same time.

Because the IEEE 802.1X authentication process could be time-consuming (depending on the authentication protocol in use), the authentication service can be invoked independently of the association service.

This type of preauthentication is typically done by a STA while it is already associated with an AP (with which it previously authenticated). IEEE Std 802.11 does not require that STAs preauthenticate with APs. However, authentication is required before an association establishment is complete.

If the authentication is left until reassociation time, this might impact the speed with which a STA reassociates between APs, limiting BSS-transition mobility performance. The use of preauthentication takes the authentication service overhead out of the time-critical reassociation process.

SAE authentication is performed prior to association and a STA can take advantage of the fact that it can be IEEE 802.11 authenticated to many APs simultaneously by completing the SAE protocol with any number of APs while still being associated to another AP. RSNA security can be established after association using the resulting shared key.

4.5.4.3 Deauthentication

The deauthentication service is invoked when an existing Open System, Shared Key, or SAE authentication is to be terminated. Deauthentication is an SS.

In an ESS, because authentication is a prerequisite for association, the act of deauthentication causes the STA to be disassociated. The deauthentication service can be invoked by either authenticated party (non-AP STA or AP). Deauthentication is not a request; it is a notification. The association at the transmitting STA is terminated when the STA sends a deauthentication notice to an associated STA. Deauthentication, and if associated, disassociation cannot be refused by the receiving STA except when management frame protection is negotiated and the message integrity check fails.

In an RSN ESS, Open System IEEE 802.11 authentication is required. In an RSN ESS, deauthentication results in termination of any association for the deauthenticated STA. It also results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the pairwise transient key security association (PTKSA). The deauthentication notification is provided to IEEE Std 802.1X-2010 via the MAC layer.

In an RSNA, deauthentication also deletes any related pairwise transient key security association (PTKSA), group temporal key security association (GTKSA), station-to-station link (STSL) master key security association (SMKSA), STSL transient key security association (STKSA), TPK security association (TPKSA), integrity group temporal key security association (IGTKSA), mesh GTKSA, and mesh TKSA that exist in the STA and closes the associated IEEE 802.1X Controlled Port. If pairwise master key security association (PMKSA) caching is not enabled, deauthentication also deletes the PMKSA or mesh PMKSA.

In an RSN IBSS, Open System authentication is optional, but a STA is required to recognize Deauthentication frames. Deauthentication results in the IEEE 802.1X Controlled Port for that STA being disabled and deletes the PTKSA.

4.5.4.4 Data confidentiality

In a wired LAN, only those STAs physically connected to the wire can send or receive LAN traffic. With a wireless shared medium, there is no physical connection, and all STAs and certain other RF devices in or near the LAN might be able to send, receive, and/or interfere with the LAN traffic. A STA receives traffic that is within range and transmits to any other STA within range. Thus, the connection of a single wireless link (without data confidentiality) to an existing wired LAN might seriously degrade the security level of the wired LAN.

To bring the security of the WLAN up to the level implicit in wired LAN design, IEEE Std 802.11 provides the ability to protect the contents of frames. This functionality is provided by the data confidentiality service. Data confidentiality is an SS.

IEEE Std 802.11 provides several cryptographic algorithms to protect data traffic, including: WEP, TKIP, CCMP, and GCMP. WEP and TKIP are based on the ARC4²⁰ algorithm, and CCMP and GCMP are based on the advanced encryption standard (AES). A means is provided for STAs to select the algorithm(s) to be used for a given association.

IEEE Std 802.11 provides the following security protocols for protection of individually addressed robust Management frames: CCMP and GCMP. This standard does not provide data confidentiality for group addressed robust Management frames, except for certain Action frames related to mesh operation, as indicated in Table 9-47.

IEEE Std 802.11 provides one security protocol, CCMP, for protection of individually addressed and group addressed Data frames between mesh STAs.

The default data confidentiality state for all IEEE 802.11 STAs is “in the clear,” i.e., without protection. If the data confidentiality service is not invoked, all frames are sent unprotected. If this policy is unacceptable to the sender, it does not send Data frames; and if the policy is unacceptable to the receiver, it discards any received Data frames. Unprotected Data frames and unprotected robust Management frames received at a STA configured for mandatory data confidentiality, as well as protected Data frames and protected robust Management frames using a key not available at the receiving STA, are discarded without an indication to LLC (or without indication to distribution services in the case of “To DS” frames received at an AP). These frames are acknowledged on the WM [if received without frame check sequence (FCS) error] to avoid wasting WM bandwidth on retries of frames that are being discarded.

4.5.4.5 Key management

The enhanced data confidentiality, data authentication, and replay protection mechanisms require fresh cryptographic keys and corresponding security associations. The procedures defined in this standard provide fresh keys by means of protocols called the *4-way handshake*, FT 4-way handshake, FT protocol, FT resource request protocol, and group key handshake.

4.5.4.6 Data origin authenticity

The data origin authenticity mechanism defines a means by which a STA that receives a Data or protected robust Management frame can determine which STA transmitted the MAC protocol data unit (MPDU). This feature is required in an RSNA to prevent one STA from masquerading as a different STA.

Data origin authenticity is applicable only to individually addressed Data frames, and individually addressed robust Management frames. The protocols do not guarantee data origin authenticity for group addressed frames, as this cannot be accomplished using symmetric keys and public key methods are too computationally expensive.

4.5.4.7 Replay detection

The replay detection mechanism defines a means by which a STA that receives a Data or protected robust Management frame from another STA can detect whether the received frame is an unauthorized

²⁰Details of the ARC4 algorithm are available from RSA Security, Inc. Contact RSA Security, 174 Middlesex Turnpike, Bedford, MA 01730 (<http://www.rsasecurity.com/>), for algorithm details and the uniform ARC4 license terms that RSA offers to anyone wishing to use ARC4 for the purpose of implementing the IEEE 802.11 WEP option. If necessary, contact the IEEE Standards Department Intellectual Property Rights Administrator for details on how to communicate with RSA.

retransmission. This replay protection mechanism is provided for Data frames for STAs that use enhanced data cryptographic encapsulation mechanisms. The replay protection mechanism is also provided for robust Management frames for STAs that use CCMP, GCMP, and broadcast/multicast integrity protocol (BIP).

4.5.4.8 Fast BSS transition

The FT mechanism defines a means for a STA to set up security and QoS parameters prior to reassociation to a new AP. This mechanism allows time-consuming operations to be removed from the time-critical reassociation process.

4.5.4.9 Robust management frame protection

Robust Management frames are a set of Management frames that can be protected by the management frame protection service.

Management frame protection protocols in an infrastructure BSS or IBSS apply to robust Management frames after RSNA PTK establishment for protection of individually addressed frames is completed and after delivery of the IGTK to protect group addressed frames. Robust management frame protection is implemented by CCMP, GCMP, BIP, and the SA Query procedure.

Management frame protection protocols in an MBSS apply to individually addressed frames after establishment of the RSNA MTK, and to group addressed frames indicated as “Group Addressed Privacy” in Table 9-47. Robust management frame protection is implemented with CCMP and GCMP.

4.5.5 Spectrum management services

4.5.5.1 General

Two services are required to satisfy requirements in some regulatory domains (see Annex D and Annex E) for operation in the 5 GHz band. These services are called *transmit power control (TPC)* and *dynamic frequency selection (DFS)*.

4.5.5.2 TPC

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to use transmitter power control, involving specification of a regulatory maximum transmit power and a mitigation requirement for each allowed channel. The TPC service is used to satisfy this regulatory requirement.

The TPC service provides for the following:

- Association of STAs with an AP based on the STAs’ power capability
- Specification of regulatory and local maximum transmit power levels for the current channel
- Selection of a transmit power for each transmission in a channel within constraints imposed by regulatory requirements
- Adaptation of transmit power based on a range of information, including path loss and link margin estimates

4.5.5.3 DFS

Regulations that apply to the 5 GHz band in certain regulatory domains require RLANs operating in the 5 GHz band to avoid co-channel operation with radar systems and to provide uniform utilization of available channels. The DFS service is used to satisfy these regulatory requirements.

The DFS service provides for the following:

- Association of STAs with an AP based on the STAs' supported channels.
- Quieting the current channel so it can be tested for the presence of radar with less interference from other STAs.
- Testing channels for radar before using a channel and while operating in a channel.
- Discontinuing operations after detecting radar in the current channel to avoid interference with radar.
- Detecting radar in the current and other channels based on regulatory requirements.
- Requesting and reporting of measurements in the current and other channels.
- Selecting and advertising a new channel to assist the migration of a BSS after radar is detected.

4.5.6 Traffic differentiation and QoS support

4.5.6.1 General

IEEE Std 802.11 uses a shared medium and provides differentiated control of access to the medium to handle data transfers with QoS requirements. The QoS facility (per MSDU traffic category and TSPEC negotiation) allows an IEEE 802.11 LAN to become part of a larger network providing end-to-end QoS delivery or to function as an independent network providing transport on a per-link basis with specified QoS commitments. The specifications regarding the integration and operability of the QoS facility with any other end-to-end QoS delivery mechanism like Resource Reservation Protocol (RSVP) are beyond the scope of this standard.

4.5.6.2 Quality-of-service management frame support

When the quality-of-service management frame (QMF) service is enabled, some Management frames might be transmitted using an access category other than the access category assigned to voice traffic (access category AC_VO, see 9.4.2.29) in order to improve the quality of service of other traffic streams. This is achievable by the use of a QMF policy. A QMF policy defines the access categories of different Management frames. Only QoS STAs are able to implement QMF policy. A non-AP QMF STA uses the default QMF policy or the QMF policy accepted from a peer QMF STA to transmit Management frames to that peer QMF STA. A QMF AP sets its own QMF policy for the transmission of QMFs to its associated STAs. A QMF STA uses access category AC_VO to transmit Management frames to STAs that do not support the QMF service.

4.5.7 Support for higher layer timer synchronization

Some applications, e.g., the transport and rendering of audio or video streams, require synchronized timers shared among different STAs. Greater accuracy (in terms of jitter bounds) or finer timer granularity than that provided by a BSS timing synchronization function (TSF) might be an additional requirement. In support of such applications, this standard defines a MAC service that enables layers above the MAC to accurately synchronize application-dependent timers shared among STAs. The service is usable by more than one application at a time.

Although the timer synchronization methods and accuracy requirements are application-dependent and are beyond the scope of this standard, they rely on an indication from each MAC that is provided essentially simultaneously, via group addressed transmissions, to the STAs. The MAC accomplishes this by indicating the occurrence of the end of the last symbol of particular Data frames; the Data frames of interest are identified by their MAC header Address 1 field when it contains a group address previously registered with the MAC. The last symbol is observed²¹ on the WM by STAs within a BSS while the delay between the observation and the delivery of the indication is known within a MAC by design (and communicated to the application by implementation dependent means). The common reference point in time provided by the end of last symbol indication is the essential building block upon which a variety of application-dependent timer synchronization methods might be based.

4.5.8 Radio measurement service

The Radio measurement service provides the following:

- The ability to request and report radio measurements in supported channels.
- The ability to perform radio measurements in supported channels.
- An interface for upper layer applications to retrieve radio measurements using MLME primitives and/or MIB access.
- Information about neighbor APs.

4.5.9 Interworking with external networks

The interworking service allows non-AP STAs to access services provided by an external network according to the subscription or other characteristics of that external network. An IEEE 802.11 non-AP STA might have a subscription relationship with an external network, e.g., with an SSPN.

An overview of the interworking functions addressed in this standard is provided below:

- Network discovery and selection
 - Discovery of suitable networks through the advertisement of access network type, roaming consortium and venue information, via Management frames
 - Selection of a suitable IEEE 802.11 infrastructure using advertisement services (e.g., access network query protocol (ANQP) or an IEEE 802.21™ Information Server) in the BSS or in an external network reachable via the BSS.
 - Selection of an SSPN or external network with its corresponding IEEE 802.11 infrastructure
- Emergency services
 - Emergency Call and Network Alert support at the link level
- QoS mapping distribution
- SSPN interface service between the AP and the SSPN

The generic advertisement service (GAS), described in 4.5.10, provides both support for a STA's network discovery and selection, and support for a conduit for communication by a non-AP STA with other information resources in a network before joining the wireless LAN.

The interworking service supports emergency services by providing methods for users to access emergency services via the IEEE 802.11 infrastructure, advertising that emergency services are supported (see 11.25.6) and identifying that a traffic stream is used for emergency services.

²¹The synchronization indication (observed time) within the BSS varies slightly due to propagation.

The interworking service provides QoS mapping for SSPNs and other external networks. Since each SSPN or other external network might have its own layer-3 end-to-end packet marking practice (e.g., differentiated services code point (DSCP) usage conventions), a means to remap the layer-3 service levels to a common over-the-air service level is necessary. The QoS Map service provides STAs a mapping of network-layer QoS packet marking to over-the-air QoS frame marking (i.e., user priority).

The SSPN Interface service supports service provisioning and transfer of user permissions from the SSPN to the AP. The method and protocol by which these permissions are transferred from the SSPN are outside the scope of this standard.

4.5.10 Generic advertisement service (GAS)

GAS provides functionality that enables STAs to discover the availability of information related to desired network services, e.g., information about services such as provided in an IBSS, local access services, available subscription service providers (SSPs) and/or SSPNs or other external networks. GAS uses a generic container to advertise network services' information over an IEEE 802.11 network. Public Action frames are used to transport this information.

While the specification of network services information is outside the scope of this standard, in an infrastructure BSS there is a need for STAs to query for information on network services provided by SSPNs or other external networks beyond an AP, before they associate with the wireless LAN. The exchange of information can also be performed after associating to the BSS.

In an IBSS/PBSS, GAS functionality enables a STA to access the availability and information related to desired services provided by other STAs in the IBSS/PBSS. Exchange of information using GAS can be performed either prior to joining an IBSS/PBSS or after joining the IBSS/PBSS.

There are a number of reasons why providing information to a STA in a preassociated state is beneficial:

- It supports more informed decision making about an IEEE 802.11 infrastructure or PBSS with which to associate. This is generally more efficient than requiring a non-AP and non-PCP STA to associate with an AP or PCP before discovering the information and then deciding whether to stay associated.
- It is possible for the non-AP and non-PCP STA to query multiple networks in parallel.
- The non-AP STA can discover information about APs that are not part of the same administrative group as the AP with which it is associated, supporting the selection of an AP belonging to a different IEEE 802.11 infrastructure that has an appropriate SSP roaming agreement in place.

4.6 Multiple logical address spaces

Just as the IEEE 802.11 architecture allows for the possibility that the WM, DSM, and an integrated non-IEEE-802.11 LAN might all be different physical media, it also allows for the possibility that each of these components might be operating within different address spaces. IEEE Std 802.11 only uses and specifies the use of the WM address space.

Each IEEE 802.11 PHY operates in a single medium—the WM. The IEEE 802.11 MAC operates in a single address space. MAC addresses are used on the WM in the IEEE 802.11 architecture. Therefore, it is unnecessary for the standard to explicitly specify that its addresses are “WM addresses.” This is assumed throughout this standard.

IEEE Std 802.11 has chosen to use the IEEE 802 48-bit address space (see 9.2.4.3.2). Thus IEEE 802.11 addresses are compatible with the address space used by the IEEE 802 LAN family.

The IEEE 802.11 choice of address space implies that for many instantiations of the IEEE 802.11 architecture, the non-IEEE-802.11 LAN MAC address space and the IEEE 802.11 MAC address space might be the same. In those situations where a DS that uses MAC level IEEE 802 addressing is appropriate, all three of the logical address spaces used within a system could be identical. While this is a common case, it is not the only combination allowed by the architecture. The IEEE 802.11 architecture allows for all three logical address spaces to be distinct.

A multiple address space example is one in which the DS implementation uses network layer addressing. In this case, the WM address space and the DS address space are different.

Note that IEEE 802.11 STAs within a single ESS share the same address space, fulfilling the transparency requirement from the definition of the DS. The DSS uses this same address space, even in the case where the DSM uses a different address space.

The ability of the architecture to handle multiple logical media and address spaces is key to the ability of IEEE Std 802.11 to be independent of the DS implementation and to interface cleanly with network layer mobility approaches. The implementation of the DS is unspecified and is beyond the scope of this standard.

4.7 Differences among ESS, PBSS, and IBSS LANs

In 4.3.2 the concept of the IBSS LAN was introduced, and in 4.3.3 the concept of the PBSS LAN was introduced. In an IBSS or PBSS, a STA communicates directly with one or more other STAs.

Consider the full IEEE 802.11 architecture as shown in Figure 4-16.

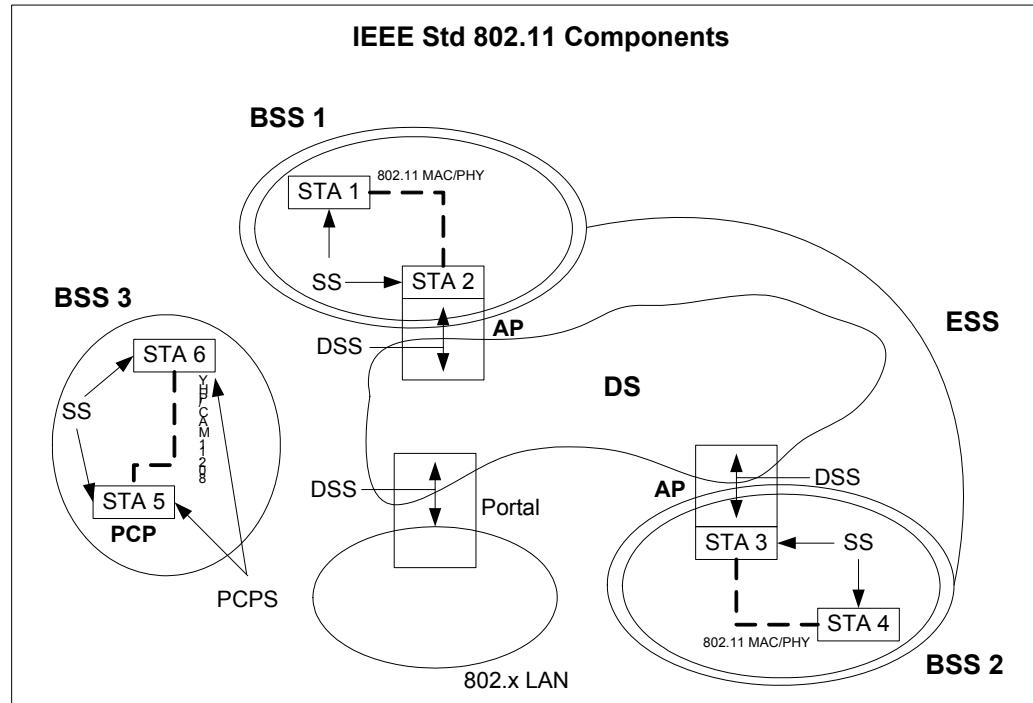

Figure 4-16—IEEE 802.11 architecture (again)

An IBSS consists of STAs that are directly connected. Thus there is (by definition) only one BSS. Further, because there is no physical DS, there is no portal, integrated non-IEEE-802.11 LAN, or DSS. The logical picture reduces to Figure 4-17.

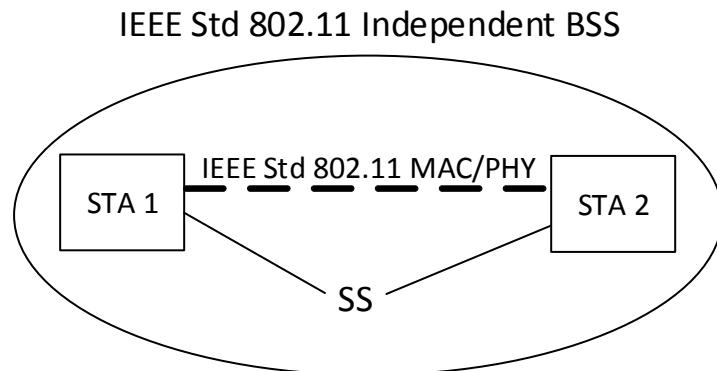

Figure 4-17—Logical architecture of an IBSS

An important difference between the IBSS and the PBSS is that, within the PBSS, Beacons are not transmitted by every STA and instead only a single STA, namely the PCP, is responsible for DMG Beacon frame transmission. Within the IBSS, all STAs are responsible for Beacon frame transmission. When compared to the infrastructure BSS, the PBSS does not provide certain DSSs as described in 4.4.3.

There can be more than one PBSS in the same BSA. One of the STAs within each PBSS assumes the role of the PCP. The logical picture of the PBSS reduces to Figure 4-18.

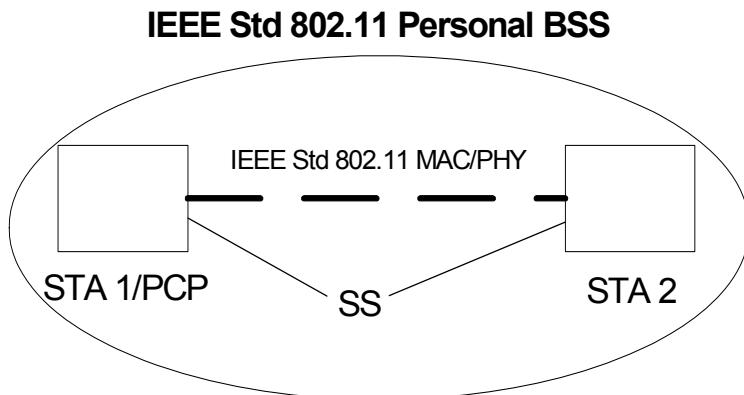

Figure 4-18—Logical architecture of a PBSS

Only the minimum two STAs are shown in Figure 4-17. An IBSS can have an arbitrary number of members. In an IBSS only Class 1 and Class 2 frames are allowed because there is no DS in an IBSS.

The services that apply to an IBSS are the SSs. A QoS IBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. The parameters that control differentiation of the delivery of MSDUs with different priority using EDCA are fixed. A QoS IBSS has no HC and does not support polled TXOP operation and setting up of TSPEC.

The services that apply to the PBSS are the SSs and the PCPSs as described in 4.4.3. A PBSS supports operation under the HCF using TXOPs gained through the EDCA mechanism. In a PBSS, the EDCA

mechanism is used only within CBAPs. The parameters that control differentiation of traffic classes using EDCA can be configured by the PCP in a PBSS. The PCP of a PBSS has no HC, but can support TSPEC setup, DMG TSPEC setup, and service periods.

In an IBSS each STA enforces its own security policy. In an infrastructure BSS or a PBSS, an AP or a PCP, respectively, can enforce a uniform security policy across all STAs.

4.8 Differences between ESS and MBSS LANs

In 4.3.20, the concept of the MBSS LAN was introduced. It was noted that using the multi-hop capability it appears as if all mesh STAs are directly connected at the MAC layer even if the STAs are not within range of each other. This is different from an IBSS, where STAs cannot communicate if they are not within range of each other.

Unlike the IBSS, an MBSS might have access to the DS. An MBSS connects through one or more mesh gates to the DS. Since in an MBSS it appears as if all mesh STAs are directly connected at the MAC layer, the MBSS can be used as a DSM. APs, a portal, and mesh gates might use the MBSS as a DSM to provide the DSS. Thus, different infrastructure BSSs can unite over the MBSS to form an ESS for example.

An AP identifies the infrastructure BSS that it forms. This is different from the MBSS where no such central entity exists. Whereas infrastructure BSSs need the ESS and thus the DS to unite, the MBSS appears the same to an LLC layer without the need for access to a DS. However, if an MBSS has one or more mesh gates providing access to the DS, the MBSS might exist in disjointed areas and yet form a single network.

4.9 Reference model

4.9.1 General

This standard presents the architectural view, emphasizing the separation of the system into two major parts: the MAC of the data link layer (DLL) and the PHY. These layers are intended to correspond closely to the lowest layers of the ISO/IEC basic reference model of Open Systems Interconnection (OSI) (ISO/IEC 7498-1:1994). The layers and sublayers described in this standard are shown in Figure 4-19.

There is an interface between the IEEE 802.1X Suplicant/Authenticator and the SME not shown in Figure 4-19. This interface is described in IEEE Std 802.1X-2010.

4.9.2 Interworking reference model

The MAC state generic convergence function (MSGCF) provides services to higher layer protocols based on MAC state machines and interactions between the layers.

Interworking functions might require correlating information from multiple management entities. It is the function of the MSGCF to correlate information for higher layer entities. The MSGCF observes the interactions between the MLME and SME, and between the PLME and SME. After correlation of lower-layer MLME and PLME events, the MSGCF might synthesize indications to higher layer entities.

Figure 4-20 shows an entity, the MSGCF, defined in 6.4, that has access to all management information through exposure to the MAC sublayer and PHY management entities, and provides management information to higher level entities, such as Mobility Managers, supporting heterogeneous medium mobility.

An example of how the MSGCF interfaces to these higher layer entities, is provided by the media-independent handover (MIH) interface, as defined in IEEE Std 802.21-2008.

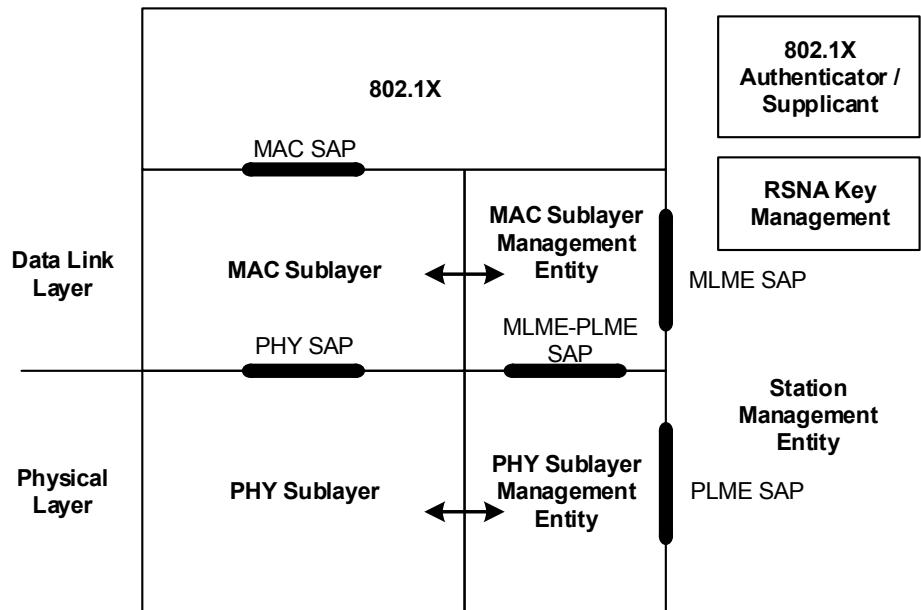

Figure 4-19—Portion of the ISO/IEC basic reference model covered in this standard

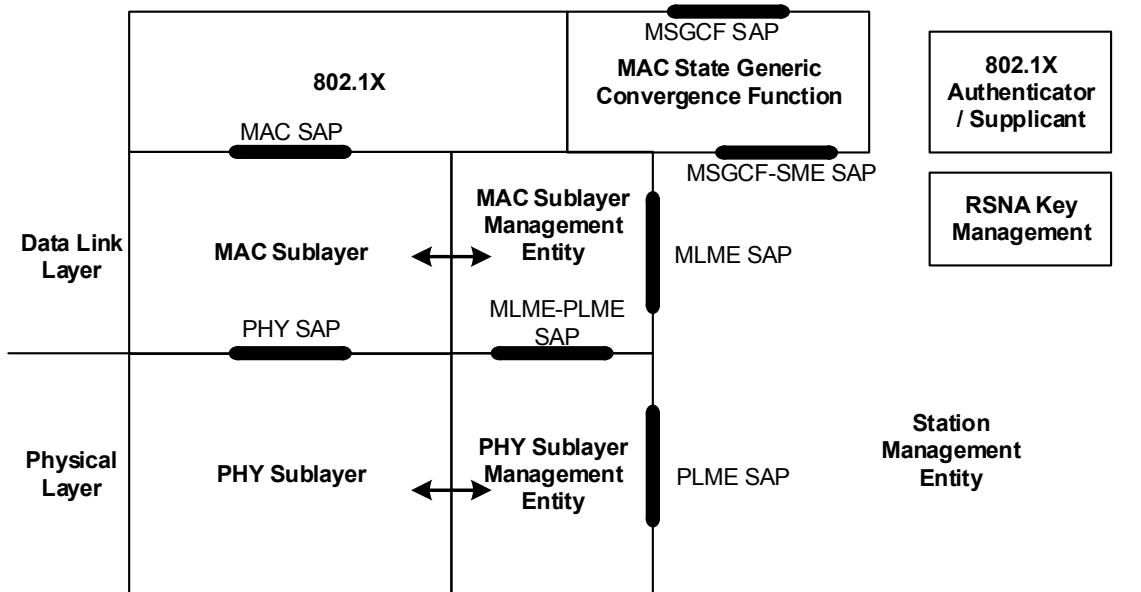

Figure 4-20—Interworking reference model

The MSGCF is designed to provide the status of the connection of a non-AP STA to a set of BSSs comprising a single ESS. Figure 4-21 illustrates the concept of an ESS Link. This reflects the state of a connection to an ESS independent of any particular access point. In Figure 4-21, STA3 is associated with either AP1 or AP2. The state of the ESS Link is up when STA3 is associated with any of the APs comprising an ESS.

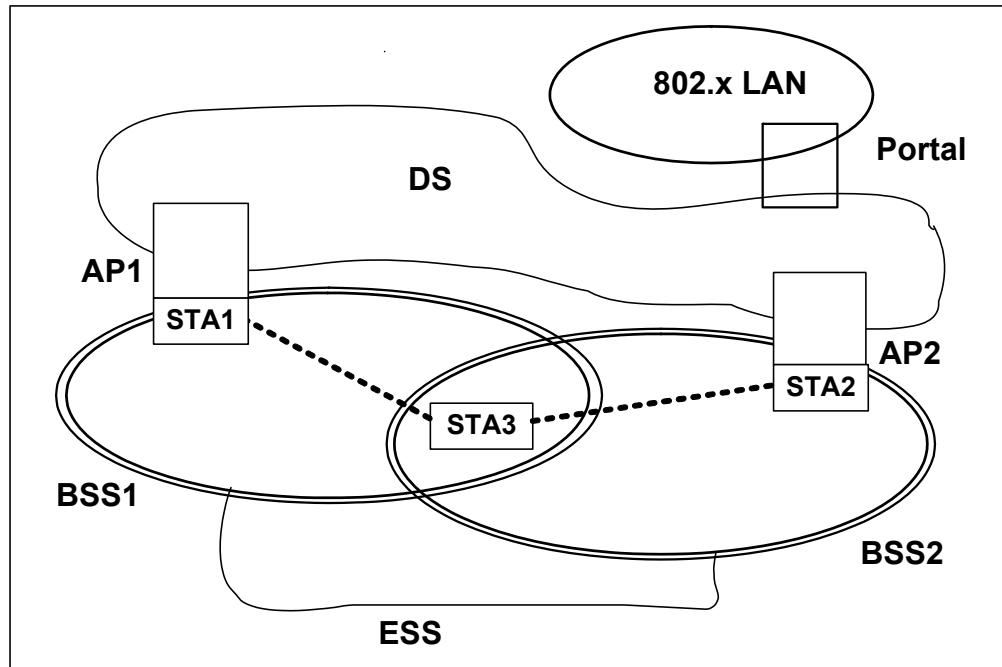

Figure 4-21—ESS link illustration

4.9.3 Reference model for supporting multiple MAC sublayers

An MM-SME function interfaces with the SMEs of the coordinating STAs. STAs managed under the MM-SME share the same antennas and PHY and optionally unify power management. The reference model for supporting multiple MAC sublayers is shown in Figure 4-22.

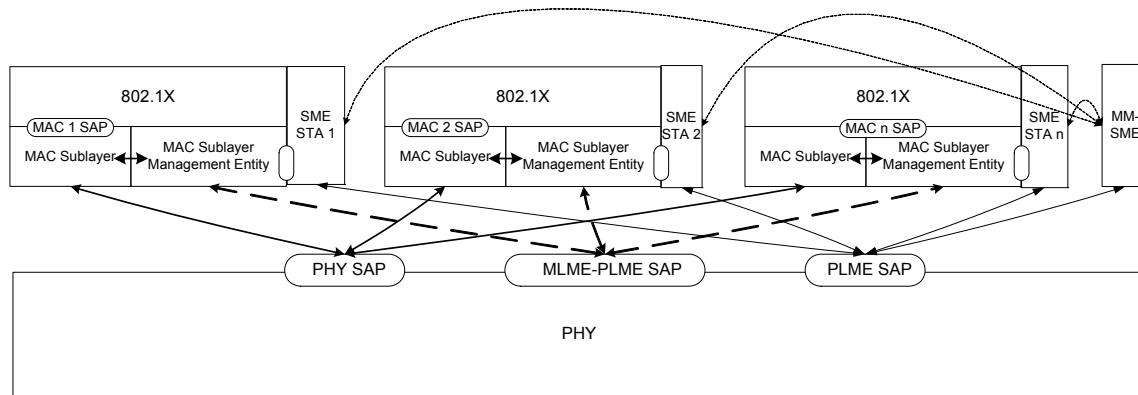

Figure 4-22—Reference model for supporting multiple MAC sublayers

An MM-SME coordinates the management of multiple MAC sublayers. Each MAC sublayer has a separate MAC SAP and MLME SAP. A MAC SAP together with its corresponding MLME SAP is identified by a MAC address.

Even when coordinated by an MM-SME, each MAC retains its single MAC address, and each STA contains a single MAC; therefore, the MM-SME coordinates multiple STAs as well as multiple MACs.

Multiple STAs coordinated by an MM-SME have a single PHY that is shared by the multiple MAC sublayers. Transmission attempts of different MAC sublayers can collide internally if the STAs share a single PHY, and a backoff procedure is invoked in this case. Since multiple STAs coordinated by the same MM-SME share the PHY, the STAs cannot directly exchange frames with each other.

NOTE—The multiple MAC reference model shown in Figure 4-22 defines how multiple STAs can share the same physical layer entity. If this model is used in conjunction with the reference model for multi-band operation (see 4.9.4), the multiple MAC reference model applies within each physical layer entity contained in the multi-band device whereas the multi-band operation reference model applies to different physical layers.

The MM-SME accesses each of the MLME SAPs of the coordinated STAs separately to deliver MLME SAP primitives. STAs that are coordinated by the same MM-SME can establish a multiple MAC sublayers link (MMSL) with a peer STA. The set of all MMSLs between a pair of STAs creates an MMSL cluster.

An MM-SME controls the power management mode, DMG antenna configuration, and other parameters and states of the coordinated STAs to eliminate unnecessary duplication of functions. A change in the power management mode of the STAs coordinated by an MM-SME is signaled to a peer STA via any one of the STAs' MAC sublayer. Also, a beamforming link established between STAs can be used by all of the MAC sublayers of any of the STAs coordinated by the same MM-SME. For these purposes, a Multiple MAC Sublayers (MMS) element is used.

The MMS element contains multiple MAC addresses of the MACs coordinated by the same MM-SME. The element can be included in any frame that advertises the MM-SME capabilities, such as Probe Request and Probe Response frames and Information Request and Information Response frames, and the frames that establish communication agreements, such as Association, ADDTS Request, ADDTS Response, BlockAckReq and BlockAck.

4.9.4 Reference model for multi-band operation

The reference model of a device that is multi-band capable (see 11.33) and that supports transparent fast session transfer (FST) is shown in Figure 4-23. The reference model of a device that is multi-band capable and that supports nontransparent FST is shown in Figure 4-24.

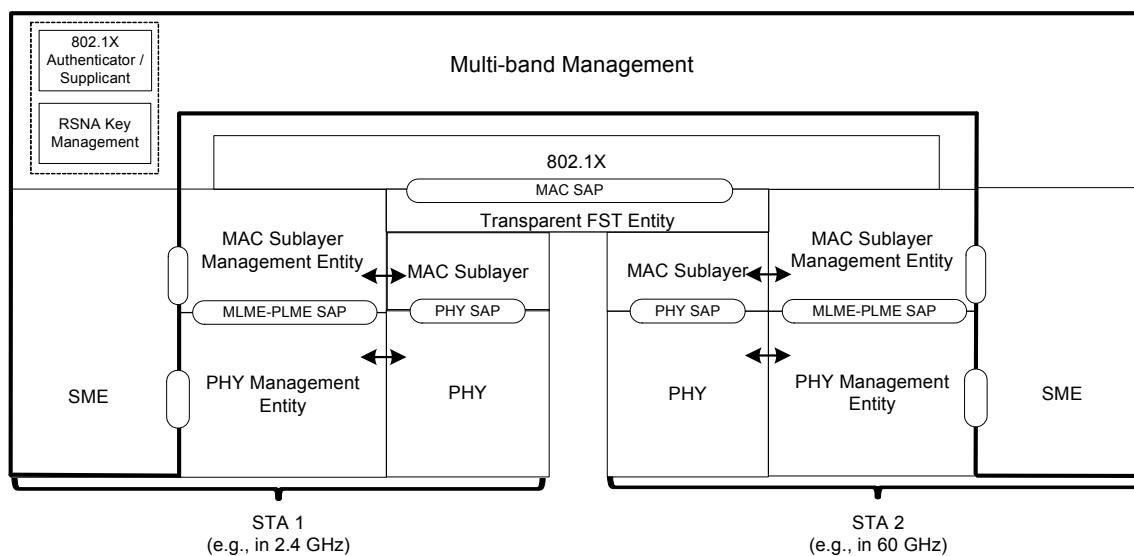

Figure 4-23—Reference model for a multi-band capable device (transparent FST)

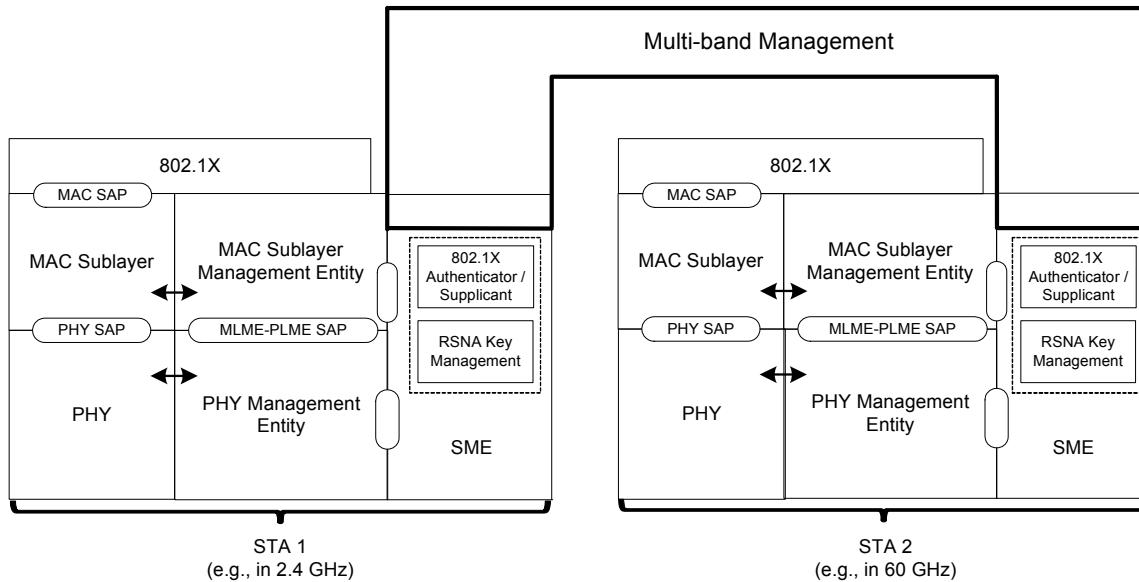

Figure 4-24—Reference model for a multi-band capable device (nontransparent FST)

A multi-band capable device can manage operation over more than one frequency band/channel. The operation across the different frequency bands/channels can be simultaneous or nonsimultaneous.

A multi-band capable device can also support multiple MAC sublayers; in this case, it is coordinated by an MM-SME.

NOTE—For simplicity, Figure 4-23 and Figure 4-24 depict the reference model when there is a one-to-one mapping between PHYs and MACs. However, the reference model for a multi-band capable device can be applied in conjunction with the reference model for STAs that support multiple MAC sublayers (see 4.9.3).

An FST session is the state resulting from the operation of the FST session setup protocol.

The SME of a multi-band capable device contains a multi-band management entity that is responsible for coordinating the setup, configuration, teardown, and transfer of FST sessions from a band/channel to another band/channel supported by the multi-band capable device. If using nontransparent FST, the multi-band management entity can employ a combination of the source and destination MAC addresses in both the old and new band/channel to configure the routing of MSDUs and MLME primitives within the STA. If using transparent FST, in addition to the MAC addresses, the multi-band management entity can employ the TID of an FST session for this routing.

The multi-band procedures (see 11.33) allow a pair of multi-band capable devices to discover, synchronize, (de)authenticate, (re)associate, disassociate, and manage resources with each other on any common band/channel that is supported by both STAs.

When used in the context of FST, the term “session” refers to non-PHY state information that is kept in a pair of STAs that communicate directly (i.e., excludes forwarding) and that is available prior to and following a session transfer. This state information is different depending if transparent or nontransparent is used. For transparent FST, a shared multi-band management entity has access to the local information within each SME; and in this case the state information includes block ack agreements, TSs, association state, RSNA, security keys, sequence counter, and PN counter. For nontransparent FST, the function of the multi-band management entity is restricted to coordinating the setup and teardown of a session transfer with no access to other local information within each SME. Therefore, with nontransparent FST, any information local to an SME needs to be reestablished for the new band/channel, and this can be done either prior to or following the session transfer (see 11.33).

By using the on-channel tunneling (OCT) multi-band procedure described in 11.33.4, the SME of a multi-band capable device can instruct one of its MLMEs to use the OCT services provided by another MLME of the same multi-band capable device to communicate with a peer MLME of a peer multi-band capable device. This enables the SMEs of a pair of multi-band capable devices to provide a seamless FST, including performing (de)authentication and (re)association across bands/channels. The MLMEs that use the OCT services provided by another MLME within the same multi-band capable device to communicate are referred to as being *over-the-WM disabled* with respect to each other. Following an FST, two peer over-the-WM disabled MLMEs can become over-the-WM enabled with respect to each other.

As described in 5.1.5, a MAC address is not unique within the multi-band capable device when transparent FST is intended to be used. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST. Therefore, when nontransparent FST is used, higher layers are responsible for managing the session transition between different frequency bands/channels.

Each MAC SAP is controlled by a separate and independent RSNA key management entity and IEEE 802.1X Authenticator/Supplicant, unless if transparent FST is used in which case the multi-band management entity is responsible for coordinating with each of the SMEs to ensure that a single RSNA key management entity and IEEE 802.1X Authenticator/Supplicant are shared among the MACs and that a single IEEE 802.1X entity is controlled.

4.10 IEEE Std 802.11 and IEEE Std 802.1X-2010

4.10.1 General

An RSNA relies on IEEE Std 802.1X-2010 to provide authentication services and uses the IEEE 802.11 key management scheme defined in 12.7. The IEEE 802.1X access control mechanisms apply to the association between a STA and an AP and to the relationship between the IBSS STA and STA peer. The AP's SME performs the Authenticator and, optionally, the Supplicant and AS roles. In an infrastructure BSS, a non-AP STA's SME performs the Supplicant role. In an IBSS the SME takes on both the Supplicant and Authenticator roles and might take on the AS role.

4.10.2 IEEE 802.11 usage of IEEE Std 802.1X-2010

IEEE Std 802.11 depends upon IEEE Std 802.1X-2010 to control the flow of MAC service data units (MSDUs) between the DS and STAs by use of the IEEE 802.1X Controlled/Uncontrolled Port model. IEEE 802.1X EAPOL PDUs are transmitted in one or more IEEE 802.11 Data frames and passed via the IEEE 802.1X Uncontrolled Port. The IEEE 802.1X Controlled Port is blocked from passing general data traffic between two STAs until an IEEE 802.1X authentication procedure completes successfully over the IEEE 802.1X Uncontrolled Port. It is the responsibility of both the Supplicant and the Authenticator to implement port blocking. Each association between a pair of STAs creates a unique pair of IEEE 802.1X Ports, and authentication takes place relative to those ports alone.

IEEE Std 802.11 depends upon IEEE Std 802.1X-2010 and the 4-way handshake, FT 4-way handshake, FT protocol, FT resource request protocol, and group key handshake, described in Clause 12 and Clause 13, to establish and change cryptographic keys. Keys are established after authentication has completed. Keys might change for a variety of reasons, including expiration of an IEEE 802.1X authentication timer, key compromise, danger of compromise, or policy.

4.10.3 Infrastructure functional model overview

4.10.3.1 General

This subclause summarizes the system setup and operation of an RSN, in three cases: when a password or PSK is used during IEEE 802.11 authentication, when an IEEE 802.1X AS is used after Open System authentication, and when a PSK is used after Open System authentication. In an RSN, an AP includes an Authenticator, and each associated STA includes a Supplicant.

4.10.3.2 AKM operations with AS

The following AKM operations are carried out when an IEEE 802.1X AS is used:

- a) Prior to any use of IEEE Std 802.1X-2010, IEEE Std 802.11 assumes that the Authenticator and AS have established a secure channel. The security of the channel between the Authenticator and the AS is outside the scope of this standard.
Authentication credentials are distributed to the Supplicant and AS prior to association.
- b) A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-25). If IEEE 802.1X authentication is used, the EAP authentication process starts when the Authenticator sends the EAP-Request (shown in Figure 4-26) or the Supplicant sends the EAPOL-Start frame. EAP messages pass between the Supplicant and AS via the Authenticator and Supplicant's Uncontrolled Ports. This is shown in Figure 4-26.

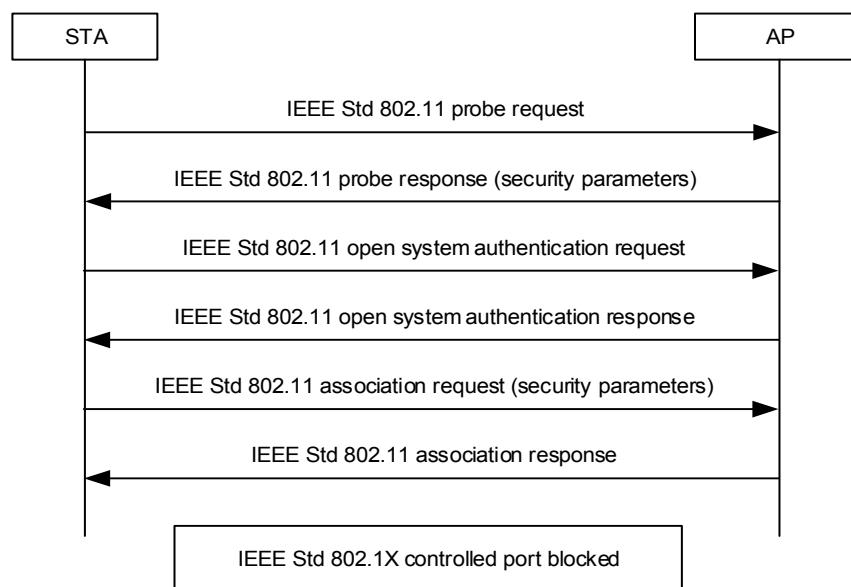

Figure 4-25—Establishing the IEEE 802.11 association

- c) The Supplicant and AS authenticate each other and generate a PMK. The PMK is sent from the AS to the Authenticator over the secure channel. See Figure 4-26.

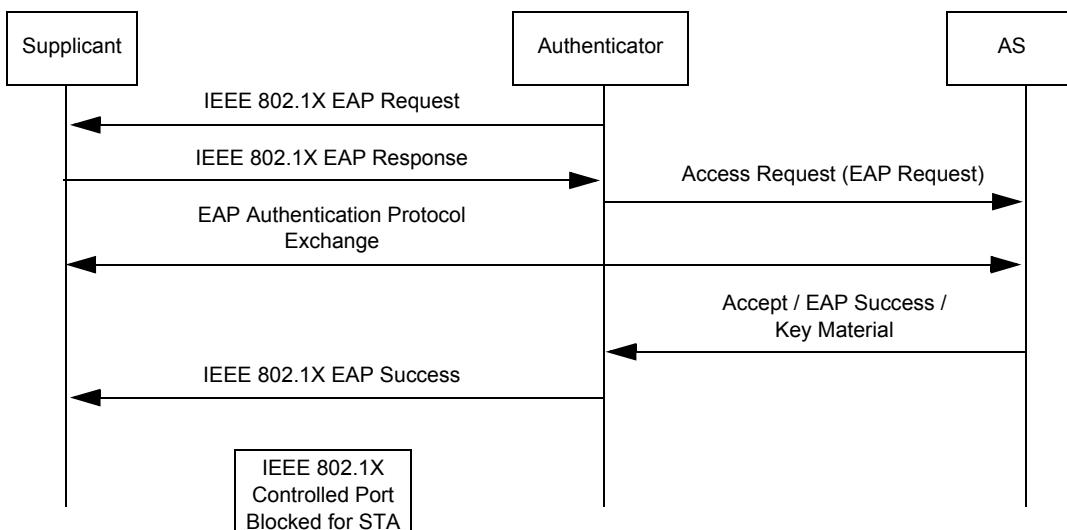

Figure 4-26—IEEE 802.1X EAP authentication

A 4-way handshake or FT 4-way handshake utilizing EAPOL-Key frames is initiated by the Authenticator to do the following:

- Confirm that a live peer holds the PMK.
- Confirm that the PMK is current.
- In the case of fast BSS transition, derive PMK-R0s and PMK-R1s.
- Derive a fresh pairwise transient key (PTK) from the PMK or, in the case of fast BSS transition, from the PMK-R1.
- Install the pairwise encryption and integrity keys.
- Transport the group temporal key (GTK) and GTK sequence number from Authenticator to Supplicant and install the GTK and GTK sequence number in the STA and, if not already installed, in the AP.
- If management frame protection is negotiated, transport the IGTK and the IGTK packet number (IPN) from the Authenticator to the Supplicant and install these values in the STA and, if not already installed, in the AP.
- Verify that the RSN capabilities negotiated are valid as defined in 9.4.2.25.4.
- Confirm the cipher suite selection.

Installing the PTK, and where applicable the GTK and, if management frame protection is negotiated, the IGTK, causes the MAC to encrypt and decrypt all subsequent MSDUs irrespective of their path through the controlled or uncontrolled ports.

Upon successful completion of the 4-way handshake, the Authenticator and Supplicant have authenticated each other; and the IEEE 802.1X Controlled Ports are unblocked to permit general data traffic. See Figure 4-27.

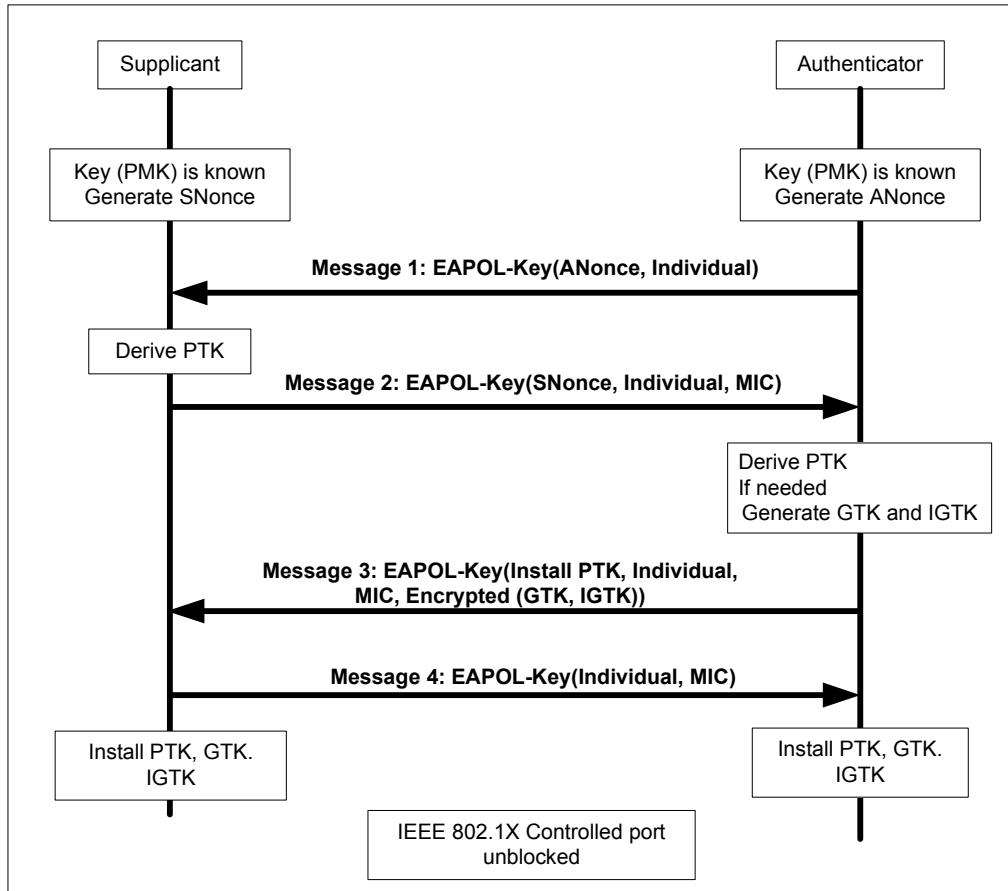

Figure 4-27—Establishing pairwise and group keys

If the Authenticator later changes the GTK, it sends the new GTK and GTK sequence number to the Supplicant using the group key handshake to allow the Supplicant to continue to receive group addressed frames and, optionally, to transmit and receive individually addressed frames. EAPOL-Key frames are used to carry out this exchange. See Figure 4-28.

When management frame protection is negotiated, the Authenticator also uses the group key handshake with all associated STAs to change the IGTK. The Authenticator encrypts the GTK and IGTK values in the EAPOL-Key frame as described in 12.7.

4.10.3.3 AKM operations with a password or PSK

The following AKM operations are carried out when authentication is accomplished using a Password or PSK:

- A STA discovers the AP's security policy through passively monitoring the Beacon frames or through active probing. After discovery the STA performs SAE authentication using Authentication frames with the AP (see Figure 4-29).
- Upon the successful conclusion of SAE, both the STA and AP generate a PMK. The STA then associates to an AP and negotiates security policy. The AKM in the Association Request and Response frames is confirmed to be the AKM of SAE or of fast BSS transition.
- The PMK generated by SAE is used in a 4-way handshake using EAPOL-Key frames, just as with IEEE 802.1X authentication when an AS is present. See Figure 4-27.

- The GTK and IGTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-27 and Figure 4-28.

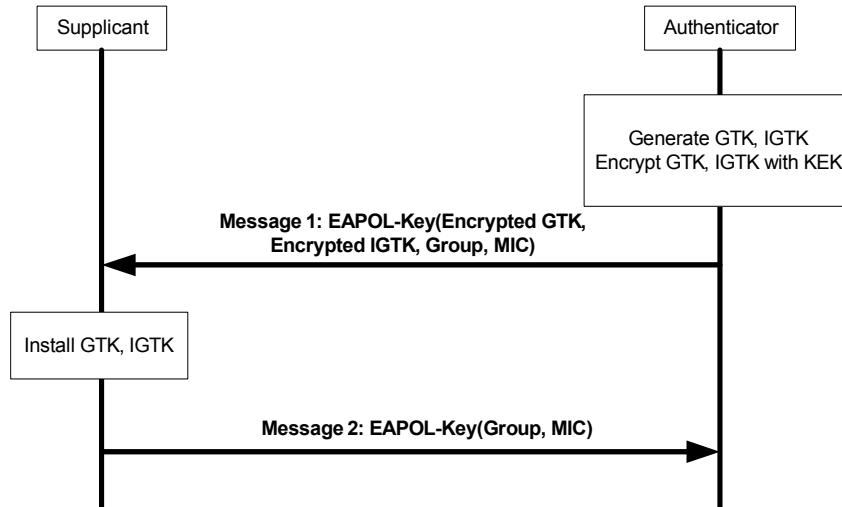

Figure 4-28—Delivery of subsequent group keys

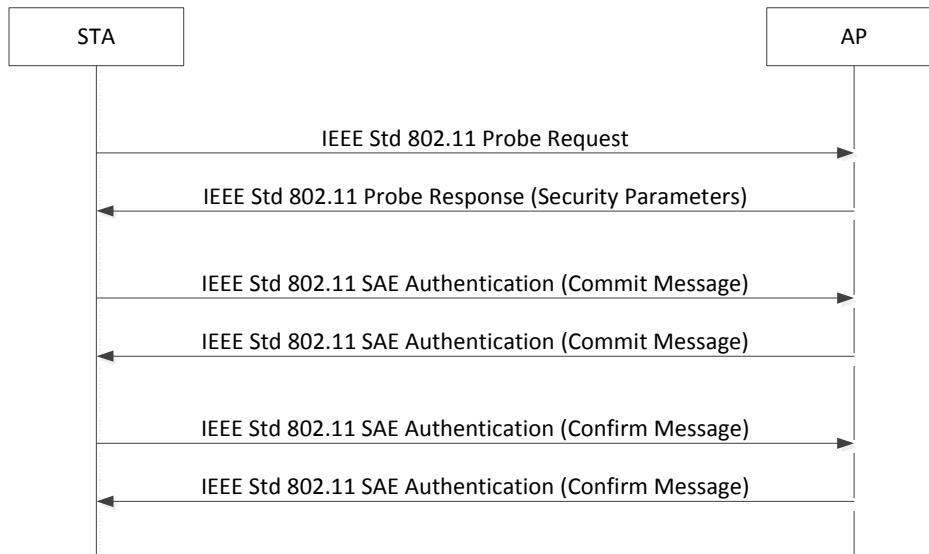

Figure 4-29—Example using SAE authentication

4.10.3.4 Alternate operations with PSK

The following AKM operations represent an alternate operation of using a PSK. This operation has security vulnerabilities when used with a low-entropy key and is recommended to be used only after taking that into account. When this operation is carried out, the PMK is a PSK:

- A STA discovers the AP's security policy through passively monitoring Beacon frames or through active probing (shown in Figure 4-25). A STA associates with an AP and negotiates a security policy. The PMK is the PSK.
- The 4-way handshake using EAPOL-Key frames is used, just as with IEEE 802.1X authentication, when an AS is present. See Figure 4-27.

- The GTK and GTK sequence number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-27 and Figure 4-28.
- If management frame protection is negotiated, the IGTK and IGTK packet number are sent from the Authenticator to the Supplicant just as in the AS case. See Figure 4-27 and Figure 4-28.

4.10.3.5 Disassociation

Disassociation initiated by either STA in an RSNA causes the deletion of the PTKSA at both ends and the deletion of the GTKSA in a non-AP STA. The controlled and uncontrolled ports created for this association are also deleted.

4.10.4 IBSS functional model description

4.10.4.1 General

This subclause summarizes the system setup and operation of an RSNA in an IBSS. An IBSS RSNA is specified in 12.6.11.

4.10.4.2 Key usage

In an IBSS the individually addressed Data frames between two STAs are protected with a pairwise key. The key is part of the PTK, which is derived during a 4-way handshake. In an IBSS the 4-way handshake can follow IEEE 802.11 authentication of one STA to another. Such authentication might be used by the peer to cause deletion of the PTKSA and Block the Controlled Port, resetting any previous handshake.

In an IBSS group addressed Data frames are protected by a key, e.g., named B1, that is generated by the STA transmitting the group addressed frame. To allow other STAs to decrypt group addressed frames, B1 is sent to all of the other STAs in the IBSS. B1 is sent in an EAPOL-Key frame, encrypted under the EAPOL-Key encryption key (KEK) portion of the PTK, and protected from modification by the EAPOL-Key confirmation key (KCK) portion of the PTK.

In an IBSS the SME responds to Deauthentication frames from a STA by deleting the PTKSA associated with that STA.

4.10.4.3 Sample IBSS 4-way handshakes

In this example (see Figure 4-30), there are three STAs: S1, S2, S3. The group addressed frames sent by S1 are protected by B1; similarly B2 for S2, and B3 for S3.

For STAs S2 and S3 to decrypt group addressed frames from S1, B1 is sent to S2 and S3. This is done using the 4-way handshake initially and using the group key handshake for GTK updates.

The 4-way handshake from S1 to S2 allows S1 to send group addressed frames to S2, but does not allow S2 to send group addressed frames to S1 because S2 has a different transmit GTK. Therefore, S2 needs to initiate a 4-way handshake to S1 to allow S1 to decrypt S2's group addressed frames. Similarly, S2 also needs to initiate a 4-way handshake to S3 to enable S3 to receive group addressed frames from S2.

In a similar manner S3 needs to complete the 4-way handshake with S1 and S2 to deliver B3 to S1 and S2.

In this example, there are six 4-way handshakes. In general, N Supplicants require $N(N-1)$ 4-way handshakes.

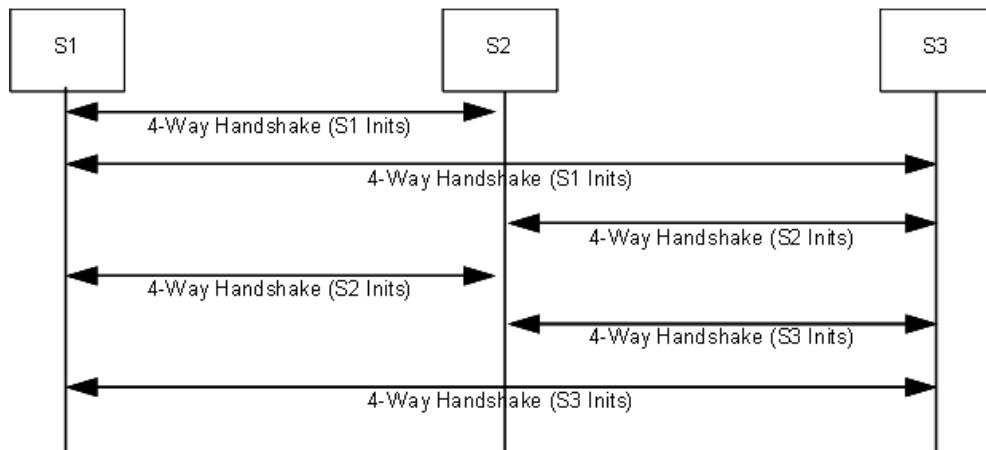

Figure 4-30—Sample 4-way handshakes in an IBSS

NOTE—In principle the KCK and KEK from a single 4-way handshake can be used for the group key handshake in both directions, but using two 4-way handshakes means the Authenticator key state machine does not need to be different between IBSS and ESS.

The group key handshake can be used to send the GTKs to the correct STAs. The 4-way handshake is used to derive the pairwise key and to send the initial GTK. Because in an IBSS there are two 4-way handshakes between any two Suplicants and Authenticators, the pairwise key used between any two STAs is from the 4-way handshake initiated by the STA Authenticator with the higher MAC address (see 12.7.1 for the notion of address comparison). The KCK and KEK used for a group key handshake are the KCK and KEK derived by the 4-way handshake initiated by the same Authenticator that is initiating the group key handshake.

In an IBSS a secure link exists between two STAs when both 4-way handshakes have completed successfully. The Suplicant and Authenticator 4-way handshake state machines interact so the IEEE 802.1X variable portValid is not set to 1 until both 4-way handshakes complete.

If a fourth STA comes within range and its SME decides to initiate a security association with the three peers, its Authenticator initiates 4-way handshakes with each of the other three Suplicants. Similarly, the original three STA Authenticators in the IBSS need to initiate 4-way handshakes to the fourth STA Suplicant. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the Authentication and Key Management Protocol (AKMP) is SAE, PSK, or IEEE 802.1X authentication) from the Beacon or Probe Response frame. The initiation might start for a number of reasons:

- The fourth STA receives a Beacon or Probe Response frame from a MAC address with which it has not completed a 4-way handshake.
- An SME receives an MLME-PROTECTEDFRAMEDROPPED.indication primitive from a MAC address with which it has not completed a 4-way handshake. This could be a group addressed Data frame transmitted by any of the STAs. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.
- An SME receives message 1 of the 4-way handshake sent to a STA because the initiator received a broadcast Data frame, Beacon frame, or Probe Response frame from that STA. In order to set up a security association to the peer STA, a STA that received a 4-way handshake but does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

4.10.4.4 IBSS IEEE 802.1X example

When IEEE 802.1X authentication is used, each STA needs to include an IEEE 802.1X Authenticator and AS. A STA learns that a peer STA is RSNA-enabled and the peer's security policy (e.g., whether the AKMP is PSK or IEEE 802.1X authentication) from the Beacon or Probe Response frame.

Each Suplicant sends an EAPOL-Start frame to every other STA to which it intends to authenticate, and each STA's Authenticator responds with the identity of the credential it intends to use.

The EAPOL-Start and EAP-Request/Identity messages are initiated when a protected Data frame (indicated via an MLME-PROTECTEDFRAMEDROPPED.indication primitive), an IEEE 802.1X message, Beacon frame, or Probe Response frame is received from a MAC address with which the STA has not completed IEEE 802.1X authentication. In order to set up a security association to the peer STA, an SME that does not know the security policy of the peer can send a Probe Request frame to the peer STA to find its security policy before setting up a security association to the peer STA.

Although Figure 4-31 shows the two IEEE 802.1X exchanges serialized, they might occur interleaved.

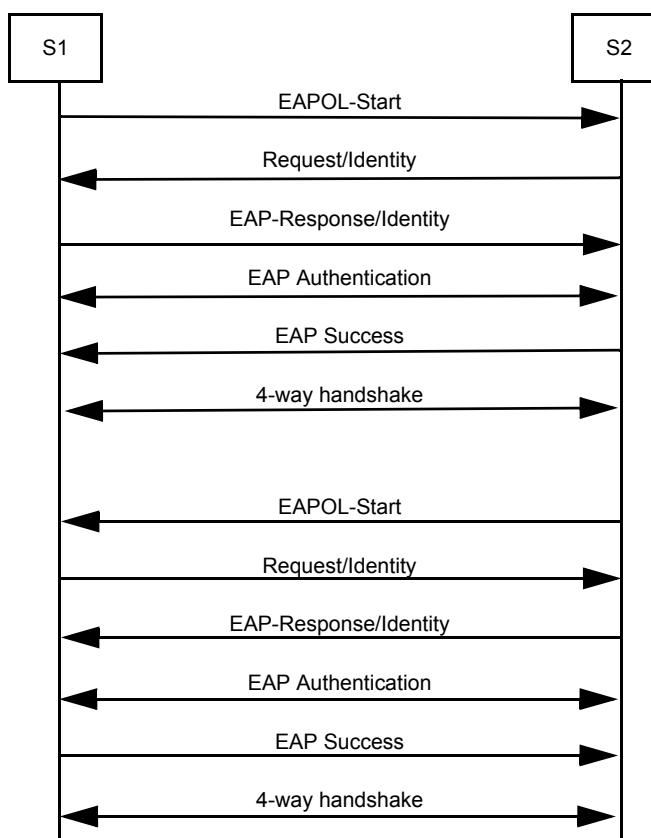

Figure 4-31—Example using IEEE 802.1X authentication

4.10.5 PBSS functional model description

This subclause summarizes the system setup and operation of an RSNA in a PBSS.

If a non-PCP STA chooses to associate with the PCP of the PBSS, the non-PCP STA establishes an RSNA with the PCP following the infrastructure functional model as specified in 4.10.3.

If a non-PCP STA wants to establish an RSNA with the PCP without association or if the non-PCP STA wants to establish an RSNA with another non-PCP STA, it can directly initiate an RSNA authentication with the peer STA, followed by a 4-way handshake. One difference between this model and the IBSS functional model is that only one RSNA authentication and one 4-way handshake are performed between two STAs. If both STAs initiate an RSNA setup at the same time, the RSNA setup initiated by the STA with the lower MAC address is carried through, while the RSNA setup initiated by the STA with the higher MAC address is terminated.

Figure 4-32 shows an example of the RSNA setup in a PBSS. An initiator STA discovers a peer STA's RSNA policies through the DMG Beacons from the peer STA if the peer STA is the PCP or through the Probe Response or Information Response frames from the peer STA. In this example, the initiator STA does not associate with the peer STA. The initiator STA performs RSNA authentication with the peer STA to derive a PMK. A 4-way handshake is then started to complete the RSNA setup.

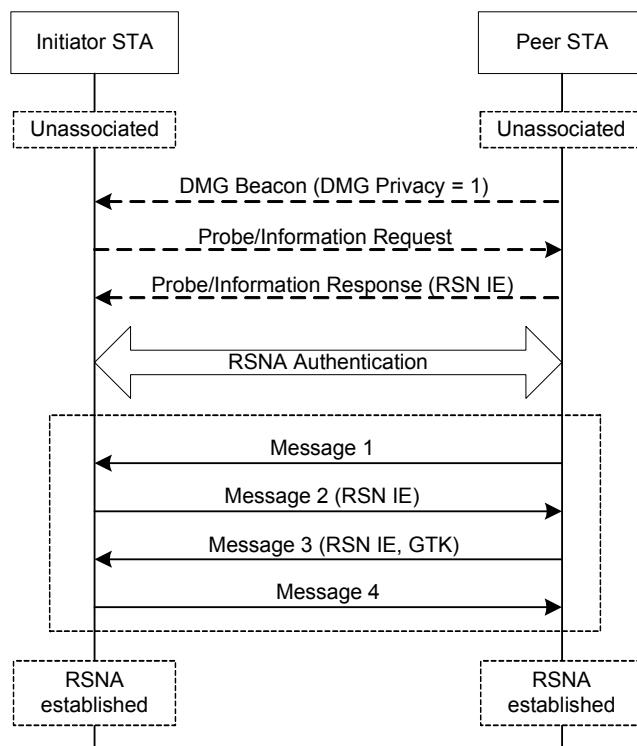

Figure 4-32—Example of RSNA setup in a PBSS

4.10.6 Authenticator-to-AS protocol

The Authenticator-to-AS authentication definition is out of the scope of this standard, but, to provide security assurances, the protocol needs to support the following functions:

- a) Mutual authentication between the Authenticator and AS
- b) A channel for the Supplicant/AS authentication
- c) The ability to pass the generated key from the AS to the Authenticator in a manner that provides authentication of the key source, preserves integrity of the key transfer, and preserves data confidentiality of the key from all other parties

Suitable protocols include, but are not limited to, remote authentication dial-in user service (RADIUS) (IETF RFC 2865 [B33]) and Diameter (IETF RFC 3588 [B40]).

4.10.7 PMKSA caching

The Authenticator and Supplicant can cache PMKSAs, which include the IEEE 802.1X state. A PMKSA can be deleted from the cache for any reason and at any time.

The STA can supply a list of PMK identifiers in the (Re)Association Request frame. Each key identifier names a PMKSA; the PMKSA can contain a single PMK. The Authenticator specifies the selected PMK identifier in message 1 of the 4-way handshake. The selection of the key identifiers to be included within the (Re)Association Request frame and message 1 of the 4-way handshake is out of the scope of this standard.

4.10.8 Protection of group addressed robust Management frames

When management frame protection is negotiated, all group addressed robust Management frames are encapsulated using the procedures defined in 11.13. This service provides integrity protection of group addressed robust Management frames using BIP.

5. MAC service definition

5.1 Overview of MAC services

5.1.1 Data service

5.1.1.1 General

This service provides peer LLC sublayer entities with the ability to exchange MSDUs. To support this service, the local MAC uses the underlying PHY-level services to transport an MSDU to a peer MAC entity, where it is delivered to the peer LLC sublayer. Such asynchronous MSDU transport is performed on a connectionless basis. By default, MSDU transport is on a best-effort basis. However, the QoS facility uses a traffic identifier (TID) to specify differentiated services on a per-MSDU basis. The QoS facility also permits more synchronous behavior to be supported on a connection-oriented basis using TSPECs. There are no guarantees that the submitted MSDU will be delivered successfully. Group addressed transport is part of the data service provided by the MAC. Due to the characteristics of the WM, group addressed MSDUs might experience a lower QoS, compared to that of individually addressed MSDUs. All STAs support the data service, but only QoS STAs in a QoS BSS differentiate their MSDU delivery according to the designated traffic category or traffic stream (TS) of individual MSDUs. QoS STAs that support the QMF service differentiate their MMPDU delivery according to the MMPDU's access category. The access category of each MMPDU is designated by the transmitter's current QMF policy.

Because operation of certain functions of the MAC can cause reordering of some MSDUs, as discussed in more detail below, in non-QoS STAs, there are two service classes within the data service. By selecting a class, each LLC sublayer entity initiating the transfer of MSDUs is able to control whether MAC entities are or are not allowed to reorder those MSDUs.

There are two service classes available in a QoS STA: QoSAck and QoSNoAck. The service classes are used to signal if the MSDU is to be transmitted with or without using the MAC-level acknowledgment.

In QoS STAs either associated in a BSS or having membership in an IBSS, the MAC uses a set of rules that tends to cause higher UP MSDUs in a BSS to be sent before lower UP MSDUs in the BSS. The MAC sublayer entities determine the UPs for MSDUs based on the TID values provided with those MSDUs. If a TSPEC has been provided for a TS, via the MAC sublayer management entity, the MAC attempts to deliver MSDUs belonging to that TS in accordance with the QoS parameter values contained in the TSPEC. In a BSS with some STAs supporting the QoS facility and others not supporting the QoS facility, in delivering an MSDU to a non-QoS STA, the QoS STA uses the access category (AC) corresponding to the UP of the MSDU.

5.1.1.2 Determination of UP

The QoS facility supports eight priority values, referred to as *UPs*. The values a UP may take are the integer values from 0 to 7 and are identical to the IEEE 802.1D™ priority tags. An MSDU with a particular UP is said to belong to a traffic category (TC) with that UP. The UP is provided with each MSDU at the medium access control service access point (MAC SAP) either directly, in the UP parameter, or indirectly, in a TSPEC or SCS Descriptor element designated by the UP parameter.

5.1.1.3 Interpretation of priority parameter in MAC service primitives

The value of the priority parameter in the MAC service primitives (see 5.2) may be a noninteger value of either Contention or ContentionFree or may be any integer value in the range 0 to 15.

When the priority parameter has an integer value, it is used in the TID subfields that appear in certain frames that are used to deliver and to control the delivery of QoS data across the WM.

Priority parameter and TID subfield values 0 to 7 are interpreted as UPs for the MSDUs. Outgoing MSDUs with UP values 0 to 7 are handled by MAC entities at STAs in accordance with the UP.

Priority parameter and TID subfield values 8 to 15 specify TIDs that are also TS identifiers (TSIDs) and select the TSPEC for the TS designated by the TID. Outgoing MSDUs with priority parameter values 8 to 15 are handled by MAC entities at STAs in accordance with the UP value determined from the UP subfield as well as other parameter values in the selected TSPEC. When an MSDU arrives with a priority value between 8 and 15 and for which there is no TSPEC defined, then the MSDU shall be sent with priority parameter set to 0.

The noninteger values of the priority parameter are allowed at all non-QoS STAs. The use of priority value of ContentionFree is deprecated at QoS STAs. The integer values of the priority parameter (i.e., TID) are supported only at QoS STAs that are in a QoS BSS. A range of 0 to 15 is supported by QoS STAs associated in a QoS BSS; whereas a range of 0 to 7 is supported by QoS STAs that are members of a QoS IBSS. If a QoS STA is associated in a non-QoS BSS, the STA is functioning as a non-QoS STA, so the priority value is always Contention or ContentionFree.

At QoS STAs associated in a QoS BSS, MSDUs with a priority of Contention are considered equivalent to MSDUs with TID 0, and those with a priority of ContentionFree are delivered using the contention free delivery if a point coordinator (PC) is present in the AP. If a PC is not present, MSDUs with a priority of ContentionFree shall be delivered using an UP of 0. At STAs associated in a non-QoS BSS, all MSDUs with an integer priority are considered equivalent to MSDUs with a priority of Contention.

The received individually addressed frames at a QoS STA may be as follows:

- a) Non-QoS subtypes, in which case the STA shall assign to them a priority of Contention, if they are received during the contention period (CP), or ContentionFree, if they are received during the contention free period (CFP).
- b) QoS subtypes, in which case the STA shall infer the UP value from the TID in the QoS Control field directly for TID values between 0 and 7. For TID values between 8 and 15 the STA shall extract the UP value in the UP subfield of the TS Info field in the associated TSPEC or from the UP field in the associated TCLAS (traffic classification) element, as applicable.

QoS APs deliver the UP with the received MSDUs to the DS.

5.1.1.4 Interpretation of service class parameter in MAC service primitives in a STA

In QoS STAs, the value of the service class parameter in the MAC service primitive (see 5.2) may be a noninteger value of QoSACK or QoSNOACK.

When an MSDU is received from the MAC SAP with one of the following service class indications, and the recipient STA is a QoS STA:

- QoSACK, the MSDU is transmitted using one or more QoS Data frame(s) with the Ack Policy subfield in the QoS Control field set to Normal ACK or Implicit Block ACK Request, PSMP ACK, or Block ACK.
- QoSNOACK, the MSDU is transmitted using one or more QoS Data frame(s) with the Ack Policy subfield in the QoS Control field set to No ACK.

When an MSDU is received from the MAC SAP and the recipient STA is not a QoS STA, the MSDU is transmitted using one or more non-QoS Data frame(s).

When a QoS Data frame is received from another STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSACK, if the frame is a QoS Data frame with the Ack Policy subfield in the QoS Control field equal to either Normal ACK or Block ACK.

- QoSAck, if the frame was delivered via the DMS or the GCR block ack retransmission policy.
- QoSNoAck, if the frame is a QoS Data frame with the Ack Policy subfield in the QoS Control field equal to No Ack. This service class is also used when the DA parameter is a group address unless the frame was delivered via DMS or the GCR block ack retransmission policy.

When a non-QoS Data frame is received from a STA, the service class parameter in the MA-UNITDATA.indication primitive is set to

- QoSAck, if the frame is an individually addressed frame and is acknowledged by the STA.
- QoSNoAck, if the frame is a group addressed frame and is not acknowledged by the STA.

5.1.2 Security services

Security services in IEEE Std 802.11 are provided by the authentication service and the CCMP, GCMP, and BIP mechanisms. The scope of the security services provided is limited to station-to-station data and robust Management frame transmissions. When CCMP or GCMP is used, the data confidentiality service is provided for Data frames and individually addressed robust Management frames. For the purposes of this standard, CCMP, GCMP, and BIP are viewed as logical services located within the MAC sublayer as shown in the reference model, Figure 4-19 (in 4.9). Actual implementations of CCMP, GCMP, and BIP are transparent to the LLC sublayer and other layers above the MAC sublayer.

The security services provided by CCMP and GCMP in IEEE Std 802.11 are as follows:

- a) Data Confidentiality;
- b) Authentication; and
- c) Access control in conjunction with layer management.

BIP provides message integrity and access control for group addressed robust Management frames.

During the authentication exchange, both parties exchange authentication information as described in Clause 12 and Clause 13.

The MAC sublayer security services provided by CCMP, GCMP, and BIP rely on information from non MAC sublayer management or system entities. Management entities communicate information to CCMP, GCMP, and BIP through a set of MAC sublayer management entity (MLME) interfaces and MIB attributes; in particular, the decision tree for CCMP, GCMP, and BIP defined in 12.9 is driven by MIB attributes.

The use of WEP for confidentiality, authentication, or access control is deprecated. The WEP algorithm is unsuitable for the purposes of this standard.

The use of TKIP is deprecated. The TKIP algorithm is unsuitable for the purposes of this standard.

A STA that has associated with management frame protection enabled shall not use pairwise cipher suite selectors WEP-40, WEP-104, TKIP, or “Use group cipher suite.”

A mesh STA with dot11MeshSecurityActivated equal to true shall not use the pairwise cipher suite selectors WEP-40, WEP-104, or TKIP.

5.1.3 MSDU ordering

The services provided by the MAC sublayer permit, and might in certain cases require, the reordering of MSDUs.

In a non-QoS STA, the MAC does not intentionally reorder MSDUs except as might be necessary to improve the likelihood of successful delivery based on the current operational (“power management,” FMS, DMS) mode of the designated recipient STA(s). The sole effect of this reordering (if any), for the set of

MSDUs received at the MAC service interface of any single STA, is a change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, originating from a single source STA address.

If a higher layer protocol using the data service cannot tolerate this possible reordering, the optional StrictlyOrdered service class can be used. MSDUs transferred between any pair of STAs using the StrictlyOrdered service class are not subject to the relative reordering that is possible when the ReorderableGroupAddressed service class is used. However, the ability to receive MSDUs sent using the StrictlyOrdered service class precludes simultaneous use of the MAC power management facilities at that STA. Note that the use of the StrictlyOrdered service class is obsolete and the StrictlyOrdered service class might be removed in a future revision of the standard.

The MSDUs are reordered, not only to improve the likelihood of successful delivery based on the current operational mode of the designated recipient STA(s), but also to honor the priority parameters, specified in the MA-UNITDATA.request primitive, of the individual MSDUs. The effects of this reordering (if any), for the set of MSDUs received at the MAC service interface of any single STA, are:

- a) A change in the delivery order of group addressed MSDUs, relative to individually addressed MSDUs, and
- b) The reordering of MSDUs with different TID values, originating from a single source STA address.

There shall be no reordering of individually addressed MSDUs with the same TID value and addressed to the same destination.

STAs operating in a non-QoS BSS shall follow the reordering rules as defined for a non-QoS STA.

In order for the MAC to operate properly, this standard assumes that the DS meets the MSDU (“object”) reordering requirements of IEEE Std 802.1AC™-2012 [B22].

Operational restrictions that provide the appropriate ordering of MSDUs are specified in 10.8.

When MSDU or A-MSDU reordering is performed, the information in the MAC service tuple(s) for the MSDU(s) shall be maintained and reordered as a unit.

5.1.4 MSDU format

Logical Link Control (LLC) sublayer entities use the MAC sublayer service to exchange PDUs with peer LLC sublayer entities. These PDUs are termed MAC sublayer SDUs (MSDUs) when sent to the MAC sublayer. There are two LLC sublayer protocols used (see IEEE Std 802-2014); LLC Protocol Discrimination (LPD) (see ISO/IEC 8802-2:1998) and EtherType Protocol Discrimination (EPD) (see IEEE Std 802.3-2012). LPD is used for transmission of all IEEE 802.11 MSDUs with the exception of the 5.9 GHz bands where EPD is used (see E.2.3 and E.2.4).

When LPD is used, in order to achieve interoperability, implementers are recommended to apply the procedures described in ISO/IEC Technical Report 11802-5:1997 (previously known as IEEE Std 802.1H-1997 [B24]), along with a selective translation table (STT) that handles a few specific network protocols, with specific attention to the operations required when passing MSDUs to or from LANs or operating system components that use the Ethernet frame format (EPD). Note that such translations might be required in a STA.

5.1.5 MAC data service architecture

5.1.5.1 General

The MAC data plane architecture (i.e., processes that involve transport of all or part of an MSDU) is shown in Figure 5-1 when transparent FST is not being used and shown in Figure 5-2 when transparent FST is being used.

The dotted line box labeled “Role-specific behaviors” is replaced by one of several options, depending on the role of the STA. See the following subclauses

During transmission, an MSDU goes through some or all of the following processes: MSDU rate limiting, aggregate MSDU (A-MSDU) aggregation, frame delivery deferral during power save mode, sequence number assignment, integrity protection, fragmentation, encryption, frame formatting, and aggregate MAC protocol data unit (A-MPDU) aggregation. When transparent FST is used, an MSDU first goes through an additional transparent FST entity that contains a demultiplexing process that forwards the MSDU down to the selected TX MSDU Rate Limiting process, and thence MAC data plane processing as described in the previous sentence. IEEE Std 802.1X-2010 may block the MSDU at the Controlled Port before the preceding processing occurs. Otherwise, at some point, the Data frames that contain all or part of the MSDU are queued per AC/TS.

During reception, a received Data frame goes through processes of possible A-MPDU deaggregation, MPDU header and cyclic redundancy code (CRC) validation, duplicate removal, decryption, possible reordering if the block ack mechanism is used, replay detection, defragmentation, integrity checking, possible A-MSDU deaggregation, and possible MSDU rate limiting. Then, one or more MSDUs are delivered to the MAC SAP or to the DS via the DSAF. When transparent FST is used, MSDUs originating from different PHY SAPs go through a final step of a transparent FST entity that contains a multiplexing process before delivering the MSDU. The IEEE 802.1X Controlled/Uncontrolled Ports discard any received MSDU if the Controlled Port is not enabled and if the MSDU does not represent an IEEE 802.1X frame.

When transparent FST is used, the same security keys, sequence counter, and PN counter are used by the MAC data plane to encrypt the MPDU prior to and following an FST, and the same security keys are used to check the integrity and perform the protection of MSDUs. When nontransparent FST is used, independent RSNAs, security keys, sequence counters, and PN counters have to be established for each MAC data plane to be used prior to and following an FST. When transparent FST is used, a single MAC SAP at each peer is presented to the higher layers of that peer for all of the frequency bands/channels that are identified by the same MAC address at that peer. When nontransparent FST is used, different MAC SAPs are presented to higher layers since different MAC addresses are used prior to and following an FST.

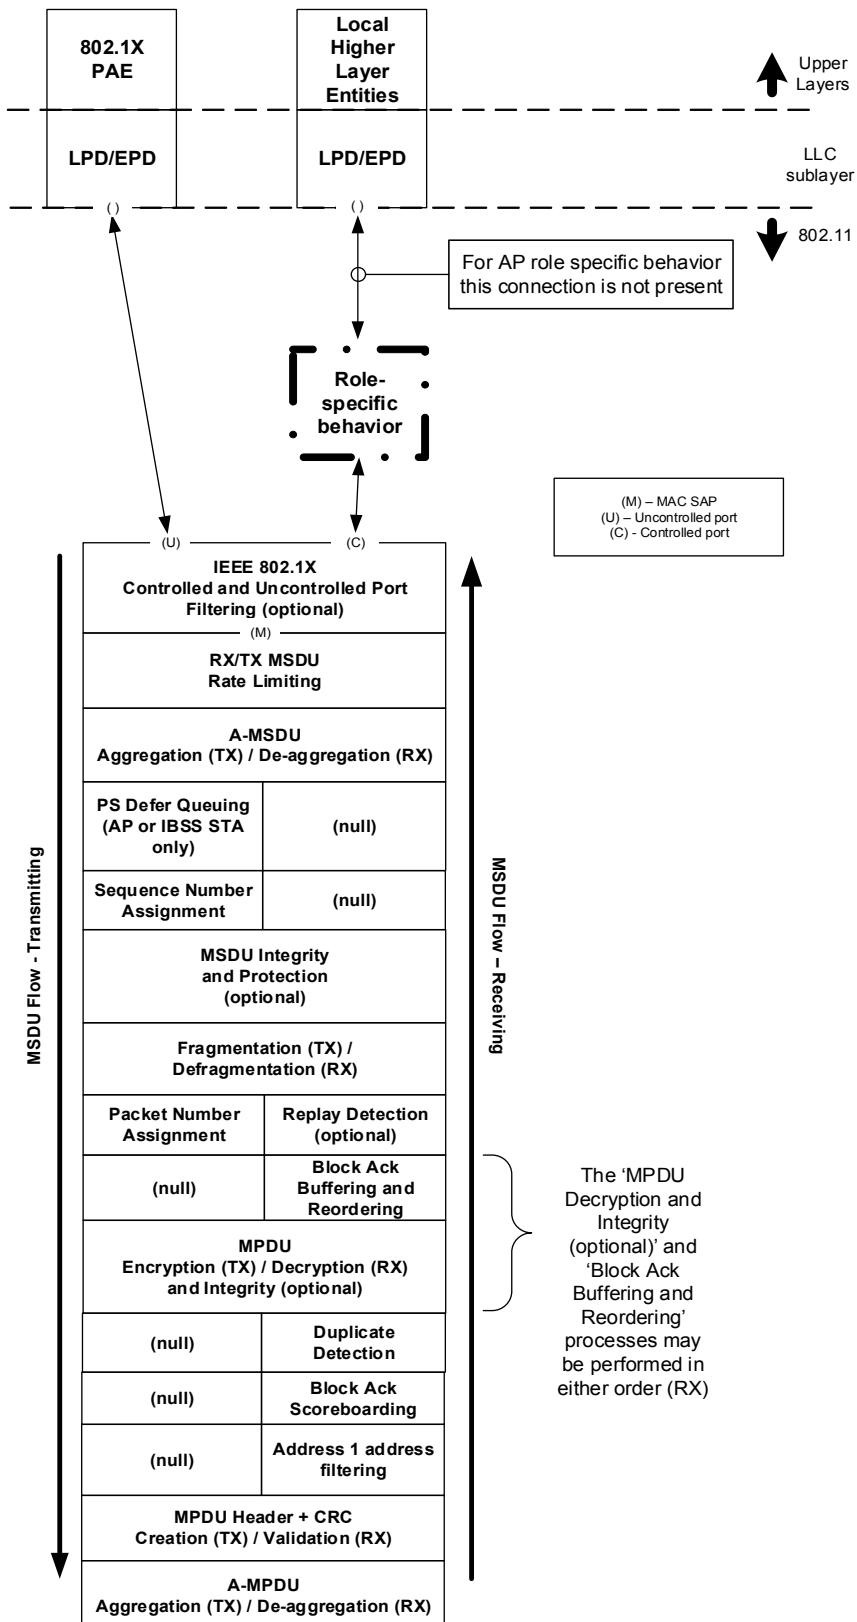

Figure 5-1—MAC data plane architecture

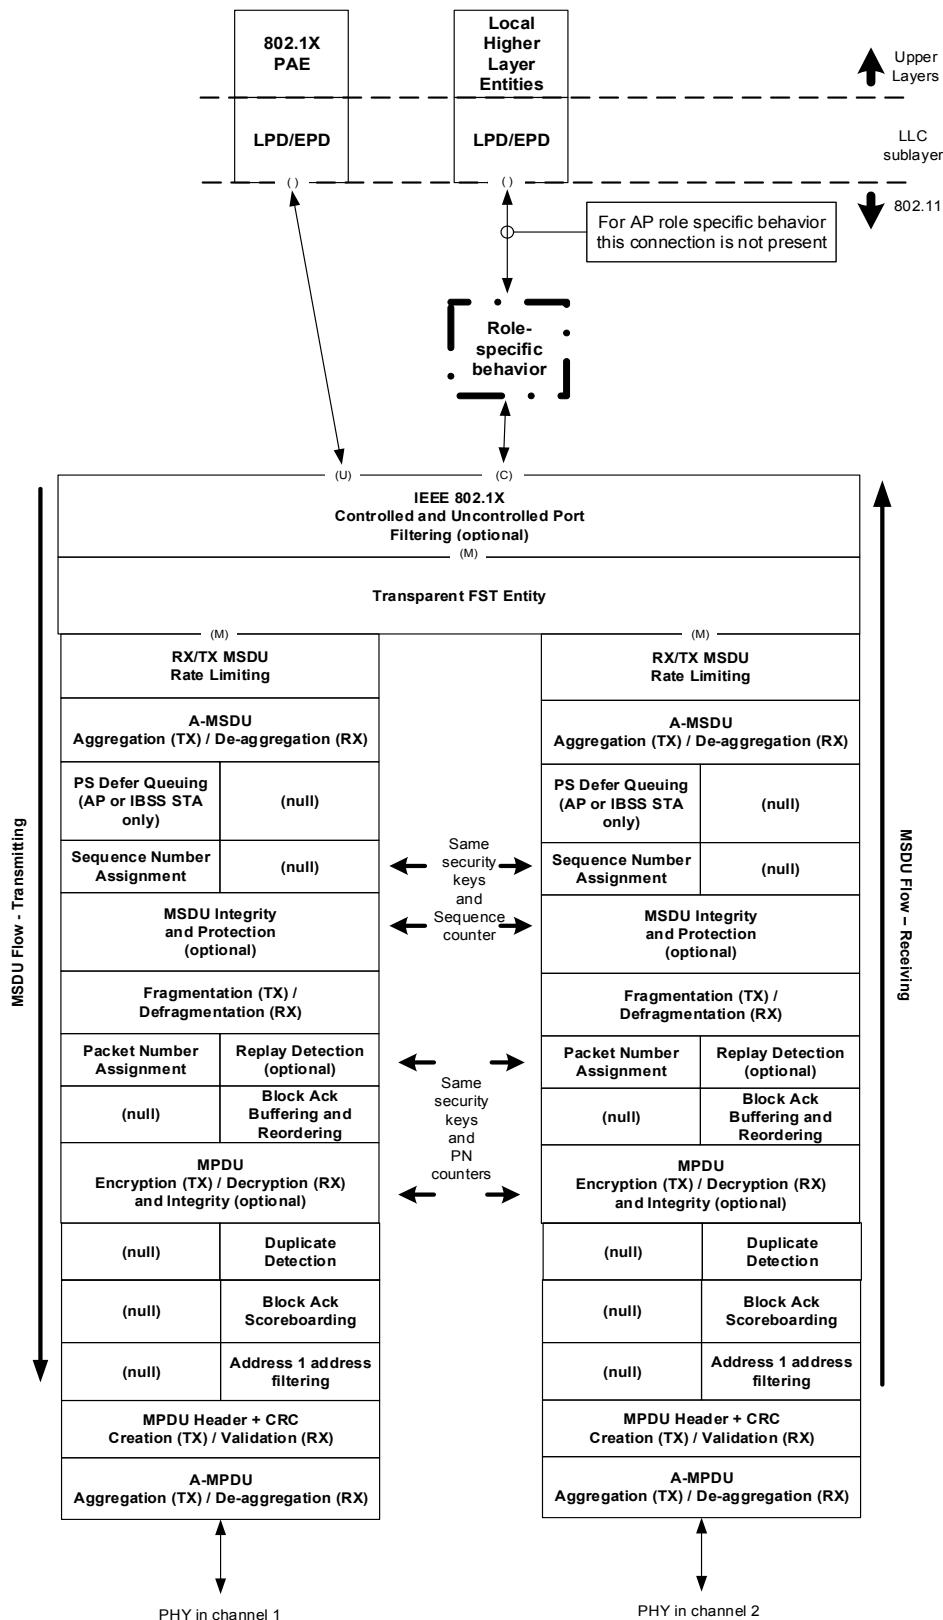

Figure 5-2—MAC data plane architecture (transparent FST)

5.1.5.2 Non-AP STA role

The MAC data plane architecture of a non-AP STA is completed by replacing the role-specific behavior block with that shown in Figure 5-3. The function of this block in a non-AP STA is to perform destination address filtering as described in 10.2.8.

NOTE—In implementations, the DA address filtering function may be done “lower in the stack.” It is shown in the role-specific behavior block location for simplicity, and any implementation choice needs to provide equivalent behavior.

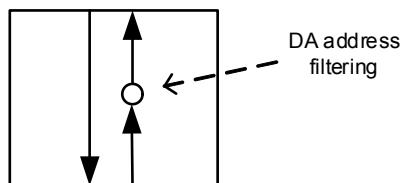

Figure 5-3—Role-specific behavior block for non-AP STA

5.1.5.3 AP role

In an AP, the MAC data plane architecture includes distribution system access in its role-specific behavior block, as shown in Figure 5-4. This block provides access to the DS for associated non-AP STAs as described in 4.5.2.1.

NOTE—This behavior block indicates that there is no access through the controlled port to or from the local upper-layers (the LLC sublayer) at an AP. Any such access is logically achieved in the architecture via transition of the DS and Portal to an integrated LAN. In actual implementations, this is likely to be optimized, and data frames appear to be delivered directly to one or more local LLC sublayer entities on the same physical device as the AP. Such optimization is effectively distributing the functions of the DS and Portal, and it is the responsibility of the implementation to ensure the logical behavior of these entities is maintained.

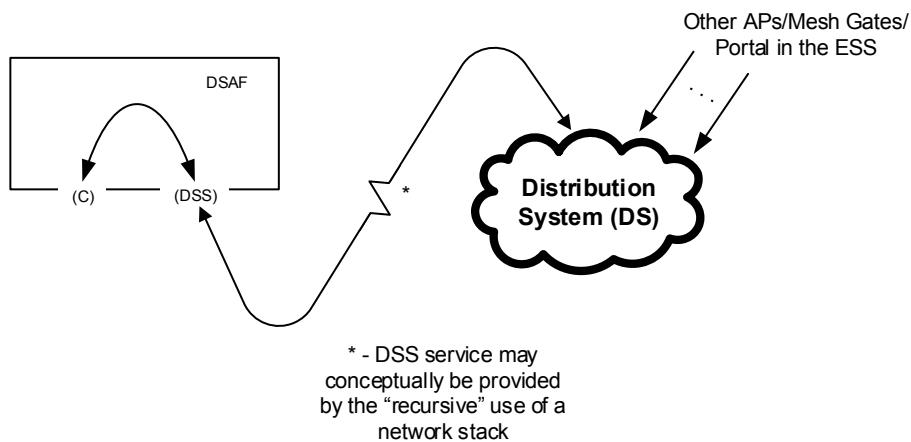

Figure 5-4—Role-specific behavior block for AP

5.1.5.4 Mesh STA role

The MAC data plane architecture of a mesh STA is completed by replacing the role-specific behavior block with that shown in Figure 5-5. The function of this block in a mesh STA is described in Figure 10.35. This role is not applicable when transparent FST is used, and does not apply to Figure 5-2.

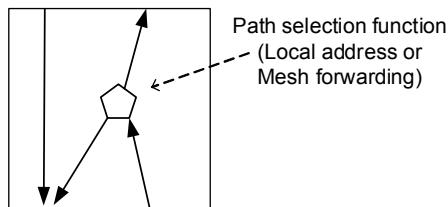

Figure 5-5—Role-specific behavior block for mesh STA

5.1.5.5 Mesh gate role

The MAC data plane architecture of a mesh gate is completed by replacing the role-specific behavior block with that shown in Figure 5-6. The function of this block in a mesh gate is described in 14.11. This role is not applicable when transparent FST is used, and does not apply to Figure 5-2.

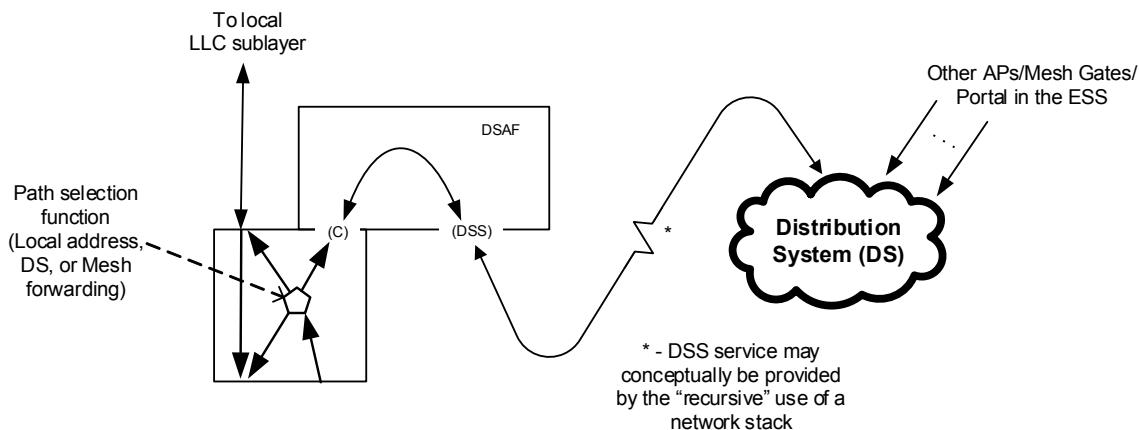

Figure 5-6—Role-specific behavior block for mesh gate

5.2 MAC data service specification

5.2.1 General

The IEEE 802.11 MAC supports the following service primitives as defined in ISO/IEC 8802-2:1998:

- MA-UNITDATA.request
- MA-UNITDATA.indication
- MA-UNITDATA-STATUS.indication

IEEE Std 802.11 places restrictions and semantics on the parameter values for these primitives, as described in 5.2.2 to 5.2.4.

5.2.2 MA-UNITDATA.request

5.2.2.1 Function

This primitive requests a transfer of an MSDU from a local LLC sublayer entity to a single peer LLC sublayer entity, or multiple peer LLC sublayer entities in the case of group addresses.

5.2.2.2 Semantics of the service primitive

The parameters of the primitive are as follows:

```
MA-UNITDATA.request(  
    source address,  
    destination address,  
    routing information,  
    data,  
    priority,  
    service class  
)
```

The source address (SA) parameter specifies an individual MAC sublayer address of the sublayer entity from which the MSDU is being transferred.

The destination address (DA) parameter specifies either an individual or a group MAC sublayer entity address.

The routing information parameter specifies the route for the data transfer (a null value indicates source routing is not to be used). For IEEE Std 802.11, the routing information parameter shall be null.

The data parameter specifies the MSDU to be transmitted by the MAC sublayer entity. The length of the MSDU shall be less than or equal to the value shown in Table 9-19.

The priority parameter specifies the requested priority of the data unit transfer. The allowed values of priority are described in 5.1.1.3.

The service class parameter specifies the requested service class of the data unit transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

5.2.2.3 When generated

This primitive is generated by the LLC sublayer entity when an MSDU is to be transferred to a peer LLC sublayer entity or entities.

5.2.2.4 Effect of receipt

On receipt of this primitive, the MAC sublayer entity determines whether it is able to fulfill the request according to the requested parameters. A request that cannot be fulfilled according to the requested parameters is discarded, and this action is indicated to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive that describes why the MAC was unable to fulfill the request. If the request can be fulfilled according to the requested parameters, the MAC sublayer entity properly formats a frame and passes it to the lower layers for transfer to a peer MAC sublayer entity or entities (see 5.1.4), and indicates this action to the LLC sublayer entity using an MA-UNITDATA-STATUS.indication primitive with transmission status set to Successful.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address and a priority of Contention or ContentionFree, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted. The specific mechanism to perform rate limiting is outside the scope of this standard.

- If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCOUNT shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB variables listed below from the dot11InterworkingEntry identified by the destination MAC address of the frame to be transmitted and perform the following operations:

- If the access category is AC_VO, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCOUNT shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCOUNT shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCOUNT shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCOUNT shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an MA-UNITDATA.request primitive having an individually addressed destination address whose priority is an integer in the range 8 to 15, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRATE; the specific mechanism to perform rate limiting is outside the scope of this standard.

- If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMMMSDUCOUNT shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.3 MA-UNITDATA.indication

5.2.3.1 Function

This primitive defines the transfer of an MSDU from the MAC sublayer entity to the LLC sublayer entity, or entities in the case of group addresses. In the absence of error, the contents of the data parameter are logically complete and unchanged relative to the data parameter in the associated MA-UNITDATA.request primitive.

5.2.3.2 Semantics of the service primitive

The parameters of the primitive are as follows:

MA-UNITDATA.indication(

source address,
destination address,
routing information,
data,
reception status,
priority,
service class
)

The SA parameter is an individual address as specified by the SA field of the incoming frame.

The DA parameter is either an individual or a group address as specified by the DA field of the incoming frame.

The routing information parameter specifies the route that was used for the data transfer. The MAC sublayer entity shall set this field to null.

The data parameter specifies the MSDU as received by the local MAC entity.

The reception status parameter indicates the success or failure of the received frame. The MAC always reports “success” because all failures of reception are discarded without generating MA-UNITDATA.indication primitive.

The priority parameter specifies the receive processing priority that was used for the data unit transfer. The allowed values of priority are described in 5.1.1.3.

The service class parameter specifies the receive service class that was used for the data unit transfer. The allowed values of service class are described in 5.1.1.4 and 5.1.3.

5.2.3.3 When generated

The MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities to indicate the arrival of a frame at the local MAC sublayer entity. Frames are reported only if they are validly formatted at the MAC sublayer, received without error, received with valid (or null) security and integrity information, and their destination address designates the local MAC sublayer entity.

5.2.3.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent on the content of the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame with the Type subfield equal to Data having a group DA, the AP's MAC sublayer shall discard the frame if dot11NonAPStationAuthSourceMulticast is false in the dot11InterworkingEntry identified by the source MAC address of the received frame. If dot11NonAPStationAuthSourceMulticast is true, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

- If the rate limiting mechanism does not discard the frame, then dot11NonAPStationMulticast-MSDUCOUNT shall be incremented by 1 and dot11NonAPStationMulticastOctetCount shall be incremented by the number of octets in the MSDU.
- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedMulticast-MSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedMulticastOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data and a priority of Contention or ContentionFree, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. The specific mechanism to perform rate limiting is outside the scope of this standard.

- If the rate limiting mechanism does not discard the frame, then dot11NonAPStationBestEffort-MSDUCOUNT shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffort-MSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data, for which the priority is an integer in the range 0 to 7, then the AP's MAC sublayer shall derive the access category from the priority using the mapping in Table 10-1. The AP's MAC sublayer shall retrieve the MIB variables from the dot11InterworkingEntry identified by the source MAC address of the received frame and perform the following operations:

- If the access category is AC_Vo, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVoiceRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVoiceMSDUCOUNT shall be incremented by 1 and dot11NonAPStationVoiceOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVoiceMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedVoiceOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_VI, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthVideoRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationVideoMSDUCOUNT shall be incremented by 1 and dot11NonAPStationVideoOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedVideoMSDUCOUNT shall be incremented by 1 and dot11NonAPStationDroppedVideoOctetCount shall be incremented by the number of octets in the MSDU.

- If the access category is AC_BE, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBestEffortRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationBestEffortOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBestEffortMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBestEffortOctetCount shall be incremented by the number of octets in the MSDU.
- If the access category is AC_BK, then the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationMaxAuthBackgroundRate; the specific mechanism to perform rate limiting is outside the scope of this standard. If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationBackgroundOctetCount shall be incremented by the number of octets in the MSDU. If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedBackgroundMSDUCount shall be incremented by 1 and dot11NonAPStationDroppedBackgroundOctetCount shall be incremented by the number of octets in the MSDU.

At an AP for which dot11SSPNInterfaceActivated is true, upon receipt of an individually addressed frame with the Type subfield equal to Data for which the priority is an integer in the range 8 to 15, the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxHCCAHEMMRate; the specific mechanism to perform rate limiting is outside the scope of this standard.

- If the rate-limiting mechanism does not discard the frame, then dot11NonAPStationHCCAHEMM-MSDUCount shall be incremented by 1, and dot11NonAPStationHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.
- If the rate limiting mechanism discards the frame, then dot11NonAPStationDroppedHCCAHEMM-MSDUCount shall be incremented by 1 and dot11NonAPStationDroppedHCCAHEMMOctetCount shall be incremented by the number of octets in the MSDU.

5.2.4 MA-UNITDATA-STATUS.indication

5.2.4.1 Function

This primitive has local significance and provides the LLC sublayer with status information for the corresponding preceding MA-UNITDATA.request primitive.

5.2.4.2 Semantics of the service primitive

The parameters of the primitive are as follows:

MA-UNITDATA-STATUS.indication(

source address,
destination address,
transmission status,
provided priority,
provided service class
)

The SA parameter is an individual MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The DA parameter is either an individual or group MAC sublayer entity address as specified in the associated MA-UNITDATA.request primitive.

The transmission status parameter is used to pass status information back to the local requesting LLC sublayer entity. IEEE Std 802.11 specifies the following values for transmission status:

- a) Successful.
- b) Undeliverable (excessive data length).
- c) Undeliverable (non-null source routing).
- d) Undeliverable: unsupported priority (for priorities other than Contention or ContentionFree at a non-QoS STA; or for priorities other than Contention, ContentionFree, or an integer in the range 0 to 15 at a QoS STA).
- e) Undeliverable: unsupported service class (for service classes other than ReorderableGroupAddressed or StrictlyOrdered for non-QoS STAs and service classes other than QoSAck or QoSNoAck for QoS STAs).
- f) Unavailable priority (for ContentionFree when no PC or HC is available, or an integer in the range 1 to 15 at a STA that is associated in a non-QoS BSS, or an integer in the range 8 to 15 at a STA that is a member of an IBSS, in which case the MSDU is transmitted with a provided priority of Contention).
- g) Undeliverable: unavailable service class (for StrictlyOrdered service when the STA's power management mode is other than "active" for non-QoS STAs; QoS STAs do not return this value as they do not provide the StrictlyOrdered service).
- h) Undeliverable (no BSS available).
- i) Undeliverable (cannot encrypt with a null key).
- j) In a STA in which dot11RejectUnadmittedTraffic is true, Undeliverable: unadmitted traffic (for a requested priority in the range 0 to 7 because there is no admitted TS for this priority and admission control is required for the AC).
- k) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVoiceRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
- l) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthVideoRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
- m) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationMaxAuthBestEffortRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
- n) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxBackgroundRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).
- o) In an AP in which dot11SSPNInterfaceActivated is true, Undeliverable (violation of limit specified by dot11NonAPStationAuthMaxHCCAHEMMRate in the dot11InterworkingTable for the non-AP STA identified by the destination address of the MA-UNITDATA.request primitive).

If the transmission status parameter is Successful, the provided priority parameter specifies the priority used for the associated data unit transfer (Contention, ContentionFree, or an integer in the range 0 to 15); otherwise the provided priority parameter is not present.

If the transmission status parameter is Successful, the provided service class parameter specifies the class of service for the associated data unit transfer; otherwise the provided service class parameter is not present. In non-QoS STAs, the value of this parameter is ReorderableGroupAddressed or StrictlyOrdered. In QoS STAs, it is QoSack or QoSNoAck.

5.2.4.3 When generated

The MA-UNITDATA-STATUS.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity to indicate the status of the service provided for the corresponding MA-UNITDATA.request primitive.

5.2.4.4 Effect of receipt

The effect of receipt of this primitive by the LLC sublayer is dependent upon the type of operation employed by the LLC sublayer entity.

6. Layer management

6.1 Overview of management model

Both the MAC sublayer and PHY conceptually include management entities, called *MLME* and *PLME*, respectively. These entities provide the layer management service interfaces through which layer management functions are invoked.

In order to provide correct MAC operation, an SME is present within each STA. The SME is a layer-independent entity that resides in a separate management plane or resides “off to the side.” Some of the functions of the SME are specified in this standard. Typically this entity is responsible for such functions as the gathering of layer-dependent status from the various layer management entities (LMEs), and similarly setting the value of layer-specific parameters. The SME typically performs such functions on behalf of general system management entities and would implement standard management protocols. Figure 4-19 (in 4.9) depicts the relationship among management entities.

The various entities within this model interact in various ways. Certain of these interactions are defined explicitly within this standard, via a SAP across which defined primitives are exchanged. This definition includes the GET and SET operations between MLME, PLME and SME as well as other individually defined service primitives, represented as double arrows within Figure 6-1. Other interactions are not defined explicitly within this standard, such as the interfaces between the MAC and MLME and between the PLME and PHY; the specific manner in which these MAC and PHY LMEs are integrated into the overall MAC sublayer and PHY is not specified within this standard. A STA includes only one instance of a PHY entity.

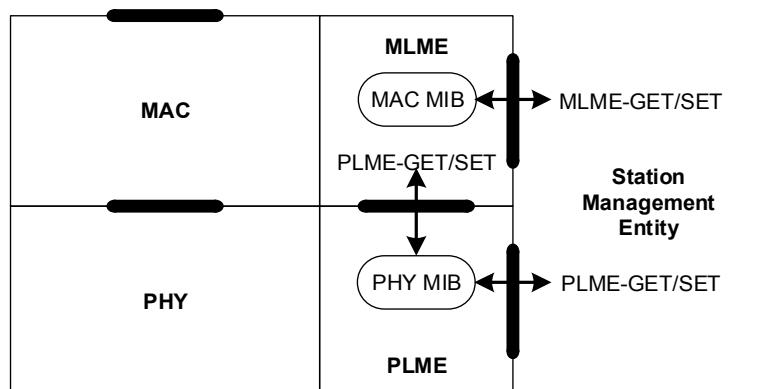

Figure 6-1—GET and SET operations

The management SAPs within this model are the following:

- SME-MLME SAP
- SME-PLME SAP
- MLME-PLME SAP

The latter two SAPs support identical primitives, and in fact might be viewed as a single SAP (called the *PLME SAP*) that is used either directly by MLME or by SME. In this fashion, the model reflects what is anticipated to be a common implementation approach in which PLME functions are controlled by the MLME (on behalf of SME).

6.2 Generic management primitives

The management information specific to each layer is represented as a MIB for that layer. The MLME and PLME are viewed as “containing” the MIB for that layer. The generic model of MIB-related management primitives exchanged across the management SAPs is to allow the SAP user-entity to either GET the value of a MIB attribute, or to SET the value of a MIB attribute. The invocation of a SET.request primitive might require that the layer entity perform certain defined actions.

Figure 6-1 depicts these generic primitives.

The GET and SET primitives are represented as REQUESTs with associated CONFIRM primitives. These primitives are prefixed by MLME or PLME depending upon whether the MAC sublayer or PHY management SAP is involved. In the following, XX denotes MLME or PLME:

XX-GET.request(MIBattribute)

Requests the value of the given MIBattribute.

XX-GET.confirm(status, MIBattribute, MIBattributevalue)

Returns the appropriate MIB attribute value if status = “success,” otherwise returns an error indication in the Status field. Possible error status values include “invalid MIB attribute” and “attempt to get write-only MIB attribute.”

XX-SET.request(MIBattribute, MIBattributevalue)

Requests that the indicated MIB attribute be set to the given value. If this MIBattribute implies a specific action, then this requests that the action be performed.

XX-SET.confirm(status, MIBattribute)

If status = “success,” this confirms that the indicated MIB attribute was set to the requested value; otherwise it returns an error condition in status field. If this MIBattribute implies a specific action, then this confirms that the action was performed. Possible error status values include “invalid MIB attribute” and “attempt to set read-only MIB attribute.”

Additionally, there are certain requests that can be invoked across a given SAP that do not involve the setting or getting of a specific MIB attribute. One of these is supported by each SAP, as follows:

- XX-RESET.request: where XX is MLME or PLME as appropriate

This service is used to initialize the management entities, the MIBs, and the datapath entities. It might include a list of attributes for items to be initialized to nondefault values.

Other SAP-specific primitives are identified in 6.3.

6.3 MLME SAP interface

6.3.1 Introduction

The services provided by the MLME to the SME are specified in this subclause. These services are described in an abstract way (following the model described in ITU-T Recommendation X.210 [B54]) and do not imply any particular implementation or exposed interface. MLME SAP primitives are of the general form ACTION.request primitive followed by ACTION.confirm primitive (for an exchange initiated by the SAP client) and ACTION.indication primitive followed by ACTION.response primitive (for an exchange initiated by the MLME). The SME uses the services provided by the MLME through the MLME SAP.

6.3.2 Power management

6.3.2.1 Introduction

This mechanism supports the process of establishment and maintenance of the power management mode of a STA.

6.3.2.2 MLME-POWERMGT.request

6.3.2.2.1 Function

This primitive requests a change in the power management mode.

6.3.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.request(
    PowerManagementMode,
    ReceiveDTIMs
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------|-----------------------|---|
| PowerManagementMode | Enumeration | ACTIVE, POWER_SAVE | An enumerated type that describes the requested power management mode of the STA. |
| ReceiveDTIMs | Boolean | true, false | Non-DMG BSS: When true, this parameter causes the STA to awaken to receive all DTIM frames. When false, the STA is not required to awaken for every DTIM Beacon frame. DMG BSS: Not applicable |

6.3.2.2.3 When generated

This primitive is generated by the SME to implement the power-saving strategy of an implementation.

6.3.2.2.4 Effect of receipt

This request sets the STA's power management parameters. The MLME subsequently issues an MLME-POWERMGT.confirm primitive that reflects the results of the power management change request.

6.3.2.3 MLME-POWERMGT.confirm

6.3.2.3.1 Function

This primitive confirms the change in power management mode.

6.3.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-POWERMGT.confirm(
    ResultCode
)
```

| Name | Type | Valid range | Description |
|------------|-------------|---------------------------|--|
| ResultCode | Enumeration | SUCCESS, NOT_SUPPORTED | Indicates the result of the MLME-POWERMGT.request primitive. |

6.3.2.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-POWERMGT.request primitive to establish a new power management mode. It is not generated until the change has completed as defined in 11.2.3.

6.3.2.3.4 Effect of receipt

The SME is notified of the change of power management mode.

6.3.3 Scan

6.3.3.1 Introduction

This mechanism supports the process of determining the characteristics of the available BSSs.

6.3.3.2 MLME-SCAN.request

6.3.3.2.1 Function

This primitive requests a survey of potential BSSs that the STA can later elect to try to join.

6.3.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN.request(
    BSSType,
    BSSID,
    SSID,
    ScanType,
    ProbeDelay,
    ChannelList,
    MinChannelTime,
    MaxChannelTime,
    RequestInformation,
    SSID List,
    ChannelUsage,
    AccessNetworkType,
    HESSID,
    MeshID,
    DiscoveryMode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|----------------------------------|--|--|
| BSSType | Enumeration | INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH, ANY_BSS | Determines whether infrastructure BSS, PBSS, IBSS, MBSS, or all, are included in the scan. |
| BSSID | MACAddress | Any valid individual or broadcast MAC address | Identifies a specific or wildcard BSSID. |
| SSID | Octet string | 0–32 octets | Specifies the desired SSID or the wildcard SSID. |
| ScanType | Enumeration | ACTIVE, PASSIVE | Indicates either active or passive scanning. |
| ProbeDelay | Integer | N/A | Delay (in microseconds) to be used prior to transmitting a Probe frame during active scanning. |
| ChannelList | Set of integers | Each channel is selected from the valid channel range for the appropriate PHY and carrier set. | Specifies a list of channels that are examined when scanning for a BSS. |
| MinChannelTime | Integer | N/A | The minimum time (in TU) to spend on each channel when scanning. |
| MaxChannelTime | Integer | ≥ MinChannelTime | The maximum time (in TU) to spend on each channel when scanning. |
| RequestInformation | A list of (Extended) Element IDs | As defined in 9.4.2.10 and 9.4.2.11. | This parameter is optionally present if dot11RadioMeasurementActivated is true and is placed in a Probe Request frame to request that the responding STA include the requested information in the Probe Response frame. |
| SSID List | A set of SSID Element | As defined in 9.4.2.2. | One or more SSID elements that are optionally present when dot11SSIDListActivated is true. |
| ChannelUsage | A set of Channel Usage element | As defined in 9.4.2.86 | Specifies request types for the Channel Usage request. |
| AccessNetworkType | As defined in Table 9-214 | 0 to 15 | Specifies the target specific access network type or the wildcard access network type. This field is present when dot11InterworkingServiceActivated is true. |
| HESSID | MAC Address | Any valid individual MAC address or the broadcast MAC address | Specifies the target specific HESSID network identifier or the wildcard network identifier. This field is present when dot11InterworkingServiceActivated is true. |
| Mesh ID | Octet string | 0–32 octets | Only present if BSSType = MESH or BSSType = ANY_BSS. Specifies the target Mesh ID or wildcard Mesh ID. |
| DiscoveryMode | Integer | 0–1 | Indicates, if equal to 1, that a DMG Beacon frame is transmitted during active scanning with the Discovery Mode field set to 1 and, if equal to 0, that a DMG Beacon frame is not transmitted during active scanning. Present only when dot11DMGOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.3.2.3 When generated

This primitive is generated by the SME for a STA to determine if there are other BSSs that it can join.

6.3.3.2.4 Effect of receipt

This request initiates the scan process when the current frame exchange sequence is completed.

6.3.3.3 MLME-SCAN.confirm

6.3.3.3.1 Function

This primitive returns the descriptions of the set of BSSs detected by the scan process.

6.3.3.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCAN.confirm(
    BSSDescriptionSet,
    BSSDescriptionFromMeasurementPilotSet,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|--|------------------------|--|
| BSSDescriptionSet | Set of BSSDescriptions | N/A | The BSSDescriptionSet is returned to indicate the results of the scan request. It is a set containing zero or more instances of a BSSDescription. |
| BSSDescriptionFromMeasurementPilotSet | Set of BSSDescriptionFromMeasurementPilots | N/A | The BSSDescriptionFromMeasurementPilotSet is returned to indicate the results of the scan request derived from measurement pilots. It is a set containing zero or more instances of a BSSDescriptionFromMeasurementPilot. Present if dot11RMMeasurementPilotActivated is nonzero; otherwise not present. |
| ResultCode | Enumeration | SUCCESS, NOT_SUPPORTED | Indicates the result of the MLME-SCAN.confirm primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

Each BSSDescription consists of the parameters shown in the following table, in which the term *peer STA* refers to the STA transmitting the Beacon frame or Probe Response frame from which the BSSDescription was determined and the term *local STA* refers to the STA performing the scan, and in which the “IBSS adoption” column indicates whether

- a) This parameter is adopted by a STA that is joining an IBSS.
- b) This parameter is adopted by a STA that is a member of an IBSS that receives a beacon from a STA that is a member of the same IBSS and that has a timestamp value that is greater than the local TSF value (see 11.1.5).

| Name | Type | Valid range | Description | IBSS adoption |
|-----------------------|---|---|--|---------------|
| BSSID | MACAddress | N/A | The BSSID of the found BSS or the MAC address of the found mesh STA. | Adopt |
| SSID | Octet string | 0–32 octets | The SSID of the found BSS. | Adopt |
| BSSType | Enumeration | INFRASTRUCTURE, PERSONAL, INDEPENDENT, MESH | The type of the found BSS. | Adopt |
| Beacon Period | Integer | N/A | The beacon period (in TU) of the found BSS if the BSSType is not MESH, or of the found mesh STA if the BSSType = MESH. | Adopt |
| DTIM Period | Integer | As defined in 9.4.2.6 | The DTIM period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType = MESH. | Adopt |
| Timestamp | Integer | N/A | The timestamp of the received frame (Probe Response/ Beacon) from the found BSS. | Adopt |
| Local Time | Integer | N/A | The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame (Probe Response or Beacon) from the found BSS. | Do not adopt |
| PHY Parameter Set | As defined in frame format or according to the relevant PHY clause. | As defined in frame format or according to the relevant PHY clause. | The parameter sets relevant to the PHY from the received Beacon or Probe Response frame. If no PHY Parameter Set element is present in the received frame, this parameter contains the channel number on which the frame was received. Valid channel numbers are defined in the relevant PHY clause. | Adopt |
| CF Parameter Set | CF Parameter Set element | As defined in 9.4.2.5 | The parameter set for the CF periods, if found BSS supports CF mode. | Do not adopt |
| IBSS Parameter Set | IBSS Parameter Set element | As defined in 9.4.2.7 | The parameter set for the IBSS, if found BSS is an IBSS. | Adopt |
| CapabilityInformation | Capability Information field | As defined in 9.4.1.4 | The advertised capabilities of the BSS. | Do not adopt |
| BSSBasicRateSet | Set of integers | Non-DMG BSS: 1–127 excluding values from Table 9-78, for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty. | Adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|----------------------------|---|---|---|---------------|
| OperationalRateSet | Non-DMG BSS: Set of integers DMG BSS: Set of numbers | Non-DMG BSS: 1-127 excluding values from Table 9-78, for each member of the set DMG BSS: 0-24, 9.1, or 12.1-12.6, for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the peer STA is able to use for communication within the BSS. The peer STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the peer STA uses for communication within the BSS. | Do not adopt |
| Country | As defined in the Country element | As defined in the Country element | The information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.8, or dot11MultiDomainCapability Activated is true or dot11RadioMeasurementActivated is true; otherwise not present. | Adopt |
| IBSS DFS Recovery Interval | Integer | 1-255 | The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.9 and BSSType = INDEPENDENT; otherwise not present. | Adopt |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites and AKM suites supported in the BSS. | Do not adopt |
| Load | BSS Load element | As defined in 9.4.2.28 | The values from the BSS Load element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| EDCAPerParameterSet | EDCA Parameter Set element | As defined in 9.4.2.29 | The values from the EDCA Parameter Set element if such an element was present in the Probe Response or Beacon frame, else null. | Adopt |
| QoS Capability | QoS Capability element | As defined in 9.4.2.35 | The values from the QoS Capability element if such an element was present in the Probe Response or Beacon frame, else null. | Adopt |
| AP Channel Report | AP Channel Report element | As defined in 9.4.2.36 | The values from the AP Channel Report element if such an element was present in the probe response or Beacon frame, else null. | Adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|--|--|------------------------|--|---------------|
| BSS Average Access Delay | BSS Average Access Delay element | As defined in 9.4.2.39 | The values from the BSS Average Access Delay element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| Antenna | Antenna element | As defined in 9.4.2.40 | The values from the Antenna element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| BSS Available Admission Capacity | BSS Available Admission Capacity element | As defined in 9.4.2.43 | The values from the BSS Available Admission Capacity element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| BSS AC Access Delay | BSS AC Access Delay element | As defined in 9.4.2.44 | The values from the BSS AC Access Delay element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| Measurement Pilot Transmission Information | Measurement Pilot Transmission element | As defined in 9.4.2.42 | The values from the Measurement Pilot Transmission element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| Multiple BSSID | As defined in Multiple BSSID element | As defined in 9.4.2.46 | The values from the Multiple BSSID element if such an element was present in the probe response or Beacon frame, else null. | Do not adopt |
| RM Enabled Capabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | The values from the RM Enabled Capabilities element if such an element was present in the probe response or Beacon frame, else null. | Adopt |
| RCPIMeasurement | Integer | As defined in 9.4.2.38 | The RCPI of the received frame. | Adopt |
| RSNIMeasurement | Integer | As defined in 9.4.2.41 | The RSNI of the received frame. | Adopt |
| Requested elements | Set of elements | As defined in 9.4.1.36 | Elements requested by the Request element or Extended Request element of the Probe Request frame. | Adopt |
| DSERegisteredLocation | DSE Registered Location element | As defined in 9.4.2.52 | The information from the DSE Registered Location element, if such a field is present in the Probe Response or Beacon frame, else null. Present if DSE functionality is required, as specified in 11.12, or dot11LCIDSERequired is true; otherwise not present. | Adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|---------------------------------|--------------------------------|--|--|---------------|
| HT Capabilities | As defined in frame format | As defined in 9.4.2.56 | The values from the HT Capabilities element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOption Implemented is true; otherwise not present. | Do not adopt |
| HT Operation | As defined in frame format | As defined in 9.4.2.57 | The values from the HT Operation element if such an element was present in the Probe Response or Beacon frame, else null. The parameter is optionally present if dot11HighThroughputOption Implemented is true; otherwise not present. | Adopt |
| BSSMembershipS electorSet | Set of integers | A value from Table 9-78 for each member of the set | The set of features that are supported by all STAs joining this BSS. | Adopt |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. | Do not adopt |
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true. | Do not adopt |
| Overlapping BSS Scan Parameters | As defined in frame format | As defined in 9.4.2.59 | Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOption Implemented is true and is not present if dot11FortyMHzOption Implemented is false. | Adopt |
| FMSDescriptor | FMS Descriptor element | As defined in 9.4.2.75 | The values from the FMS Descriptor element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| QoSTrafficCapabil ity | QoS Traffic Capability element | As defined in 9.4.2.78 | The values from the QoS Traffic Capability element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| ChannelUsage | A set of Channel Usage element | As defined in 9.4.2.86 | Specifies parameters for the Channel Usage. | Do not adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|-------------------------------|---------------------------------------|----------------------------|---|---------------|
| TimeAdvertiser | Time Advertiser element | As defined in 9.4.2.61 | The values from the Time Advertisement element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| TimeZone | Time Zone element | As defined in 9.4.2.87 | The values from the Time Zone element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| MeshID | Mesh ID element | As defined in 9.4.2.99 | The value of MeshID element if such element was present in the probe response or Beacon frame, else null. | Do not adopt |
| MeshConfiguration | Mesh Configuration element | As defined in 9.4.2.98 | The values from the Mesh Configuration element if such an element was present in the probe response or Beacon frame, else null. | Do not adopt |
| Mesh Awake Window | Mesh Awake Window element | As defined in 9.4.2.104 | The values from the Mesh Awake Window element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| BeaconTiming | Beacon Timing element | As defined in 9.4.2.105 | The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| MCCAOP Advertisement Overview | MCCAOP Advertisement Overview element | As defined in frame format | The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| MCCAOP Advertisement | MCCAOP Advertisement | As defined in frame format | The values from the Beacon Timing element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | The values from the QMF Policy element if such an element was present in the Probe Response or Beacon frame, else null. | Do not adopt |
| QLoad Report | As defined in frame format | As defined in 9.4.2.123 | The values from the QLoad Report element if such an element was present in the Probe Response frame, else null. | Do not adopt. |
| Sector Sweep | As defined in frame format | As defined in 9.3.4.2 | The values from the Sector Sweep field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true. | Adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|-------------------------|----------------------------|-------------------------|---|---------------|
| Beacon Interval Control | As defined in frame format | As defined in 9.3.4.2 | The values from the Beacon Interval Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true. | Adopt |
| DMG Parameters | As defined in frame format | As defined in 9.3.4.2 | The values from the DMG Parameters field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true. | Adopt |
| Clustering Control | As defined in frame format | As defined in 9.3.4.2 | The values from the Clustering Control field from the DMG Beacon frame, else null. The parameter is present only if dot11DMGOptionImplemented is true. | Do not adopt |
| DMG Capabilities | As defined in frame format | As defined in 9.4.2.128 | The values from the DMG Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Do not adopt |
| DMG Operation | As defined in frame format | As defined in 9.4.2.128 | The values from the DMG Operation element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |
| Extended Schedule | As defined in frame format | As defined in 9.4.2.132 | The values from the Extended Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |
| Next DMG ATI | As defined in frame format | As defined in 9.4.2.135 | The values from the Next DMG ATI element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|---------------------------|----------------------------|-------------------------|--|---------------|
| DMG BSS Parameter Change | As defined in frame format | As defined in 9.4.2.127 | The values from the DMG BSS Parameter Change element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |
| Multi-band | As defined in frame format | As defined in 9.4.2.138 | The values from the Multi-band element if such an element was present in the Probe Response or DMG Beacon frame, else null. The Multi-band element is optionally present if dot11MultibandImplemented is true. | Adopt |
| DMG Wakeup Schedule | As defined in frame format | As defined in 9.4.2.131 | The values from the DMG Wakeup Schedule element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |
| Antenna Sector ID Pattern | As defined in frame format | As defined in 9.4.2.157 | The values from the Antenna Sector ID Pattern element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11DMGOptionImplemented is true. | Adopt |
| Relay Capabilities | As defined in frame format | As defined in 9.4.2.148 | The values from the Relay Capabilities element if such an element was present in the Probe Response or DMG Beacon frame, else null. The parameter is optionally present only if dot11RelayActivated is true. | Do not adopt |
| VHT Capabilities | As defined in frame format | As defined in 9.4.2.158 | The values from the VHT Capabilities element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Capabilities element was present in the Probe Response or Beacon frame from which the BSSIDDescription was determined. The parameter is not present otherwise. | Do not adopt |

| Name | Type | Valid range | Description | IBSS adoption |
|----------------|----------------------------|-------------------------|---|---------------|
| VHT Operation | As defined in frame format | As defined in 9.4.2.159 | The values from the VHT Operation element. The parameter is present if dot11VHTOptionImplemented is true and a VHT Operation element was present in the Probe Response or Beacon frame from which the BSSID was determined. The parameter is not present otherwise. | Adopt |
| TVHT Operation | As defined in frame format | As defined in 9.4.2.172 | The values from the TVHT Operation element if such an element was present in the Probe Response or Beacon frame; otherwise, null. The parameter is optionally present only if dot11TVHTOptionImplemented is true. | Adopt |

Each BSSIDDescriptionFromMeasurementPilot consists of the following parameters, in which the term *peer STA* refers to the STA transmitting the Measurement Pilot frame from which the BSSIDDescription was determined and the term *local STA* refers to the STA performing the scan:

| Name | Type | Valid range | Description |
|----------------------------------|--|---|---|
| BSSID | MACAddress | N/A | The BSSID of the found BSS. |
| BSS Type | Enumeration | INFRASTRUCTURE | The type of the found BSS. |
| Local Time | Integer | N/A | The value of the local STA's TSF timer at the start of reception of the first octet of the timestamp field of the received frame from the found BSS. |
| Condensed Capability Information | Condensed Capability Information field | As defined in 9.6.8.3 | The advertised condensed capabilities of the BSS. |
| Condensed Country String | Condensed Country String field | As defined in 9.6.8.3 | Together with the Operating Class, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. |
| Operating Class | Operating Class field | The field is defined in 9.6.8.3, valid values for the field are defined in Annex E. | Together with the Condensed Country String, the information required to identify the regulatory domain in which the peer STA is located and to configure its PHY for operation in that regulatory domain. |
| Channel | Channel field | The field is defined in 9.6.8.3, valid values for the field are defined in Annex E. | The operating channel of the BSS indicated in the received frame |
| Measurement Pilot Interval | Measurement Pilot Interval field | As defined in 9.6.8.3 | The Measurement Pilot interval of the BSS indicated in the received frame |

| Name | Type | Valid range | Description |
|------------------------|------------------------|------------------------|--|
| Multiple BSSID element | Multiple BSSID element | As defined in 9.4.2.46 | Indicates that the BSS is within a multiple BSSID set (see 11.11.14). The range of BSSIDs is determined by the BSSID and Multiple BSSID element. |
| PHY Type | Integer | As defined in Annex C | The dot11PHYType of the received frame. |
| RCPIMeasurement | Integer | As defined in 9.4.2.38 | The RCPI of the received frame. |
| RSNIMeasurement | Integer | As defined in 9.4.2.41 | The RSNI of the received frame. |

6.3.3.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-SCAN.request primitive to ascertain the operating environment of the STA.

6.3.3.3.4 Effect of receipt

The SME is notified of the results of the scan procedure.

6.3.4 Synchronization

6.3.4.1 Introduction

This mechanism supports the process of selection of a peer in the authentication process.

6.3.4.2 MLME-JOIN.request

6.3.4.2.1 Function

This primitive requests synchronization with a BSS, of which type is infrastructure or independent.

6.3.4.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.request(
    SelectedBSS,
    JoinFailureTimeout,
    NAVSyncDelay,
    OperationalRateSet,
    Capability Information,
    HT Capabilities,
    VHT Capabilities,
    Extended Capabilities,
    20/40 BSS Coexistence,
    InterworkingInfo,
    AdvertisementProtocolInfo,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|---|--|---|
| SelectedBSS | BSSDescription | N/A | The BSSDescription of the BSS to join. The SelectedBSS is a member of the set of descriptions that was returned as a result of an MLME-SCAN.request primitive. |
| JoinFailureTimeout | Integer | ≥ 1 | The time limit, in units of beacon intervals, after which the join procedure is terminated. |
| NAVSyncDelay | Integer | N/A | Delay (in microseconds) to be used prior to transmitting when changing from doze to awake state, if no frame is detected by which the network allocation vector (NAV) can be set. |
| OperationalRateSet | Non-DMG BSS: Set of integers DMG BSS: Set of numbers | Non-DMG BSS: a value in dot11SupportedData RatesRxTable, for each member of the set DMG BSS: 0-24, 9.1, or 12.1-12.6, for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter of the SelectedBSS parameter. DMG BSS: The set of MCS indexes that the STA uses for communication within the BSS. |
| CapabilityInformation | Capability Information field | As defined in 9.4.1.4 | The capabilities to be advertised for the BSS. |
| HT Capabilities | As defined in frame format HT Capabilities element | As defined in 9.4.2.56; the HT-MCSs in the element are present in dot11SupportedMC SRxTable and the highest supported data rate in the element does not exceed dot11HighestSupportedDataRate | The HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present. |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158; the VHT-MCSs in the element are present in dot11VHTRxVHTM CSMMap/ dot11VHTTxVHTM CSMMap and the highest supported rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported | Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |

| Name | Type | Valid range | Description |
|---------------------------|---------------------------------|---|---|
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true. |
| InterworkingInfo | As defined in frame format | As defined in Interworking element in 9.4.2.92 | Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true. |
| AdvertisementProtocolInfo | Integer or Sequence of integers | As defined in Advertisement Protocol element in Table 9-215 | Identifies zero or more Advertisement Protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.4.2.3 When generated

This primitive is generated by the SME for a STA to establish synchronization with a BSS.

6.3.4.2.4 Effect of receipt

This primitive initiates a synchronization procedure once the current frame exchange sequence is complete. The MLME synchronizes its timing with the specified BSS based on the information provided in the SelectedBSS parameter. The MLME subsequently issues an MLME-JOIN.confirm primitive that reflects the results.

If the MLME of a non-DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that contains any unsupported rates, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a Basic HT-MCS Set field in the HT Operation parameter that contains any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-JOIN.request primitive with a SelectedBSS parameter containing a Basic VHT-MCS And NSS Set field in the VHT Operation parameter that contains any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-JOIN.request primitive with the SelectedBSS parameter containing a BSSBasicRateSet parameter that is not empty, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-JOIN.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.3.4.3 MLME-JOIN.confirm

6.3.4.3.1 Function

This primitive confirms synchronization with a BSS.

6.3.4.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-JOIN.confirm(
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--------------------------------------|--|
| ResultCode | Enumeration | SUCCESS, JOIN_FAILURE_TI MEOUT | Indicates the result of the MLME-JOIN.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.4.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-JOIN.request primitive to establish synchronization with a BSS.

6.3.4.3.4 Effect of receipt

The SME is notified of the results of the synchronization procedure.

6.3.5 Authenticate

6.3.5.1 Introduction

This mechanism supports the process of establishing an authentication relationship with a peer MAC entity.

6.3.5.2 MLME-AUTHENTICATE.request

6.3.5.2.1 Function

This primitive requests authentication with a specified peer MAC entity.

6.3.5.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.request(
    PeerSTAAddress,
    AuthenticationType,
    AuthenticateFailureTimeout,
    Content of FT Authentication elements,
    Content of SAE Authentication frame,
    Multi-band local,
    Multi-band peer,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|---------------------------------|--|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the authentication process. |
| AuthenticationType | Enumeration | OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE | Specifies the type of authentication algorithm to use during the authentication process. |
| AuthenticateFailureTimeout | Integer | ≥ 1 | Specifies a time limit (in TU) after which the authentication procedure is terminated. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| Content of SAE Authentication frame | Sequence of elements and fields | As defined in 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, 9.4.1.42, and 9.4.1.43 | The set of elements and fields to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.5.2.3 When generated

This primitive is generated by the SME for a STA to establish authentication with a specified peer MAC entity in order to permit Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, to be exchanged between the two STAs. During the authentication procedure, the SME might generate additional MLME-AUTHENTICATE.request primitives.

6.3.5.2.4 Effect of receipt

This primitive initiates an authentication procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-AUTHENTICATE.confirm primitive that reflects the results.

6.3.5.3 MLME-AUTHENTICATE.confirm

6.3.5.3.1 Function

This primitive reports the results of an authentication attempt with a specified peer MAC entity.

6.3.5.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.confirm(
    PeerSTAAddress,
    AuthenticationType,
    ResultCode,
    Content of FT Authentication elements,
    Content of SAE Authentication frame,
    Multi-band local,
    Multi-band peer,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|---|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the authentication process was attempted. This value matches the peerSTAAddress parameter specified in the corresponding MLME-AUTHENTICATE.request primitive. |
| AuthenticationType | Enumeration | OPEN_SYSTEM, SHARED_KEY FAST_BSS_TRANSITION, SAE | Specifies the type of authentication algorithm that was used during the authentication process. This value matches the AuthenticationType parameter specified in the corresponding MLME-AUTHENTICATE.request primitive. |
| ResultCode | Enumeration | SUCCESS, REFUSED, ANTI-CLOGGING TOKEN REQUIRED, FINITE CYCLIC GROUP NOT SUPPORTED, AUTHENTICATION REJECTED, AUTH FAILURE TIMEOUT | Indicates the result of the MLME-AUTHENTICATE.request primitive. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| Content of SAE Authentication frame | Sequence of elements | As defined in 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, 9.4.1.42, and 9.4.1.43 | The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.5.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-AUTHENTICATE.request primitive to authenticate with a specified peer MAC entity.

6.3.5.3.4 Effect of receipt

The SME is notified of the results of the authentication procedure.

6.3.5.4 MLME-AUTHENTICATE.indication

6.3.5.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an authentication relationship with the STA processing this primitive.

6.3.5.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-AUTHENTICATE.indication(

PeerSTAAddress,
 AuthenticationType,
 Content of FT Authentication elements,
 Content of SAE Authentication frame,
 Multi-band local,
 Multi-band peer,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|--|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the authentication relationship was established. |
| AuthenticationType | Enumeration | OPEN_SYSTEM, SHARED_KEY, FAST_BSS_TRANSITION, SAE | Specifies the type of authentication algorithm that was used during the authentication process. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the first message of the FT authentication sequence, as described in 13.8.2. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| Content of SAE Authentication frame | Sequence of elements | As defined in 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, 9.4.1.42, and 9.4.1.43 | The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if AuthenticationType indicates SAE authentication; otherwise not present. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. This parameter is present if OCT is being used and is absent otherwise. |

| Name | Type | Valid range | Description |
|--------------------|--------------------|-------------------------|--|
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.5.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an authentication request from a specific peer MAC entity.

6.3.5.4.4 Effect of receipt

The SME is notified of the receipt of the authentication request.

6.3.5.5 MLME-AUTHENTICATE.response

6.3.5.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested authentication with the STA that issued this primitive.

6.3.5.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-AUTHENTICATE.response(
    PeerSTAAddress,
    ResultCode,
    Content of FT Authentication elements,
    Content of SAE Authentication frame,
    Multi-band local,
    Multi-band peer,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|---|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the authentication request was received. |
| ResultCode | Enumeration | SUCCESS, REFUSED, ANTI-CLOGGING TOKEN REQUIRED, FINITE CYCLIC GROUP NOT SUPPORTED, AUTHENTICATION REJECTED | Indicates the result response to the authentication request from the peer MAC entity. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the second message of the FT authentication sequence, as described in 13.8.3. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|-------------------------------------|----------------------|--|--|
| Content of SAE Authentication frame | Sequence of elements | As defined in 9.4.1.38, 9.4.1.39, 9.4.1.40, 9.4.1.41, 9.4.1.42, and 9.4.1.43 | The set of elements to be included in the SAE Commit message or SAE Confirm message. Present if the AuthenticationType of the MLME-AUTHENTICATE.indication primitive that generated this response indicated SAE authentication; otherwise not present. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.5.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-AUTHENTICATE.indication primitive.

6.3.5.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested authentication.

6.3.6 Deauthenticate

6.3.6.1 Introduction

This mechanism supports the process of invalidating an authentication relationship with a peer MAC entity.

6.3.6.2 MLME-DEAUTHENTICATE.request

6.3.6.2.1 Function

This primitive requests that the authentication relationship with a specified peer MAC entity be invalidated.

6.3.6.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEAUTHENTICATE.request(
    PeerSTAAddress,
    ReasonCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the deauthentication process. |
| ReasonCode | Reason Code field | As defined in 9.4.1.7 | Specifies the reason for initiating the deauthentication procedure. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.6.2.3 When generated

This primitive is generated by the SME for a STA to invalidate authentication with a specified peer MAC entity in order to prevent the exchange of Class 2 frames, or mesh peering Management frames for AMPE utilizing SAE authentication, between the two STAs. During the deauthentication procedure, the SME might generate additional MLME-DEAUTHENTICATE.request primitives.

6.3.6.2.4 Effect of receipt

This primitive initiates a deauthentication procedure. The MLME subsequently issues an MLME-DEAUTHENTICATE.confirm primitive that reflects the results.

6.3.6.3 MLME-DEAUTHENTICATE.confirm

6.3.6.3.1 Function

This primitive reports the results of a deauthentication attempt with a specified peer MAC entity.

6.3.6.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-DEAUTHENTICATE.confirm(
    PeerSTAAddress
)
```

| Name | Type | Valid range | Description |
|----------------|------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the deauthentication process was attempted. |

6.3.6.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DEAUTHENTICATE.request primitive to invalidate the authentication relationship with a specified peer MAC entity.

6.3.6.3.4 Effect of receipt

The SME is notified of the results of the deauthentication procedure.

6.3.6.4 MLME-DEAUTHENTICATE.indication

6.3.6.4.1 Function

This primitive reports the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DEAUTHENTICATE.indication(

PeerSTAAddress,
 ReasonCode,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the authentication relationship was invalidated. |
| ReasonCode | Reason Code field | As defined in 9.4.1.7 | Specifies the reason the deauthentication procedure was initiated. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.6.4.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an authentication relationship with a specific peer MAC entity.

6.3.6.4.4 Effect of receipt

The SME is notified of the invalidation of the specific authentication relationship.

6.3.7 Associate

6.3.7.1 Introduction

The following primitives describe how a STA becomes associated with an AP.

6.3.7.2 MLME-ASSOCIATE.request

6.3.7.2.1 Function

This primitive requests association with a specified peer MAC entity that is within an AP.

6.3.7.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.request(

PeerSTAAddress,
 ListenInterval,
 Supported Channels,
 RSN,
 QoS Capability,
 Content of FT Authentication elements,
 SupportedOperatingClasses,
 SM Power Save,
 QoSTrafficCapability,
 TIMBroadcastRequest,
 EmergencyServices,

DMG Capabilities,
 Multi-band local,
 Multi-band peer,
 MMS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------------------------|---|--|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the association process. |
| ListenInterval | Integer | ≥ 0 | Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode. |
| Supported Channels | As defined in the Supported Channels element | As defined in the Supported Channels element | The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.9; otherwise not present. |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites and AKM suites selected by the STA. |
| QoS Capability | QoS Capability element | As defined in 9.4.2.35 | Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.4 | The set of elements to be included in the initial mobility domain association request, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperating Classes | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes capabilities of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true. |
| SM Power Save | Integer | As defined in Table 9-162 | Indicates the spatial multiplexing power save mode that is in operation immediately after association. |
| QoS Traffic Capability | As defined in the QoS Traffic Capability element | As defined in 9.4.2.78 | Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise. |
| TIMBroadcastRequest | As defined in the TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise. |
| EmergencyServices | Boolean | true, false | Specifies that the non-AP STA intends to associate for the purpose of unauthenticated access to emergency services. The parameter is optionally be present if dot11InterworkingServiceActivated is true and is not present otherwise. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|---|
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

Additional parameters needed to perform the association procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.2.3 When generated

This primitive is generated by the SME when a STA wishes to establish association with an AP or PCP.

6.3.7.2.4 Effect of receipt

This primitive initiates an association procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-ASSOCIATE.confirm primitive that reflects the results.

6.3.7.3 MLME-ASSOCIATE.confirm

6.3.7.3.1 Function

This primitive reports the results of an association attempt with a specified peer MAC entity that is in an AP or PCP.

6.3.7.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.confirm(

ResultCode,
 CapabilityInformation,
 AssociationID,
 EDCAParameterSet,
 RCPI of Request,
 RSNI of Request,
 RCPI of Response,
 RSNI of Response,

RMEEnabledCapabilities,
 Content of FT Authentication elements,
 SupportedOperatingClasses,
 Extended Capabilities,
 20/40 BSS Coexistence,
 TimeoutInterval,
 BSSMaxIdlePeriod,
 TIMBroadcastResponse,
 QosMapSet,
 QMFPolicy,
 DMG Capabilities,
 Multi-band local,
 Multi-band peer,
 MMS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|------------------------|------------------------------|--|---|
| ResultCode | Enumeration | SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY | Indicates the result of the MLME-ASSOCIATE.request primitive. |
| Capability-Information | Capability Information field | As defined in 9.4.1.4 | Specifies the operational capabilities advertised by the AP or PCP. |
| AssociationID | Integer | Non-DMG: 1–2007 DMG: 1–254 | If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. |
| EDCAParameter Set | EDCA Parameter Set element | As defined in 9.4.2.29 | Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QoSOptionImplemented is true; otherwise not present. |
| RCPI of Request | Integer | As defined in 9.4.2.38 | Indicates the RCPI value contained in the received Association Response frame. This value represents the RCPI that the AP or PCP measured at the time it received the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|---------------------------------------|---|------------------------|---|
| RSNI of Request | Integer | As defined in 9.4.2.41 | Indicates the RSNI value contained in the received Association Response frame. This value represents the RSNI that the AP or PCP measured at the time it received the corresponding Association Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RCPI of Response | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Association Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |
| RSNI of Response | Integer | As defined in 9.4.2.41 | RSNI at the time the corresponding Association Response frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivate d is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.4 | The set of elements included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperatingClasses | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes capabilities of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true; otherwise not present. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true. |
| TimeoutInterval | Timeout Interval element, as defined in frame format | As defined in 9.4.2.49 | This parameter is present when ResultCode is REFUSED_TEMPORARILY. |

| Name | Type | Valid range | Description |
|----------------------|--|-------------------------|--|
| BSSMaxIdlePeriod | As defined in BSS Max Idle Period element | As defined in 9.4.2.79 | Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true and is not present otherwise. |
| TIMBroadcastResponse | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map the non-AP and non-PCP STA should use. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | The values from the QMF Policy element if such an element was present in the Association Response frame; otherwise, null. |
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.7.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ASSOCIATE.request primitive or receipt of an Association Response frame from the peer MAC entity to associate with a specified peer MAC entity that is in an AP or PCP.

6.3.7.3.4 Effect of receipt

The SME is notified of the results of the association procedure.

6.3.7.4 MLME-ASSOCIATE.indication

6.3.7.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting association with the local MAC entity, which is in an AP or PCP.

6.3.7.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ASSOCIATE.indication(
    PeerSTAAddress,
    CapabilityInformation,
    ListenInterval,
    SSID,
    OperationalRateSet,
    BSSMembershipSelectorSet,
    RSN,
    QoSCapability,
    RCPI,
    RSNI,
    RMEnabledCapabilities,
    Content of FT Authentication elements,
    SupportedOperatingClasses,
    DSERegisteredLocation,
    HT Capabilities,
    Extended Capabilities,
    20/40 BSS Coexistence,
    QoSTrafficCapability,
    TIMBroadcastRequest,
    EmergencyServices,
    DMG Capabilities,
    Multi-band local,
    Multi-band peer,
    MMS,
    VHT Capabilities,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|------------------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the association was received. |
| Capability-Information | Capability Information field | As defined in 9.4.1.4 | Specifies the operational capability definitions provided by the peer MAC entity as part of the association request. |
| ListenInterval | Integer | ≥ 0 | Specifies the listen interval provided by the peer MAC entity as part of the association request. |
| SSID | Octet string | 0–32 octets | Specifies the SSID provided by the peer MAC entity as part of the association request. |

| Name | Type | Valid range | Description |
|---------------------------------------|--|--|--|
| OperationalRateSet | Non-DMG BSS: Set of integers DMG BSS: Set of numbers | Non-DMG BSS: 1-127 excluding values from Table 9-78 for each member of the set DMG BSS: 0-24, 9.1, or 12.1-12.6, for each member of the set | The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the AP or PCP uses for communication within the BSS. |
| BSSMembershipSelectorSet | Set of integers | A value from Table 9-78, for each member of the set | The set of features that the STA that is requesting association is able to use for communication |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites and AKM suites selected by the STA. |
| QoS Capability | QoS Capability element | As defined in 9.4.2.35 | Specifies the parameters within the QoS Capability that are supported by the peer MAC entity. The parameter is optionally present if dot11QosOptionImplemented is true; otherwise not present. |
| RCPI | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |
| RSNI | Integer | As defined in 9.4.2.41 | The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.4 | The set of elements included in the initial mobility domain association, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperating Classes | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Indicates the supported operating classes capabilities of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated is true; otherwise not present. |
| DSERegisteredLocation | As defined in the DSE Registered Location element | As defined in 9.4.2.52 | Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present. |
| HT Capabilities | As defined in frame format | As defined in 9.4.2.56 | Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |

| Name | Type | Valid range | Description |
|------------------------|--|-------------------------|---|
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true. |
| QoS Traffic Capability | As defined in the QoS Traffic Capability element | As defined in 9.4.2.78 | Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise. |
| TIMBroadcastRequest | As defined in TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise. |
| EmergencyServices | Boolean | true, false | Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Association Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present. |
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158 | Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Association Request frame received from the STA. The parameter is not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.7.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an association request from a specific peer MAC entity.

6.3.7.4.4 Effect of receipt

The SME is notified of the receipt of the association request.

6.3.7.5 MLME-ASSOCIATE.response

6.3.7.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested an association with the STA that issued this primitive, which is in an AP or PCP.

6.3.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ASSOCIATE.response(

PeerSTAAddress,
 ResultCode,
 AssociationID,
 RCPI,
 RSNI,
 RMEnabledCapabilities,
 Content of FT Authentication elements,
 SupportedOperatingClasses,
 TimeoutInterval,
 BSSMaxIdlePeriod,
 TIMBroadcastResponse,
 QoSMapSet,
 Multi-band peer,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------|-------------|--|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the association request was received. |
| ResultCode | Enumeration | SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY | Indicates the result response to the association request from the peer MAC entity. |
| AssociationID | Integer | Non-DMG: 1–2007 DMG: 1–254 | If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP. |
| RCPI | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Association Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|---------------------------------------|---|-------------------------|---|
| RSNI | Integer | As defined in 9.4.2.41 | The RSNI value represents the measured RSNI at the time the corresponding Association Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.4 | The set of elements to be included in the initial mobility domain association response, as described in 13.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperatingClasses | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Indicates the supported operating classes capabilities of the AP or PCP. This parameter is present if dot11ExtendedChannelSwitchActivated is true. |
| TimeoutInterval | Timeout Interval element, as defined in frame format | As defined in 9.4.2.49 | This parameter is present when ResultCode is REFUSED_TEMPORARILY. |
| BSSMaxIdlePeriod | As defined in BSS Max Idle Period element | As defined in 9.4.2.79 | Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true and is not present otherwise. |
| TIMBroadcastResponse | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map the non-AP and non-PCP STA should use. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

Additional parameters needed to perform the association response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.7.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-ASSOCIATE.indication primitive.

6.3.7.5.4 Effect of receipt

This primitive initiates transmission of an AssociationResponse to the specific peer MAC entity that requested association.

6.3.8 Reassociate

6.3.8.1 Introduction

The following primitives describe how a STA becomes associated with another AP or PCP.

6.3.8.2 MLME-REASSOCIATE.request

6.3.8.2.1 Function

This primitive requests a change in association to a specified new peer MAC entity that is in an AP or PCP.

6.3.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REASSOCIATE.request(  
    NewPCPorAPAddress,  
    ListenInterval,  
    Supported Channels  
    RSN,  
    QoS Capability,  
    Content of FT Authentication elements,  
    SupportedOperatingClasses,  
    SM Power Save,  
    QoSTrafficCapability,  
    TIMBroadcastRequest,  
    FMSRequest,  
    DMSRequest,  
    EmergencyServices,  
    DMG Capabilities,  
    Multi-band local,  
    Multi-band peer,  
    MMS,  
    VendorSpecificInfo  
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|---|--|---|
| NewPCPorAPAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the reassociation process. |
| ListenInterval | Integer | ≥ 0 | Specifies how often the STA awakens and listens for the next Beacon frame, if it enters power save mode. |
| Supported Channels | As defined in the Supported Channels element | As defined in the Supported Channels element | The list of channels in which the STA is capable of operating. Present if DFS functionality is required, as specified in 11.9; otherwise not present. |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites and AKM suites selected by the STA. |
| QoS Capability | QoS Capability element | As defined in 9.4.2.35 | Specifies the parameters within the QoS Capability element that are supported by the MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperating Classes | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true. |
| SM Power Save | Integer | As defined in Table 9-162 | Indicates the spatial multiplexing power save mode that is in operation immediately after reassociation. |
| QoS Traffic Capability | As defined in the QoS Traffic Capability element | As defined in 9.4.2.78 | Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise. |
| TIMBroadcastRequest | As defined in TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise. |
| FMSRequest | As defined in FMS Request element | As defined in 9.4.2.76 | Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise. |
| DMSRequest | Sequence of DMS Request elements | As defined in 9.4.2.88 | Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise. |
| EmergencyServices | Boolean | true, false | Specifies that the non-AP and non-PCP STA intends to reassociate for the purpose of unauthenticated access to emergency services. The parameter shall only be present if dot11InterworkingServiceActivated is true. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|---|
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

Additional parameters needed to perform the reassociation procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.2.3 When generated

This primitive is generated by the SME for a STA to change association to a specified new peer MAC entity that is in an AP or PCP.

6.3.8.2.4 Effect of receipt

This primitive initiates a reassociation procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-REASSOCIATE.confirm primitive that reflects the results.

6.3.8.3 MLME-REASSOCIATE.confirm

6.3.8.3.1 Function

This primitive reports the results of a reassociation attempt with a specified peer MAC entity that is in an AP or PCP.

6.3.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.confirm(
 resultCode,
 capabilityInformation,
 associationID,
 edcaParameterSet,
 rcpi of Request,
 rsni of Request,
 rcpi of Response,

RSNI of Response,
 RMEnabledCapabilities,
 Content of FT Authentication elements,
 SupportedOperatingClasses,
 Extended Capabilities,
 20/40 BSS Coexistence,
 TimeoutInterval,
 BSSMaxIdlePeriod,
 TIMBroadcastResponse,
 FMSResponse,
 DMSResponse,
 QoSMapSet,
 QMFPolicy,
 DMG Capabilities,
 Multi-band local,
 Multi-band peer,
 MMS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|------------------------|------------------------------|--|---|
| ResultCode | Enumeration | SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_NOT_AUTHENTICATED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH, REJECTED_EMERGENCY_SERVICES_NOT_SUPPORTED, REFUSED_TEMPORARILY | Indicates the result of the MLME-REASSOCIATE.request primitive. |
| Capability-Information | Capability Information field | As defined in 9.4.1.4 | Specifies the operational capabilities advertised by the AP or PCP. |
| AssociationID | Integer | Non-DMG: 1–2007 DMG: 1–254 | If the association request result was SUCCESS, then AssociationID specifies the association ID value assigned by the AP or PCP. |
| EDCAParameterSet | EDCA Parameter Set element | As defined in 9.4.2.29 | Specifies the EDCA parameter set that the STA should use. The parameter is present if dot11QosOptionImplemented is true; otherwise not present. |
| RCPI of Request | Integer | As defined in 9.4.2.38 | Indicates the RCPI value contained in the received Reassociation Response frame. This value represents the RCPI that the AP or PCP measured at the time it received the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|---------------------------------------|---|------------------------|---|
| RSNI of Request | Integer | As defined in 9.4.2.41 | Indicates the RSNI value contained in the received Reassociation Response frame. This value represents the RSNI that the AP or PCP measured at the time it received the corresponding Reassociation Request frame. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RCPI of Response | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Reassociation Response frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |
| RSNI of Response | Integer | As defined in 9.4.2.41 | RSNI at the time the corresponding Reassociation Response frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperating Classes | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true; otherwise not present. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true. |
| TimeoutInterval | Timeout Interval element, as defined in frame format | As defined in 9.4.2.49 | This parameter is present when ResultCode is REFUSED_TEMPORARILY. |
| BSSMaxIdlePeriod | As defined in BSS Max Idle Period element | As defined in 9.4.2.79 | Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true and is not present otherwise. |

| Name | Type | Valid range | Description |
|----------------------|--|-------------------------|--|
| TIMBroadcastResponse | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| FMSResponse | As defined in FMS Response element | As defined in 9.4.2.77 | Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map the non-AP and non-PCP STA should use. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | Describes the QMF policy of the AP. This parameter is present when dot11QMFAActivated is true and is not present otherwise. |
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.8.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-REASSOCIATE.request primitive to reassociate with a specified peer MAC entity that is in an AP or PCP.

6.3.8.3.4 Effect of receipt

The SME is notified of the results of the reassociation procedure.

6.3.8.4 MLME-REASSOCIATE.indication

6.3.8.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting reassociation with the local MAC entity, which is in an AP or PCP.

6.3.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REASSOCIATE.indication(
    PeerSTAAddress,
    CurrentAPAddress,
    CapabilityInformation,
    ListenInterval,
    SSID,
    OperationalRateSet,
    BSSMembershipSelectorSet,
    RSN,
    QoSCapability,
    RCPI,
    RSNI,
    RMEnabledCapabilities,
    Content of FT Authentication elements,
    SupportedOperatingClasses,
    DSERegisteredLocation,
    HT Capabilities,
    Extended Capabilities,
    20/40 BSS Coexistence,
    QoSTrafficCapability,
    TIMBroadcastRequest,
    FMSRequest,
    DMSRequest,
    EmergencyServices,
    DMG Capabilities,
    Multi-band local,
    Multi-band peer,
    MMS,
    VHT Capabilities,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------|------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the reassociation request was received. |
| CurrentAPAddress | MACAddress | Any valid individual MAC address | Specifies the address of the AP or PCP with which the peer STA is currently associated. |

| Name | Type | Valid range | Description |
|---------------------------------------|---|--|--|
| Capability-Information | Capability Information field | As defined in 9.4.1.4 | Specifies the operational capability definitions provided by the peer MAC entity as part of the reassociation request. |
| ListenInterval | Integer | ≥ 0 | Specifies the listen interval provided by the peer MAC entity as part of the reassociation request. |
| SSID | Octet string | 0–32 octets | Specifies the desired SSID provided by the peer MAC entity as part of the reassociation request. |
| OperationalRateSet | Non-DMG BSS: Set of integers DMG BSS: Set of numbers | Non-DMG BSS: 1-127 excluding values from Table 9-78 for each member of the set DMG BSS: 0-24, 9.1, or 12.1-12.6, for each member of the set | The set of data rates (in units of 500 kb/s) that the STA that is requesting association is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the AP or PCP uses for communication within the BSS. |
| BSSMembershipSelectorSet | Set of integers | A value from Table 9-78, for each member of the set | The set of features that the STA that is requesting association is able to use for communication |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites and AKM suites selected by the STA. |
| QoS Capability | QoS Capability element | As defined in 9.4.2.35 | Specifies the parameters within the QoS Capability that are supported by the peer MAC entity. The parameter is present if dot11QosOptionImplemented is true; otherwise not present. |
| RCPI | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |
| RSNI | Integer | As defined in 9.4.2.41 | The RSNI value represents the measured RSNI at the time the corresponding Reassociation Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the third message of the FT authentication sequence, as described in 13.8.4. Present if dot11FastBSSTransitionActivated is true; otherwise not present. |
| SupportedOperatingClasses | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|------------------------|---|-------------------------|--|
| DSERegisteredLocation | As defined in the DSE Registered Location element | As defined in 9.4.2.52 | Indicates the DSE registered location including the dependent enablement identifier assigned by the enabling STA. This parameter is optionally present if dot11LCIDSERequired is true; otherwise not present. |
| HT Capabilities | As defined in frame format | As defined in 9.4.2.56 | Specifies the parameters within the HT Capabilities element that are supported by the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistenceManagementSupport is true. |
| QoS Traffic Capability | As defined in the QoS Traffic Capability element | As defined in 9.4.2.78 | Specifies the QoS Traffic Capability flags of the non-AP and non-PCP STA. This parameter is optionally present if dot11ACStationCountActivated is true and is not present otherwise. |
| TIMBroadcastRequest | As defined in TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for TIM Broadcast. This parameter is optionally present if dot11TIMBroadcastActivated is true and is not present otherwise. |
| FMSRequest | As defined in FMS Request element | As defined in 9.4.2.76 | Specifies the proposed multicast parameters for FMS Request. This parameter is optionally present if dot11FMSActivated is true and is not present otherwise. |
| DMSRequest | Sequence of DMS Request elements | As defined in 9.4.2.88 | Specifies the proposed multicast parameters for DMS Request. This parameter is optionally present if dot11DMSActivated is true and is not present otherwise. |
| EmergencyServices | Boolean | true, false | Specifies the setting of the UESA field received from the non-AP and non-PCP STA, if an Interworking element was present in the Reassociation Request frame. The parameter is present if dot11InterworkingServiceActivated is true; otherwise not present. |
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band local | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the local MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |

| Name | Type | Valid range | Description |
|--------------------|--|-------------------------|---|
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the remote (peer) MAC entity. This parameter is present if OCT is being used and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158 | Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and the VHT Capabilities element is present in the Reassociation Request frame received from the STA. The parameter is not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.8.4.3 When generated

This primitive is generated by the MLME as a result of the establishment of a reassociation with a specific peer MAC entity that resulted from a reassociation procedure that was initiated by that specific peer MAC entity.

6.3.8.4.4 Effect of receipt

The SME is notified of the establishment of the reassociation.

6.3.8.5 MLME-REASSOCIATE.response

6.3.8.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that requested a reassociation with the STA that issued this primitive, which is in an AP or PCP.

6.3.8.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-REASSOCIATE.response(
 PeerSTAAddress,
 ResultCode,
 AssociationID,
 RCPI,
 RSNI,
 RMEnabledCapabilities,
 Content of FT Authentication elements,
 SupportedOperatingClasses,
 TimeoutInterval,
 BSSMaxIdlePeriod,
 TMBroadcastResponse,
 FMSResponse,

DMSResponse,
 QoSMapSet,
 Multi-band peer,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------------------------|---------------------------------|--|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the reassociation request was received. |
| ResultCode | Enumeration | SUCCESS, REFUSED_REASON_UNSPECIFIED, REFUSED_CAPABILITIES_MISMATCH, REFUSED_EXTERNAL_REASON, REFUSED_AP_OUT_OF_MEMORY, REFUSED_BASIC_RATES_MISMATCH REJECTED_EMERGENCY_SERVICE_S_NOT_SUPPORTED, REFUSED_TEMPORARILY | Indicates the result response to the reassociation request from the peer MAC entity. |
| AssociationID | Integer | Non-DMG: 1–2007 DMG: 1–254 | If the reassociation request result was SUCCESS, then AssociationID specifies the association ID value assigned to the peer MAC entity by the AP or PCP. |
| RCPI | Integer | As defined in 9.4.2.38 | The RCPI value represents the measured RCPI of the corresponding Reassociation Request frame. The element is optionally present if dot11RMRCPIMeasurementActivated is true; otherwise not present. |
| RSNI | Integer | As defined in 9.4.2.41 | The RSNI value represents the measured RSNI at the time the corresponding Reassociation Request frame was received. The element is optionally present if dot11RMRSNIMeasurementActivated is true; otherwise not present. |
| RMEabledCapabilities | RM Enabled Capabilities element | As defined in 9.4.2.45 | Specifies the RM enabled capabilities advertised by the AP or PCP. The element is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the fourth message of the FT authentication sequence, as described in 13.8.5. This includes an optional response to a resource request (RIC). Present if dot11FastBSSTransitionActivated is true; otherwise not present. |

| Name | Type | Valid range | Description |
|---------------------------|---|-------------------------|---|
| SupportedOperatingClasses | As defined in the Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the supported operating classes of the STA. This parameter is present if dot11ExtendedChannelSwitchActivated is true. |
| TimeoutInterval | Timeout Interval element, as defined in frame format | As defined in 9.4.2.49 | This parameter is present when ResultCode is REFUSED_TEMPORARILY. |
| BSSMaxIdlePeriod | As defined in BSS Max Idle Period element | As defined in 9.4.2.79 | Indicates the BSS max idle period parameters of the AP or PCP. This parameter is present if dot11WirelessManagementImplemented is true and is not present otherwise. |
| TIMBroadcastResponse | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies the service parameters for TIM Broadcast. This parameter is optionally present if dot11TMBroadcastActivated is true and the TIM Broadcast Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| FMSResponse | As defined in FMS Response element | As defined in 9.4.2.77 | Specifies the multicast parameters for FMS Response. This parameter is optionally present if dot11FMSActivated is true and the FMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the multicast parameters for DMS Response. This parameter is optionally present if dot11DMSActivated is true and the DMS Request element is present in the corresponding Association Request frame; this parameter is not present otherwise. |
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map the non-AP and non-PCP STA should use. |
| Multi-band peer | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that identify the remote (peer) MAC entity. The parameter is present if OCT is being used and is absent otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

Additional parameters needed to perform the reassociation response procedure are not included in the primitive parameter list since the MLME already has that data (maintained as internal state).

6.3.8.5.3 When generated

This primitive is generated by the SME of a STA that is in an AP or PCP as a response to an MLME-REASSOCIATE.indication primitive.

6.3.8.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested reassociation.

6.3.9 Disassociate

6.3.9.1 MLME-DISASSOCIATE.request

6.3.9.1.1 Function

This primitive requests disassociation with a specified peer MAC entity.

6.3.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DISASSOCIATE.request(
    PeerSTAAddress,
    ReasonCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the disassociation process. |
| ReasonCode | Reason Code field | As defined in 9.4.1.7 | Specifies the reason for initiating the disassociation procedure. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.9.1.3 When generated

This primitive is generated by the SME for a STA to disassociate from a STA with which it has an association.

6.3.9.1.4 Effect of receipt

This primitive initiates a disassociation procedure. The MLME subsequently issues an MLME-DISASSOCIATE.confirm primitive that reflects the results.

6.3.9.2 MLME-DISASSOCIATE.confirm

6.3.9.2.1 Function

This primitive reports the results of a disassociation procedure with a specific peer MAC entity.

6.3.9.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.confirm()

6.3.9.2.3 When generated

This primitive is generated by the MLME as a result of an MLME-DISASSOCIATE.request primitive to disassociate with a specified peer MAC entity.

6.3.9.2.4 Effect of receipt

The SME is notified of the results of the disassociation procedure.

6.3.9.3 MLME-DISASSOCIATE.indication

6.3.9.3.1 Function

This primitive reports disassociation with a specific peer MAC entity.

6.3.9.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DISASSOCIATE.indication(
 PeerSTAAddress,
 ReasonCode,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the association relationship was invalidated. |
| ReasonCode | Reason Code field | As defined in 9.4.1.7 | Specifies the reason the disassociation procedure was initiated. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.9.3.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an association relationship with a specific peer MAC entity.

6.3.9.3.4 Effect of receipt

The SME is notified of the invalidation of the specific association relationship.

6.3.10 Reset

6.3.10.1 Introduction

This mechanism supports the process of resetting the MAC.

6.3.10.2 MLME-RESET.request

6.3.10.2.1 Function

This primitive requests that the MAC entity be reset.

6.3.10.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESET.request(
    STAAddress,
    SetDefaultMIB
)
```

| Name | Type | Valid range | Description |
|---------------|------------|----------------------------------|---|
| STAAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address that is to be used by the MAC entity that is being reset. This value can be used to provide a locally administered STA address. |
| SetDefaultMIB | Boolean | true, false | If true, all MIB attributes are set to their default values. The default values are implementation dependent. If false, the MAC is reset, but all MIB attributes retain the values that were in place prior to the generation of the MLME-RESET.request primitive. |

6.3.10.2.3 When generated

This primitive is generated by the SME to reset the MAC to initial conditions. The MLME-RESET.request primitive shall be used prior to use of the MLME-START.request primitive.

6.3.10.2.4 Effect of receipt

This primitive sets the MAC to initial conditions, clearing all internal variables to the default values. MIB attributes can be reset to their implementation dependent default values by setting the SetDefaultMIB flag to true.

If dot11OCBActivated is true and if the SetDefaultMIB parameter is false, MAC operation shall resume in less than 2 TU after the STAAddress parameter is changed.

6.3.11 Start

6.3.11.1 Introduction

This mechanism supports the process of creating a new BSS or becoming a member of an MBSS.

6.3.11.2 MLME-START.request

6.3.11.2.1 Function

This primitive requests that the MAC entity start a new BSS or become a member of an MBSS.

6.3.11.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

MLME-START.request(
    SSID,
    BSSType,
    BeaconPeriod,
    DTIMPeriod,
    CF parameter set,
    PHY parameter set,
    IBSS parameter set,
    NAVSyncDelay,
    CapabilityInformation,
    BSSBasicRateSet,
    OperationalRateSet,
    Country,
    IBSS DFS Recovery Interval,
    EDCAParameterSet,
    DSERegisteredLocation,
    HT Capabilities,
    HT Operation,
    BSSMembershipSelectorSet,
    Extended Capabilities,
    20/40 BSS Coexistence,
    Overlapping BSS Scan Parameters,
    MultipleBSSID,
    InterworkingInfo,
    AdvertisementProtocolInfo,
    RoamingConsortiumInfo,
    Mesh ID,
    Mesh Configuration,
    QMFPolicy,
    DMG Capabilities,
    Multi-band,
    MMS,
    DMG Operation,
    Clustering Control,
    CBAP Only,
    PCP Association Ready,
    VHT Capabilities,
    VHT Operation,
    VendorSpecificInfo
)
    
```

| Name | Type | Valid range | Description |
|------------------|--------------------------|---|---|
| SSID | Octet string | 0–32 octets | The SSID of the BSS. |
| BSSType | Enumeration | INFRASTRUCTURE, INDEPENDENT, MESH, PERSONAL | The type of the BSS. |
| Beacon Period | Integer | ≥ 1 | The beacon period (in TU) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH. |
| DTIM Period | Integer | As defined in 9.4.2.6 | The DTIM Period (in beacon periods) of the BSS if the BSSType is not MESH, or of the mesh STA if the BSSType is MESH. |
| CF parameter set | CF Parameter Set element | As defined in 9.4.2.5 | The parameter set for CF periods, if the BSS supports CF mode. |

| Name | Type | Valid range | Description |
|-----------------------------|---|---|--|
| PHY parameter sets | DSSS Parameter Set element | As defined in 9.4.2.4 | The parameter sets relevant to the PHY. |
| IBSS parameter set | IBSS Parameter Set element | As defined in 9.4.2.7 | The parameter set for the IBSS, if BSS is an IBSS. |
| NAVSsyncDelay | Integer | N/A | Delay (in microseconds) to be used, while the STA is a member of this BSS, prior to transmitting when changing from doze to awake state, if no frame is detected by which the NAV can be set. |
| CapabilityInformation | Capability Information field | As defined in 9.4.1.4 | The capabilities to be advertised for the BSS. |
| BSSBasicRateSet | Set of integers | Non-DMG BSS: a value in both dot11SupportedDataRatesRxTable and dot11SupportedDataRatesTxTable for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that all STAs in the BSS are able to use for communication. All STAs in the BSS including the STA that is creating the BSS, are able to receive and transmit at each of the data rates listed in the set. DMG BSS: Empty. |
| OperationalRateSet | Non-DMG BSS: Set of integers DMG BSS: Set of numbers | Non-DMG BSS: a value in dot11SupportedDataRatesRxTable for each member of the set DMG BSS: 0-24, 9.1, or 12.1-12.6, for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the STA is able to use for communication within the BSS. The STA is able to receive at each of the data rates listed in the set. This set is a superset of the rates contained in the BSSBasicRateSet parameter. DMG BSS: The set of MCS indexes that the STA uses for communication within the BSS. |
| Country | As defined in the Country element | As defined in the Country element | The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present if TPC functionality is required, as specified in 11.8 or dot11MultiDomainCapabilityActivated is true; otherwise not present. |
| IBSS DFS Recovery Interval | Integer | 1–255 | The time interval that is used for DFS recovery. Present if DFS functionality is required, as specified in 11.9 and BSSType = INDEPENDENT; otherwise not present. |
| EDCAParameterSet (QoS only) | EDCA Parameter Set element | As defined in 9.4.2.29 | The initial EDCA parameter set values to be used in the BSS. The parameter is present if dot11QosOptionImplemented is true; otherwise not present. |
| DSERegisteredLocation | As defined in the DSE Registered Location element | As defined in 9.4.2.52 | The information for the DSE Registered Location element. The parameter is present if dot11LCIDSERequired is true. |

| Name | Type | Valid range | Description |
|---------------------------------|--|---|---|
| HT Capabilities | As defined in frame format HT Capabilities element | As defined in 9.4.2.56; the HT-MCSs in the element are present in dot11SupportedMCSRx Table and the highest supported data rate in the element does not exceed dot11HighestSupported DataRate | The HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present. |
| HT Operation | As defined in frame format HT Operation element | As defined in 9.4.2.57; the HT-MCSs in the element are present in both dot11SupportedMCSRx Table and dot11SupportedMCSTx Table | The additional HT capabilities to be advertised for the BSS. The parameter is present if dot11HighThroughputOptionImplemented is true; otherwise, this parameter is not present. |
| BSSMembershipSelectorSet | Set of integers | A value from Table 9-78 for each member of the set | The set of features that are supported by all STAs joining this BSS, and by the STA that is creating the BSS. |
| Extended Capabilities | As defined in frame format | As defined in 9.4.2.27 | Specifies the parameters within the Extended Capabilities element that are supported by the MAC entity. |
| 20/40 BSS Coexistence | As defined in frame format | As defined in 9.4.2.60 | Specifies the parameters within the 20/40 BSS Coexistence element that are indicated by the MAC entity. The parameter is present if dot112040BSSCoexistence-ManagementSupport is true. |
| Overlapping BSS Scan Parameters | As defined in frame format | As defined in 9.4.2.59 | Specifies the parameters within the Overlapping BSS Scan Parameters element that are indicated by the MAC entity. This parameter is optionally present if dot11FortyMHzOptionImplemented is true; otherwise, it is not present. |
| MultipleBSSID | As defined in Multiple BSSID Element in 9.4.2.46 | As defined in Multiple BSSID Element in 9.4.2.46 | This element is optionally present when dot11RMMeasurementPilotActivated is a value between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.11.14) with two or more members, or if dot11MultiBSSIDActivated is true. |
| InterworkingInfo | As defined in frame format | As defined in Interworking element in 9.4.2.92 | Specifies the Interworking capabilities of STA. This field is present when dot11InterworkingServiceActivated is true. |
| AdvertisementProtocolInfo | Integer or Sequence of integers | As defined in Advertisement Protocol element in Table 9-215 | Identifies zero or more Advertisement Protocols and advertisement control to be used in the BSSs. This field is present when dot11InterworkingServiceActivated is true. |
| RoamingConsortiumInfo | As defined in frame format | As defined in roaming consortium element in 9.4.2.96 | Specifies identifying information for SSPs whose security credentials can be used to authenticate with the AP. This field is optionally present when dot11InterworkingServiceActivated is true. |
| Mesh ID | Octet string | 0–32 octets | The value of MeshID. This element is present if the BSSType = MESH; otherwise not present. |

| Name | Type | Valid range | Description |
|-----------------------|--|---|--|
| Mesh Configuration | As defined in frame format | As defined in 9.4.2.98 | Specifies the configuration of the mesh STA. This element is present if the BSSType = MESH; otherwise not present. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | This element is present when dot11QMFActivated is true and BSSType = INFRASTRUCTURE or MESH, and it is not present otherwise. The element is provided by the SME to signal to the MLME the QMF policy to be used for this BSS. |
| DMG Capabilities | DMG Capabilities element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Capabilities element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the parameters within the Multi-band element that are supported by the MAC entity. The parameter is present if dot11MultibandImplemented is true and is absent otherwise. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | Specifies the parameters within the Multiple MAC Sublayers element that are supported by the MAC entity. The parameter is present if dot11MultipleMACActivated is true and is absent otherwise. |
| DMG Operation | DMG Operation element | As defined in 9.4.2.128 | Specifies the parameters within the DMG Operation element that are supported by the MAC entity. The parameter is present if dot11DMGOptionImplemented is true and is absent otherwise. |
| Clustering Control | Clustering Control field | As defined in 9.3.4.2 | Specifies the parameters within the Clustering Control field that are supported by the MAC entity. The parameter is present if dot11ClusteringActivated is true and is absent otherwise. |
| CBAP Only | Integer | 0 or 1 | Specifies the setting of the CBAP Only field as defined in 9.3.4.2 |
| PCP Association Ready | Integer | 0 or 1 | Specifies the setting of the PCP Association Ready field as defined in 9.3.4.2 |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158; the VHT-MCSs in the element are present in dot11VHTRxVHTMCS Map/ dot11VHTTxVHTMCS Map and the highest supported data rates in the element do not exceed dot11VHTRxHighestDataRateSupported/ dot11VHTTxHighestDataRateSupported | Specifies the parameters in the VHT Capabilities element that are supported by the STA. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise. |

| Name | Type | Valid range | Description |
|--------------------|-------------------------------------|--|---|
| VHT Operation | As defined in VHT Operation element | As defined in 9.4.2.159; the VHT-MCSs in the element are present in both dot11VHTRxVHTMCS Map and dot11VHTTxVHTMCS Map | Provides additional information for operating the VHT BSS. The parameter is present if dot11VHTOptionImplemented is true and not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.11.2.3 When generated

This primitive is generated by the SME to start an infrastructure BSS (with the MAC entity within an AP), an IBSS (with the MAC entity acting as the first STA in the IBSS), or an MBSS (with the MAC entity acting as the first mesh STA in the MBSS) or to become a member of an existing MBSS or a PBSS (with the MAC entity within a PCP). In an MBSS, this primitive starts the process of mesh beaconing.

The MLME-START.request primitive in an MBSS shall be generated before any synchronization or mesh peering have been attempted.

The MLME-START.request primitive shall not be used after successful use of the MLME-START.request primitive or successful use of the MLME-JOIN.request primitive without generating an intervening MLME-RESET.request primitive.

6.3.11.2.4 Effect of receipt

This primitive initiates the BSS initialization procedure once the current frame exchange sequence is complete. The MLME subsequently issues an MLME-START.confirm primitive that reflects the results of the creation procedure.

If the MLME of a non-DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any unsupported rates, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of an HT STA receives an MLME-START.request primitive with the Basic HT-MCS Set field of the HT Operation parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a VHT STA receives an MLME-START.request primitive with a Basic VHT-MCS And NSS Set field in the VHT Operation parameter containing any unsupported <VHT-MCS, NSS> tuple, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

If the MLME of a DMG STA receives an MLME-START.request primitive with a BSSBasicRateSet parameter containing any rates, or with the OperationalRateSet parameter containing any unsupported MCSs, the MLME response in the resulting MLME-START.confirm primitive shall contain a ResultCode parameter that is not set to the value SUCCESS.

6.3.11.3 MLME-START.confirm

6.3.11.3.1 Function

This primitive reports the results of a BSS creation procedure or a procedure to become a member of an MBSS.

6.3.11.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-START.confirm(
    ResultCode
)
```

| Name | Type | Valid range | resetDescription |
|------------|-------------|---|---|
| ResultCode | Enumeration | SUCCESS, BSS_ALREADY_STARTED_OR_JOINED, RESET_REQUIRED_BEFORE_START, NOT_SUPPORTED | Indicates the result of the MLME-START.request primitive. |

6.3.11.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-START.request primitive to create a new BSS or to become a member of an MBSS.

6.3.11.3.4 Effect of receipt

The SME is notified of the results of the BSS creation procedure or a procedure to become a member of an MBSS.

6.3.12 Stop

6.3.12.1 General

This mechanism supports the process of terminating an existing BSS.

6.3.12.2 MLME-STOP.request

6.3.12.2.1 Function

This primitive requests that the MAC entity stop a BSS previously started by using an MLME-START.request primitive

6.3.12.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-STOP.request(
    SSID
)
```

| Name | Type | Valid range | Description |
|------|--------------|-------------|------------------------------------|
| SSID | Octet string | 0–32 octets | The SSID of the BSS to be stopped. |

6.3.12.2.3 When generated

This primitive is generated by the SME to terminate an infrastructure BSS (with the MAC entity within an AP) or a PBSS (with the MAC entity within the PCP). The MLME-STOP.request primitive shall be generated only after successful use of an MLME-START.confirm primitive.

The MLME-STOP termination procedure does not reset the MAC to initial conditions. An MLME-RESET.request primitive shall be issued prior to use of the MLME-START.request primitive and subsequent to the use of an MLME-STOP.request primitive.

The SME should notify associated non-AP STAs of imminent infrastructure BSS termination before issuing the MLME-STOP.request primitive. This can be done with the BSS transition management procedure, using the Termination information.

6.3.12.2.4 Effect of receipt

This primitive initiates the termination of the BSS. All services provided by the AP to an infrastructure BSS, including Beacon and Probe Response frame transmissions and access to the DS, are stopped by the termination. All STAs in an infrastructure BSS are deauthenticated by the termination. In a PBSS, all of the services provided by the PCP, including DMG Beacons, are stopped by the termination. All of the STAs in a PBSS have their RSNA unestablished by the termination.

6.3.13 Protocol layer model for spectrum management and radio measurement

The layer management extensions for measurement, TPC, and channel switching assume a certain partition of functionality between the MLME and SME. This partitioning assumes that policy decisions (e.g., regarding measurement and channel switching) reside in the SME, while the protocol for measurement, switch timing, and the associated frame exchanges resides within the MLME (see Figure 6-2).

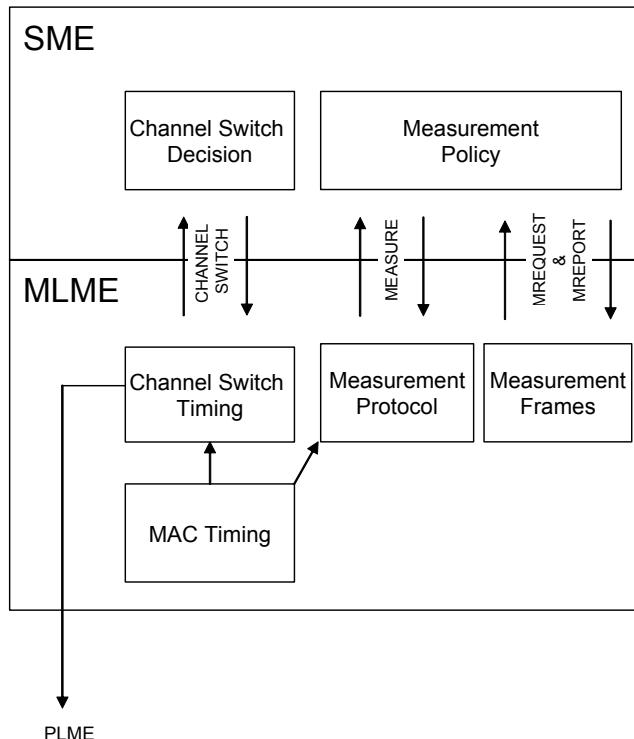

Figure 6-2—Layer management model

The informative diagrams within this subclause further illustrate the protocol layer model adopted. Figure 6-3 and Figure 6-4 depict the measurement process for a peer STA to accept and reject a measurement request, respectively. Figure 6-5 illustrates the TPC adaptation process. Lastly, Figure 6-6 depicts the management process for a channel switch using a Channel Switch Announcement frame.

Note that these diagrams are intended as examples and do not depict all possible protocol scenarios, e.g., a measurement request may result in more than one Measurement Report frame as described in 11.9.7 and 11.11.

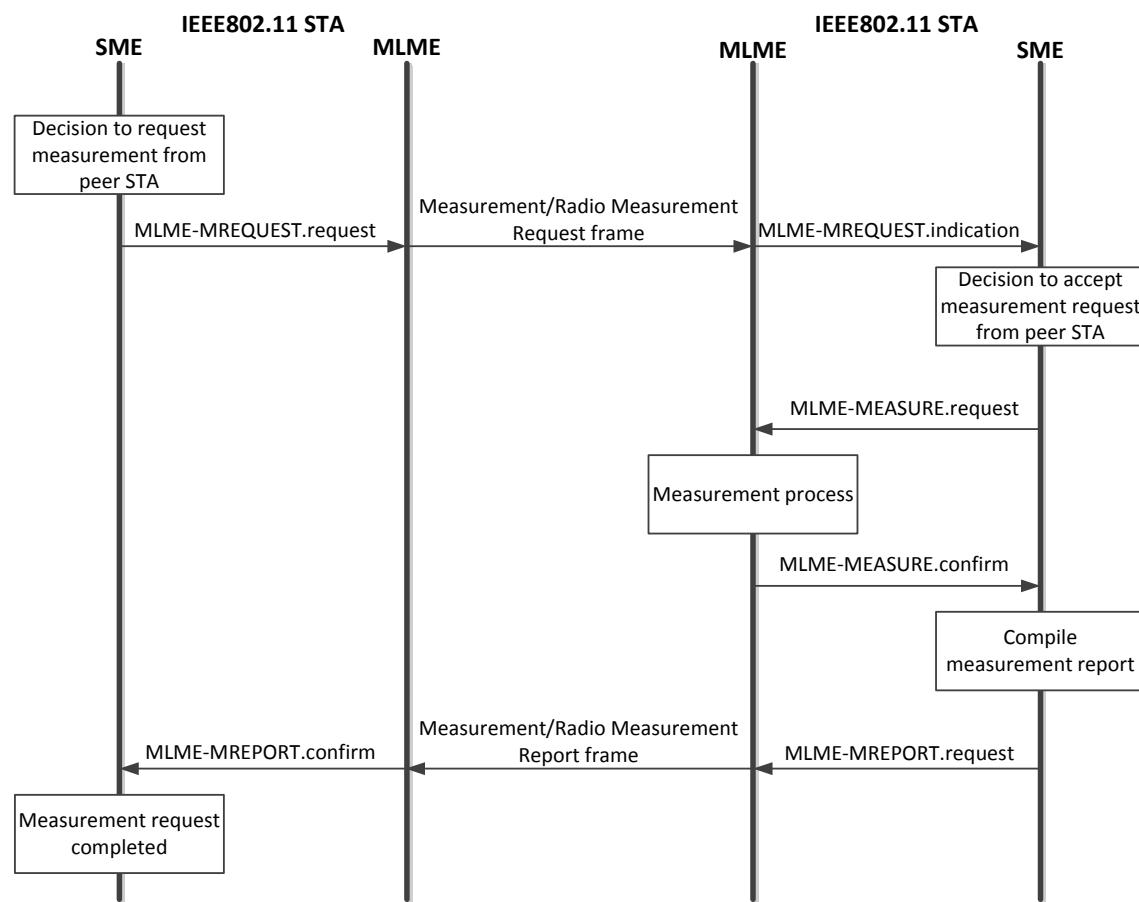

Figure 6-3—Measurement request—accepted

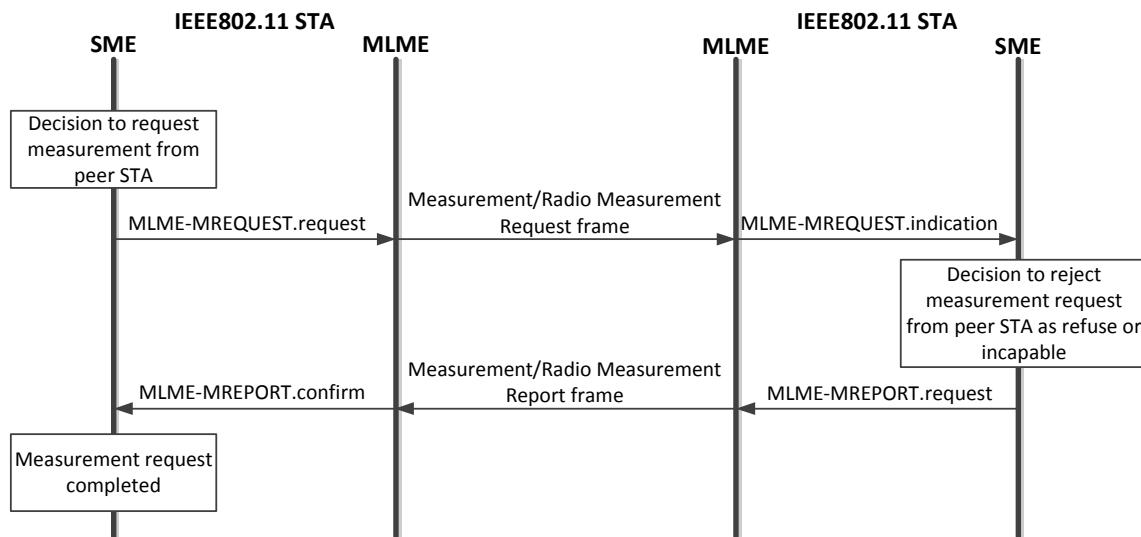

Figure 6-4—Measurement request—rejected

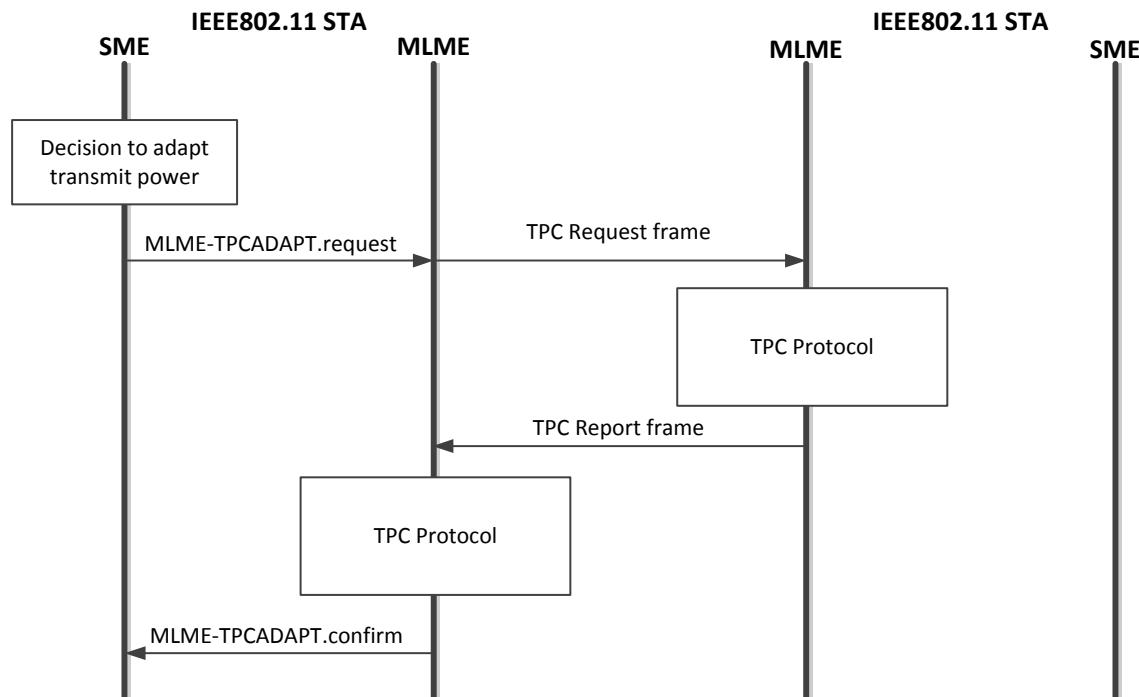

Figure 6-5—TPC adaptation

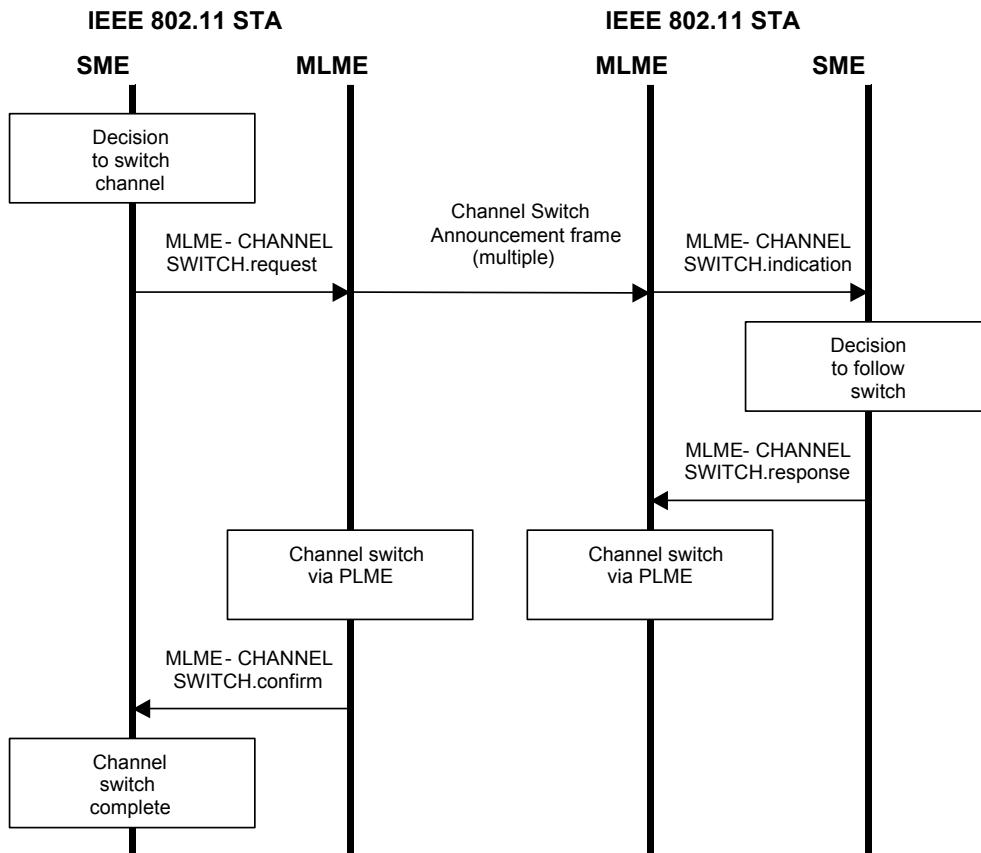

Figure 6-6—Channel switching

6.3.14 Measurement request

6.3.14.1 Introduction

This set of primitives supports the signaling of measurement requests between peer SMEs.

6.3.14.2 MLME-MREQUEST.request

6.3.14.2.1 Function

This primitive requests the transmission of a measurement request to a peer entity.

6.3.14.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREQUEST.request(
 Peer MAC Address,
 Dialog Token,
 Measurement Request Set,
 Number of Repetitions,
 Measurement Category,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-------------------------|--|--|--|
| Peer MAC Address | MACAddress | Any valid individual or group MAC address | The address of the peer MAC entity to which the measurement request is transmitted. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the measurement transaction. |
| Measurement Request Set | Set of measurement requests, each as defined in the Measurement Request element format | Set of measurement requests, each as defined in 9.4.2.21 | A set of measurement requests, each containing a measurement token, measurement request mode, measurement type, and measurement request. |
| Number of Repetitions | Integer | 0 – 65 535 | The number of times the Measurement Request Set is to be repeated. The parameter is present if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true; otherwise not present. |
| Measurement Category | Enumeration | SPECTRUM MANAGEMENT, or RADIO MEASUREMENT | Indicates whether the contents of the Measurement Report Set parameter is a set of Spectrum Management requests or a set of Radio Measurement requests. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.14.2.3 When generated

This primitive is generated by the SME to request that a Measurement Request frame be sent to a peer entity to initiate one or more measurements.

6.3.14.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Request frame containing the set of Measurement Request elements specified. This frame is then scheduled for transmission.

6.3.14.3 MLME-MREQUEST.indication

6.3.14.3.1 Function

This primitive indicates that a Measurement Request frame has been received requesting the measurement of one or more channels.

6.3.14.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREQUEST.indication(
 Peer MAC Address,
 Dialog Token,
 Measurement Request Set,
 Number of Repetitions,

Measurement Category,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-------------------------|--|--|--|
| Peer MAC Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the measurement request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the measurement transaction. |
| Measurement Request Set | Set of measurement requests, each as defined in the Measurement Request element format | Set of measurement requests, each as defined in 9.4.2.21 | A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request. |
| Number of Repetitions | Integer | 0 – 65 535 | The number of times the Measurement Request Set is to be repeated. The parameter is present if Measurement Category is Radio Measurement and dot11RadioMeasurementActivated is true; otherwise not present. |
| Measurement Category | Enumeration | SPECTRUM MANAGEMENT, or RADIO MEASUREMENT | Indicates whether the contents of the Measurement Report Set parameter is a set of Spectrum Management requests or a set of Radio Measurement requests. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.14.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Request frame is received.

6.3.14.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the requested measurements.

6.3.15 Channel measurement

6.3.15.1 Introduction

This set of primitives supports the requesting and reporting of measurement data.

6.3.15.2 MLME-MEASURE.request

6.3.15.2.1 Function

This primitive is generated by the SME to request that the MLME initiate specified measurements.

6.3.15.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MEASURE.request(

Dialog Token,
 Measurement Request Set
)

| Name | Type | Valid range | Description |
|-------------------------|---|--|--|
| Dialog Token | Integer | 0–255 | The dialog token to identify the measurement transaction. |
| Measurement Request Set | Set of measurement requests, each as defined in the Measurement Request element | Set of measurement requests, each as defined in 9.4.2.21 | A set of measurement requests, each containing a Measurement Token, Measurement Request Mode, Measurement Type, and Measurement Request. |

6.3.15.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified measurements.

6.3.15.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the measurement process.

6.3.15.3 MLME-MEASURE.confirm

6.3.15.3.1 Function

This primitive reports the result of a measurement.

6.3.15.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MEASURE.confirm(

Dialog Token,
 Measurement Report Set,
)

| Name | Type | Valid range | Description |
|------------------------|---|---|---|
| Dialog Token | Integer | 0–255 | The dialog token to identify the measurement transaction. |
| Measurement Report Set | Set of measurement reports, each as defined in the Measurement Report element | Set of measurement reports, each as defined in 9.4.2.22 | A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report. |

6.3.15.3.3 When generated

This primitive is generated by the MLME to report the results when a measurement set completes.

6.3.15.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result code and, if appropriate, stores the channel measurements pending communication to the requesting entity or for local use.

6.3.16 Measurement report

6.3.16.1 Introduction

This set of primitives supports the signaling of measurement reports.

6.3.16.2 MLME-MREPORT.request

6.3.16.2.1 Function

This primitive supports the signaling of measurement reports between peer SMEs.

6.3.16.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MREPORT.request(
    Peer MAC Address,
    Dialog Token,
    Measurement Report Set,
    Measurement Category,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|--|---|---|
| Peer MAC Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the measurement report is sent. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the measurement transaction. Set to 0 for an autonomous report. |
| Measurement Report Set | Set of measurement reports, each as defined in the Measurement Report element format | Set of measurement reports, each as defined in 9.4.2.22 | A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report. |
| Measurement Category | Enumeration | SPECTRUM MANAGEMENT, or RADIO MEASUREMENT | Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.16.2.3 When generated

This primitive is generated by the SME to request that a frame be sent to a peer entity to report the results of measuring one or more channels.

6.3.16.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Measurement Report frame containing the set of measurement reports. This frame is then scheduled for transmission.

6.3.16.3 MLME-MREPORT.indication

6.3.16.3.1 Function

This primitive indicates that a Measurement Report frame has been received from a peer entity. This management report is either a response to an earlier measurement request (e.g., MLME-MREQUEST.request primitive) or an autonomous report.

6.3.16.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MREPORT.indication(

Peer MAC Address,
 Dialog Token,
 Measurement Report Set,
 Measurement Category,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|------------------------|--|---|---|
| Peer MAC Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Measurement Report frame was received. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the measurement transaction. Set to 0 for an autonomous report. |
| Measurement Report Set | Set of measurement reports, each as defined in the Measurement Report element format | Set of measurement reports, each as defined in 9.4.2.22 | A set of measurement reports, each containing a Measurement Token, Measurement Report Mode, Measurement Type, and Measurement Report. |
| Measurement Category | Enumeration | SPECTRUM MANAGEMENT, or RADIO MEASUREMENT | Indicates whether the Measurement Report Set is a set of Spectrum Management or Radio Measurement reports. The parameter is present if dot11RadioMeasurementActivated is true; otherwise not present. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.16.3.3 When generated

This primitive is generated by the MLME when a valid Measurement Report frame is received.

6.3.16.3.4 Effect of receipt

On receipt of this primitive, measurement data might be available for SME processes, such as channel selection.

6.3.17 Channel switch

6.3.17.1 MLME-CHANNELSWITCH.request

6.3.17.1.1 Function

This primitive requests a switch to a new operating channel.

6.3.17.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.request(
    Mode,
    Channel Number,
    Secondary Channel Offset,
    Channel Switch Count,
    Mesh Channel Switch Parameters,
    Wide Bandwidth Channel Switch,
    New Transmit Power Envelope,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------|---|--------------------------|---|
| Mode | Integer | 0, 1 | Channel switch mode, as defined for the Channel Switch Announcement element. |
| Channel Number | Integer | As defined in 17.3.8.4.3 | Specifies the new channel number. |
| Secondary Channel Offset | Integer | As in Table 9-80 | Specifies the position of secondary channel in relation to the primary channel. The parameter is present if dot11FortyMHzOperationImplemented is true; otherwise, the parameter is not present. |
| Channel Switch Count | As defined in 9.4.2.19 | As defined in 9.4.2.19 | Specifies the time period until the channel switch event, as described in 9.4.2.19 |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.17.1.3 When generated

This primitive is generated by the SME to schedule a channel switch and announce this switch to peer entities in the BSS.

6.3.17.1.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch event and announces this switch to other STAs in the BSS using the Channel Switch Announcement frame or element. The MLME sets the timing of the frame transmission taking into account the activation delay.

6.3.17.2 MLME-CHANNELSWITCH.confirm

6.3.17.2.1 Function

This primitive reports the result of a request to switch channel.

6.3.17.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.confirm(
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---------------------------------|---|
| ResultCode | Enumeration | SUCCESS, UNSPECIFIED FAILURE | Reports the result of a channel switch request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.17.2.3 When generated

This primitive is generated by the MLME when a channel switch request completes. Possible unspecified failure causes include an inability to schedule a channel switch announcement.

6.3.17.2.4 Effect of receipt

The SME is notified of the results of the channel switching procedure.

6.3.17.3 MLME-CHANNELSWITCH.indication

6.3.17.3.1 Function

This primitive indicates that a channel switch announcement has been received from a peer entity.

6.3.17.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.indication(
    Peer MAC Address,
    Mode,
    Channel Number,
    Secondary Channel Offset,
```

Channel Switch Count,
 Mesh Channel Switch Parameters,
 Wide Bandwidth Channel Switch,
 New Transmit Power Envelope,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------------------|---|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Measurement Report frame was received. |
| Mode | Integer | 0, 1 | Channel switch mode, as defined for the Channel Switch Announcement element. |
| Channel Number | Integer | As defined in 17.3.8.4.3 | Specifies the new channel number. |
| Secondary Channel Offset | Integer | As in Table 9-80 | Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present if dot11FortyMHzOperationImplemented is true; otherwise not present. |
| Channel Switch Count | As defined in 9.4.2.19 | As defined in 9.4.2.19 | Specifies the time period until the channel switch event, as described in 9.4.2.19 |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.17.3.3 When generated

This primitive is generated by the MLME when a valid Channel Switch Announcement frame is received.

6.3.17.3.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch.

6.3.17.4 MLME-CHANNELSWITCH.response

6.3.17.4.1 Function

This primitive is used to schedule an accepted channel switch.

6.3.17.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSWITCH.response(
    Mode,
    Channel Number,
    Secondary Channel Offset,
    Channel Switch Count,
    Mesh Channel Switch Parameters,
    Wide Bandwidth Channel Switch,
    New Transmit Power Envelope,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------|---|--------------------------|---|
| Mode | Integer | 0, 1 | Channel switch mode, as defined for the Channel Switch Announcement element. |
| Channel Number | Integer | As defined in 17.3.8.4.3 | Specifies the new channel number. |
| Secondary Channel Offset | Integer | As in Table 9-80 | Specifies the position of secondary channel in relation to the primary channel. The parameter is optionally present if dot11FortyMHzOperationImplemented is true; otherwise not present. |
| Channel Switch Count | As defined in 9.4.2.19 | As defined in 9.4.2.19 | Specifies the time period until the channel switch event, as described in 9.4.2.19 |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.17.4.3 When generated

This primitive is generated by the SME to schedule an accepted channel switch request.

6.3.17.4.4 Effect of receipt

On receipt of this primitive, the MLME schedules the channel switch.

6.3.18 TPC request

6.3.18.1 Introduction

This set of primitives supports the adaptation of transmit power between peer entities as described in 11.8.7.

6.3.18.2 MLME-TPCADAPT.request

6.3.18.2.1 Function

This primitive supports the adaptation of transmit power between peer entities as specified in 11.8.7.

6.3.18.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TPCADAPT.request(
    Peer MAC Address,
    Dialog Token,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| Peer MAC Address | MACAddress | Any valid individual or group MAC address | The address of the peer MAC entity to which the TPC request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the TPC transaction. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.18.2.3 When generated

This primitive is generated by the SME to request that a TPC Request frame be sent to a peer entity to request that entity to report transmit power and link margin information.

6.3.18.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TPC Request frame. This frame is then scheduled for transmission.

6.3.18.3 MLME-TPCADAPT.confirm

6.3.18.3.1 Function

This primitive reports the result of the TPC adaptation procedure.

6.3.18.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TPCADAPT.confirm(
    ResultCode
    Transmit Power,
    Link Margin,
```

Rate,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|---------------------------------|--|
| ResultCode | Enumeration | SUCCESS, UNSPECIFIED FAILURE | Reports the outcome of a request to send a TPC Request frame. |
| Transmit Power | Integer | -127 to 127 | Value of the Transmit Power field of the TPC Report element of the TPC Report frame. |
| Link Margin | Integer | -127 to 127 | Value of the Link Margin field of the TPC Report element of the TPC Report frame. |
| Rate | Integer | As defined in 9.4.2.3 | The rate at which the TPC Request frame was sent. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.18.3.3 When generated

This primitive is generated by the MLME when the TPC adaptation procedure completes.

6.3.18.3.4 Effect of receipt

The SME is notified of the results of the TPC adaptation procedure.

6.3.19 SetKeys

6.3.19.1 MLME-SETKEYS.request

6.3.19.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be set in the MAC and enabled for use.

6.3.19.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-SETKEYS.request(
 Keylist
)

| Name | Type | Valid range | Description |
|---------|----------------------------|-------------|---|
| Keylist | A set of SetKeyDescriptors | N/A | The list of keys to be used by the MAC. |

Each SetKeyDescriptor consists of the following parameters:

| Name | Type | Valid range | Description |
|--------|------------|-------------|---|
| Key | Bit string | N/A | The temporal key value |
| Length | Integer | N/A | The number of bits in the Key to be used. |

| Name | Type | Valid range | Description |
|------------------------|------------|---|---|
| Key ID | Integer | 0–3 shall be used with WEP, TKIP, CCMP, and GCMP; 4–5 with BIP; and 6–4095 are reserved | Key identifier |
| Key Type | Integer | Group, Pairwise, PeerKey, IGTK | Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key. |
| Address | MACAddress | Any valid individual MAC address | This parameter is valid only when the Key Type value is Pairwise, when the Key Type value is Group and the STA is in IBSS, or when the Key Type value is PeerKey. |
| Receive Sequence Count | 8 octets | N/A | Value to which the RSC(s) is initialized. |
| Cipher Suite Selector | 4 octets | As defined in 9.4.2.25 | The cipher suite required for this association. |

6.3.19.1.3 When generated

This primitive is generated by the SME at any time when one or more keys are to be set in the MAC.

6.3.19.1.4 Effect of receipt

Receipt of this primitive causes the MAC to apply the keys as follows, subject to the MLME-SETPROTECTION.request primitive:

- The MAC uses the key information (as defined by the Key Type, Key ID, Address and Cipher Suite Selector parameters) for the transmission of subsequent frames to which the key applies (as defined by the Key Type, Key ID and Address elements).
- The MAC installs the key with the associated Key ID such that received frames for the cipher suite indicated by the Cipher Suite Selector, of the appropriate type, and containing the matching Key ID are processed using that key and its associated state information, subject to validation based on the Receive Sequence Count.

6.3.20 DeleteKeys

6.3.20.1 MLME-DELETEKEYS.request

6.3.20.1.1 Function

This primitive causes the keys identified in the parameters of the primitive to be deleted from the MAC and thus disabled for use.

6.3.20.1.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-DELETEKEYS.request(
 Keylist
)

| Name | Type | Valid range | Description |
|---------|-------------------------------|-------------|--|
| Keylist | A set of DeleteKeyDescriptors | N/A | The list of keys to be deleted from the MAC. |

Each DeleteKeyDescriptor consists of the following parameters:

| Name | Type | Valid range | Description |
|----------|------------|---|---|
| Key ID | Integer | 0–3 shall be used with WEP, TKIP, CCMP, and GCMP; 4–5 with BIP; and 6–4095 are reserved | Key identifier. |
| Key Type | Integer | Group, Pairwise, PeerKey, IGTK | Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key. |
| Address | MACAddress | Any valid individual MAC address | This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey. |

6.3.20.1.3 When generated

This primitive is generated by the SME at any time when keys for a security association are to be deleted in the MAC.

6.3.20.1.4 Effect of receipt

Receipt of this primitive causes the MAC to delete all the temporal keys identified by each DeleteKeyDescriptor in the Keylist (as defined by the Key Type, Key ID and Address elements), and to cease using them.

6.3.21 MIC (michael) failure event

6.3.21.1 MLME-MICHAELMICFAILURE.indication

6.3.21.1.1 Function

This primitive reports that a MIC failure event was detected.

6.3.21.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MICHAELMICFAILURE.indication (
    Count,
    Address,
    Key Type,
    Key ID,
    TSC
)
```

| Name | Type | Valid range | Description |
|----------|------------|----------------------------------|--|
| Count | Integer | 1 or 2 | The current number of MIC failure events. |
| Address | MACAddress | Any valid individual MAC address | The source MAC address of the frame. |
| Key Type | Integer | Group, Pairwise, PeerKey | The key type that the received frame used. |
| Key ID | Integer | 0–3 | Key identifier. |
| TSC | 6 octets | N/A | The TSC value of the frame that generated the MIC failure. |

6.3.21.1.3 When generated

This primitive is generated by the MAC when it has detected a MIC failure.

6.3.21.1.4 Effect of receipt

The SME is notified that the MAC has detected a MIC failure; see 12.5.2.4.

6.3.22 EAPOL

6.3.22.1 MLME-EAPOL.request

6.3.22.1.1 Function

This primitive is generated by the SME when the SME has an EAPOL-Key frame to send.

6.3.22.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.request (
    Source Address,
    Destination Address,
    Data
)
```

| Name | Type | Valid range | Description |
|---------------------|--|-------------|---|
| Source Address | MACAddress | N/A | The MAC sublayer address from which the EAPOL PDU is being sent. |
| Destination Address | MACAddress | N/A | The MAC sublayer entity address to which the EAPOL PDU is being sent. |
| Data | EAPOL PDU (as defined in IEEE Std 802.1X-2010 Clause 11) | N/A | The EAPOL PDU to be transmitted. |

6.3.22.1.3 When generated

This primitive is generated by the SME when the SME has a EAPOL-Key frame to send.

6.3.22.1.4 Effect of receipt

The MAC sends this EAPOL-Key frame.

6.3.22.2 MLME-EAPOL.confirm

6.3.22.2.1 Function

This primitive indicates that this EAPOL-Key frame has been transmitted by the MAC.

6.3.22.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EAPOL.confirm (
    ResultCode
)
```

| Name | Type | Valid range | Description |
|------------|-------------|----------------------------------|---|
| ResultCode | Enumeration | SUCCESS, TRANSMISSION_FAILURE | Indicates whether the EAPOL-Key frame has been transmitted to the target STA. |

6.3.22.2.3 When generated

This primitive is generated by the MAC as a result of an MLME-EAPOL.request primitive being generated to send an EAPOL-Key frame.

6.3.22.2.4 Effect of receipt

The SME is always notified whether this EAPOL-Key frame has been transmitted to the IEEE 802.11 MAC.

This primitive communicates that the frame has been transmitted; see the procedures in 12.5.2.4.1.

6.3.23 MLME-PEERKEY-START

6.3.23.1 MLME-PEERKEY-START.request

6.3.23.1.1 Function

This primitive is generated by the SME to start a PeerKey handshake with a peer.

6.3.23.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-PEERKEY-START.request (
    PeerSTAAddress,
    RSN
)
```

| Name | Type | Valid range | Description |
|----------------|------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the PeerKey handshake process. |
| RSN | RSNE | As defined in 9.4.2.25 | A description of the cipher suites supported by initiator STA. |

6.3.23.1.3 When generated

This primitive is generated by the SME for a STA to initiate a PeerKey handshake with a specified peer MAC entity in order to create a secure link between the two STAs.

6.3.23.1.4 Effect of receipt

This primitive initiates the SMK handshake as part of PeerKey handshake by sending an EAPOL-Key frame.

6.3.24 SetProtection

6.3.24.1 MLME-SETPROTECTION.request

6.3.24.1.1 Function

This primitive indicates whether protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SETPROTECTION.request(
    Protectlist
)
```

| Name | Type | Valid range | Description |
|-------------|------------------------------|-------------|---|
| Protectlist | A set of protection elements | N/A | The list of how each key is being used currently. |

Each Protectlist consists of the following parameters:

| Name | Type | Valid range | Description |
|-------------|-------------|----------------------------------|--|
| Address | MACAddress | Any valid individual MAC address | This parameter is valid only when the Key Type value is Pairwise or when the Key Type value is Group and is from an IBSS STA or PeerKey. |
| ProtectType | Enumeration | None, Rx, Tx, Rx_Tx | The protection value for this MAC. |
| Key Type | Integer | Group, Pairwise, PeerKey, IGTK | Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key. |

6.3.24.1.3 When generated

This primitive is generated by the SME when protection is required for frames sent to and received from the indicated MAC address.

6.3.24.1.4 Effect of receipt

Receipt of this primitive causes the MAC to set the protection and to protect Data frames as indicated in the ProtectType parameter of the Protectlist parameter:

- None: Specifies that Data frames to and from the MAC address are not protected.

- Rx: Specifies that Data frames from the MAC address are protected (i.e., any Data frames without protection received from the MAC address are discarded) but Data frames to the MAC address are not protected.
- Tx: Specifies that Data frames to the MAC address are protected but Data frames from the MAC address are not protected.
- Rx_Tx: Specifies that Data frames to and from the MAC address are protected.

Once Data frames are protected to and/or from the specified MAC address, the MLME-SETPROTECTION.request primitive is used to reset the prior setting. Invocation of the MLME-SETPROTECTION.request primitive with a ProtectType of None deletes a protection state.

6.3.25 MLME-PROTECTEDFRAMEDROPPED

6.3.25.1 MLME- PROTECTEDFRAMEDROPPED.indication

6.3.25.1.1 Function

This primitive notifies the SME that a frame has been dropped because a temporal key was unavailable.

6.3.25.1.2 Semantics of the service primitive

This primitive has two parameters, the MAC addresses of the two STAs.

The primitive parameters are as follows:

```
MLME-PROTECTEDFRAMEDROPPED.indication (
    Address1,
    Address2
)
```

| Name | Type | Valid range | Description |
|----------|------------|----------------------------------|--------------------|
| Address1 | MACAddress | Any valid individual MAC address | MAC address of TA. |
| Address2 | MACAddress | Any valid individual MAC address | MAC address of RA. |

6.3.25.1.3 When generated

This primitive is generated by the MAC when a frame is dropped because no temporal key is available for the frame.

6.3.25.1.4 Effect of receipt

The SME is notified that a frame was dropped. The SME can use this information in an IBSS to initiate a security association to the peer STA.

6.3.26 TS management interface

6.3.26.1 General

This mechanism supports the process of adding, modifying, or deleting a TS in a BSS using the procedures defined in 11.4.

The primitives used for this mechanism are called *TS Management primitives*, which include MLME-ADDTS.xxx, MLME-DELTS.xxx, and MLME-ADDTSRESERVE.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a QoS Action frame. Requests and responses may cause the transmission of the corresponding QoS Action frames. Confirms and indications are issued upon the receipt of the appropriate QoS Action frame.

Table 6-1 defines which primitives are supported by which type of STA.

Table 6-1—Supported TS management primitives

| Primitive | Request | Confirm | Indication | Response |
|--|---------------------------------|---------------------------------|---------------------------------|----------------|
| ADDTS (in the context of establishing a TS) | DMG STA non-AP QoS STA | DMG STA non-AP QoS STA | DMG STA HC | DMG STA HC |
| ADDTS (in the context of requesting an allocation) | Non-AP and non-PCP DMG STA | Non-AP and non-PCP DMG STA | DMG AP or PCP | DMG AP or PCP |
| DELTS | DMG STA non-AP QoS STA HC | DMG STA non-AP QoS STA HC | DMG STA non-AP QoS STA HC | — |
| ADDTSRESERVE | HC | HC | non-AP QoS STA | non-AP QoS STA |

6.3.26.2 MLME-ADDTS.request

6.3.26.2.1 Function

This primitive requests addition (or modification) of a TS. It requests the HC or PCP to admit the new or changed TS.

6.3.26.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTS.request (
    DialogToken,
    TSPEC,
    TCLAS,
    TCLASProcessing,
    U-APSD Coexistence,
    EBR,
    IntraAccessCategoryPriority,
    HigherLayerStreamID,
    STAAddress,
    DMG TSPEC,
    Multi-band,
    U-PID,
    MMS,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--|---|---|
| DialogToken | Integer | 0–127 | Identifies the ADDTS transaction. |
| TSPEC | As defined in TSPEC element with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified | As defined in 9.4.2.30 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified | Specifies the TSID, traffic characteristics, and QoS requirements of the TS of concern. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS. |
| TCLASProcessing | TCLAS Processing element | As defined in 9.4.2.33 | Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements. |
| U-APSD Coexistence | U-APSD Coexistence element | As defined in 9.4.2.91. | Indicates the coexistence parameters for requested transmission during a U-APSD service period. |
| EBR | Expedited Bandwidth Request element | As defined in 9.4.2.94 | Specifies the precedence level of the TS request. This element is optionally present when dot11EBRAActivated is true. |
| IntraAccessCategoryPriority | Intra-Access Category Priority element | As defined in 9.4.2.121 | Specifies the intra-AC priorities the STA should use. |
| HigherLayerStreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Identifies the higher layer stream. |
| STAAddress | MACAddress | | Specifies the MAC address of the peer STA for a PTP TSPEC. |
| DMG TSPEC | DMG TSPEC element | As defined in 9.4.2.134 | Specifies the characteristics and QoS (scheduling) requirements of the DMG allocation request. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|--|
| U-PID | U-PID element | As defined in 9.4.2.154 | This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | This parameter is optionally present and specifies the parameters of an MMSL cluster establishment. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.2.3 When generated

This primitive is generated by the SME to request the addition of a new (or modification of an existing) TS in order to support parameterized QoS transport of the MSDUs belonging to this TS when a higher layer protocol or mechanism signals the STA to initiate such an addition (or modification).

6.3.26.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.

6.3.26.3 MLME-ADDTS.confirm

6.3.26.3.1 Function

This primitive reports the results of a TS addition (or modification) attempt.

6.3.26.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTS.confirm(
    ResultCode,
    DialogToken,
    TSDelay,
    TSPEC,
    Schedule,
    TCLAS,
    TCLASProcessing,
    EBR,
    HigherLayerStreamID,
    STAAddress,
    DMG TSPEC,
    Multi-band,
    U-PID,
    MMS,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------------|-------------------------------------|--|---|
| resultCode | Enumeration | SUCCESS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS, SUCCESS_STA_IN_PS_MODE, REJECT_U-PID_SETTING | Indicates the results of the corresponding MLME-ADDTs.request primitive. |
| DialogToken | Integer | As defined in the corresponding MLME-ADDTs.request primitive | Identifies the ADDTs transaction. |
| TSDelay | Integer | ≥ 0 | When the result code is REJECTED_FOR_DELAY_PERIOD, provides the amount of time a STA should wait before attempting another ADDTs Request frame. |
| TSPEC | TSPEC element | As defined in 9.4.2.30 | Specifies the TS information, traffic characteristics, and QoS requirements of the TS. |
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule information, service start time, SI, and the specification interval. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS. |
| TCLASProcessing | TCLAS Processing element | As defined in 9.4.2.33 | Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements. |
| EBR | Expedited Bandwidth Request element | As defined in 9.4.2.94 | Specifies the precedence level of the TS request. This element is optionally present when dot11EBRAActivated is true. |
| HigherLayerStream ID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Identifies the higher layer stream. |
| STAAddress | MACAddresses | | Specifies the MAC address of the peer STA for a PTP TSPEC. |
| DMG TSPEC | DMG TSPEC element | As defined in 9.4.2.134 | Specifies the characteristics and QoS (scheduling) requirements of the DMG allocation request. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|---|
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted. |
| U-PID | U-PID element | As defined in 9.4.2.154 | This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | This parameter is optionally present and specifies the parameters of an MMSL cluster establishment. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

For the ResultCode value of SUCCESS received by a non-DMG STA, the TSPEC and the optional TCLAS parameters describe the characteristics of the TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Service Start Time, Medium Time, and any possibly unspecified minimum set of parameters (see 10.22.4.3) in the TSPEC in ADDTS Request frame] exactly match those of the matching MLME-ADDTs.request primitive.

For other values of ResultCode received by a non-DMG STA, no new TS has been created. In the case of REJECTED_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information about the current status of the MAC entity. In the case of REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC represents an alternative proposal by the HC based on information received from the SSPN interface. A TS is not created with this definition. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the TS with the suggested changes.

In the case of REJECTED_WITH_SUGGESTED_BSS_TRANSITION, non-AP STA should retry TS setup process with the newly associated AP once the transition is done.

If this is the result of a modification of an existing TS, the status of that TS remains unchanged.

For the ResultCode value of SUCCESS or SUCCESS_STA_IN_PS_MODE received by a DMG STA, the DMG TSPEC and the optional TCLAS parameters describe the characteristics of the allocation or TS that has been created (or modified); and the specified (nonzero) parameters [with the exception of Maximum Allocation in the DMG TSPEC in the ADDTS Request frame] exactly match those of the matching MLME-ADDTs.request primitive.

For other values of ResultCode received by a DMG STA, no new allocation or TS has been created. In the case of REJECTED_WITH_SUGGESTED_CHANGES or REJECT_U-PID_SETTING, then the DMG TSPEC, Multi-band, and U-PID parameters represent an alternative proposal by the peer STA. In such cases, an allocation or TS has not been created. If the suggested changes are acceptable to the STA, it is the responsibility of the STA to set up the allocation or TS with the suggested changes.

If this failure is the result of a modification of an existing allocation or TS, the status of that allocation or TS remains unchanged.

6.3.26.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDTs.request primitive indicating the results of that request.

This primitive is generated when the STA receives a response in the form of an ADDTS Response frame in the corresponding QoS Action frame from the HC or DMG STA.

6.3.26.3.4 Effect of receipt

The SME is notified of the results of the TS addition (or modification) procedure.

The SME should operate according to the procedures defined in 11.4.

6.3.26.4 MLME-ADDTs.indication

6.3.26.4.1 Function

This primitive reports to the DMG STA's SME or the HC's SME the request for adding (or modifying) a TS.

6.3.26.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTs.indication (
    DialogToken,
    STAAddress,
    TSPEC,
    TCLAS,
    TCLASProcessing,
    U-APSD Coexistence,
    EBR,
    IntraAccessCategoryPriority,
    HigherLayerStreamID,
    DMG TSPEC,
    Multi-band,
    U-PID,
    MMS,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------|------------|--|--|
| DialogToken | Integer | As defined in the received ADDTS Request frame | Identifies the ADDTS transaction. |
| STAAddress | MACAddress | | Contains the MAC address of the STA that initiated the MLME-ADDTs.request primitive. |

| Name | Type | Valid range | Description |
|------------------------------|---|---|---|
| TSPEC | As defined in the TSPEC element, with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified | As defined in 9.4.2.30 with the exception of the surplus bandwidth allowance, minimum PHY rate, and maximum and minimum SIs, which are optionally specified | Specifies the TSID, traffic characteristics, and QoS requirements of the TS. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS. |
| TCLASProcessing | TCLAS Processing element | As defined in 9.4.2.33 | Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements. |
| U-APSD Coexistence | U-APSD Coexistence element | As defined in 9.4.2.91 | Indicates the coexistence parameters for requested transmission during a U-APSD service period. |
| EBR | Expedited Bandwidth Request element | As defined in 9.4.2.94 | Specifies the precedence level of the TS request. This element is optionally present when dot11EBRAActivated is true. |
| IntraAccessCategory Priority | Intra-Access Category Priority element | As defined in 9.4.2.121 | Specifies the intra-AC priorities the STA should use. |
| HigherLayerStreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Identifies the higher layer stream. |
| DMG TSPEC | DMG TSPEC element | As defined in 9.4.2.134 | Specifies the characteristics (scheduling) and QoS requirements of the DMG allocation request. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted. |
| U-PID | U-PID element | As defined in 9.4.2.154 | This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | This parameter is optionally present and specifies the parameters of an MMSL cluster establishment. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

The TCLAS is optional at the discretion of the STA that originated the request.

6.3.26.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a request to add (or modify) a TS by a specified STA in the form of an ADDTS Request frame.

6.3.26.4.4 Effect of receipt

The SME is notified of the request for a TS addition (or modification) by a specified STA.

This primitive solicits an MLME-ADDTS.response primitive from the SME that reflects the results of admission control at the HC or DMT STA on the TS requested to be added (or modified).

The SME should operate according to the procedures defined in 11.4.

The SME generates an MLME-ADDTS.response primitive within a dot11ADDTSResponseTimeout.

6.3.26.5 MLME-ADDTS.response

6.3.26.5.1 Function

This primitive responds to the request for a TS addition (or modification) by a specified STA's MAC entity.

6.3.26.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDTS.response(
 ResultCode,
 DialogToken,
 STAAddress,
 TSDelay,
 TSPEC,
 Schedule,
 TCLAS,
 TCLASProcessing,
 EBR,
 HigherLayerStreamID,
 DMG TSPEC,
 Multi-band,
 U-PID,
 MMS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------------|-------------------------------------|---|---|
| ResultCode | Enumeration | SUCCESS, REJECTED_WITH_SUGGESTED_CHANGES, REJECTED_FOR_DELAY_PERIOD, REJECTED_WITH_SUGGESTED_BSS_TRANSITION, REQUESTED_TCLAS_NOT_SUPPORTED, TCLAS_RESOURCES_EXHAUSTED, REJECTED_HOME_WITH_SUGGESTED_CHANGES, REJECTED_FOR_SSP_PERMISSIONS, SUCCESS_STA_IN_PS_MODE, REJECT_U-PID_SETTING | Indicates the results of the corresponding MLME-ADDS.indication primitive. |
| DialogToken | Integer | As defined in the corresponding MLME-ADDS.indication | DialogToken of the matching MLME-ADDS.indication primitive. |
| STAAddress | MACAddress | | Contains the STA address of the matching MLME-ADDS.indication primitive. |
| TSDelay | Integer | ≥ 0 | When the result code is REJECTED_FOR_DELAY_PERIOD, provides the amount of time a STA should wait before attempting another ADDTS request. |
| TSPEC | TSPEC element | As defined in 9.4.2.30 | Specifies the QoS parameters of the TS. |
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule information, service start time, SI, and the specification interval. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU may be classified to the specified TS. |
| TCLASProcessing | TCLAS Processing element | As defined in 9.4.2.33 | Specifies how the TCLAS elements are to be processed when there are multiple TCLAS elements. |
| EBR | Expedited Bandwidth Request element | As defined in 9.4.2.94 | Specifies the precedence level of the TS request. This element is optionally present when dot11EBRActivated is true. |
| HigherLayerStream ID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Identifies the higher layer stream. |
| DMG TSPEC | DMG TSPEC element | As defined in 9.4.2.134 | Specifies the characteristics (scheduling) and QoS requirements of the DMG allocation request. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|---|
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the TSID is to be established. The parameter is absent if the TSID is intended to be established on the same frequency band and channel where the ADDTS Request frame is transmitted. |
| U-PID | U-PID element | As defined in 9.4.2.154 | This parameter is optionally present and specifies the parameters of the LLC for the purpose of (de)multiplexing of frames associated with the TSID. |
| MMS | Multiple MAC Sublayers element | As defined in 9.4.2.153 | This parameter is optionally present and specifies the parameters of an MMSL cluster establishment. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

The DialogToken and STAAddress parameters contain the values from the matching MLME-ADDTs.indication primitive.

If a non-DMG STA receives a result code of SUCCESS, the TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTs-indication.

If a DMG STA receives a result code of SUCCESS or SUCCESS_STA_IN_PS_MODE, the DMG TSPEC and (optional) TCLAS parameters contain the values from the matching MLME-ADDTs.indication primitive.

If a non-DMG STA receives a result code of REJECTED_WITH_SUGGESTED_CHANGES or REJECTED_HOME_WITH_SUGGESTED_CHANGES, the TSPEC and TCLAS parameters represent an alternative proposed TS either based on information local to the MAC entity or using additional information received across the SSPN interface. The TS, however, is not created. The TSID and direction values within the TSPEC are as in the matching MLME-ADDTs.indication primitive. The difference may lie in the QoS (e.g., minimum data rate, mean data rate, and delay bound) values, as a result of admission control performed at the SME of the HC on the TS requested to be added (or modified) by the STA. If sufficient bandwidth is not available, the QoS values may be reduced. In one extreme, the minimum data rate, mean data rate, and delay bound may be all set to 0, indicating that no QoS is to be provided to this TS.

If a DMG STA receives a result code of REJECTED_WITH_SUGGESTED_CHANGES or REJECT_U-PID_SETTING, then the DMG TSPEC, TCLAS, Multi-band, and U-PID parameters represent an alternative proposal for the allocation or TS. The allocation or TS, however, has not been created. The allocation ID value within the DMG TSPEC is as in the matching MLME-ADDTs.indication primitive. The difference might lie in the other parameter values, as a result of admission control performed at the SME of the peer STA on the allocation or TS requested to be added (or modified). If sufficient bandwidth is not available, the QoS values might be reduced.

If the result code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION, the non-AP STA should initiate a transition query as defined in 11.24.7. Once the transition is completed, the STA should retry TS setup process, as defined in 11.4.4.

6.3.26.5.3 When generated

This primitive is generated by the SME at the HC or DMG STA as a result of an MLME-ADDTs.indication primitive to initiate addition (or modification) of a TS with a specified peer MAC entity or entities.

6.3.26.5.4 Effect of receipt

This primitive approves addition (or modification) of a TS requested by a specified STA's MAC entity, with or without altering the TSPEC.

This primitive causes the MAC entity at the HC or DMG STA to send an ADDTS Response frame to the requesting STA containing the specified parameters.

6.3.26.6 MLME-DELTS.request

6.3.26.6.1 Function

This primitive requests deletion of a TS with a specified peer MAC.

This primitive may be generated by one of the following:

- DMG STA
- Non-AP STA
- PCP
- HC

6.3.26.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.request(
    STAAddress,
    TSInfo,
    ReasonCode,
    STAAddress,
    DMG Allocation Info,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------|---------------|---|---|
| STAAddress | MACAddress | | Specifies the MAC address of the STA that initiated this TS. Present only at the HC. |
| TSInfo | TS Info field | As defined in 9.4.2.30 | Specifies the TS to be deleted. Not present when DMG Allocation Info is present. |
| ReasonCode | Enumeration | STA_LEAVE, END_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS | Indicates the reason why the TS is being deleted. |
| STAAddress | MACAddress | | Specifies the MAC address of the peer STA for the PTP TSPEC. |

| Name | Type | Valid range | Description |
|---------------------|---------------------------|-------------------------|---|
| DMG Allocation Info | DMG Allocation Info field | As defined in 9.4.2.134 | Specifies the DMG allocation to be deleted. Not present when TSInfo is present. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the TS is to be deleted. The parameter is absent if the TS is intended to be deleted on the same frequency band and channel where the DELTS is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.6.3 When generated

This primitive is generated by the SME to initiate deletion of a TS when a higher layer protocol or mechanism signals the STA to initiate such a deletion.

6.3.26.6.4 Effect of receipt

This primitive initiates a TS deletion procedure.

This primitive causes the local MAC entity to send out a DELTS frame containing the specified parameters. If this primitive was generated at the HC, the frame is sent to the specified STA's MAC address. If this primitive was generated at the non-AP STA that is a non-DMG STA, the frame is sent to its HC. A DMG STA sends the frame to the specified STA's MAC address. In any of these cases, the DELTS frame does not solicit a response from the recipient frame other than an acknowledgment to receipt of the frame.

6.3.26.7 MLME-DELTS.indication

6.3.26.7.1 Function

This primitive reports the deletion of a TS by a specified peer MAC entity or deletion of the TS due to an inactivity timeout (HC or PCP only).

6.3.26.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DELTS.indication(
    STAAddress,
    TSInfo,
    ReasonCode,
    DMG Allocation Info,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|---------------------------|--|--|
| STAAddress | MACAddress | | Specifies the MAC address of the STA for which the TS is being deleted. Present only at the HC. |
| TSInfo | TS Info field | As defined in 9.4.2.30 | Specifies the TS information of the TS of concern. Not present when DMG Allocation Info is present. |
| ReasonCode | Enumeration | STA_LEAVE_TS, UNKNOWN_TS, TIMEOUT, SERVICE_CHANGE_PRECLUDES_TS | Indicates the reason why the TS is being deleted. |
| DMG Allocation Info | DMG Allocation Info field | As defined in 9.4.2.134 | Specifies the DMG allocation under consideration. Not present when TSInfo is present. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number for the TS under consideration. The parameter is absent if the TS is intended to be deleted on the same frequency band and channel where the DELTS is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.7.3 When generated

This primitive is generated by the MLME when it receives a DELTS frame from the specified peer MAC entity.

This primitive may also be generated by the MLME at the DMG STA or HC as a result of inactivity of a particular TS. Inactivity results when a period equal to the inactivity interval in the TSPEC for the TS elapses

- Without arrival of an MSDU belonging to that TS at the MAC entity of the DMG STA or HC via an MA-UNITDATA.request primitive when the DMG STA or HC is the source STA of that TS or
- Without reception of an MSDU belonging to that TS by the MAC entity of the DMG STA or HC when the DMG STA or HC is not the source STA of that TS.

This primitive is generated after any other state concerning the TSID/direction within the MAC has been deleted.

6.3.26.7.4 Effect of receipt

The SME is notified of the initiation of a TS deletion by a specified peer MAC entity.

6.3.26.8 MLME-ADDTSRESERVE.request

6.3.26.8.1 Function

This primitive request is used by the SME at the AP to start the AP-initiated TS setup procedure.

6.3.26.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSERVE.request (
    TSPEC,
    HigherLayerStreamID,
    Schedule,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|-------------------------|---|
| TSPEC | TSPEC element | As defined in 9.4.2.30 | Specifies the QoS parameters of the TS. |
| HigherLayerStreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Stream identifier assigned by a higher layer protocol. |
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule information, service start time, SI, and the specification interval. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.8.3 When generated

This primitive is generated by the SME at the AP to start the AP-initiated TS setup procedure. If the parameter validation on the parameters used in this primitive succeeds, an ADDTS Reserve Request frame is transmitted from the AP to a non-AP STA.

6.3.26.8.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.4.3.

6.3.26.9 MLME-ADDTSERVE.confirm

6.3.26.9.1 Function

This primitive is an indication to the SME that is generated by the MLME as a result of receiving an ADDTS Reserve Response frame from the non-AP STA to which the AP sent a corresponding ADDTS Reserve Request frame.

6.3.26.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSERVE.confirm (
    ResultCode,
    StreamID,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|-------------------------|---|
| ResultCode | Enumeration | SUCCESS, FAILURE | Indicates the results of the corresponding MLME-ADDTSReserve.request primitive. |
| StreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Stream identifier specified in the corresponding MLME-ADDTSReserve.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.9.3 When generated

This primitive is generated by the MLME as a result of receiving an ADDTS Reserve Response frame from the non-AP STA to which the AP sent a corresponding ADDTS Reserve Request action.

6.3.26.9.4 Effect of receipt

The SME is notified of the results of the AP-initiated TS setup procedure.

6.3.26.10 MLME-ADDTSRESERVE.indication

6.3.26.10.1 Function

This primitive reports to the non-AP STA's SME the initiation of AP-initiated TS setup procedure.

6.3.26.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSRESERVE.indication (
    APAddress,
    TSPEC,
    Schedule,
    HigherLayerStreamID,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|-------------------------|---|
| APAddress | MAC Address | — | Contains the MAC address of the AP initiating the TS setup procedure. |
| TSPEC | TSPEC element | As defined in 9.4.2.30 | Specifies the QoS parameters of the TS. |
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule information, service start time, SI, and the specification interval. |
| HigherLayerStreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Stream identifier in the received ADDTS Reserve Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.10.3 When generated

This primitive is generated by the MLME at the non-AP STA as a result of the receipt of an ADDTS Reserve Request frame from the AP to which the non-AP STA is associated.

6.3.26.10.4 Effect of receipt

The SME is notified of the receipt of the ADDTS Reserve Request frame from the AP. This primitive solicits the SME to participate in the AP-initiated TS setup procedure.

The SME should operate according to the procedures defined in 11.4.4.3.

6.3.26.11 MLME-ADDTSERVE.response

6.3.26.11.1 Function

This primitive is used by a non-AP STA to indicate to the HC the completion of an AP-initiated TS setup procedure.

6.3.26.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDTSERVE.response (
    HigherLayerStreamID,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|-------------------------|---|
| HigherLayerStreamID | Higher Layer Stream ID element | As defined in 9.4.2.125 | Stream identifier specified in the corresponding MLME-ADDTSERVE.indication primitive. |
| ResultCode | Enumeration | SUCCESS, FAILURE | Indicates the result of the AP-initiated TS setup procedure. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.26.11.3 When generated

This primitive is generated by the SME at the non-AP STA to indicate to an HC that the non-AP STA has setup a TS in response to a higher layer protocol.

6.3.26.11.4 Effect of receipt

The STA operates according to the procedures defined in 11.4.4.3.

6.3.27 Management of direct links

6.3.27.1 Introduction

This subclause describes the management procedures associated with direct links.

6.3.27.2 MLME-DLS.request

6.3.27.2.1 Function

This primitive requests the setup of a direct link with a specified peer MAC entity.

6.3.27.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLS.request(

PeerMACAddress,
DLSTimeoutValue,
VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the intended immediate recipient of the data flow. |
| DLSTimeoutValue | Integer | ≥ 0 | Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.2.3 When generated

This primitive is generated by the SME to set up a direct link with another STA.

6.3.27.2.4 Effect of receipt

This primitive initiates a DLS procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-DLS.confirm primitive that reflects the results.

6.3.27.3 MLME-DLS.confirm

6.3.27.3.1 Function

This primitive reports the results of a DLS attempt with a specified peer MAC entity.

6.3.27.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLS.confirm(

PeerMACAddress,
ResultCode,
CapabilityInformation,
DLSTimeoutValue,
OperationalRateSet,
HT Capabilities,

VHT Capabilities
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-----------------------|--|--|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the intended immediate recipient of the data flow. |
| ResultCode | Enumeration | SUCCESS, DLS_NOT_ALLOWED, NOT_PRESENT, NOT_QOS_STA, REFUSED | Indicates the results of the corresponding MLME-DLS.request primitive. |
| CapabilityInformation | Capability Information field | As defined in 9.4.1.4 | Specifies the capabilities of the peer MAC entity. |
| DLSTimeoutValue | Integer | ≥ 0 | Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout. |
| OperationalRateSet | Set of integers | Non-DMG BSS: 1-127 excluding values from Table 9-78 for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the peer STA is able to use for direct link communication. The peer STA is able to receive at each of the data rates listed in the set. |
| HT Capabilities | As defined in frame format | As defined in 9.4.2.56 | Specifies the parameters within the HT Capabilities element that are supported by the peer MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present. |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158 | Specifies the parameters in the VHT Capabilities element that are supported by the peer MAC entity. The parameter is optionally present if dot11VHTOptionImplemented is true and not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-DLS.request primitive to establish a direct link with a specified peer MAC entity.

6.3.27.3.4 Effect of receipt

The SME is notified of the results of the DLS procedure.

6.3.27.4 MLME-DLS.indication

6.3.27.4.1 Function

This primitive reports the establishment of a direct link with a specified peer MAC entity.

6.3.27.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DLS.indication(

PeerMACAddress,
 CapabilityInformation,
 DLSTimeoutValue,
 OperationalRateSet,
 HT Capabilities,
 VHT Capabilities
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-----------------------|--|--|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the sender of the data flow. |
| CapabilityInformation | Capability Information field | As defined in 9.4.1.4 | Specifies the operational capability definitions to be used by the peer MAC entity. |
| DLSTimeoutValue | Integer | ≥ 0 | Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout. |
| OperationalRateSet | Set of integers | Non-DMG BSS: 1-127 excluding values from Table 9-78 for each member of the set | Non-DMG BSS: The set of data rates (in units of 500 kb/s) that the peer STA is able to use for direct link communication. The peer STA is able to receive at each of the data rates listed in the set. |
| HT Capabilities | As defined in frame format | As defined in 9.4.2.56 | Specifies the parameters within the HT Capabilities element that are supported by peer the MAC entity. The parameter is optionally present if dot11HighThroughputOptionImplemented is true; otherwise not present. |
| VHT Capabilities | As defined in VHT Capabilities element | As defined in 9.4.2.158 | Specifies the parameters in the VHT Capabilities element that are supported by the peer MAC entity. The parameter is optionally present if dot11VHTOptionImplemented is true and not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.4.3 When generated

This primitive is generated by the MLME as result of the establishment of a direct link with a specific peer MAC entity that resulted from a DLS procedure that was initiated by that specific peer MAC entity.

6.3.27.4.4 Effect of receipt

The SME is notified of the establishment of the DLS.

6.3.27.5 MLME-DLS.response

6.3.27.5.1 Function

This primitive responds to the request for establishment of a direct link.

6.3.27.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS.response(
    PeerMACAddress,
    ResultCode,
    DLSTimeoutValue,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---------------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the sender of the data flow. |
| ResultCode | Enumeration | SUCCESS, DLS_NOT_ALLOW ED, REFUSED | Indicates the results of the corresponding MLME-DLS.indication primitive. |
| DLSTimeoutValue | Integer | ≥ 0 | Specifies a time limit (in seconds) after which the direct link is terminated if there are no frame exchange sequences with the peer. A value of 0 implies that the direct link is never to be terminated based on a timeout. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.5.3 When generated

This primitive is generated by the SME as a result of an MLME-DLS.indication primitive to initiate establishment of a direct link.

6.3.27.5.4 Effect of receipt

This primitive causes the MAC entity to send a DLS Response frame to the requesting STA containing the specified parameters.

6.3.27.6 MLME-DLS-TEARDOWN.request

6.3.27.6.1 Function

When initiated by a non-AP STA, this primitive requests the teardown of the direct link with a specified peer MAC entity. When initiated by an AP, this primitive requests the teardown of direct link between two specified MAC entities.

6.3.27.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS-TEARDOWN.request(
    PeerMACAddress1,
    PeerMACAddress2,
    ReasonCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| PeerMACAddress1 | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the intended immediate recipient of the teardown. |
| PeerMACAddress2 | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA with which the DLS is being torn down. This parameter is applicable only at the AP. |
| ReasonCode | Enumeration | STA_LEAVEING, END_DLS, PEERKEY_MISMATCH, UNKNOWN_DLS, TIMEOUT, PEER_INITIATED, AP_INITIATED | Indicates the reason why the direct link is being torn down. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.6.3 When generated

This primitive is generated by the SME for tearing down a direct link with another STA.

6.3.27.6.4 Effect of receipt

This primitive initiates a direct-link teardown procedure. The MLME subsequently issues an MLME-DLS-TEARDOWN.confirm primitive that reflects the results.

6.3.27.7 MLME-DLS-TEARDOWN.indication

6.3.27.7.1 Function

This primitive indicates the teardown of an already established direct link with a specific peer MAC entity.

6.3.27.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DLS-TEARDOWN.indication(
    PeerMACAddress,
    ReasonCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the sender of the data flow. |
| ReasonCode | Enumeration | STA_LEAVEING, END_DLS, PEERKEY_MISMATCH, UNKNOWN_DLS, TIMEOUT, PEER_INITIATED, AP_INITIATED | Indicates the reason why the direct link is being torn down. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.27.7.3 When generated

This primitive is generated by the MLME as result of the teardown of a direct link with a specific peer MAC entity that resulted from a direct link teardown procedure that was initiated either by that specific peer MAC entity or by the local MAC entity.

6.3.27.7.4 Effect of receipt

The SME is notified of the teardown of the DLS.

6.3.28 Higher layer synchronization support

6.3.28.1 Introduction

This mechanism supports the process of synchronization among higher layer protocol entities residing within different wireless STAs. The actual synchronization mechanism in the higher layer is out of the scope of this standard. In principle, the MLME indicates the transmission/reception of frames with a specific group address in the Address 1 field of a Data frame.

6.3.28.2 MLME-HL-SYNC.request

6.3.28.2.1 Function

This primitive requests activation of the synchronization support mechanism.

6.3.28.2.2 Semantics of the service primitive

The primitive parameter is as follows:

MLME-HL-SYNC.request(
 GroupAddress
)

| Name | Type | Valid range | Description |
|--------------|------------|---------------------|---|
| GroupAddress | MACAddress | A group MAC address | Specifies the group MAC address to which the synchronization frames are addressed. A synchronization frame is a Data frame with higher layer synchronization information. |

6.3.28.2.3 When generated

This primitive is generated by the SME when a higher layer protocol initiates a synchronization process.

6.3.28.2.4 Effect of Receipt

This request activates the synchronization support mechanism at the STA. The MLME issues an MLME-HL-SYNC.indication primitive when a higher layer synchronization frame, which is a Data frame with the specified group address in Address 1 field, is received or transmitted.

6.3.28.3 MLME-HL-SYNC.indication

6.3.28.3.1 Function

This primitive indicates the last symbol on air of a higher layer synchronization frame, whether transmitted or received by the MAC.

6.3.28.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HL-SYNC.indication(
    SourceAddress,
    SequenceNumber
)
```

| Name | Type | Valid range | Description |
|----------------|------------|----------------------------------|--|
| SourceAddress | MACAddress | Any valid individual MAC address | Specifies the SA of the STA that transmitted the higher layer synchronization frame. |
| SequenceNumber | Integer | As defined in 9.2.4.4.2 | Specifies the sequence number of the higher layer synchronization frame received or transmitted. |

6.3.28.3.3 When generated

This primitive is generated by the MLME when the reception or transmission of a higher layer synchronization frame is detected, as indicated by the PHY-RXEND.indication or PHY-TXEND.confirm primitives generated by the PHY. The higher layer synchronization frame is identified by the group MAC address registered by an earlier MLME-HL-SYNC.request primitive in the Address 1 field of a Data frame.

6.3.28.3.4 Effect of receipt

The SME is notified of the reception or transmission of a higher layer synchronization frame.

6.3.29 Block Ack

6.3.29.1 General

This mechanism supports the initiation (or modification) and termination of block ack.

The primitives used for this mechanism are called *block ack primitives*, which include MLME-ADDBA.xxx and MLME-DELBA.xxx primitives, where xxx denotes request, confirm, indication, or response. Each primitive contains parameters that correspond to a Block Ack Action frame body. Requests and responses may cause these frames to be sent. Confirms and indications are emitted when an appropriate Block Ack Action frame is received.

6.3.29.2 MLME-ADDBA.request

6.3.29.2.1 Function

This primitive requests the initiation (or modification) of block ack with a peer MAC entity.

6.3.29.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.request(

```
PeerSTAAddress,
DialogToken,
TID,
BlockAckPolicy,
BufferSize,
BlockAckTimeout,
BlockAckStartingSequenceControl,
GCRGroupAddress,
Multi-band,
TCLAS,
ADDBA Extension,
VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------|--|-------------------------|---|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity with which to perform the block ack initiation (or modification). |
| DialogToken | Integer | 0–255 | Identifies the ADDBA transaction. |
| TID | Integer | 0–15 | Specifies the TID of the data. |
| BlockAckPolicy | Enumeration | Immediate, Delayed | Specifies the block ack policy. |
| BufferSize | Integer | 0–1023 | Specifies the number of MPDUs that can be held in its buffer. |
| BlockAckTimeout | Integer | 0 – 65 535 | Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down. |
| BlockAckStartingSequenceControl | Block Ack Starting Sequence Control subfield | As defined in 9.3.1.8 | Specifies the value of the Block Ack Starting Sequence Control subfield. |
| GCRGroupAddress | GCR Group Address element | As defined in 9.4.2.126 | Specifies the group address for which a block ack agreement is requested. If the element is present, a GCR Group Address element is included in the transmitted ADDBA Request frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the block ack agreement is to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Request frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| ADDBA Extension | ADDBA Extension element | As defined in 9.4.2.139 | Specifies additional parameters associated with the block ack agreement. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.2.3 When generated

This primitive is generated by the SME to request initiation (or modification) of block ack with the specified peer MAC entity.

6.3.29.2.4 Effect of receipt

The STA sends the ADDBA Request frame to the specified peer MAC entity.

6.3.29.3 MLME-ADDBA.confirm

6.3.29.3.1 Function

The primitive reports the results of initiation (or modification) of the block ack attempt with the specified peer MAC entity.

6.3.29.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ADDBA.confirm(
    PeerSTAAddress,
    DialogToken,
    TID,
    ResultCode,
    BlockAckPolicy,
    BufferSize,
    BlockAckTimeout,
    GCRGroupAddress,
    Multi-band,
    TCLAS,
    ADDBA Extension,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------|---------------------------|-------------------------|--|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity with which the block ack initiation (or modification) was attempted. This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.request primitive. |
| DialogToken | Integer | 0–255 | Identifies the ADDBA transaction. This value matches the DialogToken parameter specified in MLME-ADDBA.request primitive. |
| TID | Integer | 0–15 | Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.request primitive. |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the result of the corresponding MLME-ADDBA.request primitive. |
| BlockAckPolicy | Enumeration | Immediate, Delayed | Specifies the block ack policy. |
| BufferSize | Integer | 0–1023 | Specifies the maximum number of MPDUs in the block for the specified TID. |
| BlockAckTimeout | Integer | 0 – 65 535 | Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down. |
| GCRGroupAddress | GCR Group Address element | As defined in 9.4.2.126 | Specifies the group address for which a block ack agreement was requested. |

| Name | Type | Valid range | Description |
|--------------------|-------------------------|-------------------------|---|
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the block ack initiation was attempted. The parameter is absent if the block ack agreement is intended was attempted to be established on the same frequency band and channel where the ADDBA Request frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| ADDBA Extension | ADDBA Extension element | As defined in 9.4.2.139 | Specifies additional parameters associated with the block ack agreement. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.request primitive to indicate the results of that request.

6.3.29.3.4 Effect of receipt

The SME is notified of the results of the block ack initiation (or modification).

6.3.29.4 MLME-ADDBA.indication

6.3.29.4.1 Function

This primitive reports the initiation (or modification) of block ack by a peer MAC entity.

6.3.29.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.indication(

```

        PeerSTAAddress,
        DialogToken,
        TID,
        BlockAckPolicy,
        BufferSize,
        BlockAckTimeout,
        GCRGroupAddress,
        Multi-band,
        TCLAS,
        ADDBA Extension,
        VendorSpecificInfo
    )
```

| Name | Type | Valid range | Description |
|----------------|------------|-------------|---|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity that requested the block ack initiation (or modification). |
| DialogToken | Integer | 0–255 | Identifies the ADDBA transaction. |
| TID | Integer | 0–15 | Specifies the TID of the data. |

| Name | Type | Valid range | Description |
|--------------------|---------------------------|-------------------------|---|
| BlockAckPolicy | Enumeration | Immediate, Delayed | Specifies the block ack policy. |
| BufferSize | Integer | 0–1023 | Specifies the number of MPDUs that can be held in peerSTAAddress buffer. |
| BlockAckTimeout | Integer | 0 – 65 535 | Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down. |
| GCRGroupAddress | GCR Group Address element | As defined in 9.4.2.126 | Specifies the group address for which a block ack agreement is requested. This element is present if a GCR Group Address element was included in the transmitted ADDBA Request frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the block ack agreement is to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Request frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| ADDBA Extension | ADDBA Extension element | As defined in 9.4.2.139 | Specifies additional parameters associated with the block ack agreement. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a block ack initiation (or modification) by the specified peer MAC entity in the form of an ADDBA Request frame.

6.3.29.4.4 Effect of receipt

The SME is notified of the initiation (or modification) of the block ack by the specified peer MAC entity.

6.3.29.5 MLME-ADDBA.response

6.3.29.5.1 Function

The primitive responds to the initiation (or modification) by a specified peer MAC entity.

6.3.29.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ADDBA.response(

PeerSTAAddress,
DialogToken,
TID,
ResultCode,
BlockAckPolicy,
BufferSize,
BlockAckTimeout,
GCRGroupAddress,
Multi-band,

TCLAS,
 ADDBA Extension,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|---------------------------|-------------------------|---|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity that attempted the block ack initiation (or modification). This value matches the PeerSTAAddress parameter specified in MLME-ADDBA.indication primitive. |
| DialogToken | Integer | 0–255 | Identifies the ADDBA transaction. This value matches the DialogToken parameter specified in MLME-ADDBA.indication primitive. |
| TID | Integer | 0–15 | Specifies the TID of the data. This value matches the TID specified in MLME-ADDBA.indication primitive. |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the result of the corresponding MLME-ADDBA.indication primitive. |
| BlockAckPolicy | Enumeration | Immediate, Delayed | Specifies the block ack policy. Undefined when the result code is REFUSED. |
| BufferSize | Integer | 0–1023 | Specifies the maximum number of MPDUs in the block for the specified TID. Undefined when the result code is REFUSED. |
| BlockAckTimeout | Integer | 0 – 65 535 | Specifies the number of TUs without a frame exchange between peers after which the block ack agreement is considered to be torn down. |
| GCRGroupAddress | GCR Group Address element | As defined in 9.4.2.126 | Specifies the group address for which a block ack agreement was requested. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the block ack agreement is intended to be established. The parameter is absent if the block ack agreement is intended to be established on the same frequency band and channel where the ADDBA Response frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| ADDBA Extension | ADDBA Extension element | As defined in 9.4.2.139 | Specifies additional parameters associated with the block ack agreement. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-ADDBA.indication primitive to initiate block ack by the specified peer MAC entity.

6.3.29.5.4 Effect of receipt

The primitive causes the MAC entity to send an ADDBA Response frame to the specified peer MAC entity.

6.3.29.6 MLME-DELBA.request

6.3.29.6.1 Function

This primitive requests the deletion of block ack with a peer MAC entity.

6.3.29.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELBA.request(

PeerSTAAddress,
 Direction,
 TID,
 ReasonCode,
 Multi-band,
 TCLAS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|--------------------|---|--|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity with which to perform the block ack deletion. |
| Direction | Enumeration | Originator, Recipient | Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses the Block Ack. |
| TID | Integer | 0–15 | Specifies the TID of the MSDUs for which this block ack agreement has been set up. |
| ReasonCode | Enumeration | STA_LEAVEING, END_BA, UNKNOWN_BA, TIMEOUT | Indicates the reason why the block ack agreement is being deleted. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the block ack agreement is to be deleted. The parameter is absent if the block ack agreement to be deleted is established on the same frequency band and channel where the DELBA frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.6.3 When generated

This primitive is generated by the SME to request deletion of block ack with the specified peer MAC entity.

6.3.29.6.4 Effect of receipt

The STA sends the DELBA frame to the specified peer MAC entity.

6.3.29.7 MLME-DELBA.indication

6.3.29.7.1 Function

This primitive reports the deletion of block ack by a peer MAC entity.

6.3.29.7.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DELBA.indication(

PeerSTAAddress,
 Direction,
 TID,
 ReasonCode,
 Multi-band,
 TCLAS,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|--------------------|---|---|
| PeerSTAAddress | MACAddress | N/A | Specifies the address of the peer MAC entity with which to perform the block ack deletion. |
| Direction | Enumeration | Originator, Recipient | Specifies if the MAC entity initiating the MLME-DELBA.request primitive is the originator or the recipient of the data stream that uses block ack. |
| TID | Integer | 0–15 | Specifies the TID of the MSDUs for which this block ack agreement has been set up. |
| ReasonCode | Enumeration | STA_LEAVEING, END_BA, UNKNOWN_BA, TIMEOUT | Indicates the reason why the block ack agreement is being deleted. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where block ack agreement is to be deleted. The parameter is absent if the block ack deletion refers to the same frequency band and channel where the DELBA frame is transmitted. |
| TCLAS | TCLAS element | As defined in 9.4.2.31 | Zero or more TCLAS elements. Specifies the rules and parameters by which an MSDU might be classified to the specified TID. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.29.7.3 When generated

This primitive is generated by the MLME as a result of receipt of a block ack deletion by the specified peer MAC entity in the form of a DELBA frame.

6.3.29.7.4 Effect of receipt

The SME is notified of the deletion of the block ack by the specified peer MAC entity.

6.3.30 Schedule element management

6.3.30.1 Introduction

This subclause describes the management procedures associated with the QoS Schedule element.

The primitives defined are MLME-SCHEDULE.request and MLME-SCHEDULE.indication.

6.3.30.2 MLME-SCHEDULE.request

6.3.30.2.1 Function

This primitive requests transmission of a Schedule frame. It is valid at the HC.

6.3.30.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCHEDULE.request(
    STAAddress,
    Schedule,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------------|--|
| STAAddress | MACAddress | Any valid individual address | MAC address of the STA to which the Schedule frame shall be sent. |
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.30.2.3 When generated

This primitive is generated by the SME at the HC to send the schedule information, in the form of a Schedule frame, to a specified STA when the schedule information for the STA is changed.

6.3.30.2.4 Effect of receipt

This primitive causes the MAC entity at the HC to send a Schedule frame to the STA specified in the primitive containing the specified Schedule parameters.

6.3.30.3 MLME-SCHEDULE.indication

6.3.30.3.1 Function

This primitive reports the reception of a new schedule by the STA in the form of a Schedule frame.

6.3.30.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-SCHEDULE.indication(
    Schedule,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| Schedule | Schedule element | As defined in 9.4.2.34 | Specifies the schedule for the STA, including the SI (minimum and maximum), TXOP duration (minimum and maximum), and specification interval. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.30.3.3 When generated

This primitive is generated by the MLME as a result of receipt of a new schedule in the form of a Schedule frame.

6.3.30.3.4 Effect of receipt

The SME is notified of the receipt of QoS schedule in the form of a Schedule frame. The new Schedule parameters overwrite the previously stored values.

6.3.31 Vendor-specific action

6.3.31.1 Introduction

This set of primitives supports the signaling of (Protected) Vendor Specific frames among peer SMEs.

6.3.31.2 MLME-VSPECIFIC.request

6.3.31.2.1 Function

This primitive requests transmission of a Vendor Specific frame.

6.3.31.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-VSPECIFIC.request(
    PeerMACAddress,
    Protected,
    Organization Identifier,
    VendorSpecificContent
)
```

| Name | Type | Valid range | Description |
|-------------------------|--|--|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address or any valid group MAC address | The address of the peer MAC entity or group of entities to which the Vendor Specific frame is sent. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using a Protected Vendor Specific frame. If false, the request is sent using a Vendor Specific frame. |
| Organization Identifier | As defined in 9.4.1.32 | As defined in 9.4.1.32 | Contains a public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action. |
| VendorSpecificContent | Determined by the entity to whom the Organization Identifier is registered | Determined by the entity to whom the Organization Identifier is registered | Vendor-specific content. |

6.3.31.2.3 When generated

This primitive is generated by the SME to request that a Vendor Specific frame be sent.

6.3.31.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Vendor Specific frame containing the set of elements and vendor-specific fields. The STA then attempts to transmit the frame.

6.3.31.3 MLME-VSPECIFIC.indication

6.3.31.3.1 Function

This primitive indicates that a Vendor Specific frame has been received from a peer entity.

6.3.31.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-VSPECIFIC.indication(
 PeerMACAddress,
 Protected,
 Organization Identifier,
 RCPI,
 VendorSpecificContent
)

| Name | Type | Valid range | Description |
|-------------------------|--|--|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Vendor Specific frame was received. |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using a Protected Vendor Specific frame. If false, the request was received using a Vendor Specific frame. |
| Organization Identifier | As defined in 9.4.1.32 | As defined in 9.4.1.32 | Contains a public value assigned by the IEEE to identify the organization that has defined the content of the particular vendor-specific action. |
| RCPI | As defined in 9.4.2.38 | As defined in 9.4.2.38 | Present when dot11OCBActivated is true. RCPI is the measured value of received channel power on the received Vendor Specific frame. |
| VendorSpecificContent | Determined by the entity to whom the Organization Identifier is registered | Determined by the entity to whom the Organization Identifier is registered | Vendor-specific content. |

6.3.31.3.3 When generated

This primitive is generated by the MLME when a valid Vendor Specific frame is received.

6.3.31.3.4 Effect of receipt

On receipt of this primitive, the vendor specific content can be made available for SME processes.

6.3.32 Neighbor report request

6.3.32.1 General

The following MLME primitives support the signaling of neighbor report requests.

6.3.32.2 MLME-NEIGHBORREPREQ.request

6.3.32.2.1 Function

This primitive requests that a Neighbor Report Request frame be sent to the AP with which the STA is associated. It is valid only at a radio measurement capable STA.

6.3.32.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPREQ.request(
    DialogToken,
    SSID,
    LCI Measurement Request,
    Location Civic Measurement Request,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------------------|--------------------------------|--------------------------------|---|
| DialogToken | Integer | 1–255 | The dialog token to identify the neighbor report transaction. |
| SSID | As defined in the SSID element | As defined in the SSID element | Optional SSID element to request a neighbor list for a specific SSID. |
| LCI Measurement Request | As defined in 9.6.7.6 | As defined in 9.6.7.6 | Optional element included to request LCI information in Neighbor Report elements |
| Location Civic Measurement Request | As defined in 9.6.7.6 | As defined in 9.6.7.6 | Optional element included to request location civic information in Neighbor Report elements |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.32.2.3 When generated

This primitive is generated by the SME to request that a Neighbor Report Request frame be sent to the AP with which the STA is associated to request a neighbor report.

6.3.32.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.32.3 MLME-NEIGHBORREQ.indication

6.3.32.3.1 Function

This primitive indicates that a Neighbor Report Request frame was received. It is valid only at a radio measurement capable AP.

6.3.32.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREQ.indication(
    PeerSTAAddress,
    DialogToken,
    SSID,
    LCI Measurement Request,
    Location Civic Measurement Request,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the STA's MAC entity from which a Neighbor Report Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token in the Neighbor Report Request frame that was received. |
| SSID | As defined in the SSID element | As defined in the SSID element | Optional SSID element to request a neighbor list for a specific SSID. |

| Name | Type | Valid range | Description |
|------------------------------------|-----------------------|------------------------|---|
| LCI Measurement Request | As defined in 9.6.7.6 | As defined in 9.6.7.6 | Optional element included to request LCI information in Neighbor Report elements |
| Location Civic Measurement Request | As defined in 9.6.7.6 | As defined in 9.6.7.6 | Optional element included to request location civic information in Neighbor Report elements |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.32.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Request frame is received.

6.3.32.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.11.10.3.

6.3.33 Neighbor report response

6.3.33.1 General

The following MLME primitives support the signaling of neighbor report responses.

6.3.33.2 MLME-NEIGHBORREPRES.P.request

6.3.33.2.1 Function

This primitive requests that a neighbor report response be sent. This may be in response to an MLME-NEIGHBORREPREQ.indication primitive or an autonomous request. It is valid only at a radio measurement capable AP.

6.3.33.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPRES.P.request(
    PeerSTAAddress,
    DialogToken,
    NeighborListSet,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the STA's MAC entity to which a Neighbor Report Response frame is to be sent. |
| DialogToken | Integer | 0–255 | The dialog token to identify the neighbor report transaction. Set to the value received in the corresponding MLME-NEIGHBORREPREQ.indication primitive or to 0 for an autonomous report. |

| Name | Type | Valid range | Description |
|--------------------|---|------------------------|--|
| NeighborListSet | Set of Neighbor List elements each as defined in the Neighbor Report element format | As defined in 9.4.2.37 | A set of Neighbor List elements, each representing a neighboring AP being reported as defined in the Neighbor Report element format. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.33.2.3 When generated

This primitive is generated by the SME to request a neighbor report be sent. This may be in response to an earlier MLME-NEIGHBORREPREQ.indication primitive or a request to transmit an autonomous report.

6.3.33.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Neighbor Report Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.33.3 MLME-NEIGHBORREPRES.indication

6.3.33.3.1 Function

This primitive indicates that a neighbor report response has been received. This may be in response to an earlier neighbor report request (MLME-NEIGHBORREPREQ.request primitive) or an autonomous report. It is valid only at a radio measurement capable STA.

6.3.33.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NEIGHBORREPRES.indication(
    PeerSTAAddress,
    DialogToken,
    NeighborListSet,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the AP from which the Neighbor Report Response frame was received. |
| DialogToken | Integer | 0–255 | The Dialog Token received in the Neighbor Report Response frame to identify the neighbor report transaction. |
| NeighborListSet | Set of Neighbor List elements, each as defined in the Neighbor Report element format | As defined in 9.4.2.37 | A set of Neighbor List elements derived from the MIB table dot11RMNeighborReportTable, each representing a neighboring AP being reported as defined in the Neighbor Report element format. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.33.3.3 When generated

This primitive is generated by the MLME when a valid Neighbor Report Response frame is received.

6.3.33.3.4 Effect of receipt

The SME is notified of the receipt of the neighbor report data.

6.3.34 Link Measure Request

6.3.34.1 General

The following primitives support the measurement of link path loss and the estimation of link margin between peer entities.

6.3.34.2 MLME-LINKMEASURE.request

6.3.34.2.1 Function

This primitive supports the measurement of link path loss and the estimation of link margin between peer entities.

NOTE—The layer management model used assumes that the handling of a received Link Measurement Request frame is entirely within the MLME. Correspondingly there are no MLME-SME primitives specified for the peer side of a link measurement request transaction.

6.3.34.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LINKMEASURE.request(
    PeerMACAddress,
    DialogToken,
    Transmit Power,
    Max Transmit Power,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the Link Measure Request shall be sent. |
| DialogToken | Integer | 1–255 | The dialog token to identify the Link Measure transaction. |
| Transmit Power | Integer | As defined in 9.6.7.4 | The transmit power to be used when transmitting the Link Measurement Request frame and included in the frame body. See 9.6.7.4. |
| Max Transmit Power | Integer | As defined in 9.6.7.4 | The maximum transmit power to be used by the transmitting STA on its operating channel. See 9.6.7.5. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.34.2.3 When generated

This primitive is generated by the SME to request that a Link Measurement Request frame be sent to the peer entity to request that entity to report transmit power and link margin information.

6.3.34.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Link Measurement Request frame. The STA then attempts to transmit this to the STA indicated in the PeerMACAddress parameter.

6.3.34.3 MLME-LINKMEASURE.confirm

6.3.34.3.1 Function

This primitive reports the result of a Link Measurement request.

6.3.34.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LINKMEASURE.confirm(
    ResultCode,
    DialogToken,
    TransmitPower,
    LinkMargin,
    RCPI of Request,
    RSNI of Request,
    RCPI of Report,
    RSNI of Report,
    ReceiveAntennaID,
    TransmitAntennaID,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------|--------------------------------------|--|---|
| ResultCode | Enumeration | SUCCESS, UNSPECIFIED FAILURE | Indicates the result of the corresponding MLME-LINKMEASURE.request primitive. |
| DialogToken | Integer | As defined in the corresponding MLME-LINKMEASURE.request primitive | The dialog token to identify the link measurement transaction. |
| TransmitPower | As defined in the TPC Report element | As defined in the TPC Report element | The contents of the Transmit Power field of the received Link Measurement Report frame. Present if ResultCode = SUCCESS; otherwise not present. |
| LinkMargin | As defined in the TPC Report element | As defined in the TPC Report element | The contents of the Link Margin field of the received Link Measurement Report frame. Present if ResultCode = SUCCESS; otherwise not present. |
| RCPI of Request | Integer | As defined in 9.4.2.38 | Indicates the RCPI value contained in the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present. |
| RSNI of Request | Integer | As defined in 9.4.2.41 | Indicates the RSNI value contained in the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present. |

| Name | Type | Valid range | Description |
|---------------------|-------------------|------------------------|---|
| RCPI of Report | Integer | As defined in 9.4.2.38 | The RCPI level of the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present. |
| RSNI of Report | Integer | As defined in 9.4.2.41 | The RSNI of the corresponding Link Measurement Report frame received at the requesting STA. Present if ResultCode = SUCCESS; otherwise not present. |
| Receive Antenna ID | Integer | 0–255 | The Antenna ID corresponding to the antenna on which the Link Measurement Request frame was received at the reporting STA. Antenna ID is defined in 9.4.2.29. |
| Transmit Antenna ID | Integer | 0–255 | The Antenna ID corresponding to the antenna used to transmit the Link Measurement Report frame. Antenna ID is defined in 9.4.2.29. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.34.3.3 When generated

This primitive is generated by the MLME when a valid Link Measurement Report frame is received from the requested STA.

6.3.34.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the ResultCode and may use the reported data.

6.3.35 MLME SAP interface for resource request

6.3.35.1 MLME-RESOURCE-REQUEST.request

6.3.35.1.1 Function

This primitive is used to perform the over-the-air resource request of an FT resource request protocol. The over-the-air resource request is performed using Authentication frames, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 3 or 4.

6.3.35.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.request(
    PeerMACAddress,
    Contents of FT Authentication elements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the AP that is the intended immediate recipient of the resource request. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the FT Confirm frame, as described in 13.8.4. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.35.1.3 When generated

This primitive is generated by the SME to send the third frame of the over-the-air FT resource request protocol. The third frame is an Authentication frame, with an number corresponding to FT authentication and an Authentication algorithm sequence number of 3.

6.3.35.1.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.2 MLME-RESOURCE-REQUEST.indication

6.3.35.2.1 Function

This primitive is used to enact the security and QoS resource request with a specified peer MAC entity.

6.3.35.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-RESOURCE-REQUEST.indication(
 PeerMACAddress,
 Content of FT Authentication elements,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that was the sender of the resource request. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the FT Confirm frame, as described in 13.8.4. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.35.2.3 When generated

This primitive is generated by the MLME at an AP to indicate that the third frame of the over-the-air FT resource request protocol has been received. The third frame is an Authentication frame, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 3.

6.3.35.2.4 Effect of receipt

Upon receipt of this primitive, the SME examines the Transition element and RSNE contents and responds to the peer MAC address using the MLME-RESOURCE-REQUEST.response primitive.

6.3.35.3 MLME-RESOURCE-REQUEST.response

6.3.35.3.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.response(
    PeerMACAddress,
    Content of FT Authentication elements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the intended immediate recipient of the resource response. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements to be included in the FT Ack frame, as described in 13.8.5. This includes an optional response to a resource request (RIC). |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.35.3.3 When generated

This primitive is generated by the SME at an AP to cause the transmission of the fourth frame in the over-the-air FT resource request protocol. The fourth frame is an Authentication frame, with an authentication algorithm number corresponding to FT authentication and an authentication algorithm sequence number of 4.

6.3.35.3.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the appropriate Authentication frame and causes it to be transmitted to the peer MAC address.

6.3.35.4 MLME-RESOURCE-REQUEST.confirm

6.3.35.4.1 Function

This primitive is used to enact the security and QoS resource request protocol with a specified peer MAC entity.

6.3.35.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST.confirm(
    PeerMACAddress,
    Content of FT Authentication elements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------------------------|----------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the AP that was the sender of the resource response. |
| Content of FT Authentication elements | Sequence of elements | As defined in 13.8 | The set of elements included in the FT Ack frame, as described in 13.8.5. This includes an optional response to a resource request (RIC). |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.35.4.3 When generated

This primitive is generated by the MLME on receipt of the fourth frame in the FT resource request protocol.

6.3.35.4.4 Effect of receipt

Upon receipt of this primitive, the SME examines the content of the message and completes its processing of the resource request.

6.3.35.5 MLME-RESOURCE-REQUEST-LOCAL.request

6.3.35.5.1 Function

This primitive is used to enact the over-the-DS FT resource request protocol for a specified peer MAC entity. The over-the-DS FT resource request protocol is performed by communication between the STA and the SME of the target AP, bypassing the MAC of the target AP. This MLME function is used to allow the MAC of the target AP to process the resource requests.

6.3.35.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.request(
    MACAddress,
    Content of Resource Descriptor(s)
)
```

| Name | Type | Valid range | Description |
|-----------------------------------|----------------------|----------------------------------|---|
| MACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is making the resource request. |
| Content of Resource Descriptor(s) | Sequence of elements | As defined in 13.11.2 | Specifies the resource(s) that are being requested. |

6.3.35.5.3 When generated

This primitive is generated by the SME at a target AP upon receiving an over-the-DS resource request to request resources within the local MAC.

6.3.35.5.4 Effect of receipt

Upon receipt of this primitive, the MAC checks for resource availability and allocates resources as requested.

6.3.35.6 MLME-RESOURCE-REQUEST-LOCAL.confirm

6.3.35.6.1 Function

This primitive is used to respond to a local resource request for resources from the SME.

6.3.35.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RESOURCE-REQUEST-LOCAL.confirm(
    MACAddress,
    Content of Resource Descriptor(s),
    ResultCode
)
```

| Name | Type | Valid range | Description |
|-----------------------------------|----------------------|--|---|
| MACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is making the resource request. |
| Content of Resource Descriptor(s) | Sequence of elements | As defined in 13.11.2 | Specifies the resource(s) that were allocated or could have been allocated. |
| ResultCode | Enumeration | SUCCESS, REFUSED, UNSPECIFIED FAILURE | Indicates the result of the outcome of a resource request. |

6.3.35.6.3 When generated

This primitive is generated by the MAC in response to a local resource request for resources via MLME-RESOURCE-REQUEST-LOCAL.request primitive.

6.3.35.6.4 Effect of receipt

Upon receipt of this primitive, the SME prepares a success or failure response to be sent to the STA via the current AP.

6.3.36 MLME SAP interface for remote requests

6.3.36.1 MLME-REMOTE-REQUEST.request

6.3.36.1.1 Function

This primitive is used by the SME of a non-AP STA (to send over-the-DS requests) and the SME of an AP (to send over-the-DS responses) to request the MAC to send an FT Action frame.

6.3.36.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REMOTE-REQUEST.request(
    PeerMACAddress,
    Content of FT Action Frame
)
```

| Name | Type | Valid range | Description |
|----------------------------|--------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the destination of the Action frame |
| Content of FT Action Frame | Sequence of octets | As defined in 9.6.9 | The Action frame to send to the STA. |

6.3.36.1.3 When generated

This primitive is generated by the SME to send an FT Action frame to a specific peer MAC entity.

6.3.36.1.4 Effect of receipt

Upon receipt of this primitive, the MAC forwards the Action frame to the STA identified in the Action frame.

6.3.36.2 MLME-REMOTE-REQUEST.indication

6.3.36.2.1 Function

This primitive is used by the MAC to indicate to the SME the reception of an FT Action frame.

6.3.36.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-REMOTE-REQUEST.indication(
    PeerMACAddress,
    Contents of FT Action Frame
)
```

| Name | Type | Valid range | Description |
|----------------------------|--------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that issued the Action frame. |
| Content of FT Action Frame | Sequence of octets | As defined in 9.6.9 | The Action frame received from the STA. |

6.3.36.2.3 When generated

This primitive is generated by the MAC as a result of the receipt of an FT Action frame from a specific peer MAC entity.

6.3.36.2.4 Effect of receipt

Upon receipt of this primitive, the remote request broker (RRB) in the SME of the current AP forwards the Action frame to the target AP identified in the Action frame.

6.3.37 Extended channel switch announcement

6.3.37.1 General

The following MLME primitives support the signaling of extended channel switch announcement.

6.3.37.2 MLME-EXTCHANNELSWITCH.request

6.3.37.2.1 Function

This primitive requests that a (Protected) Extended Channel Switch Announcement frame be sent by an AP or mesh STA.

6.3.37.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.request(
    Mode,
    OperatingClass,
    ChannelNumber,
    ChannelSwitchCount,
    Protected,
    Mesh Channel Switch Parameters,
    New Country,
    Wide Bandwidth Channel Switch,
    New Transmit Power Envelope,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------------|-------------------------|-------------------------|---|
| Mode | Integer | 0,1 | Channel switch mode, as defined for the Extended Channel Switch Announcement element. |
| OperatingClass | Integer | As defined in Annex E | Specifies the new operating class. |
| ChannelNumber | Integer | As defined in Annex E | Specifies the new channel number. |
| ChannelSwitchCo unt | As defined in 9.4.2.53 | As defined in 9.4.2.53 | Specifies the time period until the channel switch event, as described in 9.4.2.53 |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Extended Channel Switch Announcement frame. If false, the request is sent using the Extended Channel Switch Announcement frame. |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| New Country | As defined in 9.4.2.9 | As defined in 9.4.2.9 | Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |

| Name | Type | Valid range | Description |
|-----------------------------|---|------------------------|--|
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.37.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) Extended Channel Switch Announcement frame be sent to a STA that is associated to the AP or to peer mesh STAs in the MBSS.

6.3.37.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) Extended Channel Switch Announcement frame.

6.3.37.3 MLME-EXTCHANNELSWITCH.confirm

6.3.37.3.1 Function

This primitive reports the result of a request to switch channel.

6.3.37.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.confirm(
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|------------------------|
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.37.3.3 When generated

This primitive is generated by the MLME when an extended channel switch request completes. Possible unspecified failure causes include an inability to schedule an extended channel switch announcement.

6.3.37.3.4 Effect of receipt

The SME is notified of the results of the extended channel switching procedure.

6.3.37.4 MLME-EXTCHANNELSWITCH.indication

6.3.37.4.1 Function

This primitive indicates that a (Protected) Extended Channel Switch Announcement frame was received from an AP or from a peer mesh STA.

6.3.37.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EXTCHANNELSWITCH.indication(

Peer MAC Address,
 Mode,
 OperatingClass,
 ChannelNumber,
 ChannelSwitchCount,
 Protected,
 Mesh Channel Switch Parameters,
 New Country,
 Wide Bandwidth Channel Switch,
 New Transmit Power Envelope,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------------------|---|----------------------------------|--|
| Peer MAC Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Extended Channel Switch Announcement frame was received. |
| Mode | Integer | 0, 1 | Channel switch mode, as defined for the Channel Switch Announcement element. |
| OperatingClass | Integer | As defined in Annex E | Specifies the new operating class. |
| ChannelNumber | Integer | As defined in Annex E | Specifies the new channel number. |
| ChannelSwitchCount | As defined in 9.4.2.53 | As defined in 9.4.2.53 | Specifies the time period until the channel switch event, as described in 9.4.2.53 |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected Extended Channel Switch Announcement frame. If false, the request was received using the Extended Channel Switch Announcement frame. |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| New Country | As defined in 9.4.2.9 | As defined in 9.4.2.9 | Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.37.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) Extended Channel Switch Announcement frame is received.

6.3.37.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the switch request.

6.3.37.5 MLME-EXTCHANNELSWITCH.response

6.3.37.5.1 Function

This primitive is used to schedule an accepted extended channel switch.

6.3.37.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EXTCHANNELSWITCH.response(
    Mode,
    OperatingClass,
    ChannelNumber,
    ChannelSwitchCount,
    Mesh Channel Switch Parameters,
    New Country,
    Wide Bandwidth Channel Switch,
    New Transmit Power Envelope,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------------|-------------------------|-------------------------|---|
| Mode | Integer | 0, 1 | Channel switch mode, as defined for the Channel Switch Announcement element. |
| OperatingClass | Integer | As defined in Annex E | Specifies the new operating class. |
| ChannelNumber | Integer | As defined in Annex E | Specifies the new channel number. |
| ChannelSwitchCo unt | As defined in 9.4.2.53 | As defined in 9.4.2.53 | Specifies the time period until the channel switch event, as described in 9.4.2.53 |
| Mesh Channel Switch Parameters | As defined in 9.4.2.103 | As defined in 9.4.2.103 | Specifies MBSS Channel Switch Parameters used by a mesh STA. This parameter is present if the dot11MeshActivated is true; otherwise, the parameter is not present. |
| New Country | As defined in 9.4.2.9 | As defined in 9.4.2.9 | Specifies the country, operating class table and operating classes used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| Wide Bandwidth Channel Switch | As defined in 9.4.2.161 | As defined in 9.4.2.161 | Specifies channel parameters used when switching to a channel width wider than 40 MHz. The parameter is present if dot11VHTOptionImplemented is true and switching to a channel width wider than 40 MHz; otherwise, the parameter is not present. |

| Name | Type | Valid range | Description |
|-----------------------------|---|------------------------|--|
| New Transmit Power Envelope | Set of New Transmit Power Envelope elements | N/A | Specifies power parameters used for the BSS after the channel switch. Optionally present if dot11VHTOptionImplemented is true. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.37.5.3 When generated

This primitive is generated by the SME to schedule an accepted extended channel switch request.

6.3.37.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the extended channel switch.

6.3.38 DSE power constraint announcement

6.3.38.1 General

The following MLME primitives support the signaling of DSE power constraint to dependent STAs.

6.3.38.2 MLME-DSETPC.request

6.3.38.2.1 Function

This primitive requests that a (Protected) DSE Power Constraint frame be sent by an enabling STA.

6.3.38.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.request(
    RequesterSTAAddress,
    ResponderSTAAddress,
    DSELocalPowerConstraint,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|------------|----------------------------------|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity of the enabling STA. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity that initiates the enablement process. |
| DSELocalPowerConstraint | Integer | 0–255 | Specifies the local power constraint, as described in the DSE Power Constraint frame (see 9.6.8.10). |

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| Protected | Boolean | true, false | <p>Specifies whether the request is sent using a robust Management frame.</p> <p>If true, the request is sent using the Protected DSE Power Constraint frame.</p> <p>If false, the request is sent using the DSE Power Constraint frame.</p> |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.38.2.3 When generated

This primitive is generated by the SME to request that a (Protected) DSE Power Constraint Announcement frame be sent to a dependent STA.

6.3.38.2.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs a (Protected) DSE Power Constraint Announcement frame. The enabling STA then schedules this frame for transmission.

6.3.38.3 MLME-DSETPC.confirm

6.3.38.3.1 Function

This primitive reports the results of a request to send a (Protected) DSE Power Constraint Announcement frame.

6.3.38.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.confirm(
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the result of MLME-DSETPC.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.38.3.3 When generated

This primitive is generated by the MLME when a DSE power constraint announcement completes.

6.3.38.3.4 Effect of receipt

The SME is notified of the results of the DSE power constraint procedure.

6.3.38.4 MLME-DSETPC.indication

6.3.38.4.1 Function

This primitive indicates that a DSE Power Constraint Announcement frame was received from an enabling STA.

6.3.38.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.indication(
    RequesterSTAAddress,
    ResponderSTAAddress,
    DSELocalPowerConstraint,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|-------------------|----------------------------------|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that initiated the enablement process. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that is the enabling STA. |
| DSELocalPowerConstraint | Integer | 0–255 | Specifies the local power constraint, as described in the DSE Power Constraint frame (see 9.6.8.10). |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected DSE Power Constraint frame. If false, the request was received using the DSE Power Constraint frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.38.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) DSE Power Constraint Announcement frame is received.

6.3.38.4.4 Effect of receipt

On receipt of this primitive, the SME performs the DSE power constraint procedure (see 11.12.5).

6.3.38.5 MLME-DSETPC.response

6.3.38.5.1 Function

This primitive is used to report the result of the DSE power constraint procedure.

6.3.38.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DSETPC.response(
    RequesterSTAAddress,
    ResponderSTAAddress,
    ResultCode,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------|----------------------------------|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity of the enabling STA. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that initiates the enabling process. |
| ResultCode | Enumeration | SUCCESS, REFUSED | Reports the result of a DSE power constraint procedure. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected DSE Power Constraint frame. If false, the response is sent using the DSE Power Constraint frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.38.5.3 When generated

This primitive is generated by the SME to schedule a response to DSE power constraint announcement.

6.3.38.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the transmission of a (Protected) DSE power constraint result to the enabling STA that sent the DSE power constraint announcement.

6.3.39 Enablement

6.3.39.1 General

This mechanism supports the process of establishing an enablement relationship with a peer MAC entity.

6.3.39.2 MLME-ENABLEMENT.request

6.3.39.2.1 Function

This primitive requests enablement with a specified peer MAC entity.

6.3.39.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.request(

RequesterSTAAddress,
ResponderSTAAddress,
EnablementTimeLimit,
Protected,
VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------|-------------------|----------------------------------|---|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity that initiates the enablement process. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity of the enabling STA. |
| EnablementTimeLimit | Integer | > 0 | Specifies a time limit (in TU) after which the enablement process is terminated. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected DSE Enablement frame. If false, the request is sent using the DSE Enablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.39.2.3 When generated

This primitive is generated by the SME for a STA to establish enablement with a specified peer MAC entity. During the enablement procedure, the SME can generate additional MLME-ENABLEMENT.request primitives.

6.3.39.2.4 Effect of receipt

This primitive initiates an enablement procedure. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-ENABLEMENT.confirm primitive that reflects the results.

6.3.39.3 MLME-ENABLEMENT.confirm

6.3.39.3.1 Function

This primitive reports the results of an enablement attempt with a specified peer MAC entity.

6.3.39.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.confirm(

RequesterSTAAddress,
ResponderSTAAddress,
ResultCode,
Protected,

EnablementIdentifier,
VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------------|-------------------|--|---|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity that initiated the enablement process. This value matches the RequesterSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peerMAC entity with which the enablement process was attempted. This value matches the ResponderSTAAddress parameter specified in the corresponding MLME-ENABLEMENT.request primitive. |
| ResultCode | Enumeration | SUCCESS, REFUSED, TOO_MANY_SI MULTANEOUS_ REQUESTS | Indicates the result of MLME-ENABLEMENT.request primitive. |
| EnablementIdentifier | Integer | 0 – 65 535 | Specifies the dependent enablement identifier. |
| Protected | Boolean | true, false | Specifies whether the response was received using a robust Management frame. If true, the response was received using the Protected DSE Enablement frame. If false, the response was received using the DSE Enablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.39.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-ENABLEMENT.request primitive for enablement with a specified peer MAC entity.

6.3.39.3.4 Effect of receipt

The SME is notified of the results of the enablement procedure.

6.3.39.4 MLME-ENABLEMENT.indication

6.3.39.4.1 Function

This primitive indicates receipt of a request from a specific peer MAC entity to establish an enablement relationship with the STA processing this primitive.

6.3.39.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.indication(

RequesterSTAAddress,
 ResponderSTAAddress,
 Protected,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------|-------------------|----------------------------------|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that initiated the enablement process. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that is the enabling STA. |
| Protected | Boolean | true, false | Specifies whether the request was sent using a robust Management frame. If true, the request was sent using the Protected DSE Enablement frame. If false, the request was sent using the DSE Enablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.39.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of an enablement request from a specific peer MAC entity.

6.3.39.4.4 Effect of receipt

The SME is notified of the receipt of this enablement request.

6.3.39.5 MLME-ENABLEMENT.response

6.3.39.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested enablement with the STA that issued this primitive.

6.3.39.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-ENABLEMENT.response(

RequesterSTAAddress,
 ResponderSTAAddress,
 ResultCode,
 EnablementIdentifier,
 Protected,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------------|-------------------|---|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity that initiated the enablement process. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peerMAC entity that is the enabling STA. |
| ResultCode | Enumeration | SUCCESS, REFUSED, TOO_MANY_SI MULTIPLICATIVE REQUESTS | Indicates the result response to the enablement request from the peer MAC entity. |
| EnablementIdentifier | Integer | 0-65 535 | Specifies the dependent enablement identifier. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected DSE Enablement frame. If false, the response is sent using the DSE Enablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.39.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-ENABLEMENT.indication primitive.

6.3.39.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that requested enablement.

6.3.40 Deenablement

6.3.40.1 MLME-DEENABLEMENT.request

6.3.40.1.1 Function

This primitive requests that the enablement relationship with a specified peer MAC entity be invalidated.

6.3.40.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.request(
    RequesterSTAAddress,
    ResponderSTAAddress,
    ReasonCode,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------|----------------------------------|---|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity that requests the deenablement process. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity that becomes deenable in the process. |
| ReasonCode | Reason Result Code field | As defined in 9.6.8.5 | Specifies the reason code for initiating the deenablement process. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected DSE Deenablement frame. If false, the request is sent using the DSE Deenablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.40.1.3 When generated

This primitive is generated by the SME for a STA to invalidate enablement with a specified peer MAC entity in order to prevent the exchange of (Protected dual of) Public Action frames between the two STAs. During the deenablement procedure, the SME can generate additional MLME-DEENABLEMENT.request primitives.

6.3.40.1.4 Effect of receipt

This primitive initiates a deenablement procedure.

6.3.40.2 MLME-DEENABLEMENT.indication

6.3.40.2.1 Function

This primitive reports the invalidation of an enablement relationship with a specified peer MAC entity.

6.3.40.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DEENABLEMENT.indication(
    RequesterSTAAddress,
    ResponderSTAAddress,
    ReasonCode,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|------------|----------------------------------|--|
| RequesterSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which the enablement relationship was invalidated. |
| ResponderSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the MAC entity with which the enablement relationship was invalidated. |

| Name | Type | Valid range | Description |
|--------------------|--------------------------|------------------------|--|
| ReasonCode | Reason Result Code field | As defined in 9.6.8.5 | Specifies the reason the deenablement procedure was initiated. |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected DSE Deenablement frame. If false, the request was received using the DSE Deenablement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.40.2.3 When generated

This primitive is generated by the MLME as a result of the invalidation of an enablement relationship with a specific peer MAC entity.

6.3.40.2.4 Effect of receipt

The SME is notified of the invalidation of the specific enablement relationship.

6.3.41 SA Query support

6.3.41.1 MLME-SA-QUERY.request

6.3.41.1.1 Function

This primitive requests that a SA Query Request frame be sent to a specified peer STA to which the STA is associated.

6.3.41.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.request(
    PeerSTAAddress,
    TransactionIdentifier,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|-------------------|----------------------------------|--|
| PeerSTA Address | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity for the SA Query |
| TransactionIdentifier | 2 octets | As defined in 9.6.10.2 | The Transaction Identifier to identify the SA Query Request and Response transaction |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.41.1.3 When generated

This primitive is generated by the SME to request that a SA Query Request frame be sent to a specified peer STA with which the STA is associated.

6.3.41.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Request frame. The STA then attempts to transmit this to the peer STA with which it is associated.

6.3.41.2 MLME-SA-QUERY.confirm

6.3.41.2.1 Function

This primitive reports the result of a SA Query procedure.

6.3.41.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.confirm(
    PeerSTAAddress,
    TransactionIdentifier,
    VendorSpecificInfo
)
```

| Name | Type | Valid Range | Description |
|-----------------------|-------------------|----------------------------------|--|
| PeerSTA Address | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity for the SA Query |
| TransactionIdentifier | 2 octets | As defined in 9.6.10.2 | The Transaction Identifier to identify the SA Query Request and Response transaction |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.41.2.3 When generated

This primitive is generated by the MLME as a result of the receipt of a valid SA Query Response frame.

6.3.41.2.4 Effect of receipt

On receipt of this primitive, the SME may use the response as a sign of liveness of the peer STA.

6.3.41.3 MLME-SA-QUERY.indication

6.3.41.3.1 Function

This primitive indicates that a SA Query Request frame was received from a STA.

6.3.41.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.indication(
    PeerSTAAddress,
    TransactionIdentifier,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|-------------------|----------------------------------|--|
| PeerSTA Address | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity for the SA Query |
| TransactionIdentifier | 2 octets | As defined in 9.6.10.2 | The Transaction Identifier to identify the SA Query Request and Response transaction |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.41.3.3 When generated

This primitive is generated by the MLME when a valid SA Query Request frame is received.

6.3.41.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.3.

6.3.41.4 MLME-SA-QUERY.response

6.3.41.4.1 Function

This primitive is generated in response to an MLME-SA-QUERY.indication primitive requesting a SA Query Response frame be sent to a STA.

6.3.41.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SA-QUERY.response(
    PeerSTAAddress,
    TransactionIdentifier,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|-------------------|----------------------------------|--|
| PeerSTA Address | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity for the SA Query |
| TransactionIdentifier | 2 octets | As defined in 9.6.10.2 | The Transaction Identifier to identify the SA Query Request and Response transaction |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.41.4.3 When generated

This primitive is generated by the SME, in response to an MLME-SA-QUERY.indication primitive, requesting a SA Query Response frame be sent to a STA.

6.3.41.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SA Query Response frame. The STA then attempts to transmit this to the STA indicated by the PeerSTAAddress parameter.

6.3.42 Get TSF timer

6.3.42.1 General

This mechanism is used to request the current value of the TSF timer that the STA maintains.

6.3.42.2 MLME-GETTSFTIME.request

6.3.42.2.1 Function

This primitive is generated by the SME to request that the MLME returns the value of its TSF timer. The value returned in TSFtime (as specified in 6.3.42.3.2) is the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive is received.

6.3.42.2.2 Semantics of the service primitive

This primitive has no parameters.

6.3.42.2.3 When generated

This primitive is generated by the SME to request the value of the TSF timer from the MLME.

6.3.42.2.4 Effect of receipt

The MLME issues an MLME-GETTSFTIME.confirm primitive.

6.3.42.3 MLME-GETTSFTIME.confirm

6.3.42.3.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the value of the TSF timer.

6.3.42.3.2 Semantics of the service primitive

This primitive uses the following parameters:

MLME-GETTSFTIME.confirm(
 resultCode,
 TSFtime
)

| Name | Type | Valid range | Description |
|------------|-------------|---------------------------|--|
| resultCode | Enumeration | SUCCESS, FAILURE | Reports the outcome of an MLME-GETTSFTIME.request primitive |
| TSFtime | Integer | 0 – (2 ⁶⁴ – 1) | The value of the TSF timer. Present if ResultCode is SUCCESS; otherwise not present. |

6.3.42.3.3 When generated

This primitive is generated by the MLME to report to the SME the result of an MLME-GETTSFTIME.request primitive.

6.3.42.3.4 Effect of receipt

The SME is notified of the result of an MLME-GETTSFTIME.request primitive and, if successful, has the value of the TSF timer at the instant the MLME-GETTSFTIME.request primitive was received by the MLME. If the result of an MLME-GETTSFTIME.request primitive is failure, the TSFtime parameter is not included in the MLME-GETTSFTIME.confirm primitive.

NOTE—The TSF timer value can be used, along with other information, by the SME to compute an offset between an external time standard such as a version of Coordinated Universal Time (UTC) from a Global Positioning System (GPS) unit and the TSF timer.

6.3.43 Timing Advertisement

6.3.43.1 General

The Timing Advertisement primitives are used to communicate timing and other information from the higher layers or the SME of one STA to the higher layers or SME of other STAs.

6.3.43.2 MLME-TIMING-ADVERTISEMENT.request

6.3.43.2.1 Function

This primitive is generated by the SME to request that the MLME generate a Timing Advertisement frame to transmit timing and, optionally, higher layer information.

6.3.43.2.2 Semantics of the service primitive

This primitive provides the following parameters:

```
MLME-TIMING-ADVERTISEMENT.request(
    PeerMACAddress,
    Capability Information,
    Country,
    Power Constraint,
    Time Advertisement,
    Extended Capabilities,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|------------------------|---|---|
| PeerMACAddress | MACAddress | Any valid individual or group MAC address | The address of the peer MAC entity or group of entities to which the Timing Advertisement frame is sent. |
| Capability Information | As defined in 9.4.1.4 | As defined in 9.4.1.4 | The announced capabilities of the STA. |
| Country | As defined in 9.4.2.9 | As defined in 9.4.2.9 | The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 11.8 or when dot11MultiDomainCapabilityActivated is true. |
| Power Constraint | As defined in 9.4.2.14 | As defined in 9.4.2.14 | Optional. The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. |

| Name | Type | Valid range | Description |
|-----------------------|------------------------|------------------------|--|
| Time Advertisement | As defined in 9.4.2.61 | As defined in 9.4.2.61 | Timing announced by the STA. |
| Extended Capabilities | As defined in 9.4.2.27 | As defined in 9.4.2.27 | Optional. The Extended Capabilities element might be present if any of the fields in this element are nonzero. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.43.2.3 When generated

This primitive is generated by the SME to request that the MLME generates a Timing Advertisement frame for transmission.

6.3.43.2.4 Effect of receipt

Upon the receipt of this primitive, the MLME attempts to transmit a Timing Advertisement frame to the specified MAC address, using the procedures defined in 11.22.

6.3.43.3 MLME-TIMING-ADVERTISEMENT.indication

6.3.43.3.1 Function

This primitive is generated by the MLME to indicate to the SME the reception of a Timing Advertisement frame.

6.3.43.3.2 Semantics of the service primitive

This primitive provides the following parameters:

```
MLME-TIMING-ADVERTISEMENT.indication(
    Timestamp,
    Capability Information,
    Local Time,
    Country,
    Power Constraint,
    Time Advertisement,
    Extended Capabilities,
    RCPI,
    Source MAC address,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|-----------------------|-----------------------|--|
| Timestamp | Integer | N/A | The timestamp of the received frame. |
| Capability Information | As defined in 9.4.1.4 | As defined in 9.4.1.4 | The announced capabilities of the STA. |
| Local Time | Integer | N/A | Local Time is the value of a station's TSF timer at the start of reception of the first octet of the timestamp field of the received Timing Advertisement frame. |

| Name | Type | Valid range | Description |
|-----------------------|--------------------------------|-------------------------|---|
| Country | As defined in 9.4.2.9 | As defined in 9.4.2.9 | The information required to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. Present only when TPC functionality is required, as specified in 11.8 or when dot11MultiDomainCapabilityActivated is true. |
| Power Constraint | As defined in 9.4.2.14 | As defined in 9.4.2.14 | The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. |
| Time Advertisement | As defined in 9.4.2.61 | As defined in 9.4.2.61 | Timing announced by the STA. |
| Extended Capabilities | As defined in 9.4.2.27 | As defined in 9.4.2.27 | The Extended Capabilities element might be present if any of the fields in this element are nonzero. |
| RCPI | Integer as defined in 9.4.2.38 | As defined in 9.4.2.38 | RCPI is the measured value of received channel power on the received Timing Advertisement frame. |
| Source MAC Address | As defined in 9.2.4.3.6 | As defined in 9.2.4.3.6 | The SA field of the MAC header from the received Timing Advertisement frame. |
| VendorSpecific Info | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.43.3.3 When generated

This primitive is generated by the MLME when a Timing Advertisement frame is received.

6.3.43.3.4 Effect of receipt

Upon the receipt of this primitive, the SME is notified that a Timing Advertisement frame has been received.

6.3.44 TDLS Discovery

6.3.44.1 General

The following MLME primitives support the signaling of TDLS Discovery.

6.3.44.2 MLME-TDLSDISCOVERY.request

6.3.44.2.1 Function

This primitive requests that a TDLS Discovery Request frame be sent through the AP path.

6.3.44.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.request(
    DestinationAddress,
    TDLSDiscoveryRequest
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|---|
| DestinationAddress | MAC Address | Any valid individual MAC Address | Specifies the DA to which a TDLS Discovery Request frame is transmitted. |
| TDLSDiscoveryRequest | Sequence of octets | As defined in TDLS Discovery Request frame | Specifies the proposed service parameters for the TDLS Discovery Request frame. |

6.3.44.2.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Request frame be sent through the AP.

6.3.44.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Request frame. The STA then attempts to transmit this frame.

6.3.44.3 MLME-TDLSDISCOVERY.confirm

6.3.44.3.1 Function

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.confirm(
    TDLSPeerSTAAddress,
    TDLSDiscoveryResponse
)
```

| Name | Type | Valid range | Description |
|-----------------------|--------------------|---|---|
| TDLS_peer_STA_address | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Response frame was received. |
| TDLSDiscoveryResponse | Sequence of octets | As defined in TDLS Discovery Response frame | Specifies the service parameters contained in the received TDLS Discovery Response frame. |

6.3.44.3.3 When generated

This primitive is generated when a valid TDLS Discovery Response frame is received.

6.3.44.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the MLME-TDLSDISCOVERY.confirm primitive and may use the reported data.

6.3.44.4 MLME-TDLSDISCOVERY.indication

6.3.44.4.1 Function

This primitive indicates that a TDLS Discovery Request frame was received from a TDLS peer STA.

6.3.44.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.indication(
    TDLSPeerSTAAddress,
    TDLSDiscoveryRequest
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MACAddress | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA from which a TDLS Discovery Request frame was received. |
| TDLSDiscoveryRequest | Sequence of octets | As defined in TDLS Discovery Request frame | Specifies the proposed service parameters of the TDLS Discovery Request frame. |

6.3.44.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Discovery Request frame is received.

6.3.44.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.23.

6.3.44.5 MLME-TDLSDISCOVERY.response

6.3.44.5.1 Function

This primitive requests that a TDLS Discovery Response frame be sent directly to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSDISCOVERY.response(
    TDLSPeerSTAAddress,
    TDLSDiscoveryResponse
)
```

| Name | Type | Valid range | Description |
|-----------------------|--------------------|---|---|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA to which a TDLS Discovery Response frame is transmitted. |
| TDLSDiscoveryResponse | Sequence of octets | As defined in TDLS Discovery Response frame | Specifies the proposed service parameters for the TDLS Discovery Response frame. |

6.3.44.5.3 When generated

This primitive is generated by the SME to request that a TDLS Discovery Response frame be sent to the TDLS peer STA from which a TDLS Discovery Request frame was received.

6.3.44.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Discovery Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.45 TDLS direct-link establishment

6.3.45.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-7 depicts the TDLS direct-link establishment process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

6.3.45.2 MLME-TDLSSETUPREQUEST.request

6.3.45.2.1 Function

This primitive requests that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPREQUEST.request(
    TDLSResponderAddress,
    TDLSSetupRequest
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|--|
| TDLSResponderAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the STA to which the TDLS Setup Request frame is transmitted. |
| TDLSSetupRequest | Sequence of octets | As defined in TDLS Setup Request frame | Specifies the proposed service parameters for the TDLS Setup. |

6.3.45.2.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Request frame be sent to a candidate TDLS responder STA.

6.3.45.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Request frame. The STA then attempts to transmit this frame to the candidate TDLS responder STA.

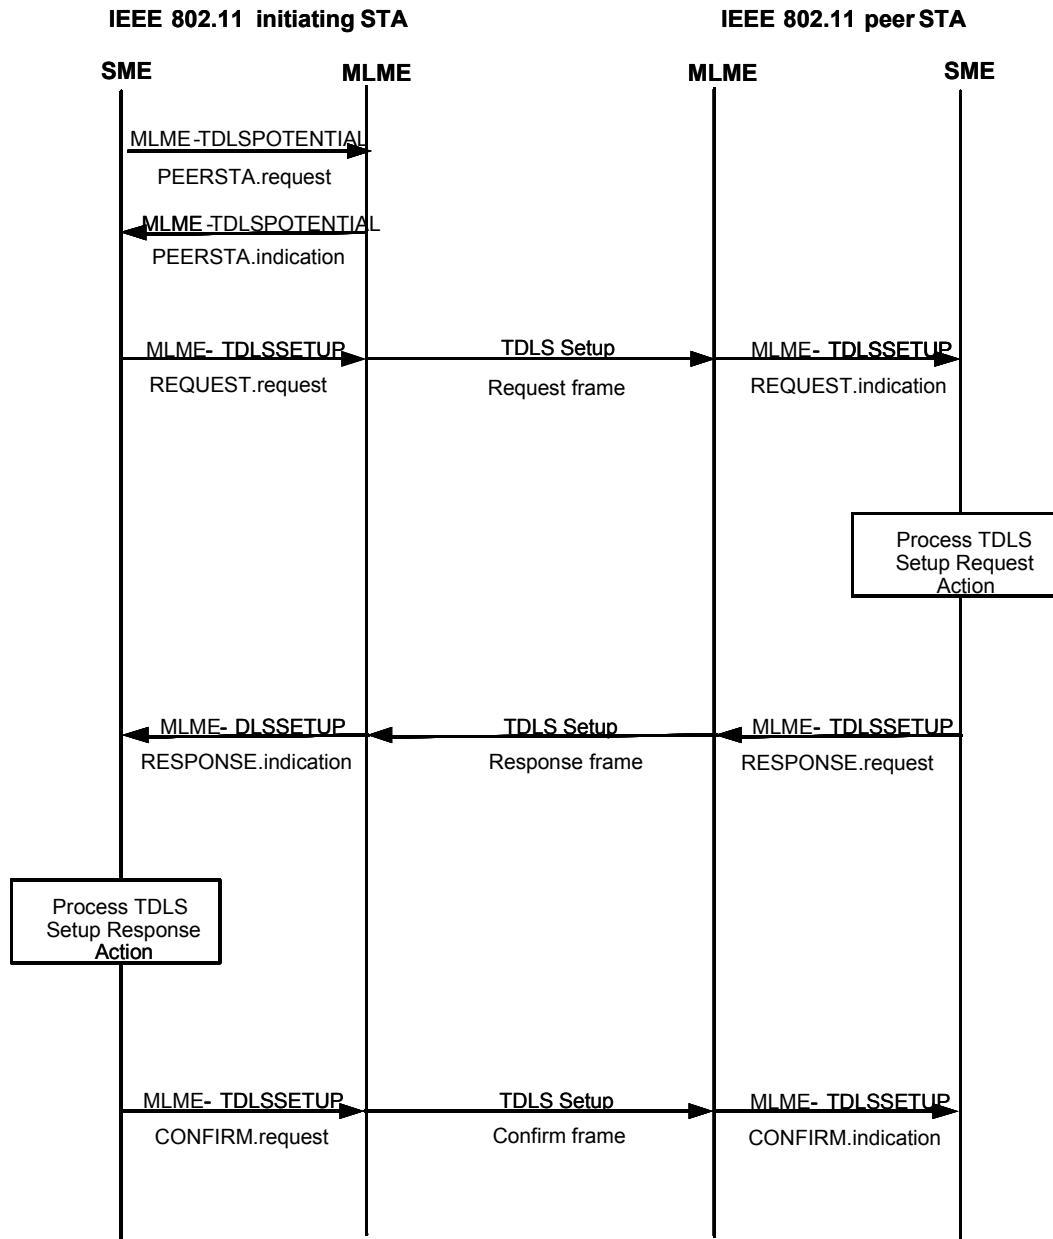

Figure 6-7—TDLS direct-link establishment

6.3.45.3 MLME-TDLSSETUPREQUEST.indication

6.3.45.3.1 Function

This primitive indicates that a TDLS Setup Request frame was received.

6.3.45.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPREQUEST.indication(
    TDLSInitiatorAddress,
    TDLSSetupRequest
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|---|
| TDLSInitiatorAddress | MACAddress | Any valid individual MAC Address | Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Request frame was received. |
| TDLSSetupRequest | Sequence of octets | As defined in TDLS Setup Request frame | Specifies the proposed service parameters for the TDLS Setup. |

6.3.45.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Request frame is received.

6.3.45.3.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.23.

6.3.45.4 MLME-TDLSSETUPRESPONSE.request

6.3.45.4.1 Function

This primitive requests that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPRESPONSE.request(
    TDLSInitiatorAddress,
    TDLSSetupResponse
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|---|--|
| TDLSInitiatorAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS initiator STA to which a TDLS Setup Response frame is transmitted. |
| TDLSSetupResponse | Sequence of octets | As defined in TDLS Setup Response frame | Specifies the proposed service parameters for the TDLS Setup. |

6.3.45.4.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Response frame be sent to the TDLS initiator STA.

6.3.45.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Response frame. The STA then attempts to transmit this to the TDLS initiator STA.

6.3.45.5 MLME-TDLSSETUPRESPONSE.indication

6.3.45.5.1 Function

This primitive indicates that a TDLS Setup Response frame was received from the TDLS responder STA.

6.3.45.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPRESPONSE.indication(
    TDLSResponderAddress,
    TDLSSetupResponse
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|---|--|
| TDLSResponderAddress | MACAddress | Any valid individual MAC Address | Specifies the MAC address of the TDLS responder STA from which a TDLS Setup Response frame was received. |
| TDLSSetupResponse | Sequence of octets | As defined in TDLS Setup Response frame | Specifies the proposed service parameters for the TDLS Setup. |

6.3.45.5.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Response frame is received.

6.3.45.5.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.23.

6.3.45.6 MLME-TDLSSETUPCONFIRM.request

6.3.45.6.1 Function

This primitive requests that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPCONFIRM.request(
    TDLSResponderAddress,
    TDLSSetupConfirm
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|---|
| TDLSResponderAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS responder STA to which a TDLS Setup Confirm frame is transmitted. |
| TDLSSetupConfirm | Sequence of octets | As defined in TDLS Setup Confirm frame | Specifies the proposed service parameters for the TDLS Setup. |

6.3.45.6.3 When generated

This primitive is generated by the SME to request that a TDLS Setup Confirm frame be sent to the TDLS responder STA.

6.3.45.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Setup Confirm frame. The STA then attempts to transmit this to the TDLS responder STA.

6.3.45.7 MLME-TDLSSETUPCONFIRM.indication

6.3.45.7.1 Function

This primitive indicates that a TDLS Setup Confirm frame was received from the TDLS initiator STA.

6.3.45.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSSETUPCONFIRM.indication(
    TDLSInitiatorAddress,
    TDLSSetupConfirm
)
```

| Name | Type | Valid range | Description |
|----------------------|--------------------|--|---|
| TDLSInitiatorAddress | MACAddress | Any valid individual MAC Address | Specifies the MAC address of the TDLS initiator STA from which a TDLS Setup Confirm frame was received. |
| TDLSSetupConfirm | Sequence of octets | As defined in TDLS Setup Confirm frame | Specifies the proposed service parameters for the TDLS setup. |

6.3.45.7.3 When generated

This primitive is generated by the MLME when a valid TDLS Setup Confirm frame is received.

6.3.45.7.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.23.

6.3.45.8 MLME-TDLSPOTENTIALPEERSTA.request

6.3.45.8.1 Function

This primitive requests information about a potential TDLS peer STA.

6.3.45.8.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-TDLSPOTENTIALPEERSTA.request(
    MACAddress
)
```

| Name | Type | Valid Range | Description |
|------------|-------------|----------------------------------|---|
| MACAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the potential TDLS peer STA. |

6.3.45.8.3 When generated

This primitive is generated by the SME to request the MLME to provide information about a potential TDLS peer STA.

6.3.45.8.4 Effect of receipt

On receipt of this primitive, the MLME responds with the requested information about the identified STA.

6.3.45.9 MLME-TDLSPEOTENTIALPEERSTA.confirm

6.3.45.9.1 Function

This primitive informs the SME about a potential TDLS peer STA.

6.3.45.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEOTENTIALPEERSTA.confirm(
    MACAddress,
    RSSI
)
```

| Name | Type | Valid range | Description |
|------------|-------------|----------------------------------|--|
| MACAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the STA for which information is requested. |
| RSSI | Integer | -1 to RSSI Max | Specifies the RSSI from the STA. -1 indicates that the STA is not present. |

6.3.45.9.3 When generated

This primitive is generated by the MLME to indicate to the SME that a potential TDLS peer STA has been detected.

6.3.45.9.4 Effect of receipt

On receipt of this primitive, the SME may attempt to set up a TDLS direct link by issuing an MLME-TDLSSETUPREQUEST.request primitive to the MLME.

6.3.46 TDLS direct-link teardown

6.3.46.1 General

The following MLME primitives support the signaling of tunneled direct-link setup. Figure 6-8 depicts the TDLS direct-link teardown process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

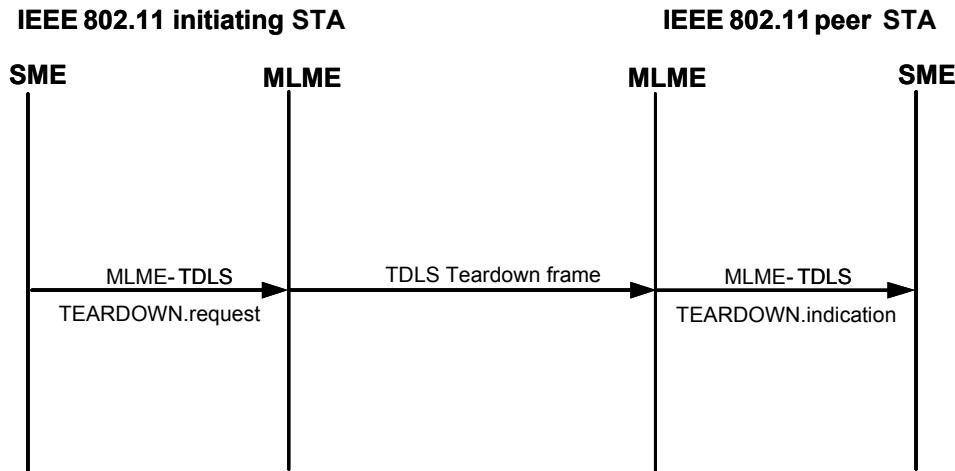

Figure 6-8—TDLS direct-link teardown

6.3.46.2 MLME-TDLSTEARDOWN.request

6.3.46.2.1 Function

This primitive requests that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.46.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

MLME-TDLSTEARDOWN.request(
    TDLSPeerSTAAddress,
    TDLSTeardown
)
  
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|-----------------------------------|---|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA to which a TDLS Teardown frame is transmitted. |
| TDLSTeardown | Sequence of octets | As defined in TDLS Teardown frame | Specifies the proposed service parameters for the TDLS teardown. |

6.3.46.2.3 When generated

This primitive is generated by the SME to request that a TDLS Teardown frame be sent to the TDLS peer STA.

6.3.46.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Teardown frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.46.3 MLME-TDLSTEARDOWN.indication

6.3.46.3.1 Function

This primitive indicates that a TDLS Teardown frame was received from a TDLS peer STA.

6.3.46.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSTEARDOWN.indication(
    TDLSPeerSTAAddress,
    TDLSTeardown
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|-----------------------------------|---|
| TDLSPeerSTAAddress | MACAddress | Any valid individual MAC Address | The MAC address of the TDLS peer STA from which a TDLS Teardown frame was received. |
| TDLSTeardown | Sequence of octets | As defined in TDLS Teardown frame | Specifies the proposed service parameters for the TDLS teardown. |

6.3.46.3.3 When generated

This primitive is generated by the MLME when a valid TDLS Teardown frame is received.

6.3.46.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.23.

6.3.47 TDLS peer U-APSD (TPU)

6.3.47.1 General

The following MLME primitives support the signaling of TPU. Figure 6-9 depicts the TPU process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

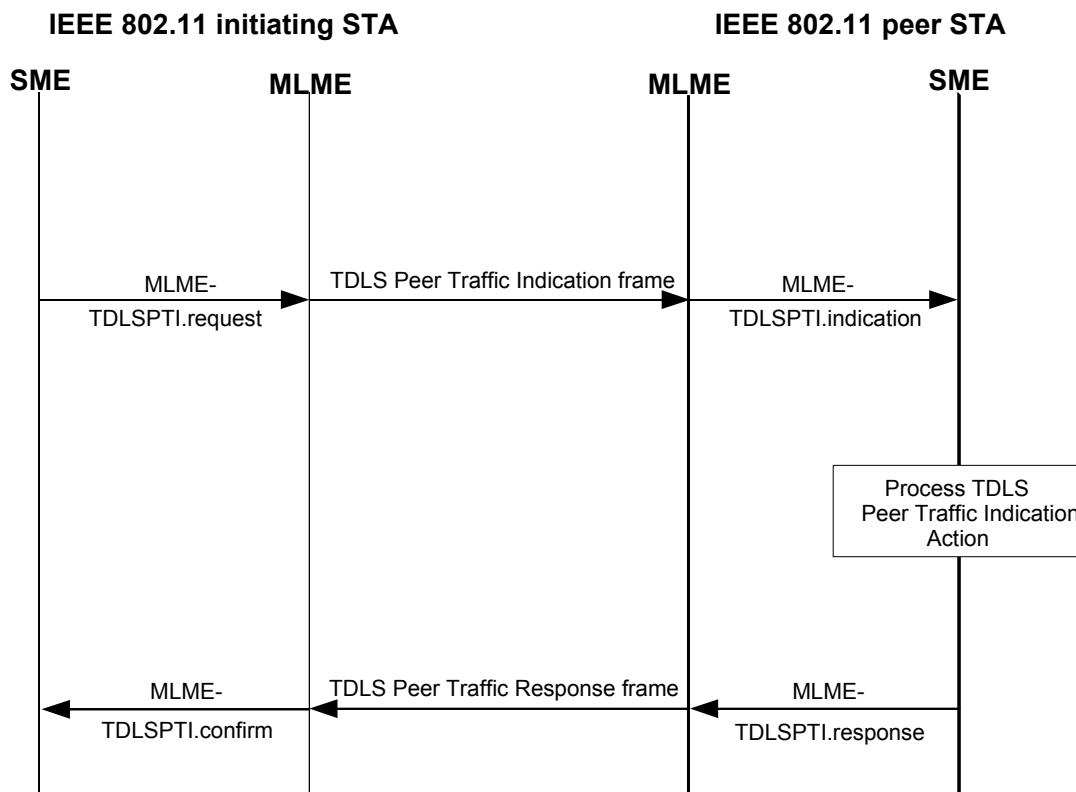

Figure 6-9—TPU

6.3.47.2 MLME-TDLSPTI.request

6.3.47.2.1 Function

This primitive requests that a TDLS Peer Traffic Indication frame be sent to a TDLS peer STA.

6.3.47.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

MLME-TDLSPTI.request(
    TDLSPeerSTAAddress,
    TDLSPTI
)
  
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the MAC entity with which to perform the TPU process. |
| TDLSPTI | Sequence of octets | As defined in TDLS Peer Traffic Indication frame | Specifies the proposed service parameters for the TPU. |

6.3.47.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Indication frame be sent to the TDLS peer STA.

6.3.47.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Indication frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.47.3 MLME-TDLSPTI.confirm

6.3.47.3.1 Function

This primitive reports the result of an MLME-TDLSPTI.request primitive to trigger an unscheduled SP from a candidate TDLS peer STA. This primitive is generated after transmitting a Peer Traffic Indication frame when this frame contains a PTI Control field, and after receiving a Peer Traffic Response frame otherwise.

6.3.47.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.confirm(
    TDLSPeerSTAAddress,
    TDLSPTR
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|--|---|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the peer MAC entity with which to perform the TPU process. |
| TDLSPTR | Sequence of octets | As defined in TDLS Peer Traffic Response frame | Specifies the proposed service parameters for the TPU. |

6.3.47.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPTI.request primitive and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer Traffic Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.47.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPTI.request primitive and may use the reported data.

6.3.47.4 MLME-TDLSPTI.indication

6.3.47.4.1 Function

This primitive indicates that a TDLS Peer Traffic Indication frame was received from a TDLS peer STA.

6.3.47.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.indication(
    TDLSPeerSTAAddress,
    TDLSPTI
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MACAddress | Any valid individual MAC Address | The MAC address of the non-AP STA MAC entity from which a TDLS Peer Traffic Indication frame was received. |
| TDLSPTI | Sequence of octets | As defined in TDLS Peer Traffic Indication frame | Specifies the proposed service parameters for the TPU. |

6.3.47.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer Traffic Indication frame is received.

6.3.47.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure as specified in 11.2.3.15.

6.3.47.5 MLME-TDLSPTI.response

6.3.47.5.1 Function

This primitive requests that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.47.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPTI.response(
    PeerSTAAddress,
    TDLSPTR
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the TPU. |
| TDLSPTR | Sequence of octets | As defined in TDLS Peer Traffic Response frame | Specifies the proposed service parameters for the TPU. |

6.3.47.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer Traffic Response frame be sent to the TDLS peer STA.

6.3.47.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer Traffic Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48 TDLS channel switching

6.3.48.1 General

The following MLME primitives support the signaling of a TDLS channel switch. Figure 6-10 depicts the TDLS channel switching process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

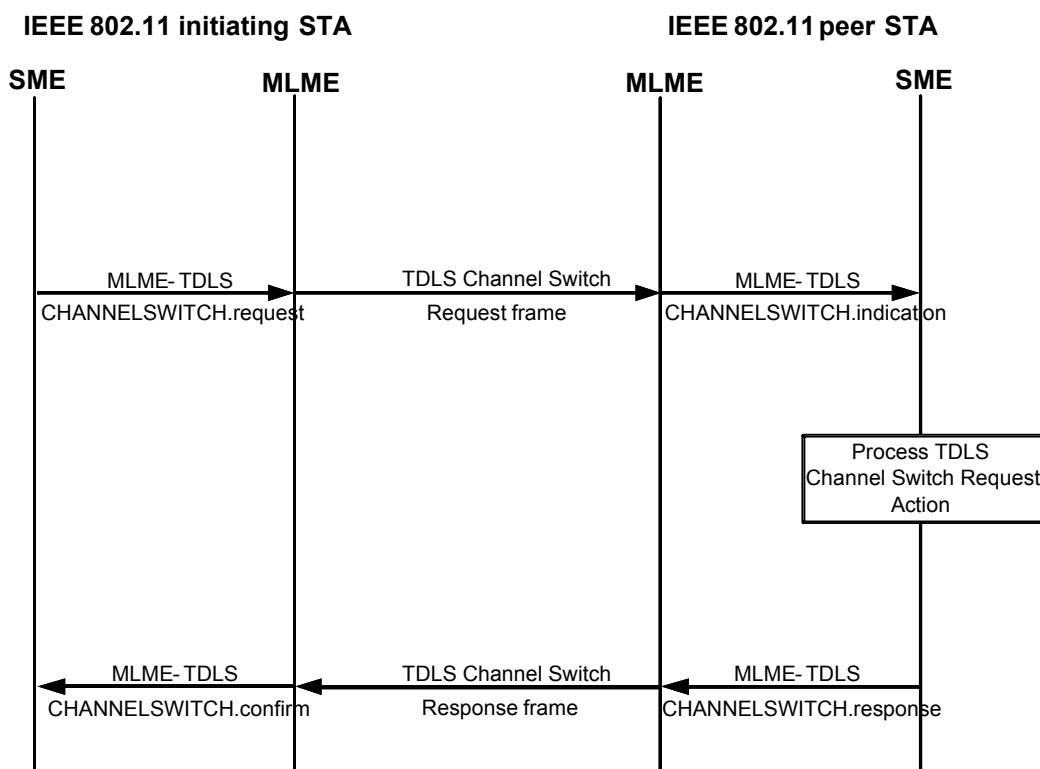

Figure 6-10—TDLS channel switching

6.3.48.2 MLME-TDLSCHANNELSWITCH.request

6.3.48.2.1 Function

This primitive requests that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

MLME-TDLSCHANNELSWITCH.request(
    TDLSPeerSTAAddress,
    TDLSChannelSwitchRequest
)
  
```

| Name | Type | Valid range | Description |
|--------------------------|--------------------|---|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the TDLS peer MAC entity to which a TDLS Channel Switch Request frame is transmitted. |
| TDLSChannelSwitchRequest | Sequence of octets | As defined in TDLS Channel Switch Request frame | Specifies the proposed service parameters for the TDLS Channel Switch. |

6.3.48.2.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Request frame be sent to the TDLS peer STA.

6.3.48.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.48.3 MLME-TDLSCHANNELSWITCH.confirm

6.3.48.3.1 Function

This primitive reports the result of an MLME-TDLSCHANNELSWITCH.request primitive to switch a channel with a TDLS peer STA.

6.3.48.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.confirm(
    TDLSPeerSTAAddress,
    TDLSChannelSwitchResponse
)
```

| Name | Type | Valid range | Description |
|---------------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Response frame was received. |
| TDLSChannelSwitchResponse | Sequence of octets | As defined in TDLS Channel Switch Response frame | Specifies the proposed service parameters for the TDLS Channel Switch. |

6.3.48.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSCHANNELSWITCH.request primitive and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Channel Switch Response frame from the TDLS peer STA.

6.3.48.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSCHANNELSWITCH.request primitive and may use the reported data.

6.3.48.4 MLME-TDLSCHANNELSWITCH.indication

6.3.48.4.1 Function

This primitive indicates that a TDLS Channel Switch Request frame was received from a TDLS peer STA.

6.3.48.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.indication(
    TDLSPeerSTAAddress,
    TDLSChannelSwitchRequest
)
```

| Name | Type | Valid range | Description |
|--------------------------|--------------------|---|---|
| TDLSPeerSTAAddress | MACAddress | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA from which a TDLS Channel Switch Request frame was received. |
| TDLSChannelSwitchRequest | Sequence of octets | As defined in TDLS Channel Switch Request frame | Specifies the proposed service parameters for the TDLS Channel Switch. |

6.3.48.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Channel Switch Request frame is received.

6.3.48.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.23.

6.3.48.5 MLME-TDLSCHANNELSWITCH.response

6.3.48.5.1 Function

This primitive requests that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSCHANNELSWITCH.response(
    TDLSPeerSTAAddress,
    TDLSChannelSwitchResponse
)
```

| Name | Type | Valid range | Description |
|---------------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA to which a TDLS Channel Switch Response frame is transmitted. |
| TDLSChannelSwitchResponse | Sequence of octets | As defined in TDLS Channel Switch Response frame | Specifies the proposed service parameters for the TDLS Channel Switch. |

6.3.48.5.3 When generated

This primitive is generated by the SME to request that a TDLS Channel Switch Response frame be sent to the TDLS peer STA.

6.3.48.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Channel Switch Response frame. The STA then attempts to transmit this frame to the TDLS peer STA.

6.3.49 TDLS peer PSM

6.3.49.1 General

The following MLME primitives support the management of TDLS peer PSM. Figure 6-11 depicts the TDLS peer PSM process. The figure is an example of only the basic procedure and is not meant to be exhaustive of all possible uses of the protocol.

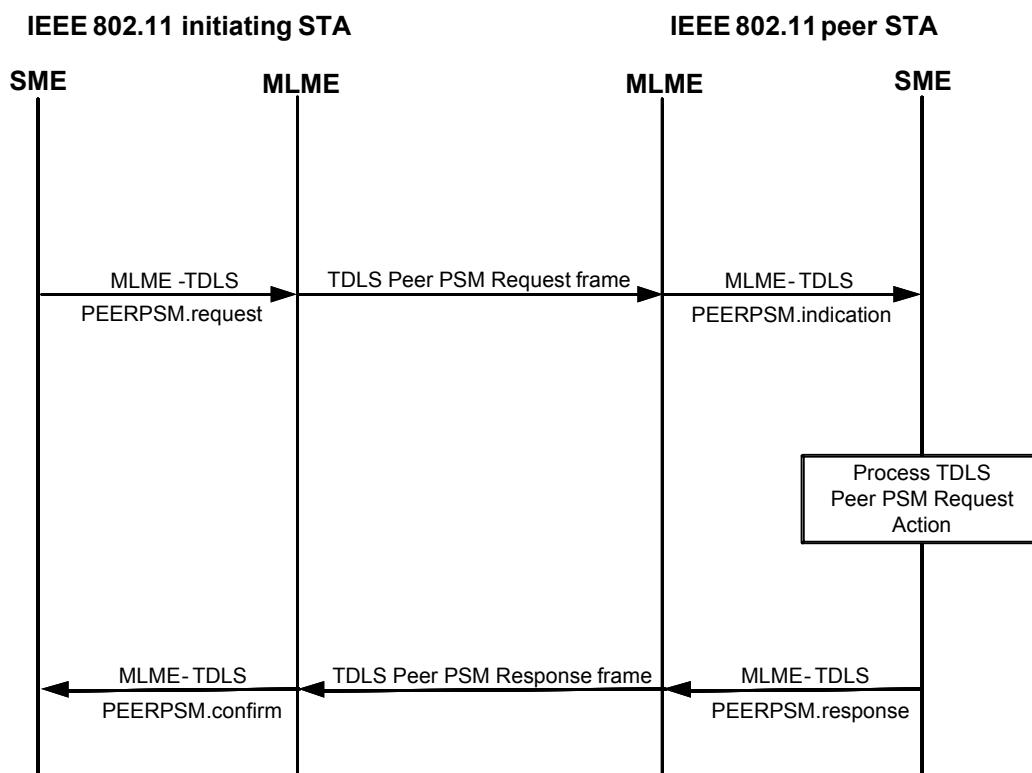

Figure 6-11—TDLS peer PSM

6.3.49.2 MLME-TDLSPEERPSM.request

6.3.49.2.1 Function

This primitive requests that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.request(
    TDLSPeerSTAAddress,
    TDLSPeerPSMRequest
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|---|---|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Request frame is transmitted. |
| TDLSPeerPSMRequest | Sequence of octets | As defined in TDLS Peer PSM Request frame | Specifies the proposed service parameters for the TDLS peer PSM. |

6.3.49.2.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Request frame be sent to the TDLS peer STA.

6.3.49.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Request frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.49.3 MLME-TDLSPEERPSM.confirm

6.3.49.3.1 Function

This primitive reports the result of an MLME-TDLSPEERPSM.request primitive to initiate power save mode based on scheduled service periods with a TDLS peer STA.

6.3.49.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.confirm(
    TDLSPeerSTAAddress,
    TDLSPeerPSMResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA from which a TDLS Peer PSM Response frame was received. |
| TDLSPeerPSMResponse | Sequence of octets | As defined in TDLS Peer PSM Response frame | Specifies the proposed service parameters for the TDLS peer PSM. |

6.3.49.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TDLSPEERPSM.request primitive and indicates the results of the request.

This primitive is generated when the STA successfully receives a TDLS Peer PSM Response frame from the TDLS peer STA or when an unspecified failure occurs.

6.3.49.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-TDLSPEERPSM.request primitive and may use the reported data.

6.3.49.4 MLME-TDLSPEERPSM.indication

6.3.49.4.1 Function

This primitive indicates that a TDLS Peer PSM Request frame was received from a TDLS peer STA.

6.3.49.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.indication(
    TDLSPeerSTAAddress,
    TDLSPeerPSMRequest
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|---|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA MAC entity from which a TDLS Peer PSM Request frame was received. |
| TDLSPeerPSMRequest | Sequence of octets | As defined in TDLS Peer PSM Request frame | Specifies the proposed service parameters for the TDLS peer PSM. |

6.3.49.4.3 When generated

This primitive is generated by the MLME when a valid TDLS Peer PSM Request frame is received.

6.3.49.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.14.

6.3.49.5 MLME-TDLSPEERPSM.response

6.3.49.5.1 Function

This primitive requests that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TDLSPEERPSM.response(
    TDLSPeerSTAAddress,
    TDLSPeerPSMResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------|--|--|
| TDLSPeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the TDLS peer STA to which a TDLS Peer PSM Response frame is transmitted. |
| TDLSPeerPSMResponse | Sequence of octets | As defined in TDLS Peer PSM Response frame | Specifies the proposed service parameters for the TDLS peer PSM. |

6.3.49.5.3 When generated

This primitive is generated by the SME to request that a TDLS Peer PSM Response frame be sent to the TDLS peer STA.

6.3.49.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TDLS Peer PSM Response frame. The STA then attempts to transmit this to the TDLS peer STA.

6.3.50 Event request

6.3.50.1 General

This set of primitives supports the exchange of Event Request and Event Report frames. The informative diagram shown in Figure 6-12 illustrates the Event Request and Event Report process and is not meant to be exhaustive of all possible protocol uses.

6.3.50.2 MLME-EVLREQUEST.request

6.3.50.2.1 Function

This primitive requests the transmission of an event request to a peer entity.

6.3.50.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Event Request Set,
    Destination URI,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------------|----------------------------------|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the event request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Request Set | Set of event elements | Set of event elements | A set of event elements describing the requested event. |
| Destination URI | Destination URI element | Destination URI element | The Destination URI element as defined in 9.4.2.90. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

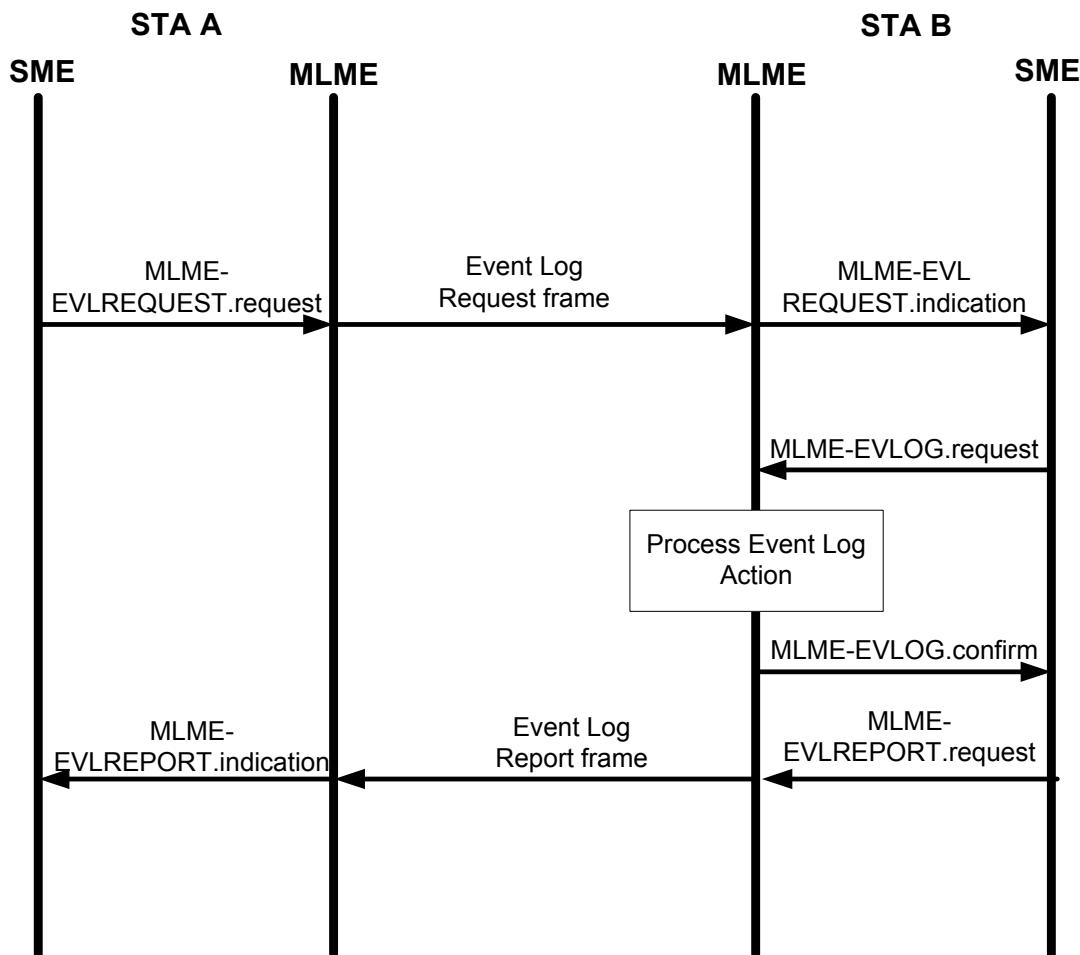

Figure 6-12—Event protocol exchange

6.3.50.2.3 When generated

This primitive is generated by the SME to request that an Event Request frame be sent to a peer entity to initiate one or more transactions.

6.3.50.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Request frame containing the set of event elements specified. This frame is then scheduled for transmission.

6.3.50.3 MLME-EVLREQUEST.indication

6.3.50.3.1 Function

This primitive indicates that an Event Request frame requesting an event transaction has been received.

6.3.50.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREQUEST.indication(

Peer MAC Address,
 Dialog Token,
 Event Request Set,
 Destination URI,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the event request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Request Set | Set of event elements | Set of event elements | A set of event elements describing the requested event. |
| Destination URI | Destination URI element | Destination URI element | The Destination URI element as defined in 9.4.2.90. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.50.3.3 When generated

This primitive is generated by the MLME when a valid Event Request frame is received.

6.3.50.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the event transaction.

6.3.51 Event report

6.3.51.1 General

This set of primitives supports the signaling of event reports.

6.3.51.2 MLME-EVLREPORT.request

6.3.51.2.1 Function

This primitive supports the signaling of event reports between peer SMEs.

6.3.51.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-EVLREPORT.request(
 Peer MAC Address,
 Dialog Token,
 Event Report Set,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-----------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the event report is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Report Set | Set of event elements | Set of event elements | A set of event elements describing the response to the event request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.51.2.3 When generated

This primitive is generated by the SME to request that an Event Report frame be sent to a peer entity to report the results of one or more transactions.

6.3.51.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an Event Report frame containing the set of event elements. This frame is then scheduled for transmission.

6.3.51.3 MLME-EVLREPORT.indication

6.3.51.3.1 Function

This primitive indicates that an Event Report frame has been received from a peer entity.

6.3.51.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLREPORT.indication(
    Peer MAC Address,
    Dialog Token,
    Event Report Set,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------|----------------------------------|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the event report was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Report Set | Set of event elements | Set of event elements | A set of event elements describing the response to the event request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.51.3.3 When generated

This primitive is generated by the MLME when a valid Event Report frame is received.

6.3.51.3.4 Effect of receipt

On receipt of this primitive, the event data can be made available for SME processes.

6.3.52 Event

6.3.52.1 General

This set of primitives supports the requesting and reporting of event data.

6.3.52.2 MLME-EVLOG.request

6.3.52.2.1 Function

This primitive is generated by the SME to request that the MLME identify specific events.

6.3.52.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLOG.request(
    Dialog Token,
    Event Request Set
)
```

| Name | Type | Valid range | Description |
|-------------------|-----------------------|-----------------------|---|
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Request Set | Set of event elements | Set of event elements | A set of event elements describing the response to the event request. |

6.3.52.2.3 When generated

This primitive is generated by the SME to request that the MLME initiate the specified event.

6.3.52.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the identification of events.

6.3.52.3 MLME-EVLOG.confirm

6.3.52.3.1 Function

This primitive reports the result of an event.

6.3.52.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-EVLOG.confirm(
    Dialog Token,
    Event Report Set
)
```

| Name | Type | Valid range | Description |
|------------------|------------------------------|------------------------------|---|
| Dialog Token | Integer | 1–255 | The dialog token to identify the event transaction. |
| Event Report Set | Set of event report elements | Set of event report elements | A set of event report elements describing the reported event. |

6.3.52.3.3 When generated

This primitive is generated by the MLME to report the results when event identification completes.

6.3.52.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and, if appropriate, stores the events pending communication to the requesting entity or for local use.

6.3.53 Diagnostic request

6.3.53.1 General

This set of primitives supports the initiation of diagnostics between peer SMEs. The informative diagram shown in Figure 6-13 depicts the diagnostic reporting process and is not meant to be exhaustive of all possible protocol uses.

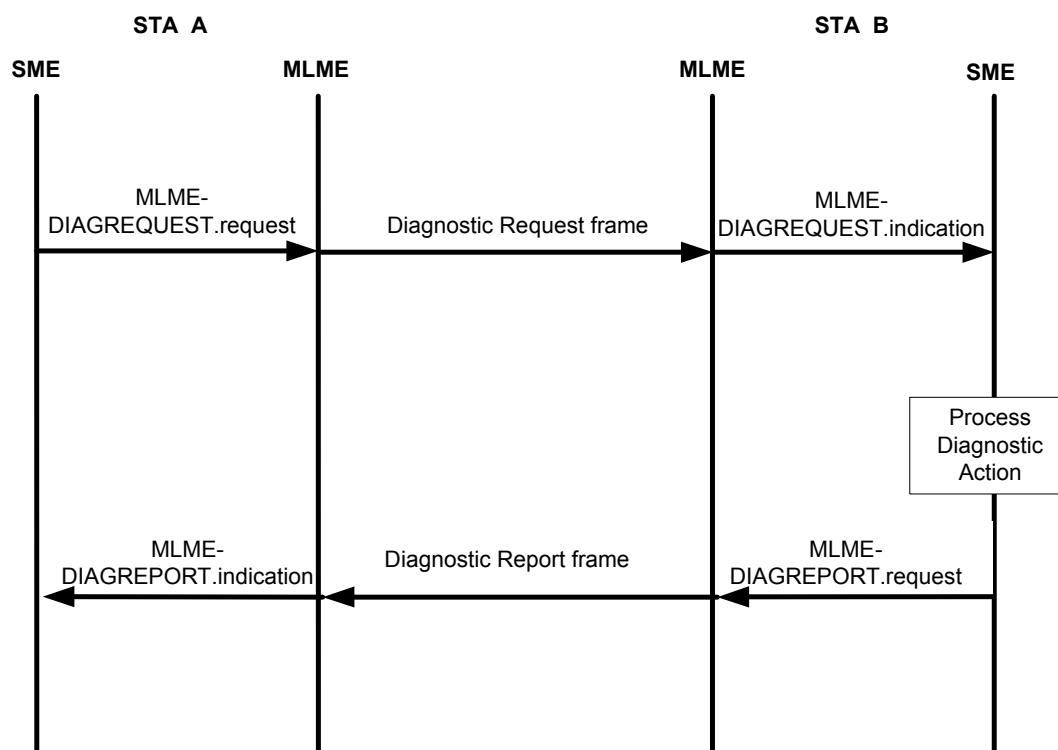

Figure 6-13—Diagnostic protocol exchange

6.3.53.2 MLME-DIAGREQUEST.request

6.3.53.2.1 Function

This primitive requests the transmission of a Diagnostic Request frame to a peer entity.

6.3.53.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DIAGREQUEST.request(

Peer MAC Address,
 Dialog Token,
 Diagnostic Request Set,
 Destination URI,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|------------------------|----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the diagnostic request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the diagnostic transaction. |
| Diagnostic Request Set | Set of diagnostic elements | Set of diagnostic elements | A set of diagnostic elements describing the requested diagnostics. |
| Destination URI | Destination URI element | Destination URI element | The Destination URI element as defined in 9.4.2.90. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.53.2.3 When generated

This primitive is generated by the SME to request that a Diagnostic Request frame be sent to a peer entity to initiate one or more diagnostic transactions.

6.3.53.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Request frame containing the set of diagnostic elements specified. This frame is then scheduled for transmission.

6.3.53.3 MLME-DIAGREQUEST.indication

6.3.53.3.1 Function

This primitive indicates that a Diagnostic Request frame requesting a Diagnostic transaction has been received.

6.3.53.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-DIAGREQUEST.indication(

Peer MAC Address,
 Dialog Token,
 Diagnostic Request Set,
 Destination URI,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|------------------------|----------------------------|----------------------------------|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the diagnostic request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the diagnostic transaction. |
| Diagnostic Request Set | Set of diagnostic elements | Set of diagnostic elements | A set of diagnostic elements describing the requested diagnostics. |
| Destination URI | Destination URI element | Destination URI element | The Destination URI element as defined in 9.4.2.90. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.53.3.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Request frame is received.

6.3.53.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the diagnostic transaction.

6.3.54 Diagnostic report

6.3.54.1 MLME-DIAGREPORT.request

6.3.54.1.1 Function

This primitive supports the signaling of diagnostic reports between peer SMEs.

6.3.54.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DIAGREPORT.request(
    Peer MAC Address,
    Dialog Token,
    Diagnostic Report Set,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the diagnostic report was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the diagnostic transaction. |
| Diagnostic Report Set | Set of diagnostic elements | Set of diagnostic elements | A set of diagnostic elements describing the results of the requested diagnostics. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.54.1.3 When generated

This primitive is generated by the SME to request that a Diagnostic Report frame be sent to a peer entity to report the results of one or more diagnostic transactions.

6.3.54.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Diagnostic Report frame containing the set of diagnostic elements. This frame is then scheduled for transmission.

6.3.54.2 MLME-DIAGREPORT.indication

6.3.54.2.1 Function

This primitive indicates that a Diagnostic Report frame has been received from a peer entity.

6.3.54.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-DIAGREPORT.indication(
    Peer MAC Address,
    Dialog Token,
    Diagnostic Report Set,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the diagnostic report is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the diagnostic transaction. |
| Diagnostic Report Set | Set of diagnostic elements | Set of diagnostic elements | A set of diagnostic elements describing the results of the requested diagnostics. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.54.2.3 When generated

This primitive is generated by the MLME when a valid Diagnostic Report frame is received.

6.3.54.2.4 Effect of receipt

On receipt of this primitive, the diagnostic data can be made available for SME processes.

6.3.55 Location configuration request

6.3.55.1 General

This set of primitives supports the exchange of location configuration parameter information between peer SMEs. The informative diagram shown in Figure 6-14 depicts the location configuration request and response process and is not meant to be exhaustive of all possible protocol uses.

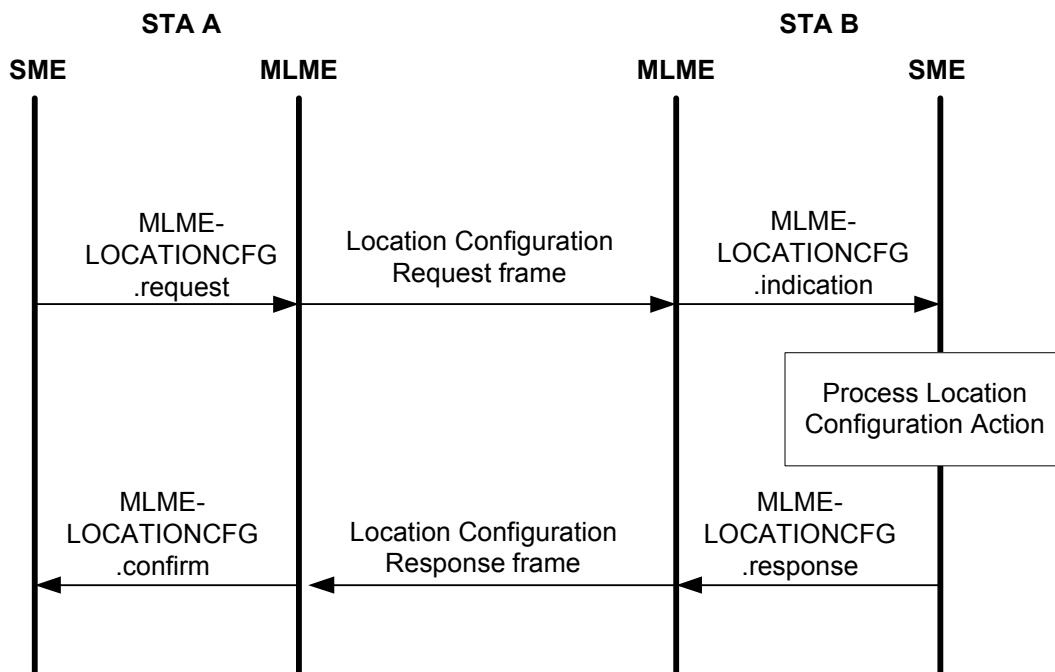

Figure 6-14—Location configuration request and response protocol exchange

6.3.55.2 MLME-LOCATIONCFG.request

6.3.55.2.1 Function

This primitive requests the transmission of a Location Configuration Request frame to a peer entity.

6.3.55.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONCFG.request(
    Peer MAC Address,
    Dialog Token,
    Location Parameters,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the location configuration request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the location transaction. |
| Location Parameters | Location Parameters element | Location Parameters element | A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.55.2.3 When generated

This primitive is generated by the SME to request that a Location Configuration Request frame be sent to a peer entity to convey location configuration information.

6.3.55.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Request frame containing the set of Location Parameters elements specified. This frame is then scheduled for transmission.

6.3.55.3 MLME-LOCATIONCFG.confirm

6.3.55.3.1 Function

This primitive reports the result of a location configuration request.

6.3.55.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONCFG.confirm(
    Dialog Token,
    Peer MAC Address,
    Location Parameters,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|----------------------------------|---|
| Dialog Token | Integer | 1–255 | The dialog token to identify the location transaction. |
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the location configuration response is sent. |
| Location Parameters | Location Parameters element | Location Parameters element | A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.55.3.3 When generated

This primitive is generated by the MLME when transmission of the Location Configuration Request frame is acknowledged, when (re)transmission of the Location Configuration Request frame fails, or when a failure reason is unspecified.

6.3.55.3.4 Effect of receipt

No effect of receipt is specified.

6.3.55.4 MLME-LOCATIONCFG.indication

6.3.55.4.1 Function

This primitive indicates that a Location Configuration Request frame has been received requesting a location transaction.

6.3.55.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONCFG.indication(
    Peer MAC Address,
    Dialog Token,
    Location Parameters,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the location configuration request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the location transaction. |
| Location Parameters | Location Parameters element | Location Parameters element | A Location Parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.55.4.3 When generated

This primitive is generated by the MLME when a valid Location Configuration Request frame is received.

6.3.55.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the location transaction.

6.3.55.5 MLME-LOCATIONCFG.response

6.3.55.5.1 Function

This primitive requests the transmission of location information to a peer entity, in response to a received Location Configuration Request frame.

6.3.55.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-LOCATIONCFG.response(
    Peer MAC Address,
    Dialog Token,
    Location Parameters,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the location request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the location transaction. |
| Location Parameters | Location Parameters element | Location Parameters element | A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.55.5.3 When generated

This primitive is generated by the SME to request that a Location Configuration Response frame be sent to a peer entity to convey location configuration information.

6.3.55.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Configuration Response frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.56 Location track notification

6.3.56.1 General

This set of primitives supports the location track notification from one SME to one or more receiving SMEs. The informative diagram in Figure 6-15 depicts the location track notification process, is not meant to be exhaustive of all possible protocol uses.

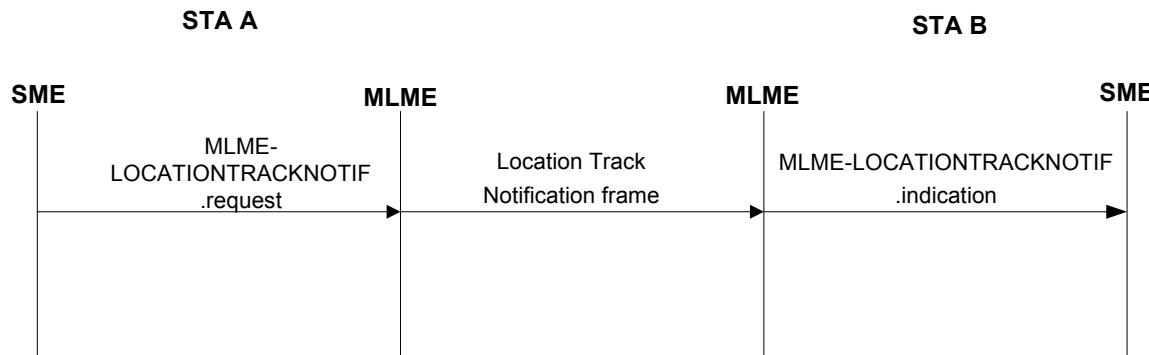

Figure 6-15—Location track notification protocol exchange

6.3.56.2 MLME-LOCATIONTRACKNOTIF.request

6.3.56.2.1 Function

This primitive requests the transmission of Location Configuration Request frame to a peer entity.

6.3.56.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONTRACKNOTIF.request(

Peer MAC Address,
 Location Parameters,
 Measurement Report,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|---|---|
| Peer MAC Address | MACAddress | Any valid individual or group addressed MAC Address | The address of the peer MAC entity to which the location track notification is sent. |
| Location Parameters | Location Parameters element | Location Parameters element | A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| Measurement Report | Measurement Report element | Measurement Report element | A Measurement Report element contains the beacon measurement information. See 9.4.2.22. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.56.2.3 When generated

This primitive is generated by the SME to request that a Location Track Notification frame be sent to a peer entity to help convey location information.

6.3.56.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Location Track Notification frame containing the set of location parameters elements specified. This frame is then scheduled for transmission.

6.3.56.3 MLME-LOCATIONTRACKNOTIF.indication

6.3.56.3.1 Function

This primitive indicates that a Location Track Notification frame has been received.

6.3.56.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-LOCATIONTRACKNOTIF.indication(

Peer MAC Address,
 Location Parameters,
 Measurement Report,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|---------------------|-----------------------------|---|---|
| Peer MAC Address | MACAddress | Any valid individual or group addressed MAC Address | The address of the peer MAC entity from which the location track notification was received. |
| Location Parameters | Location Parameters element | Location Parameters element | A location parameters element containing one or more subelements describing the STA location information. See 9.4.2.71. |
| Measurement Report | Measurement Report element | Measurement Report element | A Measurement Report element contains the beacon measurement information. See 9.4.2.22. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.56.3.3 When generated

This primitive is generated by the MLME when a valid Location Track Notification frame is received.

6.3.56.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57 Timing measurement

6.3.57.1 General

The following set of primitives supports exchange of timing measurement information from one SME to another. The informative diagram in Figure 6-16 depicts various points in time that are of interest to the timing measurement procedure.

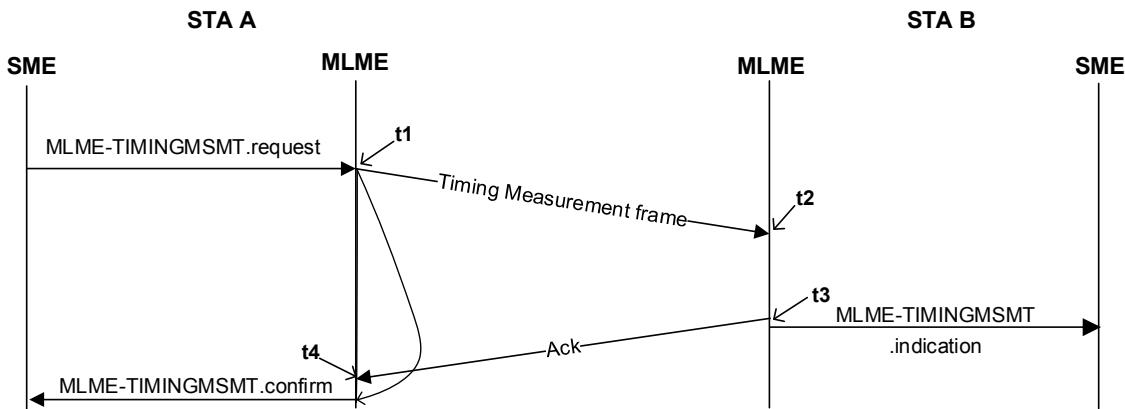

Figure 6-16—Timing measurement primitives and timestamps capture

NOTE 1—In Figure 6-16, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna connector. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-16, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna connector. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the receive antenna connector by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

6.3.57.2 MLME-TIMINGMSMT.request

6.3.57.2.1 Function

This primitive requests the transmission of Timing Measurement frame to a peer entity.

6.3.57.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMT.request(
    Peer MAC Address,
    Dialog Token,
    Follow Up Dialog Token,
    t1,
    Max t1 Error,
    t4,
    Max t4 Error,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|------------------------|-------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity to which the Timing Measurement frame is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the Timing Measurement frame. |
| Follow Up Dialog Token | Integer | 0–255 | The dialog token of a Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.24.5. |
| t1 | Integer | 0–(2 ³² –1) | The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0. |
| Max t1 Error | Integer | 0–255 | The maximum error in the t1 value in units of 10 ns; see 9.6.15.3, or null if the Follow Up Dialog Token is 0. |
| t4 | Integer | 0–(2 ³² –1) | The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0. |
| Max t4 Error | Integer | 0–255 | The maximum error in the t4 value in units of 10 ns, or null if the Follow Up Dialog Token is 0. |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.57.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement frame be sent to a peer entity.

6.3.57.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.57.3 MLME-TIMINGMSMT.confirm

6.3.57.3.1 Function

This primitive indicates that a Timing Measurement frame has been received by the peer STA to which it was sent.

6.3.57.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMT.confirm(
    Peer MAC Address,
    Dialog Token,
    t1,
    Max t1 Error,
    t4,
    Max t4 Error
)
```

| Name | Type | Valid range | Description |
|------------------|-------------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity to which acknowledges the receipt of the Timing Measurement frame. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the Timing Measurement frame. |
| t1 | 32-bit unsigned Integer | 0 – (2 ³² –1) | The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0. |
| Max t1 Error | Integer | 0–255 | The maximum error in the t1 value in units of 10 ns; see 9.6.15.3, or null if the Dialog Token is 0. |
| t4 | 32-bit unsigned Integer | 0 – (2 ³² –1) | The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0. |
| Max t4 Error | Integer | 0–255 | The maximum error in the t4 value in units of 10 ns, or null if the Dialog Token is 0. |

6.3.57.3.3 When generated

This primitive is generated by the MLME when an Ack frame corresponding to the Timing Measurement frame is received from the peer STA.

6.3.57.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.57.4 MLME-TIMINGMSMT.indication

6.3.57.4.1 Function

This primitive indicates that a Timing Measurement frame has been received and the corresponding Ack frame has been transmitted.

6.3.57.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TIMINGMSMT.indication(

Peer MAC Address,
 Dialog Token,
 Follow Up Dialog Token,
 t1,
 Max t1 Error,
 t4,
 Max t4 Error,
 t2,
 Max t2 Error,
 t3,
 Max t3 Error,
 VendorSpecific
)

| Name | Type | Valid range | Description |
|------------------------|-------------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity from which the Timing Measurement frame was sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the Timing Measurement frame. |
| Follow Up Dialog Token | Integer | 1–255 | The dialog token of a Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.24.5. |
| t1 | 32-bit unsigned integer | $0 - (2^{32}-1)$ | The value of t1 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0. |
| Max t1 Error | Integer | 0–255 | The maximum error in the t1 value in units of 10 ns; see 9.6.15.3, or null if the Follow Up Dialog Token is 0. |
| t4 | 32-bit unsigned integer | $0 - (2^{32}-1)$ | The value of t4 (see Figure 6-16) for the Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Follow Up Dialog Token is 0. |
| Max t4 Error | Integer | 0–255 | The maximum error in the t4 value in units of 10 ns, or null if the Follow Up Dialog Token is 0. |

| Name | Type | Valid range | Description |
|----------------|-------------------------|------------------------|---|
| t2 | 32-bit unsigned Integer | 0 – (2^{32} –1) | The value of t2 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0. |
| Max t2 Error | Integer | 0–255 | The maximum error in the t2 value in units of 10 ns, or null if the Dialog Token is 0. |
| t3 | 32-bit unsigned integer | 0 – (2^{32} –1) | The value of t3 (see Figure 6-16) for the Timing Measurement frame identified by the Dialog Token, in units of 10 ns, or null if the Dialog Token is 0. |
| Max t3 Error | Integer | 0–255 | The maximum error in the t3 value in units of 10 ns, or null if the Dialog Token is 0. |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.57.4.3 When generated

This primitive is generated by the MLME when a valid Timing Measurement frame is received.

6.3.57.4.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.58 Fine timing measurement (FTM)

6.3.58.1 General

The following set of primitives supports exchange of FTM information from one SME to another. The informative diagram in Figure 6-17 depicts various points in time that are of interest to the FTM procedure.

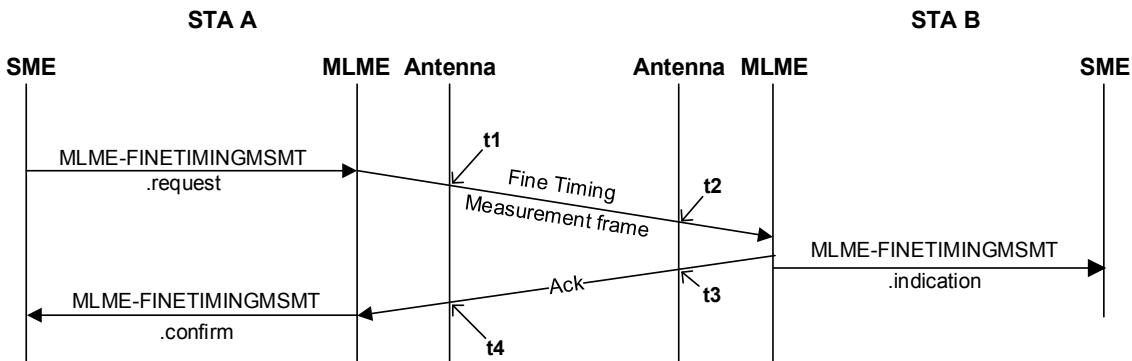

Figure 6-17—Fine timing measurement primitives and timestamps capture

NOTE 1—In Figure 6-17, t1 and t3 correspond to the point in time at which the start of the preamble for the transmitted frame appears at the transmit antenna connector. An implementation may capture a timestamp during the transmit processing earlier or later than the point at which it actually occurs and offset the value to compensate for the time difference.

NOTE 2—In Figure 6-17, t2 and t4 correspond to the point in time at which the start of the preamble for the incoming frame arrives at the receive antenna connector. Because time is needed to detect the frame and synchronize with its logical structure, an implementation determines when the start of the preamble for the incoming frame arrived at the

receive antenna connector by capturing a timestamp some time after it occurred and compensating for the delay by subtracting an offset from the captured value.

NOTE 3—In the MLME-FINETIMINGMSMT.request primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values in the prior MLME-FINETIMINGMSMT.confirm primitive for that Peer MAC Address and with a Dialog Token parameter equal to the Follow Up Dialog Token parameter in the request, or 0 if there was none. In the MLME-FINETIMINGMSMT.confirm primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values determined for the Fine Timing Measurement frame and its acknowledgment. This primitive is not issued if no acknowledgment is received. In the MLME-FINETIMINGMSMT.indication primitive the t1, Max t1 Error Exponent, t4 and Max t4 Error Exponent parameters are set to the values in the Fine Timing Measurement frame and the t2, Max t2 Error Exponent, t3 and Max t3 Error Exponent parameters are set to the values determined for the Fine Timing Measurement frame and its acknowledgment.

6.3.58.2 MLME-FINETIMINGMSMT.request

6.3.58.2.1 Function

This primitive requests the transmission of a Fine Timing Measurement frame to a peer entity.

6.3.58.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FINETIMINGMSMT.request(
    Peer MAC Address,
    Dialog Token,
    Follow Up Dialog Token,
    t1,
    Max t1 Error Exponent,
    t4,
    Max t4 Error Exponent,
    FTM Synchronization Information,
    LCI Report,
    Location Civic Report,
    Fine Timing Measurement Parameters,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|------------------------|------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity to which the Fine Timing Measurement frame is sent. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session. |
| Follow Up Dialog Token | Integer | 0–255 | The dialog token of a Fine Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.24.6. |
| t1 | Integer | 0–(2 ⁴⁸ –1) | The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0. |
| Max t1 Error Exponent | Integer | 0–31 | The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0. |

| Name | Type | Valid range | Description |
|------------------------------------|-------------------------|-------------------------|---|
| t4 | Integer | 0–(2^{48} –1) | The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0. |
| Max t4 Error Exponent | Integer | 0–31 | The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0. |
| FTM Synchronization Information | As defined in 9.4.2.173 | As defined in 9.4.2.173 | Optional element to report synchronization information of sender |
| LCI Report | As defined in 9.6.8.33 | As defined in 9.6.8.33 | Optional element to report LCI information of sender |
| Location Civic Report | As defined in 9.6.8.33 | As defined in 9.6.8.33 | Optional element to report location civic information of sender |
| Fine Timing Measurement Parameters | As defined in 9.4.2.168 | As defined in 9.4.2.168 | Optional element containing the proposed FTM configuration |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.58.2.3 When generated

This primitive is generated by the SME to request that a Fine Timing Measurement frame be sent to a peer entity.

6.3.58.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Fine Timing Measurement frame with the specified parameters. This frame is then scheduled for transmission.

6.3.58.3 MLME-FINETIMINGMSMT.confirm

6.3.58.3.1 Function

This primitive indicates that a Fine Timing Measurement frame has been received by the peer STA to which it was sent.

6.3.58.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FINETIMINGMSMT.confirm(
    Peer MAC Address,
    Dialog Token,
    t1,
    Max t1 Error Exponent,
    t4,
    Max t4 Error Exponent
)
```

| Name | Type | Valid range | Description |
|-----------------------|-------------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity to which acknowledges the receipt of the Fine Timing Measurement frame. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session. |
| t1 | 48-bit unsigned Integer | 0–(2 ⁴⁸ –1) | The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0. |
| Max t1 Error Exponent | Integer | 0–31 | The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Dialog Token is 0. |
| t4 | 48-bit unsigned Integer | 0–(2 ⁴⁸ –1) | The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0. |
| Max t4 Error Exponent | Integer | 0–31 | The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Dialog Token is 0. |

6.3.58.3.3 When generated

This primitive is generated by the MLME when an Ack frame corresponding to the Fine Timing Measurement frame is received from the peer STA.

6.3.58.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.58.4 MLME-FINETIMINGMSMT.indication

6.3.58.4.1 Function

This primitive indicates that a Fine Timing Measurement frame has been received and the corresponding Ack frame has been transmitted.

6.3.58.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FINETIMINGMSMT.indication(
 Peer MAC Address,
 Dialog Token,
 Follow Up Dialog Token,
 t1,
 Max t1 Error Exponent,
 t4,
 Max t4 Error Exponent,
 t2,
 Max t2 Error Exponent
 t3,

Max t3 Error Exponent,
 FTM Synchronization Information,
 LCI Report,
 Location Civic Report,
 Fine Timing Measurement Parameters,
 VendorSpecific
)

| Name | Type | Valid range | Description |
|---------------------------------|-------------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual addressed MAC Address | The address of the peer MAC entity from which the Fine Timing Measurement frame was sent. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the Fine Timing Measurement frame. A value of 0 indicates the end of the FTM session. |
| Follow Up Dialog Token | Integer | 0–255 | The dialog token of a Fine Timing Measurement frame which the current frame follows, or 0 if there is no such frame. See 11.24.6. |
| t1 | 48-bit unsigned integer | 0–(2 ⁴⁸ –1) | The value of t1 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0. |
| Max t1 Error Exponent | Integer | 0–31 | The maximum error in the t1 value. This is represented using a function of the Max t1 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0. |
| t4 | 48-bit unsigned integer | 0–(2 ⁴⁸ –1) | The value of t4 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Follow Up Dialog Token, contained in the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Follow Up Dialog Token is 0. |
| Max t4 Error Exponent | Integer | 0–31 | The maximum error in the t4 value. This is represented using a function of the Max t4 Error Exponent parameter as defined in Equation (9-4), or is null if the Follow Up Dialog Token is 0. |
| t2 | 48-bit unsigned Integer | 0–(2 ⁴⁸ –1) | The value of t2 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0. |
| Max t2 Error Exponent | Integer | 0–31 | The maximum error in the t2 value. This is represented using a function of the Max t2 Error Exponent parameter defined in Equation (9-4), or is null if the Dialog Token is 0. |
| t3 | 48-bit unsigned integer | 0–(2 ⁴⁸ –1) | The value of t3 (see Figure 6-17) for the Fine Timing Measurement frame identified by the Dialog Token, in units of picoseconds, or null if the Dialog Token is 0. |
| Max t3 Error Exponent | Integer | 0–31 | The maximum error in the t3 value. This is represented using a function of the Max t3 Error Exponent parameter defined in Equation (9-4), or is null if the Dialog Token is 0. |
| FTM Synchronization Information | As defined in 9.4.2.173 | As defined in 9.4.2.173 | Optional element to report synchronization information of sender |

| Name | Type | Valid range | Description |
|------------------------------------|-------------------------|-------------------------|---|
| LCI Report | As defined in 9.6.8.33 | As defined in 9.6.8.33 | Optional element to report LCI information of sender |
| Location Civic Report | As defined in 9.6.8.33 | As defined in 9.6.8.33 | Optional element to report location civic information of sender |
| Fine Timing Measurement Parameters | As defined in 9.4.2.168 | As defined in 9.4.2.168 | Optional element containing the proposed FTM configuration |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.58.4.3 When generated

This primitive is generated by the MLME when a valid Fine Timing Measurement frame is received.

6.3.58.4.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.59 BSS transition management

6.3.59.1 BSS transition management procedure

The informative diagram shown in Figure 6-18 depicts the BSS transition management procedure and is not meant to be exhaustive of all possible protocol uses.

6.3.59.2 MLME-BTMQUERY.request

This set of primitives supports the signaling of BSS Transition Management Query frames between non-AP STAs and an AP.

6.3.59.2.1 Function

This primitive requests transmission of a BSS Transition Management Query frame to the AP with which the STA is associated.

6.3.59.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTMQUERY.request(
    Peer MAC Address,
    DialogToken,
    BSSTransitionQueryReason,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

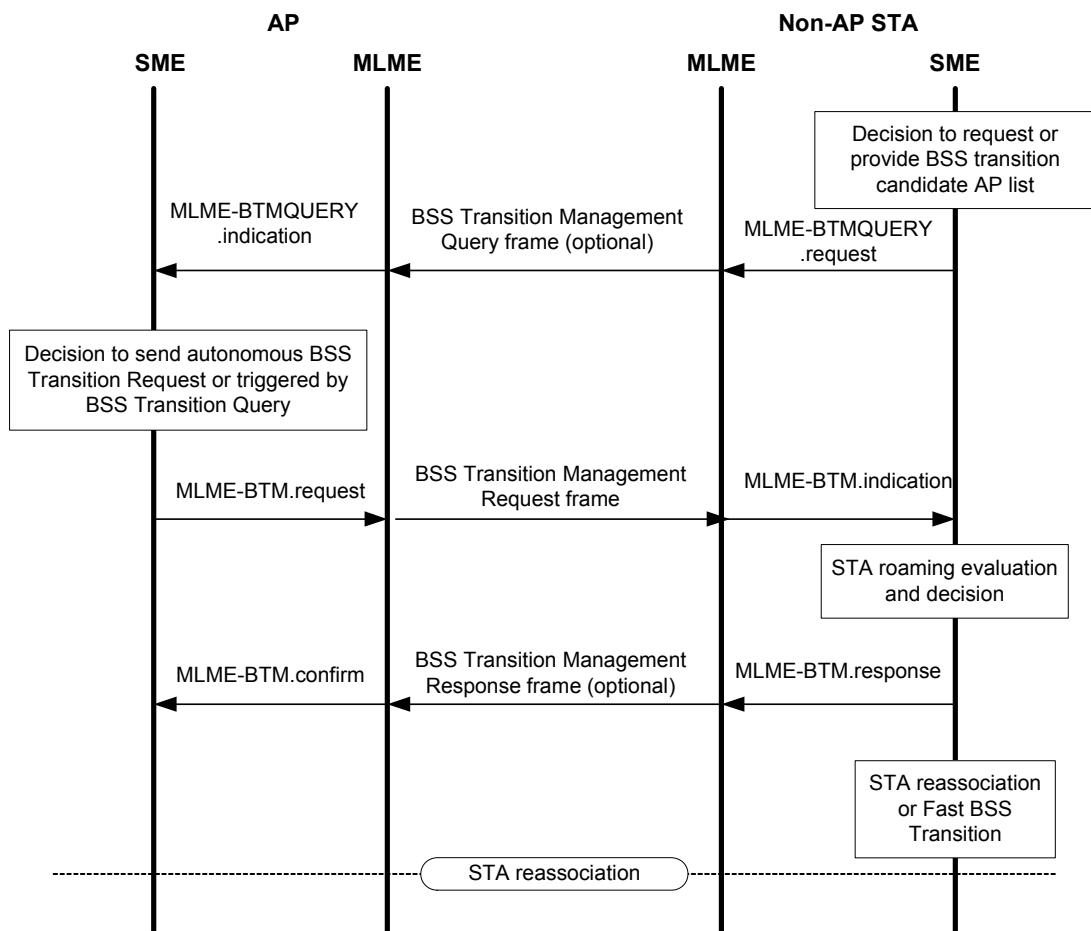

Figure 6-18—BSS transition management request—accepted

| Name | Type | Valid range | Description |
|-----------------------------------|---------------------------------|---|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the BSS Transition Management Query frame is sent. |
| DialogToken | Integer | 1–255 | The dialog token to identify this BSS transition management transaction. |
| BSSTransitionQueryReason | Integer | 0–255 | As defined in 9.6.14.8. |
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37 | Contains the description of candidate BSS transition APs and their capabilities as described in 9.4.2.37. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.2.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Query frame be sent to the AP with which the STA is associated to initiate a BSS transition management procedure.

6.3.59.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Query frame. The STA then attempts to transmit the frame to the AP with which it is associated.

6.3.59.3 MLME-BTMQUERY.indication

6.3.59.3.1 Function

This primitive indicates that a BSS Transition Management Query frame was received from a non-AP STA.

6.3.59.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTMQUERY.indication(
    Peer MAC Address,
    DialogToken,
    BSSTransitionQueryReason,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------------|---------------------------------|---|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a BSS Transition Management Query frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the BSS transition management transaction received in the BSS Transition Management Query frame. |
| BSSTransitionQuery Reason | Integer | 0–255 | The BSS Transition Query Reason Code in the BSS Transition Management Query frame that was received. |
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37 | Contains the description of candidate BSS transition APs and their capabilities as described in 9.4.2.37. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.3.3 When generated

This primitive is generated by the MLME when a valid BSS Transition Management Query frame is received.

6.3.59.3.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 11.24.7.

6.3.59.4 MLME-BTM.request

6.3.59.4.1 Function

This primitive requests transmission of a BSS Transition Management Request frame to a non-AP STA.

6.3.59.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.request(
    Peer MAC Address
    DialogToken,
    RequestMode,
    DisassociationTimer,
    ValidityInterval,
    BSSTerminationDuration,
    SessionInformationURL,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------------|-------------------------------------|---|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the BSS Transition Management Request frame is sent. |
| DialogToken | Integer | 1–255 | The dialog token to identify the BSS transition management transaction. Set to 0 for an autonomous BSS Transition Management Request frame. |
| RequestMode | Integer | As specified in 9.6.14.10 | Contains RequestMode for the BSS Transition Management Request frame. |
| DisassociationTimer | Integer | 0 – 65 535 | Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not yet been determined and a value of 1 indicates disassociation shall occur before the next TBTT. |
| ValidityInterval | Integer | 1–255 | Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid. |
| BSSTerminationDuration | BSS Termination Duration subelement | BSS Termination Duration subelement | Contains the BSS Termination Duration subelement (see 9.4.2.37) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field. |
| SessionInformationURL | URL | n/a | Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user's accounting session is found. |
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37 | Contains the description of candidate BSS transition APs and their capabilities as described in 9.4.2.37. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.4.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Request frame be sent to an associated non-AP STA. This request is sent either following the reception of an MLME-BTMQUERY.indication primitive or may be sent autonomously.

6.3.59.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Request frame. The STA then attempts to transmit this frame to the indicated non-AP STA.

6.3.59.5 MLME-BTM.indication

6.3.59.5.1 Function

This primitive indicates that a BSS Transition Management Request frame was received from the AP with which the STA is associated.

6.3.59.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.indication(
    PeerMACAddress,
    DialogToken,
    RequestMode,
    DisassociationTimer,
    ValidityInterval,
    BSSTerminationDuration,
    SessionInformationURL,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|-------------------------------------|-------------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC Address | The address of the MAC entity from which a BSS Transition Management Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the BSS transition management transaction as received in the BSS Transition Management Request frame. |
| RequestMode | Integer | As specified in 9.6.14.10 | Contains the RequestMode for the BSS Transition Management Request frame. |
| Disassociation Timer | Integer | 0 – 65 535 | Specifies the number of TBTTs until the AP disassociates the non-AP STA. A value of 0 indicates time of disassociation has not been determined yet and a value of 1 indicates disassociation shall occur before the next TBTT. |
| ValidityInterval | Integer | 1–255 | Specifies the number of beacon transmission times (TBTTs) until this recommendation of this BSS transition candidate list is no longer valid. |
| BSSTerminationDuration | BSS Termination Duration subelement | BSS Termination Duration subelement | Contains the BSS Termination Duration subelement (see 9.4.2.37) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field. |

| Name | Type | Valid range | Description |
|-----------------------------------|---------------------------------|---|--|
| SessionInformationURL | URL | n/a | Optionally contains a URL formatted per IETF RFC 3986 where additional information pertaining to the user's accounting session may be found. |
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37 | Contains the description of candidate BSS transition APs and their capabilities as described in 9.4.2.37. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.5.3 When generated

This primitive is generated by the MLME when a valid BSS Transition Management Request frame is received.

6.3.59.5.4 Effect of receipt

On receipt of this primitive the SME shall operate according to the procedure in 11.24.7.

6.3.59.6 MLME-BTM.response

6.3.59.6.1 Function

This primitive requests transmission of a BSS Transition Management Response frame to the AP with which the STA is associated.

6.3.59.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.response(
    Peer MAC Address
    DialogToken,
    BTMStatusCode,
    BSSTerminationDelay,
    TargetBSSID,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|------------|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the BSS Transition Management Query frame is sent. |
| DialogToken | Integer | 1–255 | The dialog token to identify the BSS transition management transaction. |
| BTMStatusCode | Integer | 0–255 | As defined in 9.6.14.10. |
| BSSTerminationDelay | Integer | 0–255 | As defined in 9.6.14.10. |
| TargetBSSID | MACAddress | Any valid individual MAC Address | The BSSID of the BSS that the STA decided to transition to. Field shall be null if STA decided not to transition. |

| Name | Type | Valid range | Description |
|-----------------------------------|---------------------------------|--|---|
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37. | Contains the description of candidate BSS transition APs and their capabilities as described in 9.4.2.37. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.6.3 When generated

This primitive is generated by the SME to request that a BSS Transition Management Response frame be sent to the AP with which the STA is associated.

6.3.59.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a BSS Transition Management Response frame. The non-AP STA then attempts to transmit this to the AP with which it is associated.

6.3.59.7 MLME-BTM.confirm

6.3.59.7.1 Function

This primitive reports the results of a BSS Transition Management attempt with a specified peer MAC entity that is within an AP.

6.3.59.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BTM.confirm(
    Peer MAC Address,
    DialogToken,
    BSSTransitionQueryReason,
    BTMStatusCode,
    BSSTerminationDelay,
    TargetBSSID,
    BSSTransitionCandidateListEntries,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------|----------------------------------|---|
| Peer MAC Address | MAC Address | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a BSS Transition Management Response frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the BSS transition management transaction as received in the BSS Transition Management Response frame. |
| BTMStatusCode | Integer | 0–255 | As defined in 9.6.14.10. |
| BSSTerminationDelay | Integer | 0–255 | As defined in 9.6.14.10. |
| TargetBSSID | MACAddress | Any valid individual MAC Address | The BSSID of the BSS that the STA indicated to transition to as received in the BSS Transition Management Response frame. |

| Name | Type | Valid range | Description |
|-----------------------------------|---------------------------------|---|--|
| BSSTransitionCandidateListEntries | Set of Neighbor Report Elements | Set of Neighbor Report Elements as defined in the Neighbor Report Element in 9.4.2.37 | Contains the BSS Transition Candidate List Entries in the received BSS Transition Management Response frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.59.7.3 When generated

This primitive is generated by the MLME when transmission of the BSS Transition Management Request frame is acknowledged, when (re)transmission of the BSS Transition Management Request frame fails, or when a failure reason is unspecified.

6.3.59.7.4 Effect of receipt

On receipt of this primitive, the SME shall operate according to the procedure in 11.24.7.

6.3.60 FMS setup

6.3.60.1 General

The following MLME primitives support the signaling of FMS setup. The informative diagram shown in Figure 6-19 depicts the FMS setup process and is not meant to be exhaustive of all possible protocol uses.

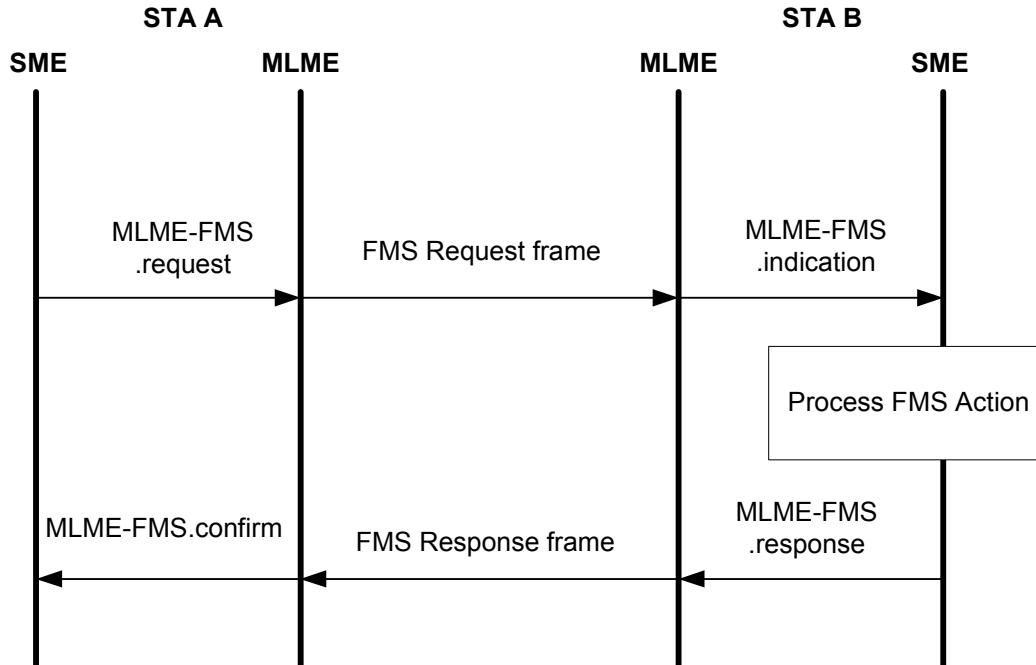

Figure 6-19—FMS setup protocol exchange

6.3.60.2 MLME-FMS.request

6.3.60.2.1 Function

This primitive requests that an FMS Request frame be sent to the AP with which the non-AP STA is associated.

6.3.60.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FMS.request(
    PeerSTAAddress,
    DialogToken,
    FMSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the FMS process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the FMS transaction. |
| FMSRequest | FMS Request element | As defined in 9.4.2.76 | Specifies the proposed service parameters for the FMS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.60.2.3 When generated

This primitive is generated by the SME to request that an FMS Request frame be sent to the AP with which the STA is associated.

6.3.60.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.60.3 MLME-FMS.confirm

6.3.60.3.1 Function

This primitive reports the result of an FMS procedure.

6.3.60.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FMS.confirm(
    Peer MAC Address,
    Dialog Token,
    FMSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|----------------------|----------------------------------|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the location response is sent. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the FMS transaction. |
| FMSResponse | FMS Response element | As defined in 9.4.2.77 | Specifies service parameters for the FMS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.60.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-FMS.request primitive and indicates the results of the request. This primitive is generated when the STA receives an FMS Response frame from the AP.

6.3.60.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.16.

6.3.60.4 MLME-FMS.indication

6.3.60.4.1 Function

This primitive indicates that an FMS Request frame was received from a non-AP STA.

6.3.60.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- FMS.indication(
    PeerSTAAddress,
    DialogToken,
    FMSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which an FMS Request frame was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the FMS transaction. |
| FMSRequest | FMS Request element | As defined in 9.4.2.76 | Specifies the proposed service parameters for the FMS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.60.4.3 When generated

This primitive is generated by the MLME when a valid FMS Request frame is received.

6.3.60.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.16.

6.3.60.5 MLME-FMS.response

6.3.60.5.1 Function

This primitive is either generated in response to a received FMS Request frame or autonomously by the AP and requests the transmission of an FMS Response frame.

6.3.60.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-FMS.response(

PeerSTAAddress,
 FMSResponse,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|----------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which an FMS Request frame was received. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the FMS transaction. |
| FMSResponse | FMS Response element | As defined in 9.4.2.77 | Specifies service parameters for the FMS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.60.5.3 When generated

This primitive is generated by the SME to request that an FMS Response frame be sent to a peer entity to convey FMS information.

6.3.60.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an FMS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.61 Collocated Interference request

6.3.61.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs. The informative diagram shown in Figure 6-20 depicts the Collocated Interference request and response process and is not meant to be exhaustive of all possible protocol uses.

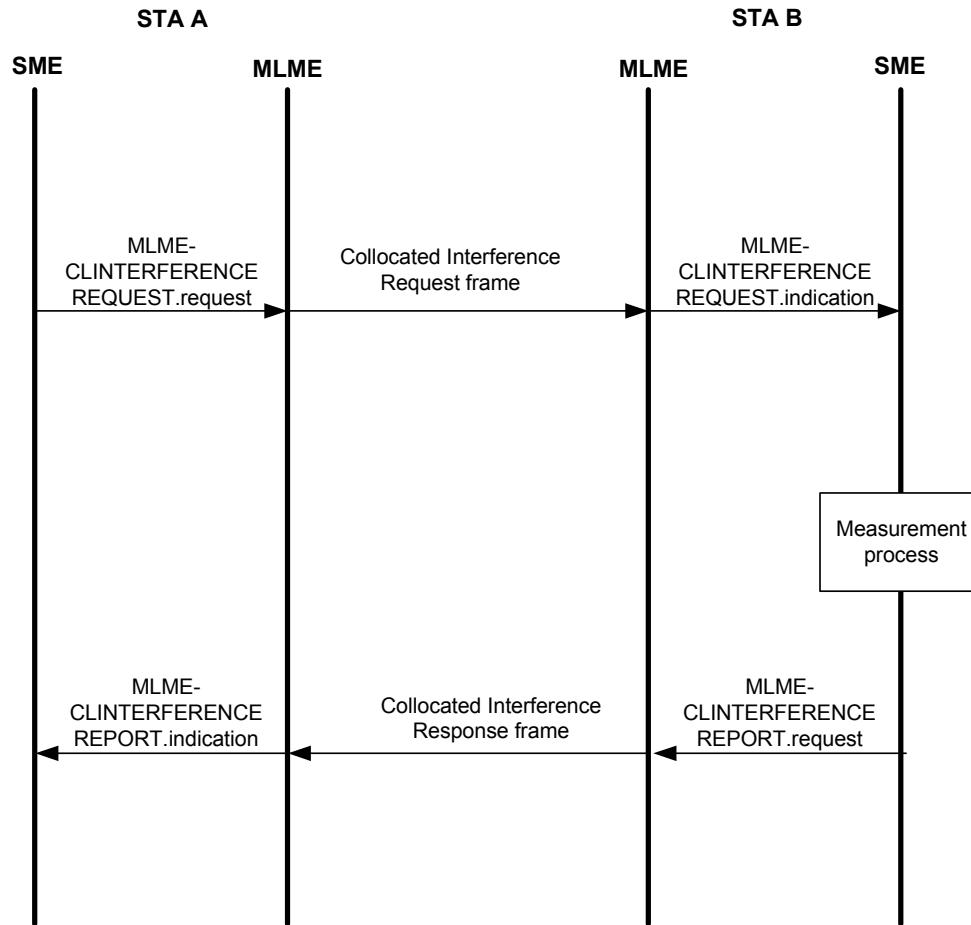

Figure 6-20—Collocated interference protocol exchange

6.3.61.2 MLME-CLINTERFERENCEREQUEST.request

6.3.61.2.1 Function

This primitive requests the transmission of Collocated Interference Request frame to a peer entity.

6.3.61.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Request Info,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------|------------|--|--|
| Peer MAC Address | MACAddress | Any valid individual MAC Address, or the group MAC address | The address of the peer MAC entity to which the collocated interference request is sent. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|---|
| Dialog Token | Integer | 1–255 | The dialog token to identify the collocated interference transaction. |
| Request Info | Integer | As defined in the Collocated Interference Request frame, see 9.6.14.13 | Specifies the requested information. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.61.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Request frame be sent to a peer entity.

6.3.61.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Request frame. This frame is then scheduled for transmission.

6.3.61.3 MLME-CLINTERFERENCEREQUEST.indication

6.3.61.3.1 Function

This primitive indicates that a Collocated Interference Request frame has been received requesting a Collocated Interference report.

6.3.61.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREQUEST.indication(
    Peer MAC Address,
    Dialog Token,
    Request Info,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address or the group MAC address | The address of the peer MAC entity from which the Collocated Interference request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the collocated interference transaction. |
| Request Info | Integer | As defined in the Collocated Interference Request frame, see 9.6.14.13 | Specifies the requested information. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.61.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Request frame is received.

6.3.61.3.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the Collocated Interference reporting procedure as described in 11.24.9.

6.3.62 Collocated Interference report

6.3.62.1 General

This set of primitives supports the exchange of collocated interference information between peer SMEs.

6.3.62.2 MLME-CLINTERFERENCEREPORt.request

6.3.62.2.1 Function

This primitive requests the transmission of Collocated Interference Report to a peer entity, in response to a received Collocated Interference Request frame.

6.3.62.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPORt.request(
    Peer MAC Address,
    Dialog Token,
    Collocated Interference Report,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------|---|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity to which the Collocated Interference Report is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the collocated interference transaction. |
| Collocated Interference Report | Collocated Interference Report elements | As defined in 9.4.2.85 | Specifies the collocated interference characteristics. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.62.2.3 When generated

This primitive is generated by the SME to request that a Collocated Interference Report frame be sent to a peer entity to convey collocated interference information.

6.3.62.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Collocated Interference Report frame. This frame is then scheduled for transmission.

6.3.62.3 MLME-CLINTERFERENCEREPOR.T.indication

6.3.62.3.1 Function

This primitive indicates that a Collocated Interference Report frame has been received.

6.3.62.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CLINTERFERENCEREPOR.T.indication(
    Peer MAC Address,
    Dialog Token,
    Collocated Interference Report,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------------|---|----------------------------------|---|
| Peer MAC Address | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the location response was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the location transaction. |
| Collocated Interference Report | Collocated Interference Report elements | As defined in 9.4.2.85 | Specifies the collocated interference characteristics. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.62.3.3 When generated

This primitive is generated by the MLME when a valid Collocated Interference Report frame is received.

6.3.63 TFS setup

6.3.63.1 General

This set of primitives supports the exchange of the signaling of TFS setup between peer SMEs. The informative diagram shown in Figure 6-21 depicts the TFS request and response process and is not meant to be exhaustive of all possible protocol uses.

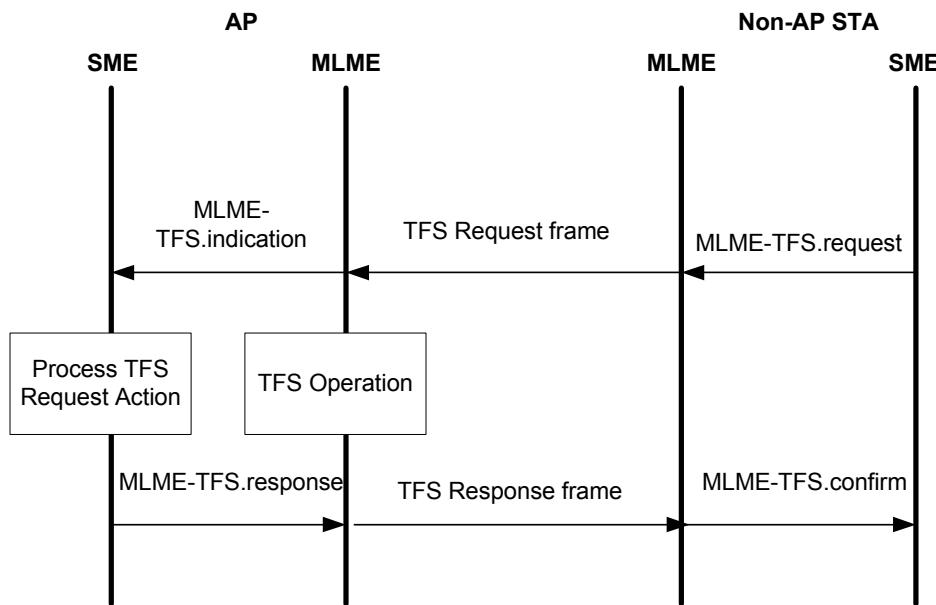

Figure 6-21—TFS request and response exchange

6.3.63.2 MLME-TFS.request

6.3.63.2.1 Function

This primitive requests that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.63.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.request(
    PeerSTAAddress,
    DialogToken,
    TFSRequest,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|----------------|-------------------------------|---------------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity for TFS. |
| DialogToken | Integer | 0–255 | The dialog token to identify the TFS Request and Response transaction. |
| TFSRequest | A set of TFS Request elements | As defined in the TFS Request element | Specifies the proposed service parameters for the TFS. One or more TFS Request elements. |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.63.2.3 When generated

This primitive is generated by the SME to request that a TFS Request frame be sent to the AP with which the STA is associated.

6.3.63.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.63.3 MLME-TFS.confirm

6.3.63.3.1 Function

This primitive reports the result of a TFS procedure.

6.3.63.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.confirm(
    PeerSTAAddress,
    DialogToken,
    TFSResponse,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------------------|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the TFS Response frame is received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the TFS Request and Response transaction. |
| TFSResponse | A set of TFS Response elements | As defined in the TFS Response element | Specifies service parameters for the TFS. One or more TFS Response elements. |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.63.3.3 When generated

This primitive is generated by the MLME when the STA receives a TFS Response frame from the AP.

6.3.63.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the result and may use the reported data. The SME should operate according to the procedure in 11.24.12.

6.3.63.4 MLME-TFS.indication

6.3.63.4.1 Function

This primitive indicates that a TFS Request frame was received from a non-AP STA.

6.3.63.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.indication(
    PeerSTAAddress,
    DialogToken,
    TFSRequest,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|----------------|-------------------------------|---------------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a TFS Request frame was received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the TFS Request and Response transaction. |
| TFSRequest | A set of TFS Request elements | As defined in the TFS Request element | Specifies the proposed service parameters for the TFS. One or more TFS Request elements. |
| VendorSpecific | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.63.4.3 When generated

This primitive is generated by the MLME when a valid TFS Request frame is received.

6.3.63.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.12.

6.3.63.5 MLME-TFS.response

6.3.63.5.1 Function

This primitive is generated in response to an MLME-TFS.indication primitive requesting a TFS Response frame be sent to a non-AP STA.

6.3.63.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TFS.response(
    PeerSTAAddress,
    DialogToken,
    TFSResponse,
    VendorSpecific
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a TFS Request frame was received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the TFS Request and Response transaction. |
| TFSResponse | A set of TFS Response elements | As defined in 9.4.2.81 | Specifies service parameters for the TFS. One or more TFS Response elements. |
| VendorSpecific | A set of elements. | As defined in 9.4.2.26 | Zero or more elements. |

6.3.63.5.3 When generated

This primitive is generated by the SME in response to an MLME-TFS.indication primitive requesting a TFS Response be sent to a non-AP STA.

6.3.63.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TFS Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.64 WNM sleep mode request

6.3.64.1 General

This set of primitives supports the exchange of sleep mode parameter information between peer SMEs. The informative diagram shown in Figure 6-22 depicts the sleep mode request and response process and is not meant to be exhaustive of all possible protocol uses.

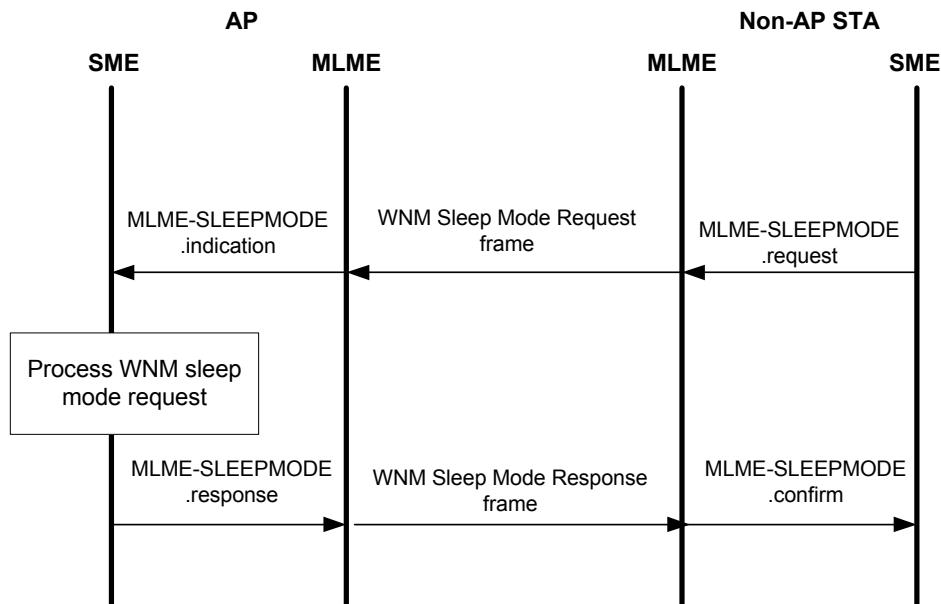

Figure 6-22—WNM sleep mode request and response exchange

6.3.64.2 MLME-SLEEPMODE.request

6.3.64.2.1 Function

This primitive requests that a WNM Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.64.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.request(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--|--|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the WNM Sleep Mode Request frame is to be sent. |
| DialogToken | Integer | 0–255 | The dialog token to identify the WNM sleep mode request and response transaction. |
| SleepMode | As defined in the WNM Sleep Mode element | As defined in the WNM Sleep Mode element | Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Request frame. |
| TFSRequest | A set of TFS Request elements | As defined in 9.4.2.80 | Specifies the proposed TFS service parameters for the WNM Sleep Mode Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.64.2.3 When generated

This primitive is generated by the SME to request that a WNM Sleep Mode Request frame be sent to the AP with which the STA is associated.

6.3.64.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Sleep Mode Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.64.3 MLME-SLEEPMODE.indication

6.3.64.3.1 Function

This primitive indicates that a WNM Sleep Mode Request frame was received from a non-AP STA.

6.3.64.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.indication(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--|--|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the peer MAC entity from which the WNM Sleep Mode Request frame is received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the WNM sleep mode request and response transaction. |
| SleepMode | As defined in the WNM Sleep Mode element | As defined in the WNM Sleep Mode element | Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Request frame. |
| TFSRequest | A set of TFS Request elements | As defined in 9.4.2.80 | Specifies the proposed TFS service parameters for the WNM Sleep Mode Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.64.3.3 When generated

This primitive is generated by the MLME when a valid WNM Sleep Mode Request frame is received.

6.3.64.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.18.

6.3.64.4 MLME-SLEEPMODE.response

6.3.64.4.1 Function

This primitive requests the transmission of sleep mode information to a peer entity, in response to a received WNM Sleep Mode Request frame.

6.3.64.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.response(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the WNM Sleep Mode Response frame is to be sent. |
| DialogToken | Integer | 0–255 | The dialog token to identify the WNM sleep mode request and response transaction. |
| SleepMode | As defined in the WNM Sleep Mode element | As defined in the WNM Sleep Mode element | Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Response frame. |
| TFSResponse | A set of TFS Request elements | As defined in 9.4.2.81 | Specifies the proposed TFS service parameters for the WNM Sleep Mode Response frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.64.4.3 When generated

This primitive is generated by the SME to request that a WNM Sleep Mode Response frame be sent to a peer entity to convey WNM sleep mode information.

6.3.64.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Sleep Mode Response frame containing the WNM Sleep Mode elements specified. This frame is then scheduled for transmission.

6.3.64.5 MLME-SLEEPMODE.confirm

6.3.64.5.1 Function

This primitive reports the result of a request to send a WNM Sleep Mode Response frame.

6.3.64.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SLEEPMODE.confirm(
    PeerSTAAddress,
    DialogToken,
    SleepMode,
    TFSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|--|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the WNM Sleep Mode Response frame is received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the WNM sleep mode request and response transaction. |
| SleepMode | As defined in the WNM Sleep Mode element | As defined in the WNM Sleep Mode element | Specifies the proposed WNM sleep mode service parameters for the WNM Sleep Mode Response frame. |

| Name | Type | Valid range | Description |
|--------------------|-------------------------------|--|--|
| TFSResponse | A set of TFS Request elements | As defined in the TFS Response element | Specifies the proposed TFS service parameters for the WNM Sleep Mode Response frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.64.5.3 When generated

This primitive is generated by the MLME when the STA receives a WNM Sleep Mode Response frame from the AP.

6.3.64.5.4 Effect of receipt

No effect of receipt is specified.

6.3.65 TIM broadcast setup

6.3.65.1 General

The following MLME primitives support the signaling of TIM Broadcast Setup. The informative diagram shown in Figure 6-23 depicts the TIM Broadcast setup process and is not meant to be exhaustive of all possible protocol uses.

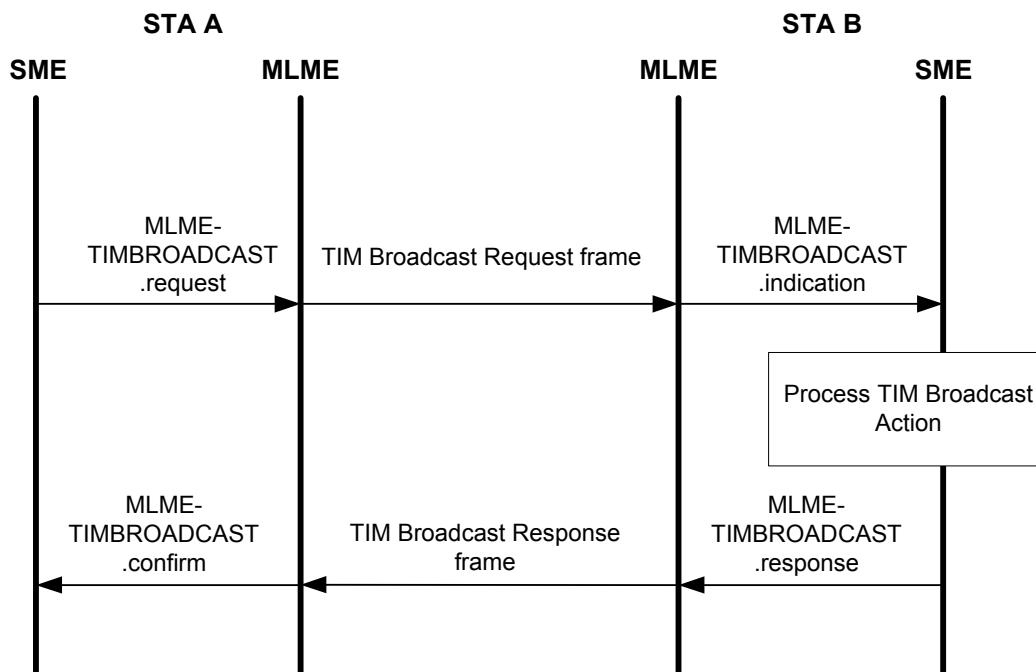

Figure 6-23—TIM broadcast setup protocol exchange

6.3.65.2 MLME-TIMBROADCAST.request

6.3.65.2.1 Function

This primitive requests that a TIM Broadcast Request frame be sent to the AP with which the non-AP STA is associated.

6.3.65.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.request(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|---|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the TIM Broadcast request and response transaction. |
| TIMBroadcastRequest | As defined in TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for the TIM Broadcast. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.65.2.3 When generated

This primitive is generated by the SME to request that a TIM Broadcast Request frame be sent to the AP with which the STA is associated.

6.3.65.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Request frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.65.3 MLME-TIMBROADCAST.confirm

6.3.65.3.1 Function

This primitive reports the result of a TIM Broadcast procedure.

6.3.65.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.confirm(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------------|--|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the TIM Broadcast process. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the TIM Broadcast request and response transaction. |
| TIMBroadcastResponse | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies service parameters for the TIM Broadcast. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.65.3.3 When generated

This primitive is generated by the MLME when the STA receives a TIM Broadcast Response frame from the AP.

6.3.65.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results in the TIMBroadcastResponse element and may use the reported data.

6.3.65.4 MLME-TIMBROADCAST.indication

6.3.65.4.1 Function

This primitive indicates that a TIM Broadcast Request frame was received from a non-AP STA.

6.3.65.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.indication(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|---|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the TIM Broadcast request and response transaction. |
| TIMBroadcastRequest | As defined in TIM Broadcast Request element | As defined in 9.4.2.83 | Specifies the proposed service parameters for the TIM Broadcast. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.65.4.3 When generated

This primitive is generated by the MLME when a valid TIM Broadcast Request frame is received.

6.3.65.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.2.3.17.

6.3.65.5 MLME-TIMBROADCAST.response

6.3.65.5.1 Function

This primitive is generated in response to an MLME-TIMBROADCAST.indication primitive requesting a TIM Broadcast Response frame be sent to a non-AP STA.

6.3.65.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMBROADCAST.response(
    PeerSTAAddress,
    Dialog Token,
    TIMBroadcastResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|--|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a TIM Broadcast Request frame was received. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the TIM Broadcast request and response transaction. |
| TIM Broadcast Response | As defined in TIM Broadcast Response element | As defined in 9.4.2.84 | Specifies service parameters for the TIM Broadcast. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.65.5.3 When generated

This primitive is generated by the SME in response to an MLME-TIMBROADCAST.indication primitive requesting a TIM Broadcast Response be sent to a non-AP STA.

6.3.65.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TIM Broadcast Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.66 QoS traffic capability update

6.3.66.1 General

The MLME-QOSTRAFFICCAPUPDATE.request and MLME-QOSTRAFFICCAPUPDATE.indication primitives provide the transport of QoS Traffic Capability information from a non-AP STA to the AP with which the STA is associated. The informative diagram shown in Figure 6-24 depicts the QoS traffic capability update process.

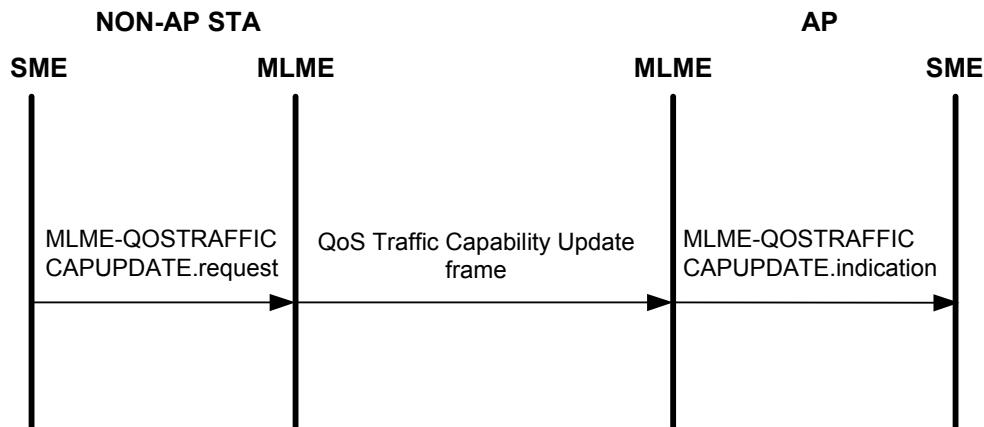

Figure 6-24—QoS traffic capability update protocol exchange

6.3.66.2 MLME-QOSTRAFFICCAPUPDATE.request

6.3.66.2.1 Function

This primitive requests that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.66.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-QOSTRAFFICCAPUPDATE.request(
    QoSTrafficCapability,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|-----------------------------------|-------------------------|--|
| QoS Traffic Capability | Bit field as defined in 9.6.14.23 | As defined in 9.6.14.23 | Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11QoSTrafficCapabilityActivated is true, and it is not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.66.2.3 When generated

This primitive is generated by the SME to request that a QoS Traffic Capability Update frame be sent to the AP with which the STA is associated.

6.3.66.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QoS Traffic Capability Update frame. The STA then attempts to transmit this to the AP with which it is associated.

6.3.66.3 MLME-QOSTRAFFICCAPUPDATE.indication

6.3.66.3.1 Function

This primitive indicates that a QoS Traffic Capability Update frame was received from a non-AP STA.

6.3.66.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QOSTRAFFICCAPUPDATE.indication(
    PeerSTAAddress,
    QoS Traffic Capability,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|-----------------------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a QoS Traffic Capability Update frame was received. |
| QoS Traffic Capability | Bit field as defined in 9.6.14.23 | As defined in 9.6.14.23 | Specifies the QoS Traffic Capability flags of the non-AP STA. This parameter is present if dot11WirelessManagementImplemented is true and dot11QoSTrafficCapabilityActivated is true, and it is not present otherwise. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.66.3.3 When generated

This primitive is generated by the MLME when a valid QoS Traffic Capability Update frame is received.

6.3.66.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.10.

6.3.67 Channel Usage request

6.3.67.1 General

The following MLME primitives support the signaling of Channel Usage request. Figure 6-25 depicts the Channel Usage request process. The figure illustrates the basic protocol and is only an example and therefore is not meant to be exhaustive of all possible protocol uses.

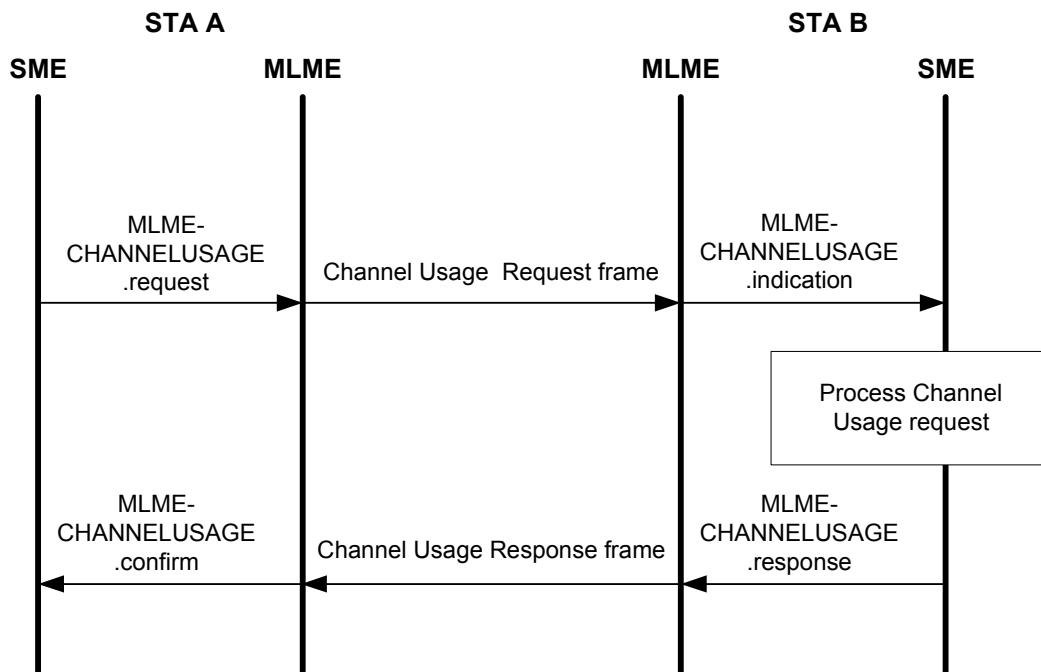

Figure 6-25—Channel usage request protocol exchange

6.3.67.2 MLME-CHANNELUSAGE.request

6.3.67.2.1 Function

This primitive requests the transmission of a Channel Usage Request frame be sent to an AP.

6.3.67.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.request(
    PeerSTAAddress,
    Dialog Token,
    ChannelUsage,
    SSID,
    SupportedOperatingClasses,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the Channel Usage process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the Channel Usage request and response transaction. |
| ChannelUsage | A set of Channel Usage element | As defined in 9.4.2.86 | Specifies request types for the Channel Usage request. |

| Name | Type | Valid range | Description |
|---------------------------|---|------------------------|--|
| SSID | Octet string | 0–32 octets | Specifies the desired SSID or the wildcard SSID. |
| SupportedOperatingClasses | As defined in Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the Supported Operating Classes information for the Channel Usage Request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.67.2.3 When generated

This primitive is generated by the SME to request that a Channel Usage Request frame be sent to the BSS which is advertising the SSID passed down in this primitive.

6.3.67.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Request frame. The STA then attempts to transmit this to the BSS which is advertising the SSID included in this primitive request. When wild card SSID is passed down, the MLME-CHANNELREQUEST.request primitive shall be transmitted to all BSSs in the current scan list as determined by the most recent MLME-SCAN.request primitive.

6.3.67.3 MLME-CHANNELUSAGE.confirm

6.3.67.3.1 Function

This primitive reports the result of a Channel Usage procedure.

6.3.67.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.confirm(
    PeerSTAAddress,
    Dialog Token,
    ChannelUsage,
    SSID,
    Country String,
    Power Constraint,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|--------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the Channel Usage process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the Channel Usage request and response transaction. |
| ChannelUsage | A set of Channel Usage element | As defined in 9.4.2.86 | Specifies parameters for the Channel Usage. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| SSID | Octet string | 0–32 octets | Specifies the SSID or the wildcard SSID used in the request. |
| Country String | Octet string | 3 octets | Specifies Country strings. |
| Power Constraint | An element | As defined in 9.4.2.14 | Zero or one Power Constraint element. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.67.3.3 When generated

This primitive is generated when the STA receives a Channel Usage Response frame from the AP.

6.3.67.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.15.

6.3.67.4 MLME-CHANNELUSAGE.indication

6.3.67.4.1 Function

This primitive indicates that a Channel Usage Request frame was received from a non-AP STA.

6.3.67.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CHANNELUSAGE.indication(
 PeerSTAAddress,
 Dialog Token,
 ChannelUsage,
 SSID,
 SupportedOperatingClasses,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------------------|---|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the Channel Usage request and response transaction. |
| ChannelUsage | A set of Channel Usage element | As defined in 9.4.2.86 | Specifies request types for the Channel Usage request. |
| SSID | Octet string | 0–32 octets | Specifies the desired SSID or the wildcard SSID. |
| SupportedOperating Classes | As defined in Supported Operating Classes element | As defined in 9.4.2.54 | Specifies the Supported Operating Classes information for the Channel Usage Request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.67.4.3 When generated

This primitive is generated by the MLME when a valid Channel Usage Request frame is received.

6.3.67.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.15.

6.3.67.5 MLME-CHANNELUSAGE.response

6.3.67.5.1 Function

This primitive is generated in response to an MLME-CHANNELUSAGE.indication primitive requesting a Channel Usage Response frame be sent to a non-AP STA.

6.3.67.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELUSAGE.response(
    PeerSTAAddress,
    Dialog Token,
    ChannelUsage,
    SSID,
    Country String,
    Power Constraint,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA MAC entity from which a Channel Usage Request frame was received. |
| Dialog Token | Integer | 0–255 | The dialog token to identify the Channel Usage request and response transaction. |
| ChannelUsage | A set of Channel Usage elements | As defined in 9.4.2.86 | Specifies parameters for the Channel Usage. |
| SSID | Octet string | 0–32 octets | Specifies the desired SSID or the wildcard SSID. |
| Country String | Octet string | 3 octets | Specifies Country strings. |
| Power Constraint | An element | As defined in 9.4.2.14 | Zero or one Power Constraint element. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.67.5.3 When generated

This primitive is generated by the SME in response to an MLME-CHANNELUSAGE.indication primitive requesting a Channel Usage Response be sent to a non-AP STA.

6.3.67.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Channel Usage Response frame. The STA then attempts to transmit this to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.68 DMS or GCR request and response procedure

6.3.68.1 General

The following MLME primitives support the signaling of DMS or GCR request and response procedure. The informative diagram shown in Figure 6-26 depicts the DMS or GCR request and response process and is not meant to be exhaustive of all possible protocol uses.

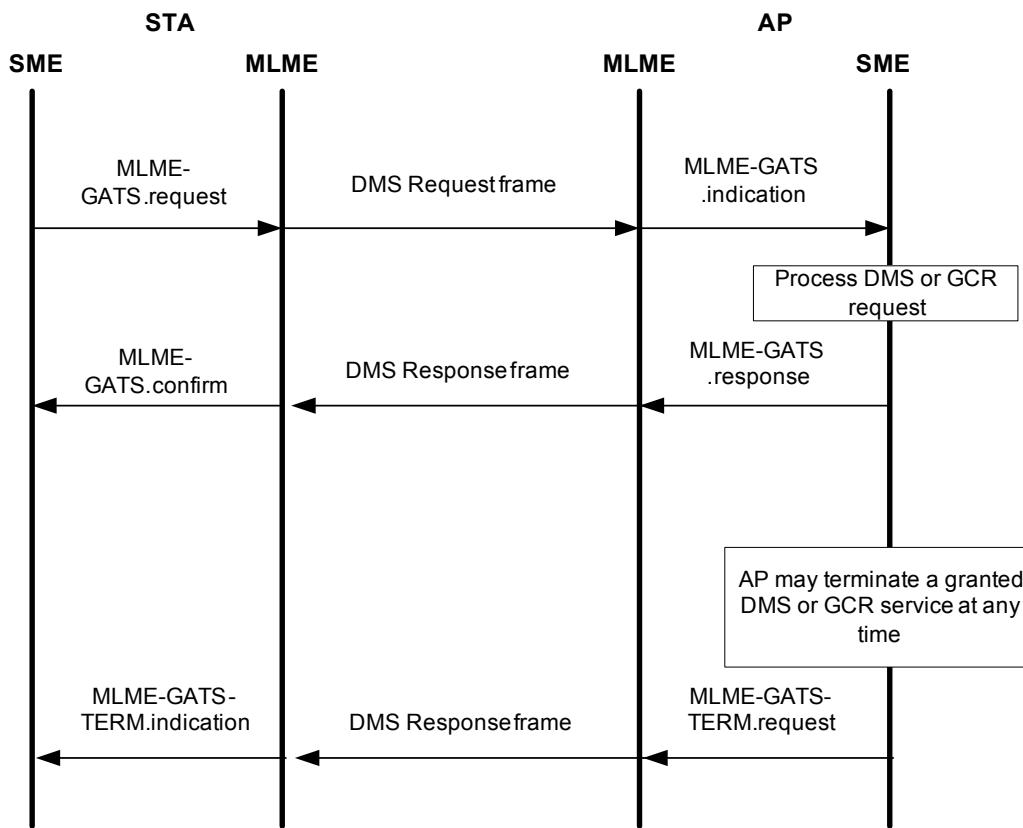

Figure 6-26—DMS or GCR setup protocol exchange

6.3.68.2 MLME-GATS.request

6.3.68.2.1 Function

This primitive requests the transmission of a DMS Request frame be sent to an AP or peer mesh STA.

6.3.68.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

MLME-GATS.request(
    PeerSTAAddress,
    Dialog Token,
    DMSRequest,
    VendorSpecificInfo
)
  
```

| Name | Type | Valid range | Description |
|--------------------|----------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the DMS or GCR process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the DMS or GCR request and response transaction. |
| DMSRequest | Sequence of DMS Request elements | As defined in 9.4.2.88 | Specifies group addressed frames and parameters for the requested DMS or GCR stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.2.3 When generated

This primitive is generated by the SME to request that a DMS Request frame be sent to the AP with which the STA is associated or peer mesh STA.

6.3.68.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Request frame. The STA then attempts to transmit this to the AP with which the STA is associated or peer mesh STA.

6.3.68.3 MLME-GATS.confirm

6.3.68.3.1 Function

This primitive reports the result of a DMS or GCR procedure.

6.3.68.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS.confirm(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the DMS or GCR process. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the DMS or GCR request and response transaction. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the status returned by the AP or peer mesh STA responding to the STA's requested DMS or GCR stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.3.3 When generated

This primitive is generated when the STA receives a DMS Response frame from the AP or peer mesh STA.

6.3.68.3.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.16.

6.3.68.4 MLME-GATS.indication

6.3.68.4.1 Function

This primitive indicates that a DMS Request frame was received from a non-AP STA or peer mesh STA.

6.3.68.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS.indication(
    PeerSTAAddress,
    Dialog Token,
    DMSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|----------------------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the DMS or GCR request and response transaction. |
| DMSRequest | Sequence of DMS Request elements | As defined in 9.4.2.88 | Specifies group addressed frames for the requested DMS or GCR stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.4.3 When generated

This primitive is generated by the MLME when a valid DMS Request frame is received.

6.3.68.4.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.16.

6.3.68.5 MLME-GATS.response

6.3.68.5.1 Function

This primitive is generated in response to an MLME-GATS.indication primitive requesting a DMS Response frame be sent to a non-AP STA or peer mesh STA.

6.3.68.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS.response(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received. |
| Dialog Token | Integer | 1–255 | The Dialog Token to identify the DMS or GCR request and response transaction. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the status returned by the AP or peer mesh STA responding to the STA's requested DMS or GCR stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.5.3 When generated

This primitive is generated by the SME in response to an MLME-GATS.indication primitive requesting a DMS Response be sent to a non-AP STA or peer mesh STA.

6.3.68.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA or peer mesh STA indicated by the PeerSTAAddress parameter.

6.3.68.6 MLME-GATS-TERM.request

6.3.68.6.1 Function

This primitive requests the transmission of a DMS Response frame to terminate a granted DMS or GCR service.

6.3.68.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS-TERM.request(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC Address | The address of the non-AP STA or peer mesh STA MAC entity from which a DMS Request frame was received. |
| Dialog Token | Integer | 0 | Set to 0 for an autonomous DMS Response frame. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the requested DMS or GCR stream that is canceled by the AP or peer mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.6.3 When generated

This primitive is generated by the SME to terminate DMS or GCR service.

6.3.68.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs a DMS Response frame. The STA then attempts to transmit this to the non-AP STA or peer mesh STA indicated by the PeerSTAAddress parameter.

6.3.68.7 MLME-GATS-TERM.indication

6.3.68.7.1 Function

This primitive is generated by the MLME when a valid unsolicited DMS Response frame is received.

6.3.68.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GATS-TERM.indication(
    PeerSTAAddress,
    Dialog Token,
    DMSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the DMS or GCR process. |
| Dialog Token | Integer | 0 | Set to 0 for an autonomous DMS Response frame. |
| DMSResponse | Sequence of DMS Response elements | As defined in 9.4.2.89 | Specifies the requested DMS or GCR stream that is canceled by the AP or peer mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.68.7.3 When generated

This primitive is generated when the STA receives an unsolicited DMS Response frame from the AP or peer mesh STA.

6.3.68.7.4 Effect of receipt

On receipt of this primitive the SME should operate according to the procedure in 11.24.16.

6.3.69 Timing measurement request

6.3.69.1 General

The following set of primitives supports triggering a Timing Measurement procedure or stopping an ongoing Timing Measurement procedure.

6.3.69.2 MLME-TIMINGMSMTRQ.request

6.3.69.2.1 Function

This primitive requests the transmission of a Timing Measurement Request frame to a peer entity.

6.3.69.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMTRQ.request(
    Peer MAC Address,
    Trigger,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the Timing Measurement Request frame is sent. |
| Trigger | Integer | 0–1 | The trigger to identify the action. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.69.2.3 When generated

This primitive is generated by the SME to request that a Timing Measurement Request frame be sent to a peer entity.

6.3.69.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.69.3 MLME-TIMINGMSMTRQ.indication

6.3.69.3.1 Function

This primitive indicates that a Timing Measurement Request frame has been received and the corresponding Ack frame has been transmitted.

6.3.69.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TIMINGMSMTRQ.indication(
    Peer MAC Address,
    Trigger,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the Timing Measurement Request frame is sent. |
| Trigger | Integer | 0–1 | The trigger to identify the action. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.69.3.3 When generated

This primitive is generated by the MLME when a valid Timing Measurement Request frame is received.

6.3.69.3.4 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.70 Fine timing measurement request

6.3.70.1 General

The following set of primitives supports triggering a FTM procedure or stopping an ongoing FTM procedure.

6.3.70.2 MLME-FINETIMINGMSMTRQ.request

6.3.70.2.1 Function

This primitive requests the transmission of a Fine Timing Measurement Request frame to a peer entity.

6.3.70.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FINETIMINGMSMTRQ.request(
    Peer MAC Address,
    Trigger,
    LCI Request,
    Location Civic Request,
    Fine Timing Measurement Parameters,
    Vendor Specific
)
```

| Name | Type | Valid range | Description |
|------------------------------------|-------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the Fine Timing Measurement Request frame is sent. |
| Trigger | Integer | 0–1 | The trigger to identify the action. |
| LCI Request | As defined in 9.6.8.32 | As defined in 9.6.8.32 | Optional element to request LCI information of sender |
| Location Civic Request | As defined in 9.6.8.32 | As defined in 9.6.8.32 | Optional element to request location civic information of sender |
| Fine Timing Measurement Parameters | As defined in 9.4.2.168 | As defined in 9.4.2.168 | Optional element containing the requested FTM configuration |
| VendorSpecific | A set of elements | As defined by 9.4.2.26 | Zero or more elements |

6.3.70.2.3 When generated

This primitive is generated by the SME to request that a Fine Timing Measurement Request frame be sent to a peer entity.

6.3.70.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Fine Timing Measurement Request frame with the specified parameters. This frame is then scheduled for transmission.

6.3.70.3 MLME-FINETIMINGMSMTRQ.indication

6.3.70.3.1 Function

This primitive indicates that a Fine Timing Measurement Request frame has been received and the corresponding Ack frame has been transmitted.

6.3.70.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FINETIMINGMSMTRQ.indication(
    Peer MAC Address,
    Trigger,
    LCI Request,
    Location Civic Request,
    Fine Timing Measurement Parameters,
    Vendor Specific
)
```

| Name | Type | Valid range | Description |
|------------------------|------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the Fine Timing Measurement Request frame is sent. |
| Trigger | Integer | 0–1 | The trigger to identify the action. |
| LCI Request | As defined in 9.6.8.32 | As defined in 9.6.8.32 | Optional element to request LCI information of sender |
| Location Civic Request | As defined in 9.6.8.32 | As defined in 9.6.8.32 | Optional element to request location civic information of sender |

| Name | Type | Valid range | Description |
|------------------------------------|-------------------------|-------------------------|---|
| Fine Timing Measurement Parameters | As defined in 9.4.2.168 | As defined in 9.4.2.168 | Optional element containing the requested FTM configuration |
| VendorSpecific | A set of elements | As defined by 9.4.2.26 | Zero or more elements |

6.3.70.3.3 When generated

This primitive is generated by the MLME when a valid Fine Timing Measurement Request frame is received.

6.3.70.3.4 1 Effect of receipt

On receipt of this primitive, the SME uses the information contained within the notification.

6.3.71 WNM notification request

6.3.71.1 General

This set of primitives supports the exchange of WNM Notification Request and Response frames between peer SMEs.

6.3.71.2 MLME-WNMNOTIFICATIONREQUEST.request

6.3.71.2.1 Function

This primitive requests the transmission of a WNM Notification Request frame to a peer entity.

6.3.71.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONREQUEST.request(
    Peer MAC Address,
    Dialog Token,
    Type,
    Optional Subelements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------------|-------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the WNM Notification Request frame is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the WNM notification transaction. |
| Type | Integer | 1–255 | The type of WNM notification. |
| Optional Subelements | Set subelements | As defined in 9.6.14.29 | A set of subelements describing the notification. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.71.2.3 When generated

This primitive is generated by the SME to request that a WNM Notification Request frame be sent to a peer entity to initiate a WNM notification.

6.3.71.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Notification Request frame containing the elements specified. This frame is then scheduled for transmission.

6.3.71.3 MLME-WNMNOTIFICATIONREQUEST indication

6.3.71.3.1 Function

This primitive indicates that a WNM Notification Request frame has been received.

6.3.71.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONREQUEST.indication(
    Peer MAC Address,
    Dialog Token,
    Type,
    Optional Subelements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------------|-------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the WNM notification request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the WNM notification transaction. |
| Type | Integer | 1–255 | The type of WNM notification request. |
| Optional Subelements | Set subelements | As defined in 9.6.14.29 | A set of subelements describing the notification. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.71.3.3 When generated

This primitive is generated by the MLME when a valid WNM Notification Request frame is received.

6.3.71.3.4 Effect of receipt

On receipt of this primitive, the SME replies to the request.

6.3.72 WNM notification response

6.3.72.1 MLME-WNMNOTIFICATIONRESPONSE.request

6.3.72.1.1 Function

This primitive supports the signaling of the WNM Notification Response frame between peer SMEs.

6.3.72.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONRESPONSE.request(
    Peer MAC Address,
    Dialog Token,
    Response Status,
    Optional Subelements,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------------|-------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the WNM Notification Response frame is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the WNM notification transaction. |
| Response Status | Integer | 1–255 | The response status of the WNM notification. |
| Optional Subelements | Set subelements | As defined in 9.6.14.30 | A set of subelements describing the results of the WNM notification. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.72.1.3 When generated

This primitive is generated by the SME to request that a WNM Notification Response frame be sent to a peer entity to report the results of the WNM notification.

6.3.72.1.4 Effect of receipt

On receipt of this primitive, the MLME constructs a WNM Notification Response frame containing the indicated fields. This frame is then scheduled for transmission.

6.3.72.2 MLME-WNMNOTIFICATIONRESPONSE.indication

6.3.72.2.1 Function

This primitive indicates that a WNM Notification Response frame has been received from a peer entity.

6.3.72.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WNMNOTIFICATIONRESPONSE.indication(
    Peer MAC Address,
    Dialog Token,
    Response Status,
```

Optional Subelements,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|----------------------|-------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the WNM Notification Response frame was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the WNM notification transaction. |
| Response Status | Integer | 1–255 | The response status of the WNM notification. |
| Optional Subelements | Set subelements | As defined in 9.6.14.30 | A set of subelements describing the results of the WNM notification. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.72.2.3 When generated

This primitive is generated by the MLME when a valid WNM Notification Response frame is received.

6.3.72.2.4 Effect of receipt

On receipt of this primitive, the WNM notification can be made available for SME processes.

6.3.73 Network discovery and selection support

6.3.73.1 General

This set of primitives supports the process of GAS.

6.3.73.2 MLME-GAS.request

6.3.73.2.1 Function

This primitive requests the information of a specific advertisement service from another STA and requests the STA to provide GAS.

6.3.73.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.request(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    QueryFailureTimeout,
    Protected,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|---------------------------------|---------------------------------|---|
| PeerSTAAddress | MacAddress | Any valid individual MacAddress | Specifies the address of the peer MAC entity to which query is transmitted. |
| DialogToken | Integer | 0–255 | The dialog token to identify the GAS transaction. |
| AdvertisementProtocolID | Integer or Sequence of integers | As defined in Table 9-215 | This contains an Advertisement Protocol ID (see 9.4.2.93), which might be IEEE 802.11 assigned or vendor specified. |
| Query | String | N/A | Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.11-2008. |
| QueryFailureTimeout | Integer | > 1 | The time limit, in units of beacon intervals, after which the GAS Query procedure is terminated. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using a Protected Dual of Public Action frame. Otherwise, the request is sent using a Public Action frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.73.2.3 When generated

This primitive is generated by the SME to request a specific Advertisement Service from another STA.

6.3.73.2.4 Effect of receipt

The STA operates according to the procedures defined in 11.25.3.

6.3.73.3 MLME-GAS.confirm

6.3.73.3.1 Function

This primitive reports the status code and Query Response from an Advertisement Server to the requesting STA.

6.3.73.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.confirm(
    PeerSTAAddress,
    DialogToken,
    ResultCode,
    ResponseInfo,
    Protected,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|--|--|
| PeerSTAAddress | MacAddress | Any valid individual MacAddress | Specifies the address of the peer MAC entity to which query is transmitted. |
| DialogToken | Integer | 0–255 | The dialog token to identify the GAS transaction. |
| resultCode | Enumeration | SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GASADVERTISEMENT_PROTOCOL_NOT_SUPPORTED, GAS_QUERY_RESPONSE_OUTSTANDING, GAS_QUERY_RESPONSE_TOO_LARGE, , SERVER_UNREACHABLE, GAS_QUERY_TIMEOUT, GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER | Indicates the result response to the GAS request from the peer MAC entity. |
| ResponseInfo | String | N/A | Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008. |
| Protected | Boolean | true, false | Specifies whether the response was received in a robust Management frame. If true, the response was received using a Protected Dual of Public Action frame. Otherwise, the response was received using a Public Action frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

The mapping of Status Code received in the GAS Response frame is mapped to the corresponding Result Code in Table 9-46.

6.3.73.3.3 When generated

This primitive is generated by the MLME as a response to the MLME-GAS.request primitive indicating the result of that request.

The primitive is generated when the requesting STA receives a query response in a (Protected) GAS Initial Response frame or one or more (Protected) GAS Comeback Response frames.

6.3.73.3.4 Effect of receipt

The STA operates according to the procedures defined in 11.25.3.

6.3.73.4 MLME-GAS.indication

6.3.73.4.1 Function

This primitive reports to the STA's SME about the GAS Request.

6.3.73.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.indication(
    PeerSTAAddress,
    DialogToken,
    AdvertisementProtocolID,
    Query,
    Protected,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|---------------------------------|----------------------------------|---|
| PeerSTAAddress | MacAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the query message was received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the GAS transaction. |
| AdvertisementProtocolID | Integer or Sequence of integers | As defined in Table 9-215 | This contains an Advertisement Protocol ID (see 9.4.2.93), which might be IEEE 802.11 assigned or vendor specified. |
| Query | String | N/A | Query string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008. |
| Protected | Boolean | true, false | Specifies whether the request was received in a robust Management frame. If true, the request was received in a Protected Dual of Public Action frame. Otherwise, the request was received in a Public Action frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number to which the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.73.4.3 When generated

This primitive is generated by the MLME as a result of receipt of a GAS request from STA.

6.3.73.4.4 Effect of receipt

The SME is notified of the request from the STA.

The SME operates according to the procedures defined in 11.25.3.

The SME generates an MLME-GAS.response primitive within a dot11GASResponseTimeout.

6.3.73.5 MLME-GAS.response

6.3.73.5.1 Function

This primitive responds to the request for an advertisement service by a specified STA MAC entity.

6.3.73.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GAS.response(
    PeerSTAAddress,
    DialogToken,
    ResultCode,
    ResponseInfo,
    Protected,
    Multi-band,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|---|--|
| PeerSTAAddress | MacAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity to which query response information is transmitted. |
| DialogToken | Integer | 0–255 | The dialog token to identify the GAS transaction. |
| ResultCode | Enumeration | SUCCESS, NO_OUTSTANDING_GAS_REQUEST, GASADVERTISEMENT_PROTOCOL_ NOT_SUPPORTED, GASQUERY_RESPONSE_ OUTSTANDING, GASQUERY_RESPONSE_TOO_LARGE, SERVER_UNREACHABLE, GASQUERY_TIMEOUT, GASRESPONSE_NOT_RECEIVED_ FROM_SERVER | Indicates the result response to the GAS-request from the peer MAC entity. See Table 9-46. |

| Name | Type | Valid range | Description |
|--------------------|--------------------|-------------------------|---|
| ResponseInfo | String | N/A | Query Response string formatted using protocol identified in AdvertisementProtocolID. E.g., if the AdvertisementProtocolID value is 1, then Query is formatted as defined in IEEE Std 802.21-2008. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using a Protected Dual of Public Action frame. Otherwise, the response is sent using a Public Action frame. |
| Multi-band | Multi-band element | As defined in 9.4.2.138 | Specifies the frequency band and channel number where the GAS transaction applies. The parameter is absent if the GAS transaction applies to the same frequency band and channel where the frame is transmitted. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.73.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-GAS.indication primitive.

6.3.73.5.4 Effect of receipt

This primitive causes the MAC entity at the STA to send a (Protected) GAS Initial Response frame to the requesting STA and optionally one or more (Protected) GAS Comeback Response frames.

6.3.74 QoS Map element management

6.3.74.1 General

The QoS Map element is provided to non-AP STAs in (Re)Association Response frames. However, if the SME of an AP detects a change of the QoS Map information while one or more non-AP STAs are associated to the BSS, then the AP may transmit an unsolicited QoS Map element to associated STAs. The AP's SME invokes the MLME-QOS-MAP.request primitive to cause individually addressed frames containing a QoS Map element to be transmitted to associated STAs. The AP's SME invokes the MLME-QOS-MAP.request primitive to transmit individually addressed frames containing a QoS Map element to associated STAs. When a non-AP STA receives such unsolicited QoS Map information, its MLME generates an MLME-QOS-MAP.indication primitive to the STA's SME. In turn, the SME should take appropriate action, e.g., initiate an ADDTS or DELTS if admission control changes are necessary.

6.3.74.2 MLME-QOS-MAP.request

6.3.74.2.1 Function

This primitive is used by an AP to transmit an unsolicited QoS Map Configure frame to a specified non-AP STA MAC entity. The specified non-AP STA MAC address is an individual MAC address.

6.3.74.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QOS-MAP.request(
    Non-APSTAAddress,
    QoSMapSet,
    IntraAccessCategoryPriority,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--|----------------------------------|---|
| Non-APSTAAddress | MacAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity from which query message is received. |
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map information the non-AP STA should use. |
| IntraAccessCategoryPriority | Intra-Access Category Priority element | As defined in 9.4.2.121 | Specifies the intra-AC priorities the STA should use. The parameter is present if dot11SCSActivated is true; otherwise not present. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.74.2.3 When generated

This primitive is generated by the MLME at the AP as a result of any change in the AP QoS Map configurations.

6.3.74.2.4 Effect of receipt

This primitive causes the MAC entity at the AP to send a QoS Map element in a QoS Map Configure frame to the non-AP STA.

6.3.74.3 MLME-QOS-MAP.indication

6.3.74.3.1 Function

This primitive reports the QoS mapping information sent from the AP to the non-AP STA.

6.3.74.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-QOS-MAP.indication(
    QoSMapSet,
    IntraAccessCategoryPriority,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--|-------------------------|---|
| QoSMapSet | As defined in frame format | As defined in 9.4.2.95 | Specifies the QoS Map information to be used by the non-AP STA. |
| IntraAccessCategoryPriority | Intra-Access Category Priority element | As defined in 9.4.2.121 | Specifies the intra-AC priorities the STA should use. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.74.3.3 When generated

This primitive is generated when the non-AP STA receives a QoS Map element in an unsolicited QoS Map Configure frame from the AP.

The SME of the non-AP STA should use the information to decide proper actions. For example, an ADDTS or DELTS procedure should be activated if the QoS Map information indicates a change in the admission control.

6.3.74.3.4 Effect of receipt

The non-AP STA operates according to the procedures defined in 11.25.9.

6.3.75 Mesh peering management

6.3.75.1 Introduction

The following primitives facilitate the mesh peering management protocol and authenticated mesh peering exchange protocol.

6.3.75.2 MLME-MESHPEERINGMANAGEMENT.request

6.3.75.2.1 Function

This primitive requests that the MAC entity establish, confirm, or close a mesh peering with the specified peer MAC entity by sending a mesh peering Management frame to the peer MAC entity. The mesh peering management procedures are specified in 14.3.

6.3.75.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.request(
    PeerMACAddress,
    MeshPeeringMgmtFrameContent,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--------------------|---|--|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the Mesh Peering Management frame is to be sent. |
| MeshPeeringMgmtFrameContent | Sequence of octets | As defined in 9.6.16.2, 9.6.16.3, or 9.6.16.4 | The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.75.2.3 When generated

This primitive is generated by the SME to request that a mesh peering Management frame be sent to the specified mesh STA.

6.3.75.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a mesh peering Management frame containing the information specified. The frame is scheduled for transmission.

6.3.75.3 MLME-MESHPEERINGMANAGEMENT.confirm

6.3.75.3.1 Function

This primitive reports the results of a request to send a mesh peering Management frame.

6.3.75.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.confirm(
    PeerMACAddress,
    MeshPeeringMgmtFrameContent,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--------------------|---|---|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the Mesh Peering Management frame was sent. |
| MeshPeeringMgmtFrameContent | Sequence of octets | As defined in 9.6.16.2, 9.6.16.3, or 9.6.16.4 | The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.75.3.3 When generated

This primitive is generated as a result of an MLME-MESHPEERINGMANAGEMENT.request primitive with a specified MAC peer.

6.3.75.3.4 Effect of receipt

The SME is notified of the results of the mesh peering management protocol request.

6.3.75.4 MLME-MESHPEERINGMANAGEMENT.indication

6.3.75.4.1 Function

This primitive indicates to the SME that the MLME has received a mesh peering Management frame from a peer MAC entity.

6.3.75.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.indication(
    PeerMACAddress,
    MeshPeeringMgmtFrameContent,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--------------------|---|---|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity from which the Mesh Peering Management frame was received. |
| MeshPeeringMgmtFrameContent | Sequence of octets | As defined in 9.6.16.2, 9.6.16.3, or 9.6.16.4 | The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame received from the peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.75.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a mesh peering Management frame from a peer MAC entity.

6.3.75.4.4 Effect of receipt

The SME is notified of the reception of a mesh peering Management frame and is provided the contents of the frame.

6.3.75.5 MLME-MESHPEERINGMANAGEMENT.response

6.3.75.5.1 Function

This primitive is used to send a response to a mesh peering Management frame to the specified peer MAC entity.

6.3.75.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPEERINGMANAGEMENT.response(
    PeerMACAddress,
    ResultCode,
    MeshPeeringMgmtFrameContent,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--------------------|---|--|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the Mesh Peering Management frame is to be sent. |
| ResultCode | Enumeration | SUCCESS, INVALID_PARAMETERS | Reports the result response to the mesh peering Management frame from the peer MAC entity. |
| MeshPeeringMgmtFrameContent | Sequence of octets | As defined in 9.6.16.2, 9.6.16.3, or 9.6.16.4 | The contents of the Action field of the Mesh Peering Open, Mesh Peering Confirm, or Mesh Peering Close frame to send to the peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.75.5.3 When generated

This primitive is generated by the SME as a response to an MLME-MESHPEERINGMANAGEMENT.indication primitive.

6.3.75.5.4 Effect of receipt

This primitive indicates scheduling for transmission of a Mesh Peering frame containing the indicated response.

6.3.76 Mesh power management

6.3.76.1 Introduction

The following primitives describe how a mesh entity changes its mesh power management mode for a mesh peering.

6.3.76.2 MLME-MESHPowerMGT.request

6.3.76.2.1 Function

This primitive requests a change in the mesh STAs mesh power management mode for the mesh peering.

6.3.76.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHPowerMGT.request(
    PeerMACAddress,
    Mesh Power Management Mode
)
```

| Name | Type | Valid Range | Description |
|----------------------------|-------------|--|--|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the mesh power management mode is changed. |
| Mesh Power Management Mode | Enumeration | ACTIVE_MODE, LIGHT_SLEEP_MODE, DEEP_SLEEP_MODE | Specifies the mesh power management mode that the local mesh STA is using for the mesh peering. |

6.3.76.2.3 When generated

The primitive is generated when the mesh entity wishes to change the mesh power management mode of a mesh peering.

6.3.76.2.4 Effect of receipt

This primitive initiates the local mesh STA's mesh power management mode change of the mesh peering. The MLME subsequently issues an MLME-MESHPOWERMGT.confirm primitive that reflects the results.

6.3.76.3 MLME-MESHPOWERMGT.confirm

6.3.76.3.1 Function

This primitive reports the result of a mesh power management mode change attempt.

6.3.76.3.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHPOWERMGT.confirm(
    PeerMACAddress
)
```

| Name | Type | Valid Range | Description |
|-----------------|-------------|------------------------------|--|
| PeerMAC Address | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the mesh power management mode is changed. |

6.3.76.3.3 When generated

This primitive is generated as a result of an MLME-MESHPOWERMGT.request primitive.

6.3.76.3.4 Effect of receipt

The SME is notified of the results of the mesh power management mode change for a mesh peering procedure.

6.3.77 Mesh neighbor offset synchronization

6.3.77.1 Introduction

This mechanism manages the neighbor offset synchronization method with the specified neighbor STA.

6.3.77.2 MLME-MESHNEIGHBOROFFSETSETSYNCSTART.request

6.3.77.2.1 Function

This primitive requests to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.77.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSETSYNCSTART.request(
    PeerMACAddress
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to start the neighbor offset synchronization method. |

6.3.77.2.3 When generated

This primitive is generated by the SME to start the neighbor offset synchronization method with the specified neighbor STA.

6.3.77.2.4 Effect of receipt

On receipt of this primitive, the MLME commences the neighbor offset synchronization method and the calculation of the TSF timer offset value. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSETSYNCSTART.confirm primitive that reflects the results of this request.

6.3.77.3 MLME-MESHNEIGHBOROFFSETSETSYNCSTART.confirm

6.3.77.3.1 Function

This primitive reports the results of a mesh neighbor offset synchronization request.

6.3.77.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHNEIGHBOROFFSETSETSYNCSTART.confirm(
    PeerMACAddress,
    TSFOffsetValue
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|------------------------------|---|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the neighbor offset synchronization is requested. |
| TSFOffsetValue | Integer | -2^{63} to $(2^{63}-1)$ | Indicates the TSF offset value with the specified neighbor STA, expressed in 2s complement in μ s. |

6.3.77.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTART.request primitive and report the TSF offset value.

6.3.77.3.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization request.

6.3.77.4 MLME-MESHNEIGHBOROFFSETCALCULATE.request

6.3.77.4.1 Function

This primitive requests a calculation result of the TSF timer offset value for the specified neighbor STA.

6.3.77.4.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETCALCULATE.request(
    PeerMACAddress
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to report the TSF offset value. |

6.3.77.4.3 When generated

This primitive is generated by the SME to order a calculation of the TSF timer offset value with the specified neighbor STA.

6.3.77.4.4 Effect of receipt

On receipt of this primitive, the MLME receives a Beacon or Probe Response frame and calculates the TSF timer offset value from the received frame. The MLME tries to receive a Beacon frame immediately after the issue of MLME-MESHNEIGHBOROFFSETCALCULATE.request primitive even if the mesh STA does not listen to the Beacon frame from the specified neighbor STA regularly (i.e., in deep sleep mode toward the specified neighbor STA). The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETCALCULATE.confirm primitive that reflects the results of this request.

6.3.77.5 MLME-MESHNEIGHBOROFFSETCALCULATE.confirm

6.3.77.5.1 Function

This primitive reports the results of a mesh neighbor offset calculation request.

6.3.77.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHNEIGHBOROFFSETCALCULATE.confirm(
    PeerMACAddress,
    TSFOffsetValue
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|------------------------------|---|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the Neighbor Offset Measure is requested. |
| TSFOffsetValue | Integer | -2^{63} to $(2^{63}-1)$ | Indicates the TSF offset value with the specified neighbor STA, expressed in 2s complement in μs . |

6.3.77.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETCALCULATE.request primitive to report a TSF offset value.

6.3.77.5.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset calculation request.

6.3.77.6 MLME-MESHNEIGHBOROFFSETSETSYNCSTOP.request

6.3.77.6.1 Function

This primitive requests to stop the neighbor offset synchronization method with the specified neighbor STA.

6.3.77.6.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSETSYNCSTOP.request(
    PeerMACAddress
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to stop the neighbor offset synchronization method. |

6.3.77.6.3 When generated

This primitive is generated by the SME to stop the maintenance of the neighbor offset synchronization method with the specified neighbor STA.

6.3.77.6.4 Effect of receipt

On receipt of this primitive, the MLME stops the neighbor offset synchronization method with the specified peer. The MLME subsequently issues an MLME-MESHNEIGHBOROFFSETSETSYNCSTOP.confirm primitive that reflects the results of this request.

6.3.77.7 MLME-MESHNEIGHBOROFFSETSETSYNCSTOP.confirm

6.3.77.7.1 Function

This primitive reports the results of a neighbor offset synchronization method stop request.

6.3.77.7.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHNEIGHBOROFFSETSYNCSTOP.confirm(
    PeerMACAddress
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|------------------------------|--|
| PeerMACAddress | MAC Address | Valid individual MAC address | Specifies the address of the peer MAC entity to which the Neighbor Offset Stop is requested. |

6.3.77.7.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHNEIGHBOROFFSETSYNCSTOP.request primitive.

6.3.77.7.4 Effect of receipt

The SME is notified of the results of the mesh neighbor offset synchronization stop request.

6.3.78 Mesh TBTT adjustment

6.3.78.1 Introduction

The following primitives describe how a mesh STA requests a TBTT adjustment from a neighboring peer mesh STA.

6.3.78.2 MLME-MESHTBTTADJUSTMENT.request

6.3.78.2.1 Function

This primitive requests transmission of a TBTT Adjustment Request frame.

6.3.78.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.request(
    PeerMACAddress,
    BeaconTiming,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the TBTT Adjustment Request is sent. |
| BeaconTiming | A set of Beacon Timing elements | As defined in 9.4.2.105 | A set of Beacon Timing elements of the mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.78.2.3 When generated

This primitive is generated by the SME to request that a TBTT Adjustment Request frame be sent to a peer entity to request the adjustment of the peer entity's TBTT.

6.3.78.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a TBTT Adjustment Request frame containing the Beacon Timing elements. This frame is then scheduled for transmission. The MLME subsequently issues an MLME-MESHTBTTADJUSTMENT.confirm primitive that reflects the result of this request.

6.3.78.3 MLME-MESHTBTTADJUSTMENT.confirm

6.3.78.3.1 Function

This primitive reports the result of a mesh TBTT adjustment request.

6.3.78.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.confirm(
    PeerMACAddress,
    ResultCode,
    BeaconTiming,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|---|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the TBTT Adjustment Response is received. |
| ResultCode | Enumeration | SUCCESS, REFUSED_REASON_ UNSPECIFIED, CANNOT_FIND_ ALTERNATIVE_TBTT | Indicates the result of the TBTT adjustment request. |
| BeaconTiming | A set of Beacon Timing elements | As defined in 9.4.2.105 | A set of Beacon Timing elements of the responding mesh STA. Present only when such an element was present in the TBTT Adjustment Response frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.78.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHTBTTADJUSTMENT.request primitive to indicate the result of that request.

6.3.78.3.4 Effect of receipt

The SME is notified of the result of the mesh TBTT adjustment request.

6.3.78.4 MLME-MESHTBTTADJUSTMENT.indication

6.3.78.4.1 Function

This primitive indicates that a specific peer MAC entity is requesting adjustment of the TBTT.

6.3.78.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.indication(
    PeerMACAddress,
    BeaconTiming,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the TBTT Adjustment request was received. |
| BeaconTiming | A set of Beacon Timing elements | As defined in 9.4.2.105 | A set of Beacon Timing elements of the requesting mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.78.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a TBTT Adjustment Request frame from the specified peer MAC entity.

6.3.78.4.4 Effect of receipt

The SME is notified of the receipt of the TBTT adjustment request by the specified peer MAC entity. The mesh STA that received this primitive subsequently processes the TBTT scanning and adjustment procedure described in 14.13.4.4.3, and responds with the MLME-MESHTBTTADJUSTMENT.response primitive.

6.3.78.5 MLME-MESHTBTTADJUSTMENT.response

6.3.78.5.1 Function

This primitive is used to send a response to the specified peer MAC entity that requested a TBTT adjustment from the mesh STA that issued this primitive.

6.3.78.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHTBTTADJUSTMENT.response(
    PeerMACAddress,
    Status Code,
    BeaconTiming,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|---|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the TBTT Adjustment Response is sent. |
| Status Code | As defined in frame format | SUCCESS, REFUSED_REASON_ UNSPECIFIED, CANNOT_FIND_ ALTERNATIVE_TBTT | Indicates the result response to the TBTT adjustment request from the peer mesh STA. |
| BeaconTiming | A set of Beacon Timing elements | As defined in 9.4.2.105 | A set of Beacon Timing elements of the mesh STA. Present only when the STA could not find an alternative TBTT. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.78.5.3 When generated

This primitive is generated by the SME of a mesh STA as response to an MLME-MESHTBTTADJUSTMENT.indication primitive.

6.3.78.5.4 Effect of receipt

This primitive initiates the transmission of a TBTT Adjustment Response frame to the peer MAC entity that requested the TBTT adjustment.

On receipt of this primitive, the MLME constructs a TBTT Adjustment Response frame. This frame is then scheduled for transmission.

6.3.79 MCCA management interface

6.3.79.1 Introduction

The following primitives describe how a mesh entity manages its MCCA operation.

6.3.79.2 MLME-ACTIVATEMCCA.request

6.3.79.2.1 Function

This primitive requests that the MAC entity activate MCCA.

6.3.79.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ACTIVATEMCCA.request(
    MCCAScanDuration,
    MAFLimit,
    MCCAAAdvertPeriodMax,
    MCCAMaxTrackStates,
    MCCACWmin,
    MCCACWmax,
    MCCAAIFS
)
```

| Name | Type | Valid range | Description |
|---------------------|---------|----------------------------------|--|
| MCCAScanDuration | Integer | 0 – 65 535 | Specifies the duration in TUs that the mesh STA shall not initiate or accept MCCA Setup Request frames. |
| MAFLimit | Integer | 0–255 | Specifies the maximum MCCA access fraction allowed at the mesh STA. This number is always a multiple of (1/255) of the DTIM Interval. |
| MCCAAdvertPeriodMax | Integer | 0–255 | Specifies the maximum interval that a mesh STA with dot11MCCAActivated equal to true waits for an MCCAOP advertisement. It is expressed in number of DTIM intervals. |
| MCCAMaxTrackStates | Integer | dot11MCCAMinTrackStates – 65 535 | Specifies the total number of MCCAOP reservations that the MAC entity is able to track. |
| MCCACWmin | Integer | 0–15 | Specifies the value of the minimum size of the contention window that the MAC entity uses for channel access during an MCCAOP. |
| MCCACWmax | Integer | 0–63 | Specifies the value of the maximum size of the contention that the MAC entity uses for channel access during an MCCAOP. |
| MCCAIFSN | Integer | 0–15 | Specifies the value of the AIFSN that the MAC entity uses for channel access during an MCCAOP. |

6.3.79.2.3 When generated

This primitive is generated by the SME to start the use of MCCA.

6.3.79.2.4 Effect of receipt

This primitive sets dot11MCCAActivated to true and initializes the MCCA parameters.

6.3.79.3 MLME-MCCASETUP.request

6.3.79.3.1 Function

This primitive requests that the MAC entity set up an MCCAOP reservation.

6.3.79.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.request(
    MCCAOPDuration,
    MCCAOPPeriodicity,
    MCCAOPOffset,
    MCCAOPResponder,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------|---------|-------------|---|
| MCCAOPDuration | Integer | 0 – 65 535 | Specifies the MCCAOP Duration of the needed MCCAOPs as described in 9.4.2.106.2. |
| MCCAOPPeriodicity | Integer | 0–255 | Specifies the MCCAOP Periodicity of the needed MCCAOPs as described in 9.4.2.106.2. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| MCCAOPOffset | Integer | 0 – 16 777 215 | Specifies the MCCAOP offset of the needed MCCAOPs as described in 9.4.2.106.2. |
| MCCAOPResponder | MAC address | Any valid individual or group MAC address | Specifies the MAC address of the intended MCCAOP responder. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.3.3 When generated

This primitive is generated by the SME to start an MCCAOP setup procedure.

6.3.79.3.4 Effect of receipt

This primitive causes the transmission of an MCCA Setup Request frame to the MCCAOP responder provided that the conditions for the transmission are met. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-MCCASETUP.confirm primitive that reflects the results.

6.3.79.4 MLME-MCCASETUP.confirm

6.3.79.4.1 Function

This primitive is generated by the MLME to report the result of an MLME-MCCASETUP.request primitive, which was issued in order to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPResponder.

6.3.79.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.confirm(
    MCCAOPParameters,
    MCCAOPID,
    MCCAOPResponder,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------|--------------------|---|---|
| MCCAOPParameters | MCCAOP Reservation | See 9.4.2.106.2 | The MCCAOP reservation parameters. |
| MCCAOPID | Integer | 0–254 | MCCAOP reservation ID of the MCCAOP reservation. |
| MCCAOPResponder | MAC address | Any valid individual or group MAC address | Specifies the MAC address of the intended MCCAOP responder. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|---|
| ResultCode | Enumeration | SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED | Indicates the result of the MLME-MCCASETUP.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.4.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCASETUP.request primitive to establish an MCCAOP reservation with the peer mesh STA identified in MCCAOPResponder or upon receipt of an MCCA Setup Reply frame from the peer mesh STA identified in MCCAOPResponder.

6.3.79.4.4 Effect of receipt

The SME is notified of the results of the MCCAOP setup procedure.

6.3.79.5 MLME-MCCASETUP.indication

6.3.79.5.1 Function

This primitive indicates the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.79.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCASETUP.indication(
    MCCAOPParameters,
    MCCAOPID,
    MCCAOPOwner,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|----------------------------------|--|
| MCCAOPParameters | MCCAOP Reservation | See 9.4.2.106.2 | The MCCAOP reservation parameters. |
| MCCAOPID | Integer | 0–254 | MCCAOP reservation ID of the MCCAOP reservation. |
| MCCAOPOwner | MAC address | Any valid individual MAC address | Specifies the MAC address of the MCCAOP owner. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.5.3 When generated

This primitive is generated by the MLME as result of the receipt of an MCCA Setup Request frame from the peer MAC entity specified in MCCAOPOwner.

6.3.79.5.4 Effect of receipt

The SME is notified of the request to establish an MCCAOP reservation with the peer MAC entity specified in MCCAOPOwner.

6.3.79.6 MLME-MCCASETUP.response

6.3.79.6.1 Function

This primitive is used to send a response to the peer MAC entity specified in MCCAOPOwner that requested the set up of the MCCAOP reservation.

6.3.79.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCASETUP.response(

MCCAOPParameters,
 MCCAOPID,
 MCCAOPOwner,
 ResultCode,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|--------------------|---|---|
| MCCAOPParameters | MCCAOP Reservation | See 9.4.2.106.2 | The MCCAOP reservation parameters. |
| MCCAOPID | Integer | 0–254 | MCCAOP reservation ID of the MCCAOP reservation. |
| MCCAOPOwner | MAC address | Any valid individual MAC address | Specifies the MAC address of the MCCAOP owner. |
| ResultCode | Enumeration | SUCCESS, INVALID_PARAMETERS, MCCAOP_RESERVATION_CONFLICT, MAF_LIMIT_EXCEEDED, MCCA_TRACK_LIMIT_EXCEEDED | Indicates the result of the MLME-MCCASETUP.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.6.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCASETUP.indication primitive.

6.3.79.6.4 Effect of receipt

This primitive initiates transmission of a response to the peer MAC entity specified in the MCCAOPOwner that requested the set up of an MCCAOP reservation.

6.3.79.7 MLME-MCCAADVERTISEMENT.request

6.3.79.7.1 Function

This primitive requests that the MAC entity request an MCCAOP advertisement from the specified peer MAC entity by sending an MCCA Advertisement Request frame to the peer MAC entity.

6.3.79.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.request(
    PeerMACAddress,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the peer MAC that sends the Advertisement. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.7.3 When generated

This primitive is generated by the SME to request an MCCAOP advertisement from the specified peer MAC entity.

6.3.79.7.4 Effect of receipt

This primitive causes the transmission of an MCCA Advertisement Request frame to the specified peer MAC entity. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-MCCAADVERTISEMENT.confirm primitive that reflects the results.

6.3.79.8 MLME-MCCAADVERTISEMENT.confirm

6.3.79.8.1 Function

This primitive reports the result of an MLME-MCCAADVERTISEMENT.request primitive.

6.3.79.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.confirm(
    MCCAOPAdvertisement,
    PeerMACAddress,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|----------------------|----------------------------------|---|
| MCCAOPAdvertisement | MCCAOP Advertisement | See 9.4.2.109 | One or more MCCAOP Advertisement elements. |
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the transmitter of the MCCAOP advertisement. |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the result of the MLME-MCCAADVERTISEMENT.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.8.3 When generated

This primitive is generated by the MLME as a result of an MLME-MCCAADVERTISEMENT.request primitive.

6.3.79.8.4 Effect of receipt

The SME is notified of the results of the MCCA Advertisement Request frame.

6.3.79.9 MLME-MCCAADVERTISEMENT.indication

6.3.79.9.1 Function

This primitive reports that an MCCA Advertisement Request frame has been received from the specified peer MAC entity.

6.3.79.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.indication(
    PeerMACAddress,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the transmitter of the MCCA Advertisement Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.9.3 When generated

This primitive is generated by the MLME upon receipt of an MCCA Advertisement Request frame from the specified peer MAC entity.

6.3.79.9.4 Effect of receipt

The SME is notified of the request to advertise its MCCAOP reservations.

6.3.79.10 MLME-MCCAADVERTISEMENT.response

6.3.79.10.1 Function

This primitive requests that the MAC entity respond to the MCCAOP advertisement request from the specified peer MAC entity by sending an MCCA Advertisement frame to the peer MAC entity.

6.3.79.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCAADVERTISEMENT.response(
    MCCAOPAdvertisement,
    PeerMACAddress,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|----------------------|----------------------------------|---|
| MCCAOPAdvertisement | MCCAOP Advertisement | See 9.4.2.109 | One or more MCCAOP Advertisement elements. |
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the transmitter of the MCCA Advertisement frame. |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the result of the MLME-MCCAADVERTISEMENT.response primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.10.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MCCAADVERTISEMENT.indication procedure.

6.3.79.10.4 Effect of receipt

This primitive initiates transmission of a response to the specified peer MAC entity that requested advertisement of the MCCAOP reservations.

6.3.79.11 MLME-MCCATEARDOWN.request

6.3.79.11.1 Function

This primitive requests that the MAC entity tear down an MCCAOP reservation.

6.3.79.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MCCATEARDOWN.request(
    MCCAOID,
    PeerMACAddress,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| MCCAOPID | Integer | 0–255 | Specifies the MCCAOP reservation ID of the MCCAOP reservation to be torn down. |
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the peer MAC for the MCCAOP reservation. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.11.3 When generated

This primitive is generated by the SME to start an MCCAOP teardown procedure.

6.3.79.11.4 Effect of receipt

This primitive causes the teardown MCCAOP reservation identified by means of the MCCAOP reservation ID in MCCAOPID, and the transmission of an MCCA Teardown frame to the peer MAC entity in Peer-MACAddress.

6.3.79.12 MLME-MCCATEARDOWN.indication

6.3.79.12.1 Function

This primitive reports that an MCCA Teardown frame has been received from the specified peer MAC entity.

6.3.79.12.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-MCCATEARDOWN.indication(
 MCCAOPID,
 PeerMACAddress,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| MCCAOPID | Integer | 0–255 | MCCAOP reservation ID of the MCCAOP reservation to be torn down. |
| PeerMACAddress | MAC address | Any valid individual MAC address | Specifies the MAC address of the peer MAC for the MCCAOP reservation. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.79.12.3 When generated

This primitive is generated by the MLME as result of receipt of a MCCA Teardown frame.

6.3.79.12.4 Effect of receipt

The SME is notified of the request to start an MCCAOP teardown procedure.

6.3.80 MBSS congestion control

6.3.80.1 Introduction

The following primitives describe how a mesh STA manages its congestion control operation.

6.3.80.2 MLME-MBSSCONGESTIONCONTROL.request

6.3.80.2.1 Function

This primitive requests that the MAC entity notify the peer MAC entity on the congestion level or requests to traffic generation by transmitting a Congestion Control Notification frame to the specified peer MAC entity.

6.3.80.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSCONGESTIONCONTROL.request(
    PeerMACAddress,
    CongestionNotification,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|---|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the Congestion Control Notification frame is sent. |
| CongestionNotification | A set of Congestion Notification elements | As defined in 9.4.2.101 | Congestion notification information generated by the mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.80.2.3 When generated

The SME generates this primitive to request that the MAC notify its peer MAC about the current congestion level.

6.3.80.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Congestion Control Notification frame. This frame is then scheduled for transmission.

6.3.80.3 MLME-MBSSCONGESTIONCONTROL.indication

6.3.80.3.1 Function

This primitive indicates that a congestion notification has been received.

6.3.80.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSCONGESTIONCONTROL.indication(
    PeerMACAddress,
    CongestionNotification,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------|---|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the Congestion Control Notification frame was received. |
| CongestionNotification | A set of Congestion Notification elements | As defined in 9.4.2.101 | Congestion notification information contained in the received Congestion Control Notification frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.80.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Congestion Control Notification frame from a specific peer MAC entity.

6.3.80.3.4 Effect of receipt

The SME is notified of the results of the receipt of the congestion control notification from the specified peer MAC entity. The mesh STA that received this primitive subsequently activates the local rate control as described in 14.12.

6.3.81 MBSS proxy update

6.3.81.1 Introduction

The following primitives describe how a mesh STA reports the proxy update information to another mesh STA in the MBSS.

6.3.81.2 MLME-MBSSPROXYUPDATE.request

6.3.81.2.1 Function

This primitive requests that the MAC entity inform a destination mesh STA about its proxy information by transmitting a Proxy Update frame to the specified peer MAC entity.

6.3.81.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.request(
    PeerMACAddress,
    ProxyUpdate,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the Proxy Update frame is sent. |
| ProxyUpdate | A set of PXU elements | As defined in 9.4.2.116 | A set of proxy information available at the mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.81.2.3 When generated

This primitive is generated by the SME to request that a Proxy Update frame be sent to the specified peer MAC entity.

6.3.81.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Proxy Update frame containing the PXU element. This frame is then scheduled for transmission. In the case that a response is received from the responder STA, the MLME subsequently issues an MLME-MBSSPROXYUPDATE.confirm primitive that reflects the results of this request.

6.3.81.3 MLME-MBSSPROXYUPDATE.confirm

6.3.81.3.1 Function

This primitive reports the results of a proxy update request.

6.3.81.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.confirm(
    PeerMACAddress,
    ProxyUpdateConfirmation,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|------------------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the Proxy Update Confirmation frame is received. |
| ProxyUpdateConfirmation | A set of PXUC elements | As defined in 9.4.2.117 | A set of proxy update confirmation information from the peer MAC entity to which the Proxy Update frame was sent. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.81.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MBSSPROXYUPDATE.request primitive.

6.3.81.3.4 Effect of receipt

The SME is notified of the results of the MBSS proxy update request.

6.3.81.4 MLME-MBSSPROXYUPDATE.indication

6.3.81.4.1 Function

This primitive indicates that an update of the proxy information has been received from a specific peer MAC entity.

6.3.81.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.indication(
    PeerMACAddress,
    ProxyUpdate,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-----------------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the update of the proxy information was received. |
| ProxyUpdate | A set of PXU elements | As defined in 9.4.2.116 | A set of proxy information received from the peer mesh STA. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.81.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Proxy Update frame from a specific peer MAC entity.

6.3.81.4.4 Effect of receipt

The SME is notified of the results of the receipt of the proxy update request by the specified peer MAC entity. The mesh STA that received this primitive subsequently updates the proxy information as described in 14.11.4.3.

6.3.81.5 MLME-MBSSPROXYUPDATE.response

6.3.81.5.1 Function

This primitive is used to send a response to a specific peer MAC entity that sent an update of the proxy information to the mesh STA that issued this primitive.

6.3.81.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSPROXYUPDATE.response(
    PeerMACAddress,
    ProxyUpdateConfirmation,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------|------------------------|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the Proxy Update Confirmation frame is sent. |
| ProxyUpdateConfirmation | A set of PXUC elements | As defined in 9.4.2.117 | A set of proxy update confirmation information to be sent to the peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.81.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-MBSSPROXYUPDATE.indication primitive.

6.3.81.5.4 Effect of receipt

This primitive initiates transmission of a response to the specific peer MAC entity that sent an update of the proxy information.

On receipt of this primitive, the MLME constructs a Proxy Update Confirmation frame. The frame contains one or more PXUC elements. This frame is then scheduled for transmission.

6.3.82 MBSS mesh gate announcement

6.3.82.1 Introduction

The following primitives describe how a mesh STA announces mesh gate reachability.

6.3.82.2 MLME-MBSSGATEANNOUNCEMENT.request

6.3.82.2.1 Function

This primitive requests that the MAC entity update the mesh gate information by transmitting a Gate Announcement frame to the specified MAC entity.

6.3.82.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MBSSGATEANNOUNCEMENT.request(
    PeerMACAddress,
    GateAnnouncement,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|-----------------------------|---|
| PeerMACAddress | MAC Address | Any valid group MAC address | Specifies the address of the MAC entity to which the Gate announcement frame is sent. |
| GateAnnouncement | GANN element | As defined in 9.4.2.111 | A set of gate announcement information to be sent through a Gate Announcement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.82.2.3 When generated

This primitive is generated by the SME to request that a Gate Announcement frame be sent to the specified MAC entity.

6.3.82.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Gate Announcement frame containing the GANN element. This frame is then scheduled for transmission following the interval specified by dot11MeshGateAnnouncementInterval.

6.3.82.3 MLME-MBSSGATEANNOUNCEMENT.indication

6.3.82.3.1 Function

This primitive indicates that a mesh gate announcement has been received from the specific peer MAC entity.

6.3.82.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MBSSGATEANNOUNCEMENT.indication(
    PeerMACAddress,
    GateAnnouncement,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the gate announcement was received. |
| GateAnnouncement | GANN element | As defined in 9.4.2.111 | A set of gate announcement information contained in the received Gate Announcement frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.82.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Gate Announcement frame from a specific peer MAC entity.

6.3.82.3.4 Effect of receipt

The SME is notified of the reachability to a mesh gate in the mesh BSS. The mesh STA received this primitive subsequently triggers an MBSSGATEANNOUNCEMENT.request primitive as described in 14.11.2.

6.3.83 Mesh link metric

6.3.83.1 Introduction

Subclause 6.3.83 describes the management procedures associated with mesh link metric reporting.

6.3.83.2 MLME-MESHLINKMETRICREAD.request

6.3.83.2.1 Function

This primitive requests to read a link metric value between the local MAC entity and a specific peer MAC entity.

6.3.83.2.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MLME-MESHLINKMETRICREAD.request(  
    PeerMACAddress  
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity for which the link metric value is read |

6.3.83.2.3 When generated

This primitive is generated by the SME to read the link metric value for the mesh link to the specified peer MAC entity.

6.3.83.2.4 Effect of receipt

On receipt of this primitive, the MLME reports the link metric value. The MLME subsequently issues an MLME-MESHLINKMETRICREAD.confirm primitive that reflects the results of this request.

6.3.83.3 MLME-MESHLINKMETRICREAD.confirm

6.3.83.3.1 Function

This primitive reports the results of a link metric read request.

6.3.83.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MESHLINKMETRICREAD.confirm(
    LinkMetricValue,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---------------------------------|-------------------------|---|
| LinkMetricValue | Mesh Link Metric Report element | As defined in 9.4.2.100 | The link metric value for the mesh link to the specified peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.83.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-MESHLINKMETRICREAD.request primitive to request a link metric value.

6.3.83.3.4 Effect of receipt

The SME is notified of the results of the link metric read request.

6.3.83.4 MLME-MESHLINKMETRICREPORT.request

6.3.83.4.1 Function

This primitive requests that the MAC entity either transmit a link metric to or request a link metric from the specified peer MAC entity.

6.3.83.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-MESHLINKMETRICREPORT.request(
    PeerMACAddress,
    LinkMetricRequestFlag,
    MeshLinkMetricReport,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|---------------------------------|--|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity to which the Mesh Link Metric Report is sent. |
| LinkMetricRequestFlag | Enumeration | REPORT_ONLY, REPORT_AN D_REQUEST | Indicates whether the mesh STA requests a link metric report from the peer MAC entity. |
| MeshLinkMetricReport | Mesh Link Metric Report element | As defined in 9.4.2.100 | A metric value computed for the corresponding link. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.83.4.3 When generated

This primitive is generated by the SME to request that a Mesh Link Metric Report frame be sent to a peer MAC entity in order to report a link metric value and to request a mesh link metric report from the peer MAC entity if LinkMetricRequestFlag is equal to REPORT_AND_REQUEST.

6.3.83.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Mesh Link Metric Report frame. The Request subfield in the Flags field of the Mesh Link Metric Report element is set depending on the parameter given by the LinkMetricRequestFlag. If LinkMetricRequestFlag is equal to REPORT_ONLY, the Request subfield is set to 0. If LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the Request subfield is set to 1. This frame is then scheduled for transmission.

6.3.83.5 MLME-MESHLINKMETRICREPORT.indication

6.3.83.5.1 Function

This primitive indicates that a Mesh Link Metric Report frame has been received from a peer MAC entity. This Mesh Link Metric Request Report can be in response to an earlier MLME-MESHLINKMETRICREPORT.request primitive with LinkMetricRequestFlag equal to REPORT_AND_REQUEST.

6.3.83.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME- MESHLINKMETRICREPORT.indication(
    PeerMACAddress,
    LinkMetricRequestFlag,
    MeshLinkMetricReport,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|---------------------------------|------------------------------------|---|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the Mesh Link Metric Report frame was received. |
| LinkMetricRequestFlag | Enumeration | REPORT_ONLY, REPORT_AND_REQUEST | Indicates whether the peer MAC entity requests a link metric report. |
| MeshLinkMetricReport | Mesh Link Metric Report element | As defined in 9.4.2.100 | A metric value reported from the specified peer MAC entity. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.83.5.3 When generated

This primitive is generated by the MLME as a result of the receipt of a Mesh Link Metric Report frame from a specific peer MAC entity.

6.3.83.5.4 Effect of receipt

The SME is notified of the receipt of the link metric report from the specified peer MAC entity. When LinkMetricRequestFlag is equal to REPORT_AND_REQUEST, the mesh STA responds with a Mesh Link Metric Report frame.

6.3.84 HWMP mesh path selection

6.3.84.1 Introduction

The following primitives describe how a mesh STA establishes and maintains a mesh path to a specified peer MAC entity.

6.3.84.2 MLME-HWMPMESHPATHSELECTION.request

6.3.84.2.1 Function

This primitive requests that the MAC entity establish or maintain a mesh path to the specified peer MAC entity by transmitting an HWMP Mesh Path Selection frame to the specified peer MAC entity.

6.3.84.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HWMPMESHPATHSELECTION.request(
    PeerMACAddress,
    RootAnnouncement,
    PathRequest,
    PathReply,
    PathError,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| PeerMACAddress | MAC Address | Any valid individual or group MAC address | Specifies the address of the peer MAC entity to which the HWMP Mesh Path Selection frame is sent. |
| RootAnnouncement | RANN element | As defined in 9.4.2.112 | A set of RANN elements generated by the mesh STA. Present if the mesh STA is configured as a root mesh STA using the proactive RANN mechanism [dot11MeshHWMProotMode = rann (4)], and as described in 14.10.12; otherwise not present. |
| PathRequest | PREQ element | As defined in 9.4.2.113 | A set of PREQ elements generated by the mesh STA. Present as described in 14.10.9. |
| PathReply | PREP element | As defined in 9.4.2.114 | A set of PREP elements generated by the mesh STA. Present as described in 14.10.10. |
| PathError | PERR element | As defined in 9.4.2.115 | A set of PERR elements generated by the mesh STA. Present as described in 14.10.11. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.84.2.3 When generated

This primitive is generated by the SME to request that an HWMP Mesh Path Selection frame be sent to a specified peer entity.

6.3.84.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HWMP Mesh Path Selection frame. This frame is then scheduled for transmission.

6.3.84.3 MLME-HWMPMESHPATHSELECTION.indication

6.3.84.3.1 Function

This primitive indicates that an HWMP Mesh Path Selection frame has been received from the specified peer MAC entity.

6.3.84.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-HWMPMESHPATHSELECTION.indication(
    PeerMACAddress,
    RootAnnouncement,
    PathRequest,
    PathReply,
    PathError,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity from which the HWMP Mesh Path Selection frame was received. |
| RootAnnouncement | RANN element | As defined in 9.4.2.112 | A set of RANN elements contained in the received frame. Present only when such an element was present in the received frame. |
| PathRequest | PREQ element | As defined in 9.4.2.113 | A set of PREQ elements contained in the received frame. Present only when such an element was present in the received frame. |
| PathReply | PREP element | As defined in 9.4.2.114 | A set of PREP elements contained in the received frame. Present only when such an element was present in the received frame. |
| PathError | PERR element | As defined in 9.4.2.115 | A set of PERR elements contained in the received frame. Present only when such an element was present in the received frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.84.3.3 When generated

This primitive is generated by the MLME as a result of the receipt of an HWMP Mesh Path Selection frame from a specific peer MAC entity.

6.3.84.3.4 Effect of receipt

The SME is notified of the results of the receipt of the HWMP Mesh Path Selection from the specified peer MAC entity. The mesh STA received this primitive subsequently activates path selection procedures described in 14.10.

6.3.85 QMF policy

6.3.85.1 Introduction

The following MLME primitives support the signaling of QMF policy.

6.3.85.2 MLME-QMFPOLICY.request

6.3.85.2.1 Function

This primitive requests the transmission of an unsolicited QMF Policy frame to a peer entity.

6.3.85.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICY.request (
    Peer STA Address,
    QMFPolicy,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|----------------------------------|--|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the QMF policy is sent. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | This parameter describes the QMF policy the peer STA is required to use. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.2.3 When generated

This primitive is generated by the SME to request that a QMF Policy frame be sent to a peer entity to communicate QMF policy information.

6.3.85.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy frame. This frame is then scheduled for transmission.

6.3.85.3 MLME-QMF POLICY.indication

6.3.85.3.1 Function

This primitive indicates that an unsolicited QMF Policy frame has been received from a peer entity.

6.3.85.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMF POLICY.indication (
    Peer STA Address,
    QMFPOLICY,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|----------------------------------|---|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC from which the QMF policy was received. |
| QMFPOLICY | QMF Policy element | As defined in 9.4.2.120 | This parameter describes the QMF policy the peer STA is requiring to be used. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.3.3 When generated

This primitive is generated by the MLME when a valid QMF Policy frame with dialog token equal to 0 is received from a peer entity.

6.3.85.3.4 Effect of receipt

The SME is notified of the receipt of a QMF policy.

6.3.85.4 MLME-QMF POLICY CHANGE.request

6.3.85.4.1 Function

This primitive supports the change of QMF Policy between peer STAs. The SME requests the transmission of a QMF Policy Change frame in order to request a change in the QMF policy the STA uses to transmit to the peer STA.

6.3.85.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMF POLICY CHANGE.request (
    Peer STA Address,
    Dialog Token,
    QMFPOLICY,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|----------------------------------|--|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the QMF policy change request is sent. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the QMF policy change transaction. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | This parameters describes the QMF policy the STA is requesting to use. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.4.3 When generated

This primitive is generated by the SME when a STA wishes to request a change of the QMF policy it uses to transmit Management frames to a peer entity.

6.3.85.4.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy Change frame containing the set of QMF policy parameters. This frame is then scheduled for transmission.

6.3.85.5 MLME-QMFPOLICYCHANGE.confirm

6.3.85.5.1 Function

This primitive reports the results of a policy change attempt with a peer QMF STA.

6.3.85.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICYCHANGE.confirm (
    Peer STA Address,
    Dialog Token,
    Result Code,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the QMF policy was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the QMF policy change transaction. |
| Result Code | Enumeration | SUCCESS, REJECT | Reports the receipt of a QMF Policy frame and the result of the QMF policy change at the peer SME or if no matching response is received within dot11QMFPolicyChangeTimeout TU. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.5.3 When generated

This primitive is generated by the MLME as a result of receipt of a QMF Policy frame with a dialog token that matches the dialog token from the MLME-QMFPOLICYCHANGE.request primitive.

6.3.85.5.4 Effect of receipt

The SME is notified of the results of the QMF policy change procedure.

6.3.85.6 MLME-QMFPOLICYCHANGE.indication

6.3.85.6.1 Function

This primitive indicates that a QMF Policy Change frame has been received from a peer entity.

6.3.85.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMFPOLICYCHANGE.indication (
    Peer STA Address,
    Dialog Token,
    QMFPolicy,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------|----------------------------------|---|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which the QMF policy change request was received. |
| Dialog Token | Integer | 1–255 | The dialog token to identify the QMF policy change transaction. |
| QMFPolicy | QMF Policy element | As defined in 9.4.2.120 | This parameter describes the QMF policy the peer STA is requesting to use. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.6.3 When generated

This primitive is generated by the MLME when a valid QMF Policy Change frame is received from a peer entity.

6.3.85.6.4 Effect of receipt

On receipt of this primitive, the parameters of the QMF Policy Change frame are provided to the SME to be processed.

6.3.85.7 MLME-QMFPOLICYCHANGE.response

6.3.85.7.1 Function

This primitive requests the transmission of a QMF Policy frame with no QMF Policy field to a peer entity, in response to a received QMF Policy Change frame.

6.3.85.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMF POLICY CHANGE.response (
    Peer STA Address,
    Dialog Token,
    Result Code,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| Peer STA Address | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity to which the QMF Policy frame is sent in response to a QMF policy change request. |
| Dialog Token | Integer | 1–255 | The dialog token identifying the QMF policy change transaction. |
| Result Code | Enumeration | SUCCESS, REJECT | Reports the outcome of the transaction. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.85.7.3 When generated

This primitive is generated by the SME to request that a QMF Policy frame be transmitted to a peer entity to convey the results of the QMF policy change procedure.

6.3.85.7.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QMF Policy frame containing the set of QMF Policy elements specified. This frame is then scheduled for transmission.

6.3.85.8 MLME-QMF POLICY SET.request

6.3.85.8.1 Function

This primitive directs the setting of a specific QMF policy in the local MLM.

6.3.85.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QMF POLICY SET.request (
    Peer STA address,
    QMFPOLICY
)
```

| Name | Type | Valid range | Description |
|------------------|--------------------|----------------------------------|---|
| Peer STA Address | MAC Address | Any valid individual MAC address | The address of the peer STA for which the QMF policy is to be used. If this parameter is null, the QMF policy applies to all transmissions. |
| QMFPOLICY | QMF Policy element | As defined in 9.4.2.120 | This parameter describes the QMF policy the MLME is directed to use for all QMFs transmitted to the Peer STA Address. |

6.3.85.8.3 When generated

This primitive is generated by the SME to set the MLME's QMF policy for a peer STA.

6.3.85.8.4 Effect of receipt

On receipt of this primitive, the MLME uses the supplied set of QMF policy parameters in future transmissions to the peer.

6.3.86 SCS request and response procedure

6.3.86.1 General

The following MLME primitives support the signaling of the SCS request and response procedure. The informative diagram shown in Figure 6-27 depicts the SCS request and response process and is not meant to be exhaustive of all possible protocol uses.

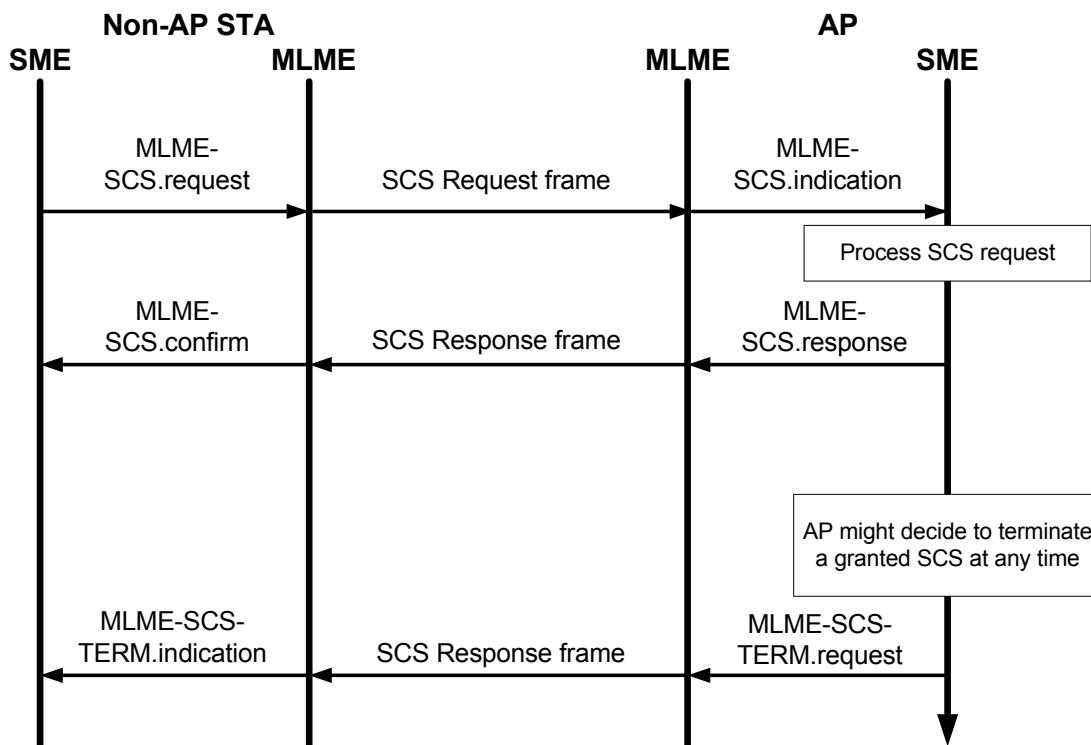

Figure 6-27—Example SCS setup and termination protocol exchange

6.3.86.2 MLME-SCS.request

6.3.86.2.1 Function

This primitive requests transmission of an SCS Request frame to an AP.

6.3.86.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCS.request(

```
PeerSTAAddress,
DialogToken,
SCSRequest,
VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|------------------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the SCS process. |
| DialogToken | Integer | 1–255 | The dialog token to identify the SCS request and response transaction. |
| SCSRequest | SCS Descriptor element | SCS Descriptor element, as defined in 9.4.2.122 | Specifies frame classifiers and priority for the requested SCS stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.2.3 When generated

This primitive is generated by the SME to request that a SCS Request frame be sent to the AP with which the STA is associated.

6.3.86.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SCS Request frame. The STA then attempts to transmit this frame to the AP with which the STA is associated.

6.3.86.3 MLME-SCS.confirm

6.3.86.3.1 Function

This primitive reports the result of a SCS procedure.

6.3.86.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCS.confirm(

```
PeerSTAAddress,
DialogToken,
SCSResponse,
VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform the SCS process. |
| DialogToken | Integer | 1–255 | The dialog token to identify the SCS request and response transaction. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|--|
| SCSResponse | SCS Status duple | SCS Status duple, as defined in 9.6.19.3 | Specifies the status returned by the AP responding to the STA's requested SCSID. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-SCS.request primitive and indicates the results of the request.

This primitive is generated when the STA receives a SCS Response frame from the AP.

6.3.86.3.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.27.2.

6.3.86.4 MLME-SCS.indication

6.3.86.4.1 Function

This primitive indicates that an SCS Request frame was received from a non-AP STA.

6.3.86.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS.indication(
    PeerSTAAddress,
    DialogToken,
    SCSRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|------------------------|---|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the non-AP STA MAC entity from which an SCS Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the SCS request and response transaction. |
| SCSRequest | SCS Descriptor element | SCS Descriptor element, as defined in 9.4.2.122 | Specifies frame classifiers and priority for the requested SCS stream. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.4.3 When generated

This primitive is generated by the MLME when a valid SCS Request frame is received.

6.3.86.4.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.27.2.

6.3.86.5 MLME-SCS.response

6.3.86.5.1 Function

This primitive is generated in response to an MLME-SCS.indication primitive requesting an SCS Response frame be sent to a non-AP STA.

6.3.86.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCS.response(

```
PeerSTAAddress,  
DialogToken,  
SCSResponse,  
VendorSpecificInfo  
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the non-AP STA MAC entity from which a SCS Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the SCS request and response transaction. |
| SCSResponse | SCS Status duple | SCS Status duple, as defined in 9.6.19.3 | Specifies the status returned by the AP responding to the STA's requested SCSID. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.5.3 When generated

This primitive is generated by the SME in response to an MLME-SCS.indication primitive requesting an SCS Response frame be sent to a non-AP STA.

6.3.86.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a SCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.86.6 MLME-SCS-TERM.request

6.3.86.6.1 Function

This primitive requests the transmission of a SCS Response frame to a non-AP STA to terminate an established SCS stream.

6.3.86.6.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-SCS-TERM.request(

```
PeerSTAAddress,  
DialogToken,  
SCSResponse,  
VendorSpecificInfo  
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | The address of the non-AP STA MAC entity to which the SCS Response frame is to be sent. |
| DialogToken | Integer | 0 | Set to 0 for an autonomous SCS Response frame. |
| SCSResponse | SCS Status duple | SCS Status duple, as defined in 9.6.19.3 | Specifies the requested SCSID that is canceled by the AP. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.6.3 When generated

This primitive is generated by the SME to terminate an SCS stream.

6.3.86.6.4 Effect of receipt

On receipt of this primitive, the MLME constructs an SCS Response frame. The STA then attempts to transmit this frame to the non-AP STA indicated by the PeerSTAAddress parameter.

6.3.86.7 MLME-SCS-TERM.indication

6.3.86.7.1 Function

This primitive is generated by the MLME when a valid unsolicited SCS Response frame is received.

6.3.86.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-SCS-TERM.indication(
    ResultCode,
    DialogToken,
    SCSResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|--|
| ResultCode | Enumeration | SUCCESS, FAILURE | Indicates the result of the MLME-SCS-TERM.request primitive. |
| DialogToken | Integer | 0 | Set to 0 for an autonomous SCS Response frame. |
| SCSResponse | SCS Status duple | SCS Status duple, as defined in 9.6.19.3 | Specifies the requested SCSID that is canceled by the AP. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.86.7.3 When generated

This primitive is generated when the STA receives an unsolicited SCS Response frame from the AP.

6.3.86.7.4 Effect of receipt

On receipt of this primitive, the SME should operate according to the procedure in 11.27.2.

6.3.87 QLoad report management

6.3.87.1 General

The QLoad report management primitives support the process of QLoad reporting between APs as described in 11.28.2.

6.3.87.2 MLME-QLOAD.request

6.3.87.2.1 Function

This primitive is used by an AP to transmit a QLoad Request frame to a specified AP.

6.3.87.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QLOAD.request(
    PeerMACAddress,
    DialogToken,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the QLoad Request frame is sent. |
| DialogToken | Integer | 1–255 | Specifies a number unique to the MLME-QLOAD.request primitive. |
| Protected | Boolean | true, false | If true, the request is sent using the Protected QLoad Request frame. If false, the request is sent using the QLoad Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.87.2.3 When generated

This primitive is generated by the SME at an AP to request the transmission of a QLoad Request frame to the AP indicated by the PeerMACAddress parameter.

6.3.87.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QLoad Request frame if the Protected parameter is false or a Protected QLoad Request frame if the Protected parameter is true. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.87.3 MLME-QLOAD.confirm

6.3.87.3.1 Function

This primitive reports the result of a request to send a QLoad Request frame.

6.3.87.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QLOAD.confirm(
    PeerMACAddress,
    DialogToken,
    Protected,
    QLoadReport,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|---|---|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the QLoad Request frame was sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the QLoad Report request and response transaction or 0 when an unsolicited report was sent. |
| Protected | Boolean | true, false | If true, the response was sent using the Protected QLoad Report frame. If false, the response was sent using the QLoad Report frame. |
| QLoadReport | Set of reports, each as defined in the QLoad Report element | Set of reports, each as defined in the QLoad Report element | Set of reports, each as defined in the QLoad Report element. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.87.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-QLOAD.request primitive indicating the results of that request. This primitive is generated when the STA receives a response in the form of a QLoad Report frame in the corresponding Robust AV Streaming Action frame.

6.3.87.3.4 Effect of receipt

The SME is notified of the results of the QLoad request procedure.

The SME should operate according to the procedures defined in 11.28.2.

6.3.87.4 MLME-QLOAD.indication

6.3.87.4.1 Function

This primitive indicates that a QLoad Request frame has been received.

6.3.87.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QLOAD.indication(

PeerMACAddress,
 DialogToken,
 Protected,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the QLoad Request frame was received. |
| DialogToken | Integer | 1–255 | Specifies a number unique to the MLME-QLOAD.request primitive. |
| Protected | Boolean | true, false | If true, the request was sent using the Protected QLoad Request frame. If false, the request was sent using the QLoad Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.87.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) QLoad Request frame is received.

6.3.87.4.4 Effect of receipt

On receipt of this primitive, the SME either rejects the request or commences the transaction as described in 11.28.2.

6.3.87.5 MLME-QLOAD.response

6.3.87.5.1 Function

This primitive is used by an AP to transmit a QLoad Report frame to a specified AP in response to a QLoad Request frame.

6.3.87.5.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-QLOAD.response(

PeerMACAddress,
 DialogToken,
 Protected,

QLoadReport,
VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|---|---|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the QLoad Report frame is sent. |
| DialogToken | Integer | 0–255 | The dialog token of the matching MLME-QLOAD.indication primitive or 0 when sending an unsolicited report. |
| Protected | Boolean | true, false | If true, the response is sent using the Protected QLoad Report frame. If false, the response is sent using the QLoad Report frame. |
| QLoadReport | Set of reports, each as defined in the QLoad Report element | Set of reports, each as defined in the QLoad Report element | Set of reports, each as defined in the QLoad Report element. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.87.5.3 When generated

This primitive is generated by the SME at an AP in response to the reception of a QLoad Request frame from the AP indicated by the PeerMACAddress parameter.

6.3.87.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a QLoad Report frame if the Protected parameter is false or a Protected QLoad Report frame if the Protected parameter is true. The AP then attempts to transmit this frame to the other AP indicated by the PeerMACAddress parameter.

6.3.88 HCCA TXOP advertisement management

6.3.88.1 General

The TXOP advertisement management primitives support the process of TSPEC schedule negotiation between APs, as described in 11.28.

6.3.88.2 MLME-TXOPADVERTISEMENT.request

6.3.88.2.1 Function

This primitive is used by an AP to transmit an HCCA TXOP advertisement to a specified AP.

6.3.88.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TXOPADVERTISEMENT.request(
 PeerMACAddress,
 DialogToken,
 Protected,
 ActiveTXOPReservations,

PendingTXOPReservations,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-------------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the TXOP Advertisement frame is sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the TXOPAdvertisement.request primitive. |
| Protected | Boolean | true, false | If true, the request is sent using the Protected HCCA TXOP Advertisement frame. If false, the request is sent using the HCCA TXOP Advertisement frame. |
| ActiveTXOPReservations | TXOP Reservation | As defined in 9.4.1.44 | Specifies the HCCA TXOPs that have been created. |
| PendingTXOPReservations | TXOP Reservation | As defined in 9.4.1.44 | Specifies the HCCA TXOPs that are in the process of being created. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.88.2.3 When generated

This primitive is generated by the SME at an AP to request a (Protected) HCCA TXOP Advertisement frame be sent to the AP indicated by the PeerMACAddress parameter.

6.3.88.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HCCA TXOP Advertisement frame if the Protected parameter is false or constructs a Protected HCCA TXOP Advertisement frame if the Protected parameter is true. This frame is then scheduled for transmission.

6.3.88.3 MLME-TXOPADVERTISEMENT.confirm

6.3.88.3.1 Function

This primitive reports the result of a request to perform HCCA TXOP negotiation.

6.3.88.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TXOPADVERTISEMENT.confirm(
    ResultCode,
    PeerMACAddress,
    DialogToken,
    Protected,
    AlternateSchedule,
    AvoidanceRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--------------------------------------|--|
| ResultCode | Enumeration | SUCCESS, TS_SCHEDULE_ CONFLICT | Reports the outcome of a request to send a TXOP advertisement. Indicates the results of the corresponding MLME-TXOPADVERTISE.request primitive. |
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Scheduled TXOP Response frame was received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the scheduled TXOP advertisement and scheduled TXOP response transaction. |
| Protected | Boolean | true, false | If true, the response was sent using the Protected HCCA TXOP Response frame. If false, the response was sent using the HCCA TXOP Response frame. |
| AlternateSchedule | TXOP Reservation | As defined in 9.4.1.44 | Specifies an alternate TXOP when status code is not SUCCESS. |
| AvoidanceRequest | TXOP Reservation | As defined in 9.4.1.44 | Specifies a TXOP to avoid when status code is not SUCCESS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.88.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-TXOPADVERTISE.request primitive indicating the results of that request. This primitive is generated when the STA receives a response in the form of an HCCA TXOP Response frame in the corresponding Public Action frame, or when the STA receives a response in the form of a Protected HCCA TXOP Response frame in the corresponding frame.

6.3.88.3.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.28.3.

6.3.88.4 MLME-TXOPADVERTISE.indication

6.3.88.4.1 Function

This primitive indicates that an HCCA TXOP Advertisement frame has been received from a peer entity.

6.3.88.4.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-TXOPADVERTISE.indication(
 PeerMACAddress,
 DialogToken,
 Protected,
 ActiveTXOPReservations,

PendingTXOPReservations,
VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-------------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the HCCA TXOP Advertisement frame was sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the MLME-TXOPADVERTISEMENT.request primitive. |
| Protected | Boolean | true, false | If true, the request was sent using the Protected HCCA TXOP Request frame. If false, the request was sent using the HCCA TXOP Request frame. |
| ActiveTXOPReservations | TXOP Reservation | As defined in 9.4.1.44 | Specifies the HCCA TXOPs that have been created. |
| PendingTXOPReservations | TXOP Reservation | As defined in 9.4.1.44 | Specifies the HCCA TXOPs that are in the process of being created. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.88.4.3 When generated

This primitive is generated by the MLME when a valid HCCA TXOP Advertisement frame is received.

6.3.88.4.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.28.3.

6.3.88.5 MLME-TXOPADVERTISEMENT.response

6.3.88.5.1 Function

This primitive is used by an AP to transmit an HCCA TXOP Response frame to a specified AP.

6.3.88.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-TXOPADVERTISEMENT.response(
    PeerMACAddress,
    DialogToken,
    Protected,
    StatusCode,
    ScheduleConflict,
    AlternateSchedule,
    AvoidanceRequest,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|--|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the HCCA TXOP Response frame is sent. |
| DialogToken | Integer | 0–255 | The dialog token to identify the TXOP advertisement and TXOP response transaction. |
| Protected | Boolean | true, false | If true, the response is sent using the Protected HCCA TXOP Response frame. If false, the response is sent using the HCCA TXOP Response frame. |
| StatusCode | Enumeration | SUCCESS, TS_SCHEDULE_CONFLICT (as defined in 9.4.1.9) | The result of checking the TXOP reservation from the corresponding TXOP advertisement. |
| ScheduleConflict | Integer | 1–number of TXOP reservations | The TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule. |
| AlternateSchedule | TXOP Reservation | As defined in 9.4.1.44 | Specifies an alternate TXOP when status code is not SUCCESS. |
| AvoidanceRequest | TXOP Reservation | As defined in 9.4.1.44 | Specifies a TXOP to avoid when status code is not SUCCESS. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.88.5.3 When generated

This primitive is generated by the SME at an AP to request the sending of an HCCA TXOP Response frame to another AP indicated by the PeerMACAddress parameter.

6.3.88.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an HCCA TXOP Response frame if the Protected parameter is false or constructs a Protected HCCA TXOP Response frame if the Protected parameter is true. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.89 GCR group membership management

6.3.89.1 General

The group membership primitives support the process of group membership requesting and reporting between an AP and its associated STAs as described in 11.24.16.3.2.

6.3.89.2 MLME-GROUP-MEMBERSHIP.request

6.3.89.2.1 Function

This primitive is used by an AP to initiate a Group Membership Request frame to a specified associated STA.

6.3.89.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GROUP-MEMBERSHIP.request(
    PeerMACAddress,
    DialogToken,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the Group Membership Request frame is to be sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the MLME-GROUP-MEMBERSHIP.request primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.89.2.3 When generated

This primitive is generated by the SME at an AP to request the sending of a Group Membership Request frame to the associated STA indicated by the PeerMACAddress parameter.

6.3.89.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Group Membership Request frame. The AP then attempts to transmit this frame to the STA indicated by the PeerMACAddress parameter.

6.3.89.3 MLME-GROUP-MEMBERSHIP.confirm

6.3.89.3.1 Function

This primitive reports the result of a request for a STA's group membership.

6.3.89.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GROUP-MEMBERSHIP.confirm(
    GroupAddress,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| GroupAddress | MAC Address | Any valid MAC address that has the Individual/Group Address bit set | Zero or more MAC addresses that correspond to the contents of the dot11GroupAddressesTable of the STA that responded to the group address request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.89.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-GROUP-MEMBERSHIP.request primitive indicating the results of that request.

This primitive is generated when the STA receives a response in the form of a Group Membership Response frame in the corresponding robust Action frame from the associated STA.

6.3.89.3.4 Effect of receipt

The SME is notified of the results of the group membership request procedure.

The SME should operate according to the procedures defined in 11.24.16.3.2.

6.3.89.4 MLME-GROUP-MEMBERSHIP.indication

6.3.89.4.1 Function

This primitive indicates that a Group Membership Request frame has been received from a peer entity.

6.3.89.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GROUP-MEMBERSHIP.indication(
    PeerMACAddress,
    DialogToken,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Group Membership Request frame was sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the MLME-GROUP-MEMBERSHIP primitive. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.89.4.3 When generated

This primitive is generated by the MLME when a valid Group Membership Request frame is received.

6.3.89.4.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.24.16.3.2.

6.3.89.5 MLME-GROUP-MEMBERSHIP.response

6.3.89.5.1 Function

This primitive responds to the request for the contents of the group address table by a specified STA's MAC entity.

6.3.89.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GROUP-MEMBERSHIP.response(
    PeerMACAddress,
    DialogToken,
    GroupAddress,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|-------------------|---|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the Group Membership Response frame is sent. |
| DialogToken | Integer | 0–255 | Specifies a number unique to the MLME-GROUP-MEMBERSHIP primitive. |
| GroupAddress | MAC Address | Any valid MAC address that has the Individual/Group Address bit set | Zero or more MAC addresses that correspond to the contents of the dot11GroupAddressesTable of the STA that is responding to the group address request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.89.5.3 When generated

This primitive is generated by the MLME as a result of an MLME-GROUP-MEMBERSHIP.indication primitive.

6.3.89.5.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 11.24.16.3.2.

6.3.90 AP PeerKey management

6.3.90.1 General

The AP PeerKey management primitives support the AP PeerKey protocol to provide session identification and data confidentiality for an AP-to-AP connection, as described in 12.11.

6.3.90.2 MLME-APPEERKEY.request

6.3.90.2.1 Function

This primitive is used by an AP to transmit a public key to a specified AP and to request the peer's public key.

6.3.90.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-APPEERKEY.request()
```

```

        PeerMACAddress,
        RequestType,
        Group,
        PublicKey,
        VendorSpecificInfo
    )

```

| Name | Type | Valid range | Description |
|--------------------|---------------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the Public Key frame is sent. |
| RequestType | Integer | As defined in Table 9-321 | Specifies the type of request. |
| Group | Finite Cyclic Group field | As defined in 9.4.1.41 | Specifies cyclic group from which the public key was generated. |
| PublicKey | Scalar field | As defined 9.4.1.40 | The public key of the AP sending this Public Key frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.90.2.3 When generated

This primitive is generated by the SME at an AP to request the sending of a Public Key frame to another AP indicated by the PeerMACAddress parameter.

6.3.90.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Public Key frame. The AP then attempts to transmit this frame to the AP indicated by the PeerMACAddress parameter.

6.3.90.3 MLME-APPEERKEY.indication

6.3.90.3.1 Function

This primitive indicates that a Public Key frame has been received from a peer entity.

6.3.90.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-APPEERKEY.indication(

```

        PeerMACAddress,
        RequestType,
        Group,
        PublicKey,
    )

```

VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|--------------------|---------------------------|----------------------------------|---|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the Public Key frame has been received. |
| RequestType | Integer | As defined in Table 9-321 | Specifies the type of request. |
| Group | Finite Cyclic Group field | 9.4.1.41 | Specifies cyclic group from which the public key was generated. |
| PublicKey | Scalar field | 9.4.1.40 | The public key of the AP that sent this Public Key frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.90.3.3 When generated

This primitive is generated by the MLME when a valid Public Key frame is received.

6.3.90.3.4 Effect of receipt

On receipt of this primitive, the SME performs the behavior defined in 12.11.

6.3.91 On-channel Tunneling operation

6.3.91.1 General

On-channel tunneling (OCT) primitives are used as part of multi-band operation (see 11.33). OCT frames are used to transport Management frames between peer MLME entities of multi-band capable devices.

The operation of the OCT is illustrated in Figure 6-28.

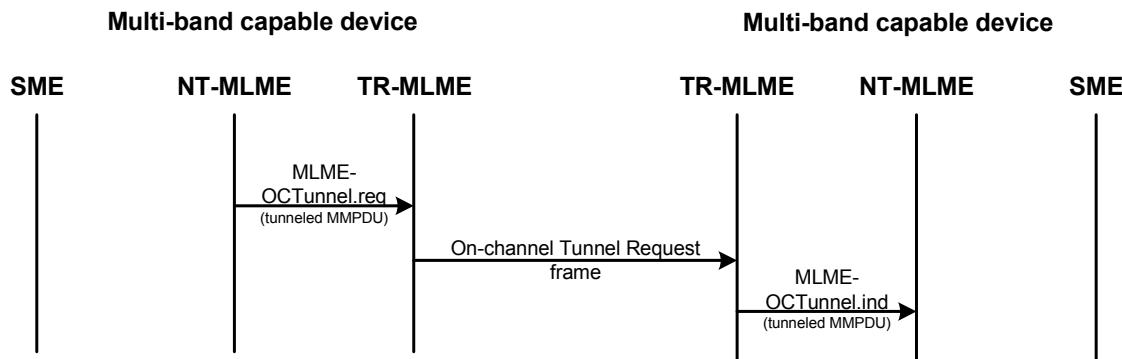

Figure 6-28—Operation of OCT

An initiator MLME of a STA that might not be currently enabled to transmit generates an MLME-OCTunnel.request primitive to a local MLME entity of a STA that is enabled to transmit. This request carries the contents of a Management frame and replaces transmission over-the-WM of that frame.

The recipient MLME generates the MLME-OCTunnel.indication primitive to the local MLME entity identified in the On-channel Tunnel Request frame.

The direct MLME-to-MLME primitive exchange should be viewed as shorthand for an exchange through the SMEs and multi-band entity, i.e., an MLME addresses another local MLME entity by sending that primitive through its SME and the multi-band entity to the SME of the MLME entity of a STA that is enabled to transmit, which reflects that primitive to the appropriate recipient.

6.3.91.2 MLME-OCTunnel.request

6.3.91.2.1 Function

This primitive requests transmission of an On-channel Tunnel Request frame.

6.3.91.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-OCTunnel.request(
    PeerSTAAddress,
    OCT MMPDU,
    Multi-band peer
)
```

| Name | Type | Valid range | Description |
|-----------------|---------------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the On-channel Tunnel Request frame is transmitted. |
| OCT MMPDU | OCT MMPDU structure | As defined in the On-channel Tunnel Request frame format (see 9.6.21.7) | The OCT MMPDU carries the MMPDU to be tunneled to the specified MLME entity of the specified STA. |
| Multi-band peer | Multi-band element | As defined in the Multi-band element format (see 9.4.2.138) | The Multi-band element identifies the peer MLME entity that should receive the OCT MMPDU. |

6.3.91.2.3 When generated

This primitive is generated by another MLME to request that an On-channel Tunnel Request frame be sent to another STA.

6.3.91.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an On-channel Tunnel Request frame.

6.3.91.3 MLME-OCTunnel.indication

6.3.91.3.1 Function

This primitive indicates that an On-channel Tunnel Request frame was received.

6.3.91.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-OCTunnel.indication()
```

```

        PeerSTAAddress,
        OCT MMPDU,
        Multi-band local
    )

```

| Name | Type | Valid range | Description |
|------------------|---------------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the On-channel Tunnel Request frame was received. |
| OCT MMPDU | OCT MMPDU structure | As defined in the On-channel Tunnel Request frame format (see 9.6.21.7) | The OCT MMPDU carries the MMPDU that is being tunneled to the local MLME entity. |
| Multi-band local | Multi-band element | As defined in the Multi-band element format (see 9.4.2.138) | The Multi-band element identifies the local MLME entity that should receive the OCT MMPDU. |

6.3.91.3.3 When generated

This primitive is generated by the MLME to notify another MLME when a valid On-channel Tunnel Request frame is received.

6.3.91.3.4 Effect on receipt

The recipient of this primitive is an MLME entity in a multi-band device.

On receipt of this primitive, the MLME retrieves the tunneled frame and processes it as though it were received over-the-WM.

6.3.92 Multi-band operation

6.3.92.1 General

This subclause describes the management procedures associated with the multi-band operation mechanism.

6.3.92.2 MLME-FST-SETUP.request

6.3.92.2.1 Function

This primitive requests transmission of an FST Setup Request frame.

6.3.92.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```

    MLME-FST-SETUP.request(
        FSTResponderAddress,
        FSTSetupRequest
    )

```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|--|---|
| FSTResponderAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the FST Setup Request frame is transmitted. |
| FSTSetupRequest | FST Setup Request Action field | As defined in the FST Setup Request frame format | Specifies the parameters of the FST Setup. |

6.3.92.2.3 When generated

This primitive is generated by the SME to request that an FST Setup Request frame be sent to another STA.

6.3.92.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Setup Request frame.

6.3.92.3 MLME-FST-SETUP.indication

6.3.92.3.1 Function

This primitive indicates that an FST Setup Request frame was received.

6.3.92.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-SETUP.indication(
    FSTInitiatorAddress,
    FSTSetupRequest
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|---------------------------------------|---|
| FSTInitiatorAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the FST Setup Request frame was received. |
| FSTSetupRequest | FST Setup Request Action field | As defined in FST Setup Request frame | Specifies the parameters of the FST Setup. |

6.3.92.3.3 When generated

This primitive is generated by the MLME when a valid FST Setup Request frame is received.

6.3.92.3.4 Effect on receipt

On receipt of this primitive, the SME operates according to the procedure in 11.33.

6.3.92.4 MLME-FST-SETUP.response

6.3.92.4.1 Function

This primitive requests that an FST Setup Response frame be transmitted to the FST initiator STA.

6.3.92.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-SETUP.response(
    FSTInitiatorAddress,
    FSTSetupResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|---------------------------------|--|--|
| FSTInitiatorAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the FST Setup Response frame is transmitted. |
| FSTSetupResponse | FST Setup Response Action field | As defined in FST Setup Response frame | Specifies the parameters of the FST Setup. |

6.3.92.4.3 When generated

This primitive is generated by the SME to request that an FST Setup Response frame is be transmitted to the FST initiator STA.

6.3.92.4.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Setup Response frame.

6.3.92.5 MLME-FST-SETUP.confirm

6.3.92.5.1 Function

This primitive indicates that an FST Setup Response frame was received.

6.3.92.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-SETUP.confirm(
    FSTResponderAddress,
    FSTSetupResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|---------------------------------|--|--|
| FSTResponderAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the FST Setup Response frame was received. |
| FSTSetupResponse | FST Setup Response Action field | As defined in FST Setup Response frame | Specifies the parameters of the FST Setup. |

6.3.92.5.3 When generated

This primitive is generated by the MLME when a valid FST Setup Response frame is received.

6.3.92.5.4 Effect on receipt

On receipt of this primitive, the SME operates according to the procedure in 11.33.

6.3.92.6 MLME-FST-ACK.request

6.3.92.6.1 Function

This primitive requests transmission of an FST Ack Request frame.

6.3.92.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.request(
    FSTResponderAddress,
    FSTAckRequest
)
```

| Name | Type | Valid range | Description |
|---------------------|------------------------------|-------------------------------------|---|
| FSTResponderAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the FST Ack Request frame is transmitted. |
| FSTAckRequest | FST Ack Request Action field | As defined in FST Ack Request frame | Specifies the parameters of the FST Ack Request. |

6.3.92.6.3 When generated

This primitive is generated by the SME to request that an FST Ack Request frame be sent to another STA.

6.3.92.6.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Ack Request frame.

6.3.92.7 MLME-FST-ACK.indication

6.3.92.7.1 Function

This primitive indicates that an FST Ack Request frame was received.

6.3.92.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.indication(
    FSTInitiatorAddress,
    FSTAckRequest
)
```

| Name | Type | Valid range | Description |
|---------------------|------------------------------|-------------------------------------|---|
| FSTInitiatorAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the FST Ack Request frame was received. |
| FSTAckRequest | FST Ack Request Action field | As defined in FST Ack Request frame | Specifies the parameters of the FST Ack Request. |

6.3.92.7.3 When generated

This primitive is generated by the MLME when a valid FST Ack Request frame is received.

6.3.92.7.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.33.

6.3.92.8 MLME-FST-ACK.response

6.3.92.8.1 Function

This primitive requests that an FST Ack Response frame be transmitted to the FST initiator STA.

6.3.92.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.response(
    FSTInitiatorAddress,
    FSTAckResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------------------|--------------------------------------|--|
| FSTInitiatorAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the FST Ack Response frame is transmitted. |
| FSTAckResponse | FST Ack Response Action field | As defined in FST Ack Response frame | Specifies the parameters of the FST Ack Response. |

6.3.92.8.3 When generated

This primitive is generated by the SME to request that an FST Ack Response frame be transmitted to the FST initiator STA.

6.3.92.8.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Ack Response frame.

6.3.92.9 MLME-FST-ACK.confirm

6.3.92.9.1 Function

This primitive indicates that an FST Ack Response frame was received.

6.3.92.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-ACK.confirm(
    FSTResponderAddress,
    FSTAckResponse
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------------------|--------------------------------------|--|
| FSTResponderAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the FST Ack Response frame was received. |
| FSTAckResponse | FST Ack Response Action field | As defined in FST Ack Response frame | Specifies the parameters of the FST Ack Response. |

6.3.92.9.3 When generated

This primitive is generated by the MLME when a valid FST Ack Response frame is received.

6.3.92.9.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.33.

6.3.92.10 MLME-FST-TEARDOWN.request

6.3.92.10.1 Function

This primitive requests that an FST Teardown frame be transmitted to the FST initiator STA.

6.3.92.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-TEARDOWN.request(
    FSTPeerSTAAddress,
    FSTTeardown
)
```

| Name | Type | Valid range | Description |
|-------------------|---------------------------|----------------------------------|--|
| FSTPeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA to which the FST Teardown frame is transmitted. |
| FSTTeardown | FST Teardown Action field | As defined in FST Teardown frame | Specifies the parameters of the FST teardown. |

6.3.92.10.3 When generated

This primitive is generated by the SME to request that an FST Teardown frame be transmitted to the FST peer STA.

6.3.92.10.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an FST Teardown frame.

6.3.92.11 MLME-FST-TEARDOWN.indication

6.3.92.11.1 Function

This primitive indicates that an FST Teardown frame was received.

6.3.92.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-TEARDOWN.indication(
    FSTPeerSTAAddress,
    FSTAckResponse
)
```

| Name | Type | Valid range | Description |
|-------------------|---------------------------|----------------------------------|--|
| FSTPeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA from which the FST Teardown frame was received. |
| FSTTeardown | FST Teardown Action field | As defined in FST Teardown frame | Specifies the parameters of the FST teardown. |

6.3.92.11.3 When generated

This primitive is generated by the MLME when a valid FST Teardown frame is received.

6.3.92.11.4 Effect on receipt

On receipt of this primitive, the MLME operates according to the procedure in 11.33.

6.3.92.12 MLME-FST-INCOMING.request

6.3.92.12.1 Function

This primitive announces an incoming FST from another band/channel. This primitive does not result in the transmission of a frame.

6.3.92.12.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-FST-INCOMING.request(
    FSTInitiatorAddress,
    FSTResponderAddress,
    FSTSetupRequest,
    FSTSetupResponse,
    FSTIsInitiator
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|---------------------------------------|---|
| FSTInitiatorAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA that is the FST initiator. |
| FSTResponderAddress | MAC Address | Any valid individual MAC address | Specifies the MAC address of the STA that is the FST responder. |
| FSTSetupRequest | FST Setup Request Action field | As defined in FST Setup Request frame | Specifies the parameters of the last FST Setup Request frame exchanged between the initiator and responder. |

| Name | Type | Valid range | Description |
|------------------|---------------------------------|--|--|
| FSTSetupResponse | FST Setup Response Action field | As defined in FST Setup Response frame | Specifies the parameters of the last FST Setup Response frame exchanged between the initiator and responder. |
| FSTIsInitiator | Boolean | true, false | Indicates the role that the STA performs in the FST. Set to true if the STA performs in the role of initiator STA, and set to false otherwise. |

6.3.92.12.3 When generated

This primitive is generated by the SME to announce that an FST session is being transferred from another band/channel.

6.3.92.12.4 Effect on receipt

On receipt of this primitive, the MLME is notified of an incoming FST session. The MLME does not transmit a frame as a result of this primitive.

6.3.93 DMG relay operation

6.3.93.1 General

This subclause describes the management procedures associated with DMG relay.

6.3.93.2 MLME-RELAY-SEARCH.request

6.3.93.2.1 Function

This primitive requests a list of relay DMG STAs (RDSs) in the BSS.

6.3.93.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.request(
    DestinationMACAddress
)
```

| Name | Type | Valid range | Description |
|-----------------------|------------|----------------------------------|--|
| DestinationMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow. |

6.3.93.2.3 When generated

This primitive is generated by the SME at a non-AP and non-PCP STA to transmit a request to the PCP/AP for a list of RDSs in the BSS.

6.3.93.2.4 Effect on receipt

This primitive initiates a relay search procedure. The MLME subsequently issues an MLME-RELAY-SEARCH.confirm primitive that reflects the results.

6.3.93.3 MLME-RELAY-SEARCH.confirm

6.3.93.3.1 Function

This primitive reports a list of RDSs in the BSS.

6.3.93.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.confirm(
    RelayCapableSTAInfo,
    ResultCode
)
```

| Name | Type | Valid range | Description |
|------------------------------------|----------------------------|------------------------|---|
| RelayCapableSTAInfo (zero or more) | As defined in frame format | As defined in 9.4.1.45 | As described in 9.4.1.45 |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the results of the corresponding MLME-RELAY-SEARCH.request primitive. |

6.3.93.3.3 When generated

This primitive is generated when a valid Relay Search Response frame is received.

6.3.93.3.4 Effect on receipt

The SME is notified of the results of the relay search procedure.

6.3.93.4 MLME-RELAY-SEARCH.indication

6.3.93.4.1 Function

This primitive reports to the SME the request for obtaining a list of RDSs in the BSS.

6.3.93.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.indication(
    SourceMACAddress
)
```

| Name | Type | Valid range | Description |
|------------------|------------|----------------------------------|--|
| SourceMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow. |

6.3.93.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a request to obtain a list of RDSs in the BSS. The receipt of the request resulted from a relay search procedure that was initiated by the STA indicated by the source MAC address specified in the primitive.

6.3.93.4.4 Effect on receipt

The SME is notified of a request by a specified non-AP and non-PCP STA to obtain a list of RDSs in the BSS.

6.3.93.5 MLME-RELAY-SEARCH.response

6.3.93.5.1 Function

This primitive is used to provide the results of a Relay Search Request.

6.3.93.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RELAY-SEARCH.response(
    PeerMACAddress,
    RelayCapableSTAInfo,
    StatusCode
)
```

| Name | Type | Valid range | Description |
|------------------------------------|----------------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the MAC entity to which the Relay Search Response frame was sent. |
| RelayCapableSTAInfo (zero or more) | As defined in frame format | As defined in 9.4.1.45 | As described in 9.4.1.45 |
| StatusCode | As defined in frame format | As defined in 9.4.1.9 | As described in 9.4.1.9 |

6.3.93.5.3 When generated

This primitive is generated by the SME to provide the results of a Relay Search Request.

6.3.93.5.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit a Relay Search Response frame.

6.3.93.6 MLME-RLS.request

6.3.93.6.1 Function

This primitive requests the set up of a relay link with a specified peer MAC entity via a specified relay MAC entity.

6.3.93.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.request(
    DestinationMACAddress,
    RelayMACAddress,
    DestinationCapabilityInformation,
    RelayCapabilityInformation,
    RelayTransferParameterSet
)
```

| Name | Type | Valid range | Description |
|----------------------------------|----------------------------|----------------------------------|---|
| DestinationMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow. |
| RelayMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the selected RDS. |
| DestinationCapabilityInformation | As defined in frame format | As defined in frame format | Indicates the Relay Capability Information field within the Relay Capabilities element of the target destination relay endpoint DMG STA (REDS). |
| RelayCapabilityInformation | As defined in frame format | As defined in frame format | Indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS. |
| RelayTransferParameterSet | As defined in frame format | As defined in frame format | Specifies the parameters for the relay operation. |

6.3.93.6.3 When generated

This primitive is generated by the SME at a non-AP and non-PCP STA to set up a relay link with another non-AP and non-PCP STA.

6.3.93.6.4 Effect on receipt

This primitive initiates a relay link setup procedure.

6.3.93.7 MLME-RLS.confirm

6.3.93.7.1 Function

This primitive reports the results of a relay link setup attempt with a specified peer MAC entity.

6.3.93.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.confirm(
    PeerMACAddress,
    RelayMACAddress,
    ResultCode
)
```

| Name | Type | Valid range | Description |
|-----------------|-------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA from which the frame was received. |
| RelayMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the selected RDS |
| ResultCode | Enumeration | SUCCESS, REFUSED | Indicates the results of the corresponding MLME-RLS.request primitive. |

6.3.93.7.3 When generated

This primitive is generated when a valid RLS Response frame is received.

6.3.93.7.4 Effect on receipt

The SME is notified of the results of the relay link setup procedure.

6.3.93.8 MLME-RLS.indication

6.3.93.8.1 Function

This primitive reports the establishment of a relay link with a specified peer MAC entity.

6.3.93.8.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.indication(
    SourceMACAddress,
    RelayMACAddress,
    SourceCapabilityInformation,
    RelayCapabilityInformation,
    RelayTransferParameterSet
)
```

| Name | Type | Valid range | Description |
|-----------------------------|----------------------------|----------------------------------|--|
| SourceMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the STA that is the intended immediate recipient of the data flow. |
| RelayMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the selected RDS |
| SourceCapabilityInformation | As defined in frame format | As defined in frame format | Specifies the operational capability definitions to be used by the peer MAC entity. |
| RelayCapabilityInformation | As defined in frame format | As defined in frame format | Indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS |
| RelayTransferParameterSet | As defined in frame format | As defined in frame format | Specifies the parameters for the relay operation |

6.3.93.8.3 When generated

This primitive is generated by the MLME as a result of the establishment of a relay link with a specific peer MAC entity, and that resulted from a relay link setup procedure that was initiated by that specific source MAC entity.

6.3.93.8.4 Effect on receipt

The SME is notified of the establishment of the relay link setup.

6.3.93.9 MLME-RLS.response

6.3.93.9.1 Function

This primitive is used to provide the results of an RLS Request.

6.3.93.9.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS.response(
    PeerMACAddress,
    DestinationStatusCode,
    RelayStatusCode
)
```

| Name | Type | Valid range | Description |
|-----------------------|----------------------------|----------------------------------|--|
| PeerMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the peer STA. |
| DestinationStatusCode | As defined in frame format | As defined in 9.4.1.9 | As described in 9.4.1.9 |
| RelayStatusCode | As defined in frame format | As defined in 9.4.1.9 | As described in 9.4.1.9 |

6.3.93.9.3 When generated

This primitive is generated by the SME to provide the results of a RLS Request.

6.3.93.9.4 Effect on receipt

On receipt of this primitive, the MLME constructs and attempts to transmit an RLS Response frame.

6.3.93.10 MLME-RLS-TEARDOWN.request

6.3.93.10.1 Function

This primitive requests the teardown of the relay link with a specified peer MAC entity.

6.3.93.10.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS-TEARDOWN.request(
    DestinationMACAddress,
    RelayMACAddress,
    Reason
)
```

| Name | Type | Valid range | Description |
|-----------------------|-------------|----------------------------------|--|
| DestinationMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow. |
| RelayMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the selected RDS. |
| Reason | Enumeration | REQUESTED | Indicates the reason why the relay link is being torn down. |

6.3.93.10.3 When generated

This primitive is generated by the SME for tearing down a relay link with another non-AP and non-PCP STA.

6.3.93.10.4 Effect on receipt

This primitive initiates a relay link teardown procedure. The MLME subsequently issues an MLME-RLS-TEARDOWN.confirm primitive that reflects the results.

6.3.93.11 MLME-RLS-TEARDOWN.indication

6.3.93.11.1 Function

This primitive indicates the teardown of an already established relay link with a specific peer MAC entity.

6.3.93.11.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-RLS-TEARDOWN.indication(
    SourceMACAddress,
    Reason
)
```

| Name | Type | Valid range | Description |
|------------------|-------------|----------------------------------|--|
| SourceMACAddress | MACAddress | Any valid individual MAC address | Specifies the MAC address of the non-AP and non-PCP STA that is the intended immediate recipient of the data flow. |
| Reason | Enumeration | REQUESTED | Indicates the reason why the relay link is being torn down. |

6.3.93.11.3 When generated

This primitive is generated by the MLME as result of the teardown of a relay link with a specific peer MAC entity, and that resulted from a relay link teardown procedure that was initiated either by that specific peer MAC entity or by the local MAC entity.

6.3.93.11.4 Effect on receipt

The SME is notified of the relay link teardown.

6.3.94 Quieting adjacent BSS operation

6.3.94.1 General

This subclause describes the management procedure associated with the QAB operation.

The primitives defined are MLME-QAB.request, MLME-QAB.confirm, MLME-QAB.indication, and MLME-QAB.response primitive.

6.3.94.2 MLME-QAB.request

6.3.94.2.1 Function

This primitive requests transmission of a (protected) QAB Request frame.

6.3.94.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QAB.request(
    DialogToken,
    RequesterAP Address,
    ResponderAP Address,
    QuietPeriodRequest,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|----------------------------------|---|
| DialogToken | Integer | 1–255 | The dialog token to identify the QAB transaction. |
| RequesterAP Address | MACAddress | Any valid individual MAC address | The address of the MAC entity from which the (protected) QAB Request frame was sent. |
| ResponderAP Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity to which the (protected) QAB request was sent. |
| QuietPeriodRequest | A set of information subfields | As described in 9.4.2.150 | As described in 9.4.2.150. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected QAB Request frame. If false, the request is sent using the QAB Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.94.2.3 When generated

This primitive is generated by the STA management entity (SME) to request that a (Protected) QAB frame be sent by a STA.

6.3.94.2.4 Effect on receipt

On receipt of this primitive, the MLME constructs and transmits a (Protected) QAB Request frame.

6.3.94.3 MLME-QAB.confirm

6.3.94.3.1 Function

This primitive reports the result of a transmission of a QAB Request frame.

6.3.94.3.2 Semantics of the service primitive

The primitive parameters as follows:

```
MLME-QAB.confirm(
    DialogToken,
    RequesterAP Address,
    ResponderAP Address,
    QuietPeriodResponse,
    ResultCode,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|----------------------------------|--|
| DialogToken | Integer | 1–255 | The dialog token to identify the QAB transaction. |
| RequesterAP Address | MACAddress | Any valid individual MAC address | The address of the MAC entity to which the (protected) QAB Response frame was addressed. |
| ResponderAP Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the (protected) QAB Response was received. |
| QuietPeriodResponse | A set of information subfields | As described in 9.4.2.151 | As described in 9.4.2.151. |
| ResultCode | Enumeration | SUCCESS | Reports the result of an QAB request. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.94.3.3 When generated

This primitive is generated by the MLME when a QAB request completes. Possible unspecified failure causes include an inability to provide the Quiet Period Request element.

6.3.94.3.4 Effect on receipt

The SME is notified of the results of the QAB request procedure.

6.3.94.4 MLME-QAB.indication

6.3.94.4.1 Function

This primitive indicates that a (Protected) QAB Request frame was received.

6.3.94.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QAB.indication(
    DialogToken
    PeerMACAddress,
    QuietPeriodRequest,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------|--------------------------------|----------------------------------|--|
| DialogToken | Integer | 1–255 | The dialog token to identify the QAB transaction. |
| PeerMACAddress | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the QAB Request frame was received. |
| QuietPeriodRequest | A set of information subfields | As described in 9.4.2.150 | As described in 9.4.2.150. |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected QAB Request frame. If false, the request was received using the QAB Request frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.94.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) QAB Request frame is received.

6.3.94.4.4 Effect on receipt

On receipt of this primitive, the SME decides whether to schedule quiet periods as requested.

6.3.94.5 MLME-QAB.response

6.3.94.5.1 Function

This primitive is used to provide the results of a QAB Request.

6.3.94.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-QAB.response(
    DialogToken,
    RequesterAP Address,
    ResponderAP Address,
    QuietPeriodResponse,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|---------------------|------------|----------------------------------|--|
| DialogToken | Integer | 1–255 | The dialog token to identify the QAB transaction. |
| RequesterAP Address | MACAddress | Any valid individual MAC address | The address of the MAC entity to which the (protected) QAB Response frame was sent. |
| ResponderAP Address | MACAddress | Any valid individual MAC address | The address of the peer MAC entity from which the (protected) QAB Response was sent. |

| Name | Type | Valid range | Description |
|---------------------|--------------------------------|---------------------------|----------------------------|
| QuietPeriodResponse | A set of information subfields | As described in 9.4.2.151 | As described in 9.4.2.151. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.94.5.3 When generated

This primitive is generated by the SME to provide the results of a QAB Request.

6.3.94.5.4 Effect on receipt

On receipt of this primitive, the MLME provides the results of a QAB Request.

6.3.95 DMG beamforming

6.3.95.1 General

This subclause describes the management procedures associated with DMG beamforming.

6.3.95.2 MLME-BF-TRAINING.request

6.3.95.2.1 Function

This primitive requests that beamforming training occur with a peer STA.

6.3.95.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-BF-TRAINING.request(
 PeerSTAAddress,
 RequestBRP
)

| Name | Type | Valid range | Description |
|----------------|------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which to perform beamforming training. |
| RequestBRP | Boolean | true, false | If true, the beam refinement protocol (BRP) is performed as part of the beamforming training. If false, only sector-level sweep (SLS) is performed. |

6.3.95.2.3 When generated

This primitive is generated by the SME to request that beamforming training be performed with a peer STA.

6.3.95.2.4 Effect on receipt

On receipt of this primitive, the MLME invokes the MAC sublayer beamforming training procedures defined in 10.38.

6.3.95.3 MLME-BF-TRAINING.confirm

6.3.95.3.1 Function

This primitive reports the outcome of a requested beamforming training procedure.

6.3.95.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.confirm(
    PeerSTAAddress,
    ResultCode
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|--|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which beamforming training was performed or attempted. |
| ResultCode | Enumeration | SUCCESS, BF-TIMEOUT | Indicates the result of the beamforming procedure. |

6.3.95.3.3 When generated

This primitive is generated by the MLME to report the result of beamforming training with a peer STA.

6.3.95.3.4 Effect on receipt

The SME is notified of the result of the procedure.

6.3.95.4 MLME-BF-TRAINING.indication

6.3.95.4.1 Function

This primitive indicates that beamforming training with a peer STA, and at the request of that peer, has completed.

6.3.95.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-BF-TRAINING.indication(
    PeerSTAAddress,
    ResultCode
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|---|
| PeerSTAAddress | MACAddress | Any valid individual MAC address | Specifies the address of the peer MAC entity with which beamforming training was performed. |
| ResultCode | Enumeration | SUCCESS, BF-TIMEOUT | Indicates the result of the beamforming procedure. |

6.3.95.4.3 When generated

This primitive is generated by the MLME to indicate successful completion of a beamforming training procedure requested by a peer STA.

6.3.95.4.4 Effect on receipt

The SME is notified of the result of the procedure.

6.3.96 PN event report

6.3.96.1 General

This subclause describes the management procedures associated with PN event report.

6.3.96.2 MLME-PN-EXHAUSTION.indication

6.3.96.2.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

6.3.96.2.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PN-EXHAUSTION.indication(
 Key ID,
 Key Type,
 Address
)

| Name | Type | Valid range | Description |
|----------|-------------|----------------------------------|---|
| Key ID | Integer | N/A | Key identifier. |
| Key Type | Integer | Group, Pairwise, PeerKey, IGTK | Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key. |
| Address | MAC address | Any valid individual MAC address | This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey. |

6.3.96.2.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNExhaustionThresholdLow and dot11PNExhaustionThresholdHigh.

6.3.96.2.4 Effect of receipt

On receipt of this primitive, the SME deletes the temporal key associated with the PN.

6.3.96.3 MLME-PN-WARNING.indication

6.3.96.3.1 Function

This primitive indicates that the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.3.96.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-PN-WARNING.indication(
 Key ID,
 Key Type,
 Address
)

| Name | Type | Valid range | Description |
|----------|-------------|----------------------------------|---|
| Key ID | Integer | N/A | Key identifier. |
| Key Type | Integer | Group, Pairwise, PeerKey, IGTK | Defines whether this key is a group key, pairwise key, PeerKey, or Integrity Group key |
| Address | MAC address | Any valid individual MAC address | This parameter is valid only when the Key Type value is Pairwise, or when the Key Type value is Group and is from an IBSS STA, or when the Key Type value is PeerKey. |

6.3.96.3.3 When generated

This primitive is generated by the MLME when the PN associated with a temporal key exceeds the threshold that is defined in dot11PNWarningThresholdLow and dot11PNWarningThresholdHigh.

6.3.96.3.4 Effect of receipt

On receipt of this primitive, the SME can create a new temporal key before the PN space is exhausted.

6.3.97 Channel Availability Query

6.3.97.1 Introduction

The following MLME primitives support the signaling of channel availability query process for the channel query requests and responses.

6.3.97.2 MLME-CHANNELAVAILABILITYQUERY.request

6.3.97.2.1 Function

This primitive requests that a (Protected) Channel Availability Query frame be sent to a specified peer MAC entity.

6.3.97.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.request (
    PeerSTAAddress,
    ChannelAvailabilityQuery,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------|--------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | The address of the peer MAC entity to which the Channel Availability Query frame is sent. |
| ChannelAvailabilityQuery | A set of information subfields | As defined in 9.6.8.25 | Specifies the parameters of channel query. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Channel Availability Query frame. If false, the request is sent using the Channel Availability Query frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.97.2.3 When generated

This primitive is generated by the SME to request channel query procedure with a specified peer MAC entity.

6.3.97.2.4 Effect of receipt

This primitive initiates a channel query procedure. The MLME subsequently issues a MLME-CHANNELAVAILABILITYQUERY.confirm primitive that reflects the results.

6.3.97.3 MLME-CHANNELAVAILABILITYQUERY.confirm

6.3.97.3.1 Function

This primitive reports the results of a channel query attempt with a specified peer MAC entity.

6.3.97.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.confirm (
    PeerSTAAddress,
    ResultCode,
    ChannelAvailabilityQuery,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------------|-----------------------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | The address of the peer MAC entity from which the response to the Channel Availability Query frame was received. |
| ResultCode | Enumeration | SUCCESS, SUCCESS_MULTIPL E, REFUSED, DEVICE_VERIFICAT ION_FAILURE | Indicates the result of MLME-CHANNELAVAILABILITYQUERY.request primitive. |
| ChannelAvailabilityQ uery | A set of information fields | As defined in 9.6.8.25 | Specifies the parameters of channel query. |
| Protected | Boolean | true, false | Specifies whether the response was received using a robust Management frame. If true, the response was received using the Protected Channel Availability Query frame. If false, the response was received using the Channel Availability Query frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.97.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-CHANNELAVAILABILITYQUERY.request primitive and indicates the results of a channel availability query procedure.

6.3.97.3.4 Effect of receipt

The SME is notified of the results of the channel query procedure.

6.3.97.4 MLME-CHANNELAVAILABILITYQUERY.indication

6.3.97.4.1 Function

This primitive indicates that a (Protected) Channel Availability Query frame was received from a peer STA.

6.3.97.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.indication (
    PeerSTAAddress,
    ChannelAvailabilityQuery,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------------------|--------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | The address of the peer MAC entity from which the Channel Availability Query frame was received. |
| ChannelAvailabilityQ uery | A set of information subfields | As defined in 9.6.8.25 | Specifies the parameters of channel query. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected Channel Availability Query frame. If false, the request was received using the Channel Availability Query frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.97.4.3 When generated

This primitive is generated by the MLME as a result of the receipt of a channel query request from a specific peer MAC entity.

6.3.97.4.4 Effect of receipt

The SME is notified of the receipt of this channel query request.

6.3.97.5 MLME-CHANNELAVAILABILITYQUERY.response

6.3.97.5.1 Function

This primitive is used to send a response to a specified peer MAC entity that requested channel query with the STA that issued this primitive.

6.3.97.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELAVAILABILITYQUERY.response (
    PeerSTAAddress,
    ResultCode,
    ChannelAvailabilityQuery,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|--------------------------|--------------------------------|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | The address of the peer MAC entity to which the Channel Availability Query frame with the response is sent. |
| ResultCode | Enumeration | SUCCESS, SUCCESS_MULTIPLE, REFUSED, DEVICE_VERIFICATION_FAILURE | Indicates the result response of the channel availability query from the peer MAC entity. |
| ChannelAvailabilityQuery | A set of information subfields | As defined in 9.6.8.25 | Specifies the parameters of channel query. |

| Name | Type | Valid range | Description |
|--------------------|-------------------|------------------------|--|
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected Channel Availability Query frame. If false, the response is sent using the Channel Availability Query frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.97.5.3 When generated

This primitive is generated by the SME of a STA as a response to an MLME-CHANNELAVAILABILITYQUERY.indication primitive.

6.3.97.5.4 Effect of receipt

Upon receipt of this primitive, the MLME constructs the Channel Availability Query frame as the response. This frame is then scheduled for transmission to the peer MAC address.

6.3.98 Channel schedule management

6.3.98.1 Introduction

The following MLME primitives support the signaling of channel schedule management.

6.3.98.2 MLME-CHANNELSCHEDULEMANAGEMENT.request

6.3.98.2.1 Function

This primitive requests that a (Protected) Channel Schedule Management frame be sent.

6.3.98.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.request (
    PeerSTAAddress,
    ReasonResultCode,
    ChannelScheduleManagementMode,
    DeviceIdentification,
    ChannelSchedule,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|------------------|---------------------|---|--|
| PeerSTAAddress | MAC address | Any valid individual MAC address | The address of the peer MAC entity to which the Channel Schedule Management frame is sent. |
| ReasonResultCode | An enumerated value | As defined in 9.6.8.26 for the Reason Result Code field | |

| Name | Type | Valid range | Description |
|-------------------------------|---------------------------------------|---|---|
| ChannelScheduleManagementMode | An enumerated value | As defined in 9.6.8.26 for the Channel Schedule Management Mode field | |
| DeviceIdentification | Device Identification Information | As defined in 9.4.4.2.2 | The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information. |
| ChannelSchedule | A set of Channel Schedule Descriptors | As defined in 9.4.4.2.4 | The Channel Schedule parameter indicates the channels for which the schedule information is requested. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Channel Schedule Management frame. If false, the request is sent using the Channel Schedule Management frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.98.2.3 When generated

This primitive is generated by the SME to request that a (Protected) Channel Schedule Management frame be sent by a STA.

6.3.98.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs and schedules transmission of a (Protected) Channel Schedule Management frame.

6.3.98.3 MLME-CHANNELSCHEDULEMANAGEMENT.confirm

6.3.98.3.1 Function

This primitive reports the result of a channel schedule management query.

6.3.98.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.confirm (
    PeerSTAAddress,
    ReasonresultCode,
    ChannelScheduleManagementMode,
    DeviceIdentification,
    ChannelSchedule,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------------|---------------------------------------|---|--|
| PeerSTAAddress | MAC address | Any valid individual MAC address | The address of the peer MAC entity from which the Channel Schedule Management frame was received. |
| ReasonresultCode | An enumerated value | As defined in 9.6.8.26 for the Reason Result Code field | |
| ChannelScheduleManagementMode | An enumerated value | As defined in 9.6.8.26 for the Channel Schedule Management Mode field | |
| DeviceIdentification | Device Identification Information | As defined in 9.4.4.2.2 | The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information. |
| ChannelSchedule | A set of Channel Schedule Descriptors | As defined in 9.4.4.2.4 | The Channel Schedule parameter indicates the channels for which the schedule information is provided. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected Channel Schedule Management frame. If false, the response is sent using the Channel Schedule Management Public Action frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.98.3.3 When generated

This primitive is generated by the MLME when a channel schedule request completes. Possible unspecified failure causes include an inability to provide the channel schedule information.

6.3.98.3.4 Effect of receipt

The SME is notified of the results of the channel schedule management procedure.

6.3.98.4 MLME-CHANNELSCHEDULEMANAGEMENT.indication

6.3.98.4.1 Function

This primitive indicates that a (Protected) Channel Schedule Management frame was received from a peer STA.

6.3.98.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.indication (
    PeerSTAAddress,
    ReasonresultCode,
    ChannelScheduleManagementMode,
    DeviceIdentification,
    ChannelSchedule,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------------|---------------------------------------|---|--|
| PeerSTAAddress | MAC address | Any valid individual MAC address | The address of the peer MAC entity from which the Channel Schedule Management frame was received. |
| ReasonresultCode | An enumerated value | As defined in 9.6.8.26 for the Reason Result Code field | |
| ChannelScheduleManagementMode | An enumerated value | As defined in 9.6.8.26 for the Channel Schedule Management Mode field | |
| DeviceIdentification | Device Identification Information | As defined in 9.4.4.2.2 | The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information. |
| ChannelSchedule | A set of Channel Schedule Descriptors | As defined in 9.4.4.2.4 | The Channel Schedule parameter indicates the channels for which the schedule information is requested. |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected Channel Schedule Management frame. If false, the request was received using the Channel Schedule Management frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.98.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) Channel Schedule Management frame is received.

6.3.98.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to provide the channel schedule information.

6.3.98.5 MLME-CHANNELSCHEDULEMANAGEMENT.response

6.3.98.5.1 Function

This primitive is used to provide channel schedule information on channel availability.

6.3.98.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CHANNELSCHEDULEMANAGEMENT.response (
    PeerSTAAddress,
    ReasonresultCode,
    ChannelScheduleManagementMode,
    DeviceIdentification,
    ChannelSchedule,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-------------------------------|---------------------------------------|---|--|
| PeerSTAAddress | MAC address | Any valid individual MAC address | The address of the peer MAC entity to which the Channel Schedule Management frame is sent. |
| ReasonResultCode | An enumerated value | As defined in 9.6.8.26 for the Reason Result Code field | |
| ChannelScheduleManagementMode | An enumerated value | As defined in 9.6.8.26 for the Channel Schedule Management Mode field | |
| DeviceIdentification | Device Identification Information | As defined in 9.4.4.2.2 | The Device Identification Information parameter indicates the regulatory identification of the STA that is requesting the schedule information. |
| ChannelSchedule | A set of Channel Schedule Descriptors | As defined in 9.4.4.2.4 | The Channel Schedule parameter indicates the channels for which the schedule information is provided. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected Channel Schedule Management Public Action frame. If false, the response is sent using the Channel Schedule Management Public Action frame. |
| VendorSpecificInfo | A set of elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.98.5.3 When generated

This primitive is generated by the SME to provide the channel schedule information.

6.3.98.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs an appropriate response in a (Protected) Channel Schedule Management frame and schedules the transmission of the frame to the peer MAC entity.

6.3.99 Contact verification signal

6.3.99.1 Introduction

The following MLME primitives support the signaling of the contact verification signal (CVS).

6.3.99.2 MLME-CVS.request

6.3.99.2.1 Function

This primitive requests that a Contact Verification Signal frame be sent by a STA to a specified peer MAC entity in order to validate a WSM.

6.3.99.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-CVS.request (
    PeerSTAAddress,
    Protected,
    ContactVerificationSignal
)
```

| Name | Type | Valid range | Description |
|---------------------------|-------------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the contact verification signal process. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Contact Verification Signal frame. If false, the request is sent using the Contact Verification Signal frame. |
| ContactVerificationSignal | Contact Verification Signal element | As defined in 9.6.8.27 | Specifies the service parameters for the Contact Verification Signal frame. |

6.3.99.2.3 When generated

This primitive is generated by the SME to request that a Protected Contact Verification Signal frame be sent by a STA to a specified peer MAC entity.

6.3.99.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a Protected Contact Verification Signal frame. This frame is then scheduled for transmission.

6.3.99.3 MLME-CVS.indication

6.3.99.3.1 Function

This primitive indicates that a Contact Verification Signal frame was received from a specific peer MAC entity.

6.3.99.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-CVS.indication (

PeerSTAAddress,
 Protected,
 ContactVerificationSignal
)

| Name | Type | Valid range | Description |
|---------------------------|-------------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which a Contact Verification Signal frame was received. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Contact Verification Signal frame. If false, the request is sent using the Contact Verification Signal frame. |
| ContactVerificationSignal | Contact Verification Signal element | As defined in 9.6.8.27 | Specifies the service parameters for the Contact Verification Signal frame. |

6.3.99.3.3 When generated

This primitive is generated by the MLME when a valid Protected Contact Verification Signal frame is received.

6.3.99.3.4 Effect of receipt

On receipt of this primitive, the SME is notified of the receipt of the Contact Verification Signal frame.

6.3.100 GDD Enablement

6.3.100.1 Introduction

The following MLME primitives support the signaling of GDD enablement.

6.3.100.2 MLME-GDENABLEMENT.request

6.3.100.2.1 Function

This primitive requests that a (Protected) GDD Enablement Request frame be sent to a peer entity.

6.3.100.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GDENABLEMENT.request (
    PeerSTAAddress,
    DialogToken,
    Protected,
    DeviceClass,
    DeviceID
)
```

| Name | Type | Valid range | Description |
|----------------|-----------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC address | Any individual valid MAC address | Specifies the address of the peer MAC entity with which to perform the GDD enablement process. |
| DialogToken | Integer | 1–255 | The dialog token to identify the event transaction. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected GDD Enablement Request frame. If false, the request is sent using the GDD Enablement Request frame. |
| DeviceClass | DeviceClass | As defined in 9.4.4.2.1 | Specifies the service parameters for the GDD Enablement Request frame. |
| DeviceID | Device Identification Information | As defined in 9.4.4.2.2 | Specifies the service parameters for the GDD Enablement Request frame. |

6.3.100.2.3 When generated

This primitive is generated by the SME to request that a (Protected) GDD Enablement Request frame be sent to the peer entity.

6.3.100.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a (Protected) GDD Enablement Request frame. This frame is then scheduled for transmission.

6.3.100.3 MLME-GDENABLEMENT.confirm

6.3.100.3.1 Function

This primitive reports the result of an MLME-GDENABLEMENT.request primitive to initiate GDD enablement.

6.3.100.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GDENABLEMENT.confirm (
    PeerSTAAddress,
    DialogToken,
    Protected,
    ResultCode,
    WSM
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|--|--|
| PeerSTAAddress | MAC address | Any individual valid MAC address | Specifies the address of the peer MAC entity with which to perform the GDD enablement process. |
| DialogToken | Integer | 1–255 | The dialog token to identify the event transaction. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected GDD Enablement Response frame. If false, the response is sent using the GDD Enablement Response frame. |
| ResultCode | Enumeration | SUCCESS, REFUSED, ENABLEMENT DENIED, ENABLEMENT Denied due to restriction from GDB | Indicates the result response to the GDD Enablement Request frame from the peer entity. |
| WSM | WSM element | As defined in 9.4.1.57 | Specifies the service parameters for the white space map. |

6.3.100.3.3 When generated

This primitive is generated by the MLME as a result of an MLME-GDENABLEMENT.request primitive and indicates the results of the request.

This primitive is generated when the STA successfully receives a GDD Enablement Response frame from the peer entity or when an unspecified failure occurs.

6.3.100.3.4 Effect of receipt

On receipt of this primitive, the SME evaluates the results of the MLME-GDENABLEMENT.request primitive and may use the reported data.

6.3.100.4 MLME-GDENABLEMENT.indication

6.3.100.4.1 Function

This primitive indicates that a (Protected) GDD Enablement Request frame was received from a peer entity.

6.3.100.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GDENABLEMENT.indication (
    PeerSTAAddress,
    DialogToken,
    Protected,
    DeviceClass,
    DeviceID
)
```

| Name | Type | Valid range | Description |
|----------------|-----------------------------------|----------------------------------|---|
| PeerSTAAddress | MAC address | Any individual valid MAC address | The address of the peer entity from which a GDD Enablement Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the event transaction. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected GDD Enablement Request frame. If false, the request is sent using the GDD Enablement Request frame. |
| DeviceClass | DeviceClass | As defined in 9.4.4.2.1 | Specifies the service parameters for the GDD Enablement Request frame. |
| DeviceID | Device Identification Information | As defined in 9.4.4.2.2 | Specifies the service parameters for the GDD Enablement Request frame. |

6.3.100.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) GDD Enablement Request frame is received.

6.3.100.4.4 Effect of receipt

On receipt of this primitive, the SME operates according to the procedure in 11.44.1.

6.3.100.5 MLME-GDENABLEMENT.response

6.3.100.5.1 Function

This primitive indicates that a (Protected) GDD Enablement Response frame be sent to the peer entity.

6.3.100.5.2 Semantics of the service primitive

```
MLME-GDENABLEMENT.response (
    PeerSTAAddress,
    DialogToken,
```

```
Protected,
ResultCode,
WSM
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|--|--|
| PeerSTAAddress | MAC address | Any individual valid MAC address | The address of the peer entity from which a GDD Enablement Request frame was received. |
| DialogToken | Integer | 1–255 | The dialog token to identify the event transaction. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected GDD Enablement Response frame. If false, the response is sent using the GDD Enablement Response frame. |
| resultCode | Enumeration | SUCCESS, REFUSED, ENABLEMENT DENIED, ENABLEMENT Denied due to restriction from GDB | Indicates the result response to the GDD Enablement Request frame from the peer entity. |
| WSM | WSM element | As defined in 9.4.1.57 | Specifies the service parameters for the white space map. |

6.3.100.5.3 When generated

This primitive is generated by the SME to request that a GDD Enablement Response frame be sent to the peer entity.

6.3.100.5.4 Effect of receipt

On receipt of this primitive, the MLME constructs a GDD Enablement Response frame. This frame is then scheduled for transmission.

6.3.101 Network channel control management

6.3.101.1 Introduction

The following MLME primitives support the signaling of network channel control management.

6.3.101.2 MLME-NETWORKCHANNELCONTROL.request

6.3.101.2.1 Function

This primitive requests that a (Protected) Network Channel Control Public Action frame be sent by a STA to a specified peer MAC entity.

6.3.101.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NETWORKCHANNELCONTROL.request (
    PeerSTAAddress,
    DialogToken,
    NetworkChannelControl,
```

Protected,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-----------------------|-----------------------------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual or group MAC Address | The address of the peer MAC entity to which the Network Channel Control frame is transmitted. |
| DialogToken | Integer | 0–255 | The dialog token to identify the network channel control transaction. |
| NetworkChannelControl | A set of information subfields | As defined in 9.6.8.30 | Specifies the parameters of network channel control. |
| Protected | Boolean | true, false | Specifies whether the request is sent using a robust Management frame. If true, the request is sent using the Protected Network Channel Control frame. If false, the request is sent using the Network Channel Control frame. |
| VendorSpecificInfo | A set of vendor specific elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.101.2.3 When generated

This primitive is generated by the SME to request that a (Protected) Network Channel Control Public Action frame be sent by a STA to the specified peer MAC entity.

6.3.101.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a (Protected) Network Channel Control Public Action frame. This frame is then scheduled for transmission.

6.3.101.3 MLME-NETWORKCHANNELCONTROL.confirm

6.3.101.3.1 Function

This primitive reports the result of a request to network channel control.

6.3.101.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-NETWORKCHANNELCONTROL.confirm (

PeerSTAAddress,
 DialogToken,
 NetworkChannelControl,
 Protected,
 VendorSpecificInfo
)

| Name | Type | Valid range | Description |
|-----------------------|-----------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | The address of the peer MAC entity from which the response in a Network Channel Control frame is received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the network channel control transaction. |
| NetworkChannelControl | A set of information subfields | As defined in 9.6.8.30 | Specifies the parameters of network channel control. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected Network Channel Control Public Action frame. If false, the response is sent using the Network Channel Control Public Action frame. |
| VendorSpecificInfo | A set of vendor specific elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.101.3.3 When generated

This primitive is generated by the MLME when a network channel control request completes. Possible unspecified failure causes include an inability to schedule a Network Channel Control Public Action frame.

6.3.101.3.4 Effect of receipt

The SME is notified of the results of the network channel control procedure.

6.3.101.4 MLME-NETWORKCHANNELCONTROL.indication

6.3.101.4.1 Function

This primitive indicates that a (Protected) Network Channel Control Public Action frame was received from a STA.

6.3.101.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NETWORKCHANNELCONTROL.indication (
    PeerSTAAddress,
    DialogToken,
    NetworkChannelControl,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|-----------------------|-----------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC address | Any valid individual MAC address | The address of the peer MAC entity from which the Network Channel Control frame was received. |
| DialogToken | Integer | 0–255 | The dialog token to identify the network channel control transaction. |
| NetworkChannelControl | A set of information subfields | As defined in 9.6.8.30 | Specifies the parameters of network channel control. |
| Protected | Boolean | true, false | Specifies whether the request was received using a robust Management frame. If true, the request was received using the Protected Network Channel Control Public Action frame. If false, the request was received using the Network Channel Control Public Action frame. |
| VendorSpecificInfo | A set of vendor specific elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.101.4.3 When generated

This primitive is generated by the MLME when a valid (Protected) Network Channel Control Public Action frame is received.

6.3.101.4.4 Effect of receipt

On receipt of this primitive, the SME decides whether to accept the network channel control request.

6.3.101.5 MLME-NETWORKCHANNELCONTROL.response

6.3.101.5.1 Function

This primitive is generated by the SME to schedule the transmission of a network channel control response.

6.3.101.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-NETWORKCHANNELCONTROL.response (
    PeerSTAAddress,
    DialogToken,
    NetworkChannelControl,
    Protected,
    VendorSpecificInfo
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|---|---|
| PeerSTAAddress | MAC Address | Any valid individual or group MAC address | The address of the peer MAC entity to which the response in a Network Channel Control frame is transmitted. |
| DialogToken | Integer | 0–255 | The dialog token to identify the network channel control transaction. |

| Name | Type | Valid range | Description |
|-----------------------|-----------------------------------|------------------------|--|
| NetworkChannelControl | A set of information subfields | As defined in 9.6.8.30 | Specifies the parameters of network channel control. |
| Protected | Boolean | true, false | Specifies whether the response is sent using a robust Management frame. If true, the response is sent using the Protected Network Channel Control Public Action frame. If false, the response is sent using the Network Channel Control Public Action frame. |
| VendorSpecificInfo | A set of vendor specific elements | As defined in 9.4.2.26 | Zero or more elements. |

6.3.101.5.3 When generated

This primitive is generated by the SME to request that a network channel control response be sent to the peer entity.

6.3.101.5.4 Effect of receipt

On receipt of this primitive, the MLME schedules the response to the specific peer MAC entity that has requested a network channel control response.

6.3.102 White space map (WSM)

6.3.102.1 Introduction

The following MLME primitives support the signaling of the WSM.

6.3.102.2 MLME-WSM.request

6.3.102.2.1 Function

This primitive requests that a White Space Map Announcement frame be sent by a GDD enabling STA in order to provide a WSM to a GDD dependent STA.

6.3.102.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-WSM.request (
    PeerSTAAddress,
   WhiteSpaceMap
)
```

| Name | Type | Valid range | Description |
|----------------|-------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the address of the peer MAC entity with which to perform the WSM process. |
| WhiteSpaceMap | White Space Map element | As defined in 9.4.2.170 | Specifies the service parameters for the WSM. |

6.3.102.2.3 When generated

This primitive is generated by the SME to request that a White Space Map Announcement frame be sent by a GDD enabling STA to a specified peer MAC entity.

6.3.102.2.4 Effect of receipt

On receipt of this primitive, the MLME constructs a White Space Map Announcement frame. This frame is then scheduled for transmission.

6.3.102.3 MLME-WSM.indication

6.3.102.3.1 Function

This primitive indicates receipt of a request of a White Space Map Announcement frame.

6.3.102.3.2 Semantics of the service primitive

The primitive parameters are as follows:

MLME-WSM.indication (

PeerSTAAddress,
 WhiteSpaceMap
)

| Name | Type | Valid range | Description |
|----------------|-------------------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | The address of the peer MAC entity from which a WSM was received. |
| WhiteSpaceMap | White Space Map element | As defined in 9.4.2.170 | Specifies the service parameters for the WSM. |

6.3.102.3.3 When generated

This primitive is generated by the MLME when a valid White Space Map Announcement frame is received.

6.3.102.3.4 Effect of receipt

On receipt of this primitive, the SME is notified of the receipt of White Space Map Announcement frame.

6.3.103 Estimated Throughput (ESTT)

6.3.103.1 General

The following set of MLME primitives support the transport of an estimate of the achievable throughput for a potential or an existing link between two STAs.

6.3.103.2 MLME-ESTIMATED-THROUGHPUT.request

6.3.103.2.1 Function

This primitive is generated by the SME to request that the MLME provide an estimated throughput for a potential or existing association.

6.3.103.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-ESTIMATED-THROUGHPUT.request (
    PeerSTAAddress,
    AverageMSDUSizeOutbound,
    AverageMSDUSizeInbound
)
```

| Name | Type | Valid range | Description |
|-------------------------|----------------------------|--|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the STA for which throughput is to be estimated assuming an association to that STA if an association with that STA does not currently exist. |
| AverageMSDUSizeInbound | An ordered set of integers | -1 to 7920, for each member of the set | A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered to the wireless medium to this STA by the STA corresponding to the PeerMACAddress to this STA, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of -1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category. |
| AverageMSDUSizeOutbound | An ordered set of integers | -1 to 7920, for each member of the set | A set of integers providing an estimate of the average number of octets per MSDU expected to be delivered to the wireless medium by this STA to the STA corresponding to the PeerMACAddress, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of -1 means that the size is unspecified, a value of 0 means that no MSDUs are expected to be delivered for this access category. |

6.3.103.2.3 When generated

This primitive is generated by the SME to request that the MLME provide an estimate of throughput for MSDUs sent between this STA and the STA which corresponds to the PeerMACAddress provided in the parameter list.

6.3.103.2.4 Effect of receipt

On receipt of this primitive, the MLME generates a set of estimates of throughput for MSDUs sent between the STA which corresponds to the PeerMACAddress provided in the parameter list and this STA.

6.3.103.3 MLME-ESTIMATED-THROUGHPUT.confirm

6.3.103.3.1 Function

This primitive reports the result of a request to provide a set of estimated throughput values for a potential or existing link.

6.3.103.3.2 Semantics of the service primitive

The primitive uses the following parameters:

```
MLME-ESTIMATED-THROUGHPUT.confirm (
    PeerSTAAddress,
    EstimatedThroughputOutbound,
    EstimatedThroughputInbound
)
```

| Name | Type | Valid range | Description |
|-----------------------------|--------------------------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC Address | Specifies the MAC address of the STA for which throughput is to be estimated assuming a link with that STA if a link with that STA does not currently exist. |
| EstimatedThroughputOutbound | An ordered set of Real Numbers | Non-negative real numbers | The estimated throughput in the direction from the STA corresponding to the PeerMACAddress to this STA with units of MSDU bits per second, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available. |
| EstimatedThroughputInbound | An ordered set of Real Numbers | Non-negative real numbers | The estimated throughput in the direction from this STA to the STA corresponding to the PeerMACAddress with units of MSDU bits per second, specified per access category in the order AC_VO, AC_VI, AC_BE, AC_BK. A value of 0 means no estimate is available. |

6.3.103.3.3 When generated

This primitive is generated by the MLME to provide a set of estimates of throughput for MSDUs sent between the STA which corresponds to the PeerMACAddress indicated in the parameter list and this STA.

6.3.103.3.4 Effect of receipt

On receipt of this primitive, the SME may use the reported estimates to make link, association and forwarding decisions.

6.3.104 Get authentication/association state

6.3.104.1 General

This mechanism is used to obtain authentication/association state.

6.3.104.2 MLME-GETAUTHASSOCSTATE.request

6.3.104.2.1 Function

This primitive is generated by the SME to request that the MLME return the authentication/association state with respect to a given peer STA.

6.3.104.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GETAUTHASSOCSTATE.request (
    PeerSTAAddress,
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|--|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity whose authentication/association state is requested |

6.3.104.2.3 When generated

This primitive is generated by the SME to request the authentication/association state from the MLME.

6.3.104.2.4 Effect of receipt

The MLME issues an MLME-GETAUTHASSOCSTATE.confirm primitive.

6.3.104.3 MLME-GETAUTHASSOCSTATE.confirm

6.3.104.3.1 Function

This primitive is generated by the MLME to report to the SME the result of a request to get the authentication/association state.

6.3.104.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MLME-GETAUTHASSOCSTATE.confirm (
    PeerSTAAddress,
    AuthAssocState
)
```

| Name | Type | Valid range | Description |
|----------------|-------------|----------------------------------|---|
| PeerSTAAddress | MAC Address | Any valid individual MAC address | Specifies the address of the peer MAC entity whose authentication/association state was requested |
| AuthAssocState | Integer | 1-4 | See 11.3.1 and 14.3.2 |

6.3.104.3.3 When generated

This primitive is generated by the MLME to report the authentication/association state to the SME.

6.3.104.3.4 Effect of receipt

The SME is notified of the result of an MLME-GETAUTHASSOCSTATR.request primitive.

6.4 MAC state generic convergence function (MSGCF)

6.4.1 Overview of the convergence function

The MSGCF provides an abstraction of a link between a non-AP STA and an ESS (an ESS-link) to its higher layer entity. The MSGCF provides control of an ESS-link and generates events based on the state of an ESS-link. A non-AP STA that transitions between two APs in the same ESS can operate transparently to the LLC sublayer, and does not change state in the state machine defined within 6.4.

This clause defines interactions between the MSGCF and MLME and PLME through the MLME SAP and PLME SAP respectively, as well as with the SME via the MSGCF-SME SAP. The detailed manner in which the SAPs are implemented is not specified within this standard.

6.4.2 Overview of convergence function state machine

The convergence function maintains information on the state of the ESS, using the state machine shown in Figure 6-29. Because Figure 6-29 is defined in terms of ESS connectivity, it is not affected by changes in association provided that the transition was an intra-ESS transition.

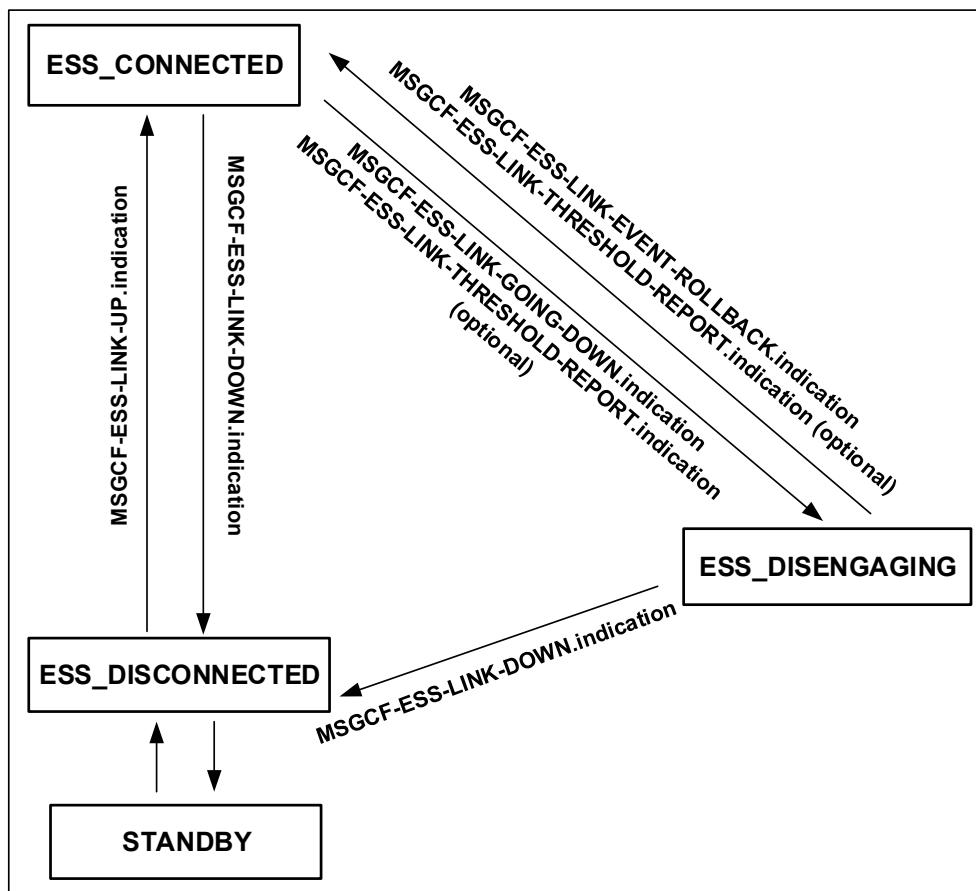

Figure 6-29—MSGCF state machine

6.4.3 Convergence function state list

6.4.3.1 ESS_CONNECTED

In the ESS_CONNECTED state, a non-AP STA has completed all layer 2 setup activities and is able to send Class 3 frames to peer LLC entities. A non-AP STA remains in this state as long as it is possible to send Class 3 frames through any AP within an ESS. A non-AP STA does not leave this state upon successful intra-ESS transitions.

6.4.3.2 ESS_DISCONNECTED

In the ESS_DISCONNECTED state, a non-AP STA is unable to send Class 3 frames to peer LLC entities. Higher layer network protocols are unavailable. In this state, a non-AP STA may use GAS to perform network discovery and selection.

6.4.3.3 ESS_DISENGAGING

In the ESS_DISENGAGING state, the non-AP STA's SME anticipates that links to all APs within the ESS will be lost in a defined time interval, but the non-AP STA is still able to send Class 3 frames to peer LLC entities. The predictive failure of the link might be due to explicit disassociation by the peer, the imminent invalidation of cryptographic keys because of usage limits (such as sequence counter exhaustion), or predictive signal strength algorithms. In this state, it is recommended that a non-AP STA also initiate a search to find a new ESS.

6.4.3.4 STANDBY

In the STANDBY state, the non-AP STA is powered down and unable to communicate with any other STAs.

6.4.4 Convergence function state transitions

6.4.4.1 Transitions to ESS_CONNECTED

6.4.4.1.1 From ESS_DISCONNECTED

To make this transition, a non-AP STA will have completed the network selection process and the relevant procedures to attach to the ESS, including IEEE 802.11 authentication, IEEE 802.11 association, and, if required, IEEE 802.11 RSN procedures. When this transition is completed, the MSGCF sends an MSGCF-ESS-LINK-UP.indication primitive to higher layers.

6.4.4.1.2 From ESS_DISENGAGING

To make this transition, the SME cancels a previous event that predicted an ESS link failure. This might be due to network parameters indicating renewed link strength or a successful renewal of an expiring RSN SA. When this transition is complete, the MSGCF sends an MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive to indicate that a prior link failure predictive event is no longer valid. If the transition was due to network parameters crossing a threshold, the MSGCF also sends an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive to higher layers.

6.4.4.2 Transitions to ESS_DISCONNECTED

6.4.4.2.1 From ESS_CONNECTED

This transition indicates that administrative action was taken to shut down the link, a sudden loss of signal strength or that RSN keys expired and could not be renewed. At the conclusion of this transition, the MSGCF sends an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.4.4.2.2 From ESS_DISENGAGING

This transition indicates that the predictive link failure event has occurred. At the conclusion of this transition, the MSGCF issues an MSGCF-ESS-LINK-DOWN.indication primitive to higher layer protocols.

6.4.4.2.3 From STANDBY

This transition occurs when the non-AP STA is powered on and initialized. No event is issued by the MSGCF.

6.4.4.3 Transitions to ESS_DISENGAGING

6.4.4.3.1 From ESS_CONNECTED

When the parameters as defined in Table 6-7 change or imminent action is taken to bring down the link, the SME may predict an imminent link failure and initiate a transition. Upon completion of this transition, the MSGCF issues an MSGCF-ESS-LINK-GOING-DOWN event. If the cause of the transition was the degradation of network parameters beyond the thresholds stored in the MIB, an MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive is also issued to higher layers.

6.4.4.4 Transitions to STANDBY

6.4.4.4.1 From ESS_DISCONNECTED

When the non-AP STA has disconnected from an ESS, it may be administratively powered off to extend battery life. No events are issued by the MSGCF upon completion of this transition.

6.4.5 Convergence function informational events

Informational events may occur in any state. When they occur, the SME updates the convergence function MIB with new parameters. Informational events do not cause state changes in Figure 6-29. Informational events are generated when new potential ESS links are discovered, when the network parameter thresholds are set or read, and when higher layer protocols issue commands to the non-AP STA through the MSGCF-ESS-LINK-COMMAND.request primitive.

6.4.6 MAC state generic convergence SAP

The MAC state generic convergence SAP is the interface between the convergence function and higher layer protocols. It presents a standardized interface for higher layer protocols to access the state of the MAC, whether that state information is available in the MLME, PLME, or SME.

Some events on the MAC state generic convergence SAP require event identifiers for use as a dialog token in event sequencing and rollback. The EventID is an unsigned integer that is initialized to 1 when the non-AP STA leaves the STANDBY state.

6.4.7 ESS status reporting

6.4.7.1 MSGCF-ESS-LINK-UP.indication

6.4.7.1.1 Function

This event is triggered when a new ESS has been made available for sending frames.

6.4.7.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-UP.indication(
    ESSIDIdentifier
)
```

| Name | Type | Valid range | Description |
|---------------|--------|-------------|---|
| ESSIdentifier | String | N/A | An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use. The HESSID is encoded in upper-case ASCII characters with the octet values separated by dash characters, as described in IETF RFC 3580 [B39]. |

6.4.7.1.3 When generated

This primitive is generated when the ESS link to a network of APs is available to exchange Data frames. The generation of this primitive may vary depending on the contents of dot11WEPDefaultKeysTable and dot11WEPKeyMappingsTable and the setting of dot11RSNAOptionImplemented.

If there are no entries in the dot11WEPDefaultKeysTable, no entry for the current AP in dot11WEPKeyMappingsTable, and dot11RSNAOptionImplemented is false, then the network does not use encryption. This event is generated upon receipt of an MLME-ASSOCIATE.confirm primitive with a result code of success.

If there are entries in the dot11WEPDefaultKeysTable, or an entry for the current AP in dot11WEPKeyMappingsTable, or dot11RSNAOptionImplemented is true, then the network requires the use of encryption on the link. Before declaring that the link is ready to exchange Data frames, the convergence function receives an MLME-ASSOCIATE.confirm primitive with a result code of success and the SME emits an MLME-SETKEYS.request primitive. The latter primitive is used to determine that a WEP key is available, or that the RSN 4-way handshake has completed.

This event is not triggered by MLME-REASSOCIATE.confirm primitives because MLME-REASSOCIATE.confirm primitives are defined as transitions within the same ESS.

The MLME-ASSOCIATE.confirm primitive may be issued upon AP transitions. It is the objective of the MSGCF to generate this event only upon the initial connection to an IEEE 802.11 network, when the MSGCF state machine moves into the ESS_CONNECTED state.

6.4.7.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by higher layers are outside of scope of this standard, but may include router discovery, IP configuration, and other higher layer protocol operations.

6.4.7.2 MSGCF-ESS-LINK-DOWN.indication

6.4.7.2.1 Function

This event is triggered to indicate that the connection to an ESS is no longer available for sending frames.

6.4.7.2.2 Semantics of the service primitive

The event's parameters are as follows:

```
MSGCF-ESS-LINK-DOWN.indication (
    ESSIDIdentifier,
    ReasonCode
)
```

| Name | Type | Valid range | Description |
|---------------|------------|--|---|
| ESSIdentifier | String | N/A | An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use. |
| ReasonCode | Enumerated | EXPLICIT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC | Reason code, drawn from Table 6-2. |

Table 6-2—Reason codes for network down

| Name | Description |
|---------------------|--|
| EXPLICIT_DISCONNECT | An explicit disconnection operation (disassociation or deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP (the AP with which the STA is associated) and the non-AP STA was unable to (re)associate with an alternate AP in the same ESS. |
| KEY_EXPIRATION | Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy. |
| LOW_POWER | If the SME reports that the interface was shut down to conserve power, that event may be reported to higher level protocols. |
| VENDOR_SPECIFIC | Vendor-specific usage. |

6.4.7.2.3 When generated

This event is generated when the SME declares that connectivity to an ESS is lost. It may be generated in the case of an explicit disconnection from the link peer, received as an MLME-DEAUTHENTICATE.indication or an MLME-DISASSOCIATE.indication primitive. The SME should wait for a period of dot11ESSDisconnectFilterInterval before declaring connectivity lost to confirm that a non-AP STA is unable to (re)associate with any alternate AP within the ESS.

6.4.7.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include removing entries from routing and forwarding tables, and attempting to initiate handover of open application connections to network interfaces that are still active.

6.4.7.3 MSGCF-ESS-LINK-GOING-DOWN.indication

6.4.7.3.1 Function

This event is triggered to indicate the expectation that the connection to an ESS will no longer be available for sending frames in the near future.

6.4.7.3.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-LINK-GOING-DOWN.indication(
    ESSIDIdentifier,
    EventID,
    TimeInterval,
    ReasonCode
)
```

| Name | Type | Valid range | Description |
|---------------|------------|---|---|
| ESSIdentifier | String | N/A | An identifier composed of the string value of the SSID element concatenated with the value of the HESSID if it is in use. |
| EventID | Integer | N/A | An integer used to identify the event that is used in the case of event rollback. |
| TimeInterval | Integer | N/A | Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by TimeInterval. |
| Reason Code | Enumerated | EXPLICIT_DISCONNECT, KEY_EXPIRATION, LOW_POWER, VENDOR_SPECIFIC | Indicates the reason the link is expected to go down, drawn from Table 6-3. |

Table 6-3—Reason codes for ESS link down

| Name | Description |
|---------------------|--|
| EXPLICIT_DISCONNECT | An explicit disconnection operation (Disassociation or Deauthentication) was initiated by the non-AP STA or the non-AP STA's current serving AP. |
| KEY_EXPIRATION | Keys used by an RSN SA have expired due to time or traffic limitations, or TKIP countermeasures have invalidated the key hierarchy. |
| LOW_POWER | If the SME reports that the interface is going to be shut down to conserve power, that event may be reported to higher level protocols. |
| VENDOR_SPECIFIC | Vendor-specific usage. |

6.4.7.3.3 When generated

This notification is generated by the MSGCF when the ESS link is currently established and is expected to go down within the specified time interval. The network can be expected to go down because of an event whose timing is well understood, such as an explicit disconnection event observed on the MLME SAP. It can also be expected as the result of a predictive algorithm that monitors link quality. The details of such a predictive algorithm used are beyond the scope of this standard.

The convergence function should attempt to deliver this event at least dot11ESSLinkDownTimeInterval time units before the link is predicted to go down. Different higher layer network protocols might need different levels of advance notice, and might configure dot11ESSLinkDownTimeInterval accordingly.

Not all thresholds in the dot11MACStateParameterTable are supported by every PHY. In the case when a threshold parameter is not supported it is not applied.

6.4.7.3.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include beginning preparations for handover.

6.4.7.4 MSGCF-ESS-LINK-EVENT-ROLLBACK.indication

6.4.7.4.1 Function

This event is used to indicate that specific previous reports or events are no longer valid and should be disregarded.

6.4.7.4.2 Semantics of the service primitive

The event parameters are as follows:

```
MSGCF-ESS-LINK-EVENT-ROLLBACK.indication(
    ESSIDIdentifier,
    EventID
)
```

| Name | Type | Valid range | Description |
|---------------|---------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EventID | Integer | N/A | An integer used to identify the event that is used in the case of event rollback. |

6.4.7.4.3 When generated

This event is generated when a previous predictive event is no longer valid within its expiration time.

The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is used in conjunction with the MSGCF-ESS-LINK-GOING-DOWN.indication primitive. The MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive is issued when the prediction of link failure is no longer valid. Algorithms used to determine that link failure predictions are beyond the scope of this standard.

6.4.7.4.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function to cancel any actions begun by the previous event. Actions taken by those higher layers are outside the scope of this standard, but may include canceling any handover procedures started by the MSGCF-ESS-LINK-GOING-DOWN event.

6.4.7.5 MSGCF-ESS-LINK-DETECTED.indication

6.4.7.5.1 Function

This event reports on the presence of a new ESS.

6.4.7.5.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-DETECTED.indication(
    ESSIDIdentifier,
    ESSDescription
)
```

| Name | Type | Valid range | Description |
|----------------|-------------------------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use. |
| ESSDescription | As defined in Table 6-4 | N/A | A set of information about the ESS. |

Table 6-4—ESS description

| Name | Syntax | Description |
|---------------------------|---------------------------|--|
| SSID | String | The SSID used by the ESS. |
| InformationServiceSupport | As described in Table 6-5 | A set of values indicating the type of information services supported on this network. |
| TriggerSupport | As described in Table 6-5 | A set of values indicating the support for the types of triggers that can be used to propose that the station take action. |
| RSN | As defined in 9.4.2.25 | The RSN configuration of the ESS. |
| Interworking | As defined in 9.4.2.92 | Interworking configuration of the ESS. |

Table 6-5—Trigger support values

| Name | Description |
|---------------------------------|--|
| MIH_CS_ES_Support | This network supports the IEEE 802.21 MIH Command Service and Event Service. |
| Vendor_Specific_Trigger_Support | This network supports a vendor-specific trigger service. |

6.4.7.5.3 When generated

Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. To maintain the list of detected networks, the SME issues recurring MLME-SCAN.request primitives to the MLME. The SME may schedule these requests to avoid interruption of user traffic. Responses to these requests, received in the MLME-SCAN.confirm primitives, contain a list of detected networks. Each network is stored in dot11MACStateESSLinkDetectedTable. This table holds a list of networks, organized by Network Identifier. Each entry in the table contains a list of BSSIDs within the network, as well as indications of support for MIH. Support for MIH is indicated by the presence or absence of the relevant Advertisement Protocol IDs in the Advertisement Protocol element. Each entry in the table is held for at least dot11ESSLinkDetectionHoldInterval time units. When a non-AP STA has not observed an ESS for longer than dot11ESSLinkDetectionHoldInterval, it may be removed from the table.

This event is generated when a new entry is made into the dot11MACStateESSLinkDetectedTable. Modifications to existing entries in the list, such as an update to the BSSID list, do not trigger this event.

6.4.7.5.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.7.6 MSGCF-ESS-LINK-SCAN.request

6.4.7.6.1 Function

This function is used by higher layer protocols to request that the SME perform a scan operation for available ESSs.

6.4.7.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.request(
    SSID,
    HESSID,
    AccessNetworkType
)
```

| Name | Type | Valid range | Description |
|-------------------|------------------------|------------------------|---|
| SSID | Octet string | 0–32 octets | Specific or wildcard. |
| HESSID | As defined in 9.4.2.92 | As defined in 9.4.2.92 | The HESSID to search for. It can be set to all 1s for use as a wildcard to match all available HESSID values. |
| AccessNetworkType | As defined in 9.4.2.92 | As defined in 9.4.2.92 | This may be a specific value to match one type of networks, or all 1s to match all access network types. |

6.4.7.6.3 When generated

This request is generated when higher protocol layers request a list of available ESSs.

6.4.7.6.4 Effect of receipt

The SME generates a corresponding MLME-SCAN.request primitive to find available networks.

6.4.7.7 MSGCF-ESS-LINK-SCAN.confirm

6.4.7.7.1 Function

This function reports information on available ESSs to higher protocol layers.

6.4.7.7.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-SCAN.confirm(
    ESSIdentifiers,
    ESSDescriptions
)
```

| Name | Type | Valid range | Description |
|-----------------|---|-------------|---|
| ESSIdentifiers | Set of Strings | N/A | An identifier for the network composed of the string value of the SSID used to identify the network, concatenated with the value of the HESSID if it is in use. |
| ESSDescriptions | Set of ESSDescriptions, as defined in Table 6-4 | N/A | A set of information about each discovered ESS. |

6.4.7.7.3 When generated

This primitive is generated when scan results are available for reporting to higher protocol layers, in response to an MSGCF-ESS-LINK-SCAN.request primitive.

6.4.7.7.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard.

6.4.8 Network configuration

6.4.8.1 MSGCF-ESS-LINK-CAPABILITY.request

6.4.8.1.1 Function

This primitive requests a list of the capabilities supported by a network.

6.4.8.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-CAPABILITY.request(
    ESSIdentifier
)
```

| Name | Type | Valid range | Description |
|---------------|--------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |

6.4.8.1.3 When generated

This primitive is issued to service higher layer protocols by reporting on the capabilities of a particular network.

6.4.8.1.4 Effect of receipt

The convergence function retrieves the capabilities and reports them via the MSGCF-ESS-LINK-CAPABILITY.confirm primitive.

6.4.8.2 MSGCF-ESS-LINK-CAPABILITY.confirm

6.4.8.2.1 Function

This primitive reports the convergence function capabilities of the network to higher layer protocols.

6.4.8.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-CAPABILITY.confirm(
    ESSIdentifier,
    EssLinkParameterSet,
    ReasonCode
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------------|--|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EventCapability Set | As defined in Table 6-6 | N/A | list of supported events. |
| ReasonCode | Enumerated | SUCCESS, UNKNOWN_NETWORK, UNKNOWN_CAPABILITIES | An error code, if applicable. |

Table 6-6—Event Capability Set

| Name | Type | Valid range | Description |
|---------------------|------------|----------------------------------|--|
| NonAPSTAMacAddress | MacAddress | Any valid individual MAC Address | The MAC address of the non-AP STA that is reporting the new network. |
| ESS-Link-Up | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-UP.indication primitive as defined in 6.4.7.1 is supported. |
| ESS-Link-Down | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-DOWN.indication primitive as defined in 6.4.7.2 is supported. |
| ESS-Link-Going-Down | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-GOING-DOWN primitive as defined in 6.4.7.3 is supported. |

Table 6-6—Event Capability Set (continued)

| Name | Type | Valid range | Description |
|---------------------------|---------|-------------|--|
| ESS-Link-Event-Rollback | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-EVENT-ROLLBACK.indication primitive as defined in 6.4.7.4 is supported. |
| ESS-Link-Detected | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-DETECTED.indication primitive as defined in 6.4.7.5 is supported. |
| ESS-Link-Threshold-Report | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-THRESHOLD-REPORT.indication primitive as defined in 6.4.9.1 is supported. |
| ESS-Link-Command | Boolean | true, false | Indicates whether the MSGCF-ESS-LINK-COMMAND.request primitive as defined in 6.4.10.1 is supported. |

6.4.8.2.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-CAPABILITY.request primitive to report whether specific events are supported.

6.4.8.2.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function.

6.4.8.3 MSGCF-ESS-LINK-PARAMETERS.request

6.4.8.3.1 Function

This primitive sets thresholds for reporting of network events.

6.4.8.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-PARAMETERS.request(
    ESSIDIdentifier,
    EssLinkParameterSet
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EssLinkParameterSet | As defined in Table 6-7 | N/A | The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers. |

The EssLinkParameterSet parameter is defined in Table 6-7. It may include any or all of the parameters in Table 6-7.

Table 6-7—ESS Link Parameter Set

| Name | Type | Valid range | Description |
|-------------------------|-----------------|------------------------|---|
| PeakOperationalRate | Integer | As defined in 9.4.2.3 | The integer representing the target peak modulation data rate used for Data frame transmission. |
| MinimumOperationalRate | Integer | As defined in 9.4.2.3 | The integer encoding of the target minimum modulation data rate used in Data frame transmission. |
| NetworkDowntimeInterval | Integer | 0 – 65 535 | Target advance warning time interval, in TUs, for MSGCF-ESS-LINK-GOING-DOWN events. |
| DataFrameRSSI | Integer | –100 to 40 | The received signal strength in dBm of received Data frames from the network. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| BeaconRSSI | Integer | –100 to 40 | The received signal strength in dBm of Beacon frames received on the channel. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| BeaconSNR | Integer | 0–100 | The signal-to-noise ratio of the received Data frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| DataFrameSNR | Integer | 0–100 | The signal-to-noise ratio of the received Beacon frames, in dB. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| DataThroughput | Integer | 0 – 65 535 | The data throughput in megabits per second, rounded to the nearest megabit. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| MissedBeaconRate | Real | N/A | The rate at which beacons have not been received in missed beacons per second. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| FrameErrorRate | Real | N/A | The frame error rate of the network in errors per second. This may be time-averaged over recent history by a vendor-specific smoothing function. |
| VendorSpecific | Vendor Specific | As defined by 9.4.2.26 | Additional vendor-specific parameters may be included in this event. |

6.4.8.3.3 When generated

This event is generated when higher protocol layers wish to set the performance parameters for a network. Higher protocol layers are responsible for ensuring that the set of configured network parameters is consistent with all subscribers to those higher layer protocols.

6.4.8.3.4 Effect of receipt

Parameters supplied in the event are stored in the MIB, either in the dot11MACStateConfigTable or the dot11MACStateParameterTable.

6.4.8.4 MSGCF-ESS-LINK-PARAMETERS.confirm

6.4.8.4.1 Function

This primitive indicates whether network parameters were accepted.

6.4.8.4.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-PARAMETERS.confirm(
    ESSIdentifier,
    EssLinkParameterSet,
)
```

| Name | Type | Valid range | Description |
|---------------------|-------------------------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EssLinkParameterSet | As defined in Table 6-7 | N/A | The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers. |

6.4.8.4.3 When generated

This primitive is generated in response to the MSGCF-ESS-LINK-PARAMETERS.request primitive and is used to indicate whether the parameter set was accepted.

6.4.8.4.4 Effect of receipt

The SME is notified of the new parameter set.

6.4.8.5 MSGCF-GET-ESS-LINK-PARAMETERS.request

6.4.8.5.1 Function

This primitive retrieves the current network parameters for a specific network.

6.4.8.5.2 Semantics of the service primitive

The primitive parameter is as follows:

```
MSGCF-GET-ESS-LINK-PARAMETERS.request(
    ESSIdentifier
)
```

| Name | Type | Valid range | Description |
|---------------|--------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |

6.4.8.5.3 When generated

This primitive is used by higher layers to retrieve the currently stored parameters for a network.

6.4.8.5.4 Effect of receipt

The SME retrieves the network parameters and makes them available through the MSGCF-GET-ESS-LINK-PARAMETERS.confirm primitive.

6.4.8.6 MSGCF-GET-ESS-LINK-PARAMETERS.confirm

6.4.8.6.1 Function

This primitive reports the current network parameters.

6.4.8.6.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-GET-ESS-LINK-PARAMETERS.confirm(
    ESSIdentifier,
    EssLinkParameterSet,
)
```

| Name | Type | Valid range | Description |
|---------------------|--------------------|-------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EssLinkParameterSet | As defined 6.4.8.3 | N/A | The EssLinkParameterSet is used to configure when event reports are sent to higher protocol layers. |

6.4.8.6.3 When generated

This primitive is generated by the MSGCF as a result of the MSGCF-GET-ESS-LINK-PARAMETERS.request primitive.

6.4.8.6.4 Effect of receipt

The higher layer protocols are notified of the current network parameters.

6.4.9 Network events

6.4.9.1 MSGCF-ESS-LINK-THRESHOLD-REPORT.indication

6.4.9.1.1 Function

This event reports that the layer 2 network performance has crossed a threshold set by the operations described in Table 6-5.

6.4.9.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-THRESHOLD-REPORT.indication(
    ESSIdentifier,
    EssLinkParameterSet,
    ThresholdCrossingDirectionSet
)
```

| Name | Type | Valid range | Description |
|-------------------------------|--|---------------------|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| EssLinkParameterSet | As defined in Table 6-7 | N/A | A list of EssLinkParameterSets and their current values that have crossed preset thresholds for alerts. |
| ThresholdCrossingDirectionSet | Set of ThresholdCrossing Directions, one for each value in the EssLinkParameterSet | UPWARD, DOWNWARD | Whether the parameter has crossed the threshold while rising or falling. |

6.4.9.1.3 When generated

The convergence function is responsible for monitoring network performance. If the monitored parameters cross the configured threshold, this event is generated to inform higher layer protocols.

6.4.9.1.4 Effect of receipt

This event is made available to higher layer protocols by the convergence function. Actions taken by those higher layers are outside the scope of this standard, but may include preparations for handover or assessing whether handover should be imminent.

6.4.10 Network command interface

6.4.10.1 MSGCF-ESS-LINK-COMMAND.request

6.4.10.1.1 Function

This primitive requests that a STA take action for a network.

6.4.10.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSGCF-ESS-LINK-COMMAND.request(
    ESSIdentifier,
    CommandType
)
```

| Name | Type | Valid range | Description |
|---------------|------------|--|--|
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |
| CommandType | Enumerated | DISCONNECT, LOW_POWER, POWER_UP, POWER_DOWN, SCAN | Type of command to perform on the link as described in the following subclauses. |

6.4.10.1.3 When generated

This primitive is generated by a higher layer protocol.

6.4.10.1.4 Effect of receipt

The convergence function issues commands to the SME to implement the requested action on behalf of higher layers.

When the DISCONNECT command type is specified, the higher layer is requesting that the STA disconnect from its peer. When the SME on a non-AP STA receives this command, the SME issues an MLME-DEAUTHENTICATE.request primitive to disconnect from the network, and the SME refrains from reconnecting to that network.

When the POWER_DOWN command type is specified, the SME powers down the non-AP STA. Before doing so, it may choose to notify the AP.

When the POWER_UP command type is specified, the SME starts the non-AP STA.

When the LOW_POWER command type is specified, the higher layer is requesting that the interface be placed in a low power mode. This action is accomplished by issuing an MLME-POWERMGT.request primitive with the PowerManagementMode parameter set to POWER_SAVE.

When the SCAN command type is specified, the higher layer is requesting that the STA search for networks. This action is accomplished by issuing an MLME-SCAN.request primitive. Detected networks are made available in the dot11MACStateESSLinkDetectedTable, as well as through the MSGCF-ESS-LINK-DETECTED.indication primitive.

6.4.11 MAC state SME SAP—mobility management

6.4.11.1 MSSME-ESS-LINK-GOING-DOWN.indication

6.4.11.1.1 Function

This primitive indicates that the SME is predicting a link failure.

6.4.11.1.2 Semantics of the service primitive

The primitive parameters are as follows:

```
MSSME-ESS-LINK-GOING-DOWN.indication(
    ESSIDIdentifier,
    TimeInterval,
    ReasonCode
)
```

| Name | Type | Valid range | Description |
|---------------------|------------|----------------------------------|--|
| NonAPSTAMac Address | MacAddress | Any valid individual MAC Address | The MAC address of the non-AP STA that is reporting that an ESS is expected to go down. |
| ESSIdentifier | String | N/A | An identifier for the network, composed of the string value of the SSID element used to identify the network, concatenated with the value of the HESSID if it is in use. |

| Name | Type | Valid range | Description |
|--------------|------------|---|---|
| TimeInterval | Integer | N/A | Time Interval, in time units, in which the link is expected to go down. Connectivity is expected to be available at least for time specified by <i>TimeInterval</i> . |
| Reason Code | Enumerated | EXPLICIT_DISCONNECT, LINK_PARAMETER_DEGRADATION, KEY_EXPIRATION, LOW_POWER, QOS_UNAVAILABLE, VENDOR_SPECIFIC | Indicates the reason the link is expected to go down. |

6.4.11.1.3 When generated

This notification is generated by the SME when the network connection is currently established and is expected to go down. The details of the predictive algorithm used are beyond the scope of this standard. One method of implementing this function would be to generate this indication when link quality is fading and no better AP can be found.

6.4.11.1.4 Effect of receipt

This indication is received by the MSGCF and is used to generate the MSGCF-ESS-LINK-DOWN.indication primitive due to link parameter degradation.

6.5 PLME SAP interface

6.5.1 General

The PHY management service interface consists of the generic PLMEGET and PLMESET primitives on PHY MIB attributes, as described previously, together with the PLME-RESET and PLME-CHARACTERISTICS primitives and the following specific primitives.

6.5.2 PLME-RESET.request

6.5.2.1 Function

This primitive is a request by the SME to reset the PHY. The PHY is always reset to the receive state to avoid accidental data transmission.

6.5.2.2 Semantics of the service primitive

This primitive has no parameters.

6.5.2.3 When generated

This primitive is generated at any time to reset the PHY.

6.5.2.4 Effect of receipt

Receipt of this primitive by the PHY causes the PHY entity to reset both the transmit and the receive state machines and places the PHY into the receive state.

6.5.3 PLME-CHARACTERISTICS.request

6.5.3.1 Function

This primitive is a request by the SME to provide the PHY operational characteristics.

6.5.3.2 Semantics of the service primitive

This primitive has no parameters.

6.5.3.3 When generated

This primitive is generated by the SME, at initialization time, to request the PHY entity to provide its operational characteristics.

6.5.3.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is the generation of a PLME-CHARACTERISTICS.confirm primitive that conveys its operational characteristics.

6.5.4 PLME-CHARACTERISTICS.confirm

6.5.4.1 Function

This primitive provides the PHY operational parameters.

6.5.4.2 Semantics of the service primitive

The primitive provides the following parameters:

PLME-CHARACTERISTICS.confirm(
 aSlotTime,
 aSIFSTime,
 aSignalExtension,
 aCCATime,
 aCCAMidTime,
 aRxPHYStartDelay,
 aRxTxTurnaroundTime,
 aTxPHYDelay,
 aRxPHYDelay,
 aRxTxSwitchTime,
 aTxRampOnTime,
 aAirPropagationTime,
 aMACProcessingDelay,
 aPreambleLength,
 aRIFSTime,
 aSymbolLength,
 aSTFOneLength,
 aSTFTwoLength,
 aLTFOneLength,
 aLTFTwoLength,
 aPHYHeaderLength,
 aPHYSigTwoLength,
 aPHYServiceLength,
 aPHYConvolutionalTailLength,

```

        aPSDUMaxLength,
        aPPDUMaxTime,
        aIUSTime,
        aDTT2UTTTime,
        aCWmin,
        aCWmax,
        aMaxCSIMatricesReportDelay
        aMaxTODError,
        aMaxTOAError,
        aTxPHYTxStartRFDelay,
        aTxPHYTxStartRMS,
        aMaxTODFineError,
        aMaxTOAFineError
    )
)
    
```

The values assigned to the parameters are as specified in the PLME SAP interface specification contained within each PHY subclass of this standard. Not all parameters are used by all PHYs defined within this standard.

| Name | Type | Description |
|---------------------|---------|--|
| aSlotTime | integer | The Slot Time (in microseconds) that the MAC uses for defining IFSs. See 10.3.7. |
| aSIFSTime | integer | The nominal time (in microseconds) that the MAC and PHY require in order to receive the last symbol of a frame on the WM, process the frame, and respond with the first symbol on the WM of the earliest possible response frame. See 10.3.7. |
| aSignalExtension | integer | Duration (in microseconds) of the signal extension (i.e., a period of no transmission) that is included at the end of certain PPDU formats; see 19.3.2 and 10.3.8. |
| aCCATime | integer | For Clause 15 through Clause 18 PHYs and Clause 20 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether the medium is busy or idle. For Clause 19 and Clause 21 PHYs, the maximum time (in microseconds) that the CCA mechanism has available to detect the start of a valid IEEE 802.11 transmission within the primary channel and to assess the energy on the medium within the primary, secondary, secondary40 (Clause 21 PHY only), and secondary80 (Clause 21 PHY only) channels that fall inside the operating channel, in order to determine the values of the STATE and channel-list parameters of the PHY-CCA.indication primitive. |
| aCCAMidTime | integer | For Clause 21 PHYs, the maximum time (in microseconds) the CCA mechanism has available to assess the medium to determine whether an IEEE 802.11 transmission is present on a nonprimary channel. |
| aRxPHYStartDelay | integer | The delay, in microseconds, from the start of the PPDU at the receiver's antenna to the issuance of the PHY-RXSTART.indication primitive. |
| aRxTxTurnaroundTime | integer | The maximum time (in microseconds) that the PHY requires to change from receiving to transmitting the start of the first symbol. See 10.3.7. |
| aTxPHYDelay | integer | The nominal time (in microseconds) that the PHY uses to deliver a symbol from the MAC interface to the air interface. |
| aRxPHYDelay | integer | The nominal time (in microseconds) that the PHY uses to deliver the last bit of a received frame from end of the last symbol on the WM to the MAC. |
| aRxTxSwitchTime | integer | The nominal time (in microseconds) that the PHY takes to switch from Receive to Transmit. |
| aTxRampOnTime | integer | The maximum time (in microseconds) that the PHY takes to turn the Transmitter on. |

| Name | Type | Description |
|-----------------------------|---------|--|
| aAirPropagationTime | integer | Twice the propagation time (in microseconds) for a signal to cross the maximum distance between the most distant allowable STAs that are slot synchronized. |
| aMACProcessingDelay | integer | The maximum time (in microseconds) available for the MAC to issue a PHY-TXSTART.request primitive pursuant to a PHY-RXEND.indication primitive (for response after SIFS) or PHY-CCA.indication(IDLE) primitive (for response at any slot boundary following a SIFS). This constraint on MAC performance is defined as a PHY-specific parameter because of its use, along with other PHY-specific time delays, in calculating the two PHY characteristics of primary concern to the MAC: aSlotTime and aSIFSTime. See 10.3.7. |
| aPreambleLength | integer | The current PHY's preamble length (in microseconds). If the actual value of the length of the modulated preamble is not an integer number of microseconds, the value is rounded up to the next higher value. |
| aRIFSTime | integer | Value of the reduced interframe space (in microseconds), which is the time by which multiple transmissions from a single transmitter may be separated, when no SIFS-separated response transmission is expected. See 10.3.2.3.2 |
| aSymbolLength | integer | The current PHY's Symbol length (in microseconds). If the actual value of the length is not an integer number of μ s, the value is rounded up to the next higher value. |
| aSTFOneLength | integer | Length of the non-HT-STF (L-STF) for HT-mixed format, and the HT-greenfield STF (HT-GF-STF) for HT-greenfield format (in microseconds) |
| aSTFTwoLength | integer | Length of the HT-STF (in microseconds) |
| aLTFOneLength | integer | Length of the First HT-LTF (in microseconds) |
| aLTFTwoLength | integer | Length of the Additional HT-LTFs (in microseconds) |
| aPHYHeaderLength | integer | The current PHY's header length (in microseconds), excluding aPHYSigTwoLength if present. If the actual value of the length of the modulated header is not an integer number of microseconds, the value is rounded up to the next higher value. |
| aPHYSigTwoLength | integer | Length of the HT SIGNAL field (HT-SIG) (in microseconds). |
| aPHYServicelength | integer | The length of the PHY SERVICE field (in number of bits). |
| aPHYConvolutionalTailLength | integer | The length of the sequence of convolutional code tail bits (in number of bits). |
| aPSDUMaxLength | integer | The maximum number of octets in a PSDU that can be conveyed by a PPDU. |
| aPPDUMaxTime | integer | The maximum duration of a PPDU in milliseconds. |
| aIUSTime | integer | The minimum time between the end of a PSMP-UTT and the start of the following PSMP-UTT in the same PSMP sequence. |
| aDTT2UTTTime | integer | The minimum time between the end of a PSMP-DTT and the start of the PSMP-UTT addressed to the same STA. |
| aCWmin | integer | The minimum size of the CW, in units of aSlotTime. |
| aCWmax | integer | The maximum size of the CW, in units of aSlotTime. |
| aMaxCSIMatricesReportDelay | integer | The maximum time (in milliseconds) between the reception of a frame containing a CSI Feedback Request or an null data packet (NDP) announcement and the transmission of the first CSI frame containing channel state information measured from the received Sounding Complete frame. See 10.32.2.4.4. |
| aMaxTODError | Integer | An estimate of the maximum error (in 10 ns units) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm(TXSTATUS) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability. |
| aMaxTOAError | Integer | An estimate of the maximum error (in 10 ns units) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication(RXVECTOR) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability. |

| Name | Type | Description |
|----------------------|---------|---|
| aTxPHYTxStartRFDelay | Integer | The delay (in units of 0.5 ns) between a PHY-TXSTART.request primitive being issued and the first frame energy sent by the transmitting port, for the current channel. |
| aTxPHYTxStartRMS | Integer | The RMS time of departure error (in units of 0.5 ns), where the time of departure error equals the difference between TIME_OF_DEPARTURE and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. |
| aMaxTODFineError | Integer | An estimate of the maximum error (in units of picoseconds) in the TX_START_OF_FRAME_OFFSET value in the PHY-TXSTART.confirm(TXSTATUS) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability. |
| aMaxTOAFineError | Integer | An estimate of the maximum error (in units of picoseconds) in the RX_START_OF_FRAME_OFFSET value in the PHY-RXSTART.indication(RXVECTOR) primitive. The estimated maximum error includes any error due to implementation component and environmental (including temperature) variability. |

6.5.4.3 When generated

This primitive is issued by the PHY entity in response to a PLME-CHARACTERISTICS.request primitive.

6.5.4.4 Effect of receipt

The receipt of this primitive provides the operational characteristics of the PHY entity.

6.5.5 PLME-TXTIME.request

6.5.5.1 Function

This primitive is a request for the PHY to calculate the time required to transmit onto the WM a PPDU containing a specified length PSDU, and using a specified format, data rate, and signaling.

6.5.5.2 Semantics of the service primitive

This primitive provides the following parameter:

PLME-TXTIME.request(
 TXVECTOR
)

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

6.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to determine the time required to transmit a particular PSDU.

6.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to generate a PHY-TXTIME.confirm primitive that conveys the required transmission time.

6.5.6 PLME-TXTIME.confirm

6.5.6.1 Function

This primitive indicates the time required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive.

When the TXVECTOR parameter FORMAT in the corresponding PLME-TXTIME.request primitive is VHT, the primitive also provides the number of octets, per user, required to fill the PPDU.

6.5.6.2 Semantics of the service primitive

This primitive provides the following parameter:

```
PLME-TXTIME.confirm(  
    TXTIME  
    PSDU_LENGTH[]  
)
```

The TXTIME represents the time, in microseconds, required to transmit the PPDU described in the corresponding PLME-TXTIME.request primitive. If the calculated time includes a fractional microsecond, a non-DMG STA rounds the TXTIME value to the next higher integer. A DMG STA does not round the TXTIME value up or down (see 20.12.3).

The PSDU_LENGTH[] parameter is an array of size TXVECTOR parameter NUM_USERS. Each value in the array indicates the number of octets required to fill the PPDU for the user represented by that array index. The parameter is present only when the TXVECTOR FORMAT parameter is VHT.

6.5.6.3 When generated

This primitive is issued by the local PHY entity in response to a PLME-TXTIME.request primitive.

6.5.6.4 Effect of receipt

The receipt of this primitive provides the MAC sublayer with the PPDU transmission time.

7. DS SAP specification

7.1 Introduction

The DS SAP is the interface between the DS SAP service users and the DS SAP service provider. The DS SAP service users are the connected APs, mesh gates, and the portal. The DS SAP service provider is the DS. Figure 7-1 shows the location of the DS in the IEEE 802.11 architecture. The DS SAP is indicated in this Figure by the lines connecting the DS to its service users. In Figure 7-1, the DS has four users, two APs, a mesh gate, and a portal, so the DS is shown passing behind the MAC/PHYs of the STAs.

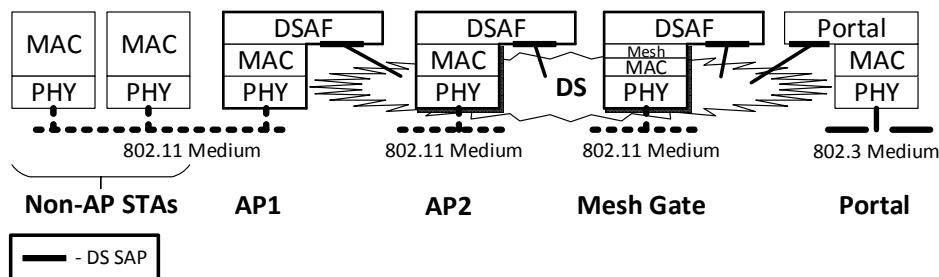

Figure 7-1—DS architecture

The DS SAP interface specification describes the primitives required to get MAC service tuples in and out of the DS and update the DS's mapping of STAs to APs or to mesh gates. Describing the DS itself or the functions thereof is out of scope of this annex.

The DS SAP actions are as follows:

- Accept MSDUs (as part of MAC service tuples) from APs, mesh gates, and the portal.
- Deliver MSDUs (as part of MAC service tuples) to APs, mesh gates, or the portal.
- Accept STA-to-AP mapping updates from the APs.
- Accept STA-to-mesh gate mapping updates from the mesh gates.

When the DS delivers the MAC service tuples to an AP, the AP then determines when and how to deliver the MAC service tuples to the AP's MAC (via the MAC SAP). When the DS delivers the MAC service tuples to a mesh gate, the mesh gate then determines when and how to deliver the MAC service tuples to the mesh gate's MAC (via the MAC SAP).

7.2 SAP primitives

7.2.1 General

The DS SAP service interface primitives are as follows:

- DS-UNITDATA.request
- DS-UNITDATA.indication
- DS-STA-NOTIFY.request

7.2.2 MSDU transfer

7.2.2.1 General

The DS-UNITDATA primitives accept and deliver IEEE 802.11 MAC service tuples, including all of the parameters and data as defined in 5.2.2.2.

7.2.2.2 DS-UNITDATA.request

7.2.2.2.1 Function

This primitive requests distribution of a MAC service tuple across the DS.

7.2.2.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
DS-UNITDATA.request(
    MAC service tuple,
    SourceType
)
```

| Name | Type | Valid range | Description |
|-------------------|------------------|---|--|
| MAC service tuple | IEEE 802.11 MSDU | Any valid data unit according to 5.2.2.2, including data and all parameters | Specifies the MAC service tuple to be distributed via the DS. |
| SourceType | Enumeration | SRC_AP, SRC_MESH_GATE, SRC_PORTAL | Specifies the type of entity that is requesting distribution of a MAC service tuple. |

7.2.2.2.3 When generated

This primitive is generated by an AP, mesh gate, or portal to submit a MAC service tuple to the DS for distribution.

7.2.2.2.4 Effect of receipt

This primitive initiates distribution of the MAC service tuple through the DS. An individually addressed MAC service tuple from an AP, mesh gate, or portal is distributed through the DS to the corresponding AP, mesh gate, or portal. A group addressed MAC service tuple from an AP is distributed to all APs, mesh gates, and the portal, including the originating entity. A group addressed MAC service tuple from a portal is distributed to all APs and mesh gates.

7.2.2.3 DS-UNITDATA.indication

7.2.2.3.1 Function

This primitive indicates delivery of a MAC service tuple from the DS to an AP, mesh gate, or portal.

7.2.2.3.2 Semantics of the service primitive

The primitive parameters are as follows:

```
DS-UNITDATA.indication(
    MAC service tuple
)
```

| Name | Type | Valid range | Description |
|-------------------|------------------|---|--|
| MAC service tuple | IEEE 802.11 MSDU | Any valid data unit according to 5.2.2.2, including data and all parameters | Specifies the MAC service tuple that is being delivered by the DS. |

7.2.2.3.3 When generated

This primitive is generated by the DS to deliver a MAC service tuple to an AP, mesh gate, or portal.

7.2.2.3.4 Effect of receipt

This primitive delivers a MAC service tuple to an AP, mesh gate, or portal.

7.2.3 Mapping updates

7.2.3.1 General

The DS-STA-NOTIFY primitive is used to maintain the STA-to-AP and mesh STA-to-mesh gate mapping data of the DS.

7.2.3.2 DS-STA-NOTIFY.request

7.2.3.2.1 Function

This primitive requests an update to the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.2 Semantics of the service primitive

The primitive parameters are as follows:

```
DS-STA-NOTIFY.request(
    STAAddress,
    UpdateType
)
```

| Name | Type | Valid range | Description |
|------------|-------------|----------------------------------|--|
| STAAddress | MACAddress | Any valid individual MAC address | When generated by an AP, specifies the address of the STA whose association status with the AP has changed. When generated by a mesh gate, specifies the address of the mesh STA whose reachability status through the mesh gate has changed. |
| UpdateType | Enumeration | ADD, MOVE, DELETE | Specifies the DS mapping update operation to be performed. |

7.2.3.2.3 When generated

This primitive is generated by an AP or mesh gate to update the DS's STA-to-AP map or mesh STA-to-mesh gate map.

7.2.3.2.4 Effect of receipt

When generated by an AP, this primitive updates the DS's STA-to-AP map, which controls to which AP the DS delivers MAC service tuples that are destined for a given STA.

When generated by a mesh gate, this primitive updates the DS's mesh STA-to-mesh gate map, which controls to which mesh gate the DS delivers MAC service tuples that are destined for a given mesh STA. The mesh STA-to-mesh gate map can be incomplete.

There are many mechanisms to implement this mapping update for the cases of ADD and MOVE. One example mechanism, in the case where the DS is an IEEE 802 LAN, is to use an IEEE 802.2TM XID null frame.

8. PHY service specification

8.1 Scope

The PHY services provided to the MAC are described in this clause. Different PHYs are defined as part of this standard. Each PHY can consist of the following protocol functions:

- a) A function that defines a method of mapping the MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs.
- b) A function that defines the characteristics of, and method of transmitting and receiving data through, a WM between two or more STAs.

8.2 PHY functions

The protocol reference model for the IEEE 802.11 architecture is shown in Figure 4-19 (in 4.9). Most PHY definitions contain two functional entities: the PHY function and the layer management function.

The PHY service is provided to the MAC entity at the STA through a SAP, called the *PHYSAP*, as shown in Figure 4-19.

8.3 Detailed PHY service specifications

8.3.1 Scope and field of application

The services provided by the PHY to the MAC are specified in this subclause. These services are described in an abstract way and do not imply any particular implementation or exposed interface.

8.3.2 Overview of the service

The function of the PHY is to provide a mechanism for transferring MPDUs between two or more STAs.

8.3.3 Overview of interactions

The primitives associated with communication between the MAC sublayer and the PHY fall into two basic categories:

- a) Service primitives that support MAC peer-to-peer interactions;
- b) Service primitives that have local significance and support sublayer-to-sublayer interactions.

8.3.4 Basic service and options

8.3.4.1 PHY SAP peer-to-peer service primitives

Table 8-1 indicates the primitives for peer-to-peer interactions.

Table 8-1—PHY SAP peer-to-peer service primitives

| Primitive | Request | Indication | Confirm |
|-----------|---------|------------|---------|
| PHY-DATA | X | X | X |

8.3.4.2 PHY SAP inter-(sub)layer service primitives

Table 8-2 indicates the primitives for sublayer-to-sublayer interactions.

Table 8-2—PHY SAP inter-(sub)layer service primitives

| Primitive | Request | Indication | Confirm |
|-----------------|---------|------------|---------|
| PHY-TXSTART | X | | X |
| PHY-TXEND | X | | X |
| PHY-CCARESET | X | | X |
| PHY-CCA | | X | |
| PHY-RXSTART | | X | |
| PHY-RXEND | | X | |
| PHY-CONFIG | X | | X |
| PHY-TXBUSY | | X | |
| PHY-TXHEADEREND | | X | |

8.3.4.3 PHY SAP service primitives parameters

Table 8-3 shows the parameters used by one or more of the PHY SAP service primitives.

Table 8-3—PHY SAP service primitive parameters

| Parameter | Associated primitive | Value |
|------------------|--|--|
| DATA | PHY-DATA.request PHY-DATA.indication | Octet value X'00'–X'FF' |
| TXVECTOR | PHY-TXSTART.request | A set of parameters |
| STATE | PHY-CCA.indication | (BUSY, [channel-list]) (IDLE) |
| RXVECTOR | PHY-RXSTART.indication PHY-RXEND.indication | A set of parameters |
| RXERROR | PHY-RXEND.indication | NoError, FormatViolation, CarrierLost, UnsupportedRate, Filtered |
| IPI-STATE | PHY-CCARESET.request PHY-CCARESET.confirm | IPI-ON, IPI-OFF |
| IPI-REPORT | PHY-CCA.indication PHY-CCARESET.confirm | A set of IPI values for the preceding time interval |
| PHYCONFIG_VECTOR | PHY-CONFIG | A set of parameters |
| TXSTATUS | PHY-TXSTART.confirm | A set of parameters |
| STATE | PHY-TXBUSY.indication | IDLE, BUSY |

8.3.4.4 Vector descriptions

Several service primitives include a parameter vector. This vector is a list of parameters that may vary depending on the PHY type. Table 8-4 lists the minimum parameter values required by the MAC or PHY in each of the parameter vectors.

Table 8-4—Vector descriptions

| Parameter | Associated vector | Value |
|--------------------------|--------------------|---|
| DATARATE | TXVECTOR, RXVECTOR | PHY dependent. The name of the field used to specify the Tx data rate and report the Rx data rate may vary for different PHYs. |
| LENGTH | TXVECTOR, RXVECTOR | PHY dependent |
| ACTIVE_RXCHAIN_SET | PHYCONFIG_VECTOR | The ACTIVE_RXCHAIN_SET parameter indicates which receive chains of the available receive chains are active. |
| OPERATING_CHANNEL | PHYCONFIG_VECTOR | The operating channel the PHY is configured use. |
| SECONDARY_CHANNEL_OFFSET | PHYCONFIG_VECTOR | Enumerated type: SECONDARY_CHANNEL_NONE indicates operation in 20 MHz HT STAs. SECONDARY_CHANNEL_ABOVE indicates operation in 40 MHz with the secondary channel above the primary. SECONDARY_CHANNEL_BELOW indicates operation in 40 MHz with the secondary channel below the primary. |
| ANT_CONFIG | PHYCONFIG_VECTOR | Indicates which antenna configuration(s) is to be used when receiving packets and which configuration is to be used when switching configurations during the reception of a packet. Values are implementation dependent. |
| GROUP_ID_MANAGEMENT | PHYCONFIG_VECTOR | Specifies membership status and STA position for each of the group IDs as described in 9.6.23.3 |
| PARTIAL_AID_LIST_GID00 | PHYCONFIG_VECTOR | Includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 0. The settings of the PARTIAL_AID are specified in 10.20). |
| PARTIAL_AID_LIST_GID63 | PHYCONFIG_VECTOR | Includes the list of partial AIDs, of which the STA is an intended recipient, associated with group ID 63. The settings of the PARTIAL_AID are specified in 10.20). |
| LISTEN_TO_GID00 | PHYCONFIG_VECTOR | When true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to the value 0. |
| LISTEN_TO_GID63 | PHYCONFIG_VECTOR | When true, indicates to the PHY not to filter out PPDUs with GROUP_ID field equal to the value 63. |

The Clause 19 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 19 PHY modes of operation as described in 19.2. In certain modes of operation, the

DATARATE parameter is replaced by MCS, CH_BANDWIDTH and GI_TYPE values. The mapping from these values to data rate is defined in 19.5.

The Clause 21 PHY TXVECTOR and RXVECTOR contain additional parameters related to the operation of the Clause 21 PHY modes of operation as described in 21.2. In certain modes of operation, the DATARATE parameter is replaced by MCS, CH_BANDWIDTH, NUM_STS, STBC and GI_TYPE values. The mapping from these values to data rate is defined 21.5, where VHT-MCS is MCS and N_{SS} is NUM_STS / (STBC + 1).

8.3.5 PHY SAP detailed service specification

8.3.5.1 Introduction

Subclause 8.3.5 describes the services provided by each PHY primitive.

8.3.5.2 PHY-DATA.request

8.3.5.2.1 Function

This primitive defines the transfer of an octet of data from the MAC sublayer to the local PHY entity.

8.3.5.2.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-DATA.request(
 DATA
 USER_INDEX
)

The DATA parameter is an octet of value X'00' to X'FF'.

The USER_INDEX parameter (typically identified as *u* for a VHT STA; see NOTE 1 at the end of Table 21-1) is present for a VHT MU PPDU and indicates the index of the user in the TXVECTOR to which the accompanying DATA octet applies; otherwise, this parameter is not present.

8.3.5.2.3 When generated

This primitive is generated by the MAC sublayer to transfer an octet of data to the PHY entity. This primitive can be issued only following a transmit initialization response (a PHY-TXSTART.confirm primitive) from the PHY.

8.3.5.2.4 Effect of receipt

The receipt of this primitive by the PHY entity causes the PHY transmit state machine to transmit an octet of data. When the PHY entity receives the octet, it issues a PHY-DATA.confirm primitive to the MAC sublayer.

8.3.5.3 PHY-DATA.indication

8.3.5.3.1 Function

This primitive indicates the transfer of data from the PHY to the local MAC entity.

8.3.5.3.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-DATA.indication(

DATA
)

The DATA parameter is an octet of value X'00' to X'FF'.

8.3.5.3.3 When generated

The PHY-DATA.indication primitive is generated by a receiving PHY entity to transfer the received octet of data to the local MAC entity. The time between receipt of the last bit of the last provided octet from the WM and the receipt of this primitive by the MAC entity is aRxPHYDelay.

8.3.5.3.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

8.3.5.4 PHY-DATA.confirm

8.3.5.4.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the transfer of data from the MAC entity to the PHY.

8.3.5.4.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-DATA.confirm

This primitive has no parameters.

8.3.5.4.3 When generated

This primitive is issued by the PHY to the MAC entity the transfer of data from the MAC entity to the PHY has completed. The PHY issues this primitive in response to every PHY-DATA.request primitive issued by the MAC sublayer.

8.3.5.4.4 Effect of receipt

The receipt of this primitive by the MAC causes the MAC to start the next MAC entity request.

8.3.5.5 PHY-TXSTART.request

8.3.5.5.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to start the transmission of a PSDU.

8.3.5.5.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-TXSTART.request(  
    TXVECTOR  
)
```

The TXVECTOR represents a list of parameters that the MAC sublayer provides to the local PHY entity in order to transmit a PSDU. The minimum required PHY parameters are listed in 8.3.4.4.

8.3.5.5.3 When generated

This primitive is issued by the MAC sublayer to the PHY entity when the MAC sublayer needs to begin the transmission of a PSDU.

8.3.5.5.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to start the local transmit state machine.

The behavior expected by the MAC pursuant to the issuance of PHY-TXSTART.request primitive is shown in Figure 10-19 (in 10.3.7) and Figure 10-26.

8.3.5.6 PHY-TXSTART.confirm

8.3.5.6.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the start of a transmission and to indicate parameters related to the start of the transmission. The PHY issues this primitive in response to every PHY-TXSTART.request issued by the MAC sublayer.

8.3.5.6.2 Semantics of the service primitive

The semantics of the primitive are as follows:

```
PHY-TXSTART.confirm(  
    TXSTATUS  
)
```

The TXSTATUS represents a list of parameters that the local PHY entity provides to the MAC sublayer related to the transmission of an MPDU. The required PHY parameters are listed in 8.3.4.3.

8.3.5.6.3 When generated

This primitive is issued by the PHY to the MAC entity once all of the following conditions are met:

- The PHY has received a PHY-TXSTART.request primitive from the MAC entity.
- The PHY is ready to begin accepting outgoing data octets from the MAC.

If dot11TODImplemented and dot11TODActivated are both true or dot11TimingMsmtActivated is true; and the parameter TIME_OF_DEPARTURE_REQUESTED in the TXVECTOR specified in the PHY-TXSTART.request is true, then the PHY shall include the TIME_OF_DEPARTURE corresponding to the time when the first frame energy is sent by the transmitting port and TIME_OF_DEPARTURE_ClockRate parameters in the TXSTATUS vector (See Table 15-3).

If dot11TimingMsmtActivated is true, then the PHY shall include TX_START_OF_FRAME_OFFSET in the TXSTATUS vector (See Table 15-3).

8.3.5.6.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to start the transfer of data octets. Parameters in the TXSTATUS vector may be included in transmitted frames so that recipients on multiple channels can compensate for differences in the transmit time of the frames, and so to determine the time differences of air propagation times between transmitter and pairs of recipients and hence to compute the location of the transmitter via multilateration. See Annex P. In addition, the TXSTATUS vector may include the TX_START_OF_FRAME_OFFSET.

8.3.5.7 PHY-TXEND.request

8.3.5.7.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity that the current transmission of the PSDU be completed.

8.3.5.7.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-TXEND.request

This primitive has no parameters.

8.3.5.7.3 When generated

This primitive is generated when the MAC sublayer has received the last PHY-DATA.confirm primitive from the local PHY entity for the PSDU currently being transferred.

8.3.5.7.4 Effect of receipt

The effect of receipt of this primitive by the local PHY entity is to stop the transmit state machine.

8.3.5.8 PHY-TXEND.confirm

8.3.5.8.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm the completion of a transmission. The PHY issues this primitive in response to every PHY-TXEND.request primitive issued by the MAC sublayer.

8.3.5.8.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-TXEND.confirm

This primitive has no parameters.

8.3.5.8.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-TXEND.request primitive immediately after transmitting the end of the last bit of the last data octet indicating that the symbol containing the last data octet has been transferred and any Signal Extension has expired.

8.3.5.8.4 Effect of receipt

The receipt of this primitive by the MAC entity provides the time reference for the contention backoff protocol.

8.3.5.9 PHY-TXHEADEREND.indication

8.3.5.9.1 Function

This primitive indicates the transmission completion of the PHY header to the local MAC entity.

8.3.5.9.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-TXHEADEREND.indication

This primitive has no parameters.

8.3.5.9.3 When generated

The PHY-TXHEADEREND.indication primitive is generated by a transmitter PHY entity at the end of transmission of the last symbol containing the PHY header.

8.3.5.9.4 Effect of receipt

The receipt of this primitive by the MAC entity causes the MAC to record the time when this primitive is received only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding PHY-TXSTART.request primitive.

8.3.5.10 PHY-CCARESET.request

8.3.5.10.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to reset the PHY to the state appropriate for the end of a received frame and to turn IPI reporting on and off by means of the IPI-STATE parameter.

8.3.5.10.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-CCARESET.request(
 IPI-STATE
)
)

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The parameter value is IPI-ON when the MAC sublayer is requesting the PHY entity to report IPI values when the PHY is neither receiving nor transmitting an MPDU. IPI-ON turns on IPI reporting in the PHY entity. IPI-OFF turns off IPI reporting in the PHY entity.

8.3.5.10.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity at the end of a NAV and at a time indicated in 10.3.2.1 after each MAC slot boundary, which is described in 10.3.7 and 10.22.2.4. This request can be used by some PHY implementations that may synchronize antenna diversity with slot timings.

8.3.5.10.4 Effect of receipt

The effect of receipt of this primitive by the PHY entity is to reset the PHY to the state appropriate for the end of a received frame and to initiate a new CCA evaluation cycle. If IPI-STATE parameter is IPI-ON, the PHY entity collects IPI values when it is not transmitting or receiving and provides those values to the MAC sublayer using the IPI-REPORT parameter.

8.3.5.11 PHY-CCARESET.confirm

8.3.5.11.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has reset the CCA state machine and to provide observed IPI values when IPI reporting is turned on.

8.3.5.11.2 Semantics of the service primitive

The primitive provides the following parameters:

PHY-CCARESET.confirm(
 IPI-STATE,
 IPI-REPORT
)

The IPI-STATE parameter is present if dot11RadioMeasurementActivated is true. The IPI-STATE parameter can be one of two values: IPI-ON or IPI-OFF. The IPI-STATE value shall be set to the value of IPI-STATE received by the PHY entity in the most recent PHY-CCARESET.request primitive.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting was turned on prior to the receipt of the latest PHY-CCARESET.request primitive. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

8.3.5.11.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received a PHY-CCA-RESET.request primitive.

8.3.5.11.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

8.3.5.12 PHY-CCA.indication

8.3.5.12.1 Function

This primitive is an indication by the PHY to the local MAC entity of the current state of the medium and to provide observed IPI values when IPI reporting is turned on.

8.3.5.12.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-CCA.indication(
    STATE,
    IPI-REPORT,
    channel-list
)
```

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the assessment of the channel(s) by the PHY determines that the channel(s) are not available. Otherwise, the value of the parameter is IDLE.

The IPI-REPORT parameter is present if dot11RadioMeasurementActivated is true and if IPI reporting has been turned on by the IPI-STATE parameter. The IPI-REPORT parameter provides a set of IPI values for a time interval. The set of IPI values may be used by the MAC sublayer for radio measurement purposes. The set of IPI values are recent values observed by the PHY entity since the generation of the most recent PHY-TXEND.confirm, PHY-RXEND.indication, PHY-CCARESET.confirm, or PHY-CCA.indication primitive, whichever occurred latest.

When STATE is IDLE or when, for the type of PHY in operation, CCA is determined by a single channel, the channel-list parameter is absent. Otherwise, it carries a set indicating which channels are busy. The channel-list parameter in a PHY-CCA.indication primitive generated by a VHT STA contains at most a single element. Table 8-5 defines the members of this set.

Table 8-5—The channel-list parameter elements

| channel-list element | Meaning |
|----------------------|--|
| primary | In an HT STA that is not a VHT STA, indicates that the primary 20 MHz channel is busy. In a VHT STA, indicates that the primary 20 MHz channel is busy according to the rules specified in 21.3.18.5.3. In a TVHT STA, indicates that the primary channel is busy according to the rules specified in 22.3.18.6.3. |
| secondary | In an HT STA that is not a VHT STA, indicates that the secondary channel is busy. In a VHT STA, indicates that the secondary 20 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary channel is busy according to the rules specified in 22.3.18.6.4. |
| secondary40 | Indicates that the secondary 40 MHz channel is busy according to the rules specified in 21.3.18.5.4. In a TVHT STA, indicates that the secondary TVHT_2W channel is busy according to the rules specified in 22.3.18.6.4. |
| secondary80 | Indicates that the secondary 80 MHz channel is busy according to the rules specified in 21.3.18.5.4. |

The relationship of the channel-list parameter elements to the 40 MHz, 80 MHz, and 160 MHz BSS operating channel is illustrated by example in Figure 8-1. The relationship of the channel-list parameter elements to the 80+80 MHz BSS operating channel is illustrated by example in Figure 8-2.

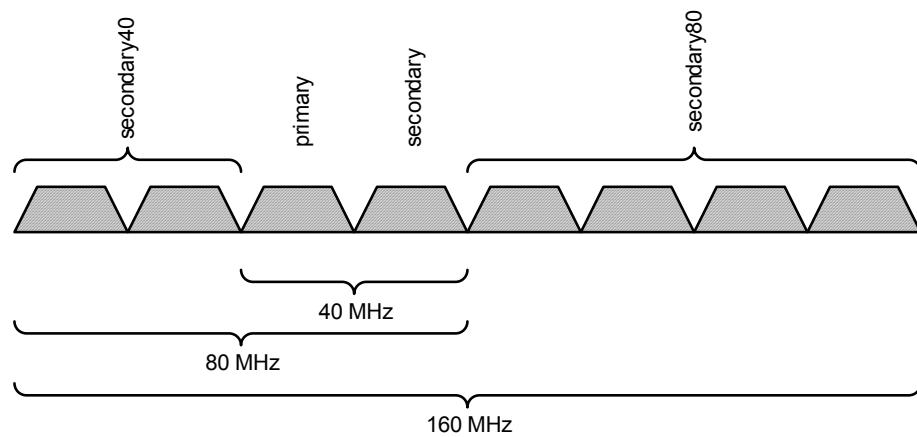

Figure 8-1—The channel-list parameter element for 40 MHz, 80 MHz, and 160 MHz channel width

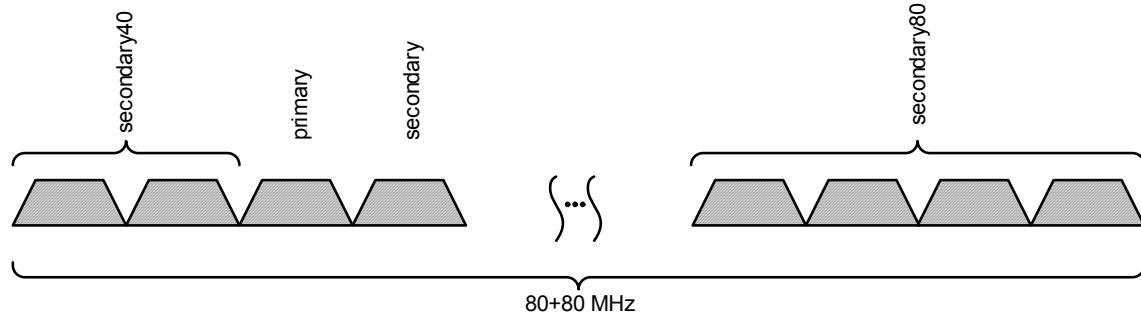

Figure 8-2—The channel-list parameter element for 80+80 MHz channel width

For a TVHT STA, the relationship of the channel-list parameter elements to the TVHT_W, TVHT_2W, and TVHT_W+W BSS operating channel is illustrated in Figure 8-3.

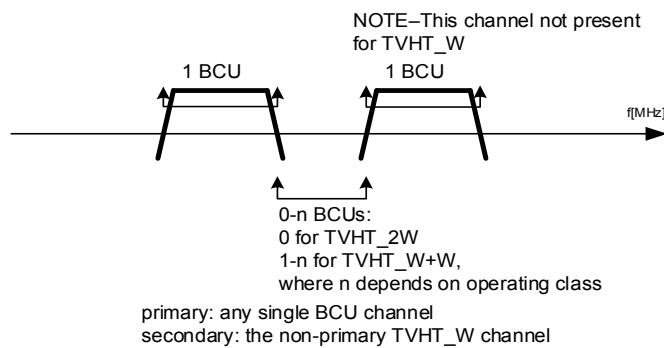

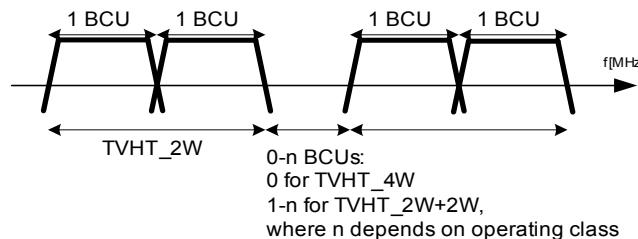

Figure 8-3—TVHT channel-list parameter element and channel bandwidth for TVHT_W, TVHT_2W, and TVHT_W+W

For a TVHT STA, the relationship of the channel-list parameter elements to the TVHT_4W and TVHT_2W+2W BSS operating channel is illustrated in Figure 8-4.

primary: any single BCU channel
 secondary: the non-primary TVHT_W channel in the same TVHT_2W channel group
 secondary40: the TVHT_2W channel group that does not contain the primaryTVHT_W

Figure 8-4—TVHT channel-list parameter element and channel bandwidth for TVHT_4W and TVHT_2W+2W

8.3.5.12.3 When generated

For Clause 15 to Clause 20 PHYs, this primitive is generated within aCCATime of the occurrence of a change in the status of the primary channel from channel idle to channel busy or from channel busy to channel idle or when the elements of the channel-list parameter change. For Clause 21 and Clause 22 PHYS, this primitive is generated when the status of the channel(s) changes from channel idle to channel busy or from channel busy to channel idle or when the elements of the channel-list parameter change. This includes the period of time when the PHY is receiving data. The timing of PHY-CCA.indication primitives related to transitions on secondary channel(s) is PHY specific. Refer to specific PHY clauses for details about CCA behavior for a given PHY.

NOTE—For the VHT PHY, the timing information is omitted here and is defined in 21.3.18.5.

If the STA is an HT STA but not a VHT STA and the operating channel width is 20 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF

If the STA is an HT STA but not a VHT STA and the operating channel width is 40 MHz, the PHY maintains the channel busy indication until the period indicated by the LENGTH field has expired, where the LENGTH field is

- In a valid SIG field if the format of the PPDU is NON_HT and the PPDU is received in the primary channel
- In a valid HT-SIG field if the format of the PPDU is HT_MF or HT_GF provided that the PPDU is either a 20 MHz PPDU received in the primary channel or a 40 MHz PPDU

8.3.5.12.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

8.3.5.13 PHY-RXSTART.indication

8.3.5.13.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PHY has received a valid start of a PPDU, including a valid PHY header.

NOTE—This primitive is not generated until the PHY has determined the PPDU format (e.g., a VHT PPDU, which starts with an HT PHY header).

8.3.5.13.2 Semantics of the service primitive

The primitive provides the following parameter:

```
PHY-RXSTART.indication(  
    RXVECTOR  
)
```

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity upon receipt of a valid PHY header. The required parameters are listed in 8.3.4.4.

8.3.5.13.3 When generated

This primitive is generated by the local PHY entity to the MAC sublayer when the PHY has successfully validated the PHY header at the start of a new PPDU.

After generating a PHY-RXSTART.indication primitive, the PHY is expected to maintain physical medium busy status (not generating a PHY-CCA.indication(IDLE) primitive) during the period required by that PHY to transfer a frame of the indicated LENGTH at the indicated DATARATE. This physical medium busy condition should be maintained even if a PHY-RXEND.indication(CarrierLost) primitive or a PHY-RXEND.indication(FormatViolation) primitive is generated by the PHY prior to the end of this period.

8.3.5.13.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified.

8.3.5.14 PHY-RXEND.indication

8.3.5.14.1 Function

This primitive is an indication by the PHY to the local MAC entity that the PPDU currently being received is complete.

8.3.5.14.2 Semantics of the service primitive

The primitive provides the following parameters:

```
PHY-RXEND.indication(  
    RXERROR,  
    RXVECTOR  
)
```

The RXERROR parameter can convey NoError or one or more values indicating an error condition. A number of error conditions may occur after the PHY's receive state machine has detected what appears to be a valid preamble and SFD. The following describes the parameter returned for each of those error conditions.

- *NoError*. This value is used to indicate that no error occurred during the receive process in the PHY.
- *FormatViolation*. This value is used to indicate that the format of the received PPDU was in error.
- *CarrierLost*. This value is used to indicate that during the reception of the incoming PSDU, the carrier was lost and no further processing of the PSDU can be accomplished.
- *UnsupportedRate*. This value is used to indicate that during the reception of the incoming PPDU, a nonsupported date rate was detected.
- *Filtered*. This value is used to indicate that during the reception of the PPDU, the PPDU was filtered out due to a condition set in the PHYCONFIG_VECTOR.

NOTE—The filtered condition might occur in a VHT STA due to GROUP_ID or PARTIAL_AID filtering in the PHY.

The RXVECTOR represents a list of parameters that the PHY provides the local MAC entity. RXVECTOR is an included parameter only when dot11RadioMeasurementActivated is true. The required parameters are listed in 8.3.4.4.

8.3.5.14.3 When generated

This primitive is generated by the PHY for the local MAC entity to indicate that the receive state machine has completed a reception with or without errors. When a Signal Extension is present, the primitive is generated at the end of the Signal Extension.

In the case of an RXERROR value of NoError, the MAC uses the PHY-RXEND.indication primitive as reference for channel access timing, as shown in Figure 10-19 (in 10.3.7) and Figure 10-26.

8.3.5.14.4 Effect of receipt

The effect of receipt of this primitive is for the MAC to begin inter-frame space processing, as described in 10.3.7 and 10.22.2.4.

8.3.5.15 PHY-CONFIG.request

8.3.5.15.1 Function

This primitive is a request by the MAC sublayer to the local PHY entity to configure the PHY.

8.3.5.15.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-CONFIG.request(
 PHYCONFIG_VECTOR
)

8.3.5.15.3 When generated

This primitive is generated by the MAC sublayer for the local PHY entity when it desires to change the configuration of the PHY.

8.3.5.15.4 Effect of receipt

The effect of receipt of this primitive by the PHY is to apply the parameters provided with the primitive and to configure the PHY for future operation.

8.3.5.16 PHY-CONFIG.confirm

8.3.5.16.1 Function

This primitive is issued by the PHY to the local MAC entity to confirm that the PHY has applied the parameters provided in the PHY-CONFIG.request primitive.

8.3.5.16.2 Semantics of the service primitive

The semantics of the primitive are as follows:

PHY-CONFIG.confirm

This primitive has no parameters.

8.3.5.16.3 When generated

This primitive is issued by the PHY to the MAC entity when the PHY has received and successfully applied the parameters in the PHY-CONFIG.request primitive.

8.3.5.16.4 Effect of receipt

The effect of the receipt of this primitive by the MAC is unspecified.

8.3.5.17 PHY-TXBUSY.indication

8.3.5.17.1 Function

This primitive is an indication by the PHY to the local MAC entity(ies) of the current transmission state of the PHY.

8.3.5.17.2 Semantics of the service primitive

The primitive provides the following parameter:

PHY-TXBUSY.indication (STATE)

The STATE parameter can be one of two values: BUSY or IDLE. The parameter value is BUSY if the PHY is transmitting a PPDU and thus not available to respond with a PHY-TXSTART.confirm primitive to a PHY-TXSTART.request primitive. Otherwise, the value of the parameter is IDLE.

8.3.5.17.3 When generated

The primitive is generated when the PHY issues a PHY-TXSTART.confirm primitive to one of the MAC entities coordinated by an MM-SME, and it is generated to all coordinated MAC entities except to the one to which it responds with the PHY-TXSTART.confirm primitive. The STATE of the primitive is set to BUSY.

This primitive is generated within aTxPHYDelay of the occurrence of a change in the state of the PHY transmit state machine to the RX state. In this case, the STATE of the primitive is set to IDLE.

8.3.5.17.4 Effect of receipt

The effect of receipt of this primitive by the MAC is unspecified if the STATE of the primitive is set to IDLE. The effect of receipt of this primitive by the MAC is specified in 10.22.2.11 if the STATE of the primitive is set to BUSY.

8.4 PHY management

The MIB comprises the managed objects, attributes, actions, and notifications required to manage a STA. The definition of these managed objects, attributes, actions, and notifications, as well as their structure, is presented in Annex C.

9. Frame formats

9.1 General requirements

The format of the MAC frames is specified in this clause. A STA shall be able to properly construct a subset of the frames specified in this clause for transmission and to decode a (potentially different) subset of the frames specified in this clause upon validation following reception. The particular subset of these frames that a STA constructs and decodes is determined by the functions supported by that particular STA. A STA shall be able to validate every received frame using the frame check sequence (FCS) and to interpret certain fields from the MAC headers of all frames.

A STA shall transmit frames using only the frame formats described in Clause 9.

9.2 MAC frame formats

9.2.1 Basic components

Each frame consists of the following basic components:

- a) A *MAC header*, which comprises frame control, duration, address, optional sequence control information, optional QoS Control information (QoS Data frames only), and optional HT Control fields (+HTC frames only);
- b) A variable-length *frame body*, which contains information specific to the frame *type* and *subtype*;
- c) An *FCS*, which contains a 32-bit CRC based on ITU-T V.42 [B53].

9.2.2 Conventions

Structures defined in the MAC sublayer are described as a sequence of components (e.g., fields, subfields, elements and subelements) in specific order. Each figure and table in Clause 9 depicts the components as they appear in the MAC frame and in the order in which they are passed to the physical layer (PHY), from left to right and then from top to bottom.

In figures, all bits within fields are numbered, from 0 to k , where the length of the field is $k + 1$ bits. Bits within numeric fields that are longer than a single bit are depicted in increasing order of significance, i.e., with the lowest numbered bit having the least significance. The octet boundaries within a field can be obtained by taking the bit numbers of the field modulo 8. Octets within numeric fields that are longer than a single octet are depicted in increasing order of significance, from lowest numbered bit to highest numbered bit. The octets in fields longer than a single octet are sent to the PHY in order from the octet containing the lowest numbered bits to the octet containing the highest numbered bits.

Any field containing a CRC is an exception to this convention and is transmitted commencing with the coefficient of the highest-order term.

MAC addresses are assigned as ordered sequences of bits. The Individual/Group bit is always transferred first and is bit 0 of the first octet.

Organizationally unique identifiers (OUIs), Company IDs (CIDs), and Organization Identifiers are specified in two forms: an ordered sequence of octets, and a numeric form. Treating the OUI, CID, or Organization Identifier as an ordered sequence of octets, the leftmost octet is always transferred first. This is equivalent to transmitting the most significant octet of the numeric form first.

Values specified in decimal are coded in natural binary unless otherwise stated. The values in Table 9-1 are in binary, with the bit assignments shown in the table. Values in other tables are shown in decimal notation.

An ASCII or UTF-8 string a sequence of ASCII-encoded octets without a terminating null.

For evaluation purposes a nonce is interpreted as a sequence of octets with the most significant octet first and the most significant bit of an octet first.

Reception, in references to frames or fields within frames (e.g., received Beacon frames or a received Duration/ID field), applies to MPDUs indicated from the PHY without error and validated by FCS within the MAC sublayer. Without further qualification, *reception* by the MAC sublayer implies that the frame contents are valid, and that the protocol version is supported (see 9.2.4.1.2), with no implication regarding frame addressing or regarding whether the frame type or other fields in the MAC header are meaningful to the MAC entity that has received the frame.

A frame that contains the HT Control field is referred to as a *+HTC frame*. A Control Wrapper frame is a +HTC frame.

A QoS Data frame that is transmitted by a mesh STA is referred to as a *mesh Data frame*.

NOTE—Subclause 9.2.4.1.4 constrains the setting of the From DS and To DS subfields in mesh Data frames.

Parentheses enclosing portions of names or acronyms are used to designate a set of related names that vary based on the inclusion of the parenthesized portion. For example,

- *QoS +CF-Poll frame* refers to the three QoS data subtypes that include “+CF-Poll”: the QoS Data +CF-Poll frame, subtype 1010; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.
- *QoS CF-Poll frame* refers specifically to the QoS CF-Poll frame, subtype 1110.
- *QoS (+)CF-Poll frame* refers to all four QoS data subtypes with CF-Poll: the QoS CF-Poll frame, subtype 1110; the QoS CF-Ack +CF-Poll frame, subtype 1111; the QoS Data +CF-Poll frame, subtype 1010; and the QoS Data +CF-Ack +CF-Poll frame, subtype 1011.
- *QoS (+)Null frame* refers to all three QoS data subtypes with “no data”: the QoS Null (no data) frame, subtype 1100; the QoS CF-Poll (no data) frame, subtype 1110; and the QoS CF-Ack +CF-Poll frame, subtype 1111.
- *QoS +CF-Ack frame* refers to the three QoS data subtypes that include “+CF-Ack”: the QoS Data +CF-Ack frame, subtype 1001; QoS Data +CF-Ack +CF-Poll frame, subtype 1011; and QoS CF-Ack +CF-Poll frame, subtype 1111.
- Whereas *(QoS) CF-Poll frame* refers to the QoS CF-Poll frame, subtype 1110, and the CF-Poll frame, subtype 0110.

Reserved fields and subfields are set to 0 upon transmission and are ignored upon reception.

9.2.3 General frame format

The MAC frame format comprises a set of fields that occur in a fixed order in all frames. Figure 9-1 depicts the general MAC frame format. The first three fields (Frame Control, Duration/ID, and Address 1) and the last field (FCS) in Figure 9-1 constitute the minimal frame format and are present in all frames, including reserved types and subtypes. The fields Address 2, Address 3, Sequence Control, Address 4, QoS Control, HT Control, and Frame Body are present only in certain frame types and subtypes. Each field is defined in 9.2.4. The format of each of the individual subtypes of each frame type is defined in 9.3. The components of management frame bodies are defined in 9.4. The formats of Action frames are defined in 9.6.

The Frame Body field is of variable size, constrained as defined in 9.2.4.7.1.

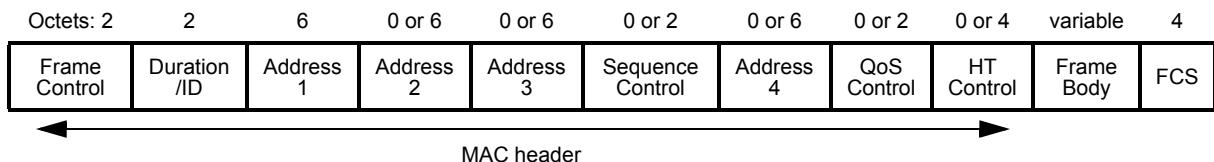

Figure 9-1—MAC frame format

9.2.4 Frame fields

9.2.4.1 Frame Control field

9.2.4.1.1 General

The first three subfields of the Frame Control field are Protocol Version, Type, and Subtype. The remaining subfields of the Frame Control field depend on the setting of the Type and Subtype subfields.

When the value of the Type subfield is not equal to 1 or the value of the Subtype subfield is not equal to 6, the remaining subfields within the Frame Control field are To DS, From DS, More Fragments, Retry, Power Management, More Data, Protected Frame, and +HTC/Order. In this case, the format of the Frame Control field is illustrated in Figure 9-2.

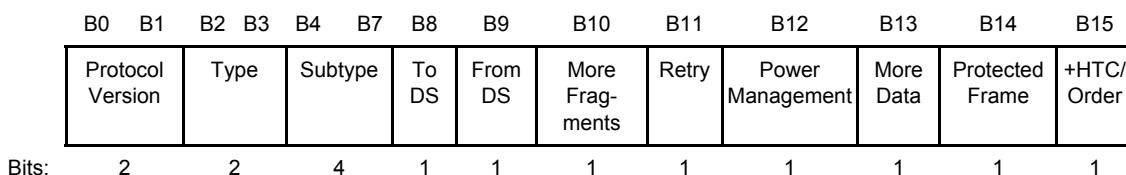

Figure 9-2—Frame Control field when Type is not equal to 1 or Subtype is not equal to 6

When the value of the Type subfield is equal to 1 and the value of the Subtype subfield is equal to 6, the remaining subfields within the Frame Control field are the following: Control Frame Extension, Power Management, More Data, Protected Frame, and +HTC/Order. In this case, the format of the Frame Control field is illustrated in Figure 9-3.

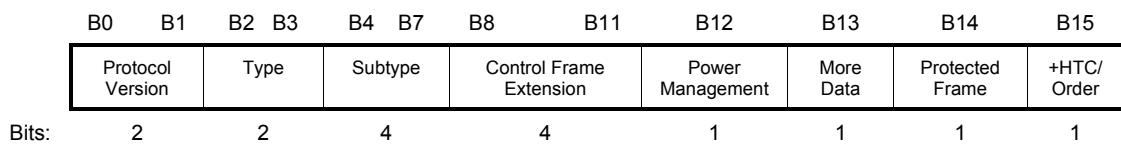

Figure 9-3—Frame Control field when Type is equal to 1 and Subtype is equal to 6

9.2.4.1.2 Protocol Version subfield

The Protocol Version subfield is 2 bits in length and is invariant in size and placement across all revisions of this standard. For this standard, the value of the protocol version is 0. All other values are reserved. The revision level is incremented only when a fundamental incompatibility exists between a new revision and the prior edition of the standard. See 10.27.2.

9.2.4.1.3 Type and Subtype subfields

The Type subfield is 2 bits in length, and the Subtype subfield is 4 bits in length. The Type and Subtype subfields together identify the function of the frame. There are three frame types: control, data, and

management. Each of the frame types has several defined subtypes. In Data frames, the most significant bit (MSB) of the Subtype subfield, B7, is defined as the QoS subfield. Table 9-1 defines the valid combinations of type and subtype. (The numeric values in Table 9-1 are shown in binary.)

Table 9-1—Valid type and subtype combinations

| Type value B3 B2 | Type description | Subtype value B7 B6 B5 B4 | Subtype description |
|---------------------|---------------------|------------------------------|---------------------------------|
| 00 | Management | 0000 | Association Request |
| 00 | Management | 0001 | Association Response |
| 00 | Management | 0010 | Reassociation Request |
| 00 | Management | 0011 | Reassociation Response |
| 00 | Management | 0100 | Probe Request |
| 00 | Management | 0101 | Probe Response |
| 00 | Management | 0110 | Timing Advertisement |
| 00 | Management | 0111 | Reserved |
| 00 | Management | 1000 | Beacon |
| 00 | Management | 1001 | ATIM |
| 00 | Management | 1010 | Disassociation |
| 00 | Management | 1011 | Authentication |
| 00 | Management | 1100 | Deauthentication |
| 00 | Management | 1101 | Action |
| 00 | Management | 1110 | Action No Ack |
| 00 | Management | 1111 | Reserved |
| 01 | Control | 0000–0011 | Reserved |
| 01 | Control | 0100 | Beamforming Report Poll |
| 01 | Control | 0101 | VHT NDP Announcement |
| 01 | Control | 0110 | Control Frame Extension |
| 01 | Control | 0111 | Control Wrapper |
| 01 | Control | 1000 | Block Ack Request (BlockAckReq) |
| 01 | Control | 1001 | Block Ack (BlockAck) |
| 01 | Control | 1010 | PS-Poll |
| 01 | Control | 1011 | RTS |
| 01 | Control | 1100 | CTS |
| 01 | Control | 1101 | Ack |
| 01 | Control | 1110 | CF-End |
| 01 | Control | 1111 | CF-End +CF-Ack |
| 10 | Data | 0000 | Data |
| 10 | Data | 0001 | Data +CF-Ack |
| 10 | Data | 0010 | Data +CF-Poll |

Table 9-1—Valid type and subtype combinations (continued)

| Type value B3 B2 | Type description | Subtype value B7 B6 B5 B4 | Subtype description |
|---------------------|---------------------|------------------------------|-------------------------------|
| 10 | Data | 0011 | Data +CF-Ack +CF-Poll |
| 10 | Data | 0100 | Null (no data) |
| 10 | Data | 0101 | CF-Ack (no data) |
| 10 | Data | 0110 | CF-Poll (no data) |
| 10 | Data | 0111 | CF-Ack +CF-Poll (no data) |
| 10 | Data | 1000 | QoS Data |
| 10 | Data | 1001 | QoS Data +CF-Ack |
| 10 | Data | 1010 | QoS Data +CF-Poll |
| 10 | Data | 1011 | QoS Data +CF-Ack +CF-Poll |
| 10 | Data | 1100 | QoS Null (no data) |
| 10 | Data | 1101 | Reserved |
| 10 | Data | 1110 | QoS CF-Poll (no data) |
| 10 | Data | 1111 | QoS CF-Ack +CF-Poll (no data) |
| 11 | Extension | 0000 | DMG Beacon |
| 11 | Extension | 0001–1111 | Reserved |

Each Subtype subfield bit position is used to indicate a specific modification of the basic Data frame (subtype 0). Frame Control bit 4 is set to 1 in data subtypes that include +CF-Ack, bit 5 is set to 1 in data subtypes that include +CF-Poll, bit 6 is set to 1 in data subtypes that contain no Frame Body field, and bit 7 is set to 1 in the QoS data subtypes, which have QoS Control fields in their MAC headers.

The Control Frame Extension subtype is used to increase the subtype space by reusing bits B8–B11. These additional Control frames are defined in Table 9-2.

Table 9-2—Control Frame Extension

| Type value B3 B2 | Subtype value B7 B6 B5 B4 | Control Frame Extension value B11 B10 B9 B8 | Description |
|---------------------|------------------------------|--|-------------|
| 01 | 0110 | 0000 | Reserved |
| 01 | 0110 | 0001 | Reserved |
| 01 | 0110 | 0010 | Poll |
| 01 | 0110 | 0011 | SPR |
| 01 | 0110 | 0100 | Grant |
| 01 | 0110 | 0101 | DMG CTS |
| 01 | 0110 | 0110 | DMG DTS |
| 01 | 0110 | 0111 | Grant Ack |
| 01 | 0110 | 1000 | SSW |

Table 9-2—Control Frame Extension (continued)

| Type value B3 B2 | Subtype value B7 B6 B5 B4 | Control Frame Extension value B11 B10 B9 B8 | Description |
|---------------------|------------------------------|--|--------------|
| 01 | 0110 | 1001 | SSW-Feedback |
| 01 | 0110 | 1010 | SSW-Ack |
| 01 | 0110 | 1011–1111 | Reserved |

9.2.4.1.4 To DS and From DS subfields

The meaning of the combinations of values for the To DS and From DS subfields in Data frames are shown in Table 9-3.

Table 9-3—To/From DS combinations in Data frames

| To DS and From DS values | Meaning |
|-----------------------------|--|
| To DS = 0 From DS = 0 | A Data frame from one STA to another STA within the same IBSS or the same PBSS, a Data frame direct from one non-AP STA to another non-AP STA within the same infrastructure BSS, or a Data frame outside the context of a BSS. This is the only valid combination for Data frames transmitted by an IBSS or PBSS STA, or outside the context of a BSS. |
| To DS = 1 From DS = 0 | A Data frame destined for the DS or being sent by a STA associated with an AP to the Port Access Entity in that AP. |
| To DS = 0 From DS = 1 | A Data frame exiting the DS or being sent by the Port Access Entity in an AP, or a group addressed mesh Data frame with the Mesh Control field present using the three-address MAC header format. This is the only valid combination for Data frames transmitted by an AP and group addressed Data frames transmitted by a mesh STA. |
| To DS = 1 From DS = 1 | A Data frame using the four-address MAC header format. This standard defines procedures for using this combination of field values only in a mesh BSS. This is the only valid combination for individually addressed Data frames transmitted by a mesh STA. |

The meanings of the combinations of values of the management frame To DS and From DS subfields are shown in Table 9-4.

In Control frames, To DS and From DS, when present, are both zero.

NOTE—In Control frames of subtype Control Frame Extension, the To DS and From DS subfields are not defined, and their bit positions are part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

Table 9-4—To/From DS combinations in Management frames

| To DS and From DS values | Meaning |
|--------------------------|--------------------------------|
| To DS = 0 From DS = 0 | All non-QMF Management frames. |
| To DS = 1 From DS = 0 | All QMF Management frames. |
| To DS = 0 From DS = 1 | This combination is reserved. |
| To DS = 1 From DS = 1 | This combination is reserved. |

9.2.4.1.5 More Fragments subfield

The More Fragments subfield is 1 bit in length and is set to 1 in all Data or Management frames that have another fragment of the current MSDU or current MMPDU to follow. It is set to 0 in all other frames in which the More Fragments subfield is present.

NOTE—In Control frames of subtype Control Frame Extension, the More Fragments subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.6 Retry subfield

The Retry subfield is 1 bit in length and is set to 1 in any Data or Management frame that is a retransmission of an earlier frame, except as specified in 10.24.3. It is set to 0 in all other frames in which the Retry subfield is present. A receiving STA uses this indication to aid in the process of eliminating duplicate frames.

NOTE—In Control frames of subtype Control Frame Extension, the Retry subfield is not present, and its bit position is part of the Control Frame Extension field (see 9.2.4.1.3, Table 9-2).

9.2.4.1.7 Power Management subfield

The Power Management subfield is 1 bit in length and is used to indicate the power management mode of a STA. The value of this subfield is either reserved (as defined below) or remains constant in each frame from a particular STA within a frame exchange sequence (see Annex G). The value indicates the mode of the STA after the successful completion of the frame exchange sequence.

In an infrastructure BSS or PBSS, the following applies:

- The Power Management subfield is valid only in frame exchanges as described in 11.2.3 and 11.2.7. In such exchanges, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.
- The Power Management subfield is reserved in all Management frames transmitted by a STA to an AP or PCP with which it is not associated.
- The Power Management subfield is reserved in all frames transmitted by the AP.

In an IBSS, the Power Management subfield is valid only in certain frames as described in 11.2.4.4. In such frames, a value of 1 indicates that the STA will be in PS mode. A value of 0 indicates that the STA will be in active mode.

In an MBSS, the Power Management subfield is valid only in frame exchanges as described per the mesh power management mode transitions rules in 14.14. In such exchanges, the value indicates the STA's power management mode (see 14.14).

9.2.4.1.8 More Data subfield

The More Data subfield is 1 bit in length and is used differently by a non-DMG STA and by a DMG STA.

A non-DMG STA uses the More Data subfield to indicate to a STA in PS mode that more BUs are buffered for that STA at the AP. The More Data subfield is valid in individually addressed Data or Management frames transmitted by an AP to a STA in PS mode. A value of 1 indicates that at least one additional buffered BU is present for the same STA.

A non-DMG STA optionally sets the More Data subfield to 1 in individually addressed data type frames transmitted by a CF-Pollable STA to the PC in response to a CF-Poll to indicate that the STA has at least one additional buffered MSDU available for transmission in response to a subsequent CF-Poll.

An AP optionally sets the More Data subfield to 1 in Ack frames to a non-DMG STA from which it has received a frame that contains a QoS Capability element in which the More Data Ack subfield is equal to 1 and that has one or more ACs that are delivery enabled and that is in PS mode to indicate that the AP has a pending transmission for the STA.

A TDLS peer STA optionally sets the More Data subfield to 1 in Ack frames to a STA that has TDLS peer PSM enabled and that has the More Data Ack subfield equal to 1 in the QoS Capability element of its transmitted TDLS Setup Request frame or TDLS Setup Response frame to indicate that it has a pending transmission for the STA.

The More Data subfield is 1 in individually addressed frames transmitted by a mesh STA to a peer mesh STA that is either in light sleep mode or in deep sleep mode for the corresponding mesh peering, when additional BUs remain to be transmitted to this peer mesh STA.

The More Data subfield is set to 1 in individually addressed frames transmitted by a VHT AP to a VHT STA when both support the VHT TXOP power save feature (as determined from their VHT Capabilities elements) to indicate that at least one additional buffered BU is present for the STA. See 11.2.3.19.

A non-DMG STA sets the More Data subfield to 0 in all other individually addressed frames.

A non-DMG STA sets the More Data subfield to 1 in non-GCR-SP group addressed frames transmitted by the AP when additional group addressed bufferable units (BUs) that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in non-GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are not part of an active GCR-SP remain to be transmitted by the AP during this beacon interval and in all group addressed frames transmitted by non-AP STAs.

The More Data subfield is set to 1 in GCR-SP group addressed frames transmitted by the AP when additional group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP. The More Data subfield is set to 0 in GCR-SP group addressed frames transmitted by the AP when no more group addressed BUs that are part of an active GCR-SP remain to be transmitted by the AP during this GCR-SP.

The More Data subfield is 1 in group addressed frames transmitted by a mesh STA when additional group addressed BUs remain to be transmitted. The More Data subfield is 0 in group addressed frames transmitted by a mesh STA when no more group addressed BUs remain to be transmitted.

A DMG STA sets the More Data subfield as follows:

- In individually addressed frames, it is set to 1 to indicate that the STA has MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.
- It is set to 1 in group addressed frames transmitted by the AP when additional group addressed BUs remain to be transmitted by the AP during this beacon interval. The More Data subfield is set to 0 in group addressed frames transmitted by the AP when no more group addressed BUs remain to be transmitted by the AP during this beacon interval.

A DMG STA does not set the More Data bit to 1 if it does not have any MSDUs or A-MSDUs buffered for transmission to the frame's recipient during the current SP or TXOP.

9.2.4.1.9 Protected Frame subfield

The Protected Frame subfield is 1 bit in length. The Protected Frame subfield is set to 1 if the Frame Body field contains information that has been processed by a cryptographic encapsulation algorithm. The Protected Frame subfield is reserved in Control frames of subtype Control Frame Extension. When the Protected Frame subfield is equal to 1, the Frame Body field is protected utilizing the cryptographic encapsulation algorithm and expanded as defined in Clause 12. The Protected Frame subfield is set to 0 in Data frames of subtype Null, CF-Ack (no data), CF-Poll (no data), CF-Ack +CF-Poll (no data), QoS Null (no data), QoS CF-Poll (no data), and QoS CF-Ack +CF-Poll (no data) (see, for example, 12.5.2.2 and 12.5.3.1 that show that the frame body needs to be 1 octet or longer to apply the encapsulation).

9.2.4.1.10 +HTC/Order subfield

The +HTC/Order subfield is 1 bit in length. It is used for two purposes:

- It is set to 1 in a non-QoS Data frame transmitted by a non-QoS STA to indicate that the frame contains an MSDU, or fragment thereof, that is being transferred using the StrictlyOrdered service class.
- It is set to 1 in a QoS Data or Management frame transmitted with a value of HT_GF, HT_MF, or VHT for the FORMAT parameter of the TXVECTOR to indicate that the frame contains an HT Control field.

Otherwise, the +HTC/Order subfield is set to 0.

NOTE—The +HTC/Order subfield is always set to 0 for frames transmitted by a DMG STA.

9.2.4.2 Duration/ID field

The Duration/ID field is 16 bits in length. The contents of this field vary with frame type and subtype, with whether the frame is transmitted during the CFP, and with the QoS capabilities of the sending STA. The contents of the field are defined as follows:

- a) In Control frames of subtype PS-Poll, the Duration/ID field carries the association identifier (AID) of the STA that transmitted the frame in the 14 least significant bits (LSB), and the 2 most significant bits (MSB) both set to 1.
- b) In frames transmitted by the PC and non-QoS STAs, during the CFP, the Duration/ID field is set to a fixed value of 32 768.
- c) In all other frames sent by non-QoS STAs and Control frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 9.3.
- d) In Data and Management frames sent by QoS STAs, the Duration/ID field contains a duration value as defined for each frame type in 9.2.5.

See 10.27.3 on the processing of this field in received frames.

The encoding of the Duration/ID field is given in Table 9-5.

Table 9-5—Duration/ID field encoding

| Bits 0–13 | Bit 14 | Bit 15 | Usage |
|------------------|---------------|---------------|---|
| 0–32 767 | | 0 | Duration value (in microseconds) within all frames except: — PS-Poll frames transmitted during the CP — frames transmitted during the CFP using the HCF |
| 0 | 0 | 1 | Fixed value under point coordination function (PCF) within frames transmitted during the CFP. |
| 1–16 383 | 0 | 1 | Reserved |
| 0 | 1 | 1 | Reserved |
| 1–2007 | 1 | 1 | AID in PS-Poll frames. |
| 2008–16 383 | 1 | 1 | Reserved |

See also 9.7.3 on the setting of the Duration/ID field of MAC headers of MPDUs in an A-MPDU.

9.2.4.3 Address fields

9.2.4.3.1 General

There are four address fields in the MAC frame format. These fields are used to indicate the basic service set identifier (BSSID), source address (SA), destination address (DA), transmitting STA address (TA), and receiving STA address (RA). Certain frames might not contain some of the address fields.

Certain address field usage is specified by the relative position of the address field (1–4) within the MAC header, independent of the type of address present in that field. For example, receiver address matching is always performed on the contents of the Address 1 field in received frames, and the receiver address of CTS and Ack frames is always obtained from the Address 2 field in the corresponding RTS frame, or from the frame being acknowledged.

9.2.4.3.2 Address representation

Each Address field contains a 48-bit address as defined in Clause 8 of IEEE Std 802-2014.

9.2.4.3.3 Address designation

A MAC sublayer address is one of the following two types:

- a) *Individual address*. The address assigned to a particular STA on the network.
- b) *Group address*. A multidestination address, which might be in use by one or more STAs on a given network. The two kinds of group addresses are as follows:
 - 1) *Multicast-group address*. An address associated by higher level convention with a group of logically related STAs.
 - 2) *Broadcast address*. A distinguished, predefined group address that always denotes the set of all STAs on a given LAN. All 1s are interpreted to be the broadcast address. This group is predefined for each communication medium to consist of all STAs actively connected to that medium; it is used to broadcast to all of the active STAs on that medium.

The address space is also partitioned into locally administered and universal (globally administered) addresses. The nature of a body and the procedures by which it administers these universal (globally administered) addresses is beyond the scope of this standard. See IEEE Std 802-2014 for more information.

9.2.4.3.4 BSSID field

The BSSID field is a 48-bit field of the same format as an IEEE 802 MAC address. When dot11OCBActivated is false, the value of this field uniquely identifies each BSS. The value of this field, in an infrastructure BSS, is the MAC address currently in use by the STA in the AP of the BSS.

The value of this field in a PBSS is the MAC address of the PCP.

The value of this field in an IBSS is a locally administered IEEE MAC address formed from a 46-bit random number generated according to the procedure defined in 11.1.4. The Individual/Group bit of the address is set to 0. The Universal/Local bit of the address is set to 1. This mechanism is used to provide a high probability of selecting a unique BSSID.

The value of all 1s is used to indicate the wildcard BSSID. The wildcard value is not used in the BSSID field except where explicitly permitted in this standard. When dot11OCBActivated is true, the wildcard value is used in the BSSID field. When dot11OCBActivated is false and the BSSID field contains the wildcard value, the Address 1 (DA) field is also set to all 1s to indicate the broadcast address.

9.2.4.3.5 DA field

The DA field contains an IEEE MAC individual or group address that identifies the MAC entity or entities intended as the final recipient(s) of the MSDU (or fragment thereof) or A-MSDU, as defined in 9.3.2.1, contained in the frame body field.

9.2.4.3.6 SA field

The SA field contains an IEEE MAC individual address that identifies the MAC entity from which the transfer of the MSDU (or fragment thereof) or A-MSDU, as defined in 9.3.2.1, contained in the frame body field was initiated. The Individual/Group bit is always transmitted as a 0 in the source address.

9.2.4.3.7 RA field

The RA field contains an IEEE MAC individual or group address that identifies the intended immediate recipient STA(s), on the WM, for the information contained in the frame body field.

9.2.4.3.8 TA field

The TA field contains an IEEE MAC address that identifies the STA that has transmitted, onto the WM, the MPDU contained in the frame body field. If the Individual/Group bit is 0, then the TA field is the individual address of the STA; otherwise, the TA field is a bandwidth signaling TA, indicating that the frame carries additional information in the scrambling sequence (see 9.3.1.2, 10.7.6.6, and 10.7.11).

9.2.4.4 Sequence Control field

9.2.4.4.1 Sequence Control field structure

The Sequence Control field is 16 bits in length and consists of two subfields, the Sequence Number and the Fragment Number. The format of the Sequence Control field is illustrated in Figure 9-4. The Sequence Control field is not present in Control frames.

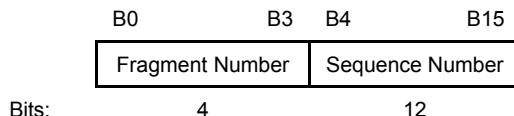

Figure 9-4—Sequence Control field

9.2.4.4.2 Sequence Number field

Each MSDU, A-MSDU, or MMPDU is assigned a sequence number. See 10.3.2.11. Sequence numbers are not assigned to Control frames, as the Sequence Control field is not present in those frames.

The Sequence Number field in Data frames is a 12-bit field indicating the sequence number of the MSDU or A-MSDU.

The Sequence Number field in QMFs comprises the QMF Sequence Number subfield and the AC Index (ACI) subfield. The QMF Sequence Number subfield is a 10-bit subfield indicating the sequence number of the frame. The ACI subfield is a 2-bit subfield indicating the ACI of the frame. The format of the Sequence Number field in QMFs is shown in Figure 9-5.

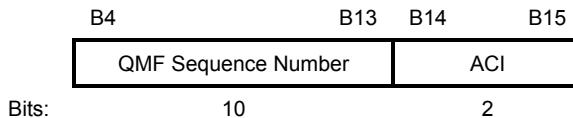

Figure 9-5—Sequence Number field in QMFs

The value of the ACI subfield represents the ACI of the frame as defined in 9.4.2.29.

The Sequence Number field in Management frames that are not QMFs is a 12-bit field indicating the sequence number of the frame.

Each fragment of an MSDU or MMPDU contains a copy of the sequence number assigned to that MSDU or MMPDU. The sequence number remains constant in all retransmissions of an MSDU, MMPDU, or fragment thereof, except when the MSDU is delivered via both DMS and group addressed delivery via NoAck, GCR unsolicited retry, or GCR block ack retransmission policies. In such cases, the sequence numbers assigned to the MSDUs (re)transmitted using group addressed delivery need not match the sequence number of the corresponding individually addressed A-MSDUs delivered via DMS.

9.2.4.4.3 Fragment Number field

The Fragment Number field is a 4-bit field indicating the number of each fragment of an MSDU or MMPDU. The fragment number is set to 0 in the first or only fragment of an MSDU or MMPDU and is incremented by one for each successive fragment of that MSDU or MMPDU. The fragment number is set to 0 in the only fragment of an A-MSDU. The fragment number remains constant in all retransmissions of the fragment.

9.2.4.5 QoS Control field

9.2.4.5.1 QoS Control field structure

The QoS Control field is a 16-bit field that identifies the TC or TS to which the frame belongs as well as various other QoS-related, A-MSDU related, and mesh-related information about the frame that varies by

frame type, subtype, and type of transmitting STA. The QoS Control field is present in all Data frames in which the QoS subfield of the Subtype subfield is equal to 1 (see 9.2.4.1.3).

When not transmitted within a DMG PPDU, each QoS Control field comprises five or eight subfields, as defined for the particular sender (HC or non-AP STA) and frame type and subtype. The usage of these subfields and the various possible layouts of the QoS Control field are described 9.2.4.5.2 to 9.2.4.5.12 and illustrated in Table 9-6.

See 10.13.1 for constraints on the contents of the QoS Control field when present in an A-MPDU.

Table 9-6—QoS Control field

| Applicable frame (sub) types | Bits 0–3 | Bit 4 | Bits 5–6 | Bit 7 | Bits 8 | Bit 9 | Bit 10 | Bits 11–15 |
|--|----------|----------|------------|----------------|-------------------------|-----------------------|--------|------------|
| QoS CF-Poll and QoS CF-Ack +CF-Poll frames sent by HC | TID | EOSP | Ack Policy | Reserved | TXOP Limit | | | |
| QoS Data +CF-Poll and QoS Data +CF-Ack +CF-Poll frames sent by HC | TID | EOSP | Ack Policy | A-MSDU Present | TXOP Limit | | | |
| QoS Data and QoS Data +CF-Ack frames sent by HC | TID | EOSP | Ack Policy | A-MSDU Present | AP PS Buffer State | | | |
| QoS Null frames sent by HC | TID | EOSP | Ack Policy | Reserved | AP PS Buffer State | | | |
| QoS Data and QoS Data +CF-Ack frames sent by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA in a nonmesh BSS | TID | 0 | Ack Policy | A-MSDU Present | TXOP Duration Requested | | | |
| | TID | 1 | Ack Policy | A-MSDU Present | Queue Size | | | |
| QoS Null frames sent by non-AP STAs that are not a TPU buffer STA or a TPU sleep STA in a nonmesh BSS | TID | 0 | Ack Policy | Reserved | TXOP Duration Requested | | | |
| | TID | 1 | Ack Policy | Reserved | Queue Size | | | |
| QoS Data and QoS Data +CF-Ack frames sent by TPU buffer STAs in a nonmesh BSS | TID | EOSP | Ack Policy | A-MSDU Present | Reserved | | | |
| QoS Null frames sent by TPU buffer STAs in a nonmesh BSS | TID | EOSP | Ack Policy | Reserved | Reserved | | | |
| QoS Data and QoS Data +CF-Ack frames sent by TPU sleep STAs in a nonmesh BSS | TID | Reserved | Ack Policy | A-MSDU Present | Reserved | | | |
| QoS Null frames sent by TPU sleep STAs in a nonmesh BSS | TID | Reserved | Ack Policy | Reserved | Reserved | | | |
| All frames sent by mesh STAs in a mesh BSS | TID | EOSP | Ack Policy | A-MSDU Present | Mesh Control Present | Mesh Power Save Level | RSPI | Reserved |

The format of the QoS Control field for MPDUs transmitted within a DMG PPDU is provided in Table 9-7. Data subtypes not shown in the table are not transmitted within a DMG PPDU.

Table 9-7—QoS Control field for frames transmitted within a DMG PPDU

| Applicable frame (sub-)types | Bits 0–3 | Bit 4 | Bits 5–6 | Bit 7 | Bit 8 | Bit 9 | Bits 10–13 | Bit 14 | Bit 15 |
|------------------------------|----------|-------|------------|----------------|-------------|----------------|-------------|----------|---------------|
| QoS Data | TID | EOSP | Ack Policy | A-MSDU Present | A-MSDU Type | RDG/ More PPDU | Buffered AC | Reserved | AC Constraint |
| QoS Null | TID | EOSP | Ack Policy | Reserved | Reserved | RDG/ More PPDU | Buffered AC | Reserved | AC Constraint |

9.2.4.5.2 TID subfield

The TID subfield identifies the TC or TS to which the corresponding MSDU (or fragment thereof) or A-MSDU in the Frame Body field belongs. The TID subfield also identifies the TC or TS of traffic for which a TXOP is being requested, through the setting of TXOP duration requested or queue size. The encoding of the TID subfield depends on the access policy (see 9.4.2.30) and is shown in Table 9-8. Additional information on the interpretation of the contents of this field appears in 5.1.1.3.

Table 9-8—TID subfield

| Access policy | Usage | Allowed values in bits 0–3 (TID subfield) |
|---------------|---|---|
| EDCA | UP for either TC or TS, regardless of whether admission control is required | 0–7 |
| HCCA, SPCA | TSID | 8–15 |
| HEMM, SEMM | TSID, regardless of the access mechanism used | 8–15 |

In QoS Data +CF-Poll frames, the TID subfield in the QoS Control field indicates the TID of the data. In QoS (+)CF-Poll frames of subtype Null, the TID subfield in the QoS Control field indicates the TID for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA can respond with any frame (see 10.22.3.5.1). For STAs where dot11OCBActivated is true, traffic streams are not used and the TID always corresponds to a TC.

9.2.4.5.3 EOSP (end of service period) subfield

The EOSP subfield is 1 bit in length and is used by the HC to indicate the end of the current service period (SP) and by a DMG STA to indicate the end of the current SP or the end of the current allocated CBAP with individually addressed destination AID. The HC sets the EOSP subfield to 1 in its transmission and retransmissions of the SP's final frame to end an SP and sets it to 0 otherwise. To end an SP allocation or a CBAP allocation with individually addressed destination AID, the DMG STA sets the EOSP subfield to 1 in its final frame transmission and retransmissions within the allocation; otherwise, the DMG STA sets the EOSP subfield to 0.

The mesh STA uses the EOSP subfield to indicate the end of the current mesh peer service period in which it operates as the owner. The mesh STA sets the EOSP subfield to 1 in its transmission and retransmissions of the mesh peer service period's final frame to end a mesh peer service period, and sets it to 0 otherwise. See 14.14.9.4 for details.

If dot11RobustAVStreamingImplemented is true, then the HC sets the EOSP subfield to 1 in a GCR-SP group addressed frame in order to indicate that no more GCR-SP frames of that group address are to be transmitted by the AP until the next scheduled SP for this GCR-SP stream.

NOTE—As GCR-A frames are sent outside of any SP, the EOSP subfield is set to 0 in a group addressed frame delivered using the GCR-A procedures described in 11.24.16.3.8.

9.2.4.5.4 Ack Policy subfield

The Ack Policy subfield is 2 bits in length and identifies the acknowledgment policy that is followed upon the delivery of the MPDU. The interpretation of these 2 bits is given in Table 9-9.

Table 9-9—Ack Policy subfield in QoS Control field of QoS Data frames

| Bits in QoS Control field | | Meaning |
|---------------------------|-------|--|
| Bit 5 | Bit 6 | |
| 0 | 0 | <p>Normal Ack or Implicit Block Ack Request.</p> <p>In a frame that is a non-A-MPDU frame or VHT single MPDU: The addressed recipient returns an Ack or QoS +CF-Ack frame after a short interframe space (SIFS) period, according to the procedures defined in 10.3.2.9 and 10.22.3.5. A non-DMG STA sets the Ack Policy subfield for individually addressed QoS Null (no data) frames to this value.</p> <p>Otherwise: The addressed recipient returns a BlockAck frame, either individually or as part of an A-MPDU starting a SIFS after the PPDU carrying the frame, according to the procedures defined in 10.3.2.9, 10.24.7.5, 10.24.8.3, 10.28.3, 10.28.4, and 10.32.3.</p> |
| 1 | 0 | <p>No Ack The addressed recipient takes no action upon receipt of the frame. More details are provided in 10.25.</p> <p>The Ack Policy subfield is set to this value in all individually addressed frames in which the sender does not require acknowledgment. The Ack Policy subfield is also set to this value in all group addressed frames that use the QoS frame format except with a TID for which a block ack agreement exists. This value of the Ack Policy subfield is not used for QoS Data frames with a TID for which a block ack agreement exists. The Ack Policy subfield for group addressed QoS Null (no data) frames is set to this value.</p> |

Table 9-9—Ack Policy subfield in QoS Control field of QoS Data frames (continued)

| Bits in QoS Control field | | Meaning |
|---------------------------|-------|--|
| Bit 5 | Bit 6 | |
| 0 | 1 | <p>No explicit acknowledgment or PSMP Ack.</p> <p>When bit 6 of the Frame Control field (see 9.2.4.1.3) is set to 1: There might be a response frame to the frame that is received, but it is neither the Ack frame nor any Data frame of subtype +CF-Ack. The Ack Policy subfield for QoS CF-Poll and QoS CF-Ack +CF-Poll Data frames is set to this value.</p> <p>When bit 6 of the Frame Control field (see 9.2.4.1.3) is set to 0: The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP downlink transmission time (PSMP-DTT) is to be received in a later PSMP uplink transmission time (PSMP-UTT). The acknowledgment for a frame indicating PSMP Ack when it appears in a PSMP-UTT is to be received in a later PSMP-DTT.</p> <p>NOTE—Bit 6 of the Frame Control field (see 9.2.4.1.3) indicates the absence of a data Frame Body field. When equal to 1, the QoS Data frame contains no Frame Body field, and any response is generated in response to a QoS CF-Poll or QoS CF-Ack +CF-Poll frame, but does not signify an acknowledgment of data. When set to 0, the QoS Data frame contains a Frame Body field, which is acknowledged as described in 10.29.2.7.</p> |
| 1 | 1 | <p>Block Ack</p> <p>The addressed recipient takes no action upon the receipt of the frame except for recording the state. The recipient can expect a BlockAckReq frame or implicit block ack request in the future to which it responds using the procedure described in 10.24.</p> |

9.2.4.5.5 TXOP Limit subfield

The TXOP Limit subfield is an 8-bit field that is present in QoS Data frames of subtypes that include CF-Poll and specifies the time limit on a TXOP granted by a QoS (+)CF-Poll frame from an HC in an infrastructure BSS. In QoS Data frames with subtypes that include CF-Poll, the addressed STA is granted a TXOP that begins a SIFS after this frame and lasts no longer than the number of 32 μ s periods specified by the TXOP Limit subfield value. The range of time values is 32 μ s to 8160 μ s. A TXOP Limit subfield value of 0 indicates that only one MPDU or one QoS Null frame is to be transmitted immediately following the QoS (+)CF-Poll frame.

9.2.4.5.6 Queue Size subfield

The Queue Size subfield is an 8-bit field that indicates the amount of buffered traffic for a given TC or TS at the STA sending this frame. The Queue Size subfield is present in QoS Data frames sent by non-AP STAs with bit 4 of the QoS Control field equal to 1. The AP might use information contained in the Queue Size subfield to determine the TXOP duration assigned to the STA.

The queue size value is the total size, rounded up to the nearest multiple of 256 octets and expressed in units of 256 octets, of all MSDUs and A-MSDUs buffered at the STA (excluding the MSDU or A-MSDU of the present QoS Data frame) in the delivery queue used for MSDUs and A-MSDUs with TID values equal to the value in the TID subfield of this QoS Control field. A queue size value of 0 is used solely to indicate the absence of any buffered traffic in the queue used for the specified TID. A queue size value of 254 is used for all sizes greater than 64 768 octets. A queue size value of 255 is used to indicate an unspecified or unknown size.

9.2.4.5.7 TXOP Duration Requested subfield

The TXOP Duration Requested subfield is present in QoS Data frames sent by STAs associated in a nonmesh BSS with bit 4 of the QoS Control field equal to 0. The TXOP Duration Requested subfield is an 8-bit field that indicates the duration, in units of 32 μ s, that the sending STA determines it needs for its next TXOP for the specified TID. A value of 0 indicates that no TXOP is requested for the specified TID in the current SP. A nonzero value represents a requested TXOP duration in the range 32 μ s to 8 160 μ s in increments of 32 μ s. See 10.22.3.5.2.

9.2.4.5.8 AP PS Buffer State subfield

The AP PS Buffer State subfield, defined in Figure 9-6, is an 8-bit field that indicates the PS buffer state at the AP for a STA. The AP PS Buffer State subfield is further subdivided into three subfields: Buffer State Indicated, Highest-Priority Buffered AC, and AP Buffered Load.

| | B8 | B9 | B10 | B11 | B12 | B15 |
|-------|----------|------------------------|------------------------------|-----|----------------------|-----|
| | Reserved | Buffer State Indicated | Highest Priority Buffered AC | | QoS AP Buffered Load | |
| Bits: | 1 | 1 | 2 | | 4 | |

Figure 9-6—QoS AP PS Buffer State subfield

The Buffered State Indicated subfield is 1 bit in length and is used to indicate whether the AP PS buffer state is specified. A value of 1 indicates that the AP PS buffer state is specified.

The Highest-Priority Buffered AC subfield is 2 bits in length and is used to indicate the AC of the highest priority traffic remaining that is buffered at the AP, excluding the MSDU or A-MSDU of the present frame.

The AP Buffered Load subfield is 4 bits in length and is used to indicate the total buffer size, rounded up to the nearest multiple of 4096 octets and expressed in units of 4096 octets, of all MSDUs and A-MSDUs buffered at the QoS AP (excluding the MSDU or A-MSDU of the present QoS Data frame). An AP Buffered Load field value of 15 indicates that the buffer size is greater than 57 344 octets. An AP Buffered Load subfield value of 0 is used solely to indicate the absence of any buffered traffic for the indicated highest priority buffered AC when the Buffer State Indicated bit is 1.

When the Buffered State Indicated subfield is equal to 0, the Highest-Priority Buffered AC subfield and the AP Buffered Load subfield are reserved.

9.2.4.5.9 A-MSDU Present subfield

The A-MSDU Present subfield is 1 bit in length and indicates the presence of an A-MSDU. The A-MSDU Present subfield is set to 1 to indicate that the Frame Body field contains an entire A-MSDU as defined in 9.3.2.2. The A-MSDU Present subfield is set to 0 to indicate that the Frame Body field contains an MSDU or fragment thereof as defined in 9.3.2.1.

NOTE—A DMG STA, when the A-MSDU Present subfield is set to 1, can use one of two A-MSDU formats in the Frame Body. The specific A-MSDU format present is indicated by the A-MSDU Type subfield.

9.2.4.5.10 Mesh Control Present subfield

The Mesh Control Present subfield is 1 bit in length, and indicates the presence of a Mesh Control field in the frame body. When the Mesh Control Present subfield is 1, the Frame Body field contains a Mesh Control field as defined in 9.2.4.7.3. The mesh STA sets the Mesh Control Present subfield to 1 in the mesh Data frame containing an unfragmented MSDU, an A-MSDU, or the first fragment of an MSDU.

9.2.4.5.11 Mesh Power Save Level subfield

The Mesh Power Save Level subfield is 1 bit in length and indicates whether the mesh STA's peer-specific mesh power management mode will be deep sleep mode or light sleep mode after the successful completion of the frame exchange sequence.

When the Power Management subfield in the Frame Control field in the frame is 1, the following applies:

In individually addressed mesh Data frames, a value of 0 indicates that the mesh STA's peer-specific mesh power management mode for the recipient mesh STA will be light sleep mode (see 14.14.8.4). In individually addressed mesh Data frames, a value of 1 indicates that the mesh STA's peer-specific mesh power management mode for the recipient mesh STA will be deep sleep mode (see 14.14.8.5).

In group addressed mesh Data frames, a value of 0 indicates that none of the peer-specific mesh power management modes of the mesh STA will be deep sleep mode. In group addressed mesh Data frames, a value of 1 indicates that at least one of the peer-specific mesh power management modes of the mesh STA is deep sleep mode.

The Mesh Power Save Level subfield is reserved if the Power Management subfield in the Frame Control field is 0.

9.2.4.5.12 Receiver Service Period Initiated (RSPI) subfield

The Receiver Service Period Initiated (RSPI) subfield is 1 bit in length. The subfield is set to 0 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is not initiated. The subfield is set to 1 to indicate that the mesh peer service period, of which the receiver of this frame is the owner, is initiated. The use of the RSPI subfield is described in 14.14.9.2. The RSPI subfield is reserved in group addressed frames.

9.2.4.5.13 A-MSDU Type subfield

The A-MSDU Type subfield is 1 bit in length and indicates the type of A-MSDU present in the Frame Body. When the A-MSDU Type subfield is set to 0, the Frame Body field contains a Basic A-MSDU as defined in 9.3.2.2.2. When the A-MSDU Type subfield is set to 1, the Frame Body field contains a Short A-MSDU as defined in 9.3.2.2.3. The A-MSDU Type subfield is reserved if the A-MSDU Present subfield is set to 0.

9.2.4.5.14 RDG/More PPDU subfield

The RDG/More PPDU subfield of the QoS Control field for DMG frames is interpreted differently depending on whether it is transmitted by an reverse direction (RD) initiator or an RD responder, as defined in Table 9-11.

9.2.4.5.15 AC Constraint subfield

The AC Constraint subfield of the QoS Control field for DMG frames indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-10.

9.2.4.5.16 Buffered AC subfield

The Buffered AC subfield is a 4-bit bitmap that indicates buffered traffic for four ACs as defined in Figure 9-7. At least one BU for the indicated AC is buffered if the related subfield is set to 1. The Buffered AC subfield is reserved except in QoS Data frames and QoS Null frames. A non-AP and non-PCP STA can use information contained in the Buffered AC subfield to determine the ACs for which BU are buffered for it.

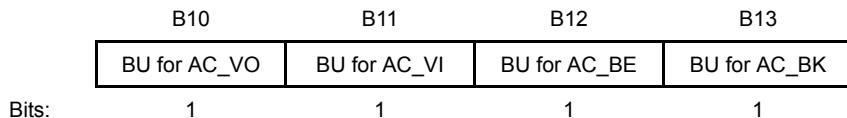

Figure 9-7—Buffered AC subfield

9.2.4.6 HT Control field

9.2.4.6.1 General

The HT Control field is always present in a Control Wrapper frame and is present in QoS Data and Management frames as determined by the +HTC/Order subfield of the Frame Control field as defined in 9.2.4.1.10.

NOTE—The only control frame subtype for which HT Control field is present is the Control Wrapper frame. A Control frame that is described as +HTC (e.g., an RTS+HTC, CTS+HTC, BlockAck+HTC or BlockAckReq+HTC frame) implies the use of the Control Wrapper frame to carry that Control frame.

The format of the 4-octet HT Control field is shown in Figure 9-8.

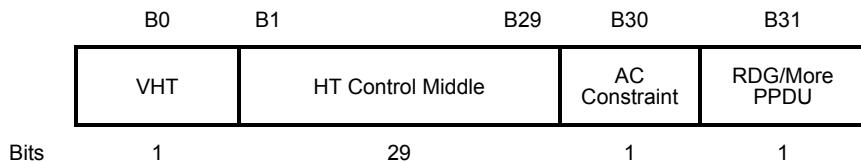

Figure 9-8—HT Control field

The HT Control field has two forms, the HT variant and the VHT variant. The two forms differ in the format of the HT Control Middle subfield, described in 9.2.4.6.2 for the HT variant and in 9.2.4.6.3 for the VHT variant and in the value of the VHT subfield.

The VHT subfield of the HT Control field indicates whether the HT Control Middle subfield is the VHT Variant or the HT Variant. The VHT subfield is set to 1 to indicate that the HT Control Middle subfield is the VHT Variant and is set to 0 to indicate that the HT Control Middle subfield is the HT Variant.

The AC Constraint subfield of the HT Control field indicates whether the mapped AC of an RD Data frame is constrained to a single AC, as defined in Table 9-10.

Table 9-10—AC Constraint subfield values

| Value | Description |
|-------|---|
| 0 | The response to a reverse direction grant (RDG) contains Data frames from any TID; see 10.28.4. |
| 1 | The response to an RDG contains Data frames only from the same AC as the last Data frame received from the RD initiator; see 10.28.4. |

NOTE—The AC of the last Data frame received from the RD initiator is determined directly from the TID of the received frame if the TID is between 0 and 7 inclusive or from the UP field of the TSPEC identified by the TID of the received frame if the TID is between 8 and 15 inclusive.

The RDG/More PPDU subfield of the HT Control field is interpreted differently depending on whether it is transmitted by an RD initiator or an RD responder, as defined in Table 9-11.

Table 9-11—RDG/More PPDU subfield values

| Value | Role of transmitting STA | Interpretation of value |
|-------|--------------------------|--|
| 0 | Not an RD responder | No reverse grant |
| | RD responder | The PPDU carrying the frame is the last transmission by the RD responder |
| 1 | RD initiator | An RDG is present |
| | RD responder | The PPDU carrying the frame is followed by another PPDU |

9.2.4.6.2 HT variant

The format of the HT Control Middle subfield of the HT variant HT Control field is shown in Figure 9-9.

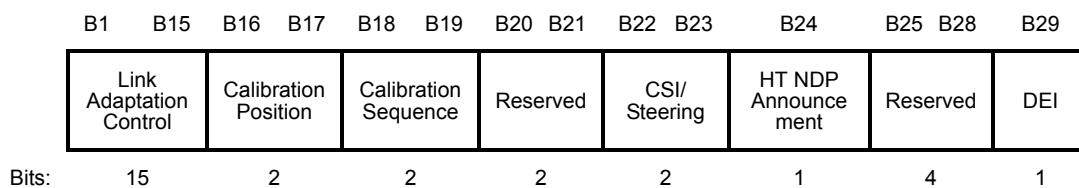

Figure 9-9—HT Control Middle subfield of the HT variant HT Control field

The format of the Link Adaptation Control subfield of the HT variant HT Control field is defined in Figure 9-10.

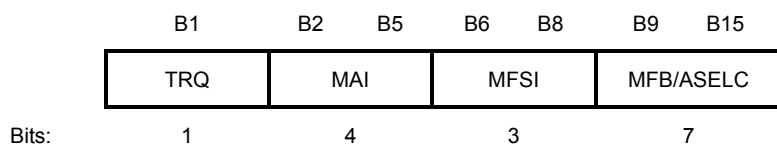

Figure 9-10—Link Adaptation Control subfield

The subfields of the Link Adaptation Control subfield are defined in Table 9-12.

Table 9-12—Subfields of Link Adaptation Control subfield

| Subfield | Meaning | Definition |
|----------|---|--|
| TRQ | Training request | Set to 1 to request the responder to transmit a sounding PPDU. Set to 0 to indicate that the responder is not requested to transmit a sounding PPDU. See 10.32.2 and 10.34.2. |
| MAI | MCS request (MRQ) or ASEL indication | Set to 14 (indicating ASELI) to indicate that the MFB/ASEL subfield is interpreted as ASELC. Otherwise, the MAI subfield is interpreted as shown in Figure 9-11, and the MFB/ASEL subfield is interpreted as MCS feedback (MFB). |
| MFSI | MCS feedback sequence identifier | Set to the received value of MSI contained in the frame to which the MFB information refers. Set to 7 for unsolicited MFB. |
| MFB/ASEL | MCS feedback and antenna selection command/data | When the MAI subfield is equal to the value ASELI, this subfield is interpreted as defined in Figure 9-12 and Table 9-14. Otherwise, this subfield contains recommended MFB. A value of 127 indicates that no feedback is present. |

The structure of the MAI subfield of the Link Adaptation Control subfield is defined in Figure 9-11. The subfields of the MAI subfield are defined in Table 9-13.

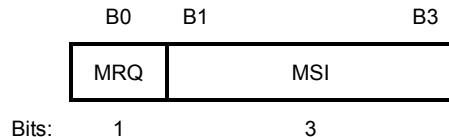

Figure 9-11—MAI subfield

Table 9-13—Subfields of the MAI subfield

| Subfield | Meaning | Definition |
|----------|-------------------------|---|
| MRQ | MCS request | Set to 1 to indicate that MFB is requested. Set to 0 to indicate that no MFB is requested. |
| MSI | MRQ sequence identifier | When the MRQ subfield is equal to 1, the MSI subfield contains a sequence number in the range 0 to 6 that identifies the specific request. When the MRQ subfield is equal to 0, the MSI subfield is reserved. |

The ASELC subfield of the Link Adaptation Control subfield contains the ASELC Command and ASELC Data subfields, as shown in Figure 9-12. The encoding of these subfields is shown in Table 9-14.

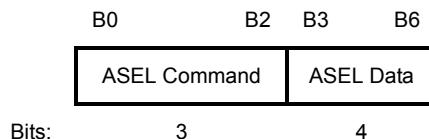

Figure 9-12—ASELC subfield

Table 9-14—ASEL Command and ASELC Data subfields

| ASEL Command | Interpretation of ASEL Command | ASEL Data |
|--|---|--|
| 0 | Transmit Antenna Selection Sounding Indication (TXASSI) | Number of remaining sounding PPDUs to be transmitted 0 to 15 See NOTE |
| 1 | Transmit Antenna Selection Sounding Request (TXASSR) or Transmit ASEL Sounding Resumption | 0 when the command is Transmit ASEL Sounding Request A number in the range 1 to 15, the number being the number of the first sounding PPDU to be transmitted when the command is Transmit ASEL Sounding Resumption, where 0 corresponds to the first sounding PPDU in the original ASEL training sequence |
| 2 | Receive Antenna Selection Sounding Indication (RXASSI) | Number of remaining sounding PPDUs to be received 0 to 15 See NOTE |
| 3 | Receive Antenna Selection Sounding Request (RXASSR) | Number of sounding PPDUs required 0 to 15 |
| 4 | Sounding Label | Sequence number of the sounding PPDU corresponding to a channel state information (CSI) frame in ASEL feedback 0 to 15 |
| 5 | No Feedback Due to ASEL Training Failure or Stale Feedback | A number in the range 0 to 15, the number being the number of the first sounding PPDU that was not received properly, where 0 corresponds to the first sounding PPDU in the ASEL training sequence, or 0 if no sounding PPDUs were received properly, or 0 if this is a request for a full retraining sequence |
| 6 | Transmit Antenna Selection Sounding Indication requesting feedback of explicit CSI (TXASSI-CSI) | Number of remaining sounding PPDUs to be transmitted 0 to 15 See NOTE |
| 7 | Reserved | Reserved |
| NOTE—If the HT variant HT Control field is carried in a sounding PPDU, then the value of the ASEL Data field contains the remaining number of sounding frames following the current one. If null data packet (NDP) sounding frame is used, then the value in the ASEL Data field contains the number of NDPs following a non-NDP+HTC. The HT NDP Announcement subfield in the HT Control field is set to 1 to indicate NDP sounding. | | |

The Calibration Position and Calibration Sequence subfields of the HT variant HT Control field are defined in Table 9-15.

Table 9-15—Calibration control subfields

| Subfield | Meaning | Definition |
|----------------------|--|--|
| Calibration Position | Position in calibration sounding exchange sequence | Set to 0 indicates this is not a calibration frame. Set to 1 indicates calibration start. Set to 2 indicates sounding response. Set to 3 indicates sounding complete. |
| Calibration Sequence | Calibration sequence identifier | The field is included in each frame within the calibration procedure and its value is unchanged for the frame exchanges during one calibration procedure. See 10.32.2.4.3. |

The Calibration Sequence subfield identifies an instance of the calibration procedure. The subfield is included in each frame within a calibration procedure, and its value is unchanged for frames within the same calibration procedure.

The CSI/Steering subfield of the HT variant HT Control field indicates the type of feedback, as shown in Table 9-16.

Table 9-16—CSI/Steering subfield values

| Value | Definition |
|-------|---------------------------|
| 0 | No feedback required |
| 1 | CSI |
| 2 | Noncompressed beamforming |
| 3 | Compressed beamforming |

The HT NDP Announcement subfield of the HT variant HT Control field indicates that an NDP will be transmitted after the frame (according to the rules described in 10.34). It is set to 1 to indicate that an NDP will follow; otherwise, it is set to 0.

The DEI subfield of the HT Control field is 1 bit in length and is set by the transmitting STA to indicate the suitability of the corresponding MSDU or A-MSDU to be discarded if there are insufficient resources at the receiving STA. See 10.9 and 11.27.2. In a Management frame, the DEI subfield is reserved.

9.2.4.6.3 VHT variant

The format of the HT Control Middle subfield of the VHT variant HT Control field is shown in Figure 9-13.

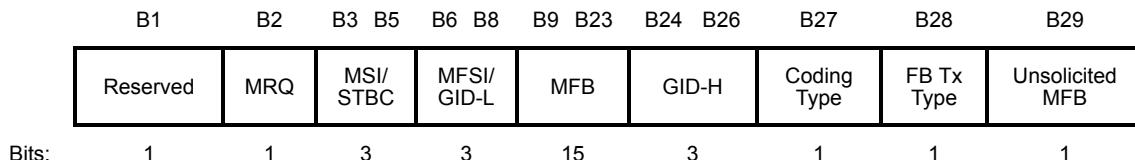

Figure 9-13—HT Control Middle subfield of the VHT variant HT Control field

The subfields of VHT variant HT Control field are defined in Table 9-17.

Table 9-17—VHT variant HT Control field subfields

| Subfield | Meaning | Definition |
|------------|--|---|
| MRQ | VHT-MCS feedback request | Set to 1 to request VHT-MCS feedback (solicited MFB); otherwise, set to 0. |
| MSI/STBC | MRQ sequence identifier/STBC indication | <p>If the Unsolicited MFB subfield is 0 and the MRQ subfield is 1, the MSI/STBC subfield contains a sequence number in the range 0 to 6 that identifies the specific MCS feedback request.</p> <p>If the Unsolicited MFB subfield is 0 and the MRQ subfield is 0, the MSI/STBC subfield is reserved.</p> <p>If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing “no feedback is present,” the MSI/STBC field contains the Compressed MSI and STBC Indication subfields as shown in Figure 9-14.</p> <p>The STBC Indication subfield indicates whether the estimate in the MFB subfield is computed based on a PPDU using STBC encoding:</p> <ul style="list-style-type: none"> Set to 0 if the PPDU was not STBC encoded Set to 1 if the PPDU was STBC encoded <p>The Compressed MSI subfield contains a sequence number that identifies the specific MCS feedback request. It is in the range 0 to 3 if STBC Indication equals 0 or in the range 0 to 2 if STBC Indication equals 1.</p> <p>Otherwise, the MSI/STBC subfield is reserved.</p> |
| MFSI/GID-L | MFB sequence identifier/LSBs of group ID | <p>If the Unsolicited MFB subfield is 0, the MFSI/GID-L subfield contains the received value of MSI contained in the frame to which the MFB information refers.</p> <p>If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing “no feedback is present,” and the MFB is estimated from a VHT MU PPDU, then the MFSI/GID-L subfield contains the lowest 3 bits of group ID of that PPDU from which the MFB was estimated (bit 0 of the group ID appears in the lowest numbered bit of the field MFSI/GID-L). If the unsolicited MFB is estimated from an SU PPDU, the MFSI/GID-L subfield is set to all 1s.</p> <p>Otherwise, this subfield is reserved.</p> |
| MFB | NUM_STS, VHT-MCS, BW and SNR feedback | MFB subfield is interpreted as defined in Table 9-18. This subfield contains the recommended MFB. The combination of VHT-MCS=15 and NUM_STS=7 indicates that no feedback is present. |

Table 9-17—VHT variant HT Control field subfields (continued)

| Subfield | Meaning | Definition |
|-----------------|--|---|
| GID-H | MSBs of group ID | If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing “no feedback is present,” and the unsolicited MFB is estimated from a VHT MU PPDU, then the GID-H subfield contains the highest 3 bits of group ID of the PPDU from which the unsolicited MFB was estimated (bit 3 of the group ID appears in the lowest numbered bit of the field GID-H). If the unsolicited MFB is estimated from an SU PPDU, the GID-H subfield is set to all 1s. Otherwise, this subfield is reserved. |
| Coding Type | Coding type of the measured PPDU | If the Unsolicited MFB subfield is 1 and the MFB does not contain the value representing “no feedback is present,” the Coding Type subfield contains the Coding information (0 for BCC and 1 for LDPC) of the PPDU from which the unsolicited MFB was estimated. Otherwise, this subfield is reserved. |
| FB Tx Type | Transmission type of the measured PPDU | If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing “no feedback is present,” and FB Tx Type subfield is 0, then the unsolicited MFB is estimated from a VHT PPDU with RXVECTOR parameter BEAMFORMED equal to 0. If the Unsolicited MFB subfield is 1, the MFB does not contain the value representing “no feedback is present,” and the FB Tx Type subfield is 1, then the unsolicited MFB is estimated from a VHT PPDU with RXVECTOR parameter BEAMFORMED equal to 1. Otherwise, this subfield is reserved. |
| Unsolicited MFB | Unsolicited VHT-MCS feedback indicator | Set to 1 if the MFB is not a response to an MRQ. Set to 0 if the MFB is a response to an MRQ. |

The format of the MSI/STBC subfield when the Unsolicited subfield is 1 is shown in Figure 9-14.

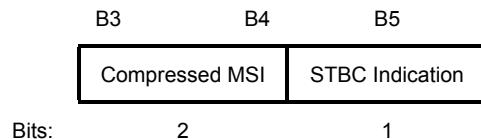

Figure 9-14—MSI/STBC subfield when the Unsolicited MFB subfield is 1

The format of the MFB subfield in the VHT variant HT Control field is shown in Figure 9-15.

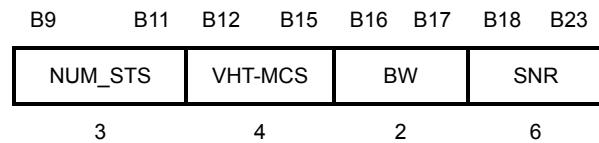

Figure 9-15—MFB subfield in the VHT variant HT Control field

The subfields of the MFB subfield in the VHT variant HT Control field are defined in Table 9-18.

Table 9-18—MFB subfield in the VHT variant HT Control field

| Subfield | Meaning | Definition |
|----------|--------------------------------------|---|
| NUM_STS | Recommended NUM_STS | Indicates the recommended NUM_STS as defined in 10.31.3. The NUM_STS subfield contains an unsigned integer representing the number of space-time streams minus 1. |
| VHT-MCS | Recommended VHT-MCS | Indicates the recommended VHT-MCS as defined in 10.31.3. The VHT-MCS subfield contains an unsigned integer in the range 0 to 9 representing a VHT-MCS Index value (defined in 21.5). |
| BW | Bandwidth of the recommended VHT-MCS | If the Unsolicited MFB subfield is 1, the BW subfield indicates the bandwidth for which the recommended VHT-MCS is intended, as defined in 10.31.3: For a VHT STA: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz and 80+80 MHz. For a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value 3 is reserved. If the Unsolicited MFB subfield is 0, the BW subfield is reserved. |
| SNR | Average SNR | Indicates the average SNR, which is an SNR averaged over data subcarriers and space-time streams. The SNR is averaged over all of the space-time streams and data subcarriers and is encoded as a 6-bit 2s complement number of SNR_average – 22, where SNR_average is the sum of the values of SNR per frequency tone (in decibels) per space-time stream divided by the product of the number of space-time streams, as indicated in the NUM_STS subfield, and the number of frequency tones represented in the bandwidth in which the MFB was estimated. This encoding covers the SNR range from –10 dB to 53 dB in 1 dB steps. |

9.2.4.7 Frame Body field

9.2.4.7.1 General

The Frame Body is a variable-length field that contains information specific to individual frame types and subtypes. The minimum length of the frame body is 0 octets. The maximum length of the frame body is constrained or affected by the following:

- The maximum MMPDU, MSDU, A-MSDU, and MPDU sizes supported by the recipient(s) for the PPDU format in use, as specified in Table 9-19
- The maximum PPDU duration (e.g., HT_MF L-SIG L_LENGTH, HT_GF, VHT, TVHT, or DMG aPPDUMaxTime (see Table 9-19); any nonzero TXOP limit; any regulatory constraints (e.g., CS4-msBehavior))
- The fields present in the MAC header (e.g., QoS Control, Address 4, HT Control)
- The presence of security encapsulation (e.g., TKIP, CCMP or GCMP Header and MIC)
- The presence of Mesh Control fields (see 9.2.4.7.3)

NOTE 1—In an A-MSDU, the Mesh Control field is located in the A-MSDU Subframe Header (see Figure 9-56). In an MMPDU, the Mesh Control field is located within the MMPDU (see 9.6.18). Such Mesh Control fields need to be taken into account if a maximum A-MSDU or MMPDU size constraint applies as well as if a maximum MPDU size constraint applies.

NOTE 2—TKIP is not allowed with A-MSDUs (see 12.2.6) or MMPDUs (see 12.5.4.1) and, therefore, need not be taken into account if a maximum A-MSDU or MMPDU size constraint applies.

Table 9-19—Maximum data unit sizes (in octets) and durations (in microseconds)

| | Non-HT non-VHT non-DMG PPDU and non-HT duplicate PPDU | HT PPDU | VHT PPDU | DMG PPDU |
|---|--|---|--|---------------------------------|
| MMPDU size | 2304 | 2304 | See NOTE 1 | 2304 |
| MSDU size | 2304 | 2304 | 2304 | 7920 |
| A-MSDU size | 3839 or 4065 (see NOTE 2) (HT STA, see also Table 9-162), or N/A (non-HT STA, see also 10.12) | 3839 or 7935 (see also Table 9-162) | See NOTE 3 | 7935 |
| MPDU size | See NOTE 4 | See NOTE 5 | 3895 or 7991 or 11 454 (see also Table 9-249) | See NOTE 5 |
| PSDU size (see NOTE 7) | $2^{12}-1$ (see Table 15-5, Table 16-4, Table 17-21, Table 18-5) | $2^{16}-1$ (see Table 19-25) | 4 692 480 ($\sim 2^{22.16}$) (see Table 21-29) | $2^{18}-1$ (see Table 20-32) |
| PPDU duration (see NOTE 7) | See NOTE 6 | 5484 (HT_MF; see 10.26.4) or 10 000 (HT_GF; see Table 19-25) | 5484 (see Table 21-29) | 2000 (see Table 20-32) |
| NOTE 1—No direct constraint on the maximum MMPDU size; indirectly constrained by the maximum MPDU size (see 9.3.3.2). | | | | |
| NOTE 2—Indirect constraint from the maximum PSDU size: $2^{12}-1$ octets minus the minimum QoS Data frame overhead (26 octets for the MAC header and 4 octets for the FCS). | | | | |
| NOTE 3—No direct constraint on the maximum A-MSDU size; indirectly constrained by the maximum MPDU size. | | | | |
| NOTE 4—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum MSDU/MMPDU or (for HT STAs only) A-MSDU size. | | | | |
| NOTE 5—No direct constraint on the maximum MPDU size; indirectly constrained by the maximum A-MSDU size. | | | | |
| NOTE 6—No direct constraint on the maximum duration, but an L_LENGTH value above 2332 might not be supported by some receivers (see last NOTE in 10.26.4). | | | | |
| NOTE 7—The values for maximum PSDU size and maximum PPDU duration are informative only. References to the normative requirements are provided. | | | | |

9.2.4.7.2 Overhead for encryption

The overhead for encryption is described in Clause 12. When the Mesh Control field is present in the frame body, the Mesh Control field is encrypted as a part of data.

9.2.4.7.3 Mesh Control field

The Mesh Control field is present in a mesh Data frame containing an unfragmented MSDU or the first fragment of a fragmented MSDU and is present in a Multihop Action frame transmitted by a mesh STA.

In mesh Data frames, when the Mesh Control Present subfield in the QoS Control field is 1, the Mesh Control field is prepended to the MSDU and located as follows:

- When the frame body contains an MSDU (or a fragment thereof) and the frame is not encrypted, the Mesh Control field is located in the first octets of the frame body.
- When the frame body contains an MSDU (or a fragment thereof) and the frame is encrypted, the Mesh Control field is located in the first octets of the encrypted data portion.
- When the frame body contains an A-MSDU, the Mesh Control field is located in the A-MSDU subframe header as shown in Figure 9-56.

In the Multihop Action frame, the Mesh Control field is present as specified in 9.6.18.

The Mesh Control field is of variable length (6, 12, or 18 octets). The structure of the Mesh Control field is defined in Figure 9-16.

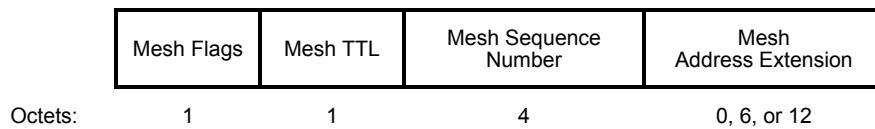

Figure 9-16—Mesh Control field

The Mesh Flags subfield is 1 octet in length and contains the Address Extension Mode subfield. The structure of the Mesh Flags subfield is shown in Figure 9-17.

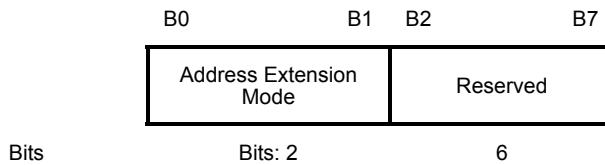

Figure 9-17—Mesh Flags subfield

The Address Extension Mode subfield indicates the contents of the Mesh Address Extension subfield. Table 9-20 defines valid values for the Address Extension Mode and describes the corresponding contents of the Mesh Address Extension subfield.

The Mesh TTL subfield is 1 octet in length and contains an unsigned integer corresponding to the remaining number of hops the MSDU/MMPDU is forwarded. How the Mesh TTL is used in both individually and group addressed frames is described in 10.35.3 and 10.35.4.

Table 9-20—Valid values for the Address Extension Mode subfield

| Address extension mode value | Address extension mode name | Address extension mode description | Mesh Address Extension subfield length (octets) | Applicable frame types |
|-------------------------------------|------------------------------------|--|--|---|
| 0 | None | No Mesh Address Extension subfield | 0 | Data, Management (Multihop Action, group addressed) |
| 1 | Address4 | Mesh Address Extension subfield contains Address 4 | 6 | Management (Multihop Action, individually addressed), Data (proxied, group addressed) |
| 2 | Address5&6 | Mesh Address Extension subfield contains Address 5 and Address 6 | 12 | Data (proxied, individually addressed) |
| 3 | | Reserved | — | — |

The Mesh Sequence Number subfield is 4 octets in length and contains an unsigned integer sequence number counter value. Source mesh STAs assign mesh sequence numbers from a single modulo 2^{32} counter, starting at 0 and incrementing by 1 for each MSDU or MMPDU that is transmitted with a Mesh Control field. Usage of the Mesh Sequence Number is described in 10.35.6.

NOTE—It is believed that a 32-bit sequence number is sufficient as the rollover would occur after a period of 5 days assuming a source continuously transmitting at a rate of 10^4 frames per second.

The Mesh Address Extension subfield, shown in Figure 9-18, is 6 or 12 octets in length and is present only when the Address Extension Mode subfield of the Mesh Flags subfield is a nonzero nonreserved value. The Mesh Address Extension subfield provides additional address fields for mesh address extension as defined in Table 9-20. The interpretation of the extended Address fields is described in 9.3.5.

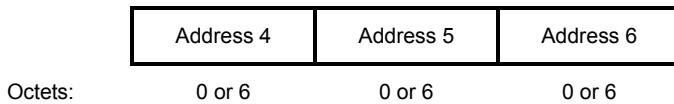

Figure 9-18—Mesh Address Extension subfield

The Address 4 subfield is present when the Address Extension Mode subfield in the Mesh Flags subfield is 1. It carries a fourth address that is not included as a part of the MAC header for these frames.

The Address 5 subfield and Address 6 subfield are present when the Address Extension Mode subfield in the Mesh Flags subfield is 2. It carries the addresses of source and destination end station of the end-to-end IEEE 802 communication in cases which either (or both) of the end stations are not mesh STAs at the beginning or end of a single mesh path. (See Figure 9-64.)

NOTE—This is useful, for example, when the end stations of IEEE 802 communication are nonmesh, external STAs that communicate over a mesh BSS via proxy mesh gates.

Details on the usage of these optional address fields are given in 14.10.8.4.

9.2.4.8 FCS field

The FCS field is a 32-bit field containing a 32-bit CRC. The FCS is calculated over all of the fields of the MAC header and the Frame Body field. These are referred to as the *calculation fields*.

The FCS is calculated using the following standard generator polynomial of degree 32:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

The FCS is the 1s complement of the sum (modulo 2) of the following:

- a) The remainder of $x^k \times (x^{31} + x^{30} + x^{29} + \dots + x^2 + x + 1)$ divided (modulo 2) by $G(x)$, where k is the number of bits in the calculation fields, and
- b) The remainder after multiplication of the contents (treated as a polynomial) of the calculation fields by x^{32} and then division by $G(x)$.

The FCS field is transmitted commencing with the coefficient of the highest-order term.

As a typical implementation, at the transmitter, the initial remainder of the division is preset to all 1s and is then modified by division of the calculation fields by the generator polynomial $G(x)$. The 1s complement of this remainder is transmitted, with the highest-order bit first, as the FCS field.

At the receiver, the initial remainder is preset to all 1s and the serial incoming bits of the calculation fields and FCS, when divided by $G(x)$, results (in the absence of transmission errors) in a unique nonzero remainder value. The unique remainder value is the polynomial:

$$x^{31} + x^{30} + x^{26} + x^{25} + x^{24} + x^{18} + x^{15} + x^{14} + x^{12} + x^{11} + x^{10} + x^8 + x^6 + x^5 + x^4 + x^3 + x + 1$$

9.2.5 Duration/ID field (QoS STA)

9.2.5.1 General

The value in the Duration/ID field within Poll, SPR, Grant, Grant Ack, DMG CTS, DMG DTS, SSW, SSW-Feedback, and SSW-Ack frames transmitted by a DMG STA are described in 9.3.1.11 to 9.3.1.19. The value in the Duration/ID field within DMG Beacon frames transmitted by a DMG STA is described in 9.3.4.2.

The value in the Duration/ID field in a frame transmitted by a QoS STA is defined in 9.2.5.2 to 9.2.5.8.

All times are calculated in microseconds. If a calculated duration includes a fractional microsecond, that value inserted in the Duration/ID field is rounded up to the next higher integer. If a calculated duration results in a negative value, the value of the Duration/ID field is 0.

9.2.5.2 Setting for single and multiple protection under enhanced distributed channel access (EDCA)

In transmissions under EDCA by a STA that initiates a TXOP, there are two classes of duration settings: single protection and multiple protection. In single protection, the value of the Duration/ID field of the frame can set a network allocation vector (NAV) value at receiving STAs that protects up to the end of any following Data, Management, or response frame plus any additional overhead frames as described below. In multiple protection, the value of the Duration/ID field of the frame can set a NAV that protects up to the estimated end of a sequence of multiple frames.

The STA selects between single and multiple protection when it transmits the first frame of a TXOP. All subsequent frames transmitted by the STA in the same TXOP use the same class of duration settings. A STA always uses multiple protection in a TXOP that includes:

- Frames that have the RDG/More PPDU subfield equal to 1
- PSMP frames
- VHT NDP Announcement frames or Beamforming Report Poll frames

The Duration/ID field is determined as follows:

- a) Single protection settings.
 - 1) In an RTS frame that is not part of a dual clear-to-send (CTS) exchange, the Duration/ID field is set to the estimated time, in microseconds, required to transmit the pending frame, plus one CTS frame, plus one Ack or BlockAck frame if required, plus any NDPS required, plus explicit feedback if required, plus applicable IFSs.
 - 2) In all CTS frames sent by STAs as the first frame in the exchange under EDCA and with the receiver address (RA) matching the MAC address of the transmitting STA, the Duration/ID field is set to one of the following:
 - i) If there is a response frame, the estimated time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus any NDPS required, plus explicit feedback if required, plus an additional SIFS
 - ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
 - 3) In a BlockAckReq frame, the Duration/ID field is set to the estimated time required to transmit one Ack or BlockAck frame, as applicable, plus one SIFS.
 - 4) In a BlockAck frame that is not sent in response to a BlockAckReq frame or an implicit block ack request, the Duration/ID field is set to the estimated time required to transmit an Ack frame plus a SIFS.
 - 5) In Management frames, non-QoS Data frames (i.e., with bit 7 of the Frame Control field equal to 0), and individually addressed Data frames with the Ack Policy subfield equal to Normal Ack only, the Duration/ID field is set to one of the following:
 - i) If the frame is the final fragment of the TXOP, the estimated time required for the transmission of one Ack frame (including appropriate IFSs)
 - ii) Otherwise, the estimated time required for the transmission of one Ack frame, plus the time required for the transmission of the following frame and its response if required, plus applicable IFSs.
 - 6) In individually addressed QoS Data frames with the Ack Policy subfield equal to No Ack or Block Ack, for Action No Ack frames, and for group addressed frames, the Duration/ID field is set to one of the following:
 - i) If the frame is the final fragment of the TXOP, 0
 - ii) Otherwise, the estimated time required for the transmission of the following frame and its response frame, if required (including appropriate IFSs)
- b) Multiple protection settings. The Duration/ID field is set to a value D as follows:
 - 1) If $T_{TXOP} = 0$ and $T_{END_NAV} = 0$, then $D = T_{SINGLE-MSDU} - T_{PPDU}$
 - 2) Else if $T_{TXOP} = 0$ and $T_{END_NAV} > 0$, then $D = \max(0, T_{END-NAV} - T_{PPDU})$
 - 3) Else if $T_{END-NAV} = 0$, then $\min(T_{PENDING}, T_{TXOP} - T_{PPDU}) \leq D \leq T_{TXOP} - T_{PPDU}$
 - 4) Else $T_{END-NAV} - T_{PPDU} \leq D \leq T_{TXOP-REMAINING} - T_{PPDU}$

where

| | |
|----------------------|--|
| $T_{SINGLE-MSDU}$ | is the estimated time required for the transmission of the allowed frame exchange sequence defined in 10.22.2.8 (for a TXOP limit of 0), including applicable IFSs |
| $T_{PENDING}$ | is the estimated time required for the transmission of <ul style="list-style-type: none"> — Pending MPDUs of the same AC — Any associated immediate response frames — Any HT NDP, VHT NDP, or Beamforming Report Poll frame transmissions and explicit feedback response frames — Applicable IFSs — Any RDG |
| T_{TXOP} | is the duration given by <code>dot11EDCATableTXOPLimit</code> (<code>dot11QAP-EDCATableTXOPLimit</code> for the AP) for that AC |
| $T_{TXOP-REMAINING}$ | is T_{TXOP} less the time already used time within the TXOP |
| $T_{END-NAV}$ | is the remaining duration of any NAV set by the TXOP holder, or 0 if no NAV has been established |
| T_{PPDU} | is the time required for transmission of the current PPDU |

The estimated time required for transmission of a VHT Compressed Beamforming frame response is determined by assuming the following:

- All feedback segments (as defined in 10.34.5.3) are transmitted, even if a Beamforming Report Poll frame is used and not all of the bits in the included Feedback Segment Retransmission Bitmap field are equal to 1.
- The subfield values of the VHT MIMO Control field are as follows:
 - The Feedback Type, Nr Index, and Channel Width fields are as specified in 10.34.5.
 - The Nc Index field is as specified in 10.34.5 if the Feedback Type field is MU, or to the greatest value allowed by 10.34.5 if the Feedback Type field is SU.
 - The Grouping field indicates no grouping.
 - The Codebook Information field has the value 1.

NOTE 1—Estimated times might prove to be inexact, if the TXOP responder has a choice of PHY options (e.g., BCC v. LDPC, use of STBC, use of short GI, PHY header/preamble format options) or MAC options (e.g., use of HT Control). Heuristics such as the TXOP responder’s previous choices and channel conditions might be used to minimize the inexactitude.

NOTE 2—if a TXOP includes the transmission of a VHT Compressed Beamforming frame by the TXOP responder, the TXOP holder can, if the duration estimates prove excessive, indicate truncation of the TXOP by using a CF-End frame, provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame (see 10.22.2.9).

9.2.5.3 Setting for QoS CF-Poll frames

Within a Data frame containing QoS CF-Poll, the Duration/ID field value is set to one of the following:

- a) One SIFS plus the TXOP limit, if the TXOP limit is nonzero, or
- b) The time required for the transmission of one MPDU of nominal MSDU size and the associated Ack frame plus two SIFSs, if the TXOP limit is 0.

9.2.5.4 Setting for frames sent by a TXOP holder under HCCA

Within a frame sent by a TXOP holder under hybrid coordination function (HCF) controlled channel access (HCCA), to provide NAV protection for the entire controlled access phase (CAP), the Duration/ID field is set to one of the following values:

- a) In an RTS frame
 - 1) If the pending frame is the final frame, the time required to transmit the pending frame, plus one CTS frame, plus one Ack frame if required, plus three SIFSs
 - 2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
- b) In a CTS frame
 - 1) If the pending frame is the sole frame in the TXOP, one of the following:
 - i) If there is a response frame, the time required to transmit the pending frame, plus one SIFS, plus the response frame (Ack or BlockAck), plus an additional SIFS
 - ii) If there is no response frame, the time required to transmit the pending frame, plus one SIFS
 - 2) If the pending frame is not the final frame in the TXOP, the remaining duration of the TXOP
- c) Otherwise
 - 1) If the frame is a nonfinal frame in a TXOP with multiple frame exchanges, the remaining duration of the TXOP
 - 2) If the frame is the sole or final frame in the TXOP, the actual remaining time needed for this frame exchange sequence

9.2.5.5 Settings within a PSMP sequence

Within a PSMP frame the Duration/ID field is set to a value that is no less than the time required to complete all PSMP-DTT and PSMP-UTT periods described in the frame.

Within the PSMP-DTT and PSMP-UTT of a PSMP sequence, the Duration/ID field is set to the Duration/ID value of the preceding PSMP frame minus the time between the end of the PSMP frame and the end of the PPDU carrying the frame.

NOTE—In other words, all frames transmitted within a PSMP sequence locate the same NAV endpoint.

9.2.5.6 Settings within a dual CTS sequence

Within a frame (“Frame1”) (excluding a second CTS (CTS2) transmission, as defined in 10.3.2.8) sent by a QoS STA that is not a TXOP holder in a PPDU that contains an immediate response or that is sent by an RD responder, the Duration/ID field is set to the Duration/ID value from the frame(s) (“Frames2”) that elicited the response or that carried the RDG minus the time interval between the end of the PPDU that carried Frame1 and the end of the PPDU that carries Frames2.

Within a frame (“Frame1”) (excluding a CTS2 transmission, as defined in 10.3.2.8) sent by a QoS STA that is a TXOP holder, the Duration/ID field is set according to the rules in the following subclauses:

- 9.2.5.2 rule b) for multiple protection if Frame1 is not a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
- 9.2.5.3 if Frame1 is a QoS +CF-Poll frame and the TXOP holder is not operating under HCCA or PSMP
- 9.2.5.4 if the TXOP holder is operating under HCCA
- 9.2.5.5. if the TXOP holder is operating under PSMP

Within the CTS2 of a dual CTS exchange, defined in 10.3.2.8, the Duration/ID field is set to the value of the Duration/ID field of the RTS frame that initiated the exchange minus the time required to transmit the first clear-to-sent (CTS1), CTS2, and the applicable IFSS.

9.2.5.7 Setting for control response frames

This subclause describes how to set the Duration/ID field for CTS, Ack, and BlockAck frames transmitted by a QoS STA.

In a CTS frame that is not part of a dual CTS sequence transmitted in response to an RTS frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the RTS frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the RTS frame and the end of the PPDU carrying the CTS frame.

In an Ack frame, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the Ack frame.

In a BlockAck frame transmitted in response to a BlockAckReq frame or transmitted in response to a frame containing an implicit block ack request, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the BlockAck frame.

9.2.5.8 Setting for other response frames

In any frame transmitted by a STA that is not the TXOP holder and is not specified by 9.2.5.1 to 9.2.5.7, the Duration/ID field is set to the value obtained from the Duration/ID field of the frame that elicited the response minus the time, in microseconds, between the end of the PPDU carrying the frame that elicited the response and the end of the PPDU carrying the frame.

9.3 Format of individual frame types

9.3.1 Control frames

9.3.1.1 Format of Control frames

In the following descriptions, “immediately previous” frame means a frame whose reception concluded within the SIFS preceding the start of the current frame.

The subfields within the Frame Control field of Control frames are set as illustrated in Figure 9-19.

| B0 | B1 | B2 | B3 | B4 | B7 | B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 |
|------------------|----------------|---------|----|-----------|-------------|---------------|-----------|------------------|-----------|---------------------|-----------------|-----|-----|
| Protocol Version | Type (Control) | Subtype | | To DS (0) | From DS (0) | More Frag (0) | Retry (0) | Power Management | More Data | Protected Frame (0) | +HTC /Order (0) | | |

Bits:

| | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2 | 2 | 4 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Figure 9-19—Frame Control field subfield values within Control frames

9.3.1.2 RTS frame format

The frame format for the RTS frame is as defined in Figure 9-20.

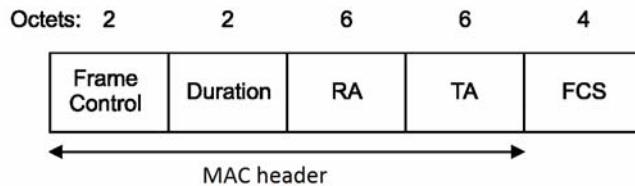

Figure 9-20—RTS frame

The RA field value of the RTS frame is the address of the STA, on the WM, that is the intended immediate recipient of the pending individually addressed Data, Management, or Control frame.

The TA field value is the address of the STA transmitting the RTS frame or the bandwidth signaling TA of the STA transmitting the RTS frame. In an RTS frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT (see 10.3.2.6), the TA field is a bandwidth signaling TA.

For all RTS frames sent by non-QoS STAs, the duration value is the time, in microseconds, required to transmit the pending Data or Management frame, plus one CTS frame, plus one Ack frame, plus three SIFSs. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. For RTS frames sent by QoS STAs, see 9.2.5.

9.3.1.3 CTS frame format

The frame format for the CTS frame is as defined in Figure 9-21.

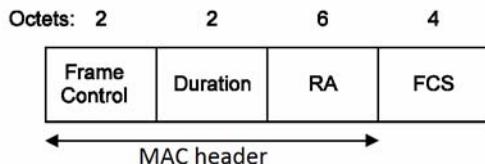

Figure 9-21—CTS frame

When the CTS frame is a response to an RTS frame, the value of the RA field of the CTS frame is set to the address from the TA field of the RTS frame with the Individual/Group bit forced to the value 0. When the CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

For all CTS frames transmitted by a non-QoS STA in response to RTS frames, the duration value is the value obtained from the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the CTS frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame requires acknowledgment, the duration value is the time, in microseconds, required to transmit the pending Data or Management frame, plus two SIFSs plus one Ack frame. At a non-QoS STA, if the CTS frame is the first frame in the exchange and the pending Data or Management frame does not require acknowledgment, the duration value is the time, in microseconds, required to transmit the pending Data or Management frame, plus one SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For other CTS frame transmissions by a QoS STA, the duration value is set as defined in 9.2.5.

A CTS-to-self frame is a CTS frame in which the RA field is equal to the transmitter's MAC address.

A CTS-to-AP frame is a CTS frame that is not transmitted in response to an RTS frame and in which the RA field is equal to the MAC address of the AP with which the STA is associated.

9.3.1.4 Ack frame format

The frame format for the Ack frame is as defined in Figure 9-22.

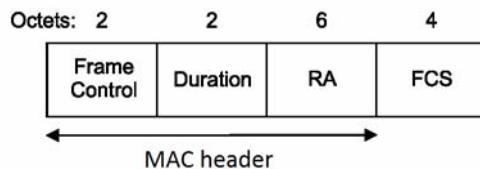

Figure 9-22—Ack frame

The value of the RA field of the Ack frame is the nonbandwidth signaling TA from the Address 2 field of the immediately previous individually addressed Data, Management, BlockAckReq, BlockAck, or PS-Poll frames.

For Ack frames sent by non-QoS STAs, if the More Fragments bit was equal to 0 in the Frame Control field of the immediately previous individually addressed Data or Management frame, the duration value is set to 0. In other Ack frames sent by non-QoS STAs, the duration value is the value obtained from the Duration/ID field of the immediately previous Data, Management, BlockAckReq, or BlockAck frame minus the time, in microseconds, required to transmit the Ack frame and its SIFS. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

In all other Ack frames, the duration value is specified by 9.2.5.

9.3.1.5 PS-Poll frame format

The frame format for the PS-Poll frame is as defined in Figure 9-23.

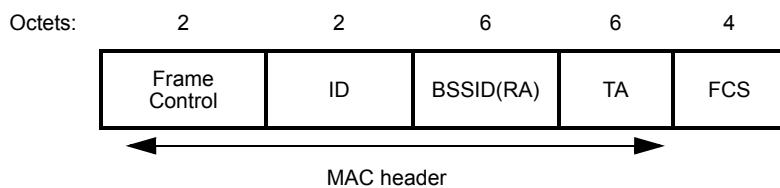

Figure 9-23—PS-Poll frame

The BSSID is the address of the STA contained in the AP. The TA field value is the address of the STA transmitting the frame or a bandwidth signaling TA. In a PS-Poll frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field value is a bandwidth signaling TA. The ID field contains the AID value assigned to the STA transmitting the frame by the AP in the (Re)Association Response frame that established that STA's current association, with the two MSBs set to 1.

9.3.1.6 CF-End frame format

The frame format for the CF-End frame is as defined in Figure 9-24.

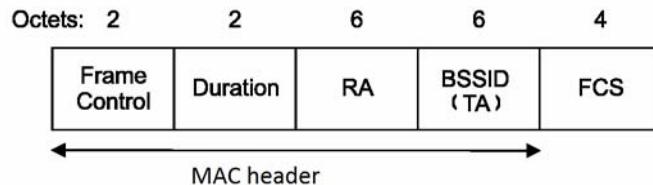

Figure 9-24—CF-End frame

When transmitted by a non-DMG STA, the Duration field is set to 0. When transmitted by a DMG STA, the Duration field is set to the time required to complete the CF-End truncation sequence of which it is part (see 10.36.8): Duration = $(i - 1) \times (\text{TXTIME(CF-End)} + \text{SIFS})$, where i is in the range 1 to 3 and indicates the order of the CF-End frame in the truncation sequence in the reverse direction (i.e., $i=1$ corresponds to the last CF-End frame in the sequence).

When transmitted by a non-DMG STA, the RA field is the broadcast group address. When transmitted by a DMG STA, the RA field is the MAC address of the STA that is the intended immediate recipient of the individually addressed Data or Management frame, or the broadcast group address.

When transmitted by a non-DMG STA, the BSSID (TA) field is the address of the STA contained in the AP except that the Individual/Group bit of the BSSID (TA) field is set to 1 in a CF-End frame transmitted by a VHT STA to a VHT AP in a non-HT or non-HT duplicate format to indicate that the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT. When transmitted by a DMG STA, the TA field is the MAC address of the STA transmitting the frame.

9.3.1.7 CF-End +CF-Ack frame format

The frame format for the CF-End +CF-Ack frame is as defined in Figure 9-25.

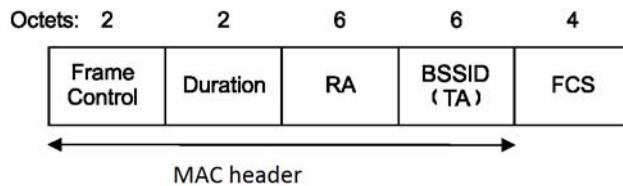

Figure 9-25—CF-End +CF-Ack frame

The BSSID field is the address of the STA contained in the AP. The RA field is the broadcast group address.

The Duration field is set to 0.

9.3.1.8 BlockAckReq frame format

9.3.1.8.1 Overview

The frame format of the BlockAckReq frame is defined in Figure 9-26.

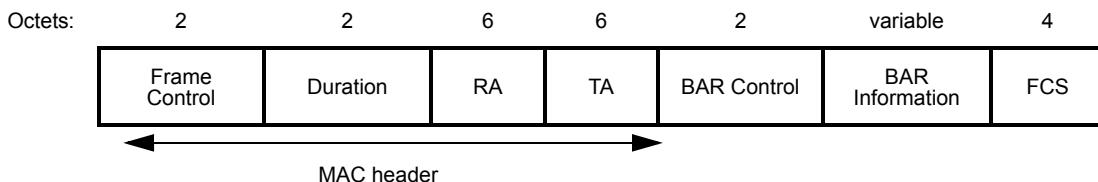

Figure 9-26—BlockAckReq frame

The Duration field value is set as defined in 9.2.5.

The RA field of the BlockAckReq frame is the address of the recipient STA.

The TA field value is the address of the STA transmitting the BlockAckReq frame or a bandwidth signaling TA. In a BlockAckReq frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field value is a bandwidth signaling TA.

The BAR (for block acknowledgment request) Control field is shown in Figure 9-27.

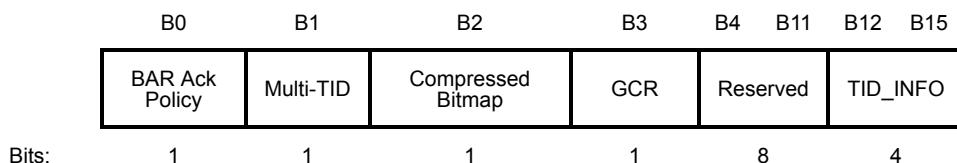

Figure 9-27—BAR Control field

For BlockAckReq frames sent under Delayed and HT-delayed agreements, the BAR Ack Policy subfield of the BAR Control field has the meaning shown in Table 9-21. For BlockAckReq frames sent under other types of agreement, the BAR Ack Policy subfield is reserved.

Table 9-21—BAR Ack Policy subfield

| Value | Meaning |
|-------|--|
| 0 | <p>Normal Acknowledgment. The BAR Ack Policy subfield is set to this value when the sender requires immediate acknowledgment. The addressee returns an Ack frame.</p> <p>See 10.29.2.7. The value 0 is not used in frames transmitted by a DMG STA.</p> |
| 1 | <p>No Acknowledgment. The addressee sends no immediate response upon receipt of the frame. The BAR Ack Policy subfield is set to this value when the sender does not require immediate acknowledgment.</p> <p>The value 1 is not used in a Basic BlockAckReq frame outside a PSMP sequence. The value 1 is not used in an Multi-TID BlockAckReq frame.</p> |

The values of the Multi-TID, Compressed Bitmap, and GCR subfields determine which of four possible BlockAckReq frame variants is represented, as indicated in Table 9-22.

Table 9-22—BlockAckReq frame variant encoding

| Multi-TID subfield value | Compressed Bitmap subfield value | GCR subfield value | BlockAckReq frame variant |
|--------------------------|----------------------------------|--------------------|---------------------------------|
| 0 | 0 | 0 | Basic BlockAckReq |
| 0 | 1 | 0 | Compressed BlockAckReq |
| 1 | 0 | 0 | Extended Compressed BlockAckReq |
| 1 | 1 | 0 | Multi-TID BlockAckReq |
| 0 | 0 | 1 | Reserved |
| 0 | 1 | 1 | GCR BlockAckReq |
| 1 | 0 | 1 | Reserved |
| 1 | 1 | 1 | Reserved |

DMG STAs use only the Compressed BlockAckReq variant and the Extended Compressed BlockAckReq variant.

The meaning of the TID_INFO subfield of the BAR Control field depends on the BlockAckReq frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAckReq frame variants.

The meaning of the BAR Information field of the BlockAckReq frame depends on the BlockAckReq frame variant type. The meaning of this field is explained within the subclause for each of the BlockAckReq frame variants.

NOTE—Reference to “a BlockAckReq” frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

9.3.1.8.2 Basic BlockAckReq variant

The use of the basic BlockAckReq variant is obsolete. Consequently, this subclause might be removed in a later revision of the standard.

The TID_INFO subfield of the BAR Control field of the Basic BlockAckReq frame contains the TID for which a Basic BlockAck frame is requested.

The BAR Information field of the Basic BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAckReq frame is sent. The Fragment Number subfield is set to 0.

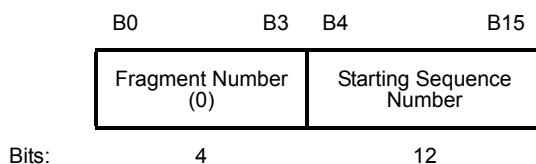

Figure 9-28—Block Ack Starting Sequence Control subfield

9.3.1.8.3 Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

9.3.1.8.4 Extended Compressed BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Extended Compressed BlockAckReq frame contains the TID for which a BlockAck frame is requested.

The BAR Information field of the Extended Compressed BlockAckReq frame contains the Block Ack Starting Sequence Control subfield, as shown in Figure 9-28 8-21. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

9.3.1.8.5 Multi-TID BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the Multi-TID BlockAckReq frame determines the number of TIDs present in the Multi-TID BlockAckReq frame as given by TID_INFO + 1, e.g., a value of 2 in the TID_INFO subfield means that three TID values are present in the Multi-TID BlockAckReq frame's BAR Information field.

The BAR Information field of the Multi-TID BlockAckReq frame comprises multiple sets of Per TID Info subfields and Block Ack Starting Sequence Control subfields, as shown in Figure 9-29. The Per TID Info subfield is shown in Figure 9-30. The Block Ack Starting Sequence Control subfield is shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

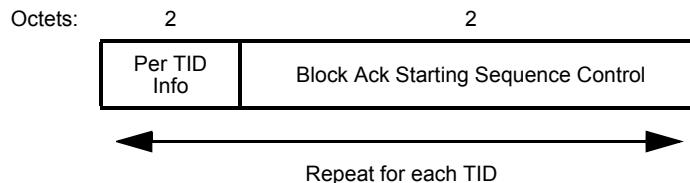

Figure 9-29—BAR Information field (Multi-TID BlockAckReq)

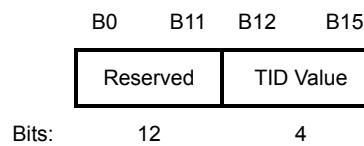

Figure 9-30—Per TID Info subfield

9.3.1.8.6 GCR BlockAckReq variant

The TID_INFO subfield of the BAR Control field of the GCR BlockAckReq frame is set to 0.

The BAR Information field of the GCR BlockAckReq frame contains the Block Ack Starting Sequence Control subfield and GCR Group Address subfield, as shown in Figure 9-31. The Block Ack Starting Sequence Control subfield is shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAckReq frame is sent. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

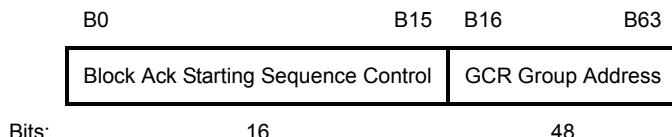

Figure 9-31—BAR Information field format (GCR BlockAckReq)

The GCR Group Address subfield contains the MAC address of the group for which reception status is being requested.

9.3.1.9 BlockAck frame format

9.3.1.9.1 Overview

The frame format of the BlockAck frame is defined in Figure 9-32.

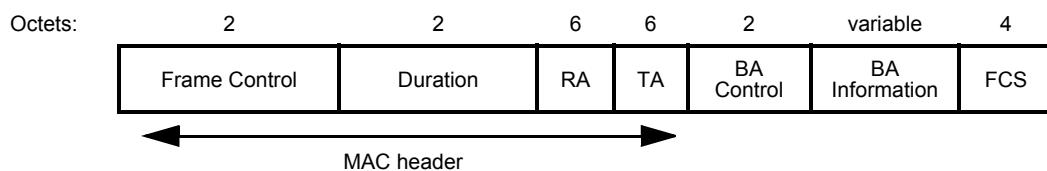

Figure 9-32—BlockAck frame

The Duration field value is set as defined in 9.2.5.

The RA field of the BlockAck frame is the address of the recipient STA that requested the Block Ack.

The TA field value is the address of the STA transmitting the BlockAck frame or a bandwidth signaling TA in the context of HT-delayed Block Ack. In a BlockAck frame transmitted in the context of HT-delayed Block Ack by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field value is a bandwidth signaling TA.

The BA Control field is defined in Figure 9-33.

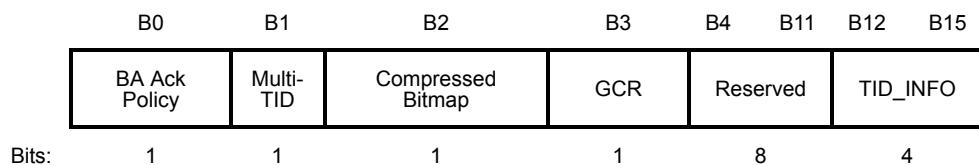

Figure 9-33—BA Control field

For BlockAck frames sent under Delayed and HT-delayed agreements, the BA Ack Policy subfield of the BA Control field has the meaning shown in Table 9-23. For BlockAck frames sent under other types of agreement, the BA Ack Policy subfield is reserved.

Table 9-23—BA Ack Policy subfield

| Value | Meaning |
|-------|---|
| 0 | <p>Normal Acknowledgment. The BA Ack Policy subfield is set to this value when the sender requires immediate acknowledgment. The addressee returns an Ack frame.</p> <p>The value 0 is not used for data sent under HT-delayed Block Ack during a PSMP sequence. The value 0 is not used in frames transmitted by DMG STAs.</p> |
| 1 | <p>No Acknowledgment. The addressee sends no immediate response upon receipt of the frame. The BA Ack Policy is set to this value when the sender does not require immediate acknowledgment.</p> <p>The value 1 in a Compressed BlockAck frame indicates HT-delayed block ack. HT-delayed block ack is obsolete and this value might be reserved in a later revision of the standard.</p> <p>The value 1 is not used in a Basic BlockAck frame outside a PSMP sequence. The value 1 is not used in an Multi-TID BlockAck frame.</p> |

The values of the Multi-TID, Compressed Bitmap, and GCR subfields of the BA Control field determine which of the BlockAck frame variants is represented, as indicated in the Table 9-24.

Table 9-24—BlockAck frame variant encoding

| Multi-TID subfield value | Compressed Bitmap subfield value | GCR subfield value | BlockAck frame variant |
|--------------------------|----------------------------------|--------------------|------------------------------|
| 0 | 0 | 0 | Basic BlockAck |
| 0 | 1 | 0 | Compressed BlockAck |
| 1 | 0 | 0 | Extended Compressed BlockAck |
| 1 | 1 | 0 | Multi-TID BlockAck |
| 0 | 0 | 1 | Reserved |
| 0 | 1 | 1 | GCR BlockAck |
| 1 | 0 | 1 | Reserved |
| 1 | 1 | 1 | Reserved |

NOTE—Reference to “a BlockAck” frame without any other qualification from other subclauses applies to any of the variants, unless specific exclusions are called out.

The GCR field indicates whether the BlockAck frame was sent in response to a GCR BlockAckReq frame. The GCR field is set to 1 when the BlockAck frame is sent in response to a GCR BlockAckReq frame and set to 0 otherwise.

The meaning of the TID_INFO subfield of the BA Control field depends on the BlockAck frame variant type. The meaning of this subfield is explained within the subclause for each of the BlockAck frame variants.

The meaning of the BA Information field depends on the BlockAck frame variant type. The meaning of this field is explained within the subclause for each of the BlockAck frame variants.

9.3.1.9.2 Basic BlockAck variant

The use of the basic BlockAck variant is obsolete. This subclause might be removed in a later revision of the standard.

The TID_INFO subfield of the BA Control field of the Basic BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Basic BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 9-34. The format of the Block Ack Starting Sequence Control subfield is shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU for which this Basic BlockAck frame is sent and is set to the same value as in the immediately previously received Basic BlockAckReq frame.

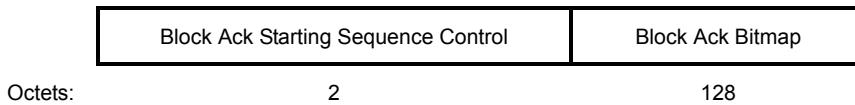

Figure 9-34—BA Information field (BlockAck)

The Block Ack Bitmap subfield is 128 octets in length and is used to indicate the received status of up to 64 MSDUs. Bit position n of the Block Ack Bitmap field, if equal to 1, acknowledges receipt of an MPDU with an MPDU sequence control value equal to $(SSC + n)$, where SSC is the value of the Block Ack Starting Sequence Control subfield. Bit position n of the Block Ack Bitmap field, if equal to 0, indicates that an MPDU with MPDU sequence control value equal to $(SSC + n)$ has not been received. Each of the MPDU Sequence Control field and Block Ack Starting Sequence Control subfield values are treated as a 16-bit unsigned integer. For unused fragment numbers of an MSDU, the corresponding bits in the bitmap are set to 0.

9.3.1.9.3 Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the Compressed BlockAck frame comprises the Block Ack Starting Sequence Control subfield and the Block Ack Bitmap subfield, as shown in Figure 9-35. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.24.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

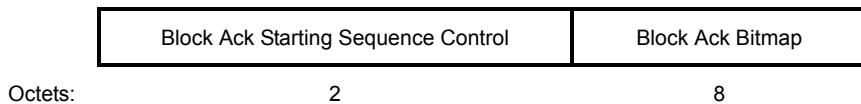

Figure 9-35—BA Information field (Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Compressed BlockAck frame is 8 octets in length and is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is equal to 1 in the compressed Block Ack Bitmap field acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap field corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.9.4 Multi-TID BlockAck variant

The TID_INFO subfield of the BA Control field of the Multi-TID BlockAck frame contains the number of TIDs, less one, for which information is reported in the BA Information field. For example, a value of 2 in the TID_INFO subfield means that information for three TIDs is present.

The BA Information field of the Multi-TID BlockAck frame comprises one or more instances of the Per TID Info, Block Ack Starting Sequence Control, and the Block Ack Bitmap subfields, as shown in Figure 9-36. The Per TID Info subfield is shown in Figure 9-30, and the Block Ack Starting Sequence Control subfield is shown in Figure 9-28.

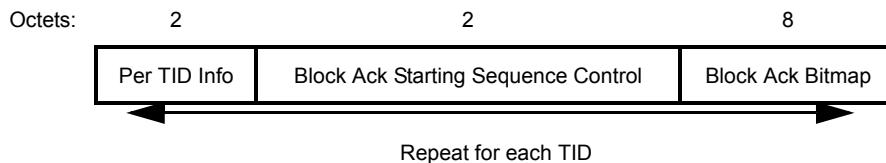

Figure 9-36—BA Information field (Multi-TID BlockAck)

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield is the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.24.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0. The first instance of the Per TID Info, Block Ack Starting Sequence Control, and Block Ack Bitmap subfields that is transmitted corresponds to the lowest TID value, with subsequent instances ordered by increasing values of the Per TID Info subfield.

The Block Ack Bitmap subfield of the BA Information field of the Multi-TID BlockAck frame contains an 8-octet block ack bitmap. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.9.5 Extended Compressed BlockAck variant

The TID_INFO subfield of the BA Control field of the Compressed BlockAck frame contains the TID for which a BlockAck frame is requested.

The BA Information field of the Extended Compressed BlockAck frame is shown in Figure 9-37. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first MSDU or A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.24.7.5. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

| | | |
|-------------------------------------|------------------|---------|
| Block Ack Starting Sequence Control | Block Ack Bitmap | RBUFCAP |
| Octets: | 2 | 8 |

Figure 9-37—BA Information field (Extended Compressed BlockAck)

The Block Ack Bitmap subfield of the BA Information field of the Extended Compressed BlockAck frame is 8 octets in length and is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is set to 1 in the Block Ack Bitmap subfield acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number. The first bit of the Block Ack Bitmap subfield corresponds to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

The RBUFCAP field contains an unsigned integer that is the number of MPDU buffers available to store received MPDUs at the time of transmission of the Extended Compressed BlockAck frame (10.39).

9.3.1.9.6 GCR Block Ack variant

The TID_INFO subfield of the BA Control field of the GCR BlockAck frame contains the TID for which this BlockAck frame is sent.

The BA Information field of the GCR BlockAck frame comprises the Block Ack Starting Sequence Control, GCR Group Address, and the Block Ack Bitmap subfields, as shown in Figure 9-38. The Block Ack Starting Sequence Control subfield is shown in Figure 9-28. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield contains the sequence number of the first A-MSDU for which this BlockAck frame is sent. The value of this subfield is defined in 10.24.10. The Fragment Number subfield of the Block Ack Starting Sequence Control subfield is set to 0.

| | | |
|-------------------------------------|-------------------|------------------|
| Block Ack Starting Sequence Control | GCR Group Address | Block Ack Bitmap |
| Octets: | 2 | 6 |

Figure 9-38—BA Information field format (GCR BlockAck)

The GCR Group Address subfield is set to the value from the Group Address subfield of the GCR BAR Information field in the BlockAckReq frame to which the BlockAck frame is sent in response.

The Block Ack Bitmap subfield is 8 octets in length and is used to indicate the received status of up to 64 entries, where each entry represents an MSDU or an A-MSDU. Each bit that is equal to 1 in the Block Ack Bitmap subfield acknowledges the successful reception of a single MSDU or A-MSDU in the order of sequence number, with the first bit of the Block Ack Bitmap subfield corresponding to the MSDU or A-MSDU with the sequence number that matches the value of the Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield.

9.3.1.10 Control Wrapper frame

The format of the Control Wrapper frame is shown in Figure 9-39.

| | | | | | | |
|---------------|-----------------|-----------|-----------------------|------------|---------------|----------|
| Frame Control | Duration/ ID | Address 1 | Carried Frame Control | HT Control | Carried Frame | FCS |
| Octets: | 2 | 2 | 6 | 2 | 4 | variable |

Figure 9-39—Control Wrapper frame

The Control Wrapper frame is used to wrap any other Control frame (i.e., excluding the Control Wrapper frame) together with an HT Control field.

The Frame Control field is defined in 9.3.1. The value of the subtype field is the value from Table 9-1 of 9.2.4.1.3 that corresponds to Control Wrapper frame.

The value of the Duration/ID field of the Control Wrapper frame is generated by following the rules for the Duration/ID field of the Control frame that is being wrapped.

The value of the Address 1 field of the Control Wrapper frame is generated by following the rules for the Address 1 field of the Control frame that is being wrapped.

The Carried Frame Control field contains the value of the Frame Control field of the wrapped Control frame.

The HT Control field is defined in 9.2.4.6.

The Carried Frame field contains the fields that follow the Address 1 field of the Control frame that is being wrapped, excluding the FCS field.

The FCS field is defined in 9.2.4.8.

9.3.1.11 Poll frame format

The format of the Poll frame is shown in Figure 9-40.

| | | | | | |
|---------------|----------|----|----|-----------------|-----|
| Frame Control | Duration | RA | TA | Response Offset | FCS |
| Octets: | 2 | 2 | 6 | 6 | 2 |

Figure 9-40—Poll frame format

The Duration field is set to include the duration, in microseconds, of the remaining Poll frame transmissions (see 10.36.7.2), plus all appropriate IFSs (10.3.2.3), plus the duration of the SPR frame transmissions.

The RA field contains the MAC address of the STA being polled.

The TA field contains the MAC address of the AP or PCP.

The Response Offset field indicates the offset, in units of 1 μ s, beginning SIFS after the end of the Poll frame when the SPR frame in response to this Poll frame is transmitted.

9.3.1.12 Service period request (SPR) frame format

The format of the SPR frame is shown in Figure 9-41.

| | | | | | | |
|---------------|----------|----|----|-------------------------|------------|-----|
| Frame Control | Duration | RA | TA | Dynamic Allocation Info | BF Control | FCS |
| Octets: | 2 | 2 | 6 | 6 | 5 | 2 |

Figure 9-41—SPR frame format

When an SPR frame is sent in response to a Poll frame (see 10.36.7), the Duration field in the SPR frame is set to the value of the Duration field contained in the Poll frame, minus the value of the Response Offset field contained in the Poll frame multiplied by its unit as specified in 9.3.1.11, minus SIFS, minus the time taken to transmit the SPR frame. When the SPR frame is not sent in response to a Poll frame (see 10.36.9 and 11.4.13) and transmitted within an SP or a TXOP allocation, the Duration field is set to the time left in the allocation excluding the SPR transmission time. In all other cases, the Duration field is set to 0.

The RA field contains the MAC address of the AP or PCP.

The TA field contains the MAC address of the STA transmitting the SP request.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

9.3.1.13 Grant frame format

The format of the Grant frame is shown in Figure 9-42.

| | | | | | | |
|---------------|----------|----|----|-------------------------|------------|-----|
| Frame Control | Duration | RA | TA | Dynamic Allocation Info | BF Control | FCS |
| Octets: | 2 | 2 | 6 | 6 | 5 | 2 |

Figure 9-42—Grant frame format

For individually addressed Grant frames:

- If the Grant frame is used to obtain a TXOP, the Duration/ID field is set to a value subject to the TXOP limit as described in 10.22.2.8. In all other cases within a CBAP, the Duration/ID field is set to the value equal of Duration/ID field of the immediately preceding frame minus TXTIME(Grant frame) minus aSIFSTime.
- If the Grant frame is sent within an SP, the value of the Duration/ID field is set according to the rules in 10.36.7, 10.36.8, and 10.36.9 as appropriate depending on the Grant frame usage.
- If the Grant frame is sent within an ATI, the value the Duration/ID is set according to the rules in 10.36.3.

For group addressed Grant frames, the Duration/ID field is set to a value that is equal to the time between PHY-TXEND.indication primitive of the Grant frame and the start of the allocation as indicated by the value of the Allocation Duration subfield within the Dynamic Allocation Info field.

The RA field contains the MAC address of the STA receiving the SP grant.

The TA field contains the MAC address of the STA that has transmitted the Grant frame.

The Dynamic Allocation Info field is defined in 9.5.2.

The BF Control field is defined in 9.5.5.

9.3.1.14 DMG CTS frame format

The frame format for the DMG CTS frame is as defined in Figure 9-43.

| | Frame Control | Duration | RA | TA | FCS |
|---------|---------------|----------|----|----|-----|
| Octets: | 2 | 2 | 6 | 6 | 4 |

Figure 9-43—DMG CTS frame format

When the DMG CTS frame is a response to an RTS frame, the value of the RA field of the DMG CTS frame is set to the address from the TA field of the RTS frame. When the DMG CTS frame is the first frame in a frame exchange, the RA field is set to the MAC address of the transmitter.

A DMG CTS-to-self frame is a DMG CTS frame in which the RA field is equal to the transmitter's MAC address.

For DMG CTS frames other than DMG CTS-to-self frames, the Duration field is set to the value of the Duration field of the immediately previous RTS frame, minus the time, in microseconds, required to transmit the DMG CTS frame and its SIFS interval. For DMG CTS-to-self frames, the Duration field is set to the remaining duration of the TXOP or SP. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer.

For DMG CTS frames other than DMG CTS-to-self frames, the TA field is the MAC address of the STA transmitting the DMG CTS frame. For DMG CTS-to-self frames, the TA field is set to the individual address of the recipient or the group address of the recipients of the frame that the DMG STA intends to transmit after the DMG CTS-to-self frame.

9.3.1.15 DMG DTS frame format

The frame format for the DMG Denial to Send (DTS) frame is as defined in Figure 9-44.

| | Frame Control | Duration | RA | NAV-SA | NAV-DA | FCS |
|---------|---------------|----------|----|--------|--------|-----|
| Octets: | 2 | 2 | 6 | 6 | 6 | 4 |

Figure 9-44—DMG DTS frame format

The Duration field is set to the value of the transmitting STA's NAV – (TXTIME(DMG DTS) + SIFS) or the remaining time in the SP at the end of the DMG DTS frame transmission, whichever is smaller. The transmitting STA's NAV is the value of its NAV at the start of the DMG DTS frame transmission.

The RA field of the frame is copied from the TA field of the immediately previous RTS frame to which the DMG DTS frame is a response.

The NAV-SA and the NAV-DA fields contain the MAC addresses of the source DMG STA and the destination DMG STA, respectively, whose exchange of an RTS and DMG CTS frame caused the last update to the NAV at the transmitting STA.

9.3.1.16 Sector sweep (SSW) frame format

The frame format for the SSW frame is as defined in Figure 9-45.

| | | | | | | | |
|---------|---------------|----------|----|----|-----|--------------|-----|
| | Frame Control | Duration | RA | TA | SSW | SSW Feedback | FCS |
| Octets: | 2 | 2 | 6 | 6 | 3 | 3 | 4 |

Figure 9-45—SSW frame format

The Duration field is set to the time until the end of the current SSW slot when the SSW frame is transmitted within an association beamforming training (A-BFT). Otherwise, it is set to the time until the end of the SSW frame transmission that has the CDOWN subfield within the SSW field equal to 0, plus MBIFS, or until the end of the current allocation (see 10.38), whichever comes first.

The RA field contains the MAC address of the STA that is the intended receiver of the sector sweep.

The TA field contains the MAC address of the transmitter STA of the sector sweep frame.

The SSW field is defined in 9.5.1.

The SSW Feedback field is defined in 9.5.3.

9.3.1.17 Sector sweep feedback (SSW-Feedback) frame format

The format of the SSW-Feedback frame is shown in Figure 9-46.

| | | | | | | | | |
|---------|---------------|----------|----|----|--------------|-------------|-----------------------------|-----|
| | Frame Control | Duration | RA | TA | SSW Feedback | BRP Request | Beamformed Link Maintenance | FCS |
| Octets: | 2 | 2 | 6 | 6 | 3 | 4 | 1 | 4 |

Figure 9-46—SSW-Feedback frame format

The Duration field is set to 0 when the SSW-Feedback frame is transmitted within an association beamforming training (A-BFT). When transmitted within a DTI, the Duration field is set to one of the following:

- a) If a BRP phase is requested through the BRP Request field, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame plus $2 \times$ MBIFS (10.38.3.1).
- b) If a BRP phase is not requested, the Duration field is set to the time, in microseconds, required to transmit an SSW-Ack frame, plus MBIFS (10.38.3.1) or the time until the end of the current allocation, whichever comes earlier.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Feedback frame.

The TA field contains the MAC address of the STA transmitting the SSW-Feedback frame.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.18 Sector sweep Ack (SSW-Ack) frame format

The format of the SSW-Ack frame is shown in Figure 9-47.

| | | | | | | | | |
|---------------|----------|----|----|--------------|-------------|-----------------------------|-----|---|
| Frame Control | Duration | RA | TA | SSW Feedback | BRP Request | Beamformed Link Maintenance | FCS | |
| Octets: | 2 | 2 | 6 | 6 | 3 | 4 | 1 | 4 |

Figure 9-47—SSW-Ack frame format

The Duration field is set to the value of the Duration field of the immediately preceding SSW-Feedback frame, minus MBIFS, minus the time required to transmit the SSW-Ack frame.

The RA field contains the MAC address of the STA that is the intended destination of the SSW-Ack frame.

The TA field contains the MAC address of the STA transmitting the SSW-Ack frame.

The SSW Feedback field is defined in 9.5.3.

The BRP Request field is defined in 9.5.4.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.3.1.19 Grant Ack frame format

The format of the Grant Ack frame is shown in Figure 9-48. The Grant Ack frame is sent as a response to the reception of a Grant frame.

| | | | | | | | |
|---------------|----------|----|----|----------|------------|-----|---|
| Frame Control | Duration | RA | TA | Reserved | BF Control | FCS | |
| Octets: | 2 | 2 | 6 | 6 | 5 | 2 | 4 |

Figure 9-48—Grant Ack frame format

The Duration field is set to the value obtained from the Duration/ID field of the immediately previous Grant frame minus the time, in microseconds, required to transmit the Grant Ack frame and its SIFS interval.

The RA field of the Grant Ack frame is copied from the Address 2 field of the immediately previous Grant frame.

The TA field contains the MAC address of the STA that has transmitted the Grant Ack frame.

The BF Control field is defined in 9.5.5.

9.3.1.20 VHT NDP Announcement frame format

The frame format of the VHT NDP Announcement frame is shown in Figure 9-49.

| | | | | | | | | |
|---------------|----------|----|----|-----------------------|------------|-----|------------|-----|
| Frame Control | Duration | RA | TA | Sounding Dialog Token | STA Info 1 | ... | STA Info n | FCS |
| Octets: | 2 | 2 | 6 | 6 | 1 | 2 | 2 | 4 |

Figure 9-49—VHT NDP Announcement frame format

The Duration field is set as defined in 9.2.5.

The VHT NDP Announcement frame contains at least one STA Info field. If the VHT NDP Announcement frame contains only one STA Info field, then the RA field is set to the address of the STA that can provide feedback (see 10.34.5.2). If the VHT NDP Announcement frame contains more than one STA Info field, then the RA field is set to the broadcast address.

The TA field is set to the address of the STA transmitting the VHT NDP Announcement frame or the bandwidth signaling TA of the STA transmitting the VHT NDP Announcement frame. In a VHT NDP Announcement frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA.

The format of the Sounding Dialog Token field is shown in Figure 9-50.

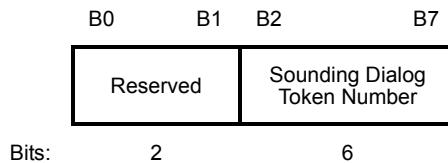

Figure 9-50—Sounding Dialog Token field

The Sounding Dialog Token Number subfield in the Sounding Dialog Token field contains a value selected by the beamformer to identify the VHT NDP Announcement frame.

The format of the STA Info field is shown in Figure 9-51.

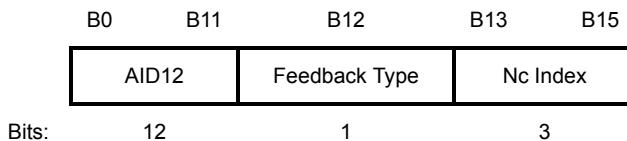

Figure 9-51—STA Info field

The subfields in the STA Info field are described in Table 9-25.

Table 9-25—STA Info subfields

| Field | Description |
|---------------|--|
| AID12 | Contains the 12 least significant bits of the AID of a STA expected to process the following VHT NDP and prepare the sounding feedback. Equal to 0 if the STA is an AP, mesh STA, or STA that is a member of an IBSS. |
| Feedback Type | Indicates the type of feedback requested. Set to 0 for SU. Set to 1 for MU. |
| Nc Index | If the Feedback Type field indicates MU, then Nc Index indicates the number of columns, N_c , in the Compressed Beamforming Feedback Matrix subfield minus 1: Set to 0 to request $N_c = 1$ Set to 1 to request $N_c = 2$... Set to 7 to request $N_c = 8$ Reserved if the Feedback Type field indicates SU. |

9.3.1.21 Beamforming Report Poll frame format

The Beamforming Report Poll frame is shown in Figure 9-52.

| | | | | | | |
|---------|---------------|----------|----|----|--|-----|
| | Frame Control | Duration | RA | TA | Feedback Segment Retransmission Bitmap | FCS |
| Octets: | 2 | 2 | 6 | 6 | 1 | 4 |

Figure 9-52—Beamforming Report Poll frame format

The Duration field is set as defined in 9.2.5.

The RA field is set to the address of the intended recipient.

The TA field is set to the address of the STA transmitting the Beamforming Report Poll or a bandwidth signaling TA. In a Beamforming Report Poll frame transmitted by a VHT STA in a non-HT or non-HT duplicate format and where the scrambling sequence carries the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT, the TA field is set to a bandwidth signaling TA.

The Feedback Segment Retransmission Bitmap field indicates the requested feedback segments of a VHT Compressed Beamforming report (see 10.34.5.3). If the bit in position n ($n=0$ for LSB and $n=7$ for MSB) is 1, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to n is requested. If the bit in position n is 0, then the feedback segment with the Remaining Feedback Segments subfield in the VHT MIMO Control field equal to n is not requested.

9.3.2 Data frames

9.3.2.1 Format of Data frames

The format of a Data frame is defined in Figure 9-53. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all data frame subtypes. The presence of the Address 4 field is determined by the setting of the To DS and From DS subfields of the Frame Control field (see below). The QoS Control field is present when the QoS subfield of the Subtype subfield is set to 1.

| | | | | | | | | | | |
|---------------|----------|-----------|-----------|-----------|------------------|-----------|-------------|------------|------------|-----|
| Octets: 2 | 2 | 6 | 6 | 6 | 2 | 0 or 6 | 0 or 2 | 0 or 4 | variable | 4 |
| Frame Control | Duration | Address 1 | Address 2 | Address 3 | Sequence Control | Address 4 | QoS Control | HT Control | Frame Body | FCS |

← →
MAC header

Figure 9-53—Data frame

NOTE—The maximum frame body size shown in Figure 9-53 is for GCMP encryption of a maximum-size A-MSDU (note that TKIP encryption is not allowed in this case and any Mesh Control fields are part of the A-MSDU subframes). The corresponding maximum for CCMP encryption is 7951 octets. The maximum frame body size if A-MSDUs are not used is 2346 octets for GCMP encryption of a maximum-size MSDU, 2338 octets for CCMP encryption of a maximum-size MSDU and 2342 octets for TKIP encryption of a maximum-size MSDU, including in both cases an 18-octet Mesh Control field. The frame body size might in all cases be greater if a vendor-specific cipher suite is used.

Data frames with a value of 1 in the QoS subfield of the Subtype subfield are collectively referred to as *QoS Data frames*. Each of these data subtypes contains QoS in their names, and this frame format is distinguished by the presence of a QoS Control field in the MAC header.

A QoS STA always uses QoS Data frames for data transmissions to other QoS STAs. A QoS STA uses frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to non-QoS STAs. A non-QoS STA always uses frames with the QoS subfield of the Subtype subfield set to 0 for data transmissions to other STAs. All STAs use frames with the QoS subfield of the Subtype subfield set to 0 for nonconcealed GCR broadcast Data frames unless a transmitting STA knows that all STAs in a BSS have QoS capability, in which case the transmitting STAs use QoS Data frames. All STAs use frames with the QoS subfield of the Subtype subfield set to 0 for nonconcealed GCR group addressed Data frames unless it is known to the transmitter that all STAs in the BSS that are members of the multicast group have QoS capability, in which case STAs use QoS Data frames. APs where dot11RobustAVStreamingImplemented is true or mesh STAs where dot11MeshGCRImplemented is true use frames with the QoS subfield of the Subtype subfield set to 1 for concealed GCR frames, as described in 11.24.16.3.5.

The content of the address fields of Data frames are dependent upon the values of the To DS and From DS subfields in the Frame Control field and whether the Frame Body field contains either an MSDU (or fragment thereof) or an entire A-MSDU, as determined by the A-MSDU Present subfield of the QoS Control field (see 9.2.4.5.9). The content of the address fields transmitted by nonmesh STAs is defined in Table 9-26. The content of the address fields transmitted by mesh STAs is defined in 9.3.5. Where the content of a field is shown as not applicable (N/A), the field is omitted. Note that Address 1 always holds the receiver address of the intended receiver (or, in the case of group addressed frames, receivers), and that Address 2 always holds the address of the STA that is transmitting the frame.

Table 9-26—Address field contents

| To DS | From DS | Address 1 | Address 2 | Address 3 | | Address 4 | |
|-------|---------|------------|------------|----------------------------|-------------------|----------------------------|-------------------|
| | | | | MSDU and Short A-MSDU case | Basic A-MSDU case | MSDU and Short A-MSDU case | Basic A-MSDU case |
| 0 | 0 | RA = DA | TA = SA | BSSID | BSSID | N/A | N/A |
| 0 | 1 | RA = DA | TA = BSSID | SA | BSSID | N/A | N/A |
| 1 | 0 | RA = BSSID | TA = SA | DA | BSSID | N/A | N/A |
| 1 | 1 | RA | TA | DA | BSSID | SA | BSSID |

A STA uses the contents of the Address 2 field to direct the acknowledgment if an acknowledgment is necessary.

The DA field contains the destination of the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

The SA field contains the address of the MAC entity that initiated the MSDU (or fragment thereof) or A-MSDU in the Frame Body field.

When a Data frame carries an MSDU (or fragment thereof), the DA and SA values related to that MSDU are carried in the Address 1, Address 2, Address 3, and Address 4 fields (according to the setting of the To DS and From DS subfields) as defined in Table 9-26.

When a Data frame carries an A-MSDU, the DA and SA values related to each MSDU carried by the A-MSDU are carried within the A-MSDU. Zero, one, or both of these fields are present in the Address 1 and Address 2 fields as indicated in Table 9-26.

The RA field is the individual address of the STA that is the immediate intended receiver of the frame or the group address of the STAs that are the immediate intended receivers of the frame.

The TA field is the address of the STA that is transmitting the frame.

The BSSID of the Data frame is determined as follows:

- a) If the STA is contained within an AP or is associated with an AP, the BSSID is the address currently in use by the STA contained in the AP.
- b) If the STA is a member of an IBSS, the BSSID is the BSSID of the IBSS.
- c) If the STA is transmitting a Data frame when dot11OCBActivated is true, the BSSID is the wildcard BSSID.
- d) If the STA is a member of an MBSS, the BSSID is the address of the transmitter and is equal to the Data frame's TA.
- e) If the STA participates in a PBSS, the BSSID is the address of the STA contained in the PCP of the PBSS.

The Sequence Control field is defined in 9.2.4.4.

The QoS Control field is defined in 9.2.4.5. The presence of the QoS Control field is determined by the Subtype subfield of the Frame Control field, as specified in 9.2.4.1.3.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC/Order subfield of the Frame Control field, as specified in 9.2.4.1.10.

The frame body consists of either:

- The MSDU (or a fragment thereof), the Mesh Control field (present if the frame is transmitted by a mesh STA and the Mesh Control Present subfield of the QoS Control field is 1, otherwise absent), and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)
- The A-MSDU and a security header and trailer (present if the Protected Frame subfield in the Frame Control field is 1, otherwise absent)

The presence of an A-MSDU in the frame body is indicated by setting the A-MSDU Present subfield of the QoS Control field to 1, as shown in Table 9-6.

For Data frames of subtype Null (no data), CF-Ack (no data), CF-Poll (no data), and CF-Ack +CF-Poll (no data) and for the corresponding QoS data frame subtypes, the Frame Body field is null (i.e., has a length of 0 octets); these subtypes are used for MAC control purposes. For Data frames of subtypes Data, Data +CF-Ack, Data +CF-Poll, and Data +CF-Ack +CF-Poll, the Frame Body field contains all of, or a fragment of, an MSDU after any encapsulation for security. For Data frames of subtypes QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, and QoS Data +CF-Ack +CF-Poll, the Frame Body field contains an MSDU (or fragment thereof) or A-MSDU after any encapsulation for security. For Data frames of subtype QoS Data that are transmitted by a mesh STA, the Frame Body field also contains a Mesh Control field, as described in 9.2.4.7.3.

The maximum length of the Frame Body field can be determined from the maximum MSDU length plus the length of the Mesh Control field (if present) plus any overhead from encapsulation for encryption (i.e., it is always possible to send a maximum length MSDU, with any encapsulations provided by the MAC layer

within a single Data frame). When the frame body carries an A-MSDU, the size of the frame body field is limited by:

- The PHY’s maximum PHY service data unit (PSDU) length
- If A-MPDU aggregation is used by a non-VHT and non-DMG STA, a maximum MPDU length of 4095 octets (see 9.7)

Within all Data frames sent by STAs during the CFP under PCF, the Duration field is set to 32 768. Within all Data frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Data frames sent during the CP by non-QoS STAs, the Duration field is set according to the following rules:

- If the Address 1 field contains a group address, the duration value is set to 0.
- If the More Fragments bit is 0 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.
- If the More Fragments bit is 1 in the Frame Control field of a frame and the Address 1 field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this Data frame, plus two Ack frames, plus three SIFSS.

The duration value calculation for the Data frame is based on the rules in 10.7 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid Data frames (without regard for the RA, DA, and/or BSSID address values that might be present in these frames) to update their NAV settings as appropriate under the coordination function rules.

NOTE 1—The QoS Data and QoS Null subtypes are the only Data subtypes transmitted by a DMG STA.

NOTE 2—The HT Control field is not present in frames transmitted by a DMG STA.

9.3.2.2 Aggregate MSDU (A-MSDU) format

9.3.2.2.1 General

An A-MSDU is a sequence of A-MSDU subframes as shown in Figure 9-54. Each A-MSDU subframe consists of an A-MSDU subframe header followed by an MSDU and 0 to 3 octets of padding as shown in Figure 9-55 (in 9.3.2.2.2) and Figure 9-57 (in 9.3.2.2.3).

Figure 9-54—A-MSDU structure

Two A-MSDU subframe formats are defined: the Basic A-MSDU subframe described in 9.3.2.2.2 and the Short A-MSDU subframe described in 9.3.2.2.3. Unless otherwise noted, in this standard, the term A-MSDU applies to both the Basic A-MSDU and the Short A-MSDU. The Basic A-MSDU uses only the Basic A-MSDU subframe format, while the Short A-MSDU uses only the Short A-MSDU subframe format.

9.3.2.2.2 Basic A-MSDU subframe format

The structure of a Basic A-MSDU subframe is shown in Figure 9-55.

In the Basic A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length is a multiple of 4 octets. The last A-MSDU subframe has no padding.

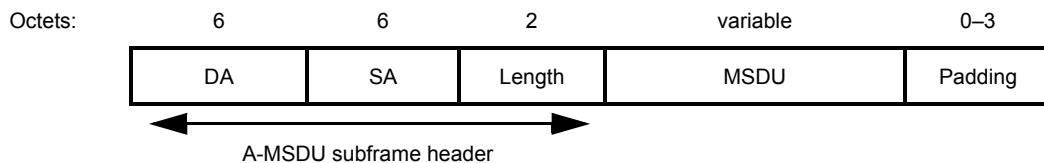

Figure 9-55—Basic A-MSDU subframe structure

The A-MSDU subframe header contains three fields: DA, SA, and Length. The order of these fields and the bits within these fields are the same as the IEEE 802.3™ frame format. The DA and SA fields of the A-MSDU subframe header contain the values passed in the MA-UNITDATA.request and MA-UNITDATA.indication primitives. The Length field contains the length in octets of the MSDU.

An A-MSDU contains only MSDUs whose DA and SA parameter values map to the same receiver address (RA) and transmitter address (TA) values. The rules for determining RA and TA are independent of whether the frame body carries an A-MSDU.

NOTE—It is possible to have different DA and SA parameter values in A-MSDU subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 parameter values.

The MPDU containing the A-MSDU is carried in any of the following data frame subtypes: QoS Data, QoS Data +CF-Ack, QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll. The A-MSDU structure is contained in the frame body of a single MPDU. If encrypted, the MPDU is encrypted as a single unit.

NOTE—The value of TID present in the QoS Control field of the MPDU carrying the A-MSDU indicates the TID for all MSDUs in the A-MSDU. Because this value of TID is common to all MSDUs in the A-MSDU, only MSDUs delivered to the MAC by an MA-UNITDATA.request primitive with an integer priority parameter that maps to the same TID can be aggregated together using A-MSDU.

When mesh Data frames are aggregated, the A-MSDU subframe header includes Mesh DA, Mesh SA, Length, and Mesh Control. The A-MSDU subframe structure for Mesh Data is defined in Figure 9-56.

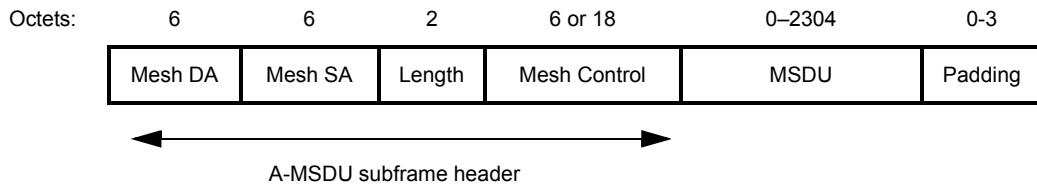

Figure 9-56—A-MSDU subframe structure for Mesh Data

The Mesh DA and Mesh SA fields contain the addresses of the destination mesh STA and the source mesh STA, respectively, determined in 9.3.5.

The Length field contains the length in octets of the MSDU.

The format of the Mesh Control field is described in 9.2.4.7.3.

NOTE—It is possible to have different Mesh DA, Mesh SA, and Mesh Control in subframe headers of the same A-MSDU as long as they all map to the same Address 1 and Address 2 values.

9.3.2.2.3 Short A-MSDU subframe format

The Short A-MSDU subframe is shown in Figure 9-57. In the Short A-MSDU subframe, each A-MSDU subframe (except the last) is padded so that its length excluding the A-MSDU subframe header is a multiple of 4 octets. The last A-MSDU subframe has no padding.

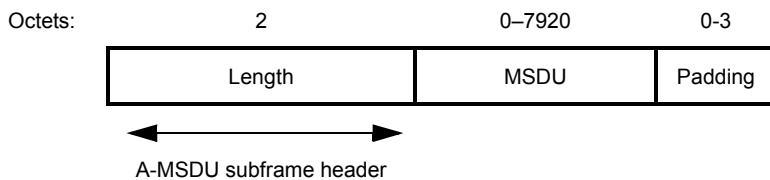

Figure 9-57—Short A-MSDU subframe structure

The Short A-MSDU subframe header consists of a Length field that contains the length in octets of the MSDU.

NOTE—The Short A-MSDU subframe format is not transmitted by non-DMG STAs.

9.3.3 Management frames

9.3.3.1 Terminology of Management frames and MMPDUs

References in this standard to a “<name> frame”, where <name> corresponds to one of the Management frame subtypes, are to be understood as being to a “<name> MMPDU”, where the MMPDU is carried in the frame body of one or more Management frames with the Subtype field value corresponding to <name>, plus information from the MPDU headers (the Management frame subtype and the addresses)”.

9.3.3.2 Format of Management frames

The format of a Management frame is defined in Figure 9-58. The Frame Control, Duration, Address 1, Address 2, Address 3, and Sequence Control fields are present in all management frame subtypes. In an MMPDU carried in one or more non-VHT PPDUs, the maximum MMPDU size is specified in Table 9-19. In an MMPDU carried in one or more PPDUs, all of which are VHT PPDUs, the maximum MMPDU size specified in Table 9-19 is the maximum MPDU size supported by the recipient(s) less the shortest management frame MAC header and FCS.

NOTE—In an MMPDU carried in one or more PPDUs, all of which are VHT PPDUs, the presence of encryption overhead (i.e., the MMPDU is transmitted in robust Management frames) or an HT Control field might cause an MMPDU to be fragmented that would not otherwise need to be fragmented.

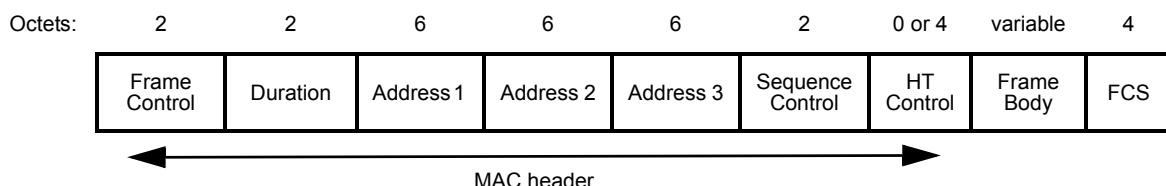

Figure 9-58—Management frame format

A STA uses the contents of the Address 1 field to perform the address matching for receive decisions. In the case where the Address 1 field contains a group address and the frame subtype is other than Beacon or the frame subtype Action, Category Multihop Action (Multihop Action frame), the Address 3 field also is validated to verify that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member or from a mesh STA to which mesh peering is maintained. Details of addressing and forwarding of the group addressed frame in an MBSS are defined in 10.35.4. When the Address 1 field contains a group address and the frame subtype is either Probe Request or Action with Category Public, a wildcard BSSID value matches all receiving STA's BSSIDs. If the frame subtype is Beacon, other address matching rules apply, as specified in 11.1.3.7. Frames of subtype Probe Request with a group address in the Address 1 field are additionally processed as described in 11.1.4.3.2 for non-DMG STAs and 11.1.4.3.3 for

DMG STAs. If the frame subtype is Action, the Category is Public, and the Action is 20/40 BSS Coexistence Management, then additional address matching rules for receive decisions apply as specified in 11.16 and 11.18.

The address fields for all Management frames except Multihop Action frames are as follows:

- a) The Address 1 field of the Management frame is the RA (=DA) and is determined as the destination of the frame.
- b) The Address 2 field of the Management frame is the TA (=SA) and is determined as the address of the STA transmitting the frame.
- c) The Address 3 field of the Management frame is set and determined as follows:
 - 1) In Probe Request frames, the Address 3 field is the BSSID. The BSSID is either a specific BSSID as described in item 4) below or the wildcard BSSID as defined in the procedures specified in 11.1.4.
 - 2) In Public Action frames, the Address 3 field is the BSSID. The BSSID value is set according to 11.20.
 - 3) If dot11OCBActivated is true, the Address 3 field is the wildcard BSSID.
 - 4) Otherwise:
 - i) If the STA is contained within an AP or is associated with an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
 - ii) If the STA is contained within an AP or is transmitting the Management frame to an AP, the Address 3 field is the BSSID. The BSSID is the address currently in use by the STA contained in the AP.
 - iii) If the STA is transmitting the Management frame to one or more members of an IBSS, the Address 3 field is the BSSID of the IBSS.
 - iv) If the STA is a mesh STA, the Address 3 field is the TA.

The address fields for Multihop action frames are described in 9.3.5.

Within a PBSS, the BSSID field of a Management frame is set to the MAC address in use by the STA contained in the PCP of the PBSS.

Within all Management frames sent by STAs during the CFP under PCF, the Duration field is set to the value 32 768. Within all Management frames sent by the QoS STA, the Duration field contains a duration value as defined in 9.2.5. Within all Management frames sent during the CP by non-QoS STAs, the Duration field is set according to the following rules:

- If the DA field contains a group address, the duration value is set to 0.
- If the More Fragments bit is 0 in the Frame Control field of a frame and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit one Ack frame, plus one SIFS.
- If the More Fragments bit is 1 in the Frame Control field of a frame, and the DA field contains an individual address, the duration value is set to the time, in microseconds, required to transmit the next fragment of this Management frame, plus two Ack frames, plus three SIFSS.

The duration value calculation for the Management frame is based on the rules in 10.7 that determine the data rate at which the Control frames in the frame exchange sequence are transmitted. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. All STAs process Duration field values less than or equal to 32 767 from valid Management frames to update their NAV settings as appropriate under the coordination function rules.

The HT Control field is defined in 9.2.4.6. The presence of the HT Control field is determined by the +HTC/Order subfield of the Frame Control field, as specified in 9.2.4.1.10.

A Management frame is an IQMF when both

- The RA of the Management frame corresponds to an individual MAC address; and
- The To DS subfield is set to 1 and the From DS subfield of the Frame Control field is set to 0.

A Management frame is a GQMF when both

- The RA of the Management frame corresponds to a group MAC address; and
- The To DS subfield is set to 1 and the From DS subfield of the Frame Control field is set to 0.

The frame body consists of the fields followed by the elements defined for each management frame subtype. All fields and elements are mandatory unless stated otherwise and appear in the specified, relative order. STAs that encounter an element ID they do not recognize in the frame body of a received Management frame ignore that element and continue to parse the remainder of the management frame body (if any) for additional elements with recognizable element IDs. See 10.27.7. Unused element ID codes are reserved.

Gaps might exist in the ordering of fields and elements within frames. The order that remains is ascending.

9.3.3.3 Beacon frame format

The frame body of a Beacon frame contains the information shown in Table 9-27.

Table 9-27—Beacon frame body

| Order | Information | Notes |
|-------|--|--|
| 1 | Timestamp | |
| 2 | Beacon interval | |
| 3 | Capability Information | |
| 4 | Service Set Identifier (SSID) | If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2. |
| 5 | Supported Rates and BSS Membership Selectors | |
| 6 | DSSS Parameter Set | The element is optionally present. The DSSS Parameter Set element is present within Beacon frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The element is present within Beacon frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band. |
| 7 | CF Parameter Set | The CF Parameter Set element is present only within Beacon frames generated by APs supporting a PCF. This element is not present if dot11HighThroughputOption-Implemented is true and the Dual CTS Protection field of the HT Operation element is 1. |
| 8 | IBSS Parameter Set | The IBSS Parameter Set element is present only within Beacon frames generated by IBSS STAs. |
| 9 | Traffic indication map (TIM) | The TIM element is present only within Beacon frames generated by APs or mesh STAs. |

Table 9-27—Beacon frame body (continued)

| Order | Information | Notes |
|--------------|---|--|
| 10 | Country | The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 11 | Power Constraint | The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true. |
| 12 | Channel Switch Announcement | Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true. |
| 13 | Quiet | The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 14 | IBSS DFS | IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS. |
| 15 | TPC Report | The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 16 | ERP | The ERP element is present within Beacon frames generated by STAs using extended rate PHYs (ERPs) defined in Clause 18 and is optionally present in other cases. |
| 17 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. |
| 18 | RSN | The RSN element is present within Beacon frames generated by STAs that have dot11RSNAActivated equal to true. |
| 19 | BSS Load | The BSS Load element is present if dot11QosOption-Implemented and dot11QBSSLLoadImplemented are both true. |
| 20 | EDCA Parameter Set | The EDCA Parameter Set element is present if dot11QosOption-Implemented is true, and dot11MeshActivated is false, and the QoS Capability element is not present. |
| 21 | QoS Capability | The QoS Capability element is present if dot11QosOption-Implemented is true, and dot11MeshActivated is false, and EDCA Parameter Set element is not present. |
| 22 | AP Channel Report | If dot11RMAPChannelReportActivated is true, one AP Channel Report element is present for each operating class that has at least 1 channel to report. |
| 23 | BSS Average Access Delay | The BSS Average Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and the value of the AP Average Access Delay field is not equal to 255 (measurement not available); otherwise, the BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true. |
| 24 | Antenna | The Antenna element is present if dot11RMAntennaInformationActivated is true and the value of the Antenna ID field is not equal to 0 (unknown antenna); otherwise, the Antenna element is optionally present if dot11RMAntennaInformationActivated is true. |

Table 9-27—Beacon frame body (continued)

| Order | Information | Notes |
|--------------|--------------------------------------|--|
| 25 | BSS Available Admission Capacity | The BSS Available Admission Capacity element is present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Admission Capacity Bitmask states that only AC_VO is present in the Available Admission Capacity List field. |
| 26 | BSS AC Access Delay | The BSS AC Access Delay element is present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available); otherwise, the BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true. |
| 27 | Measurement Pilot Transmission | The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is a value between 2 and 7. |
| 28 | Multiple BSSID | One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is a value between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.11.14) with two or more members, or if dot11MultiBSSIDActivated is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a multiple BSSID set with two or more members and at least one dot11GASAdvertisementID exists. |
| 29 | RM Enabled Capabilities | RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 30 | Mobility Domain | The Mobility Domain element (MDE) is present if dot11FastBSSTransitionActivated is true. |
| 31 | DSE registered location | The DSE Registered Location element is present if dot11LCIDSERequired is true. |
| 32 | Extended Channel Switch Announcement | The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true. |
| 33 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true. |
| 34 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 35 | HT Operation | The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true. |
| 36 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport is true. |
| 37 | Overlapping BSS Scan Parameters | The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true. |
| 38 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 39 | FMS Descriptor | The FMS Descriptor element is present if dot11FMSActivated is true. |
| 40 | QoS Traffic Capability | The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true. |

Table 9-27—Beacon frame body (continued)

| Order | Information | Notes |
|--------------|--------------------------------|---|
| 41 | Time Advertisement | The Time Advertisement element is present every dot11TimeAdvertisementDTIMInterval if dot11UTCTSFOffsetActivated is true. |
| 42 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true. |
| 43 | Advertisement Protocol | Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID MIB attribute exists. |
| 44 | Roaming Consortium | The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry. |
| 45 | Emergency Alert Identifier | One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network. |
| 46 | Mesh ID | The Mesh ID element is present if dot11MeshActivated is true. |
| 47 | Mesh Configuration | The Mesh Configuration element is present if dot11MeshActivated is true. |
| 48 | Mesh Awake Window | The Mesh Awake Window element is optionally present if dot11MeshActivated is true. |
| 49 | Beacon Timing | The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true. |
| 50 | MCCAOP Advertisement Overview | The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true. |
| 51 | MCCAOP Advertisement | One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true. |
| 52 | Mesh Channel Switch Parameters | The Mesh Channel Switch Parameters element is present when dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present. |
| 53 | QMF Policy | Indicates the QMF policy parameters of the transmitting STA. The QMF Policy element is present when dot11QMFActivated is true and the transmitting STA is an AP or a mesh STA. This element is not present otherwise. |
| 54 | QLoad Report | The QLoad Report element is present every dot11QLoadReportIntervalDTIM DTIMs if dot11QLoadReportActivated is true. |
| 55 | HCCA TXOP Update Count | The HCCA TXOP Update Count element is present if both dot11PublicHCCATXOPNegotiationActivated is true and an HC is collocated with the AP. |
| 56 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 57 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 58 | VHT Operation | The VHT Operation element is present when the dot11VHTOptionImplemented is true; otherwise, it is not present. |

Table 9-27—Beacon frame body (continued)

| Order | Information | Notes |
|--------------|---------------------------------|---|
| 59 | Transmit Power Envelope element | One Transmit Power Envelope element is present for each distinct value of the Local Maximum Transmit Power Unit Interpretation subfield that is supported for the BSS if both of the following conditions are met: <ul style="list-style-type: none"> — dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true; — Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. Otherwise, this parameter is not present. |
| 60 | Channel Switch Wrapper element | The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Beacon frame and the Channel Switch Wrapper element contains at least one subelement. |
| 61 | Extended BSS Load element | The Extended BSS Load element is optionally present if dot11QosOptionImplemented, dot11QBSSLoadImplemented, and dot11VHTOptionImplemented are true. |
| 62 | Quiet Channel | Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true. |
| 63 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 64 | Reduced Neighbor Report | The Reduced Neighbor Report element is optionally present if dot11TVHTOptionImplemented is true. |
| 65 | TVHT Operation | The TVHT Operation element is present for a TVHT STA when the dot11TVHTOptionImplemented is true; otherwise it is not present. |
| 66 | Estimated Service Parameters | The Estimated Service Parameters element is present if dot11EstimatedServiceParametersOptionImplemented is true. |
| 67 | Future Channel Guidance | The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.4 ATIM frame format

The frame body of an ATIM frame is null.

9.3.3.5 Disassociation frame format

The frame body of a Disassociation frame contains the information shown in Table 9-28.

Table 9-28—Disassociation frame body

| Order | Information |
|--|---|
| 1 | Reason code |
| Last – 1 | One or more vendor-specific elements are optionally present. |
| Last | The Management MIC element (MME) is present when management frame protection is enabled at the AP and the frame is a group addressed frame. |
| NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4. | |

9.3.3.6 Association Request frame format

The frame body of an Association Request frame contains the information shown in Table 9-29.

Table 9-29—Association Request frame body

| Order | Information | Notes |
|-------|---|---|
| 1 | Capability Information | |
| 2 | Listen Interval | |
| 3 | SSID | |
| 4 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 5 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 6 | Power Capability | The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 7 | Supported Channels | The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. |
| 8 | RSN | The RSNE is present if dot11RSNAActivated is true. |
| 9 | QoS Capability | The QoS Capability element is present if dot11QosOptionImplemented is true. |
| 10 | RM Enabled Capabilities | RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 11 | Mobility Domain | The Mobility Domain element (MDE) is present in an Association Request frame if dot11FastBSSTransitionActivated is true and if the frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated equal to true). |
| 12 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true. |
| 13 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |

Table 9-29—Association Request frame body (continued)

| Order | Information | Notes |
|-------|-----------------------------|--|
| 14 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 15 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 16 | QoS Traffic Capability | The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true. |
| 17 | TIM Broadcast Request | The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true. |
| 18 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5). |
| 19 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 20 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 21 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 22 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 23 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.7 Association Response frame format

The frame body of an Association Response frame contains the information shown in Table 9-30.

Table 9-30—Association Response frame body

| Order | Information | Notes |
|-------|---|--|
| 1 | Capability Information | |
| 2 | Status code | |
| 3 | AID | |
| 4 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 5 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 6 | EDCA Parameter Set | The EDCA Parameter Set Element is present if dot11QosOptionImplemented is true; otherwise not present. |

Table 9-30—Association Response frame body (continued)

| Order | Information | Notes |
|--------------|--|--|
| 7 | RCPI | The RCPI element is present if dot11RMRCPIMeasurementActivated is true. |
| 8 | RSNI | The RSNI element is present if dot11RMRSNIMeasurementActivated is true. |
| 9 | RM Enabled Capabilities | RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 10 | Mobility Domain | An MDE is present in an Association Response frame when dot11FastBSSTransitionActivated is true and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange). |
| 11 | Fast BSS Transition | A Fast BSS Transition element (FTE) is present in an Association Response frame when dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to an Association Request frame that contained an MDE (i.e., an FT initial mobility domain association exchange in an RSN). |
| 12 | DSE registered location | The DSE Registered Location element is present if dot11LCIDSERequired is true. |
| 13 | Timeout Interval (Association Comeback time) | A Timeout Interval element (TIE) containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and the association request is rejected with a status code REFUSED_TEMPORARILY. |
| 14 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 15 | HT Operation | The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented is true. |
| 16 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport is true. |
| 17 | Overlapping BSS Scan Parameters | The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true. |
| 18 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 19 | BSS Max Idle Period | The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true. |
| 20 | TIM Broadcast Response | The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Association Request frame that elicited this Association Response frame. |
| 21 | QoS Map | The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Association Request frame is 1. |
| 22 | QMF Policy | The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Association Request frame that elicited this Association Response frame. |
| 23 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |

Table 9-30—Association Response frame body (continued)

| Order | Information | Notes |
|--------------|-----------------------------|---|
| 24 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 25 | DMG Operation | The DMG Operation element is present if dot11DMGOptionImplemented is true. |
| 26 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 27 | Neighbor Report | One or more Neighbor Report elements is present if the Reason Code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION. |
| 27 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 28 | VHT Operation | The VHT Operation element is present when the dot11VHTOptionImplemented is true; otherwise, it is not present. |
| 29 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 30 | Future Channel Guidance | The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.8 Reassociation Request frame format

The frame body of a Reassociation Request frame contains the information shown in Table 9-31.

Table 9-31—Reassociation Request frame body

| Order | Information | Notes |
|--------------|---|--|
| 1 | Capability Information | |
| 2 | Listen Interval | |
| 3 | Current AP address | |
| 4 | SSID | |
| 5 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 6 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 7 | Power Capability | The Power Capability element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 8 | Supported Channels | The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. |

Table 9-31—Reassociation Request frame body (continued)

| Order | Information | Notes |
|--------------|--------------------------------------|--|
| 9 | RSN | The RSNE is present if dot11RSNAActivated is true; otherwise not present. |
| 10 | QoS Capability | The QoS Capability element is present if dot11QosOptionImplemented is true. |
| 11 | RM Enabled Capabilities | RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 12 | Mobility Domain | The MDE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and the frame is being sent to an AP that advertised its FT Capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true). |
| 13 | Fast BSS Transition | An FTE is present in a Reassociation Request frame if dot11FastBSSTransitionActivated is true and dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3, 00-0F-AC:4, or 00-0F-AC:9 (i.e., part of a fast BSS transition in an RSN). |
| 14 | Resource information container (RIC) | The set of elements that formulate a RIC-Request is optionally present in a Reassociation Request frame if <ul style="list-style-type: none"> — dot11FastBSSTransitionActivated is true, — The FT resource request protocol is not used, — The frame is being sent to an AP that advertised its FT capability in the MDE in its Beacon or Probe Response frame (i.e., AP also has dot11FastBSSTransitionActivated is true), and — Either dot11RSNAAuthenticationSuiteSelected is 00-0F-AC:3, 00-0F-AC:4, or 00-0F-AC:9 (i.e., part of a fast BSS transition in an RSN) or dot11RSNAActivated is false (i.e., not in an RSN). |
| 15 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true. |
| 16 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 17 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 18 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 19 | QoS Traffic Capability | The QoS Traffic Capability element is present if dot11QoSTrafficCapabilityActivated is true. |
| 20 | TIM Broadcast Request | The TIM Broadcast Request element is present if dot11TIMBroadcastActivated is true. |
| 21 | FMS Request | The FMS Request element is optionally present if dot11FMSActivated is true. |
| 22 | DMS Request | The DMS Request element is optionally present if dot11DMSActivated is true. |
| 23 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true and the non-AP STA is requesting unauthenticated access to emergency services (see 11.3.5). |

Table 9-31—Reassociation Request frame body (continued)

| Order | Information | Notes |
|-------|-----------------------------|---|
| 24 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 25 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 26 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 27 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 28 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.9 Reassociation Response frame format

The frame body of a Reassociation Response frame contains the information shown in Table 9-32.

Table 9-32—Reassociation Response frame body

| Order | Information | Notes |
|-------|---|---|
| 1 | Capability Information | |
| 2 | Status code | |
| 3 | AID | |
| 4 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 5 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optional otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 6 | EDCA Parameter Set | The EDCA Parameter Set Element is present if dot11QosOptionImplemented is true; otherwise not present. |
| 7 | RCPI | The RCPI element is present if dot11RMRCPIMeasurementActivated is true. |
| 8 | RSNI | The RSNI element is present if dot11RMRSNIMeasurementActivated is true. |
| 9 | RM Enabled Capabilities | RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 10 | RSN | An RSNE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an FTE (i.e., part of a fast BSS transition in an RSN). |

Table 9-32—Reassociation Response frame body (continued)

| Order | Information | Notes |
|--------------|--|---|
| 11 | Mobility Domain | An MDE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition). |
| 12 | Fast BSS Transition | An FTE is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true, dot11RSNAActivated is true, and this frame is a response to a Reassociation Request frame that contained an MDE (i.e., either an FT initial mobility domain association exchange or part of a fast BSS transition in an RSN). |
| 13 | RIC | The set of elements that formulate a RIC-Response is present in a Reassociation Response frame if dot11FastBSSTransitionActivated is true and this frame is a response to a Reassociation Request frame that contained a RIC-Request. |
| 14 | DSE registered location | The DSE Registered Location element is present if dot11LCIDSERequired is true. |
| 15 | Timeout Interval (Association Comeback time) | A TIE containing the Association Comeback time is present when dot11RSNAActivated is true, dot11RSNAProtectedManagementFramesActivated is true, and the reassociation is rejected with status code REFUSED_TEMPORARILY. |
| 16 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 17 | HT Operation | The HT Operation element is included by an AP when dot11HighThroughputOptionImplemented is true. |
| 18 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 19 | Overlapping BSS Scan Parameters | The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true. |
| 20 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 21 | BSS Max Idle Period | The BSS Max Idle Period element is present if dot11WirelessManagementImplemented is true. |
| 22 | TIM Broadcast Response | The TIM Broadcast Response element is present if dot11TIMBroadcastActivated is true and the TIM Broadcast Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame. |
| 23 | FMS Response | The FMS Response element is present if dot11FMSActivated is true and the FMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame. |
| 24 | DMS Response | The DMS Response element is present if dot11DMSActivated is true and the DMS Request element is present in the Reassociation Request frame that elicited this Reassociation Response frame. |
| 25 | QoS Map | The QoS Map element is present if dot11QosMapActivated is true and the QoS Map field in the Extended Capabilities element of the corresponding Reassociation Request frame is 1. |

Table 9-32—Reassociation Response frame body (continued)

| Order | Information | Notes |
|-------|-----------------------------|--|
| 26 | QMF Policy | The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Reassociation Request that elicited this Reassociation Response frame. |
| 27 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 28 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 29 | DMG Operation | The DMG Operation element is present if dot11DMGOptionImplemented is true. |
| 30 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 31 | Neighbor Report | One or more Neighbor Report elements is present if the Reason Code is REJECTED_WITH_SUGGESTED_BSS_TRANSITION. |
| 31 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 32 | VHT Operation | The VHT Operation element is present when the dot11VHTOptionImplemented is true; otherwise, it is not present. |
| 33 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 34 | Future Channel Guidance | The Future Channel Guidance element is optionally present if dot11FutureChannelGuidanceActivated is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.10 Probe Request frame format

The frame body of a Probe Request frame contains the information shown in Table 9-33.

Table 9-33—Probe Request frame body

| Order | Information | Notes |
|-------|--|--|
| 1 | SSID | If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2. |
| 2 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 3 | Request | The Request element is optionally present if dot11RadioMeasurementActivated is true. The Request element is optionally present if dot11MultiDomainCapabilityActivated is true or if dot11EstimatedServiceParametersOptionImplemented is true. |

Table 9-33—Probe Request frame body (continued)

| Order | Information | Notes |
|--------------|---|---|
| 4 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 5 | DSSS Parameter Set | <p>The element is optionally present.</p> <p>The DSSS Parameter Set element is present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is true.</p> <p>The DSSS Parameter Set element is present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is true.</p> <p>The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using Clause 15, Clause 16, or Clause 18 PHYs if dot11RadioMeasurementActivated is false.</p> <p>The DSSS Parameter Set element is optionally present within Probe Request frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band if dot11RadioMeasurementActivated is false.</p> |
| 6 | Supported Operating Classes | <p>The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true.</p> <p>The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true.</p> |
| 7 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 8 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 9 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 10 | SSID List | The SSID List element is optionally present if dot11SSIDListActivated is true. |
| 11 | Channel Usage | The Channel Usage element is optionally present if dot11ChannelUsageActivated is true. |
| 12 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true. |
| 13 | Mesh ID | The Mesh ID element is present if dot11MeshActivated is true. |
| 14 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 15 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 16 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 17 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 18 | Estimated Service Parameters | The Estimated Service Parameters element is optionally present if dot11EstimatedServiceParametersOptionImplemented is true. |

Table 9-33—Probe Request frame body (continued)

| Order | Information | Notes |
|-------|------------------|--|
| 19 | Extended Request | The Extended Request element is optionally present if dot11RadioMeasurementActivated is true. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.3.11 Probe Response frame format

The frame body of a Probe Response frame contains the information shown in Table 9-34. See additional details and procedures in 11.1.4.

Table 9-34—Probe Response frame body

| Order | Information | Notes |
|-------|--|---|
| 1 | Timestamp | |
| 2 | Beacon interval | |
| 3 | Capability Information | |
| 4 | SSID | If dot11MeshActivated is true, the SSID element is the wildcard value as described in 9.4.2.2. |
| 5 | Supported Rates and BSS Membership Selectors | This field is not present if dot11DMGOptionImplemented is true. |
| 6 | DSSS Parameter Set | The element is optionally present. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using Clause 15, Clause 16, and Clause 18 PHYs. The DSSS Parameter Set element is present within Probe Response frames generated by STAs using a Clause 19 PHY in the 2.4 GHz band. |
| 7 | CF Parameter Set | The CF Parameter Set element is present only within Probe Response frames generated by APs supporting a PCF. |
| 8 | IBSS Parameter Set | The IBSS Parameter Set element is present only within Probe Response frames generated by IBSS STAs. |
| 9 | Country | The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 10 | Power Constraint | The Power Constraint element is present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true. |
| 11 | Channel Switch Announcement | The Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true. |
| 12 | Quiet | The Quiet element is optionally present if dot11SpectrumManagementRequired is true or if dot11RadioMeasurementActivated is true. |
| 13 | IBSS DFS | The IBSS DFS element is present if dot11SpectrumManagementRequired is true in an IBSS. |

Table 9-34—Probe Response frame body (continued)

| Order | Information | Notes |
|--------------|---|---|
| 14 | TPC Report | The TPC Report element is present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 15 | ERP | The ERP element is present within Probe Response frames generated by STAs using ERPs and is optionally present otherwise. |
| 16 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates, and it is optionally present otherwise. This element is not present if dot11DMGOptionImplemented is true. |
| 17 | RSN | The RSNE is present if dot11RSNAActivated is true; otherwise not present. |
| 18 | BSS Load | The BSS Load element is present if dot11QosOption-Implemented and dot11QBSSLLoadImplemented are both true. |
| 19 | EDCA Parameter Set | The EDCA Parameter Set element is present if dot11QosOptionImplemented is true and dot11MeshActivated is false. |
| 20 | Measurement Pilot Transmission | The Measurement Pilot Transmission element is present if dot11RMMeasurementPilotActivated is between 2 and 7. |
| 21 | Multiple BSSID | One or more Multiple BSSID elements are present if dot11RMMeasurementPilotActivated is between 2 and 7 and the AP is a member of a multiple BSSID set (see 11.11.14) with two or more members, or if dot11MultiBSSIDActivated is true, or if dot11InterworkingServiceActivated is true and the AP is a member of a multiple BSSID set with two or more members and at least one dot11GASAdvertisementID MIB attribute exists. |
| 22 | RM Enabled Capabilities | The RM Enabled Capabilities element is present if dot11RadioMeasurementActivated is true. |
| 23 | AP Channel Report | If dot11RMAPChannelReportActivated is true, one AP Channel Report element is optionally present for each operating class that has at least 1 channel to report. |
| 24 | BSS Average Access Delay | The BSS Average Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and the value of the AP Average Access Delay field is not equal to 255 (measurement not available). |
| 25 | Antenna | The Antenna element is optionally present if dot11RMAntennaInformationActivated is true and the value of the Antenna ID field is not equal to 0 (unknown antenna). |
| 26 | BSS Available Admission Capacity | The BSS Available Admission Capacity element is optionally present if dot11RMBSSAvailableAdmissionCapacityActivated is true with the following exceptions: 1) when Available Admission Capacity Bitmask equals 0 (Available Admission Capacity List contains no entries), or 2) when the BSS Load element is present and the Available Capacity Bitmask equals 256 (Available Admission Capacity List contains only the AC_VO entry). |
| 27 | BSS AC Access Delay | The BSS AC Access Delay element is optionally present if dot11RMBSSAverageAccessDelayActivated is true and at least one field of the element is not equal to 255 (measurement not available). |
| 28 | Mobility Domain | The MDE is present if dot11FastBSSTransitionActivated is true. |

Table 9-34—Probe Response frame body (continued)

| Order | Information | Notes |
|--------------|--------------------------------------|--|
| 29 | DSE registered location | The DSE Registered Location element is present if dot11LCIDSERequired is true. |
| 30 | Extended Channel Switch Announcement | The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true. |
| 31 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true. The Supported Operating Classes element is optionally present if dot11TVHTOptionImplemented is true. |
| 32 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 33 | HT Operation | The HT Operation element is included by an AP and a mesh STA when dot11HighThroughputOptionImplemented is true. |
| 34 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present when dot112040BSSCoexistenceManagementSupport is true. |
| 35 | Overlapping BSS Scan Parameters | The Overlapping BSS Scan Parameters element is optionally present if dot11FortyMHzOptionImplemented is true. |
| 36 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero. |
| 37 | QoS Traffic Capability | The QoS Traffic Capability element is optionally present if dot11ACStationCountActivated is true. |
| 38 | Channel Usage | The Channel Usage element is present if the Channel Usage element is present in the Probe Request frame and dot11ChannelUsageActivated is true. |
| 39 | Time Advertisement | The Time Advertisement element is present if dot11UTCTSFOffsetActivated is true. |
| 40 | Time Zone | The Time Zone element is present if dot11UTCTSFOffsetActivated is true. |
| 41 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true. |
| 42 | Advertisement Protocol | Advertisement Protocol element is present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists. |
| 43 | Roaming Consortium | The Roaming Consortium element is present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry. |
| 44 | Emergency Alert Identifier | One or more Emergency Alert Identifier elements are present if dot11EASActivated is true and there are one or more EAS message(s) active in the network. |
| 45 | Mesh ID | The Mesh ID element is present if dot11MeshActivated is true. |
| 46 | Mesh Configuration | The Mesh Configuration element is present if dot11MeshActivated is true. |
| 47 | Mesh Awake Window | The Mesh Awake Window element is optionally present if dot11MeshActivated is true. |
| 48 | Beacon Timing | The Beacon Timing element is optionally present if both dot11MeshActivated and dot11MBCAActivated are true. |

Table 9-34—Probe Response frame body (continued)

| Order | Information | Notes |
|--------------|---------------------------------|---|
| 49 | MCCAOP Advertisement Overview | The MCCAOP Advertisement Overview element is optionally present if both dot11MeshActivated and dot11MCCAActivated are true. |
| 50 | MCCAOP Advertisement | One or more MCCAOP Advertisement elements are optionally present if both dot11MeshActivated and dot11MCCAActivated are true. |
| 51 | Mesh Channel Switch Parameters | The Mesh Channel Switch Parameters element is present if dot11MeshActivated is true and either Channel Switch Announcement element or Extended Channel Switch Announcement element is present. |
| 52 | QMF Policy | The QMF Policy element is present if dot11QMFActivated is true and the QMFActivated subfield is 1 in the Extended Capabilities element in the Probe Request that elicited this Probe Response frame. |
| 53 | QLoad Report | The QLoad Report element is present if dot11QLoadReportActivated is true. |
| 54 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 55 | DMG Capabilities | The DMG Capabilities element is present if dot11DMGOptionImplemented is true. |
| 56 | DMG Operation | The DMG Operation element is present if dot11DMGOptionImplemented is true. |
| 57 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is present if dot11MultipleMACActivated is true. |
| 58 | Antenna Sector ID Pattern | The Antenna Sector ID Pattern element is optionally present if dot11DMGOptionImplemented is true. |
| 59 | VHT Capabilities | The VHT Capabilities element is present when the dot11VHTOptionImplemented is true. |
| 60 | VHT Operation | The VHT Operation element is present when the dot11VHTOptionImplemented is true; otherwise, it is not present. |
| 61 | Transmit Power Envelope element | One Transmit Power Envelope element is present for each distinct value of the Local Maximum Transmit Power Unit Interpretation subfield that is supported for the BSS if both of the following conditions are met: <ul style="list-style-type: none"> — dot11VHTOptionImplemented — dot11ExtendedSpectrumManagementImplemented is true; — Either dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. or Otherwise, this parameter is not present. |
| 62 | Channel Switch Wrapper element | The Channel Switch Wrapper element is optionally present if dot11VHTOptionImplemented or dot11ExtendedSpectrumManagementImplemented is true and at least one of a Channel Switch Announcement element or an Extended Channel Switch Announcement element is also present in the Probe Response frame and the Channel Switch Wrapper element contains at least one subelement. |
| 63 | Extended BSS Load element | The Extended BSS Load element is optionally present if dot11QoSOptionImplemented, dot11QBSSLoadImplemented and dot11VHTOptionImplemented are true. |

Table 9-34—Probe Response frame body (continued)

| Order | Information | Notes |
|--------|------------------------------|---|
| 64 | Quiet Channel | Either one Quiet Channel element containing an AP Quiet Mode field equal to 0 or, in an infrastructure BSS, one or more Quiet Channel elements each containing an AP Quiet Mode field equal to 1 are optionally present if dot11VHTOptionImplemented is true, and either dot11SpectrumManagementRequired or dot11RadioMeasurementActivated is true. |
| 65 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |
| 66 | Reduced Neighbor Report | The Reduced Neighbor Report element is optionally present if dot11TVHTOptionImplemented is true. |
| 67 | TVHT Operation | The TVHT Operation element is present for a TVHT STA when the dot11TVHTOptionImplemented is true; otherwise it is not present. |
| 68 | Estimated Service Parameters | The Estimated Service Parameters element is optionally present if dot11EstimatedServiceParametersOptionImplemented is true. |
| 69 | Relay Capabilities | The Relay Capabilities element is present if dot11RelayActivated is true; otherwise not present. |
| Last-1 | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements, except the Requested elements. |
| Last | Requested elements | Elements requested by the Request element or Extended Request element(s) of the Probe Request frame are present if dot11MultiDomainCapabilityActivated or dot11EstimatedServiceParametersOptionImplemented is true. See 11.1.4.3.2 and 11.46. |

9.3.3.12 Authentication frame format

The frame body of an Authentication frame contains the information shown in Table 9-35. FT authentication is used when FT support is advertised by the AP and dot11FastBSSTransitionActivated is true in the STA. SAE authentication is used when dot11MeshActiveAuthenticationProtocol is sae (1).

Table 9-35—Authentication frame body

| Order | Information | Notes |
|-------|--|---|
| 1 | Authentication algorithm number | |
| 2 | Authentication transaction sequence number | |
| 3 | Status code | The status code information is reserved in certain Authentication frames as defined in Table 9-36. |
| 4 | Challenge text | A Challenge Text element is present only in certain Authentication frames as defined in Table 9-36. |
| 5 | RSN | An RSNE is present only in certain Authentication frames as defined in Table 9-36. |
| 6 | Mobility Domain | An MDE is present only in certain Authentication frames as defined in Table 9-36. |

Table 9-35—Authentication frame body (continued)

| Order | Information | Notes |
|--------------|---|---|
| 7 | Fast BSS Transition | An FTE is present only in certain Authentication frames as defined in Table 9-36. |
| 8 | Timeout Interval (reassociation deadline) | A TIE containing the reassociation deadline interval is present only in certain Authentication frames as defined in Table 9-36. |
| 9 | RIC | A resource information container, containing a variable number of elements, is present only in certain Authentication frames as defined in Table 9-36. |
| 10 | Finite Cyclic Group | An unsigned integer indicating a finite cyclic group as described in 12.4.4. This is present only in certain Authentication frames as defined in Table 9-36. |
| 11 | Anti-Clogging Token | A random bit string used for anti-clogging purposes as described in 12.4.6. This is present only in certain Authentication frames as defined in Table 9-36. |
| 12 | Send-Confirm | A binary encoding of an integer used for anti-replay purposes as described in 12.4.7.5. This is present only in certain Authentication frames as defined in Table 9-36. |
| 13 | Scalar | An unsigned integer encoded as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-36. |
| 14 | Finite field element | A Finite field element field from a finite field encoded as described in 12.4.7.4. This is present only in certain Authentication frames as defined in Table 9-36. |
| 15 | Confirm | An unsigned integer encoded as described in 12.4.7.5. This is present only in certain Authentication frames as defined in Table 9-36. |
| 16 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 17 | Neighbor Report | One or more Neighbor Report elements are present only in certain Authentication frames as defined in Table 9-36. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

Table 9-36—Presence of fields and elements in Authentication frames

| Authentication algorithm | Authentication transaction sequence number | Status code | Presence of fields 4 onwards |
|---------------------------------|---|--|---|
| Open System | 1 | Reserved | Not present |
| Open System | 2 | Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION | Not present |
| Open System | 2 | REJECTED_WITH_SUGGESTED_BSS_TRANSITION | One or more Neighbor Report element(s) is present |
| Shared Key | 1 | Reserved | Not present |
| Shared Key | 2 | Any | The Challenge text element is present |

Table 9-36—Presence of fields and elements in Authentication frames (continued)

| Authentication algorithm | Authentication transaction sequence number | Status code | Presence of fields 4 onwards |
|--------------------------|--|--|---|
| Shared Key | 3 | Reserved | The Challenge text element is present |
| Shared Key | 4 | Any | Not present |
| FT | 1 | Reserved | The Mobility Domain element is present. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true. |
| FT | 2 | Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION | The Mobility Domain element is present if the Status Code field is 0. The Fast BSS Transition element and RSNEs are present if the Status Code field is 0 and dot11RSNAActivated is true. |
| FT | 2 | REJECTED_WITH_SUGGESTED_BSS_TRANSITION | One or more Neighbor Report element(s) is present |
| FT | 3 | Reserved | The Mobility Domain element is present. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present. |
| FT | 4 | Any | The Mobility Domain element is present if the Status Code field is 0. The Fast BSS Transition element and RSNEs are present if dot11RSNAActivated is true. The RIC element is optionally present if the Status Code field is 0. The TIE (reassociation deadline) is present if a RIC element is present. |
| SAE | 1 | Any | Scalar is present if the Status Code field is zero. Element is present if the Status Code field is zero. Anti-Clogging Token is present if status is 76 or if frame is in response to a previous rejection with Status 76. Finite Cyclic Group is present if the Status Code field is zero or 76. |

Table 9-36—Presence of fields and elements in Authentication frames (continued)

| Authentication algorithm | Authentication transaction sequence number | Status code | Presence of fields 4 onwards |
|--------------------------|--|--|--|
| SAE | 2 | Not REJECTED_WITH_SUGGESTED_BSS_TRANSITION | Send-Confirm is present. Confirm is present. |
| SAE | 2 | REJECTED_WITH_SUGGESTED_BSS_TRANSITION | One or more Neighbor Report element(s) are present |

9.3.3.13 Deauthentication

The frame body of a Deauthentication frame contains the information shown in Table 9-37.

Table 9-37—Deauthentication frame body

| Order | Information |
|--|---|
| 1 | Reason code |
| Last – 1 | One or more vendor-specific elements are optionally present. |
| Last | The Management MIC element (MME) is present when management frame protection is enabled at the AP and the frame is a group addressed frame. |
| NOTE—The MME appears after all fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4. | |

9.3.3.14 Action frame format

The frame body of an Action frame contains the information shown in Table 9-38.

Table 9-38—Action frame body

| Order | Information |
|--|---|
| 1 | Action |
| Last – 2 | One or more vendor-specific elements are optionally present. These elements are absent when the Category subfield of the Action field is Vendor-Specific, Vendor-Specific Protected, or Self-protected or when the Category subfield of the Action field is VHT and the VHT Action subfield of the Action field is VHT Compressed Beamforming. |
| Last – 1 | The Management MIC element (MME) is present when management frame protection is enabled at the AP, the frame is a group addressed robust Action frame, and the category of the Action frame does not support group addressed privacy as indicated by Table 9-47. |
| Last | The Authenticated Mesh Peering Exchange element is present in a Self-protected Action frame if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true and a PMK exists between the sender and recipient of this frame; otherwise not present. |
| NOTE—The MME appears after any fields that it protects. Therefore, it appears last in the frame body to protect the frames as specified in 12.5.4. | |

9.3.3.15 Action No Ack frame format

The frame body of an Action No Ack frame contains the information shown in Table 9-39.

Table 9-39—Action No Ack frame body

| Order | Information |
|-------|---|
| 1 | Action |
| Last | One or more vendor-specific elements are optionally present. This element follows all other elements. |

NOTE—The selection of Action or Action No Ack is made per frame that uses these formats.

Unless specified as allowing the use of the Action No Ack management frame subtype, a frame described as an “Action frame” uses only the Action subtype.

9.3.3.16 Timing Advertisement frame format

The frame body of a Timing Advertisement frame contains the information shown in Table 9-40.

Table 9-40—Timing Advertisement frame body

| Order | Information | Notes |
|-------|------------------------|---|
| 1 | Timestamp | See 9.4.1.10 for Timestamp format. |
| 2 | Capability Information | |
| 3 | Country | The Country element is present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. |
| 4 | Power Constraint | The Power Constraint element is optionally present if the Country element is present; otherwise not present. |
| 5 | Time Advertisement | The Time Advertisement element is optionally present. See 9.4.2.61. |
| 6 | Extended Capabilities | The Extended Capabilities element is present. |
| Last | Vendor specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

9.3.4 Extension frames

9.3.4.1 Format of Extension frames

The format of Extension frames is defined in Figure 9-59. The MAC header of an Extension frame starts with the Frame Control field followed by the Duration field. The MAC header of different Extension frames can have different number and types of fields following the Duration field.

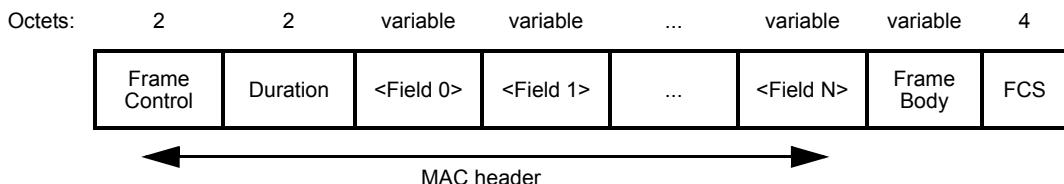

Figure 9-59—Extension frame format

9.3.4.2 DMG Beacon

The format of the DMG Beacon frame is shown in Figure 9-60.

In addition to supporting functions such as network synchronization (see 11.1), the DMG Beacon frame can also be used as a training frame for beamforming (see 10.38).

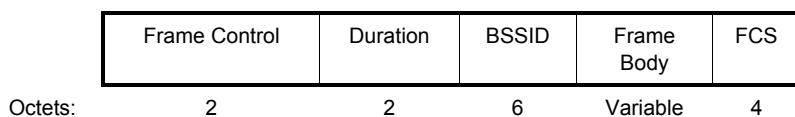

Figure 9-60—DMG Beacon frame format

The Duration field is set to the time remaining until the end of the beacon transmission interval (BTI).

The BSSID field contains the BSSID.

The Frame Body field of the DMG Beacon frame contains the elements listed in Table 9-41.

Table 9-41—DMG Beacon frame body

| Order | Information | Notes |
|-------|-------------------------|---|
| 1 | Timestamp | See 9.4.1.10 |
| 2 | Sector Sweep | See 9.5.1 |
| 3 | Beacon Interval | See 9.4.1.3 |
| 4 | Beacon Interval Control | See Figure 9-61. |
| 5 | DMG Parameters | See 9.4.1.47 |
| 6 | Clustering Control | Optional. See Figure 9-62 and Figure 9-63. |
| 7 | DMG Capabilities | The DMG Capabilities element is optionally present. |
| 8 | Extended Schedule | The Extended Schedule element is optionally present. |
| 9 | RSN | The RSNE is optionally present if dot11RSNAActivated is true. |
| 10 | Multiple BSSID | One or more Multiple BSSID elements are optionally present if dot11MultiBSSIDActivated is true. |
| 11 | DMG Operation | The DMG Operation element is optionally present. |
| 12 | Next DMG ATI | The Next DMG ATI element is optionally present. |

Table 9-41—DMG Beacon frame body (continued)

| Order | Information | Notes |
|--------------|--------------------------------------|--|
| 13 | DMG BSS Parameter Change | The DMG BSS Parameter Change element is optionally present. |
| 14 | Multi-band | Zero or more Multi-band elements are present if dot11MultibandImplemented is true. |
| 15 | Awake Window | The Awake Window element is optionally present. If present, this element specifies the characteristics of the awake window of a CBAP (see 11.2.7). |
| 16 | DMG Wakeup Schedule | The DMG Wakeup Schedule element is optionally present (see 11.2.7.3.3). |
| 17 | UPSIM | The UPSIM element is optionally present (see 11.2.7.2.2). |
| 18 | SSID | The SSID element is optionally present. |
| 19 | IBSS Parameter Set | The IBSS Parameter Set element is present only within DMG Beacon frames generated by IBSS STAs. |
| 20 | Country | The Country element is optionally present if dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 21 | BSS Load | The BSS Load element is optionally present if dot11QosOptionImplemented and dot11QBSSLoadImplemented are both true. |
| 22 | EDCA Parameter Set | The EDCA Parameter Set element is optionally present. |
| 23 | Power Constraint | The Power Constraint element is optionally present if dot11SpectrumManagementRequired is true and is optionally present if dot11RadioMeasurementActivated is true. |
| 24 | Channel Switch Announcement | The Channel Switch Announcement element is optionally present if dot11SpectrumManagementRequired is true. |
| 25 | Neighbor Report | The Neighbor Report element is optionally present. |
| 26 | Quiet | The Quiet element is optionally present if dot11SpectrumManagementRequired is true or dot11RadioMeasurementActivated is true. |
| 27 | QoS Capability | The QoS Capability element is optionally present. |
| 28 | Extended Channel Switch Announcement | The Extended Channel Switch Announcement element is optionally present if dot11ExtendedChannelSwitchActivated is true. |
| 29 | BSS Average Access Delay | The BSS Average Access Delay element is optionally present. |
| 30 | RM Enabled Capabilities | The RM Enabled Capabilities element is optionally present if dot11RadioMeasurementActivated is true. |
| 31 | Nontransmitted BSSID Capability | The Nontransmitted BSSID Capability element is optionally present. |
| 32 | SSID List | The SSID List element is optionally present if dot11SSIDListActivated is true. |
| 33 | Interworking | The Interworking element is optionally present if dot11InterworkingServiceActivated is true. |

Table 9-41—DMG Beacon frame body (continued)

| Order | Information | Notes |
|-------|---------------------------|---|
| 34 | Advertisement Protocol | The Advertisement Protocol element is optionally present if dot11InterworkingServiceActivated is true and at least one dot11GASAdvertisementID exists. |
| 35 | Roaming Consortium | The Roaming Consortium element is optionally present if dot11InterworkingServiceActivated is true and the dot11RoamingConsortiumTable has at least one entry. |
| 36 | STA Availability | The STA Availability element is optionally present. |
| 37 | Next PCP List | The Next PCP List element is optionally present. |
| 38 | PCP Handover | The PCP Handover element is optionally present. |
| 39 | Antenna Sector ID Pattern | The Antenna Sector ID Pattern element is optionally present. |
| Last | Vendor Specific | One or more vendor-specific elements are optionally present. These elements follow all other elements. |

The format of the Beacon Interval Control field is shown in Figure 9-61.

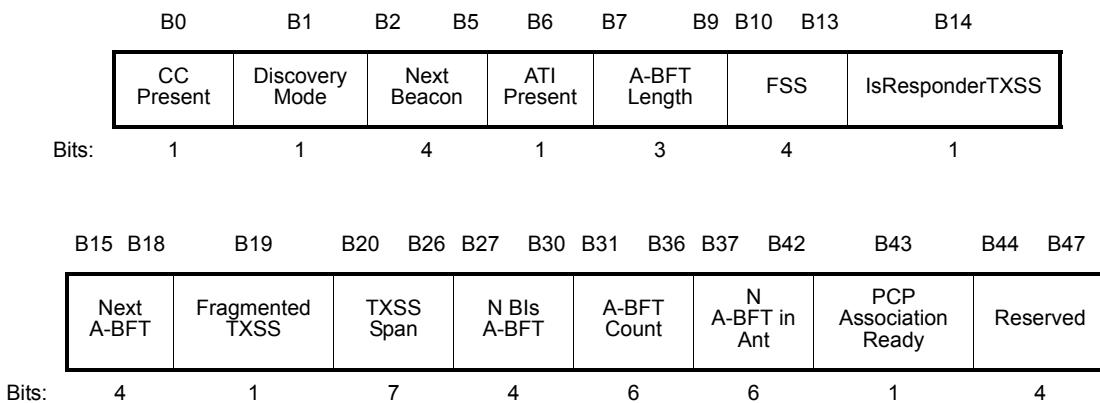

Figure 9-61—Beacon Interval Control field

The CC Present subfield is set to 1 to indicate that the Clustering Control field is present in the DMG Beacon. Otherwise, the Clustering Control field is not present.

The Discovery Mode subfield is set to 1 if the STA is generating the DMG Beacon following the procedure described in 11.1.3.4. Otherwise, this subfield is set to 0.

The Next Beacon subfield indicates the number of beacon intervals following the current beacon interval during which the DMG Beacon frame will not be present.

The ATI Present subfield is set to 1 to indicate that the announcement transmission interval (ATI) is present in the current beacon interval. Otherwise, the ATI is not present.

The A-BFT Length subfield specifies the size of the A-BFT following the BTI and is defined in units of a sector sweep slot (10.38.5). The value of this field is in the range 1 to 8, with the value being equal to the bit representation plus 1.

The FSS subfield specifies the number of SSW frames allowed per sector sweep slot minus one (10.38.5). The range of this subfield is 0 to 15. For example, when the number of SSW frames allowed per sector sweep is 5, the subfield contains the value 4.

The IsResponderTXSS subfield is set to 1 to indicate the A-BFT following the BTI is used for responder transmit sector sweep (TXSS). This field is set to 0 to indicate responder receive sector sweep (RXSS). When this subfield is set to 0, the FSS subfield specifies the length of a complete receive sector sweep by the STA sending the DMG Beacon frame.

The Next A-BFT subfield indicates the number of beacon intervals during which the A-BFT is not be present. A value of 0 indicates that the A-BFT immediately follows this BTI.

The Fragmented TXSS subfield is set to 1 to indicate the TXSS is a fragmented sector sweep and is set to 0 to indicate the TXSS is a complete sector sweep.

The TXSS Span subfield indicates the number of beacon intervals it takes for the STA sending the DMG Beacon frame to complete the TXSS phase. This subfield is always greater than or equal to 1.

The N BIs A-BFT subfield indicates the interval, in number of beacon intervals, at which the STA sending the DMG Beacon frame allocates an A-BFT. A value of 1 indicates that every beacon interval contains an A-BFT.

The A-BFT Count subfield indicates the number of A-BFTs since the STA sending the DMG Beacon frame last switched RX DMG antennas for an A-BFT. A value of 0 indicates that the DMG antenna used in the forthcoming A-BFT differs from the DMG antenna used in the last A-BFT. This subfield is reserved if the value of the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The N A-BFT in Ant subfield indicates how many A-BFTs the STA sending the DMG Beacon frame receives from each DMG antenna in the DMG antenna receive rotation. This subfield is reserved if the value of the Number of RX DMG Antennas field within the STA's DMG Capabilities element is 1.

The PCP Association Ready subfield is set to 1 to indicate that the PCP is ready to receive Association Request frames from non-PCP STAs and is set to 0 otherwise. This subfield is reserved when transmitted by a non-PCP STA.

The DMG Parameters field is defined in 9.4.1.47.

If the value of Discovery Mode field is 0, the Clustering Control field is formatted as shown in Figure 9-62. If the value of the Discovery Mode field is 1, the Clustering Control field is formatted as shown in Figure 9-63.

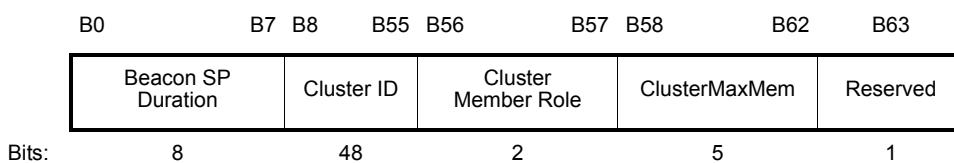

Figure 9-62—Clustering Control field format if the Discovery Mode field is 0

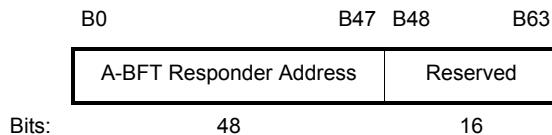

Figure 9-63—Clustering Control field format if the Discovery Mode field is 1

If ECAPC Policy Enforced field is set to 0, the Beacon SP Duration subfield indicates the duration, in units of 8 μ s, of the Beacon SPs in the cluster. If ECAPC Policy Enforced field is set to 1, the Beacon SP Duration subfield indicates the maximum duration, in units of 8 μ s, of the beacon header interval (BHI) of the BSS, and the minimum duration of Beacon SPs in the cluster (see 10.37.2.2).

The cluster to which the transmitter of the Clustering Control field belongs is identified by the Cluster ID subfield. The MAC address of the S-AP or synchronization PCP (S-PCP) is the Cluster ID of the cluster.

The Cluster Member Role subfield identifies the role that the transmitting STA assumes within the cluster. A value of 0 means that the STA is currently not participating in clustering. A value of 1 means that the STA acts as the S-AP or S-PCP of the cluster. A value of 2 means that the STA participates in the cluster, but not as the S-AP or S-PCP. The value 3 is reserved.

The ClusterMaxMem subfield defines the maximum number of PCPs and/or APs, including the S-AP or S-PCP, that can participate in the cluster. The value of the ClusterMaxMem subfield is computed in relation to the beacon interval value (10.38.2). The value 0 is reserved. Values 8 and above are reserved if the ECAPC Policy Enforced field is set to 0. The value 1 is assigned to the S-AP or S-PCP.

The A-BFT Responder Address subfield contains the MAC address of the STA that is allowed to transmit during the A-BFT, if present, that follows the BTI.

9.3.5 Frame addressing in an MBSS

Mesh Data frames and Multihop Action frames enable multihop MSDU and MMPDU forwarding in an MBSS using the Mesh Control field described in 9.2.4.7.3.

Table 9-42 shows the valid combinations of address fields in mesh Data frames and Multihop Action frames along with the corresponding value of the Address Extension Mode subfield in the Mesh Control field.

Table 9-42—Valid address field usage for Mesh Data and Multihop Action frames

| Supported frames | To DS | From DS | Address extension mode | Address 1 | Address 2 | Address 3 | Address 4 | Address 5 | Address 6 |
|---|-------|---------|------------------------|-----------|-----------|--------------|--------------|-------------|-------------|
| Mesh Data (individually addressed) | 1 | 1 | None | RA | TA | DA = Mesh DA | SA = Mesh SA | Not Present | Not Present |
| Mesh Data (group addressed) | 0 | 1 | None | DA | TA | SA = Mesh SA | Not Present | Not Present | Not Present |
| Mesh Data (proxied, individually addressed) | 1 | 1 | Address5&6 | RA | TA | Mesh DA | Mesh SA | DA | SA |

Table 9-42—Valid address field usage for Mesh Data and Multihop Action frames (continued)

| Supported frames | To DS | From DS | Address extension mode | Address 1 | Address 2 | Address 3 | Address 4 | Address 5 | Address 6 |
|--|-------|---------|------------------------|-----------|-----------|--------------|--------------|-------------|-------------|
| Mesh Data (proxied, group addressed) | 0 | 1 | Address4 | DA | TA | Mesh SA | SA | Not Present | Not Present |
| Multihop Action (individually addressed) | 0 | 0 | Address4 | RA | TA | DA = Mesh DA | SA = Mesh SA | Not Present | Not Present |
| Multihop Action (group addressed) | 0 | 0 | None | DA | TA | SA = Mesh SA | Not Present | Not Present | Not Present |

NOTE 1—To DS and From DS subfields are located in the Frame Control field (see 9.2.4.1.4). The Address Extension Mode subfield is located in the Mesh Flags subfield in the Mesh Control field (see 9.2.4.7.3). Address 1, Address 2, and Address 3 fields are located in the MAC header (see 9.2.3). The Address 4 field is located in the MAC header if both To DS and From DS subfields are 1; otherwise, the Address 4 field is located in the Mesh Address Extension subfield of the Mesh Control field (see 9.2.3 and 9.2.4.7.3). Address 5 and Address 6 fields are located in the Mesh Control field if they are present (see 9.2.4.7.3).

NOTE 2—Values for the Address Extension Mode subfield are defined in see Table 9-20.

In individually addressed Mesh Data and Multihop Action frames, Address 1 and Address 2 correspond to the mesh STA receiver address (RA) and the mesh STA transmitter address (TA) for a particular mesh link. Address 3 and Address 4 correspond to the destination mesh STA and the source mesh STA of a mesh path. The Address Extension Mode subfield in the Mesh Control field indicates the presence of an optional Mesh Address Extension subfield in the Mesh Control field. When the Extension Mode subfield equals “Address5&6” (see Table 9-20), the Mesh Control field includes Address 5 and Address 6 that correspond to the end-to-end destination address (DA) and source address (SA) of STAs that communicate over the mesh path, for instance, external STAs that communicate over the mesh BSS via proxy mesh gates (see Figure 9-64).

NOTE—The forwarding of individually addressed mesh Data frames uses only mesh STA addresses in fields Address 1, Address 2, Address 3, and Address 4. This allows intermediate mesh STAs to forward mesh Data frames without necessarily having any knowledge of the addresses of the source and destination end stations, which might be external addresses. Thus, proxy information only needs to be maintained by proxy mesh gates and by source mesh STAs.

The term source mesh STA refers to the first mesh STA on a mesh path. A source mesh STA is either a mesh STA that is the initial source of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path or from a STA outside the mesh BSS and translates and forwards the MSDU/MMPDU on the mesh path. The address of the source mesh STA is referred to as the *Mesh SA*.

The term destination mesh STA refers to the final mesh STA on a mesh path. A destination mesh STA is either a mesh STA that is the final destination of an MSDU/MMPDU or a mesh STA that receives an MSDU/MMPDU from a mesh path and translates and forwards the MSDU/MMPDU on another mesh path or to a STA outside of the mesh BSS. The address of the destination mesh STA is referred to as the *Mesh DA*.

In group addressed mesh Data frames, Address 1 and Address 2 correspond to the group address and the mesh STA transmitter address (TA). Address 3 corresponds to the mesh source address (mesh SA) of the group addressed mesh Data frame. The Address Extension Mode indicates the presence of an optional

address extension field Address 4 in the Mesh Control field that corresponds to the source address (SA) of external STAs that communicate over the mesh BSS via proxy mesh gates.

NOTE—The reason for not using the four-address MAC header format for group addressed traffic is to avoid interactions with existing implementations. Earlier revisions of this standard defined the four-address MAC header format without defining procedures for its use. As a result there is a large number of deployed devices that use the four-address frame format in ways that would affect and be affected by mesh traffic if four-address group addressed frames were to be used.

Figure 9-64 illustrates the addressing of a mesh Data frame that contains an MSDU transmitted and forwarded on a mesh path from a mesh STA collocated with a portal (STA 1) to a mesh STA collocated with an AP (STA 2) where the source is a STA outside of the mesh BSS (STA 33) that is reachable via the portal and the destination is an IEEE 802.11 STA associated with the AP (STA 22).

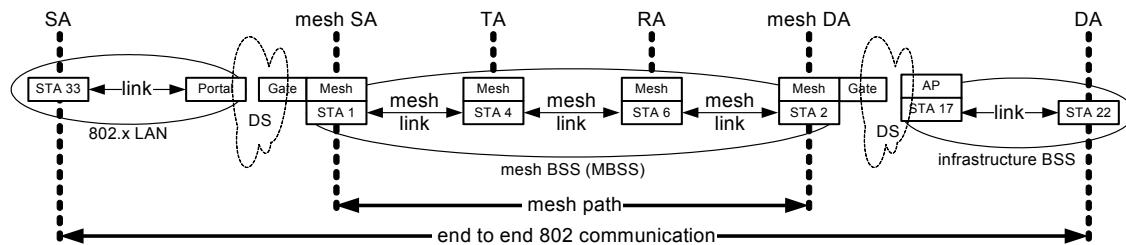

Figure 9-64—Example addressing for a mesh Data frame

Details on how these address mappings work in forwarding processing are described in 10.35.3 and 10.35.4

9.4 Management and Extension frame body components

9.4.1 Fields that are not elements

9.4.1.1 Authentication Algorithm Number field

The Authentication Algorithm Number field indicates a single authentication algorithm. The length of the Authentication Algorithm Number field is 2 octets. The Authentication Algorithm Number field is illustrated in Figure 9-65. The following values are defined for authentication algorithm number:

- Authentication algorithm number = 0: Open System
- Authentication algorithm number = 1: Shared Key
- Authentication algorithm number = 2: Fast BSS Transition
- Authentication algorithm number = 3: Simultaneous Authentication of Equals (SAE)
- Authentication algorithm number = 65 535: vendor specific use

NOTE—The use of this value implies that a Vendor Specific element is included with more information.

All other values of authentication algorithm number are reserved.

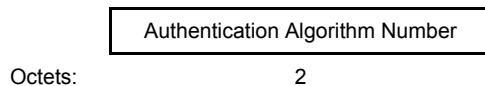

Figure 9-65—Authentication Algorithm Number field

9.4.1.2 Authentication Transaction Sequence Number field

The Authentication Transaction Sequence Number field indicates the current state of progress through a multistep transaction. The length of the Authentication Transaction Sequence Number field is 2 octets. The Authentication Transaction Sequence Number field is illustrated in Figure 9-66.

Octets: 2

Figure 9-66—Authentication Transaction Sequence Number field

9.4.1.3 Beacon Interval field

The Beacon Interval field represents the number of time units (TUs) between target beacon transmission times (TBTTs). The length of the Beacon Interval field is 2 octets. The Beacon Interval field is illustrated in Figure 9-67.

Octets: 2

Figure 9-67—Beacon Interval field

A value of 0 in the Beacon Interval field transmitted by a DMG STA indicates that the TBTT of the next BTI is unknown.

9.4.1.4 Capability Information field

The Capability Information field contains a number of subfields that are used to indicate requested or advertised optional capabilities.

The length of the Capability Information field is 2 octets. The format of the Capability Information field is defined in Figure 9-68 when transmitted by a non-DMG STA and in Figure 9-69 when transmitted by a DMG STA.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 |
|-----|------|-------------|-----------------|---------|----------------|----------|----------|
| ESS | IBSS | CF Pollable | CF-Poll Request | Privacy | Short Preamble | Reserved | Reserved |

| B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 |
|---------------------|-----|-----------------|------|-------------------|----------|-------------------|---------------------|
| Spectrum Management | QoS | Short Slot Time | APSD | Radio Measurement | Reserved | Delayed Block Ack | Immediate Block Ack |

Figure 9-68—Capability Information field (non-DMG STA)

| B0 | B7 | B8 | B9 | B10 B11 | B12 | B13 | B15 |
|----------------|---------------------|--------------------------|----------|-------------------|----------|-----|-----|
| DMG Parameters | Spectrum Management | Triggered Unscheduled PS | Reserved | Radio Measurement | Reserved | | |
| Bits: | 8 | 1 | 1 | 2 | 1 | 3 | |

Figure 9-69—Capability Information field (DMG STA)

A DMG STA sets the Triggered Unscheduled PS subfield to 1 within the Capability Information field when it transmits a Capability Information field in which the Reverse Direction subfield is equal to 1 and is capable of delivering a BU as an RD responder on receipt of a PPDU containing an RDG MPDU with the Power Management subfield set to 1 and sets it to 0 otherwise.

Each Capability Information subfield is interpreted according to the management frame subtype, as defined in this subclause.

An AP sets the ESS subfield to 1 and the IBSS subfield to 0 within transmitted Beacon or Probe Response frames. Otherwise, the ESS and IBSS subfields are reserved. An IBSS STA sets the ESS subfield to 0 and the IBSS subfield to 1 in transmitted Beacon or Probe Response frames. A mesh STA sets the ESS and IBSS subfields to 0 in transmitted Beacon or Probe Response frames.

A non-AP STA sets the QoS, CF-Pollable, and CF-Poll Request subfields in (Re)Association Request frames according to Table 9-43. A mesh STA sets the CF-Pollable and CF-Poll Request subfields to 0.

Table 9-43—Non-AP STA usage of QoS, CF-Pollable, and CF-Poll Request

| QoS | CF-Pollable | CF-Poll request | Meaning |
|-----|-------------|-----------------|--|
| 0 | 0 | 0 | STA is not CF-Pollable |
| 0 | 0 | 1 | STA is CF-Pollable, not requesting to be placed on the CF-Polling list |
| 0 | 1 | 0 | STA is CF-Pollable, requesting to be placed on the CF-Polling list |
| 0 | 1 | 1 | STA is CF-Pollable, requesting never to be polled |
| 1 | 0 | 0 | QoS STA requesting association in a QoS BSS |
| 1 | 0 | 1 | Reserved |
| 1 | 1 | 0 | Reserved |
| 1 | 1 | 1 | Reserved |

An AP sets the CF-Pollable and CF-Poll Request subfields in Beacon and Probe Response frames according to Table 9-44. A non-QoS AP sets the CF-Pollable and CF-Poll Request subfield values in (Re)Association Response frames equal to the values in the last Beacon or Probe Response frame that it transmitted.

An AP sets the Privacy subfield to 1 within transmitted Beacon, Probe Response, (Re)Association Response frames if data confidentiality is required for all Data frames exchanged within the BSS. If data confidentiality is not required, the Privacy subfield is set to 0.

In an RSNA, a non-AP STA in an infrastructure BSS sets the Privacy subfield to 0 within transmitted (Re)Association Request frames. The Privacy subfield is reserved in (Re)Association Request frames.

Table 9-44—AP usage of QoS, CF-Pollable, and CF-Poll Request

| QoS | CF-Pollable | CF-Poll Request | Meaning |
|------------|--------------------|------------------------|---|
| 0 | 0 | 0 | No PC at non-QoS AP |
| 0 | 0 | 1 | PC at non-QoS AP for delivery only (no polling) |
| 0 | 1 | 0 | PC at non-QoS AP for delivery and polling |
| 0 | 1 | 1 | Reserved |
| 1 | 0 | 0 | QoS AP (HC) does not use CFP for delivery of individually addressed Data frames |
| 1 | 0 | 1 | QoS AP (HC) uses CFP for delivery, but does not send CF-Polls to non-QoS STAs |
| 1 | 1 | 0 | QoS AP (HC) uses CFP for delivery, and sends CF-Polls to non-QoS STAs |
| 1 | 1 | 1 | Reserved |

A STA within an infrastructure BSS sets the Privacy subfield to 1 in DLS Request and DLS Response frames if encryption is required for all Data frames exchanged. If encryption is not required, the Privacy subfield is set to 0.

An IBSS STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the IBSS. If data confidentiality is not required, An IBSS STA sets the Privacy subfield to 0 within these Management frames.

A mesh STA sets the Privacy subfield to 1 in transmitted Beacon or Probe Response frames if data confidentiality is required for all Data frames exchanged within the MBSS. If data confidentiality is not required, a mesh STA sets the Privacy subfield to 0 within these Management frames.

A STA that includes the RSNE in Beacon and Probe Response frames sets the Privacy subfield to 1 in any frame that includes the RSNE.

An AP sets the Short Preamble subfield to 1 in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to indicate that the use of the short preamble, as described in 16.2.2.3, is allowed within this BSS; an IBSS STA sets the Short Preamble subfield to 1 in transmitted Beacon when `dot11ShortPreambleOptionImplemented` is true. Otherwise an AP or an IBSS STA sets the Short Preamble subfield to 0.

A mesh STA sets the Short Preamble subfield to 1 when `dot11ShortPreambleOptionImplemented` is true. Otherwise, a mesh STA sets the Short Preamble subfield to 0.

An ERP STA sets `dot11ShortPreambleOptionImplemented` to true as all ERP STAs support both long and short preamble formats.

A STA sets the Short Preamble subfield to 1 in transmitted Association Request and Reassociation Request frames and in DLS Request and DLS Response frames when `dot11ShortPreambleOptionImplemented` is true. Otherwise, a STA sets the Short Preamble subfield to 0.

A STA sets the Spectrum Management subfield in the Capability Information field to 1 if `dot11SpectrumManagementRequired` is true; otherwise, it is set to 0.

A STA sets the QoS subfield to 1 within the Capability Information field when dot11QosOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Short Slot Time subfield to 1 in transmitted Association Request, Reassociation Request, DLS Request, and DLS Response frames when dot11ShortSlotTimeOptionImplemented and dot11ShortSlotTimeOptionActivated are true. Otherwise, the STA sets the Short Slot Time subfield to 0.

An AP sets the Short Slot Time subfield in transmitted Beacon, Probe Response, Association Response, and Reassociation Response frames to indicate the currently used slot time value within this BSS. See 11.1.3.2.

See 10.3.2.13 for the operation of aSlotTime.

For IBSS and MBSS, the Short Slot Time subfield is set to 0.

An AP sets the APSD subfield to 1 within the Capability Information field when dot11APSDOptionImplemented is true and sets it to 0 otherwise. A non-AP STA always sets this subfield to 0.

A STA sets the Delayed Block Ack subfield to 1 within the Capability Information field when dot11DelayedBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Immediate Block Ack subfield to 1 within the Capability Information field when dot11ImmediateBlockAckOptionImplemented is true and sets it to 0 otherwise.

A STA sets the Radio Measurement subfield in the Capability Information field to 1 when dot11RadioMeasurementActivated is true and sets it to 0 otherwise.

The DMG Parameters field is defined in 9.4.1.47.

9.4.1.5 Current AP Address field

The Current AP Address field is the MAC address of the AP with which the STA is currently associated. The length of the Current AP Address field is 6 octets. The Current AP Address field is illustrated in Figure 9-70.

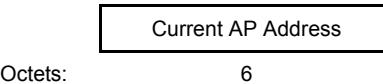

Figure 9-70—Current AP Address field

9.4.1.6 Listen Interval field

The Listen Interval field is used to indicate to the AP how often a STA in power save mode wakes to listen to Beacon frames. The value of this field is the ListenInterval parameter of the MLME-ASSOCIATE.request or MLME-REASSOCIATE.request primitive, in units of Beacon Interval. The length of the Listen Interval field is 2 octets. The Listen Interval field is illustrated in Figure 9-71.

NOTE—The value 0 might be used by a STA that never enters power save mode.

Figure 9-71—Listen Interval field

An AP uses the listen interval in determining the lifetime of frames that it buffers for a STA.

9.4.1.7 Reason Code field

This Reason Code field is used to indicate the reason that an unsolicited notification Management frame of type Disassociation, Deauthentication, DELTS, DELBA, DLS Teardown, or Mesh Peering Close was generated. It is contained in the Mesh Channel Switch Parameters element to indicate the reason for the channel switch. It is contained in the PERR element to indicate the reason for the path error. The length of the Reason Code field is 2 octets. The Reason Code field is illustrated in Figure 9-72.

Figure 9-72—Reason Code field

The reason codes are defined in Table 9-45.

Table 9-45—Reason codes

| Reason code | Name | Meaning |
|-------------|---------------------------------|---|
| 0 | | Reserved |
| 1 | UNSPECIFIED_REASON | Unspecified reason |
| 2 | INVALID_AUTHENTICATION | Previous authentication no longer valid |
| 3 | LEAVING_NETWORK_DEAUTH | Deauthenticated because sending STA is leaving (or has left) IBSS or ESS |
| 4 | REASON_INACTIVITY | Disassociated due to inactivity |
| 5 | NO_MORE_STAS | Disassociated because AP is unable to handle all currently associated STAs |
| 6 | INVALID_CLASS2_FRAME | Class 2 frame received from nonauthenticated STA |
| 7 | INVALID_CLASS3_FRAME | Class 3 frame received from nonassociated STA |
| 8 | LEAVING_NETWORK_DISASSOC | Disassociated because sending STA is leaving (or has left) BSS |
| 9 | NOT_AUTHENTICATED | STA requesting (re)association is not authenticated with responding STA |
| 10 | UNACCEPTABLE_POWER_CAPABILITY | Disassociated because the information in the Power Capability element is unacceptable |
| 11 | UNACCEPTABLE_SUPPORTED_CHANNELS | Disassociated because the information in the Supported Channels element is unacceptable |
| 12 | BSS_TRANSITION_DISASSOC | Disassociated due to BSS transition management |
| 13 | REASON_INVALID_ELEMENT | Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9 |
| 14 | MIC_FAILURE | Message integrity code (MIC) failure |
| 15 | 4WAY_HANDSHAKE_TIMEOUT | 4-way handshake timeout |
| 16 | GK_HANDSHAKE_TIMEOUT | Group key handshake timeout |
| 17 | HANDSHAKE_ELEMENT_MISMATCH | Element in 4-way handshake different from (Re)Association Request/Probe Response/Beacon frame |

Table 9-45—Reason codes (continued)

| Reason code | Name | Meaning |
|--------------------|--------------------------------|---|
| 18 | REASON_INVALID_GROUP_CIPHER | Invalid group cipher |
| 19 | REASON_INVALID_PAIRWISE_CIPHER | Invalid pairwise cipher |
| 20 | REASON_INVALID_AKMP | Invalid AKMP |
| 21 | UNSUPPORTED_RSNE_VERSION | Unsupported RSNE version |
| 22 | INVALID_RSNE_CAPABILITIES | Invalid RSNE capabilities |
| 23 | 802_1X_AUTH_FAILED | IEEE 802.1X authentication failed |
| 24 | REASON_CIPHER_OUT_OF_POLICY | Cipher suite rejected because of the security policy |
| 25 | TDLS_PEER_UNREACHABLE | TDLS direct-link teardown due to TDLS peer STA unreachable via the TDLS direct link |
| 26 | TDLS_UNSPECIFIED_REASON | TDLS direct-link teardown for unspecified reason |
| 27 | SSP_REQUESTED_DISASSOC | Disassociated because session terminated by SSP request |
| 28 | NO_SSP_ROAMING_AGREEMENT | Disassociated because of lack of SSP roaming agreement |
| 29 | BAD_CIPHER_OR_AKM | Requested service rejected because of SSP cipher suite or AKM requirement |
| 30 | NOTAUTHORIZED_THIS_LOCATION | Requested service not authorized in this location |
| 31 | SERVICE_CHANGE_PRECLUDES_TS | TS deleted because QoS AP lacks sufficient bandwidth for this QoS STA due to a change in BSS service characteristics or operational mode (e.g., an HT BSS change from 40 MHz channel to 20 MHz channel) |
| 32 | UNSPECIFIED_QOS_REASON | Disassociated for unspecified, QoS-related reason |
| 33 | NOT_ENOUGH_BANDWIDTH | Disassociated because QoS AP lacks sufficient bandwidth for this QoS STA |
| 34 | MISSING_ACKS | Disassociated because excessive number of frames need to be acknowledged, but are not acknowledged due to AP transmissions and/or poor channel conditions |
| 35 | EXCEEDED_TXOP | Disassociated because STA is transmitting outside the limits of its TXOPs |
| 36 | STA_LEAVEING | Requesting STA is leaving the BSS (or resetting) |
| 37 | END_TS END_BA END_DLS | Requesting STA is no longer using the stream or session |
| 38 | UNKNOWN_TS UNKNOWN_BA | Requesting STA received frames using a mechanism for which a setup has not been completed |
| 39 | TIMEOUT | Requested from peer STA due to timeout |
| 45 | PEERKEY_MISMATCH | Peer STA does not support the requested cipher suite |

Table 9-45—Reason codes (continued)

| Reason code | Name | Meaning |
|--------------------|--|---|
| 46 | PEER_INITIATED | In a DLS Teardown frame: The teardown was initiated by the DLS peer In a Disassociation frame: Disassociated because authorized access limit reached |
| 47 | AP_INITIATED | In a DLS Teardown frame: The teardown was initiated by the AP In a Disassociation frame: Disassociated due to external service requirements |
| 48 | REASON_INVALID_FT_ACTION_FRAME_COUNT | Invalid FT Action frame count |
| 49 | REASON_INVALID_PMKID | Invalid pairwise master key identifier (PMKID) |
| 50 | REASON_INVALID_MDE | Invalid MDE |
| 51 | REASON_INVALID_FTE | Invalid FTE |
| 52 | MESH-PEERING-CANCELED | Mesh peering canceled for unknown reasons |
| 53 | MESH-MAX-PEERS | The mesh STA has reached the supported maximum number of peer mesh STAs |
| 54 | MESH-CONFIGURATION-POLICY-VIOLATION | The received information violates the Mesh Configuration policy configured in the mesh STA profile |
| 55 | MESH-CLOSE-RCVD | The mesh STA has received a Mesh Peering Close frame requesting to close the mesh peering. |
| 56 | MESH-MAX-RETRIES | The mesh STA has resent dot11MeshMaxRetries Mesh Peering Open frames, without receiving a Mesh Peering Confirm frame. |
| 57 | MESH-CONFIRM-TIMEOUT | The confirmTimer for the mesh peering instance times out. |
| 58 | MESH-INVALID-GTK | The mesh STA fails to unwrap the GTK or the values in the wrapped contents do not match |
| 59 | MESH-INCONSISTENT-PARAMETERS | The mesh STA receives inconsistent information about the mesh parameters between mesh peering Management frames |
| 60 | MESH-INVALID-SECURITY-CAPABILITY | The mesh STA fails the authenticated mesh peering exchange because due to failure in selecting either the pairwise ciphersuite or group ciphersuite |
| 61 | MESH-PATH-ERROR-NO-PROXY- INFORMATION | The mesh STA does not have proxy information for this external destination. |
| 62 | MESH-PATH-ERROR-NO-FORWARDING- INFORMATION | The mesh STA does not have forwarding information for this destination. |
| 63 | MESH-PATH-ERROR-DESTINATION-UNREACHABLE | The mesh STA determines that the link to the next hop of an active path in its forwarding information is no longer usable. |
| 64 | MAC-ADDRESS-ALREADY-EXISTS-IN-MBSS | The Deauthentication frame was sent because the MAC address of the STA already exists in the mesh BSS. See 11.3.6. |
| 65 | MESH-CHANNEL-SWITCH-REGULATORY- REQUIREMENTS | The mesh STA performs channel switch to meet regulatory requirements. |

Table 9-45—Reason codes (continued)

| Reason code | Name | Meaning |
|--------------------|---------------------------------|--|
| 66 | MESH-CHANNEL-SWITCH-UNSPECIFIED | The mesh STA performs channel switching with unspecified reason. |
| 67–65 535 | | Reserved |

9.4.1.8 AID field

In infrastructure BSS operation, the AID field contains a value assigned by an AP or PCP during association. The field represents the 16-bit ID of a STA. In mesh BSS operation, the AID field is a value that represents the 16-bit ID of a neighbor peer mesh STA. An AID value is assigned by a mesh STA that receives and accepts a Mesh Peering Open frame to the transmitter of the Mesh Peering Open frame during the mesh peering establishment process (see 14.3.1). The length of the AID field is 2 octets. The AID field is illustrated in Figure 9-73.

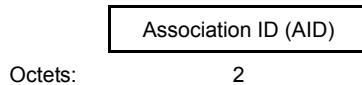

Figure 9-73—AID field

A non-DMG STA assigns the value of the AID in the range of 1 to 2007; the 5 MSBs of the AID field are reserved.

A DMG STA assigns the value of the AID field in the range 1 to 254. The value 255 is reserved as the broadcast AID, and the value 0 corresponds to the AP or PCP. The 8 MSBs of the AID field are reserved.

9.4.1.9 Status Code field

The Status Code field is used in a response Management frame to indicate the success or failure of a requested operation. The length of the Status Code field is 2 octets. The Status Code field is illustrated in Figure 9-74.

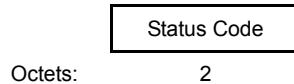

Figure 9-74—Status Code field

If an operation is successful, then the status code is set to SUCCESS (0). A status code of SUCCESS_POWER_SAVE_MODE also indicates a successful operation. If an operation results in failure, the status code indicates a failure cause. The failure cause codes are defined in Table 9-46.

Table 9-46—Status codes

| Status code | Name | Meaning |
|-------------|--|--|
| 0 | SUCCESS | Successful. |
| 1 | REFUSED, REFUSED_REASON_UNSPECIFIED | Unspecified failure. |
| 2 | TDLS_REJECTED_ALTERNATIVE_PROVIDED | TDLS wakeup schedule rejected but alternative schedule provided. |
| 3 | TDLS_REJECTED | TDLS wakeup schedule rejected. |
| 4 | | Reserved. |
| 5 | SECURITY_DISABLED | Security disabled. |
| 6 | UNACCEPTABLE_LIFETIME | Unacceptable lifetime. |
| 7 | NOT_IN_SAME_BSS | Not in same BSS. |
| 8–9 | | Reserved. |
| 10 | REFUSED_CAPABILITIES_MISMATCH | Cannot support all requested capabilities in the Capability Information field. |
| 11 | DENIED_NO_ASSOCIATION_EXISTS | Reassociation denied due to inability to confirm that association exists. |
| 12 | DENIED_OTHER_REASON | Association denied due to reason outside the scope of this standard. |
| 13 | UNSUPPORTED_AUTH_ALGORITHM | Responding STA does not support the specified authentication algorithm. |
| 14 | TRANSACTION_SEQUENCE_ERROR | Received an Authentication frame with authentication transaction sequence number out of expected sequence. |
| 15 | CHALLENGE_FAILURE | Authentication rejected because of challenge failure. |
| 16 | REJECTED_SEQUENCE_TIMEOUT | Authentication rejected due to timeout waiting for next frame in sequence. |
| 17 | DENIED_NO_MORE_STAS | Association denied because AP is unable to handle additional associated STAs. |
| 18 | REFUSED_BASIC_RATES_MISMATCH | Association denied due to requesting STA not supporting all of the data rates in the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter, or the Basic VHT-MCS and NSS Set field in the VHT Operation parameter. |
| 19 | DENIED_NO_SHORT_PREAMBLE_SUPPORT | Association denied due to requesting STA not supporting the short preamble option. |
| 20 | | Reserved. |
| 21 | | Reserved. |
| 22 | REJECTED_SPECTRUM_MANAGEMENT_REQUIRED | Association request rejected because Spectrum Management capability is required. |
| 23 | REJECTED_BAD_POWER_CAPABILITY | Association request rejected because the information in the Power Capability element is unacceptable. |
| 24 | REJECTED_BAD_SUPPORTED_CHANNELS | Association request rejected because the information in the Supported Channels element is unacceptable. |
| 25 | DENIED_NO_SHORT_SLOT_TIME_SUPPORT | Association denied due to requesting STA not supporting the Short Slot Time option. |

Table 9-46—Status codes (*continued*)

| Status code | Name | Meaning |
|-------------|------------------------------------|---|
| 26 | | Reserved. |
| 27 | DENIED_NO_HT_SUPPORT | Association denied because the requesting STA does not support HT features. |
| 28 | R0KH_UNREACHABLE | R0KH unreachable. |
| 29 | DENIED_PCO_TIME_NOT_SUPPORTED | Association denied because the requesting STA does not support the phased coexistence operation (PCO) transition time required by the AP. |
| 30 | REFUSED_TEMPORARILY | Association request rejected temporarily; try again later. |
| 31 | ROBUST_MANAGEMENT_POLICY_VIOLATION | Robust management frame policy violation. |
| 32 | UNSPECIFIED_QOS_FAILURE | Unspecified, QoS-related failure. |
| 33 | DENIED_INSUFFICIENT_BANDWIDTH | Association denied because QoS AP or PCP has insufficient bandwidth to handle another QoS STA. |
| 34 | DENIED_POOR_CHANNEL CONDITIONS | Association denied due to excessive frame loss rates and/or poor conditions on current operating channel. |
| 35 | DENIED_QOS_NOT_SUPPORTED | Association (with QoS BSS) denied because the requesting STA does not support the QoS facility. |
| 36 | | Reserved. |
| 37 | REQUEST_DECLINED | The request has been declined. |
| 38 | INVALID_PARAMETERS | The request has not been successful as one or more parameters have invalid values. |
| 39 | REJECTED_WITH_SUGGESTED_CHANGES | The allocation or TS has not been created because the request cannot be honored; however, a suggested TSPEC/DMG TSPEC is provided so that the initiating STA can attempt to set another allocation or TS with the suggested changes to the TSPEC/DMG TSPEC. |
| 40 | STATUS_INVALID_ELEMENT | Invalid element, i.e., an element defined in this standard for which the content does not meet the specifications in Clause 9. |
| 41 | STATUS_INVALID_GROUP_CIPHER | Invalid group cipher. |
| 42 | STATUS_INVALID_PAIRWISE_CIPHER | Invalid pairwise cipher. |
| 43 | STATUS_INVALID_AKMP | Invalid AKMP. |
| 44 | UNSUPPORTED_RSNE_VERSION | Unsupported RSNE version. |
| 45 | INVALID_RSNE_CAPABILITIES | Invalid RSNE capabilities. |
| 46 | STATUS_CIPHER_OUT_OF_POLICY | Cipher suite rejected because of security policy. |
| 47 | REJECTED_FOR_DELAY_PERIOD | The TS or allocation has not been created; however, the HC or PCP might be capable of creating a TS or allocation, in response to a request, after the time indicated in the TS Delay element. |
| 48 | DLS_NOT_ALLOWED | Direct link is not allowed in the BSS by policy. |
| 49 | NOT_PRESENT | The Destination STA is not present within this BSS. |

Table 9-46—Status codes (*continued*)

| Status code | Name | Meaning |
|-------------|--|---|
| 50 | NOT_QOS_STA | The Destination STA is not a QoS STA. |
| 51 | DENIED_LISTEN_INTERVAL_TOO_LARGE | Association denied because the listen interval is too large. |
| 52 | STATUS_INVALID_FT_ACTION_FRAME_COUNT | Invalid FT Action frame count. |
| 53 | STATUS_INVALID_PMKID | Invalid pairwise master key identifier (PMKID). |
| 54 | STATUS_INVALID_MDE | Invalid MDE. |
| 55 | STATUS_INVALID_FTE | Invalid FTE. |
| 56 | REQUESTED_TCLAS_NOT_SUPPORTED | Requested TCLAS processing is not supported by the AP or PCP. |
| 57 | INSUFFICIENT_TCLAS_PROCESSING_RESOURCES | The AP or PCP has insufficient TCLAS processing resources to satisfy the request. |
| 58 | TRY_ANOTHER_BSS | The TS has not been created because the request cannot be honored; however, the HC or PCP suggests that the STA transition to a different BSS to set up the TS. |
| 59 | GASADVERTISEMENT_PROTOCOL_NOT_SUPPORTED | GAS Advertisement Protocol not supported. |
| 60 | NO_OUTSTANDING_GAS_REQUEST | No outstanding GAS request. |
| 61 | GAS_RESPONSE_NOT_RECEIVED_FROM_SERVER | GAS Response not received from the Advertisement Server. |
| 62 | GAS_QUERY_TIMEOUT | STA timed out waiting for GAS Query Response. |
| 63 | GAS_QUERY_RESPONSE_TOO_LARGE | GAS Response is larger than query response length limit. |
| 64 | REJECTED_HOME_WITH_SUGGESTED_CHANGES | Request refused because home network does not support request. |
| 65 | SERVER_UNREACHABLE | Advertisement Server in the network is not currently reachable. |
| 66 | | Reserved. |
| 67 | REJECTED_FOR_SSP_PERMISSIONS | Request refused due to permissions received via SSPN interface. |
| 68 | REFUSED_UNAUTHENTICATED_ACCESS_NOT_SUPPORTED | Request refused because the AP or PCP does not support unauthenticated access. |
| 69-71 | | Reserved. |
| 72 | INVALID_RSNE | Invalid contents of RSNE. |
| 73 | U_APDSDCOEXISTANCE_NOT_SUPPORTED | U-APSD coexistence is not supported. |
| 74 | U_APDSDCOEX_MODE_NOT_SUPPORTED | Requested U-APSD coexistence mode is not supported. |
| 75 | BAD_INTERVAL_WITH_U_APSCOEX | Requested Interval/Duration value cannot be supported with U-APSD coexistence. |
| 76 | ANTI_CLOGGING_TOKEN_REQUIRED | Authentication is rejected because an Anti-Clogging Token is required. |

Table 9-46—Status codes (*continued*)

| Status code | Name | Meaning |
|-------------|---------------------------------------|---|
| 77 | UNSUPPORTEDFINITECYCLICGROUP | Authentication is rejected because the offered finite cyclic group is not supported. |
| 78 | CANNOTFINDALTERNATIVETBTT | The TBTT adjustment request has not been successful because the STA could not find an alternative TBTT. |
| 79 | TRANSMISSIONFAILURE | Transmission failure. |
| 80 | REQUESTEDTCLASNOTSUPPORTED | Requested TCLAS Not Supported. |
| 81 | TCLASRESOURCESEXHAUSTED | TCLAS Resources Exhausted. |
| 82 | REJECTEDWITHSUGGESTEDBSSTRANSITION | Rejected with Suggested BSS transition. |
| 83 | REJECTWITHSCHEDULE | Reject with recommended schedule. |
| 84 | REJECTNOWAKEUPSPECIFIED | Reject because no wakeup schedule specified. |
| 85 | SUCCESSPOWERSAVEMODE | Success, the destination STA is in power save mode. |
| 86 | PENDINGADMITTINGFSTSESSION | FST pending, in process of admitting FST session. |
| 87 | PERFORMINGFSTNOW | Performing FST now. |
| 88 | PENDINGGAPINBAWINDOW | FST pending, gap(s) in block ack window. |
| 89 | REJECTUPIIDSETTING | Reject because of U-PID setting. |
| 90–91 | | Reserved. |
| 92 | REFUSEDEXTERNALREASON | (Re)Association refused for some external reason. |
| 93 | REFUSEDAPOUTOFMEMORY | (Re)Association refused because of memory limits at the AP. |
| 94 | REJECTEDEMERGENCYSERVICESNOTSUPPORTED | (Re)Association refused because emergency services are not supported at the AP. |
| 95 | QUERYRESPONSEOUTSTANDING | GAS query response not yet received. |
| 96 | REJECTDSEBAND | Reject since the request is for transition to a frequency band subject to DSE procedures and FST Initiator is a dependent STA. |
| 97 | TCLASPROCESSINGTERMINATED | Requested TCLAS processing has been terminated by the AP. |
| 98 | TSCHEDULECONFLICT | The TS schedule conflicts with an existing schedule; an alternative schedule is provided. |
| 99 | DENIEDWITHSUGGESTEDBANDCHANNEL | The association has been denied; however, one or more Multi-band elements are included that can be used by the receiving STA to join the BSS. |
| 100 | MCCAOPRESERVATIONCONFLICT | The request failed due to a reservation conflict. |
| 101 | MAFLIMITEXCEEDED | The request failed due to exceeded MAF limit. |
| 102 | MCCATRACKLIMITEXCEEDED | The request failed due to exceeded MCCA track limit. |
| 103 | DENIEDDUETO SPECTRUMMANAGEMENT | Association denied because the information in the Spectrum Management field is unacceptable. |

Table 9-46—Status codes (continued)

| Status code | Name | Meaning |
|-------------|---------------------------------|--|
| 104 | DENIED_VHT_NOT_SUPPORTED | Association denied because the requesting STA does not support VHT features. |
| 105 | ENABLEMENT DENIED | Enablement denied. |
| 106 | RESTRICTION FROM AUTHORIZED GDB | Enablement denied due to restriction from an authorized GDB. |
| 107 | AUTHORIZATION DEENABLED | Authorization deenabled. |
| 108–65 535 | | Reserved. |

9.4.1.10 Timestamp field

This field represents the value of the timing synchronization function (TSF) timer (see 11.1 and 11.22) of a frame’s source. The length of the Timestamp field is 8 octets. The Timestamp field is illustrated in Figure 9-75.

Figure 9-75—Timestamp field

9.4.1.11 Action field

The Action field provides a mechanism for specifying extended management actions. The format of the Action field is shown in Figure 9-76.

Figure 9-76—Action field

The Category field is set to one of the nonreserved values shown in the “Code” column of Table 9-47. Action frames of a given category are referred to as *<category name> Action frames*. For example, frames in the QoS category are called *QoS Action frames*.

The Action Details field contains the details of the action. The details of the actions allowed in each category are described in the appropriate subclause referenced in Table 9-47.

Table 9-47—Category values

| Code | Meaning | See subclause | Robust | Group addressed privacy |
|------|---------------------|---------------|--------|-------------------------|
| 0 | Spectrum Management | 9.6.2 | Yes | No |
| 1 | QoS | 9.6.3 | Yes | No |
| 2 | DLS | 9.6.4 | Yes | No |

Table 9-47—Category values (continued)

| Code | Meaning | See subclause | Robust | Group addressed privacy |
|-------------|--|----------------------|-----------------|--------------------------------|
| 3 | Block Ack | 9.6.5 | Yes | No |
| 4 | Public | 9.6.8 | No | No |
| 5 | Radio Measurement | 9.6.7 | See NOTE 1 | No |
| 6 | Fast BSS Transition | 9.6.9 | Yes | No |
| 7 | HT | 9.6.12 | No | No |
| 8 | SA Query | 9.6.10 | Yes | No |
| 9 | Protected Dual of Public Action | 9.6.11 | Yes | No |
| 10 | WNM | 9.6.14 | Yes | No |
| 11 | Unprotected WNM | 9.6.15 | No | No |
| 12 | TDLS | 9.6.13 | — See NOTE 2 | No |
| 13 | Mesh | 9.6.17 | Yes | Yes |
| 14 | Multihop | 9.6.18 | Yes | Yes |
| 15 | Self-protected | 9.6.16 | No | No |
| 16 | DMG | 9.6.20 | Yes | No |
| 17 | Reserved (used by the Wi-Fi Alliance® ^a) | — | — | — |
| 18 | Fast Session Transfer | 9.6.21 | Yes | No |
| 19 | Robust AV Streaming | 9.6.19 | Yes | No |
| 20 | Unprotected DMG | 9.6.22 | No | No |
| 21 | VHT | 9.6.23 | No | No |
| 21–125 | Reserved | — | — | — |
| 126 | Vendor-specific Protected | 9.6.6 | Yes | No |
| 127 | Vendor-specific | 9.6.6 | No | No |
| 128–255 | Error | — | — | — |

NOTE 1—Radio Measurement frames are robust, except for Link Measurement Request and Link Measurement Report frames in a DMG BSS.

NOTE 2—TDLS Action fields are always transported encapsulated within a Data frame (see 11.23.1), so the question of whether these frames are robust is not applicable.

^aSee <http://www.wi-fi.org>.

9.4.1.12 Dialog Token field

The Dialog Token field is used for matching action responses with action requests when there are multiple, concurrent action requests. The length of the Dialog Token field is 1 octet. The Dialog Token field is illustrated in Figure 9-77. See 10.27.5.

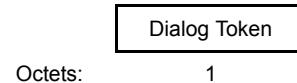

Figure 9-77—Dialog Token fixed field

9.4.1.13 DLS Timeout Value field

The DLS Timeout Value field is used in the DLS Request frame to indicate the timeout value for the direct link. The length of the DLS Timeout Value field is 2 octets. The DLS Timeout Value field is illustrated in Figure 9-78. See 11.7.2.4.

Figure 9-78—DLS Timeout Value fixed field

9.4.1.14 Block Ack Parameter Set field

The Block Ack Parameter Set field is used in ADDBA Request and ADDBA Response frames to signal the parameters for setting up a Block Ack. The length of the Block Ack Parameter Set field is 2 octets. The Block Ack Parameter Set field is illustrated in Figure 9-79.

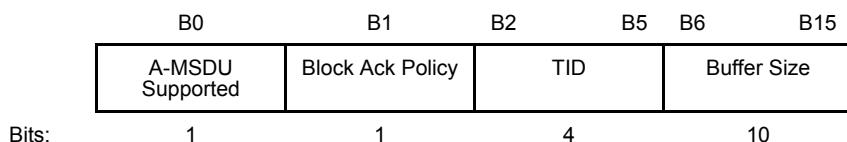

Figure 9-79—Block Ack Parameter Set fixed field

The A-MSDU Supported subfield is set to 1 by a STA to indicate that it supports an A-MSDU carried in a QoS Data frame sent under this block ack agreement. It is set to 0 otherwise.

The Block Ack Policy subfield is set to 1 for Immediate Block Ack and 0 for Delayed Block Ack.

The TID subfield contains the value of the TC or TS for which the BlockAck frame is being requested.

The Buffer Size subfield indicates the number of buffers available for this particular TID.²² When the A-MSDU Supported field is equal to 0 as indicated by the STA transmitting the Block Ack Parameter Set field, each buffer is capable of holding a number of octets equal to the maximum size of an MSDU. When the A-MSDU Supported field is equal to 1 as indicated by the STA, each buffer is capable of holding a number of octets equal to the maximum size of an A-MSDU that is supported by the STA.

²²For buffer size, the recipient of data advertises a single scalar number that is the number of fragment buffers of the maximum MSDU or A-MSDU size (indicated by the A-MSDU Supported field) available for the block ack agreement that is being negotiated. Every buffered MPDU that is associated with this block ack agreement consumes one of these buffers regardless of whether the frame contains a whole MSDU (or a fragment thereof) or an A-MSDU. For example, ten maximum-size unfragmented MSDUs consumes the same amount of buffer space at the recipient as ten smaller fragments of a single MSDU of maximum size.

In an ADDBA Request frame, the Buffer Size subfield provides guidance for the frame receiver to decide its reordering buffer size. If the Buffer Size subfield is equal to 0, it implies that the originator of the block ack has no information to specify its value.

In an ADDBA Response frame, when the Status Code field is equal to SUCCESS, the Buffer Size subfield is set to a value of at least 1.

9.4.1.15 Block Ack Timeout Value field

The Block Ack Timeout Value field is used in the ADDBA Request and Response frames to indicate the timeout value for Block Ack. The length of the Block Ack Timeout Value field is 2 octets. The Block Ack Timeout Value field is illustrated in Figure 9-80.

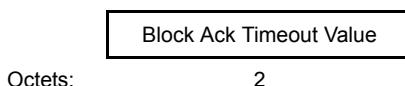

Figure 9-80—Block Ack Timeout Value fixed field

The Block Ack Timeout Value field contains the duration, in TUs, after which the block ack setup is terminated, if there are no frame exchanges (see 11.5.4) within this duration using this block ack agreement. A value of 0 disables the timeout.

9.4.1.16 DELBA Parameter Set field

The DELBA Parameter Set field is used in a DELBA frame to terminate an already set up Block Ack. The length of the DELBA Parameter Set field is 2 octets. The DELBA Parameter Set field is illustrated in Figure 9-81.

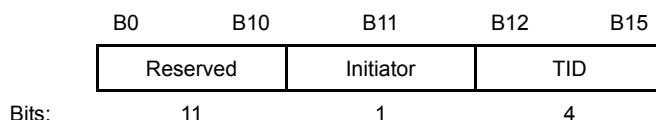

Figure 9-81—DELBA Parameter Set field

The Initiator subfield indicates if the originator or the recipient of the data is sending this frame. It is set to 1 to indicate the originator and is set to 0 to indicate the recipient. The TID subfield indicates the TSID or the UP for which the block ack has been originally set up.

9.4.1.17 QoS Info field

The QoS Info field is 1 octet in length and contains capability information bits. The contents of the field are dependent on whether the STA is contained within an AP.

The format of the QoS Info field, when sent by the AP, is defined in Figure 9-82.

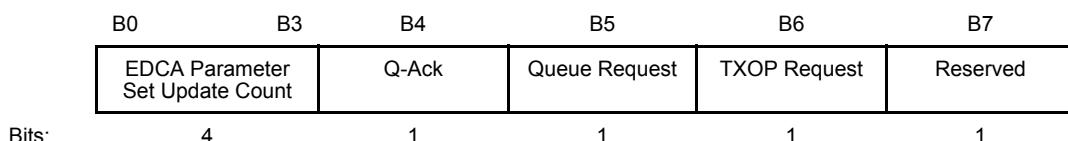

Figure 9-82—QoS Info field when sent by an AP

The EDCA Parameter Set Update Count subfield is described in 10.2.4.2.

APs set the Q-Ack subfield to 1 when `dot11QAckOptionImplemented` is true and set it to 0 otherwise.

APs set the Queue Request subfield to 1 if they can process a nonzero Queue Size subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

APs set the TXOP Request subfield to 1 if they can process a nonzero TXOP Duration Requested subfield in the QoS Control field in QoS Data frames and set it to 0 otherwise.

The format of the QoS Info field, when sent by the non-AP STA, is defined in Figure 9-83.

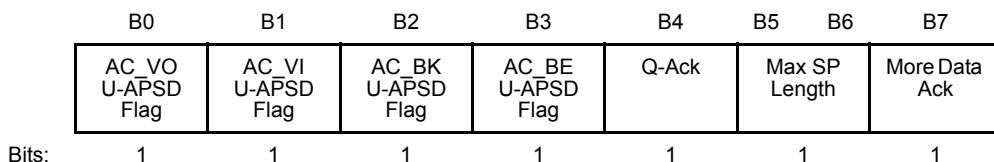

Figure 9-83—QoS Info field when set by a non-AP STA

Each of the ACs U-APSD Flag subfields is 1 bit in length and set to 1 in (Re)Association Request frames to indicate that the corresponding AC (AC_BE, AC_BK, AC_VI, or AC_VO) is both trigger-enabled and delivery-enabled. It is set to 0 in (Re)Association Request frames to indicate that the corresponding AC is neither trigger-enabled nor delivery-enabled. A TSPEC as described in 11.2.3.5 is to be used to make a particular AC exclusively either trigger-enabled or delivery-enabled. These subfields are set to 0 when the APSD subfield in the Capability Information field received from the AP with which the non-AP STA is associating is equal to 0.

Non-AP STAs set the Q-Ack subfield to 1 when `dot11QAckOptionImplemented` is true and set it to 0 otherwise.

The Max SP Length subfield is 2 bits in length and indicates the maximum number of buffered BUs the STA is prepared to receive during any SP triggered by the STA. This subfield is reserved when the APSD subfield in the Capability Information field is equal to 0. If the APSD subfield in the Capability Information field is equal to 1, the settings of the values in the Max SP Length subfield are defined in Table 9-48.

Table 9-48—Settings of the Max SP Length subfield

| Bit 5 | Bit 6 | Usage |
|-------|-------|--|
| 0 | 0 | The STA is prepared to receive all buffered BUs. |
| 1 | 0 | The STA is prepared to receive a maximum of two BUs per SP. |
| 0 | 1 | The STA is prepared to receive a maximum of four BUs per SP. |
| 1 | 1 | The STA is prepared to receive a maximum of six BUs per SP. |

Non-AP STAs set the More Data Ack subfield to 1 to indicate that they can process Ack frames with the More Data bit in the Frame Control field equal to 1 and remain in the awake state. Non-AP STAs set the More Data Ack subfield to 0 otherwise. For APs, the More Data Ack subfield is reserved.

9.4.1.18 Measurement Pilot Interval field

The Measurement Pilot Interval field represents the number of time units (TUs) between target measurement pilot transmission times (TMPTTs). The length of the Measurement Pilot Interval field is 1 octet. The Measurement Pilot Interval field is illustrated in Figure 9-84.

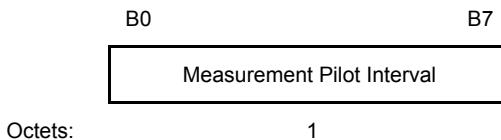

Figure 9-84—Measurement Pilot Interval fixed field

9.4.1.19 Max Transmit Power field

The Max Transmit Power field is a 2s complement signed integer and is 1 octet in length, providing an upper limit, in units of dBm, on the transmit power as measured at the output of the antenna connector to be used by that AP on the current channel. See 11.11.13. The Max Transmit Power field is illustrated in Figure 9-85.

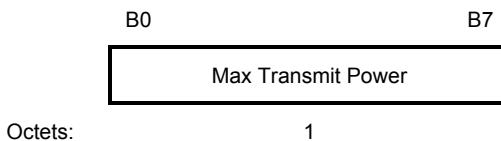

Figure 9-85—Max Transmit Power field

9.4.1.20 Transmit Power Used field

The Transmit Power Used field is a 2s complement signed integer and is 1 octet in length. It is less than or equal to the Max Transmit Power and indicates the actual power used as measured at the output of the antenna connector, in units of dBm, by a STA when transmitting the frame containing the Transmit Power Used field. The Transmit Power Used value is determined any time prior to sending the frame in which it is contained and has a tolerance of ± 5 dB. The Transmit Power Used field is illustrated in Figure 9-86.

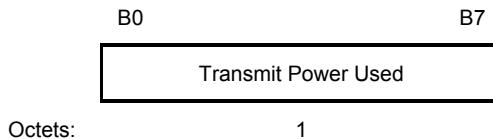

Figure 9-86—Transmit Power Used field

9.4.1.21 Channel Width field

The Channel Width field is used in a Notify Channel Width frame (see 9.6.12.2) to indicate the channel width on which the sending STA is able to receive. The length of the field is 1 octet. The Channel Width field is illustrated in Figure 9-87.

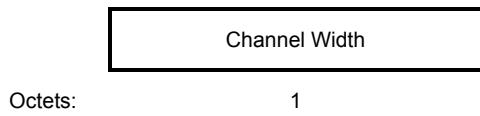

Figure 9-87—Channel Width fixed field

If a STA transmitting or receiving this field is operating in an operating class that includes a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then the values of the Channel Width field are defined in Table 9-49. If a STA transmitting or receiving this field is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E, then this field is reserved.

Table 9-49—Settings of the Channel Width field

| Value | Meaning |
|-------|---|
| 0 | 20 MHz channel width |
| 1 | Any channel width in the STA's Supported Channel Width Set subfield |
| 2–255 | Reserved |

9.4.1.22 Operating Class and Channel field

The Operating Class and Channel field is used in the Location Indication Channels subelement of the Location Parameters element and in the Channel Usage element. The Operating Class and Channel field indicates an operating class and channel. The format of the field is defined in Figure 9-88.

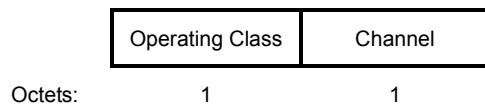

Figure 9-88—Operating Class and Channel field

The Operating Class field indicates an operating class value as defined in Annex E. The operating class is interpreted in the context of the country specified in the Beacon frame.

The Channel field indicates a channel number, which is interpreted in the context of the indicated operating class. Channel numbers are defined in Annex E.

9.4.1.23 SM Power Control field

The SM Power Control field is used in an SM Power Save frame (see 9.6.12.3) by a STA to communicate changes in its SM power-saving state. The field is 1 octet in length and is illustrated in Figure 9-89.

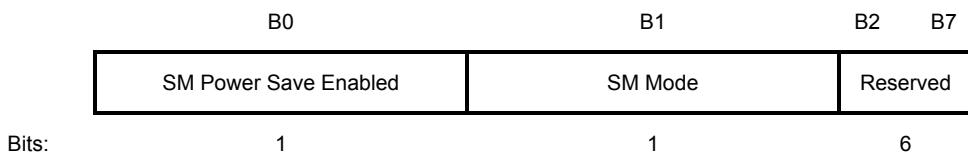

Figure 9-89—SM Power Control fixed field

The SM Power Save Enabled subfield indicates whether SM power saving is enabled at the STA. A value of 1 indicates enabled, and a value of 0 indicates disabled.

The SM Mode subfield indicates the mode of operation. A value of 1 indicates dynamic SM power save mode, a value of 0 indicates static SM power save mode. The modes are described in 11.2.6.

9.4.1.24 PCO Phase Control field

The PCO Phase Control field is used in a Set PCO Phase frame (see 9.6.12.5) to indicate the phase of PCO operation (see 11.17). The length of the field is 1 octet. The PCO Phase Control field is illustrated in Figure 9-90.

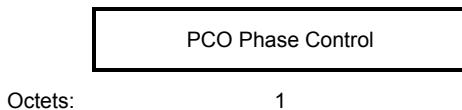

Figure 9-90—PCO Phase Control fixed field

The PCO Phase Control field indicates the current PCO phase. The values of the PCO Phase Control field are defined in Table 9-50.

Table 9-50—Settings of the PCO Phase Control field

| Value | Meaning |
|-------|--------------|
| 0 | 20 MHz phase |
| 1 | 40 MHz phase |
| 2–255 | Reserved |

9.4.1.25 PSMP Parameter Set field

The PSMP Parameter Set field is used in a PSMP frame (see 9.6.12.4) to define the number of PSMP STA Info fields held in the PSMP frame, to indicate whether the PSMP sequence is to be followed by another PSMP sequence, and to indicate the duration of the PSMP sequence.

The PSMP Parameter Set field is 2 octets in length. The structure of the PSMP Parameter Set field is defined in Figure 9-91.

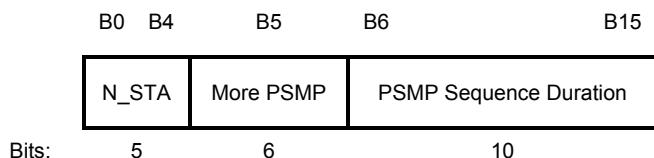

Figure 9-91—PSMP Parameter Set fixed field

The N_STA subfield indicates the number of STA Info fields present in the PSMP frame that contains the PSMP Parameter Set field.

The More PSMP subfield, when set to 1, indicates that the current PSMP sequence will be followed by another PSMP sequence. A value of 0 indicates that there will be no PSMP sequence following the current PSMP sequence.

The PSMP Sequence Duration subfield indicates the duration of the current PSMP sequence that is described by the PSMP frame, in units of 8 μ s, relative to the end of the PSMP frame. Therefore, this field can describe a PSMP sequence with a duration of up to 8.184 ms. The next PSMP sequence within the current PSMP burst starts a SIFS after the indicated duration.

9.4.1.26 PSMP STA Info field

The PSMP STA Info field is used by the PSMP frame (see 9.6.12.4). The PSMP STA Info field defines the allocation of time to the downlink (PSMP-DTT) and/or uplink (PSMP-UTT) associated with a single RA. There are two variants of the structure for the individually addressed and group addressed cases. The length of the PSMP STA Info field is 8 octets.

The structure of the STA Info field is defined in Figure 9-92 and Figure 9-93.

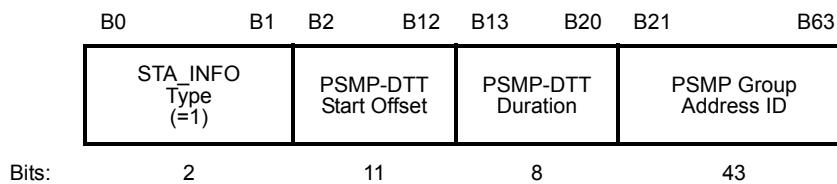

Figure 9-92—PSMP STA Info fixed field (group addressed)

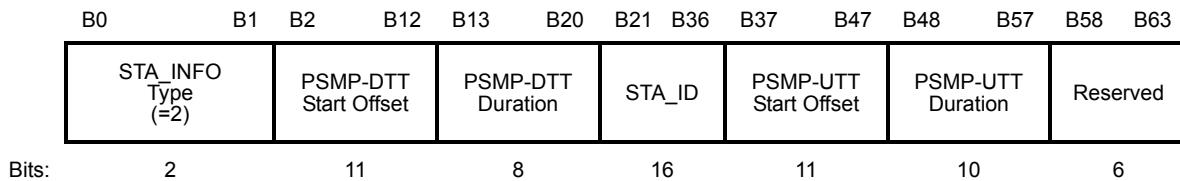

Figure 9-93—PSMP STA Info fixed field (individually addressed)

The STA_INFO Type subfield indicates the format of the remainder of the structure. When the STA_INFO Type subfield is equal to 1, the PSMP STA Info field is structured as defined in Figure 9-92 and supports the transmission of group addressed data by the AP. When the STA_INFO Type subfield is equal to 2, the PSMP STA Info field is structured as defined in Figure 9-93 and supports the exchange of data with a single STA. STA_INFO Type subfield values 0 and 3 are reserved.

The PSMP-DTT Start Offset subfield indicates the start of the PSMP-DTT for the destination identified by the PSMP STA Info field, relative to the end of the PSMP frame, in units of 4 μ s. This subfield locates the start of the first PPDU containing downlink data for this destination.

The PSMP-DTT Duration subfield indicates the duration of the PSMP-DTT for the destination identified by the PSMP STA Info field, in units of 16 μ s. This subfield locates the end of the last PPDU containing downlink data for this destination relative to the PSMP-DTT start offset.

If no PSMP-DTT is scheduled for a STA, but a PSMP-UTT is scheduled for that STA, the PSMP-DTT Duration subfield is set to 0, and the PSMP-DTT Start Offset subfield is reserved.

The PSMP Group Address ID (B21 to B63) subfield contains the 43 least significant bits (LSBs) of a 48 bit MAC address. Use of this subfield is described in 10.29.2.8. B63 contains the LSB of the group address (considering the Individual/Group bit to be the most significant bit (MSB)).

The STA_ID subfield contains the AID of the STA to which the PSMP STA Info field is directed.

The PSMP-UTT Start Offset subfield indicates the start of the PSMP-UTT. The offset is specified relative to the end of the PSMP frame. It is specified in units of 4 μ s. The first PSMP-UTT is scheduled to begin after a SIFS from the end of the last PSMP-DTT described in the PSMP.

The PSMP-UTT Duration subfield indicates the maximum length of a PSMP-UTT for a STA. PSMP-UTT duration is specified in units of 4 μ s. All transmissions by the STA within the current PSMP sequence lie within the indicated PSMP-UTT.

If no PSMP-UTT is scheduled for a STA, but a PSMP-DTT is scheduled for that STA, the PSMP-UTT Start Offset and PSMP-UTT Duration subfields are both set to 0.

9.4.1.27 MIMO Control field

The MIMO Control field is used to manage the exchange of MIMO channel state or transmit beamforming feedback information. It is used in the CSI (see 9.6.12.6), Noncompressed Beamforming (see 9.6.12.7), and Compressed Beamforming (see 9.6.12.8) frames.

The MIMO Control field is 6 octets in length and is defined in Figure 9-94.

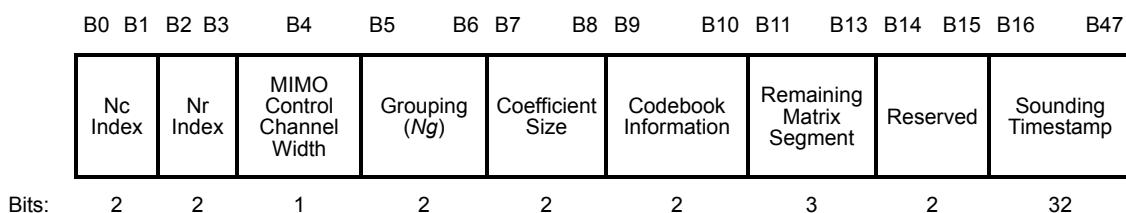

Figure 9-94—MIMO Control field

The subfields of the MIMO Control field are defined in Table 9-51.

Table 9-51—Subfields of the MIMO Control field

| Subfield | Description |
|----------------------------|--|
| Nc Index | Indicates the number of columns in a matrix minus one: Set to 0 for $Nc = 1$ Set to 1 for $Nc = 2$ Set to 2 for $Nc = 3$ Set to 3 for $Nc = 4$ |
| Nr Index | Indicates the number of rows in a matrix minus one: Set to 0 for $Nr = 1$ Set to 1 for $Nr = 2$ Set to 2 for $Nr = 3$ Set to 3 for $Nr = 4$ |
| MIMO Control Channel Width | Indicates the width of the channel in which a measurement was made: Set to 0 for 20 MHz Set to 1 for 40 MHz |
| Grouping (Ng) | Number of carriers grouped into one: Set to 0 for $Ng = 1$ (No grouping) Set to 1 for $Ng = 2$ Set to 2 for $Ng = 4$ The value 3 is reserved |

Table 9-51—Subfields of the MIMO Control field (continued)

| Subfield | Description |
|--------------------------|--|
| Coefficient Size | <p>Indicates the number of bits in the representation of the real and imaginary parts of each element in the matrix.</p> <p>For CSI feedback: Set to 0 for $Nb = 4$ Set to 1 for $Nb = 5$ Set to 2 for $Nb = 6$ Set to 3 for $Nb = 8$</p> <p>For noncompressed beamforming feedback: Set 0 for $Nb = 4$ Set 1 for $Nb = 2$ Set 2 for $Nb = 6$ Set 3 for $Nb = 8$</p> |
| Codebook Information | <p>Indicates the size of codebook entries:</p> <p>Set to 0 for 1 bit for ψ, 3 bits for ϕ Set to 1 for 2 bits for ψ, 4 bits for ϕ Set to 2 for 3 bits for ψ, 5 bits for ϕ Set to 3 for 4 bits for ψ, 6 bits for ϕ</p> |
| Remaining Matrix Segment | <p>Contains the remaining segment number for the associated measurement report. Valid range: 0 to 7. Set to 0 for the last segment of a segmented report or the only segment of an unsegmented report.</p> |
| Sounding Timestamp | <p>Contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the sounding packet that was used to generate feedback information contained in the frame.</p> |

9.4.1.28 CSI Report field

The CSI Report field is used by the CSI frame (see 9.6.12.6) to carry explicit channel state information to a transmit HT beamformer, as described in 10.32.3.

The CSI Matrix subfields in the CSI Report field shown in Table 9-52 and Table 9-53 are matrices whose elements are taken from the CHAN_MAT parameter of RXVECTOR (see Table 19-1).

Table 9-52—CSI Report field (20 MHz)

| Field | Size (bits) | Meaning |
|----------------------------|-------------------------------------|--|
| SNR in receive chain 1 | 8 | Signal-to-noise ratio in the first receive chain of the STA sending the report. |
| ... | | |
| SNR in receive chain Nr | 8 | Signal-to-noise ratio in the Nr 'th receive chain of the STA sending the report. |
| CSI Matrix for carrier –28 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix (see Figure 9-95) |
| ... | | |

Table 9-52—CSI Report field (20 MHz) (continued)

| Field | Size (bits) | Meaning |
|---------------------------|-------------------------------------|------------|
| CSI Matrix for carrier -1 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |
| CSI Matrix for carrier 1 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |
| ... | | |
| CSI Matrix for carrier 28 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |

The structure of the field depends on the value of the MIMO Control Channel Width subfield. The CSI Report field for 20 MHz has the structure defined in Table 9-52 where

- Nb is the number of bits determined by the Coefficients Size field of the MIMO Control field
- Nc is the number of columns in a CSI matrix determined by the Nc Index field of the MIMO Control field
- Nr is the number of rows in a CSI matrix determined by the Nr Index field of the MIMO Control field

The CSI Report field for 40 MHz has the structure defined in Table 9-53.

Table 9-53—CSI Report field (40 MHz)

| Field | Size (bits) | Meaning |
|----------------------------|-------------------------------------|--|
| SNR in receive chain 1 | 8 | Signal-to-noise ratio in the first receive chain of the STA sending the report. |
| ... | | |
| SNR in receive chain Nr | 8 | Signal-to-noise ratio in the Nr 'th receive chain of the STA sending the report. |
| CSI Matrix for carrier -58 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix (see Figure 9-95) |
| ... | | |
| CSI Matrix for carrier -2 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |
| CSI Matrix for carrier 2 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |
| ... | | |
| CSI Matrix for carrier 58 | $3+2 \times Nb \times Nc \times Nr$ | CSI matrix |

The signal-to-noise ratio (SNR) values in Table 9-52 and Table 9-53 are encoded as an 8-bit 2s complement value of $4 \times (\text{SNR_average} - 22)$, where SNR_average is the decibel representation of linearly averaged values over the tones represented. This encoding covers the SNR range from -10 dB to 53.75 dB in 0.25 dB steps.

Grouping is a method that reduces the size of the CSI Report field by reporting a single value for each group of Ng adjacent subcarriers. With grouping, the size of the CSI Report field is $Nr \times 8 + Ns \times (3+2 \times Nb \times Nc \times Nr)$ bits, where the number of subcarriers sent, Ns , is a function of Ng and whether matrices for 40 MHz or 20 MHz are sent. The value of Ns and the specific carriers for which matrices are sent are shown in Table 9-54. If the size of the CSI Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

Table 9-54—Number of matrices and carrier grouping

| BW | Grouping N_g | N_s | Carriers for which matrices are sent |
|--------|----------------|-------|---|
| 20 MHz | 1 | 56 | All data and pilot carriers: -28, -27, ..., -2, -1, 1, 2, ..., 27, 28 |
| | 2 | 30 | -28, -26, -24, -22, -20, -18, -16, -14, -12, -10, -8, -6, -4, -2, -1, 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 28 |
| | 4 | 16 | -28, -24, -20, -16, -12, -8, -4, -1, 1, 5, 9, 13, 17, 21, 25, 28 |
| 40 MHz | 1 | 114 | All data and pilot carriers: -58, -57, ..., -3, -2, 2, 3, ..., 57, 58 |
| | 2 | 58 | -58, -56, -54, -52, -50, -48, -46, -44, -42, -40, -38, -36, -34, -32, -30, -28, -26, -24, -22, -20, -18, -16, -14, -12, -10, -8, -6, -4, -2, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58 |
| | 4 | 30 | -58, -54, -50, -46, -42, -38, -34, -30, -26, -22, -18, -14, -10, -6, -2, 2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58 |

The CSI matrix H_{eff} for a single carrier has the structure defined in Figure 9-95. The encoding rules for the elements of the H_{eff} matrix are given in 19.3.12.3.2.

```

For each subcarrier include
{
    Carrier Matrix Amplitude of 3 bits
    For each of Nr rows in each CSI matrix in order: (1, ..., Nr)
    {
        Include Nc complex coefficients of CSI matrix  $H_{eff}$  in order: (1, ..., Nc);
        each element of  $H_{eff}$  includes the real part of the element (Nb bits) and
        imaginary part of the element (Nb bits) in that order
    }
}

```

Figure 9-95—CSI matrix coding

When operating with a 40 MHz channel width, CSI feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

9.4.1.29 Noncompressed Beamforming Report field

The Noncompressed Beamforming Report field is used by the Noncompressed Beamforming frame to carry explicit feedback in the form of noncompressed beamforming feedback matrices V for use by a transmit HT beamformer to determine steering matrices Q , as described in 10.32.3 and 19.3.12.3.

The structure of the field is dependent on the value of the MIMO Control Channel Width subfield. The Noncompressed Beamforming Report field for 20 MHz has the structure defined in Table 9-55 where

- N_b is the number of bits determined by the Coefficients Size field of the MIMO Control field
- N_c is the number of columns in a beamforming feedback matrix determined by the N_c Index field of the MIMO Control field
- N_r is the number of rows in a beamforming feedback matrix determined by the N_r Index field of the MIMO Control field

Table 9-55—Noncompressed Beamforming Report field (20 MHz)

| Field | Size (bits) | Meaning |
|---|-----------------------------------|---|
| SNR for space-time stream 1 | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream 1. |
| ... | | |
| SNR for space-time stream N_c | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream N_c . |
| Beamforming Feedback Matrix for carrier -28 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V (see Figure 9-96) |
| ... | | |
| Beamforming Feedback Matrix for carrier -1 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |
| Beamforming Feedback Matrix for carrier 1 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix for carrier 28 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |

The Noncompressed Beamforming Report field for 40 MHz has the structure defined in Table 9-56.

Table 9-56—Noncompressed Beamforming Report field (40 MHz)

| Field | Size (bits) | Meaning |
|---|------------------------------------|---|
| SNR for space-time stream 1 | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream 1. |
| ... | | |
| SNR for space-time stream N_c | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream N_c . |
| Beamforming Feedback Matrix for carrier -58 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V (see Figure 9-96) |
| ... | | |
| Beamforming Feedback Matrix for carrier -2 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |
| Beamforming Feedback Matrix for carrier 2 | $2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix for carrier 58 | $+2 \times Nb \times Nc \times Nr$ | Beamforming feedback matrix V |

The SNR values in Table 9-55 and Table 9-56 are encoded as an 8-bit 2s complement value of $4 \times (\text{SNR_average} - 22)$, where SNR_average is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from -10 dB to 53.75 dB in 0.25 dB steps. The SNR in space-time stream i corresponds to the SNR associated with the column i of the beamforming feedback matrix V . Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix V .

Grouping is a method that reduces the size of the Noncompressed Beamforming Report field by reporting a single value for each group of Ng adjacent subcarriers. With grouping, the size of the Noncompressed Beamforming Report field is $Nc \times 8 + Ns \times (2 \times Nb \times Nc \times Nr)$ bits. The number of subcarriers sent, Ns , is a function of Ng and whether matrices for 40 MHz or 20 MHz are sent. The value of Ns and the specific carriers for which matrices are sent is shown in Table 9-54. If the size of the Noncompressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

A beamforming feedback matrix V for a single carrier has the structure defined in Figure 9-96.

```

For each subcarrier include
{
    For each of Nr rows in the
        Noncompressed beamforming feedback matrix in order: (1, ..., Nr)
    {
        Include Nc complex coefficients of the Noncompressed beamforming feedback
        matrix V in order: (1, ..., Nc); each element of V includes the real
        part of the element (Nb bits) and imaginary part of the element (Nb bits)
        in that order
    }
}

```

Figure 9-96— V matrix coding (noncompressed beamforming)

Encoding rules for elements of the V matrix are given in 19.3.12.3.5.

When operating with a 40 MHz channel width, noncompressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

9.4.1.30 Compressed Beamforming Report field

The Compressed Beamforming Report field is used by the Compressed Beamforming frame (see 9.6.12.8) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit HT beamformer to determine steering matrices Q , as described in 10.32.3 and 19.3.12.3.

The size of the Compressed Beamforming Report field depends on the values in the MIMO Control field.

The Compressed Beamforming Report field contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-57 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix V is given in 19.3.12.3.6.

Table 9-57—Order of angles in the Compressed Beamforming Report field

| Size of V ($Nr \times Nc$) | Number of angles (Na) | The order of angles in the Quantized Beamforming Feedback Matrices Information field |
|-----------------------------------|------------------------------|--|
| 2×1 | 2 | ϕ_{11}, ψ_{21} |
| 2×2 | 2 | ϕ_{11}, ψ_{21} |
| 3×1 | 4 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}$ |

Table 9-57—Order of angles in the Compressed Beamforming Report field (continued)

| Size of V ($Nr \times Nc$) | Number of angles (Na) | The order of angles in the Quantized Beamforming Feedback Matrices Information field |
|-----------------------------------|------------------------------|--|
| 3×2 | 6 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}, \phi_{22}, \psi_{32}$ |
| 3×3 | 6 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}, \phi_{22}, \psi_{32}$ |
| 4×1 | 6 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}$ |
| 4×2 | 10 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}$ |
| 4×3 | 12 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}, \phi_{33}, \psi_{43}$ |
| 4×4 | 12 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}, \phi_{33}, \psi_{43}$ |

The angles are quantized as defined in Table 9-58. All angles are transmitted LSB to MSB.

Table 9-58—Quantization of angles

| Quantized Ψ | Quantized ϕ |
|---|--|
| $\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}}$ radians where $k = 0, 1, \dots, 2^{b_\psi} - 1$ b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.27); | $\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}}$ radians where $k = 0, 1, \dots, 2^{b_\phi} - 1$ b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the MIMO Control field; see 9.4.1.27) |

The Compressed Beamforming Report field for 20 MHz has the structure defined in Table 9-59, where Na is the number of angles used for beamforming feedback matrix V (see Table 9-57).

Table 9-59—Compressed Beamforming Report field (20 MHz)

| Field | Size (bits) | Meaning |
|---|---------------------------------|--|
| SNR in space-time stream 1 | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream 1 |
| ... | | |
| SNR in space-time stream Nc | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream Nc |
| Beamforming Feedback Matrix V for carrier –28 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix V for carrier –1 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |

Table 9-59—Compressed Beamforming Report field (20 MHz) (continued)

| Field | Size (bits) | Meaning |
|--|---------------------------------|---------------------------------|
| Beamforming Feedback Matrix V for carrier 1 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix V for carrier 28 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |

The Compressed Beamforming Report field for 40 MHz has the structure defined in Table 9-60, where Na is the number of angles used for beamforming feedback matrix V (see Table 9-57).

Table 9-60—Compressed Beamforming Report field (40 MHz)

| Field | Size (bit) | Meaning |
|--|---------------------------------|---|
| SNR in space-time stream 1 | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream 1 |
| ... | | |
| SNR in space-time stream N_c | 8 | Average signal-to-noise ratio in the STA sending the report for space-time stream N_c |
| Beamforming Feedback Matrix V for carrier -58 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| Beamforming Feedback Matrix V for carrier $-58 + Ng$ | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix V for carrier -2 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| Beamforming Feedback Matrix V for carrier 2 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| Beamforming Feedback Matrix V for carrier $2 + Ng$ | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |
| ... | | |
| Beamforming Feedback Matrix V for carrier 58 | $Na \times (b_\psi + b_\phi)/2$ | Beamforming feedback matrix V |

The SNR values in Table 9-59 and Table 9-60 are encoded as an 8-bit 2s complement value of $4 \times (\text{SNR_average} - 22)$, where SNR_average is the sum of the values of SNR per tone (in decibels) divided by the number of tones represented. This encoding covers the SNR range from -10 dB to 53.75 dB in 0.25 dB steps. Each SNR value per tone in stream i (before being averaged) corresponds to the SNR associated with the column i of the beamforming feedback matrix V determined at the HT beamformee. Each SNR corresponds to the predicted SNR at the HT beamformee when the HT beamformer applies the matrix V .

Grouping is a method that reduces the size of the Compressed Beamforming Report field by reporting a single value for each group of Ng adjacent subcarriers. With grouping, the size of the Compressed Beamforming Report field is $N_c \times 8 + N_s \times (Na \times (b_\psi + b_\phi)/2)$ bits, where the number of subcarriers sent, N_s , is a function of Ng and whether matrices for 40 MHz or 20 MHz are sent. The value of N_s and the specific carriers for which matrices are sent is defined in Table 9-54. If the size of the Compressed Beamforming Report field is not an integer multiple of 8 bits, up to 7 0s are appended to the end of the report to make its size an integer multiple of 8 bits.

See Figure 9-97 and Figure 9-98 for examples of this encoding.

| Bits | b1..b5 | b6..b8 | b9..b13 | b14..b16 | ... | b441..b445 | b446..b448 |
|---|------------------|------------------|------------------|------------------|-----|-----------------|-----------------|
| Data | $\phi_{11}(-28)$ | $\psi_{21}(-28)$ | $\phi_{11}(-27)$ | $\psi_{21}(-27)$ | ... | $\phi_{11}(28)$ | $\psi_{21}(28)$ |
| Conditions: | | | | | | | |
| <ul style="list-style-type: none"> — 2×2 V — $b_\psi = 3$, $b_\phi = 5$ — No grouping — 20 MHz width — The matrix V is encoded using 8 bits per tone. | | | | | | | |

Figure 9-97—First example of Compressed Beamforming Report field encoding

| Bits | b1..b4 | b5..b8 | ... | b27..b28 | b29..b30 | b31..b34 | ... | b59..b60 | ... | b871..b874 | ... | b899..b900 |
|--|------------------|------------------|-----|------------------|------------------|------------------|-----|------------------|-----|-----------------|-----|-----------------|
| Data | $\phi_{11}(-58)$ | $\phi_{21}(-58)$ | ... | $\psi_{32}(-58)$ | $\psi_{42}(-58)$ | $\phi_{11}(-54)$ | ... | $\psi_{42}(-54)$ | ... | $\phi_{11}(58)$ | ... | $\psi_{42}(58)$ |
| Conditions: | | | | | | | | | | | | |
| <ul style="list-style-type: none"> — 4×2 V — $b_\psi = 2$, $b_\phi = 4$ — 4 tone grouping — 40 MHz width — The matrix V is encoded using 30 bits per tone. | | | | | | | | | | | | |

Figure 9-98—Second example of Compressed Beamforming Report field encoding

When operating with a 40 MHz channel width, compressed feedback with a bandwidth of 20 MHz corresponds to the tones in the primary 20 MHz channel.

9.4.1.31 Antenna Selection Indices field

The Antenna Selection Indices field is used within the Antenna Selection Indices Feedback frame to carry ASEL feedback, as described in 10.33.

The Antenna Selection Indices field is 1 octet in length and illustrated in Figure 9-99.

Figure 9-99—Antenna Selection Indices fixed field

Bits 0 to 7 in the Antenna Selection Indices field correspond to antennas with indices 0 to 7, respectively. A value of 1 in a bit indicates the corresponding antenna is selected, and the value of 0 indicates the corresponding antenna is not selected.

9.4.1.32 Organization Identifier field

The Organization Identifier field contains a public unique identifier assigned by the IEEE. The order of the Organization Identifier field is described in 9.2.2. The IEEE has assigned organizationally unique identifiers

both of 24-bit length (OUI and CID) and longer length. In the latter case specific OUI values are shared over multiple organizations, e.g., using 36-bit length identifiers (OUI-36) (see IEEE Registration Authority [B19], [B20]). The length of the Organization Identifier field (j) is the minimum number of octets required to contain the entire organizationally unique identifier (see Figure 9-100), and the first 3 octets contain the OUI or CID portion of the identifier. Thus, the Organization Identifier field is 3 octets in length if the organizationally unique identifier is an OUI, or 5 octets in length if the organizationally unique identifier is an OUI-36.

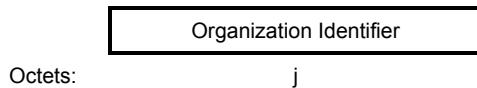

Figure 9-100—Organization Identifier field

If the length of the organizationally unique identifier is not an integer number of octets, the least significant bits of the last octet are specified by the organization identified.

NOTE—For example, for the organizationally unique identifier 0x0050C24A4, the Organization Identifier field would contain 0x0050C24A4y where y represents the four least significant bits of the fifth octet of the field. The value of y is specified by the organization whose identifier is 0x0050C24A4.

9.4.1.33 Rate Identification field

The Rate Identification field is 4 octets in length and contains the rate identification information for a frame that is not the current frame transmitted or received by a STA. This information allows services to exchange frame rate information prior to use of the frames that use the rate specified by the Rate Identification field. The contents of the field is defined in Figure 9-101.

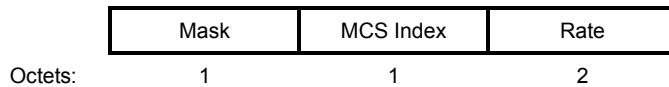

Figure 9-101—Identification field format

The Mask field specifies which other fields in the Rate Identification field are used by a STA. The format of the Mask field is shown in Figure 9-102.

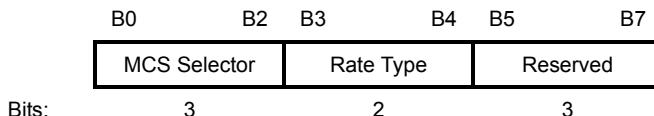

Figure 9-102—Mask field format

The MCS Selector field value 0 indicates that the MCS Index field is reserved. The MCS Selector field value 1 indicates the MCS Index field specifies an index value that is taken from Table 19-27 to Table 19-30 and Table 19-36 to Table 19-38 in 19.5. The MCS Selector field value 2 indicates the MCS Index field specifies an index value that is taken from Table 19-31 to Table 19-35 and Table 19-40 to Table 19-41 in 19.5.

The MCS Selector field value 3 indicates that the MCS Index field specifies values that are taken from Table 21-30 to Table 21-37, indicating a VHT-MCS for a 20 MHz channel width.

The MCS Selector field value 4 indicates that the MCS Index field specifies values that are taken from Table 21-38 to Table 21-45, indicating a VHT-MCS for a 40 MHz channel width.

In frames transmitted by a TVHT STA, the MCS Selector field value 4 indicates that the MCS Index field specifies values that are taken from Table 22-26 to Table 22-29, indicating a TVHT MCS for a TVHT_W channel width.

The MCS Selector field value 5 indicates that the MCS Index field specifies values that are taken from Table 21-46 to Table 21-53, indicating a VHT-MCS for an 80 MHz channel width.

In frames transmitted by a TVHT STA, the MCS Selector field value 5 indicates that the MCS Index field specifies values that are taken from Table 22-30 to Table 22-33, indicating a TVHT MCS for a TVHT_2W or TVHT_W+W channel width.

The MCS Selector field value 6 indicates that the MCS Index field specifies values that are taken from Table 21-54 to Table 21-61, indicating a VHT-MCS for a 160 MHz or 80+80 MHz channel width.

In frames transmitted by a TVHT STA, the MCS Selector field value 6 indicates that the MCS Index field specifies values that are taken from Table 22-34 to Table 22-37, indicating a TVHT MCS for a TVHT_4W or TVHT_2W+2W channel width.

The MCS Selector field value 7 is reserved.

The Rate Type field set to 0 indicates the Rate field is reserved. The Rate Type field set to 1 indicates the Rate field specifies a data rate that is in the basic rate set. The Rate Type field set to 2 indicates the Rate field specifies a data rate that is not in the basic rate set.

If MCS Selector is 1 or 2, the MCS Index field is a 1 octet unsigned integer that specifies the row index for one of the MCS parameter tables in 19.5.

If MCS Selector is 3, 4, 5, or 6, the MCS Index field format is as shown in Figure 9-103. The NSS subfield indicates the number of spatial streams, and the VHT-MCS Index Row subfield indicates a value from the “VHT-MCS Index” column of Table 21-30 to Table 21-61 in 21.5 or from the “MCS Index” column of Table 22-26 to Table 22-37 in 22.5 that corresponds to the channel width and N_{SS} values.

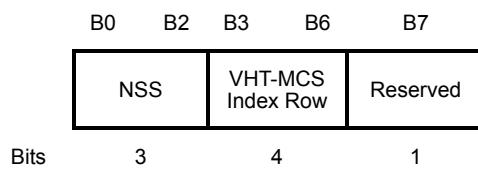

Figure 9-103—MCS Index field format when the MCS Selector field is 3, 4, 5, or 6

The Rate field contains a 2-octet unsigned integer that specifies the PHY rate in 0.5 Mb/s units.

9.4.1.34 GAS Query Response Fragment ID field

A GAS Query Fragment Response ID field is used by the STA to indicate when a GAS Query Response spans multiple MMPDUs. STAs responding to GAS request use this field to inform the requesting STA of the GAS fragment number of the transmitted frames as well as identifying the last GAS fragment of the Query Response. Requesting STAs use this field to determine if any fragments of the Query Response are missing. The maximum value permitted in the GAS Query Response Fragment ID is 127. The More GAS Fragments field is set to 1 in GAS Query Response fragments of GAS Comeback Response frames that have another GAS fragment of the current query response to follow; otherwise, it is set to 0. The format of GAS Query Response Fragment ID is shown in Figure 9-104.

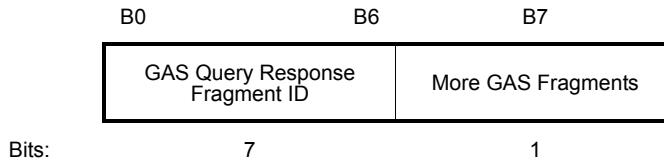

Figure 9-104—GAS Query Response Fragment ID field

9.4.1.35 Venue Info field

The Venue Info field is a 2-octet field. It contains Venue Group and Venue Type subfields. The format of Venue Info subfield is shown in Figure 9-105.

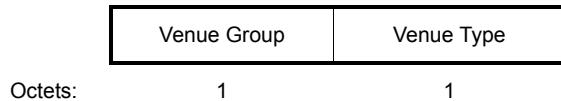

Figure 9-105—Venue Info field format

The Venue Group and Venue Type subfields are both 1-octet values selected from Table 9-61 and Table 9-62, respectively. The entries in Table 9-61 and Table 9-62 are drawn from the International Building Code’s Use and Occupancy Classifications [B48].

Table 9-61—Venue group codes and descriptions

| Venue group code | Venue group description |
|------------------|---------------------------|
| 0 | Unspecified |
| 1 | Assembly |
| 2 | Business |
| 3 | Educational |
| 4 | Factory and Industrial |
| 5 | Institutional |
| 6 | Mercantile |
| 7 | Residential |
| 8 | Storage |
| 9 | Utility and Miscellaneous |
| 10 | Vehicular |
| 11 | Outdoor |
| 12–255 | Reserved |

Table 9-62—Venue type assignments

| Venue group code | Venue type code | Venue description |
|------------------|-----------------|---|
| 0 | 0 | Unspecified |

9.4.1.36 Target Channel

The Target Channel field specifies the channel number of the target channel. The length of the Target Channel field is 1 octet. The Target Channel field is illustrated in Figure 9-106.

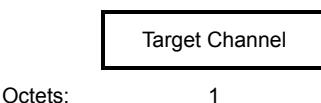

Figure 9-106—Target Channel field format

9.4.1.37 Operating Class

The Operating Class field specifies the operating class for the channel field included in the same frame. The length of the Operating Class field is 1 octet. Operating classes are defined in Annex E. The Operating Class field is illustrated in Figure 9-107.

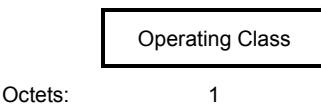

Figure 9-107—Operating Class field format

9.4.1.38 Send-Confirm field

The Send-Confirm field is used with SAE authentication as an anti-replay counter as specified in 12.4. See Figure 9-108.

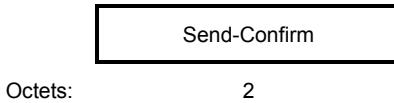

Figure 9-108—Send-Confirm field

9.4.1.39 Anti-Clogging Token field

The Anti-Clogging Token field is used with SAE authentication for denial-of-service protection as specified in 12.4. See Figure 9-109.

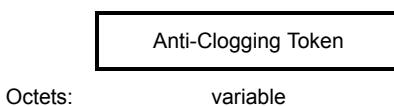

Figure 9-109—Anti-Clogging Token field

9.4.1.40 Scalar field

The Scalar field is used with SAE authentication to communicate cryptographic material as specified in 12.4. See Figure 9-110.

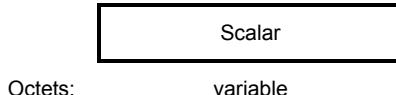

Figure 9-110—Scalar field

9.4.1.41 Finite field element (FFE) field

The FFE field is used with SAE authentication to communicate an element in a finite field as specified in 12.4. See Figure 9-111.

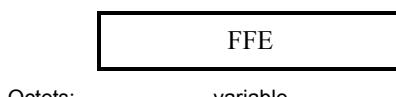

Figure 9-111—FFE field

9.4.1.42 Confirm field

The Confirm field is used with SAE authentication to authenticate and prove possession of a cryptographic key as specified in 12.4. See Figure 9-112.

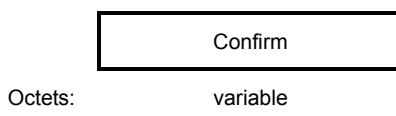

Figure 9-112—Confirm field

9.4.1.43 Finite Cyclic Group field

The Finite Cyclic Group is used in SAE to indicate which cryptographic group to use in the SAE exchange as specified in 12.4. See Figure 9-113.

Figure 9-113—Finite Cyclic Group field

9.4.1.44 TXOP Reservation field

The format of the TXOP Reservation field is shown in Figure 9-114.

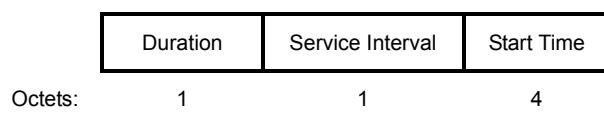

Figure 9-114—TXOP Reservation field format

The Duration subfield specifies the duration of the TXOP in units of 32 μ s.

The Service Interval subfield contains an 8-bit unsigned integer that specifies the service interval (SI) of the reservation in units of milliseconds.

The Start Time subfield is the offset from the next TBTT to the start of the first SP and indicates the anticipated start time, expressed in microseconds, of the first TXOP after the TBTT.

9.4.1.45 Relay Capable STA Info field

The format of the Relay Capable STA Info field is defined in Figure 9-115.

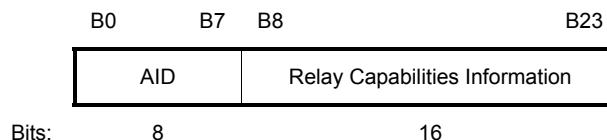

Figure 9-115—Relay Capable STA Info field

The AID subfield contains the AID of the relay capable STA that is associated with the AP or PCP.

The Relay Capability Information subfield is defined in 9.4.2.148.

9.4.1.46 Band ID field

The Band ID field is 1 octet in length and is defined in Table 9-63.

Table 9-63—Band ID field

| Band ID value | Meaning |
|---------------|---------------------------------------|
| 0 | TV white spaces |
| 1 | Sub-1 GHz (excluding TV white spaces) |
| 2 | 2.4 GHz |
| 3 | 3.6 GHz |
| 4 | 4.9 and 5 GHz |
| 5 | 60 GHz |
| 6–255 | Reserved |

9.4.1.47 DMG Parameters field

The format of the DMG Parameters field is shown in Figure 9-116.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 |
|----------|-----------|-------------|-------------|-----------------------|----------|----|----|
| BSS Type | CBAP Only | CBAP Source | DMG Privacy | ECAPC Policy Enforced | Reserved | | |
| Bits: | 2 | 1 | 1 | 1 | 1 | 2 | |

Figure 9-116—DMG Parameters

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-61) equal to 0, then the BSS Type subfield is defined in Table 9-64 for specific types of frame cited below. An AP sets the BSS Type subfield to 3 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. A PCP sets the BSS Type subfield to 2 within transmitted DMG Beacon, Probe Response, or (Re)Association Response frames. An IBSS STA or a STA that is not a member of a BSS sets the BSS Type subfield to 1 within transmitted DMG Beacon or Probe Response frames. The BSS Type subfield is reserved for all other types of frame.

Table 9-64—The BSS Type subfield when the Discovery mode field is 0

| Subfield value | BSS Type | Transmitted by DMG STA |
|----------------|--------------------|--------------------------------|
| 3 | Infrastructure BSS | AP |
| 2 | PBSS | PCP |
| 1 | IBSS | Any non-AP and non-PCP DMG STA |
| 0 | Reserved | |

If the BSS Type field is transmitted as part of a DMG Beacon frame that has the Discovery Mode field within the Beacon Interval Control field (see Figure 9-61) equal to 1, the BSS Type subfield is defined in Table 9-65. Depending on the role of the STA that responds to the DMG Beacon frame (identified by the “Responding STA role” column of Table 9-65), the behavior is different and is defined in 10.38.5.2.

Table 9-65—The BSS Type subfield when the Discovery mode field is 1

| Subfield value | Responding STA role | Applicable BSS types |
|----------------|---------------------|--------------------------------|
| 3 | AP | Infrastructure BSS |
| 2 | PCP | PBSS |
| 1 | Non-AP STA | PBSS, IBSS |
| 0 | Any | Infrastructure BSS, PBSS, IBSS |

The CBAP Only, CBAP Source, and ECAPC Policy Enforced subfields are valid only when transmitted within a DMG Beacon, Probe Response, or (Re)Association Response frames and are set as follows:

- The CBAP Only subfield indicates the type of link access provided by the STA sending the DMG Beacon frame in the data transfer interval (DTI) (see 10.36.2) of the beacon interval. The CBAP Only subfield is set to 1 when the entirety of the DTI portion of the beacon interval is allocated as a CBAP. The CBAP Only subfield is set to 0 when the allocation of the DTI portion of the beacon interval is provided through the Extended Schedule element.

- The CBAP Source subfield is valid only if the CBAP Only subfield is 1. The CBAP Source subfield is set to 1 to indicate that the AP or PCP has higher priority to transmit during the CBAP than non-AP and non-PCP STAs. The CBAP Source subfield is set to 0 otherwise.
- The ECAPC Policy Enforced subfield is set to 1 to indicate that medium access policies specific to the centralized AP or PCP cluster are required as defined in 10.37.3.4. The ECAPC Policy Enforced subfield is set to 0 to indicate that medium access policies specific to the centralized AP or PCP cluster are not required.

The DMG Privacy subfield is set to 1 if dot11RSNAActivated is true. Otherwise, this subfield is set to 0.

9.4.1.48 VHT MIMO Control field

The VHT MIMO Control field is included in every VHT Compressed Beamforming frame (see 9.6.23.2). The VHT MIMO Control field is defined in Figure 9-117.

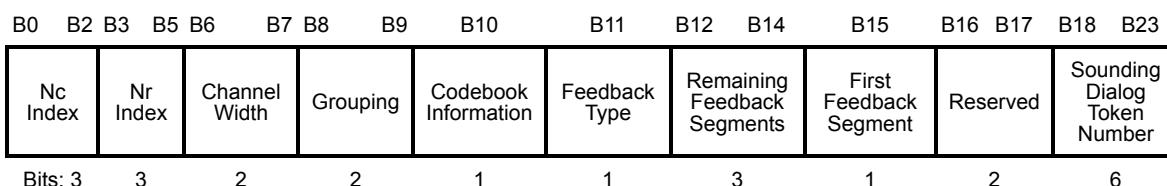

Figure 9-117—VHT MIMO Control field

The subfields of the VHT MIMO Control field are defined in Table 9-66.

Table 9-66—Subfields of the VHT MIMO Control field

| Subfield | Description |
|---------------|--|
| Nc Index | Indicates the number of columns, Nc , in the compressed beamforming feedback matrix minus 1: Set to 0 for $Nc = 1$ Set to 1 for $Nc = 2$... Set to 7 for $Nc = 8$ |
| Nr Index | Indicates the number of rows, Nr , in the compressed beamforming feedback matrix minus 1: Set to 0 for $Nr = 1$ Set to 1 for $Nr = 2$... Set to 7 for $Nr = 8$ |
| Channel Width | Indicates the width of the channel in which the measurement to create the compressed beamforming feedback matrix was made: Set to 0 for 20 MHz Set to 1 for 40 MHz Set to 2 for 80 MHz Set to 3 for 160 MHz or 80+80 MHz |
| Grouping | Indicates the subcarrier grouping, Ng , used for the compressed beamforming feedback matrix: Set to 0 for $Ng = 1$ (No grouping) Set to 1 for $Ng = 2$ Set to 2 for $Ng = 4$ The value 3 is reserved |

Table 9-66—Subfields of the VHT MIMO Control field (continued)

| Subfield | Description |
|------------------------------|--|
| Codebook Information | Indicates the size of codebook entries: If Feedback Type is SU: Set to 0 for 2 bits for ψ , 4 bits for ϕ Set to 1 for 4 bits for ψ , 6 bits for ϕ If Feedback Type is MU: Set to 0 for 5 bits for ψ , 7 bits for ϕ Set to 1 for 7 bits for ψ , 9 bits for ϕ |
| Feedback Type | Indicates the feedback type: Set to 0 for SU Set to 1 for MU |
| Remaining Feedback Segments | Indicates the number of remaining feedback segments for the associated VHT Compressed Beamforming frame: Set to 0 for the last feedback segment of a segmented report or the only feedback segment of an unsegmented report. Set to a value between 1 and 6 for a feedback segment that is neither the first nor the last of a segmented report. Set to a value between 1 and 7 for a feedback segment that is not the last feedback segment of a segmented report. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission. |
| First Feedback Segment | Set to 1 for the first feedback segment of a segmented report or the only feedback segment of an unsegmented report; set to 0 if it is not the first feedback segment or if the VHT Compressed Beamforming Report field and MU Exclusive Beamforming Report field are not present in the frame. In a retransmitted feedback segment, the field is set to the same value associated with the feedback segment in the original transmission. |
| Sounding Dialog Token Number | The sounding dialog token from the VHT NDP Announcement frame soliciting feedback |

In a VHT Compressed Beamforming frame not carrying all or part of a VHT Compressed Beamforming report (see 10.34.5 for a description of such a case), the Nc Index, Nr Index, Channel Width, Grouping, Codebook Information, Feedback Type and Sounding Dialog Token Number subfields are reserved, the First Feedback Segment subfield is set to 0 and the Remaining Feedback Segments subfield is set to 7.

9.4.1.49 VHT Compressed Beamforming Report field

The VHT Compressed Beamforming Report field is used by the VHT Compressed Beamforming feedback (see 9.6.23.2) to carry explicit feedback information in the form of angles representing compressed beamforming feedback matrices V for use by a transmit beamformer to determine steering matrices Q , as described in 10.32.3 and 19.3.12.3.

The size of the VHT Compressed Beamforming Report field depends on the values in the VHT MIMO Control field. The VHT Compressed Beamforming Report field contains VHT Compressed Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT Compressed Beamforming feedback (see 10.34.5). VHT Compressed Beamforming Report information is always included in the VHT Compressed Beamforming feedback.

The VHT Compressed Beamforming Report information contains the channel matrix elements indexed, first, by matrix angles in the order shown in Table 9-67 and, second, by data subcarrier index from lowest frequency to highest frequency. The explanation on how these angles are generated from the beamforming feedback matrix V is given in 19.3.12.3.6. In Table 9-67,

- Nc* is the number of columns in a compressed beamforming feedback matrix determined by the *Nc* Index field of the VHT MIMO Control field,
Nr is the number of rows in a compressed beamforming feedback matrix determined by the *Nr* Index field of the VHT MIMO Control field.

Table 9-67—Order of angles in the Compressed Beamforming Feedback Matrix subfield

| Size of <i>V</i> (<i>Nr</i> × <i>Nc</i>) | Number of angles (<i>Na</i>) | The order of angles in the Compressed Beamforming Feedback Matrix subfield |
|---|--------------------------------|--|
| 2×1 | 2 | ϕ_{11}, ψ_{21} |
| 2×2 | 2 | ϕ_{11}, ψ_{21} |
| 3×1 | 4 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}$ |
| 3×2 | 6 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}, \phi_{22}, \psi_{32}$ |
| 3×3 | 6 | $\phi_{11}, \phi_{21}, \psi_{21}, \psi_{31}, \phi_{22}, \psi_{32}$ |
| 4×1 | 6 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}$ |
| 4×2 | 10 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}$ |
| 4×3 | 12 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}, \phi_{33}, \psi_{43}$ |
| 4×4 | 12 | $\phi_{11}, \phi_{21}, \phi_{31}, \psi_{21}, \psi_{31}, \psi_{41}, \phi_{22}, \phi_{32}, \psi_{32}, \psi_{42}, \phi_{33}, \psi_{43}$ |
| 5×1 | 8 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}$ |
| 5×2 | 14 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \phi_{22}, \phi_{32}, \phi_{42}, \psi_{32}, \psi_{42}, \psi_{52}$ |
| 5×3 | 18 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \phi_{22}, \phi_{32}, \phi_{42}, \psi_{32}, \psi_{42}, \psi_{52}, \phi_{33}, \phi_{43}, \psi_{43}, \psi_{53}$ |
| 5×4 | 20 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \phi_{22}, \phi_{32}, \phi_{42}, \psi_{32}, \psi_{42}, \psi_{52}, \phi_{33}, \phi_{43}, \psi_{43}, \psi_{53}, \phi_{44}, \psi_{54}$ |
| 5×5 | 20 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \phi_{22}, \phi_{32}, \phi_{42}, \psi_{32}, \psi_{42}, \psi_{52}, \phi_{33}, \phi_{43}, \psi_{43}, \psi_{53}, \phi_{44}, \psi_{54}$ |
| 6×1 | 10 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \phi_{51}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \psi_{61}$ |
| 6×2 | 18 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \phi_{51}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \psi_{61}, \phi_{22}, \phi_{32}, \phi_{42}, \phi_{52}, \psi_{32}, \psi_{42}, \psi_{52}, \psi_{62}$ |
| 6×3 | 24 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \phi_{51}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \psi_{61}, \phi_{22}, \phi_{32}, \phi_{42}, \phi_{52}, \psi_{32}, \psi_{42}, \psi_{52}, \psi_{62}, \phi_{33}, \phi_{43}, \phi_{53}, \psi_{43}, \psi_{53}, \psi_{63}$ |
| 6×4 | 28 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \phi_{51}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \psi_{61}, \phi_{22}, \phi_{32}, \phi_{42}, \phi_{52}, \psi_{32}, \psi_{42}, \psi_{52}, \psi_{62}, \phi_{33}, \phi_{43}, \phi_{53}, \psi_{43}, \psi_{53}, \psi_{63}, \phi_{44}, \phi_{54}, \psi_{54}, \psi_{64}$ |
| 6×5 | 30 | $\phi_{11}, \phi_{21}, \phi_{31}, \phi_{41}, \phi_{51}, \psi_{21}, \psi_{31}, \psi_{41}, \psi_{51}, \psi_{61}, \phi_{22}, \phi_{32}, \phi_{42}, \phi_{52}, \psi_{32}, \psi_{42}, \psi_{52}, \psi_{62}, \phi_{33}, \phi_{43}, \phi_{53}, \psi_{43}, \psi_{53}, \psi_{63}, \phi_{44}, \phi_{54}, \psi_{54}, \psi_{64}, \phi_{55}, \psi_{65}$ |

The beamforming feedback matrix V is formed by the beamformee as follows. The beamformer transmits an NDP with $N_{STS,NDP}$ space-time streams, where $N_{STS,NDP}$ takes a value between 2 and 8. Based on this NDP, the beamformee estimates the $N_{RX,BFEE} \times N_{STS,NDP}$ channel, and based on that channel it determines a $Nr \times Nc$ orthonormal matrix V , where Nr and Nc satisfy Equation (9-1).

$$Nr = N_{STS,NDP}, Nc \leq \min(N_{STS,NDP}, N_{RX,BFEE}) \quad (9-1)$$

Further restrictions on Nc are described in 10.34.5.

The angles are quantized as defined in Table 9-68.

Table 9-68—Quantization of angles

| Quantized ψ | Quantized ϕ |
|---|---|
| $\psi = \frac{k\pi}{2^{b_\psi+1}} + \frac{\pi}{2^{b_\psi+2}} \text{ radians}$ <p>where</p> $k = 0, 1, \dots, 2^{b_\psi} - 1$ <p>b_ψ is the number of bits used to quantize ψ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.48))</p> | $\phi = \frac{k\pi}{2^{b_\phi-1}} + \frac{\pi}{2^{b_\phi}} \text{ radians}$ <p>where</p> $k = 0, 1, \dots, 2^{b_\phi} - 1$ <p>b_ϕ is the number of bits used to quantize ϕ (defined by the Codebook Information field of the VHT MIMO Control field (see 9.4.1.48))</p> |

The VHT Compressed Beamforming Report information has the structure and order defined in Table 9-69, where Na is the number of angles used for the compressed beamforming feedback matrix subfield (see Table 9-67).

Table 9-69—VHT Compressed Beamforming Report information

| Field | Size (bits) | Meaning |
|---|---------------------------------|--|
| Average SNR of Space-Time Stream 1 | 8 | Signal-to-noise ratio at the beamformee for space-time stream 1 averaged over all data subcarriers. See Table 9-71. |
| ... | ... | ... |
| Average SNR of Space-Time Stream Nc | 8 | Signal-to-noise ratio at the beamformee for space-time stream Nc averaged over all data subcarriers. See Table 9-71. |
| Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(0)$ | $Na \times (b_\psi + b_\phi)/2$ | Compressed beamforming feedback matrix as defined in Table 9-67 |
| Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(1)$ | $Na \times (b_\psi + b_\phi)/2$ | Compressed beamforming feedback matrix as defined in Table 9-67 |
| Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(2)$ | $Na \times (b_\psi + b_\phi)/2$ | Compressed beamforming feedback matrix as defined in Table 9-67 |
| ... | ... | ... |
| Compressed Beamforming Feedback Matrix V for subcarrier $k = scidx(Ns - 1)$ | $Na \times (b_\psi + b_\phi)/2$ | Compressed beamforming feedback matrix as defined in Table 9-67 |
| NOTE— $scidx()$ is defined in Table 9-70. | | |

N_s is the number of subcarriers for which the Compressed Beamforming Feedback Matrix subfield is sent back to the beamformer. A beamformee might choose to reduce N_s by using a method referred to as grouping, in which only a single Compressed Beamforming Feedback Matrix is reported for each group of Ng adjacent subcarriers. N_s is a function of the Channel Width and Grouping subfields in the VHT MIMO Control field (see 9.4.1.48). Table 9-70 lists N_s , the exact subcarrier indices and their order for which the Compressed Beamforming Feedback Matrix subfield is sent back. No padding is present between angles in the VHT Compressed Beamforming Report information, even if they correspond to different subcarriers. If the size of the VHT Compressed Beamforming Report information is not an integer multiple of 8 bits, up to seven zeros are appended to the end of the field to make its size an integer multiple of 8 bits.

Table 9-70—Subcarriers for which a Compressed Beamforming Feedback Matrix subfield is sent back

| Channel Width | Ng | N_s | Subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent: $scidx(0)$, $scidx(1)$, ..., $scidx(N_s-1)$ |
|---------------|------|-------|---|
| 20 MHz | 1 | 52 | -28, -27, -26, -25, -24, -23, -22, -20, -19, -18, -17, -16, -15, -14, -13, -12, -11, -10, -9, -8, -6, -5, -4, -3, -2, -1, 1, 2, 3, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28 NOTE—Pilot subcarriers ($\pm 21, \pm 7$) and DC subcarrier (0) are skipped |

Table 9-70—Subcarriers for which a Compressed Beamforming Feedback Matrix subfield is sent back (continued)

| Channel Width | N_g | N_s | Subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent: $scidx(0), scidx(1), \dots, scidx(N_s-1)$ |
|---------------|-------|-------|--|
| 80+80 MHz | 2 | 244 | -122(L), -120(L), -118(L), -116(L), -114(L), -112(L), -110(L), -108(L), -106(L), -104(L), -102(L), -100(L), -98(L), -96(L), -94(L), -92(L), -90(L), -88(L), -86(L), -84(L), -82(L), -80(L), -78(L), -76(L), -74(L), -72(L), -70(L), -68(L), -66(L), -64(L), -62(L), -60(L), -58(L), -56(L), -54(L), -52(L), -50(L), -48(L), -46(L), -44(L), -42(L), -40(L), -38(L), -36(L), -34(L), -32(L), -30(L), -28(L), -26(L), -24(L), -22(L), -20(L), -18(L), -16(L), -14(L), -12(L), -10(L), -8(L), -6(L), -4(L), -2(L), 2(L), 4(L), 6(L), 8(L), 10(L), 12(L), 14(L), 16(L), 18(L), 20(L), 22(L), 24(L), 26(L), 28(L), 30(L), 32(L), 34(L), 36(L), 38(L), 40(L), 42(L), 44(L), 46(L), 48(L), 50(L), 52(L), 54(L), 56(L), 58(L), 60(L), 62(L), 64(L), 66(L), 68(L), 70(L), 72(L), 74(L), 76(L), 78(L), 80(L), 82(L), 84(L), 86(L), 88(L), 90(L), 92(L), 94(L), 96(L), 98(L), 100(L), 102(L), 104(L), 106(L), 108(L), 110(L), 112(L), 114(L), 116(L), 118(L), 120(L), 122(L), -122(H), -120(H), -118(H), -116(H), -114(H), -112(H), -110(H), -108(H), -106(H), -104(H), -102(H), -100(H), -98(H), -96(H), -94(H), -92(H), -90(H), -88(H), -86(H), -84(H), -82(H), -80(H), -78(H), -76(H), -74(H), -72(H), -70(H), -68(H), -66(H), -64(H), -62(H), -60(H), -58(H), -56(H), -54(H), -52(H), -50(H), -48(H), -46(H), -44(H), -42(H), -40(H), -38(H), -36(H), -34(H), -32(H), -30(H), -28(H), -26(H), -24(H), -22(H), -20(H), -18(H), -16(H), -14(H), -12(H), -10(H), -8(H), -6(H), -4(H), -2(H), 2(H), 4(H), 6(H), 8(H), 10(H), 12(H), 14(H), 16(H), 18(H), 20(H), 22(H), 24(H), 26(H), 28(H), 30(H), 32(H), 34(H), 36(H), 38(H), 40(H), 42(H), 44(H), 46(H), 48(H), 50(H), 52(H), 54(H), 56(H), 58(H), 60(H), 62(H), 64(H), 66(H), 68(H), 70(H), 72(H), 74(H), 76(H), 78(H), 80(H), 82(H), 84(H), 86(H), 88(H), 90(H), 92(H), 94(H), 96(H), 98(H), 100(H), 102(H), 104(H), 106(H), 108(H), 110(H), 112(H), 114(H), 116(H), 118(H), 120(H), 122(H) |
| | 4 | 124 | -122(L), -118(L), -114(L), -110(L), -106(L), -102(L), -98(L), -94(L), -90(L), -86(L), -82(L), -78(L), -74(L), -70(L), -66(L), -62(L), -58(L), -54(L), -50(L), -46(L), -42(L), -38(L), -34(L), -30(L), -26(L), -22(L), -18(L), -14(L), -10(L), -6(L), -2(L), 2(L), 6(L), 10(L), 14(L), 18(L), 22(L), 26(L), 30(L), 34(L), 38(L), 42(L), 46(L), 50(L), 54(L), 58(L), 62(L), 66(L), 70(L), 74(L), 78(L), 82(L), 86(L), 90(L), 94(L), 98(L), 102(L), 106(L), 110(L), 114(L), 118(L), 122(L), -122(H), -118(H), -114(H), -110(H), -106(H), -102(H), -98(H), -94(H), -90(H), -86(H), -82(H), -78(H), -74(H), -70(H), -66(H), -62(H), -58(H), -54(H), -50(H), -46(H), -42(H), -38(H), -34(H), -30(H), -26(H), -22(H), -18(H), -14(H), -10(H), -6(H), -2(H), 2(H), 6(H), 10(H), 14(H), 18(H), 22(H), 26(H), 30(H), 34(H), 38(H), 42(H), 46(H), 50(H), 54(H), 58(H), 62(H), 66(H), 70(H), 74(H), 78(H), 82(H), 86(H), 90(H), 94(H), 98(H), 102(H), 106(H), 110(H), 114(H), 118(H), 122(H) |

The Average SNR of Space-Time Stream i subfield in the Table 9-69 is an 8-bit 2s complement integer whose definition is shown in Table 9-71.

Table 9-71—Average SNR of Space-Time Stream i subfield

| Average SNR of Space-Time Stream i subfield | AvgSNR_i |
|---|-------------------------|
| -128 | $\leq -10 \text{ dB}$ |
| -127 | -9.75 dB |
| -126 | -9.5 dB |
| ... | ... |
| +126 | 53.5 dB |
| +127 | $\geq 53.75 \text{ dB}$ |

The AvgSNR_i in Table 9-71 is found by computing the SNR per subcarrier in decibels for the subcarriers identified in Table 9-70, and then computing the arithmetic mean of those values. Each SNR value per tone in stream i (before being averaged) corresponds to the SNR associated with the column i of the beamforming feedback matrix V determined at the beamformee. Each SNR corresponds to the predicted SNR at the beamformee when the beamformer applies all columns of the matrix V .

A STA with a 40 MHz, 80 MHz, or 160 MHz operating channel width and sending feedback for a 20 MHz channel width includes only subcarriers corresponding to the primary 20 MHz channel in the Compressed Feedback Beamforming Matrix subfield.

A STA with an 80 MHz or 160 MHz operating channel width and sending feedback for a 40 MHz channel width includes only subcarriers corresponding to the primary 40 MHz channel in the Compressed Feedback Beamforming Matrix subfield.

A STA with a 160 MHz or 80+80 MHz operating channel width and sending feedback for an 80 MHz channel width includes only subcarriers corresponding to the primary 80 MHz channel in the Compressed Feedback Beamforming Matrix subfield.

NOTE—Multi-bit fields are transmitted LSB first according to the bit-ordering specification detailed in 9.2.2.

9.4.1.50 TVHT Compressed Beamforming Report field

The format of the TVHT Compressed Beamforming Report field is the same as the VHT Compressed Beamforming Report field in 9.4.1.49 except for the following modifications.

The subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in Table 9-70 for 40 MHz are used for each basic channel unit (BCU) in TVHT_MODE_1 and TVHT_MODE_2N. See tone location description in Table 22-9.

For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-70 and for the Upper BCU by adding 72.

For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-70 and for the Upper BCU by adding 84.

For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-70, respectively.

For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-70, respectively.

For TVHT_MODE_4N channelization, the subcarriers for which Compressed Feedback Beamforming Matrix subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

A STA with a TVHT_2W, TVHT_4W, TVHT_W+W, or TVHT_2W+2W operating channel width and sending feedback for a TVHT_W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_W channel in the Compressed Feedback Beamforming Matrix subfield.

A STA with a TVHT_4W or TVHT_2W+2W operating channel width and sending feedback for a TVHT_2W channel width includes a representation of the compressed beamforming feedback matrices of the subcarriers corresponding to the primary TVHT_2W channel in the Compressed Feedback Beamforming Matrix subfield.

9.4.1.51 MU Exclusive Beamforming Report field

The MU Exclusive Beamforming Report field is used by the VHT Compressed Beamforming feedback (see 9.6.23.2) to carry explicit feedback information in the form of delta SNRs. The information in the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field can be used by the transmit MU beamformer to determine steering matrices Q , as described in 10.32.3, 19.3.12.3, and 21.3.11.

The size of the MU Exclusive Beamforming Report field depends on the values in the VHT MIMO Control field. The MU Exclusive Beamforming Report field contains MU Exclusive Beamforming Report information or successive (possibly zero-length) portions thereof in the case of segmented VHT Compressed Beamforming feedback (see 10.34.5). The MU Exclusive Beamforming Report information is included in the VHT Compressed Beamforming feedback if the Feedback Type subfield in the VHT MIMO Control field indicates MU (see 9.4.1.48).

The MU Exclusive Beamforming Report information consists of Delta SNR subfields for each space-time stream (1 to N_c) of a subset of the subcarriers typically spaced $2N_g$ apart, where N_g is signaled in the Grouping subfield of the VHT MIMO Control field, starting from the lowest frequency subcarrier and continuing to the highest frequency subcarrier. No padding is present between $\Delta SNR_{k,i}$ in the MU Exclusive Beamforming Report field, even if they correspond to different subcarriers. The subset of subcarriers included is determined by the values of the Channel Width and Grouping subfields of the VHT MIMO Control field as listed in Table 9-73. For each subcarrier included, the deviation in dB of the SNR of that subcarrier for each column of V relative to the average SNR of the corresponding space-time stream is computed using Equation (9-2).

$$\Delta SNR_{k,i} = \min(\max(\text{round}(10\log_{10}\left(\frac{\|H_k V_{k,i}\|^2}{N}\right) - \overline{SNR}_i), -8), 7) \quad (9-2)$$

where

- k is the subcarrier index in the range $\text{sscidx}(0), \dots, \text{sscidx}(Ns'-1)$
- i is the space-time stream index in the range 1, ..., N_c
- H_k is the estimated MIMO channel for subcarrier k
- $V_{k,i}$ is column i of the beamforming matrix V for subcarrier k
- N is the average noise plus interference power, measured at the beamformee, that was used to calculate \overline{SNR}_i
- \overline{SNR}_i is the average SNR of space-time stream i reported in the VHT Compressed Beamforming Report information (Average SNR in Space-Time Stream i field)

Each Delta SNR subfield contains the $\Delta SNR_{k,i}$ computed using Equation (9-2) and quantized to 4 bits in the range -8 dB to 7 dB with 1 dB granularity. The structure of the MU Exclusive Beamforming Report field is shown in Table 9-72.

Table 9-72—MU Exclusive Beamforming Report information

| Field | Size (Bits) | Meaning |
|---|-------------|---|
| Delta SNR for space-time stream 1 for subcarrier $k = \text{sscidx}(0)$ | 4 | $\Delta SNR_{\text{sscidx}(0), 1}$ as defined in Equation (9-2) |
| ... | ... | ... |
| Delta SNR for space-time stream N_c for subcarrier $k = \text{sscidx}(0)$ | 4 | $\Delta SNR_{\text{sscidx}(0), N_c}$ as defined in Equation (9-2) |
| Delta SNR for space-time stream 1 for subcarrier $k = \text{sscidx}(1)$ | 4 | $\Delta SNR_{\text{sscidx}(1), 1}$ as defined in Equation (9-2) |
| ... | ... | ... |
| Delta SNR for space-time stream N_c for subcarrier $k = \text{sscidx}(1)$ | 4 | $\Delta SNR_{\text{sscidx}(1), N_c}$ as defined in Equation (9-2) |
| ... | ... | ... |
| Delta SNR for space-time stream 1 for subcarrier $k = \text{sscidx}(Ns'-1)$ | 4 | $\Delta SNR_{\text{sscidx}(Ns'-1), 1}$ as defined in Equation (9-2) |
| ... | ... | ... |
| Delta SNR for space-time stream N_c for subcarrier $k = \text{sscidx}(Ns'-1)$ | 4 | $\Delta SNR_{\text{sscidx}(Ns'-1), N_c}$ as defined in Equation (9-2) |
| NOTE— $\text{sscidx}()$ is defined in Table 9-73. | | |

In Table 9-72, $N_{s'}$ is the number of subcarriers for which the Delta SNR subfield is sent back to the beamformer. Table 9-73 shows $N_{s'}$, the exact subcarrier indices and their order for which the Delta SNR is sent back.

Table 9-73—Number of subcarriers and subcarrier mapping

| Channel Width | N_g | $N_{s'}$ | Subcarriers for which the Delta SNR subfield is sent: $sscidx(0), sscidx(1), \dots, sscidx(N_{s'}-1)$ |

Table 9-73—Number of subcarriers and subcarrier mapping (continued)

| Channel Width | N_g | $N_{s'}$ | Subcarriers for which the Delta SNR subfield is sent: $sscidx(0), sscidx(1), \dots, sscidx(N_{s'}-1)$ |
|---|-------|----------|--|
| 80+80 MHz | 4 | 64 | -122(L), -114(L), -106(L), -98(L), -90(L), -82(L), -74(L), -66(L), -58(L), -50(L), -42(L), -34(L), -26(L), -18(L), -10(L), -2(L), 2(L), 10(L), 18(L), 26(L), 34(L), 42(L), 50(L), 58(L), 66(L), 74(L), 82(L), 90(L), 98(L), 106(L), 114(L), 122(L), -122(H), -114(H), -106(H), -98(H), -90(H), -82(H), -74(H), -66(H), -58(H), -50(H), -42(H), -34(H), -26(H), -18(H), -10(H), -2(H), 2(H), 10(H), 18(H), 26(H), 34(H), 42(H), 50(H), 58(H), 66(H), 74(H), 82(H), 90(H), 98(H), 106(H), 114(H), 122(H) |
| NOTE 1— $sscidx()$ is defined in Table 9-72. | | | |
| NOTE 2—Subcarrier $x(L)$ denotes subcarrier index x in the frequency segment lower in frequency, and subcarrier $x(H)$ denotes subcarrier index x in the frequency segment higher in frequency. | | | |

9.4.1.52 TVHT MU Exclusive Beamforming Report field

See Table 9.4.1.51 with the following modifications.

For each BCU in TVHT_MODE_1 and TVHT_MODE_2N, the subcarriers used in the Delta SNR subfield are defined in Table 9-73 for 40 MHz. See the tone location description in Table 22-9.

For TVHT_MODE_2C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 72 from the values shown in Table 9-73 and for the Upper BCU by adding 72.

For TVHT_MODE_2C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the Lower BCU are based on subtracting 84 from the values shown in Table 9-73 and for the Upper BCU by adding 84.

For TVHT_MODE_4C with 6 MHz and 8 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 216, subtracting 72, adding 72, and adding 216 from the values shown in Table 9-73, respectively.

For TVHT_MODE_4C with 7 MHz channelization, the subcarriers for which Delta SNR subfield is sent in the lowest, second to lowest, second to highest, and highest BCUs are based on subtracting 252, subtracting 84, adding 84, and adding 252 from the values shown in Table 9-73, respectively.

For TVHT_MODE_4N channelization, the subcarriers for which Delta SNR subfield is sent in each of the two noncontiguous frequency segments are as described for TVHT_MODE_2C.

9.4.1.53 Operating Mode field

The Operating Mode field is present in the Operating Mode Notification frame (see 9.6.23.4) and Operating Mode Notification element (see 9.4.2.166).

The Operating Mode field is shown in Figure 9-118.

| | B0 | B1 | B2 | B3 | B4 | B6 | B7 |
|---------------|--------------|---------|--------|-------------|----|----|----|
| Channel Width | 160/80+80 BW | No LDPC | Rx NSS | Rx NSS Type | | | |
| Bits: | 2 | 1 | 1 | 3 | 1 | | |

Figure 9-118—Operating Mode field

The STA transmitting this field indicates its current operating channel width and the number of spatial streams it can receive using the settings defined in Table 9-74.

Table 9-74—Subfield values of the Operating Mode field

| Subfield | Description |
|---------------|---|
| Channel Width | If the Rx NSS Type subfield is 0, indicates the supported channel width: In a VHT STA, see Table 9-75 In a TVHT STA: Set to 0 for TVHT_W Set to 1 for TVHT_2W and TVHT_W+W Set to 2 for TVHT_4W and TVHT_2W+2W The value of 3 is reserved. Reserved if the Rx NSS Type subfield is 1. |
| 160/80+80 BW | This subfield, combined with the Channel Width subfield, the Supported Channel Width Set subfield and the Supported VHT-MCS and NSS Set subfield indicates whether 80+80 MHz and 160 MHz operation is supported. In a VHT STA, see Table 9-75. In a TVHT STA, this field is reserved. In a STA with dot11VHTExtendedNSSBWCapable either equal to false or not present, this field is set to 0. |
| No LDPC | Set to 1 to indicate that the STA transmitting this field prefers not to receive LDPC-encoded PPDUs; set to 0 otherwise. |

Table 9-74—Subfield values of the Operating Mode field (continued)

| Subfield | Description |
|--------------------|---|
| Rx NSS | <p>If the Rx NSS Type subfield is 0, the value of this field, combined with other information described in 9.4.2.158.3, indicates the maximum number of spatial streams that the STA can receive.</p> <p>If the Rx NSS Type subfield is 1, the value of this field, indicates the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA.</p> <p>Set to 0 for $N_{SS} = 1$ Set to 1 for $N_{SS} = 2$... Set to 7 for $N_{SS} = 8$</p> <p>NOTE—In a STA with dot11VHTExtendedNSSBWCapable equal to true, NSS might be further modified per Table 9-75.</p> |
| Rx NSS Type | <p>Set to 0 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive in any PPDU.</p> <p>Set to 1 to indicate that the Rx NSS subfield carries the maximum number of spatial streams that the STA can receive as a beamformee in an SU PPDU using a beamforming steering matrix derived from a VHT Compressed Beamforming report with the Feedback Type subfield indicating MU in the corresponding VHT Compressed Beamforming frame sent by the STA.</p> <p>NOTE—An AP always sets this field to 0.</p> |

Table 9-75—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field

| Transmitted Operating Mode field | | VHT Capabilities of STA transmitting the Operating Mode field | | NSS Support of STA transmitting the Operating Mode field as a function of the PPDU bandwidth (\times Max VHT NSS) (see requirements R1 and R2) | | | | | Location of 160 MHz center frequency if BSS bandwidth is 160 MHz | Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz |
|----------------------------------|--------------|---|-------------------------|---|--------|--------|---------|------------|--|---|
| Channel width | 160/80+80 BW | Supported Channel Width Set | Extended NSS BW Support | 20 MHz | 40 MHz | 80 MHz | 160 MHz | 80 +80 MHz | | |
| 0 | 0 | 0-2 | 0-3 | 1 | | | | | | |
| 1 | 0 | 0-2 | 0-3 | 1 | 1 | | | | | |
| 2 | 0 | 0-2 | 0-3 | 1 | 1 | 1 | | | | |
| 2 | 1 | 0 | 1 | 1 | 1 | 1 | 1/2 | | CCFS2 | |

Table 9-75—Setting of the Channel Width subfield and 160/80+80 BW subfield at a VHT STA transmitting the Operating Mode field (continued)

| Transmitted Operating Mode field | | VHT Capabilities of STA transmitting the Operating Mode field | | NSS Support of STA transmitting the Operating Mode field as a function of the PPDU bandwidth (\times Max VHT NSS) (see requirements R1 and R2) | | | | | Location of 160 MHz center frequency if BSS bandwidth is 160 MHz | Location of secondary 80 MHz center frequency if BSS bandwidth is 80+80 MHz | |
|--|--------------|---|-------------------------|---|--------|--------|---------|------------|--|---|--|
| Channel width | 160/80+80 BW | Supported Channel Width Set | Extended NSS BW Support | 20 MHz | 40 MHz | 80 MHz | 160 MHz | 80 +80 MHz | | | |
| 2 | 1 | 0 | 2 | 1 | 1 | 1 | 1/2 | 1/2 | CCFS2 | CCFS2 | |
| 2 | 1 | 0 | 3 | 1 | 1 | 1 | 3/4 | 3/4 | CCFS2 | CCFS2 | |
| 2 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | | CCFS1 | | |
| 2 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1/2 | CCFS1 | CCFS2 | |
| 2 | 1 | 1 | 2 | 1 | 1 | 1 | 1 | 3/4 | CCFS1 | CCFS2 | |
| 2 | 1 | 1 | 3 | 2 | 2 | 2 | 2 | 1 | CCFS1 | CCFS1 | |
| 2 | 1 | 2 | 0 | 1 | 1 | 1 | 1 | 1 | CCFS1 | CCFS1 | |
| 2 | 1 | 2 | 3 | 2 | 2 | 2 | 1 | 1 | CCFS1 | CCFS1 | |
| R1: NSS support shall be rounded down to the nearest integer. R2: The maximum NSS support shall be 8. | | | | | | | | | | | |
| NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.158.3. NOTE 2—1/2 \times or 3/4 \times Max VHT NSS support might end up being 0, indicating no support. NOTE 3—Any other combination than the ones listed in this table is reserved. NOTE 4—CCFS1 refers to the value of the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element. NOTE 5—CCFS2 refers to the value of the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element. NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case. NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case. NOTE 8—at most one of CCFS1 and CCFS2 is nonzero. NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive. NOTE 10—Some combinations of Supported Channel Width Set and Extended NSS BW support might not occur in practice. NOTE 11—2 \times Max VHT NSS support might be used for HT PPDUs (at 20 or 40 MHz PPDU bandwidth). | | | | | | | | | | | |

9.4.1.54 Membership Status Array field

The Membership Status Array field is used in the Group ID Management frame (see 9.6.23.3). The length of the field is 8 octets. An 8 octet Membership Status Array field (indexed by the group ID) consists of a 1-bit Membership Status subfield for each of the 64 group IDs, as shown in Figure 9-119.

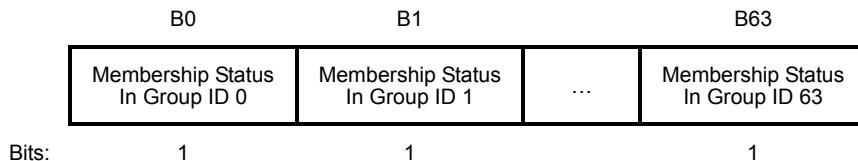

Figure 9-119—Membership Status Array field

Within the 8 octet Membership Status Array field, the 1-bit Membership Status subfield for each group ID is set as follows:

- Set to 0 if the STA is not a member of the group
- Set to 1 if STA is a member of the group

The Membership Status subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

9.4.1.55 User Position Array field

The User Position Array field is used in the Group ID Management frame (see 9.6.23.3). The length of the field is 16 octets. A 16 octet User Position Array field (indexed by the Group ID) consists of a 2-bit User Position subfield for each of the 64 group IDs, as shown in Figure 9-120.

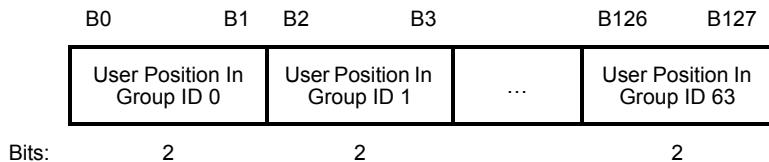

Figure 9-120—User Position Array field

If the Membership Status subfield for a particular group ID is 1, then the corresponding User Position subfield in the User Position Array field contains the group ID's User Position.

If the Membership Status subfield for a group ID is 0 (meaning the STA is not a member of that group), then the corresponding User Position subfield in the User Position Array field is reserved.

The User Position subfields for group ID 0 (transmissions to AP) and group ID 63 (downlink SU transmissions) are reserved.

9.4.1.56 Device Location Information Body field

A Device Location Information Body field includes the location configuration information (LCI), which contains latitude, longitude, and altitude information.

The format of the Device Location Information Body field is shown in Figure 9-121.

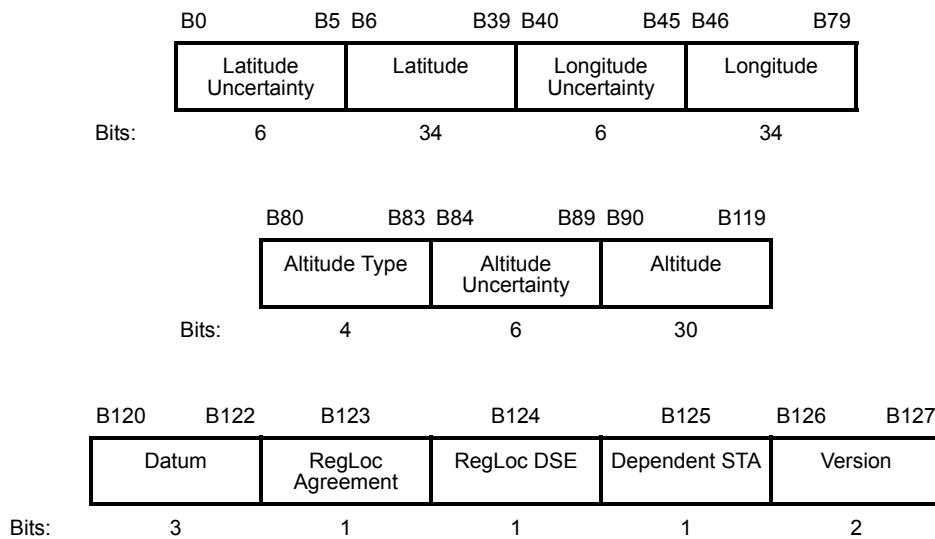

Figure 9-121—Device Location Information Body field format

The fields within the Device Location Information Body field are as defined in section 2.2 of IETF RFC 6225 except as defined in 9.4.2.52, and RegLoc Agreement and RegLoc DSE are set to 0.

9.4.1.57 WSM Type field and WSM Information field

The WSM Type field is set to a number that identifies the type of WSM information and the frequency band where the following WSM Information field is applicable. The values of WSM Types are shown in Table 9-76. A WSM Type field value of 1 indicates the WSM Information field of the WSM element contains available frequency information for operation in the TVWS. Other values are reserved.

Table 9-76—WSM Type definition

| Name | WSM Type |
|-------------|----------|
| Reserved | 0 |
| TV band WSM | 1 |
| Reserved | 2–255 |

The WSM Information field indicates the available channel information as defined in 9.4.4.2.5.

The WSM Information field corresponding to a TV band WSM is shown in Table 9-269.

9.4.2 Elements

9.4.2.1 General

Elements are defined to have a common general format consisting of a 1 octet Element ID field, a 1 octet Length field, an optional 1 octet Element ID Extension field, and a variable-length element-specific Information field. Each element is identified by the contents of the Element ID and, when present, Element ID Extension fields as defined in this standard. An Extended Element ID is a combination of an Element ID and an Element ID Extension for those elements that have a defined Element ID Extension. The Length field specifies the number of octets following the Length field. See Figure 9-122. The presence of the Element ID Extension field is determined by the Element ID field.

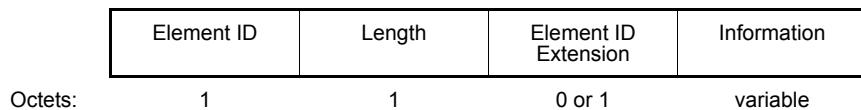

Figure 9-122—Element format

The set of valid elements is defined in Table 9-77.

Table 9-77—Element IDs

| Element | Element ID | Element ID Extension | Extensible |
|--|------------|----------------------|--|
| SSID (see 9.4.2.2) | 0 | N/A | |
| Supported Rates and BSS Membership Selectors (see 9.4.2.3) | 1 | N/A | |
| Reserved | 2 | | |
| DSSS Parameter Set (see 9.4.2.4) | 3 | N/A | |
| CF Parameter Set (see 9.4.2.5) | 4 | N/A | |
| TIM (see 9.4.2.6) | 5 | N/A | |

Table 9-77—Element IDs (continued)

| Element | Element ID | Element ID Extension | Extensible |
|--|------------|----------------------|------------|
| Reserved for elements using the Element ID Extension field | 255 | 0–8 | |
| FTM Synchronization Information | 255 | 9 | Yes |
| Extended Request | 255 | 10 | |
| Estimated Service Parameters (see 9.4.2.174) | 255 | 11 | Yes |
| Future Channel Guidance | 255 | 14 | |
| Reserved for elements using the Element ID Extension field | 255 | 12–255 | |

The frame body components specified for many management subtypes result in elements ordered by ascending values of the Element ID field and then the Element ID Extension field (when present), with the exception of the MIC Management element (9.4.2.55). If present, the MIC Management element appears at the end of the robust management frame body. See 10.27.6 on the parsing of elements.

A “Yes” in the Extensible column of an element listed in Table 9-77 indicates that the Length of the element might be extended in future revisions or amendments of this standard. See 10.27.8. When the Extensible column of an element is set to “Subelements,” then the element might be extended in future revisions or amendments of this standard by defining additional subelements. See 10.27.9.

The element is not extensible otherwise (i.e., if not marked as “Yes” or “Subelements”).

9.4.2.2 SSID element

The SSID element indicates the identity of an ESS or IBSS. See Figure 9-123.

| Octets: | Element ID | Length | SSID |
|---------|------------|--------|------|
| | 1 | 1 | 0–32 |

Figure 9-123—SSID element format

The Element ID and Length fields are defined in 9.4.2.1.

The length of the SSID field is between 0 and 32 octets. A SSID field of length 0 is used within Probe Request frames to indicate the wildcard SSID. The wildcard SSID is also used in Beacon and Probe Response frames transmitted by mesh STAs.

When the UTF-8 SSID subfield of the Extended Capabilities element is equal to 1 in the frame that includes the SSID element, or the Extended Capabilities of the source of the SSID information is known to include the UTF-8 SSID capability based on a previously received Extended Capabilities element, the SSID is interpreted using UTF-8 encoding. Otherwise, the character encoding of the octets in this SSID element is unspecified.

9.4.2.3 Supported Rates and BSS Membership Selectors element

The Supported Rates and BSS Membership Selectors element specifies up to eight rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request

primitives, and zero or more BSS membership selectors. The Information field is encoded as 1 to 8 octets, where each octet describes a single supported rate or BSS membership selector (see Figure 9-124).

| | Element ID | Length | Supported Rates |
|---------|------------|--------|-----------------|
| Octets: | 1 | 1 | 1–8 |

Figure 9-124—Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each rate contained in the BSSBasicRateSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the data rate, if necessary rounded up to the next 500 kb/s, in units of 500 kb/s (e.g., a 2.25 Mb/s rate contained in the BSSBasicRateSet parameter is encoded as X'85'). Each rate in the OperationalRateSet parameter not contained in the BSSBasicRateSet parameter is encoded with the MSB set to 0, and bits 6 to 0 are set in the same way as for a rate contained in the BSSBasicRateSet parameter (e.g., a 2 Mb/s rate not contained in the BSSBasicRateSet parameter is encoded as X'04').

Within Beacon, Probe Response, Association Response, Reassociation Response, Mesh Peering Open, and Mesh Peering Confirm frames, each BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as an octet with the MSB (bit 7) set to 1, and bits 6 to 0 are set to the encoded value for the selector as found in Table 9-78 (e.g., an HT PHY BSS membership selector contained in the BSSMembershipSelectorSet parameter is encoded as X'FF'). A BSS membership selector that has the MSB (bit 7) set to 1 in the Supported Rates and BSS Membership Selectors element is defined to be basic.

The MSB of each octet in the Supported Rates field in other management frame types is ignored by receiving STAs.

The valid values for BSS membership selectors and their associated features are shown in Table 9-78.

NOTE—Because the BSS membership selector and supported rates are carried in the same field, the BSS membership selector value cannot match the value corresponding to any valid supported rate. This allows any value to be determined as either a supported rate or a BSS membership selector.

Table 9-78—BSS membership selector value encoding

| Value | Feature | Interpretation |
|-------|---------|--|
| 127 | HT PHY | Support for the mandatory features of Clause 19 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value. |
| 126 | VHT PHY | Support for the mandatory features of Clause 21 is required in order to join the BSS that was the source of the Supported Rates and BSS Membership Selectors element or Extended Supported Rates and BSS Membership Selectors element containing this value. |

See 11.1.4.6.

9.4.2.4 DSSS Parameter Set element

The DSSS Parameter Set element contains information to allow channel number identification for STAs. See Figure 9-125.

| Octets: | Element ID | Length | Current Channel |
|---------|------------|--------|-----------------|
| | 1 | 1 | 1 |

Figure 9-125—DSSS Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The Current Channel field is set to dot11CurrentChannel (see 15.4.4.3, 16.3.6.3, 17.3.8.4.2 and 19.3.15 for values).

9.4.2.5 CF Parameter Set element

The PCF mechanism is obsolete. Consequently, this subclause might be removed in a later revision of the standard.

The CF Parameter Set element contains the set of parameters necessary to support the PCF. See Figure 9-126.

| Octets: | Element ID | Length | CFP Count | CFP Period | CFP MaxDuration | CFP DurRemaining |
|---------|------------|--------|-----------|------------|-----------------|------------------|
| | 1 | 1 | 1 | 1 | 2 | 2 |

Figure 9-126—CF Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The CFPCount field indicates how many delivery traffic indication maps (DTIMs) (including the current frame) appear before the next CFP start. A CFPCount of 0 indicates that the current DTIM marks the start of the CFP.

The CFPPeriod field indicates the number of DTIM intervals between the start of CFPs. The value is an integer number of DTIM intervals.

The CFPMaxDuration field indicates the maximum duration, in TU, of the CFP that might be generated by this PCF. This value is used by STAs to set their NAV at the TBTT of Beacon frames that begin CFPs.

The CFPDurRemaining field indicates the maximum time, in TU, remaining in the present CFP and is set to 0 in CFP Parameter elements of Beacon frames transmitted during the CP. The value of CFPDurRemaining is referenced to the immediately previous TBTT. This value is used by all STAs to update their NAVs during CFPs.

9.4.2.6 TIM element

The TIM element contains four fields: DTIM Count, DTIM Period, Bitmap Control, and Partial Virtual Bitmap. See Figure 9-127.

| Element ID | Length | DTIM Count | DTIM Period | Bitmap Control | Partial Virtual Bitmap |
|------------|--------|------------|-------------|----------------|------------------------|
| Octets: | 1 | 1 | 1 | 1 | 1–251 |

Figure 9-127—TIM element format

The Element ID and Length fields are defined in 9.4.2.1.

The Length field for this element is constrained as described below.

The DTIM Count field indicates how many Beacon frames (including the current frame) appear before the next DTIM. A DTIM count of 0 indicates that the current TIM is a DTIM. The DTIM Count field is a single octet. When a TIM element is included in a TIM frame, the DTIM Count field is reserved.

The DTIM Period field indicates the number of beacon intervals between successive DTIMs. If all TIMs are DTIMs, the DTIM Period field has the value 1. The DTIM Period value 0 is reserved. The DTIM period field is a single octet.

The Bitmap Control field is a single octet. Bit 0 of the field contains the traffic indication virtual bitmap bit associated with AID 0. This bit is set to 1 in TIM elements with a value of 0 in the DTIM Count field when one or more group addressed MSDUs/MMPDUs are buffered at the AP or the mesh STA. The remaining 7 bits of the field form the Bitmap Offset.

The traffic indication virtual bitmap, maintained by the AP or the mesh STA that generates a TIM, consists of 2008 bits, and it is organized into 251 octets such that bit number N ($0 \leq N \leq 2007$) in the bitmap corresponds to bit number $(N \bmod 8)$ in octet number $\lfloor N / 8 \rfloor$ where the low-order bit of each octet is bit number 0, and the high order bit is bit number 7. Each bit in the traffic indication virtual bitmap corresponds to traffic buffered for a specific neighbor peer mesh STA within the MBSS that the mesh STA is prepared to deliver²³ or for a STA within the BSS that the AP is prepared to deliver at the time the Beacon frame is transmitted. Bit number N indicates the status of buffered, individually addressed MSDUs/MMPDUs for the STA whose AID is N . It is determined as follows:

- If the STA is not using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered and the AP or the mesh STA is prepared to deliver them, then bit number N in the traffic indication virtual bitmap is 1.
- If the STA is using APSD, and any individually addressed MSDUs/MMPDUs for that STA are buffered in at least one nondelivery-enabled AC (if there exists at least one nondelivery-enabled AC), then bit number N in the traffic indication virtual bitmap is 1.
- If the STA is using APSD, all ACs are delivery-enabled, and any individually addressed MSDUs/MMPDUs for that STA are buffered in any AC, then bit number N in the traffic indication virtual bitmap is 1.
- Otherwise, bit number N in the traffic indication virtual bitmap is 0.

A PC might decline to set bits in the TIM for CF-Pollable STAs it does not intend to poll (see 11.2.3.7).

When `dot11MultiBSSIDActivated` is false, the Partial Virtual Bitmap field consists of octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N1$ is the largest even number such that bits numbered 1 to $(N1 \times 8) - 1$ in the traffic indication virtual bitmap are all 0 and $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. In this case, the Bitmap Offset subfield value contains the number $N1/2$, and the Length field is set to $(N2 - N1) + 4$.

NOTE—The bit numbered 0 in the traffic indication virtual bitmap need not be included in the Partial Virtual Bitmap field even if that bit is set.

²³How the AP or mesh STA determines the traffic is prepared to deliver is outside the scope of this standard.

In the event that all bits other than bit 0 in the traffic indication virtual bitmap are 0, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4.

When `dot11MultiBSSIDActivated` is true, the Partial Virtual Bitmap field of the TIM element is constructed as follows, where the maximum possible number of BSSIDs is an integer power of 2, $n = \log_2$ (maximum possible number of BSSIDs), k is the number of actually supported nontransmitted BSSIDs, and $k \leq (2^n - 1)$.

- The bits 1 to k of the bitmap are used to indicate that one or more group addressed frames are buffered for each AP corresponding to a nontransmitted BSSID. The AIDs from 1 to k are not allocated to a STA. The AIDs from $(k + 1)$ to $(2^n - 1)$ are reserved and set to 0. The remaining AIDs are shared by the BSSs corresponding to the transmitted BSSID and all nontransmitted BSSIDs.
- When the DTIM Count field is 0 for a BSS that has a nontransmitted BSSID, and one or more group addressed frames are buffered at the AP for this BSS, the corresponding bits from bit 1 to bit k is set to 1.
- Each bit starting from bit 2^n in the traffic indication virtual bitmap corresponds to individually addressed traffic buffered for a specific STA within any BSS corresponding to a transmitted or nontransmitted BSSID at the time the Beacon frame is transmitted. The correspondence is based on the AID of the STA.
- Based upon its knowledge of the capability of associated stations to support the multiple BSSID capability, as indicated by the corresponding field in the Extended Capabilities element and the content of the traffic indication virtual bitmap, an AP encodes the Partial Virtual Bitmap and the Bitmap Control field of the TIM element using one of the two following methods. Specifically, an AP uses Method B when it determines that the bit for each associated non-AP STA in the traffic indication virtual bitmap that is reconstructed by each non-AP STA from the received TIM element encoded using Method B is set correctly. Otherwise, an AP uses Method A.

Method A and Method B are described as follows:

- a) Method A: The Partial Virtual Bitmap field consists of octets numbered 0 to $N2$ of the traffic indication virtual bitmap, where $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield value always contains the number 0, and the Length field is $N2 + 4$.
- b) Method B: The Partial Virtual Bitmap field consists of a concatenation of octets numbered 0 to $N0 - 1$ and octets numbered $N1$ to $N2$ of the traffic indication virtual bitmap, where $N0$ is the smallest positive integer such that $N0 \times 8 - 2^n < 8$. If $N0$ is an odd number, then $N1$ is the largest odd number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. When $N0$ is an even number, $N1$ is the largest even number such that $N0 < N1$ and each of the bits $N0 \times 8$ to $(N1 \times 8 - 1)$ is equal to 0. If such a value $N1 > N0$ does not exist, $N1 = N0$. Additionally, $N2$ is the smallest integer value for which the values for bit $(N2+1) \times 8$ to 2007 in the traffic indication virtual bitmap are all 0. If such a value $N2$ does not exist, that is, when not all bits in the last octet of the traffic indication virtual bitmap are equal to 0, $N2 = 250$. When using this method, the Bitmap Offset subfield contains the value of $(N1 - N0)/2$, and the Length field is $N0 + N2 - N1 + 4$.

NOTE—When $N1 = N0$, Method B reduces to Method A.

For both Method A and Method B, when there are no frames buffered for any BSS corresponding to a transmitted or nontransmitted BSSID supported, the Partial Virtual Bitmap field is encoded as a single octet equal to 0, the Bitmap Offset subfield is 0, and the Length field is 4. When there are no buffered individually addressed frames for any BSS corresponding to a transmitted or nontransmitted BSSID, but there are buffered group addressed frames for one or more of the BSSs, the Partial Virtual Bitmap field consists of the octets number 0 to $N0 - 1$ where $N0$ is the smallest positive integer such that $(N0 \times 8 - 2^n < 8)$. In this case, the Bitmap Offset subfield value contains the number 0, and the Length field is $N0+3$.

9.4.2.7 IBSS Parameter Set element

The IBSS Parameter Set element contains the set of parameters necessary to support an IBSS. See Figure 9-128.

| | | | |
|---------|------------|--------|-------------|
| | Element ID | Length | ATIM Window |
| Octets: | 1 | 1 | 2 |

Figure 9-128—IBSS Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The ATIM Window field contains the ATIM window length in TU.

9.4.2.8 Challenge Text element

The Challenge Text element contains the challenge text within Authentication exchanges. See Figure 9-129.

| | | | |
|---------|------------|--------|----------------|
| | Element ID | Length | Challenge Text |
| Octets: | 1 | 1 | 1–253 |

Figure 9-129—Challenge Text element format

The Element ID and Length fields are defined in 9.4.2.1.

The content of the Challenge Text field is dependent upon the authentication algorithm and the transaction sequence number as specified in 12.3.3.2.

9.4.2.9 Country element

The Country element contains the information required to allow a STA to identify the regulatory domain in which the STA is located and to configure its PHY for operation in that regulatory domain. The format of this element is as shown in Figure 9-130.

| | | | | | |
|---------|------------|--------|----------------|--------------|---------------------|
| | Element ID | Length | Country String | Triplet | Padding (if needed) |
| Octets: | 1 | 1 | 3 | $Q \times 3$ | 0 or 1 |

Figure 9-130—Country element format

The Element ID and Length fields are defined in 9.4.2.1. The length of the element is variable, as the element contains the variable-length Triplet field.

The Country String field is 3 octets in length. The AP and mesh STA set this field to the value contained in dot11CountryString before transmission in a Beacon or Probe Response frame. Upon reception of this element, a STA sets the value of the dot11CountryString to the value contained in this field. The three octets of the Country String have additional structure as defined by dot11CountryString (see Annex C).

If dot11OperatingClassesRequired is false, then the Triplet field is a single Subband Triplet Sequence field, as shown in Figure 9-131, that is composed of Q Subband Triplet fields, where Q is one or more. The format of the Subband Triplet field is shown in Figure 9-132.

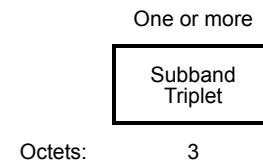

Figure 9-131—Subband Triplet Sequence format

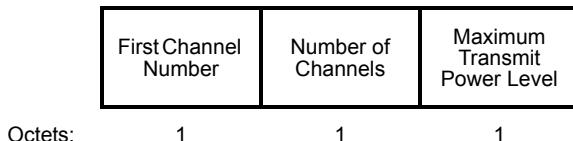

Figure 9-132—Subband Triplet field

If `dot11OperatingClassesRequired` is true, then the Triplet field is composed of zero or more Subband Triplet fields followed by one or more Operating/Subband Sequences, as shown in Figure 9-133. Each Operating/Subband Sequence is composed of one Operating Triplet field followed by one Subband Triplet Sequence field, as shown in Figure 9-134. Each Subband Triplet Sequence field is composed of zero or more Subband Triplet fields. If `dot11OperatingClassesRequired` is true, the number of triplets in the Triplet

field is $Q = N + \sum_{m=1}^M (1 + P(m))$, where N is the total number of Subband Triplet fields and M is the total number of Operating/Subband Sequences contained in Country element and $P(m)$ is the number of Subband Triplet fields making up Operating/Subband Sequence field m .

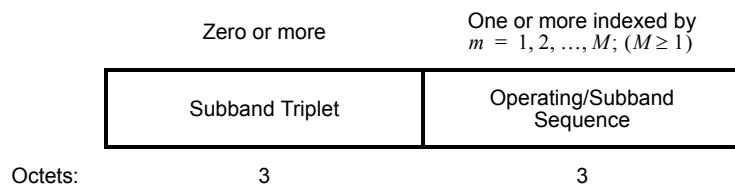

Figure 9-133—Triplet field if `dot11OperatingClassRequired` is true

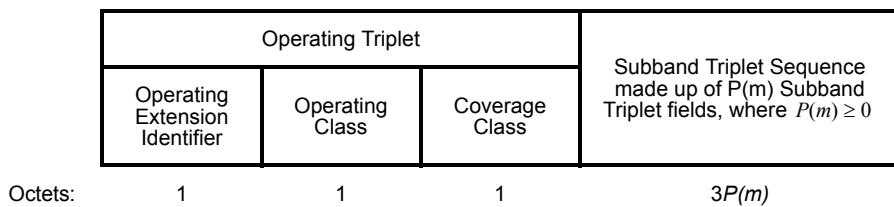

Figure 9-134—Format of m -th Operating/Subband Sequence field

The number Q of Subband fields or Operating triplet fields in the element is determined by the Length field.

An operating class for an 80+80 MHz channel width is expressed by two consecutive Operating/Subband Sequences, where the first Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz Channel Spacing with an 80+ behavior limit and the second Operating/Subband Sequence field contains an Operating Triplet field indicating an 80 MHz Channel Spacing without an 80+ behavior limit.

Operating/Subband Sequence fields that contain an Operating Class field for which the “Channel Spacing (MHz)” column in the appropriate table in Annex E equals 80 or 160 contain zero Subband Triplet fields.

NOTE 1—Any Operating Triplet field indicating 80 MHz, 160 MHz, and 80+80 MHz can be omitted from the Country element (see 10.21.3).

NOTE 2—The Transmit Power Envelope element is always used for TPC for 80 MHz, 160 MHz, or 80+80 MHz operating classes instead of Subband Triplet fields (see 11.40.1).

The first octet in each Subband Triplet field or Operating Triplet field contains an unsigned integer and identifies the type of field. If the integer has a value less than or equal to 200, then the field is a Subband Triplet field. If the integer has a value of 201 or greater, then the field is an Operating Triplet field.

The minimum length of the element is 8 octets.

The First Channel Number field indicates the lowest channel number in the Subband Triplet field. No channel is indicated by more than one pair of First Channel Number and Number of Channels fields within a Subband Triplet Sequence field. [For example, the (First Channel Number, Number of Channels) pairs (2,4) and (5,2) in 2.4 GHz each indicate channel 5, therefore are not used within the same Subband Triplet Sequence field.] The First Channel Numbers are monotonically increasing within a Subband Triplet Sequence field. The First Channel Number and the Number of Channels pairs in a Country element are used to describe channels only in the band on which the frame containing the element is transmitted.

The Number of Channels subfield of the subelement is 1 octet in length. Outside the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by the BSS bandwidth. For Subband Triplet fields that are not within an Operating/Subband Sequence field, the BSS bandwidth is 20 MHz. For Subband Triplet fields that are within an Operating/Subband Sequence field, the BSS bandwidth is as indicated by the operating class in the same Operating/Subband Sequence field. In the 2.4 GHz band, the channel numbers that are included in a group of channels are separated by 5 MHz (for both 20 and 40 MHz BSS bandwidth), except that channel 14 is treated as if it were 5 MHz above channel 13.

NOTE—For example, the channels 1 to 11 in the 2.4 GHz band can be represented using one Subband Triplet subfield with First Channel Number = 1 and Number of Channels = 11. The channels 36, 40, 44 and 48 with 20 MHz BSS bandwidth in the 5 GHz band can be represented using one Subband Triplet subfield with First Channel Number = 36 and Number of Channels = 4. The six channels 183, 184, 185, 187, 188 and 189 (but not 186) with 10 MHz BSS bandwidth can be represented using three Subband Triplet subfields: one with First Channel Number = 183 and Number of Channels = 4, one with First Channel Number = 184 and Number of Channels = 1 and one with First Channel Number = 188 and Number of Channels = 1.

The Maximum Transmit Power Level field is a signed number and is 1 octet in length. The Maximum Transmit Power Level field indicates the maximum power, in dBm, allowed to be transmitted. As the method of measurement for maximum transmit power level differs by regulatory domain, the value in this field is interpreted according to the regulations applicable for the domain identified by the Country String.

An operating class is an index into a set of values for radio equipment sets of rules. The Operating Class field is 1 octet in length.

A coverage class is an index into a set of values for aAirPropagationTime. The Coverage Class field is reserved in a DMG BSS. The Coverage Class field is 1 octet in length.

The Coverage Class field of the Operating Triplet field specifies the aAirPropagationTime characteristic used in BSS operation, as shown in Table 9-79. The characteristic aAirPropagationTime describes variations in actual propagation time that are accounted for in a BSS and, together with maximum transmit power level, allow control of BSS diameter.

The Padding field is 0 or 1 octet in length. The Padding field is used to add, if needed, a single octet (with the value 0) to the Country element so that its length is evenly divisible by 2.

Table 9-79—Coverage Class field parameters

| Coverage class value | aAirPropagationTime (μs) |
|----------------------|---|
| 0–31 | $n \times 3$, where n is the value of the coverage class |
| 32–255 | Reserved |

9.4.2.10 Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. The format of the element is as shown in Figure 9-135.

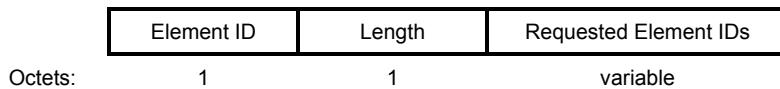

Figure 9-135—Request element

The Element ID and Length fields are defined in 9.4.2.1.

The Requested Element IDs are the list of elements that are requested to be included in the Probe Response or Information Response frame. The Requested Element IDs are listed in order of increasing element ID. The Requested Element IDs within a Request element transmitted in an Information Request frame do not include an element ID that corresponds to an element that will be included in the Information Response frame even in the absence of the Request element, as shown in Table 9-390. A given element ID is included at most once among the Requested Element IDs.

NOTE—Some implementations might unnecessarily include in a Probe Request frame a Request element that contains the element ID of an element that will be included in the Probe Response frame even in the absence of the element ID in the Request element; see the notes in Table 9-34. Some implementations might include in a Probe Request frame a Request element that contains the element ID of an element that will not be included in the Probe Response frame even in the presence of the element ID in the Request element.

The Request element does not support Extended Element IDs.

See 11.1.4.3.5 for additional requirements.

9.4.2.11 Extended Request element

This element is placed in a Probe Request frame or Information Request frame to request that the responding STA include the requested information in the Probe Response frame or Information Response frame, respectively. The format of the element is as shown in Figure 9-136.

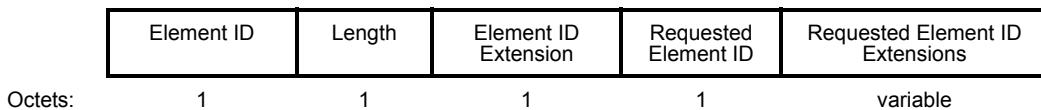

Figure 9-136—Extended Request element

The Element ID, Element ID Extension, and Length fields are defined in 9.4.2.1.

The Requested Element ID field contains one of the Element IDs used to indicate an extended element.

The Requested Element ID Extensions field contains a list of 1-octet element ID extension values that, combined with the value of the Requested Element ID field, identify elements that are requested to be included in the Probe Response or Information Response frame. The values in this field are listed in increasing order. The requested elements within an Extended Request element transmitted in a Probe Request frame do not identify an element that will be included in the Probe Response frame even in the absence of the Request element, or will be excluded from the Probe Response frame even in the presence of the Extended Request element as described by the notes in Table 9-34. The requested elements within an Extended Request element transmitted in an Information Request frame do not identify an element that will be included in the Information Response frame even in the absence of the Extended Request element, as shown in Table 9-390. A given element ID extension value is included at most once in the Requested Element ID Extensions field.

See 11.1.4.3.5 for additional requirements.

9.4.2.12 ERP element

The ERP element contains information on the presence of Clause 15 or Clause 16 STAs in the BSS that are not capable of Clause 18 (ERP-OFDM) data rates. It also contains the requirement of the ERP element sender (AP, IBSS STA, or mesh STA) as to the use of protection mechanisms to optimize BSS performance and as to the use of long or short Barker pREAMbles. See Figure 9-137 for a definition of the frame element.

The ERP element has the form shown in Figure 9-137.

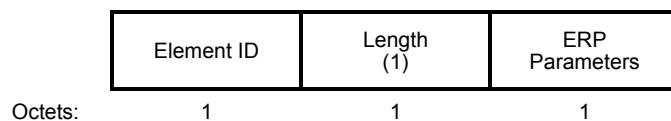

Figure 9-137—ERP element

The Element ID and Length fields are defined in 9.4.2.1.

The ERP Parameters field is defined in Figure 9-138.

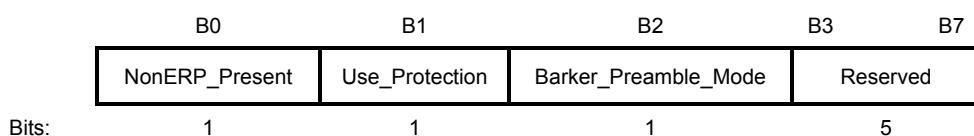

Figure 9-138—ERP Parameters field

Recommended behavior for setting the Use_Protection bit is contained in 10.26.

9.4.2.13 Extended Supported Rates and BSS Membership Selectors element

The Extended Supported Rates and BSS Membership Selectors element specifies the rates in the OperationalRateSet parameter, as described in the MLME-JOIN.request and MLME-START.request primitives, and zero or more BSS membership selectors, where these are not carried in the Supported Rates and BSS Membership Selectors element. The Information field is encoded as 1 to 255 octets, where each octet describes a single supported rate or BSS membership selector (see Figure 9-139).

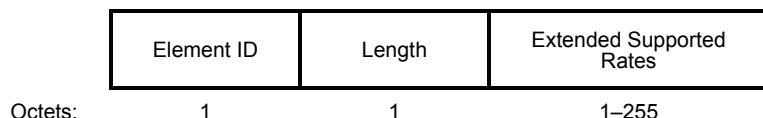

Figure 9-139—Extended Supported Rates and BSS Membership Selectors element format

The Element ID and Length fields are defined in 9.4.2.1.

The format and interpretation of each octet of the Extended Supported Rates field is the same as that of an octet in the Supported Rates field in a Supported Rates and BSS Membership Selectors element (see 9.4.2.3).

9.4.2.14 Power Constraint element

The Power Constraint element contains the information necessary to allow a STA to determine the local maximum transmit power in the current channel. The format of the Power Constraint element is shown in Figure 9-140.

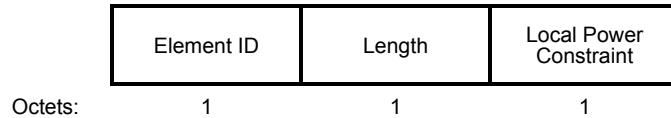

Figure 9-140—Power Constraint element format

The Element ID and Length fields are defined in 9.4.2.1.

The Local Power Constraint field is coded as an unsigned integer in units of decibels. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel (from the MIB) in the Power Constraint element.

The Power Constraint element is included in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11. The use of Power Constraint elements is described in 11.8.5.

9.4.2.15 Power Capability element

The Power Capability element specifies the minimum and maximum transmit powers with which a STA is capable of transmitting in the current channel. The format of the Power Capability element is shown in Figure 9-141.

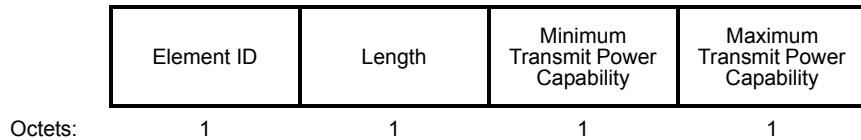

Figure 9-141—Power Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The Minimum Transmit Power Capability field is set to the nominal minimum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.8.4.

The Maximum Transmit Power Capability field is set to the nominal maximum transmit power with which the STA is capable of transmitting in the current channel, with a tolerance ± 5 dB. The field is coded as a signed integer in units of decibels relative to 1 mW. Further interpretation of this field is defined in 11.8.4.

The Power Capability element is included in Association Request frames, as described in 9.3.3.6; Reassociation Request frames, as described in 9.3.3.8; and Mesh Peering Open frame, as described in 9.6.16.2.2. The use of Power Capability elements is described in 11.8.2.

9.4.2.16 TPC Request element

The TPC Request element contains a request for a STA to report transmit power and link margin information using a TPC Report element. The format of the TPC Request element is shown in Figure 9-142.

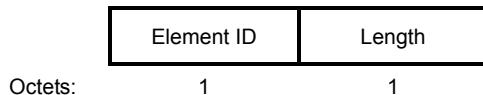

Figure 9-142—TPC Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TPC Request element is included in TPC Request frames, as described in 9.6.2.4. The use of TPC Request elements and frames is described in 11.8.7.

9.4.2.17 TPC Report element

The TPC Report element contains transmit power and link margin information sent in response to a TPC Request element or a Link Measurement Request frame. A TPC Report element is included in a Beacon frame or Probe Response frame without a corresponding request. The format of the TPC Report element is shown in Figure 9-143.

Figure 9-143—TPC Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Transmit Power field is set to the transmit power used to transmit the frame containing the TPC Report element. The field is coded as a 2s complement signed integer in units of decibels relative to 1 mW. The maximum tolerance for the transmit power value reported in the TPC Response element is ± 5 dB. This tolerance is defined as the difference, in decibels, between the reported power value and the actual EIRP of the STA (when transmitting 1500 octet frames or maximum MPDU sized-frames, whichever is smaller).

The Link Margin field contains the link margin for the receive time and for the receive rate of the frame containing the TPC Request element or the Link Measurement Request frame. The field is coded as a 2s

complement signed integer in units of decibels. The Link Margin field is reserved when a TPC Report element is included in a Beacon frame or Probe Response frame. The method used to measure the link margin is beyond the scope of this standard.

The TPC Report element is included in TPC Report frames, as described in 9.6.2.5; Link Measurement Report frames, as described in 9.6.7.5; Beacon frames, as described in 9.3.3.3; and Probe Response frames, as described in 9.3.3.11. The use of TPC Report elements and frames is described in 11.8.7.

9.4.2.18 Supported Channels element

The Supported Channels element contains a list of channel subbands (from those channels defined in 17.3.8.4.3) in which a STA is capable of operating. The format of the Supported Channels element is shown in Figure 9-144.

| One (first channel, number of channels) tuple for each subband | | | |
|--|--------|----------------------|--------------------|
| Element ID | Length | First Channel Number | Number of Channels |
| Octets: | 1 | 1 | 1 |

Figure 9-144—Supported Channels element format

The Element ID and Length fields are defined in 9.4.2.1.

The First Channel Number field is set to the first channel (as defined in 17.3.8.4.3) in a subband of supported channels.

The Number of Channels field is set to the number of channels in a subband of supported channels.

The Supported Channels element is included in Association Request frames, as described in 9.3.3.6; Reassociation Request frames, as described in 9.3.3.8; and Mesh Peering Open frame, as described in 9.6.16.2.2. The use of the Supported Channels element is described in 11.9.2 and 11.9.8.

9.4.2.19 Channel Switch Announcement element

The Channel Switch Announcement element is used by an AP, IBSS STA, mesh STA, or PCP to advertise when it is changing to a new channel and the channel number of the new channel. The format of the Channel Switch Announcement element is shown in Figure 9-145.

| Element ID | Length | Channel Switch Mode | New Channel Number | Channel Switch Count |
|------------|--------|---------------------|--------------------|----------------------|
| Octets: | 1 | 1 | 1 | 1 |

Figure 9-145—Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP or IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission. In an MBSS, the Channel Switch Mode field is reserved. See 11.9.9.

The New Channel Number field is set to the number of the channel to which the STA is moving (as defined in 17.3.8.4.3).

For nonmesh STAs, the Channel Switch Count field either is set to the number of TBTTs until the STA sending the Channel Switch Announcement element switches to the new channel or is set to 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs at any time after the frame containing the element is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Announcement element switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the element is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

The Channel Switch Announcement element is included in Channel Switch Announcement frames, as described in 9.6.2.6, and can be included in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11. The use of Channel Switch Announcement elements and frames is described in 11.9.8.

9.4.2.20 Secondary Channel Offset element

The Secondary Channel Offset element is used by an AP, IBSS STA or mesh STA when changing to a new 40 MHz or wider channel. The format of the Secondary Channel Offset element is shown in Figure 9-146.

The Secondary Channel Offset element is included in Channel Switch Announcement frames, as described in 9.6.2.6.

| | Element ID | Length | Secondary Channel Offset |
|---------|------------|--------|--------------------------|
| Octets: | 1 | 1 | 1 |

Figure 9-146—Secondary Channel Offset element format

The Element ID and Length fields are defined in 9.4.2.1.

The Secondary Channel Offset field of the Secondary Channel Offset element represents the position of the secondary channel relative to the primary channel. The values of the Secondary Channel Offset field are defined in Table 9-80.

Table 9-80—Values of the Secondary Channel Offset field

| Value | Name | Description |
|--------------|-------------------------------|--|
| 0 | SCN - no secondary channel | Indicates that no secondary channel is present. |
| 1 | SCA - secondary channel above | Indicates that the secondary channel is above the primary channel. |
| 2 | | Reserved. |
| 3 | SCB - secondary channel below | Indicates that the secondary channel is below the primary channel. |
| 4–255 | | Reserved. |

9.4.2.21 Measurement Request element

9.4.2.21.1 General

The Measurement Request element contains a request that the receiving STA undertake the specified measurement action. The Measurement Request element is included in Measurement Request frames, as described in 9.6.2.2, or Radio Measurement Request frames, as described in 9.6.7.2. Measurement types 0, 1, and 2 are defined for spectrum management and are included only in Measurement Request frames. The use of Measurement Request elements for spectrum management is described in 11.9.7. All other measurement types are included only in Radio Measurement Request frames. The use of Measurement Request elements for radio measurement is described in 11.11.

The format of the Measurement Request element is shown in Figure 9-147.

| Element ID | Length | Measurement Token | Measurement Request Mode | Measurement Type | Measurement Request |
|------------|--------|-------------------|--------------------------|------------------|---------------------|
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-147—Measurement Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The value of the Length field is variable and depends on the length of the Measurement Request field. The minimum value of the Length field is 3 (based on a minimum length for the Measurement Request field of 0 octets).

The Measurement Token is set to a nonzero number that is unique among the Measurement Request elements in a particular Measurement Request frame.

The Measurement Request Mode field (shown in Figure 9-148) is a bit field with the following bits defined:

- The Parallel bit (bit 0) is used to request that more than one measurement is to be started in parallel. Parallel is set to 1 to request that the measurement is to start at the same time as the measurement described by the next Measurement Request element in the same Measurement Request frame. Parallel is set to 0 if the measurements are to be performed in sequence. The Parallel bit is reserved when Enable is 1, in the last or only Measurement Request element in the frame, or when the value of the Measurement Type field is 0, 1, or 2 (spectrum management measurements). See 11.11.6.
- The Enable bit (bit 1) is used to differentiate between a request to make a measurement and a request to control the measurement requests and triggered or autonomous reports generated by the destination STA. The Enable bit is further described in Table 9-81.
- Request bit (bit 2) is described in Table 9-81.
- Report bit (bit 3) is described in Table 9-81.
- The Duration Mandatory bit (bit 4) indicates whether the measurement duration contained within the measurement request is interpreted as mandatory by the STA receiving the request. A value of 0 indicates that the duration requested is a maximum duration, and the requesting STA accepts measurement results taken over any shorter duration. A value of 1 indicates that the duration requested is a mandatory duration. The Duration Mandatory bit is reserved when the Enable bit is 1, or when the value of the Measurement Type field is 0, 1, 2, 8, or 255. See 11.11.4.
- All other bits are reserved.

| B0 | B1 | B2 | B3 | B4 | B5 | B7 |
|----------|--------|---------|--------|--------------------|----------|----|
| Parallel | Enable | Request | Report | Duration Mandatory | Reserved | |
| Bits: | 1 | 1 | 1 | 1 | 1 | 3 |

Figure 9-148—Measurement Request Mode field

The use of the Enable, Request, and Report bits is summarized in Table 9-81. See 11.9.7 and 11.11.6 for the description of how a STA handles requests to enable or disable measurement requests and autonomous reports. See 11.11.8 for a description of the use of the Enable and Report bits in triggered reporting.

Table 9-81—Summary of use of Enable, Request, and Report bits

| Bits | | | Meaning of bits |
|--------|----------|----------|---|
| Enable | Request | Report | |
| 0 | Reserved | Reserved | The transmitting STA is requesting that the destination STA make a measurement of type indicated in the Measurement Type field. When Enable bit is 0, Request and Report bits are reserved. |
| 1 | 0 | 0 | The transmitting STA is requesting that the destination STA not send any measurement requests or reports of the type indicated in the Measurement Type field. |
| 1 | 1 | 0 | The transmitting STA is indicating to the destination STA that it can accept measurement requests and is requesting the destination STA not send autonomous or triggered measurement reports of the type indicated in the Measurement Type field. NOTE—This setting corresponds to the default STA behavior. |
| 1 | 0 | 1 | The transmitting STA is requesting that the destination STA not send measurement requests and indicating it accepts autonomous or triggered measurement reports of the type indicated in the Measurement Type field. |
| 1 | 1 | 1 | The transmitting STA is indicating to the destination STA that it can accept measurement requests and can accept autonomous or triggered measurement reports of the type indicated in the Measurement Type field. |

The Measurement Type field is set to a number that identifies a type of measurement request or measurement report. The measurement types that have been allocated for measurement requests are shown in Table 9-82 and measurement reports are shown in Table 9-107 (in 9.4.2.22).

Table 9-82—Measurement type definitions for measurement requests

| Name | Measurement type |
|--|------------------|
| Basic | 0 |
| Clear Channel Assessment (CCA) | 1 |
| Receive Power Indication (RPI) Histogram | 2 |
| Channel Load | 3 |
| Noise Histogram | 4 |

Table 9-82—Measurement type definitions for measurement requests (continued)

| Name | Measurement type |
|--------------------------------------|------------------|
| Beacon | 5 |
| Frame | 6 |
| STA Statistics | 7 |
| LCI | 8 |
| Transmit Stream/Category Measurement | 9 |
| Multicast Diagnostics | 10 |
| Location Civic | 11 |
| Location Identifier | 12 |
| Directional Channel Quality | 13 |
| Directional Measurement | 14 |
| Directional Statistics | 15 |
| Fine Timing Measurement Range | 16 |
| Reserved | 17–254 |
| Measurement Pause | 255 |

When the Enable bit is 0, the Measurement Request field contains the specification of a single measurement request corresponding to the measurement type, as described in 9.4.2.21.2 to 9.4.2.21.12. When the Enable bit is 1, the Measurement Request field is present only when requesting a triggered measurement.

References in this standard to a ‘<name> request’, where <name> corresponds to one of the Measurement Types in Table 9-82 is equivalent to (according to context) a) ‘a Measurement Request frame or Radio Measurement Request frame carrying a Measurement Request element with the measurement type field equal to <name>’ or b) ‘a Measurement Request element with the measurement type field equal to <name>’.

9.4.2.21.2 Basic request

The Measurement Request field corresponding to a Basic request is shown in Figure 9-149. See 11.9.7.

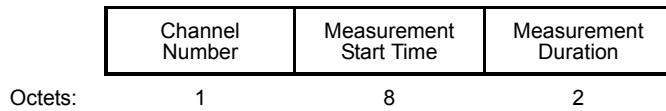

Figure 9-149—Measurement Request field format for a Basic request

The Channel Number field is set to the channel number for which the measurement request applies where the channel number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF timer at the time ($\pm 32 \mu\text{s}$) at which the requested Basic request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.21.3 CCA request (Clear channel access request)

The Measurement Request field corresponding to a CCA request is shown in Figure 9-150.

| | | | |
|---------|----------------|------------------------|----------------------|
| | Channel Number | Measurement Start Time | Measurement Duration |
| Octets: | 1 | 8 | 2 |

Figure 9-150—Measurement Request field format for a CCA request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time ($\pm 32 \mu\text{s}$) at which the requested CCA request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.21.4 RPI histogram request (Received power indicator histogram request)

The Measurement Request field corresponding to an RPI Histogram request is shown in Figure 9-151.

| | | | |
|---------|----------------|------------------------|----------------------|
| | Channel Number | Measurement Start Time | Measurement Duration |
| Octets: | 1 | 8 | 2 |

Figure 9-151—Measurement Request field format for an RPI Histogram request

The Channel Number field is set to the channel number for which the measurement request where the channel number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time ($\pm 32 \mu\text{s}$) at which the requested RPI Histogram request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in TUs.

9.4.2.21.5 Channel Load request

The Measurement Request field corresponding to a Channel Load request is shown in Figure 9-152.

| | | | | | |
|---------|-----------------|----------------|------------------------|----------------------|----------------------|
| | Operating Class | Channel Number | Randomization Interval | Measurement Duration | Optional Subelements |
| Octets: | 1 | 1 | 2 | 2 | variable |

Figure 9-152—Measurement Request field format for Channel Load request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel

Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with a value of 80 or 160 in the “Channel Spacing (MHz)” column in the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class field and Channel Number field together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.11.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-83.

Table 9-83—Optional subelement IDs for Channel Load request

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | Reserved | |
| 1 | Channel Load Reporting | Yes |
| 2–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Channel Load Reporting subelement indicates the condition for issuing a Channel Load report. The Channel Load Reporting subelement data field format is shown in Figure 9-153 and contains a 1-octet Reporting Condition subfield and a 1-octet Channel Load Reference Value subfield. The Reporting Condition subfield is described in Table 9-84. The Channel Load Reference value is a Channel Load value as defined in 11.11.9.3 and is the reference value for the indicated reporting condition.

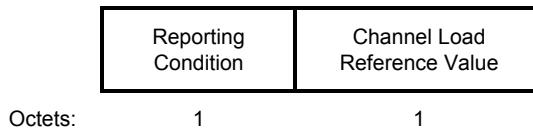

Figure 9-153—Channel Load Reporting data field format

Table 9-84—Reporting Condition subfield for Channel Load report

| Condition for report to be issued | Reporting Condition |
|--|---------------------|
| Report to be issued after each measurement (default, used when the Channel Load Reporting subelement is not included in the Channel Load request). | 0 |
| Report to be issued when the measured Channel Load is greater than or equal to the reference value. | 1 |
| Report to be issued when the measured Channel Load is less than or equal to the reference value. | 2 |
| Reserved | 3–255 |

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements might be included in the list of optional subelements.

9.4.2.21.6 Noise Histogram request

The Measurement Request field corresponding to a Noise Histogram request is shown in Figure 9-154.

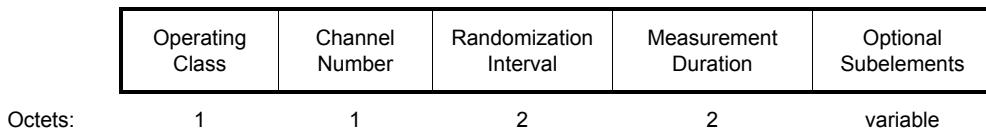

Figure 9-154—Measurement Request field format for Noise Histogram request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.11.4.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-85.

Table 9-85—Optional subelement IDs for Noise Histogram request

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | Reserved | |
| 1 | Noise Histogram Reporting | Yes |
| 2–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Noise Histogram Reporting subelement indicates the condition for issuing a Noise Histogram report. The Noise Histogram Reporting subelement data field format is shown in Figure 9-155 and contains a 1-octet Reporting Condition subfield and a 1-octet ANPI Reference Value subfield. The Reporting Condition subfield is described in Table 9-86. The ANPI Reference Value is an ANPI value as defined in 11.11.9.4 and is the reference value for the indicated reporting condition.

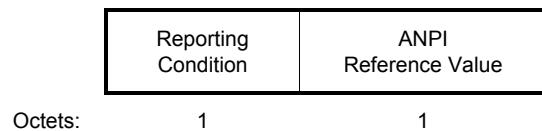

Figure 9-155—Noise Histogram Reporting data field format

Table 9-86—Reporting Condition subfield for Noise Histogram report

| Condition for report to be issued | Reporting Condition |
|--|---------------------|
| Report to be issued after each measurement (default, used when Noise Histogram Reporting subelement is not included in a Noise Histogram request). | 0 |
| Noise Histogram report to be issued when measured ANPI is greater than or equal to the reference value. | 1 |
| Noise Histogram report to be issued when measured ANPI is less than or equal to the reference value. | 2 |
| Reserved | 3–255 |

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements might be included in the list of optional subelements.

9.4.2.21.7 Beacon request

The Measurement Request field corresponding to a Beacon request is shown in Figure 9-156.

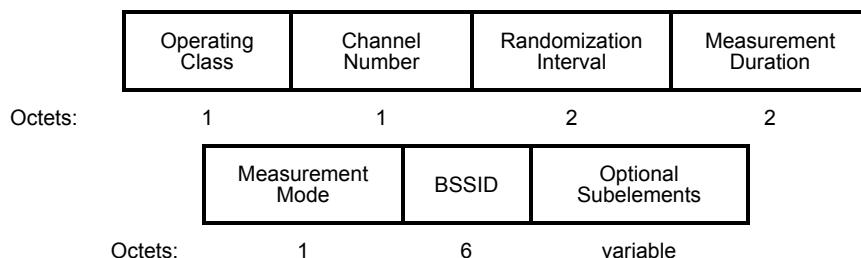

Figure 9-156—Measurement Request field format for Beacon request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, the Channel Number field value is either 0 or 255; otherwise, the Channel Number field value is 0, 255, or the channel number for which the measurement request applies and is defined within an operating class as shown in Annex E.

For operating classes that identify the location of the primary channel, a Channel Number field value of 0 indicates a request to make iterative measurements for all supported channels in the operating class where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that encompass a primary channel but do not identify the location of the primary channel, a Channel Number field value of 0 indicates a request to make iterative measurements for all primary channel positions within all requested and supported channels where the measurement is permitted on the channel and the channel is valid for the current regulatory domain.

For operating classes that identify the location of the primary channel, a Channel Number field value of 255 indicates a request to make iterative measurements for all supported channels in the current operating class listed in the latest AP Channel Report received from the serving AP.

A request frame is a request to make iterative measurements for all primary channel positions in all channels listed in the frame's AP Channel Report subelement when all of the following pertain:

- The operating class indicated by the Operating Class field in that frame encompasses a primary channel.
- The frame does not identify the location of that primary channel.
- The value of the frame's Channel Number field is 255.
- The channel is supported.
- The measurement is permitted on the channel.
- The channel is permitted in the current regulatory domain.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.11.4.

Measurement Mode indicates the mode to be used for the measurement. The valid measurement modes are listed in Table 9-87. The procedures for each mode are described in 11.11.9.1.

Table 9-87—Measurement Mode definitions for Beacon request

| Mode | Value |
|--------------|-------|
| Passive | 0 |
| Active | 1 |
| Beacon Table | 2 |
| Reserved | 3–255 |

The BSSID field indicates the BSSID of the BSS(s) for which a beacon report is requested. When requesting beacon reports for all BSSs on the channel, the BSSID field contains the wildcard BSSID; otherwise the BSSID field contains a specific BSSID for a single BSS.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-88.

Table 9-88—Optional subelement IDs for Beacon request

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | SSID | |
| 1 | Beacon Reporting | Yes |
| 2 | Reporting Detail | Yes |
| 3–9 | Reserved | |
| 10 | Request | |
| 11 | Extended Request | |
| 12–50 | Reserved | |
| 51 | AP Channel Report | |
| 52–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The SSID subelement indicates the ESS(s) or IBSS(s) for which a beacon report is requested. When SSID is not included in a Beacon request, the default “wildcard SSID” is used; otherwise the SSID is included in the Beacon request and contains a specific SSID for a single ESS or IBSS. The wildcard SSID is used to represent all possible SSIDs. The SSID element is described in 9.4.2.2.

The Beacon Reporting subelement indicates the condition for issuing a Beacon report. The Beacon Reporting subelement is optionally present in a Beacon request for repeated measurements; otherwise it is not present. The Beacon Reporting subelement data field format is shown in Figure 9-157 and contains a 1-octet Reporting Condition subfield and a 1-octet Threshold/Offset Reference subfield. The Reporting Condition subfield is described in Table 9-89. The Threshold/Offset Reference subfield contains either the threshold value or the offset value to be used for conditional reporting. For Reporting Condition subfield 1 and 2, the threshold value is a logarithmic function of the received signal power, as defined 9.4.2.38. For Reporting Condition subfield 3 and 4, the threshold value is a logarithmic function of the signal-to-noise ratio, as described in 9.4.2.41. For Reporting Condition subfield 5 to 10, the offset value is an 8-bit 2s complement integer in units of 0.5 dBm. The indicated reporting condition applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. Reporting conditions are further described in 11.11.9.1.

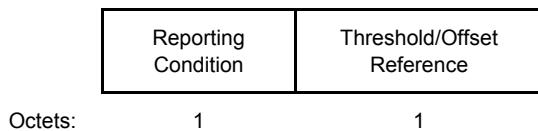

Figure 9-157—Beacon Reporting data field format

Table 9-89—Reporting Condition subfield for Beacon report

| Condition for report to be issued in Repeated Measurement | Reporting Condition |
|---|---------------------|
| Report to be issued after each measurement (default, used when the Beacon Reporting subelement is not included in a Beacon request). | 0 |
| The measured RCPI level is greater than the threshold value contained in the Threshold/Offset Reference. | 1 |
| The measured RCPI level is less than the threshold value contained in the Threshold/Offset Reference. | 2 |
| The measured RSNI level is greater than the threshold value contained in the Threshold/Offset Reference. | 3 |
| The measured RSNI level is less than the threshold value contained in the Threshold/Offset Reference. | 4 |
| The measured RCPI level is greater than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset value is contained in the Threshold/Offset Reference. | 5 |
| The measured RCPI level is less than a threshold defined by an offset from the serving AP’s reference RCPI, where the offset value is contained in the Threshold/Offset Reference. | 6 |
| The measured RSNI level is greater than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset value is contained in the Threshold/Offset Reference. | 7 |
| The measured RSNI level is less than a threshold defined by an offset from the serving AP’s reference RSNI, where the offset value is contained in the Threshold/Offset Reference. | 8 |

Table 9-89—Reporting Condition subfield for Beacon report (continued)

| Condition for report to be issued in Repeated Measurement | Reporting Condition |
|---|---------------------|
| The measured RCPI level is in a range bound by the serving AP’s reference RCPI and an offset from the serving AP’s reference RCPI, where the offset value is contained in the Threshold/Offset Reference. | 9 |
| The measured RSNI level is in a range bound by the serving AP’s reference RSNI and an offset from the serving AP’s reference RSNI, where the offset value is contained in the Threshold/Offset Reference. | 10 |
| Reserved | 11–255 |

The Reporting Detail subelement contains a 1-octet Reporting Detail data field that defines the level of detail per AP to be reported to the requesting STA. The Reporting Detail values are defined in Table 9-90.

Table 9-90—Reporting Detail values

| Level of detail requested | Reporting Detail |
|---|------------------|
| No fixed-length fields or elements | 0 |
| All fixed-length fields and any requested elements in the Request element if present | 1 |
| All fixed-length fields and elements (default, used when Reporting Detail subelement is not included in a Beacon request) | 2 |
| Reserved | 3–255 |

The indicated reporting detail applies individually to each measured Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail equals 1, a Request element is optionally present in the optional subelements field. If included, the Request element lists the Element IDs of the elements requested to be reported in the Reported Frame Body of the Beacon report.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Request, Extended Request, AP Channel Report, and Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.10, 9.4.2.11, 9.4.2.36, and 9.4.2.26, respectively). Multiple AP Channel Report and Vendor Specific subelements can be included in the list of optional subelements. An AP Channel Report subelement containing an operating class with an 80+ behavior limit (as defined in Annex E) is interpreted in conjunction with following AP Channel Report elements as defined in 11.11.9.1.

If one or more AP Channel Report elements are included, they indicate that iterative measurements are requested first on the channel(s) indicated by the Operating Class and Channel Number fields included in the Beacon request, and second on the channel(s) indicated by the Operating Class and Channel List fields of each AP Channel Report element included in the Beacon request. The procedures for iterative measurements on multiple channels are described in 11.11.9.1.

9.4.2.21.8 Frame request

The Measurement Request field corresponding to a Frame request is shown Figure 9-158.

| Operating Class | Channel Number | Randomization Interval | Measurement Duration | Frame Request Type | MAC Address | Optional subelements |
|-----------------|----------------|------------------------|----------------------|--------------------|-------------|----------------------|
| Octets: | 1 | 1 | 2 | 2 | 1 | 6 |

Figure 9-158—Measurement Request field format for Frame request

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement request applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement request applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement request applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.11.4.

The Frame Request Type indicates which subelements are requested in the Frame report. The value of 1 signifies that a Frame Count Report is requested. The values 0 and 2 to 255 are reserved.

If the MAC Address field is the broadcast address, then all Data or Management frames are counted toward the Frame report generated in response to this Frame request. For other MAC addresses, only frames matching this MAC address as the Transmitter Address are counted toward the Frame report generated in response to this Frame request.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-91.

Table 9-91—Optional subelement IDs for Frame request

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.21.9 STA Statistics request

The Measurement Request field corresponding to a STA Statistics request is shown in Figure 9-159.

| Peer MAC Address | Randomization Interval | Measurement Duration | Group Identity | Optional Subelements |
|------------------|------------------------|----------------------|----------------|----------------------|
| Octets: | 6 | 2 | 2 | 1 variable |

Figure 9-159—Measurement Request field format for STA Statistics request

The Peer MAC Address field is the RA or TA MAC address for the frame statistics of this measurement.

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Measurement Duration field is set to the duration of the requested measurement in TUs except when triggered reporting is used. When triggered reporting is used, the measurement duration is 0.

Group Identity indicates the requested statistics group according to Table 9-92.

Table 9-92—Group Identity for a STA Statistics request

| Statistics Group Name | Group Identity |
|---|----------------|
| STA Counters from dot11CountersTable | 0 |
| STA Counters from dot11MacStatistics group | 1 |
| QoS STA Counters for UP0 from dot11QosCountersTable | 2 |
| QoS STA Counters for UP1 from dot11QosCountersTable | 3 |
| QoS STA Counters for UP2 from dot11QosCountersTable | 4 |
| QoS STA Counters for UP3 from dot11QosCountersTable | 5 |
| QoS STA Counters for UP4 from dot11QosCountersTable | 6 |
| QoS STA Counters for UP5 from dot11QosCountersTable | 7 |
| QoS STA Counters for UP6 from dot11QosCountersTable | 8 |
| QoS STA Counters for UP7 from dot11QosCountersTable | 9 |
| BSS Average Access Delays as described in 9.4.2.39 and 9.4.2.44 | 10 |
| STA Counters from dot11CountersGroup3 (A-MSDU) | 11 |
| STA Counters from dot11CountersGroup3 (A-MPDU) | 12 |
| STA Counters from dot11CountersGroup3 (BlockAckReq, Channel Width, PSMP) | 13 |
| STA Counters from dot11CountersGroup3 (RD, dual CTS, L-SIG TXOP protection) | 14 |

Table 9-92—Group Identity for a STA Statistics request (continued)

| Statistics Group Name | Group Identity |
|--|----------------|
| STA Counters from dot11CountersGroup3 (beamforming and STBC) | 15 |
| RSNA Counters | 16 |
| Reserved | 17–255 |

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-93.

Table 9-93—Optional subelement IDs for STA Statistics request

| Subelement ID | Name | Extensible |
|---------------|---------------------|------------|
| 0 | Reserved | |
| 1 | Triggered Reporting | |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Triggered Reporting subelement is used to specify trigger conditions and thresholds for triggered STA Statistics measurements. It is present when setting up triggered reporting from STA Counters, QoS STA Counters, or RSNA Counters; see 11.11.9.5.

The format of the Triggered Reporting subelement for STA Counters is shown in Figure 9-160. The fields marked as optional are only present if the appropriate bit in the STA Counter Trigger Condition field is 1.

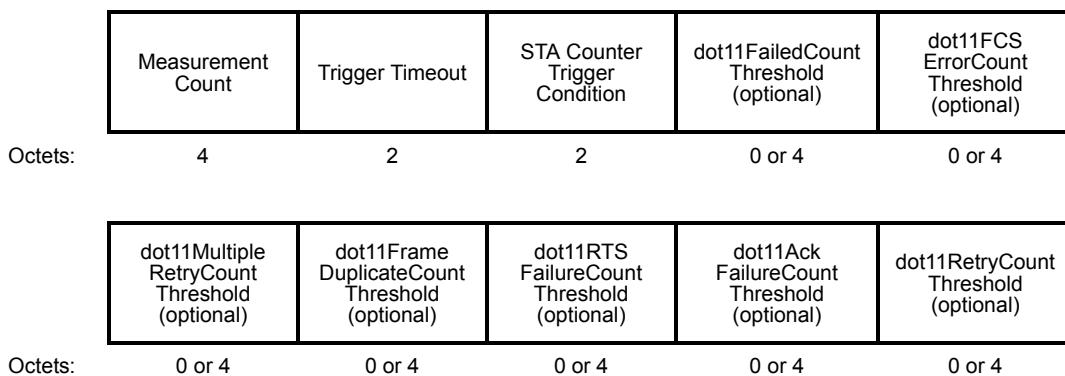

Figure 9-160—Triggered Reporting subelement for STA Counters

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The STA Counter Trigger Condition field specifies trigger values used when requesting triggered STA Statistics reporting. The format of the STA Counter Trigger Condition field is shown in Figure 9-161.

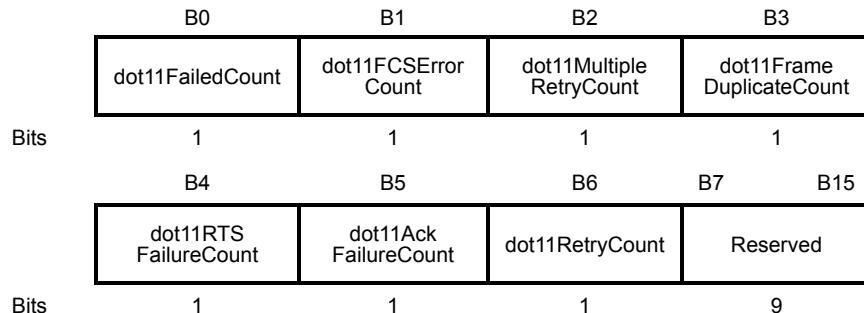

Figure 9-161—STA Counter Trigger Condition field

For each bit in the STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-160) in the Triggered Reporting subelement for STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding STA counter defined in 9-205 and 9-206 (in 9.4.2.22.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.11.9.5. One or more trigger conditions are set with specified thresholds. In the triggered STA Statistics request, the value of the Group Identity field is either 0 or 1. When the Group Identity field value of the triggered STA Statistics request is 0, B2–B6 in the STA Counter Trigger Condition field are set to 0. When the group identity of the triggered STA Statistics request is 1, B0 and B1 in the STA Counter Trigger Condition field are set to 0.

The format of the Triggered Reporting subelement for QoS STA Counters is shown in Figure 9-162. The fields marked as optional are only present if the appropriate bit in the QoS STA Counter Trigger Condition subfield is 1.

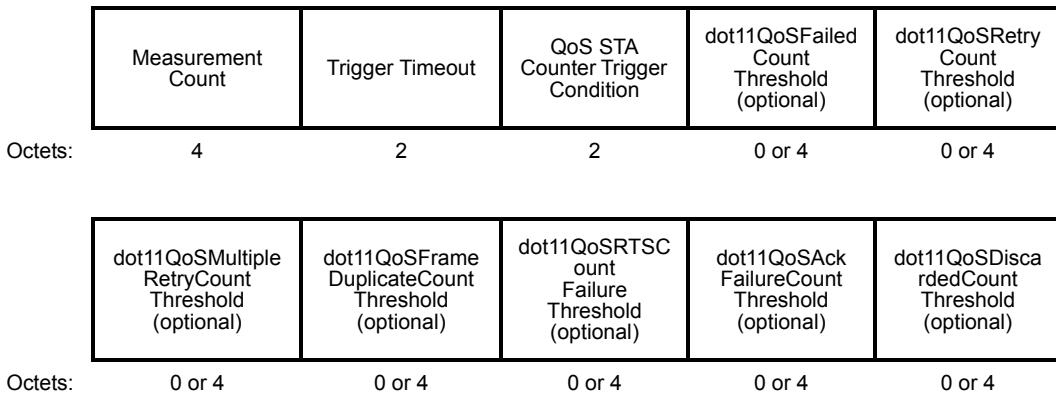

Figure 9-162—Triggered Reporting subelement for QoS STA Counters

The UP of the QoS STA Counters for triggered QoS Statistics measurement is determined by the group identity of the Measurement Request field for a STA Statistics request as defined in 9-92.

The value in the Measurement Count field specifies the number of MSDUs or MPDUs transmitted and/or received by the STAs that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The QoS STA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the QoS STA Counter Trigger Condition field is shown in Figure 9-163.

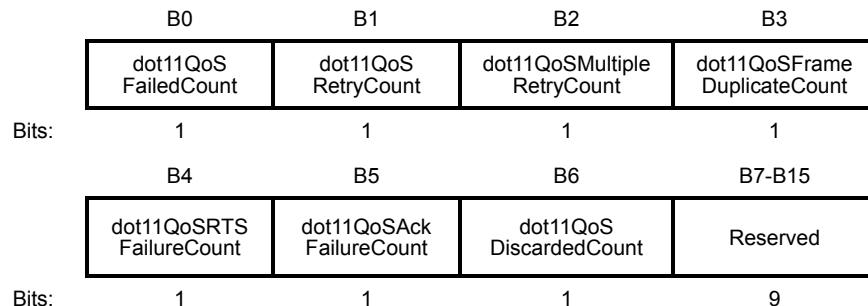

Figure 9-163—QoS STA Counter Trigger Condition field

For each bit in the QoS STA Counter Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-162) in the Triggered Reporting subelement for QoS STA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding QoS STA counter defined in Figure 9-207 (in 9.4.2.22.9) exceeds the value of the specified threshold, within the total number of MSDUs or MPDUs indicated in the Measurement Count field. See 11.11.9.5. One or more trigger conditions are set with specified thresholds.

The format of the Triggered Reporting subelement for RSNA Counters is shown in Figure 9-164. The fields marked as optional are only present if the appropriate bit in the RSNA Trigger Condition subfield is 1.

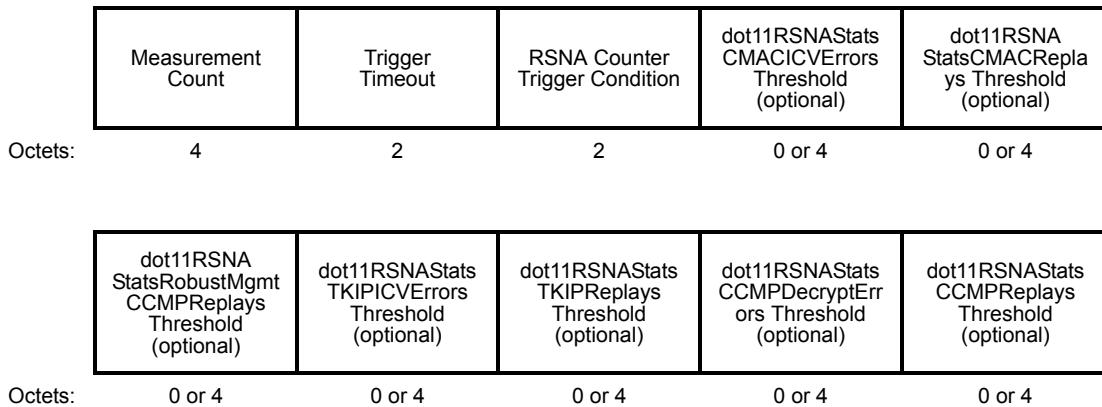

Figure 9-164—Triggered Reporting subelement for RSNA Counters

The value in the Measurement Count field specifies the number of MPDUs transmitted and/or received by the STA that are to be used to determine if one or more of the trigger conditions have been met.

The Trigger Timeout field contains a value in units of 100 TUs during which a measuring STA does not generate further triggered STA Statistics reports after a trigger condition has been met.

The RSNA Counter Trigger Condition field specifies reporting triggers when requesting triggered STA Statistics reporting. The format of the RSNA Trigger Condition field is shown in Figure 9-165.

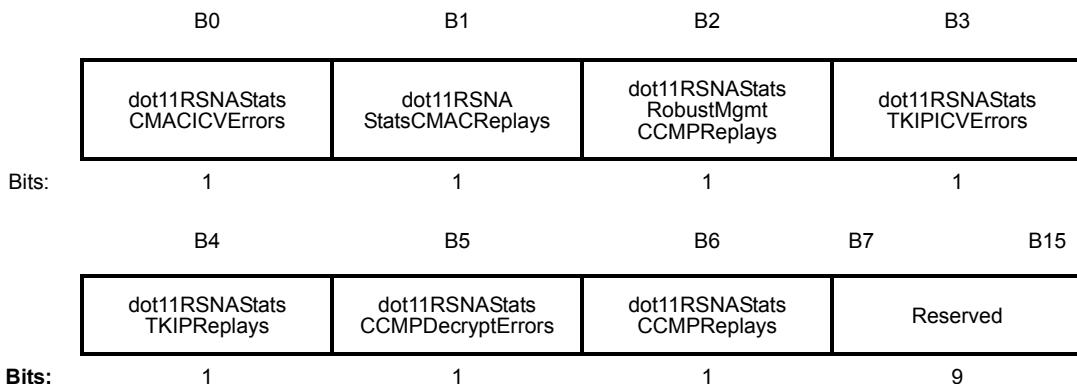

Figure 9-165—RSNA Trigger Condition field

For each bit in the RSNA Trigger Condition field that is 1, a corresponding threshold value exists (defined in Figure 9-164) in the Triggered Reporting subelement for RSNA Counters. With this, the STA Statistics request indicates that a STA Statistics report be generated when the corresponding RSNA counter defined in Figure 9-209 (in 9.4.2.22.9) exceeds the value of the specified threshold, within the total number of MPDUs indicated in the Measurement Count field. See 11.11.9.5. One or more trigger conditions are set with specified thresholds.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.21.10 LCI request (Location configuration information request)

The Measurement Request field corresponding to an LCI request is shown in Figure 9-166.

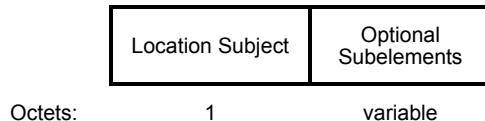

Figure 9-166—Measurement Request field format for LCI request

The Location Subject field of an LCI request is a single octet. See Table 9-94.

Table 9-94—Location Subject field definition

| Value | Location Subject |
|-------|------------------------------|
| 0 | Location Subject Local |
| 1 | Location Subject Remote |
| 2 | Location Subject Third Party |
| 3–255 | Reserved |

The term Local refers to the location of the requesting STA, and Remote refers to the location of the reporting STA.

NOTE—A measurement request with its Location Subject value Location Subject Local is used by a requesting STA to obtain its own location, asking “Where am I?” The Measurement Request with its Location Subject value Location Subject Remote is used by a requesting STA to obtain the location of the reporting STA, asking “Where are you?”

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-95.

Table 9-95—Optional subelement IDs for LCI request

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Reserved | |
| 1 | Azimuth Request | Yes |
| 2 | Originator Requesting STA MAC Address | |
| 3 | Target MAC Address | |
| 4 | Maximum Age | Yes |
| 5–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Azimuth Request subelement is present when requesting azimuth information. The Azimuth Request subelement is as shown in Figure 9-167.

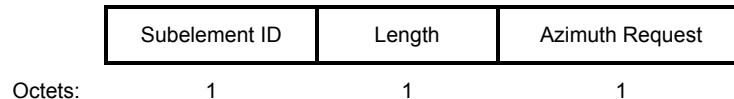

Figure 9-167—Azimuth Request subelement format

The Subelement ID field is defined in Table 9-95.

The Length field is defined in 9.4.3.

The Azimuth Request field of an Azimuth Request subelement is shown in Figure 9-168.

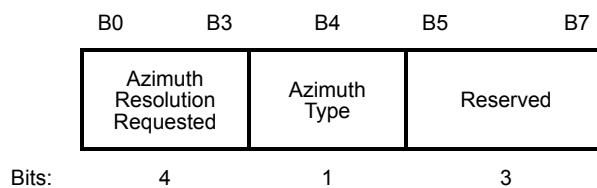

Figure 9-168—Azimuth Request field

Azimuth Resolution Requested is the number of valid most significant bits requested for the fixed-point value of Azimuth, reported in integer degrees. Values above 9 are reserved.

Azimuth Type (bit 4) is set to 1 to request a report of the Azimuth of radio reception and is set to 0 to request a report of the Azimuth of front surface of the reporting STA.

NOTE—A geographic feature is an abstraction of a real-world phenomenon; it is a geographic feature if it is associated with a location relative to the Earth. The designation of a horizontal plane is relative to the Earth. The designation of the “front surface” of a station is arbitrary, but refers to an orientable surface (possessing a centerline) of the station. It is common to use a direction cosine matrix to convert from one coordinate system to another, i.e., body-centered coordinates to earth-centered coordinates.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

Figure 9-169—Originator Requesting STA MAC Address subelement format

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC address subelement is shown in Figure 9-170.

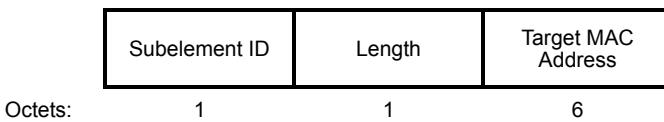

Figure 9-170—Target MAC Address subelement format

The Maximum Age subelement indicates the maximum age of the requested LCI. The format of the Maximum Age subelement is defined in Figure 9-171. The absence of a Maximum Age subelement indicates that an LCI determined at or after the LCI request is received is requested.

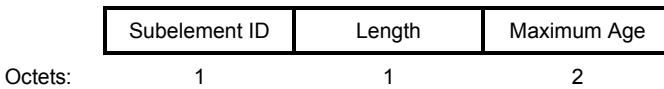

Figure 9-171—Format of Maximum Age subelement

The Length field is defined in 9.4.3.

The Maximum Age field of a Maximum Age subelement indicates the maximum elapsed time between when an LCI is determined and when an LCI request is received, within which the LCI satisfies the LCI request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value of 0 is reserved. The value of 65 535 indicates that any LCI age is acceptable.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.21.11 Transmit Stream/Category Measurement request

The Transmit Stream/Category Measurement applies to TIDs for traffic streams associated with TSPECs and also to TIDs for traffic categories for QoS traffic without TSPECs. The Measurement Request field corresponding to a Transmit Stream/Category Measurement request is shown in Figure 9-172.

| | | | | | |
|------------------------|----------------------|------------------|--------------------|-------------|----------------------|
| Randomization Interval | Measurement Duration | Peer STA Address | Traffic Identifier | Bin 0 Range | Optional Subelements |
| Octets: | 2 | 2 | 6 | 1 | 1 |

variable

Figure 9-172—Measurement Request field format for Transmit Stream/Category Measurement Request

The Randomization Interval field is set to the maximum random delay in the measurement start time, in units of TUs. The use of the Randomization Interval field is described in 11.11.3. When requesting a triggered Transmit Stream/Category Measurement, the randomization interval is not used and the Randomization Interval field is reserved. See 11.11.9.8.

The Measurement Duration is set to the duration of the requested measurement, in units of TUs except when setting up a triggered QoS measurement, when it is not used and is set to 0.

The Peer STA Address contains a MAC address indicating the RA in the MSDUs to be measured.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-173.

| | | |
|----------|-------|----|
| B0 | B3 B4 | B7 |
| Reserved | TID | |
| Bits: | 4 | 4 |

Figure 9-173—Traffic Identifier field

The TID subfield indicates the TC or TS for which traffic is to be measured.

Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. The Bin 0 Range value is used to calculate the delay ranges of the other 5 bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as described in 9.4.2.22.11.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-96.

Table 9-96—Optional subelement IDs for Transmit Stream/Category Measurement Request

| Subelement ID | Name | Extensible |
|---------------|---------------------|------------|
| 0 | Reserved | |
| 1 | Triggered Reporting | Yes |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Triggered Reporting subelement is used to specify measurement trigger thresholds. It is present only if requesting triggered transmit stream/category measurement reporting. The Triggered Reporting subelement format is shown in Figure 9-174.

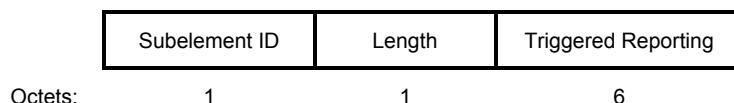

Figure 9-174—Triggered Reporting subelement format

The Subelement ID field is defined in Table 9-96.

The Length field is defined in 9.4.3.

The Triggered Reporting field is as shown in Figure 9-175.

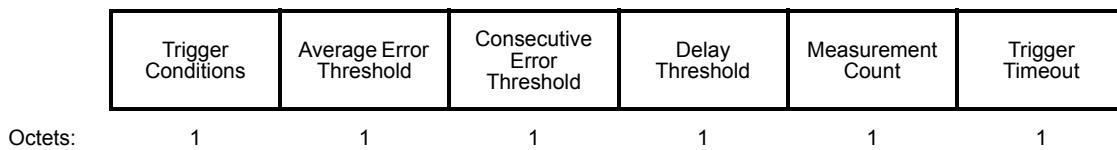

Figure 9-175—Triggered Reporting field

Trigger Conditions is a bit-field that specifies reporting triggers when requesting a triggered transmit stream/category measurement. The format of the Trigger Conditions bit-field is shown in Figure 9-176.

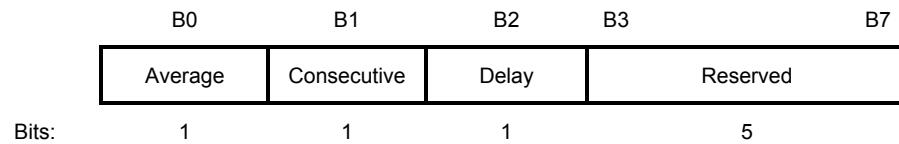

Figure 9-176—Trigger Conditions bit-field

- Average is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded out of the number of preceding MSDUs specified in Measurement Count is greater than or equal to the value given in Average Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding

dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.

- Consecutive is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of MSDUs for the TC or TS given by the TID that are discarded in succession is greater than or equal to the value given in Consecutive Error Threshold. MSDUs discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit, or due to the MSDU lifetime having been reached, are counted.
- Delay is set to 1 to request that a Transmit Stream/Category Measurement report be generated when the number of consecutive MSDUs for the TC or TS given by the TID that experience a transmit delay greater than or equal to the value specified in the Delay Threshold subfield is greater than or equal to the value given in Delayed MSDU Count. Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used.

The Average Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the Average trigger condition. The field is reserved if the Average Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Consecutive Error Threshold field contains a value representing the number of discarded MSDUs to be used as the threshold value for the consecutive trigger condition. The field is reserved if the Consecutive Error Threshold subfield of the Trigger Conditions bit-field is 0.

The Delay Threshold field contains two subfields as shown in Figure 9-177. The Delay Threshold field is reserved if the Delay Threshold subfield of the Trigger Conditions bit-field is 0.

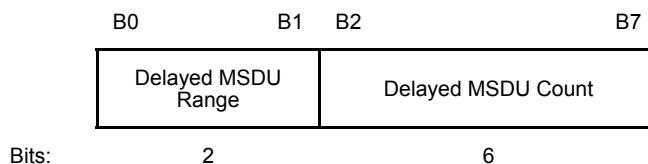

Figure 9-177—Delay Threshold subfield

Delayed MSDU Range contains a value representing the MSDU transmit delay at or above which an MSDU is counted toward the Delayed MSDU Count threshold. Delayed MSDU Range is encoded as a value representing the lower bound of a bin in the Transmit Delay Histogram as shown in Table 9-97. The Transmit Delay Histogram is defined in 9.4.2.22.11.

Table 9-97—Delayed MSDU Range Definitions

| Delayed MSDU Range | Condition |
|--------------------|---------------------------------------|
| 0 | Transmit Delay = Lower Bound of Bin 2 |
| 1 | Transmit Delay = Lower Bound of Bin 3 |
| 2 | Transmit Delay = Lower Bound of Bin 4 |
| 3 | Transmit Delay = Lower Bound of Bin 5 |

Delayed MSDU Count contains a value representing the number of MSDUs to be used as the threshold value for the delay trigger condition.

The Measurement Count field contains a number of MSDUs. This value is used to calculate an average discard count for the average trigger condition. It is also used in place of measurement duration in determining the scope of the reported results when a report is triggered; see 11.11.9.8.

The Trigger Timeout field contains a value, in units of 100 TU, during which a measuring STA does not generate further triggered transmit stream/category measurement reports after a trigger condition has been met. See 11.11.9.8.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.21.12 Measurement Pause request

The Measurement Request field corresponding to a Measurement Pause request is shown in Figure 9-178. The Measurement Pause request cannot be processed in parallel with any other measurement request. See 11.11.9.7.

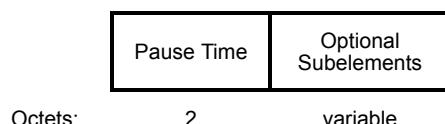

Figure 9-178—Measurement Request field format for Measurement Pause request

The Pause Time field contains a number between 1 and 65 535 representing the time period for which measurements are suspended or paused. The time unit for the Pause Time is 10 TUs. The Pause Time value 0 is reserved. Measurement Pause requests are used to provide time delays between the execution times of Measurement Request elements in a Measurement Request frame.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-98.

Table 9-98—Optional subelement IDs for Measurement Pause request

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.21.13 Multicast Diagnostics request

The Measurement Request field corresponding to a Multicast Diagnostics request is shown in Figure 9-179. The response to a Multicast Diagnostics request is a Multicast Diagnostics report.

| | | | | |
|------------------------|----------------------|-------------------|--|----------------------|
| Randomization Interval | Measurement Duration | Group MAC Address | Multicast Triggered Reporting (optional) | Optional Subelements |
| Octets: 2 | 2 | 6 | 0 or 5 | variable |

Figure 9-179—Measurement Request field format for a Multicast Diagnostics request

The Randomization Interval field is the upper limit of random delay before the measurement begins, expressed in TUs. The use of the Randomization Interval field is described in 11.12.3. When requesting a triggered multicast diagnostic report, the Randomization Interval field is reserved.

The Measurement Duration field is the duration of the requested measurement, expressed in TUs. When requesting a triggered multicast diagnostic report, the Measurement Duration field is reserved.

A Group MAC Address field with the LSB of the first octet set to 1 contains the MAC address of the group addressed frames to which the measurement request relates. A Group MAC Address field with the LSB of the first octet set to 0 indicates that all group addressed frames, apart from the broadcast MAC address, are requested.

The Multicast Triggered Reporting field is used to specify trigger conditions and thresholds. It is present only when requesting triggered multicast diagnostic reporting. The format of Multicast Triggered Reporting subelement is as shown in Figure 9-180.

| | | | | |
|---------------|--------|-----------------------------|--------------------|--------------------|
| Subelement ID | Length | Multicast Trigger Condition | Inactivity Timeout | Reactivation Delay |
| Octets: 1 | 1 | 1 | 1 | 1 |

Figure 9-180—Multicast Triggered Reporting subelement format

The Multicast Trigger Condition field specifies reporting triggers for triggered management diagnostic reporting. The format of the Multicast Trigger Condition field is shown in Figure 9-181.

| B0 | B1 | B7 |
|----------------------------|----|----------|
| Inactivity Timeout Request | | Reserved |
| Bits: 1 | | 7 |

Figure 9-181—Multicast Trigger Condition field

The Inactivity Timeout Request field is 1 to request that a multicast triggered report be generated when no group addressed frames with the monitored group address are received in a time equal to the value given in the Inactivity Timeout field. The Inactivity Timeout Request field is 0 when a multicast reception timeout is not requested.

The Inactivity Timeout field contains a time value in units of 100 TUs to be used as the threshold value for the inactivity timeout trigger condition.

The Reactivation Delay field contains a value in units of 100 TU during which a measuring STA does not generate further multicast triggered reports after a trigger condition has been met.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-99.

Table 9-99—Optional subelement IDs for STA Multicast Diagnostics request

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | Reserved | |
| 1 | Multicast Triggered Reporting | |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

The use of Multicast Diagnostics request is defined in 11.11.19.

9.4.2.21.14 Location Civic request

The Measurement Request field corresponding to a Location Civic request is shown in Figure 9-182. The response to a Location Civic request is a Location Civic report.

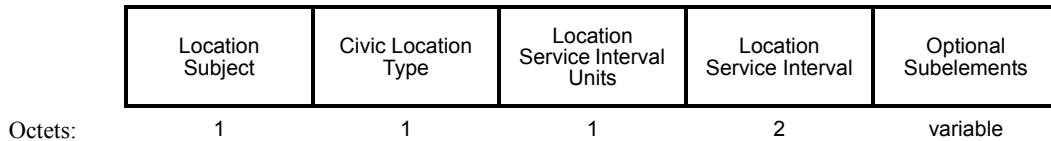

Figure 9-182—Location Civic Request field format

The Location Subject field is a single octet and is defined in Table 9-94.

The Civic Location Type field contains the format of location information in the Location Civic report, as indicated in Table 9-100.

When the Civic Location Type value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type field.

Table 9-100—Civic Location Type field values

| Civic Location Type field value | Name | Description |
|---------------------------------|-----------------|--|
| 0 | IETF RFC 4776 | Starting at the country code field (i.e., excluding the GEOCONF_CIVIC/OPTION_GEOCONF_CIVIC, N/option-len and what fields); includes all subsequent RFCs that define additional civic address Types |
| 1 | Vendor Specific | |
| 2–255 | Reserved | |

The Location Service Interval Units field contains the units for the Location Service Interval field, as indicated in Table 9-101.

Table 9-101—Location Service Interval Units

| Location Service Interval Units value | Description |
|---------------------------------------|-------------|
| 0 | Seconds |
| 1 | Minutes |
| 2 | Hours |
| 3–255 | Reserved |

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Civic reports. A Location Service Interval of 0 indicates that only a single Location Civic report is requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-102.

Table 9-102—Optional subelement IDs for Location Civic request

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Reserved | |
| 1 | Originator Requesting STA MAC Address | |
| 2 | Target MAC Address | |
| 3–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting for the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC address subelement is shown in Figure 9-170.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.21.15 Location Identifier request

The Measurement Request field corresponding to a Location Identifier request is shown in Figure 9-183. The response to a Location Identifier request is a Location Identifier report.

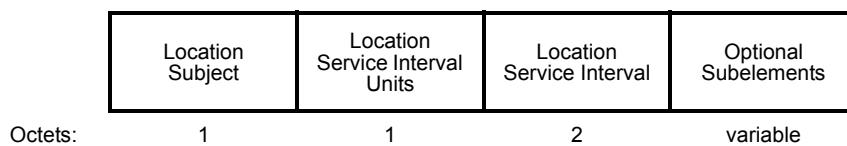

Figure 9-183—Location Identifier request field format

The Location Subject field is a single octet and is defined in Table 9-94.

The Location Service Interval Units field is defined in Table 9-101.

The Location Service Interval field is the time interval, expressed in the units indicated in the Location Service Interval Units field, at which the STA requests to receive Location Identifier reports. A Location Service Interval of 0 indicates that only a single Location Identifier report is requested.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-103.

Table 9-103—Optional subelement IDs for Location Identifier request

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Reserved | |
| 1 | Originator Requesting STA MAC Address | |
| 2 | Target MAC Address | |
| 3–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA requesting the Location Information and it is present whenever the Location Subject field is set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information is requested and it is present whenever the Location Subject field is set to 2. The format of the Target MAC address subelement is shown in Figure 9-170.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.21.16 Directional Channel Quality request

The Measurement Request field corresponding to a Directional Channel Quality request is shown in Figure 9-184. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform measurements toward a Target STA.

| | | | | |
|------------------------|----------------------|-----------------------|----------------------|--------------------|
| Operating Class | Channel Number | AID | Reserved | Measurement Method |
| Octets: | 1 | 1 | 1 | 1 |
| Measurement Start Time | Measurement Duration | Number of Time Blocks | Optional Subelements | |
| Octets: | 8 | 2 | 1 | Variable |

Figure 9-184—Measurement Request field format for Directional Channel Quality request

The Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The AID field indicates the Target STA.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RSNI. Other values are reserved.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A value of 0 indicates that the measurement starts immediately.

The Measurement Duration field is set to the preferred or mandatory duration of the requested measurement, in units of TUs. See 11.11.4.

The Number of Time Blocks field indicates the number of time blocks within the Measurement Duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-104.

Table 9-104—Optional subelement IDs for Directional Channel Quality request

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Reserved | |
| 1 | Directional Channel Quality Reporting | Yes |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Directional Channel Quality Reporting subelement indicates the condition for issuing a Directional Channel Quality report. Directional Channel Quality Reporting subelement data field format is shown in Figure 9-185 and contains a 1-octet Reporting Condition subfield and a 1-octet Directional Channel Quality Reference Value subfield. The Reporting Condition subfield is described in Table 9-105. The Directional Channel Quality Reference value is a Directional Channel Quality value and is the reference value for the indicated reporting condition.

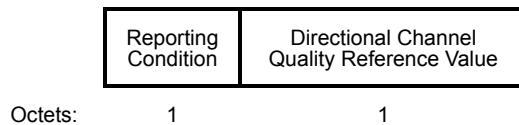

Figure 9-185—Directional Channel Quality Reporting data field format

Table 9-105—Reporting Condition subfield for Directional Channel Quality report

| Condition for report to be issued | Reporting condition |
|--|---------------------|
| Report to be issued after each measurement (default, used when Directional Channel Quality Reporting subelement is not included in Directional Channel Quality Request). | 0 |
| Report to be issued when measured ANIPI or RSNI is greater than or equal to the reference value. | 1 |
| Report to be issued when measured ANIPI or RSNI is less than or equal to the reference value. | 2 |
| Reserved | 3–255 |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the list of Optional Subelements.

9.4.2.21.17 Directional Measurement request

The Measurement Request field corresponding to a Directional Measurement request is shown in Figure 9-186. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

| Operating Class | Channel Number | Measurement Start Time | Measurement Duration per Direction | Measurement Method |
|-----------------|----------------|------------------------|------------------------------------|--------------------|
| Octets | 1 | 1 | 8 | 2 |

Figure 9-186—Measurement Request field format for Directional Measurement request

Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A value of 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RCPI. If the field is set to 2, it indicates Channel Load. Other values are reserved.

9.4.2.21.18 Directional Statistics request

The Measurement Request field corresponding to a Directional Statistics request is shown in Figure 9-187. This Measurement Request is transmitted from a Requesting STA to a Requested STA to perform directional channel measurements in all sectored receiving directions.

| Operating Class | Channel Number | Measurement Start Time | Measurement Duration per Direction | Measurement Method | Directional Statistics Bitmap |
|-----------------|----------------|------------------------|------------------------------------|--------------------|-------------------------------|
| Octets | 1 | 1 | 8 | 2 | 1 |

Figure 9-187—Measurement Request field format for Directional Statistics request

Operating Class field indicates the channel set for which the measurement request applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement request applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement request applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the TSF timer at the time at which the requested measurement starts. A value of 0 indicates that the measurement starts immediately.

The Measurement Duration per Direction field is set to the preferred or mandatory duration of the requested measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method that is to be used by the Requested STA to carry out this measurement request and report back in the measurement report. If this field is set to 0, it indicates ANIPI. If this field is set to 1, it indicates RCPI. If the field is set to 2, it indicates Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is shown in Figure 9-188. The Maximum field set to 1 indicates that the maximum measurement result among all directions is expected in the measurement report. The Minimum field set to 1 indicates that the minimum measurement result among all directions is expected in the measurement report. The Average field set to 1 indicates that the average measurement result among all directions is expected in the measurement report. The Variance field set to 1 indicates that the variance of measurement results among all directions is expected in the measurement report. Other bits are reserved.

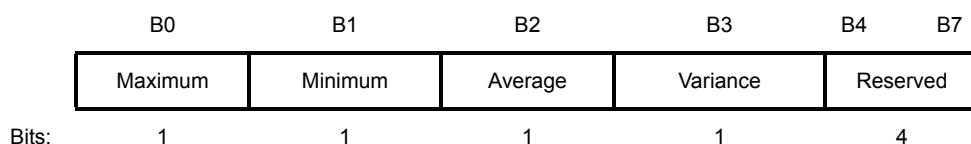

Figure 9-188—Directional Statistics Bitmap field format

9.4.2.21.19 Fine Timing Measurement Range request

The Measurement Request field corresponding to a Fine Timing Measurement Range request is shown in Figure 9-189.

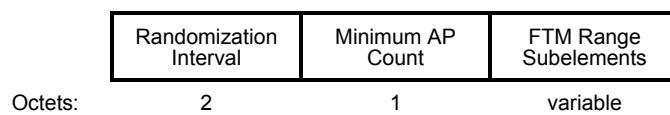

Figure 9-189—Measurement Request field for a Fine Timing Measurement Range request

The Randomization Interval field specifies the upper bound of the random delay to be used prior to making the measurement, in units of TUs. See 11.11.3.

The Minimum AP Count field specifies the minimum number of FTM ranges between the requested STA and the APs listed in the Neighbor Report Subelements field that are requested. The value 0 and values above 15 are reserved.

The FTM Range Subelements field contains one or more subelements. The subelement format and ordering of subelements are defined in 9.4.3. The FTM Range subelements are listed in Table 9-106.

The Subelement IDs for subelements in the Fine Timing Measurement Range request are defined in Table 9-106.

Table 9-106—FTM Range subelement IDs for Fine Timing Measurement Range request

| Subelement ID | Name | Extensible |
|---------------|-------------|------------|
| 0–3 | Reserved | |
| 4 | Maximum Age | Yes |
| 5–51 | Reserved | |

Table 9-106—FTM Range subelement IDs for Fine Timing Measurement Range request (continued)

| Subelement ID | Name | Extensible |
|---------------|-----------------|-------------|
| 52 | Neighbor Report | Subelements |
| 53–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The FTM Range Subelements field includes a concatenation of at least Minimum AP Count Neighbor Report subelements. Each Neighbor Report subelement has the same format as the Neighbor Report element and contains the Wide Bandwidth Channel subelement. See Table 9-106 and Table 9.4.2.37. The Neighbor Report Subelements field specifies a superset of nearby APs with which the requested STA is requested to perform the FTM procedure (see 11.11.9.11).

The Maximum Age subelement indicates the maximum age of the requested FTM ranges. The format of the Maximum Age subelement is defined in Figure 9-190. The absence of a Maximum Age subelement indicates that FTM ranges determined at or after the Fine Timing Measurement Range request is received are requested.

| Subelement ID | Length | Maximum Age |
|---------------|--------|-------------|
| Octets: | 1 | 1 |

Figure 9-190—Format of Maximum Age subelement

The Subelement ID field is defined in Table 9-106.

The Length field is defined in 9.4.3.

The Maximum Age field of the Maximum Age subelement indicates the maximum elapsed time between when FTM ranges are determined and when a Fine Timing Measurement Range request is received, within which the FTM ranges satisfy the Fine Timing Measurement Range request. The Maximum Age field is encoded as an unsigned integer with units of 0.1 s. The value 0 is reserved. The value 65 535 indicates that FTM ranges determined at any time are acceptable.

The Vendor Specific subelement has the same format as the corresponding element (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the Optional Subelements field.

9.4.2.22 Measurement Report element

9.4.2.22.1 General

The Measurement Report element contains a measurement report. The format of the Measurement Report element is shown in Figure 9-191. The Measurement Report element is included in Measurement Report frames, as described in 9.6.2.3, or Radio Measurement Report frames, as described in 9.6.7.3. Measurement Types 0, 1, and 2 are used for spectrum management and are included only in Measurement Report frames. All other Measurement Types are included only in Radio Measurement Report frames. The use of Measurement Report elements and frames for spectrum management is described in 11.9.7. The use of Measurement Report elements and frames for radio measurement is described in 11.11.

| Element ID | Length | Measurement Token | Measurement Report Mode | Measurement Type | Measurement Report |
|------------|--------|-------------------|-------------------------|------------------|--------------------|
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-191—Measurement Report element format

The Element ID and Length fields are defined in 9.4.2.1. The minimum value of the Length field is 3.

The Measurement Token field is set to the value of the Measurement Token field in the corresponding Measurement Request element. If the Measurement Report element is being sent autonomously, then the Measurement Token is set to 0. If the Measurement Report element is being sent in a Location Track Notification frame, then the value of the Measurement Token field is set to the same value as the Location Configuration Request frame Dialog Token field that configured the STA to send the Location Track Notification frames.

The Measurement Report Mode field (shown in Figure 9-192) is used to indicate the reason for a failed or rejected measurement request. The Measurement Report Mode is a bit field with the following bits defined:

- Late bit (bit 0) indicates whether this STA is unable to carry out a measurement request because it received the request after the requested measurement time. The Late bit is set to 1 to indicate the request was too late. The Late bit is set to 0 to indicate the request was received in time for the measurement to be executed. The Late bit only applies to spectrum management measurement and is set to 0 in all measurement report elements for radio measurement types (see Table 9-107).
- Incapable bit (bit 1) indicates whether this STA is incapable of generating a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Incapable bit is set to 1 to indicate the STA is incapable. The Incapable bit is set to 0 to indicate the STA is capable or the report is autonomous.
- Refused bit (bit 2) indicates whether this STA is refusing to generate a report of the type specified in the Measurement Type field that was previously requested by the destination STA of this Measurement Report element. The Refused bit is set to 1 to indicate the STA is refusing. The Refused bit is set to 0 to indicate the STA is not refusing or the report is autonomous.
- All other bits are reserved.

| B0 | B1 | B2 | B3 | B7 |
|-------|-----------|---------|----------|----|
| Late | Incapable | Refused | Reserved | |
| Bits: | 1 | 1 | 1 | 5 |

Figure 9-192—Measurement Report Mode field

No more than one bit is set to 1 within a Measurement Report Mode field. All bits within the Measurement Mode field are set to 0 if the results of a successful measurement request or an autonomous measurement are being reported.

The Measurement Type field is set to a number that identifies the measurement report. The Measurement Types that have been allocated are shown in Table 9-107.

Table 9-107—Measurement Type field definitions for measurement reports

| Name | Measurement Type |
|--------------------------------------|------------------|
| Basic | 0 |
| CCA | 1 |
| RPI Histogram | 2 |
| Channel Load | 3 |
| Noise Histogram | 4 |
| Beacon | 5 |
| Frame | 6 |
| STA Statistics | 7 |
| LCI | 8 |
| Transmit Stream/Category Measurement | 9 |
| Multicast Diagnostics | 10 |
| Location Civic | 11 |
| Location Identifier | 12 |
| Directional Channel Quality | 13 |
| Directional Measurement | 14 |
| Directional Statistics | 15 |
| Fine Timing Measurement Range | 16 |
| Reserved | 17–255 |

The Measurement Report field is not present when the Late bit is equal to 1, the Incapable bit is equal to 1, or the Refused bit is equal to 1. Otherwise, it contains a single measurement report, as described in 9.4.2.22.2 to 9.4.2.22.11.

References in this standard to a ‘<name> report’, where <name> corresponds to one of the Measurement Types in Table 9-107 is equivalent to (according to context) a) ‘a Measurement Report frame or Radio Measurement Report frame carrying a Measurement Report element with the Measurement Type field equal to <name>’ or b) ‘a Measurement Report element with the Measurement Type field equal to <name>’.

9.4.2.22.2 Basic report

The format of the Measurement Report field corresponding to a Basic report is shown in Figure 9-193.

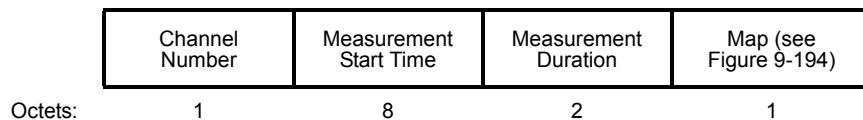

Figure 9-193—Measurement Report field format for a Basic report

The Channel Number field is set to the channel number to which the Basic report applies where the Channel Number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time ($\pm 32 \mu\text{s}$) at which the Basic report measurement started.

The Measurement Duration field is set to the duration over which the Basic report was measured, expressed in TUs.

The Map field is coded as a bit field, as shown in Figure 9-194, and contains the following bits:

- BSS bit, which is set to 1 when at least one valid MPDU was received in the channel during the measurement period from another BSS. Otherwise, the BSS bit is set to 0.
- OFDM preamble bit, which is set to 1 when at least one sequence of short training symbols, as defined in 17.3.3, was detected in the channel during the measurement period without a subsequent valid SIGNAL field (see 17.3.4). This indicates the presence of an OFDM preamble, such as high-performance RLAN/2 (HIPERLAN/2). Otherwise, the OFDM preamble bit is set to 0.
- Unidentified Signal bit, which is set to 1 when, in the channel during the measurement period, there is significant power detected that is not characterized as radar, an OFDM preamble, or a valid MPDU. Otherwise, the Unidentified Signal bit is set to 0. The definition of significant power is implementation dependent.
- Radar bit, which is set to 1 when radar was detected operating in the channel during the measurement period. The radar detection algorithm that satisfies regulatory requirements is outside the scope of this standard. Otherwise, the Radar bit is set to 0.
- Unmeasured bit, which is set to 1 when this channel has not been measured. Otherwise, the Unmeasured bit is set to 0. When the Unmeasured field is equal to 1, all of the other bit fields are set to 0.

| | BSS | Orthogonal frequency division multiplexing (OFDM) Preamble | Unidentified Signal | Radar | Unmeasured | Reserved |
|------|-----|--|---------------------|-------|------------|----------|
| Bit: | 0 | 1 | 2 | 3 | 4 | 5-7 |

Figure 9-194—Map field format

9.4.2.22.3 CCA report

The format of the Measurement Report field corresponding to a CCA report is shown in Figure 9-195.

| | | | | |
|---------|----------------|------------------------|----------------------|-------------------|
| | Channel Number | Measurement Start Time | Measurement Duration | CCA Busy Fraction |
| Octets: | 1 | 8 | 2 | 1 |

Figure 9-195—Measurement Report field format for a CCA report

The Channel Number field contains the channel number to which the CCA report applies where the Channel Number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time ($\pm 32 \mu\text{s}$) at which the CCA report measurement started.

The Measurement Duration field is set to the duration over which the CCA report was measured, expressed in TUs.

The CCA Busy Fraction field contains the fractional duration over which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds. The CCA Busy Fraction value is defined as

$$\left\lceil \frac{255 \times t_{busy}}{1024 \times t_{MD}} \right\rceil$$

where

- t_{busy} is the duration CCA indicated channel was busy (μ s)
- t_{MD} is the measurement duration (TUs)

9.4.2.22.4 RPI histogram report

The format of the Measurement Report field corresponding to an RPI histogram report is shown in Figure 9-196.

| | Channel Number | Measurement Start Time | Measurement Duration | | | | | | |
|---------|----------------|------------------------|----------------------|---------------|---------------|---------------|---------------|---------------|--|
| Octets: | 1 | 8 | 2 | | | | | | |
| | RPI 0 density | RPI 1 density | RPI 2 density | RPI 3 density | RPI 4 density | RPI 5 density | RPI 6 density | RPI 7 density | |
| Octets: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | |

Figure 9-196—Measurement Report field format for an RPI histogram report

The Channel Number field is set to the channel number to which the RPI histogram report applies where the Channel Number is a value from the “Channel set” column in Table E-4, in a row having the same value in the “Channel spacing (MHz)” column as the width of the primary channel.

The Measurement Start Time field is set to the TSF at the time ($\pm 32 \mu$ s) at which the RPI histogram report measurement started.

The Measurement Duration field is set to the duration over which the RPI histogram report was measured, expressed in TUs.

The RPI histogram report contains the RPI densities observed in the channel for the eight RPI levels defined in Table 9-108. See 11.11.12.

Table 9-108—RPI definitions for an RPI histogram report

| RPI | Power observed at the antenna (dBm) |
|-----|-------------------------------------|
| 0 | Power ≤ -87 |
| 1 | $-87 < \text{Power} \leq -82$ |
| 2 | $-82 < \text{Power} \leq -77$ |

Table 9-108—RPI definitions for an RPI histogram report (continued)

| RPI | Power observed at the antenna (dBm) |
|-----|-------------------------------------|
| 3 | $-77 < \text{Power} \leq -72$ |
| 4 | $-72 < \text{Power} \leq -67$ |
| 5 | $-67 < \text{Power} \leq -62$ |
| 6 | $-62 < \text{Power} \leq -57$ |
| 7 | $-57 < \text{Power}$ |

The RPI histogram report provides an additional mechanism for a STA to gather information on the state of a channel from other STAs. The STA might use this information to assist in the choice of new channel, to help avoid false radar detections, and to assess the general level of interference present on a channel.

9.4.2.22.5 Channel Load report

The format of the Measurement Report field corresponding to a Channel Load report is shown in Figure 9-197.

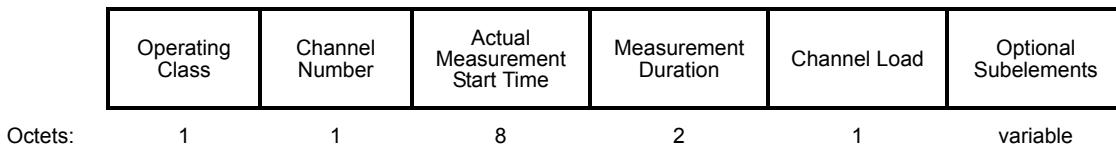

Figure 9-197—Measurement Report field format for Channel Load report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

NOTE—Examples of operating classes that encompass a primary channel but do not identify the location of the primary channel are operating classes with a value of 80 or 160 in the “Channel Spacing (MHz)” column of the applicable table in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

Actual Measurement Start Time is set to the value of the measuring STA’s TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Channel Load report was measured, in units of TUs.

Channel Load contains the proportion of measurement duration for which the measuring STA determined the channel to be busy. Procedure for Channel Load measurement and definition of channel load values are found in 11.11.9.3.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-109.

Table 9-109—Optional subelement IDs for Channel Load report

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.6 Noise Histogram report

The format of the Measurement Report field of a Noise Histogram report is shown in Figure 9-198.

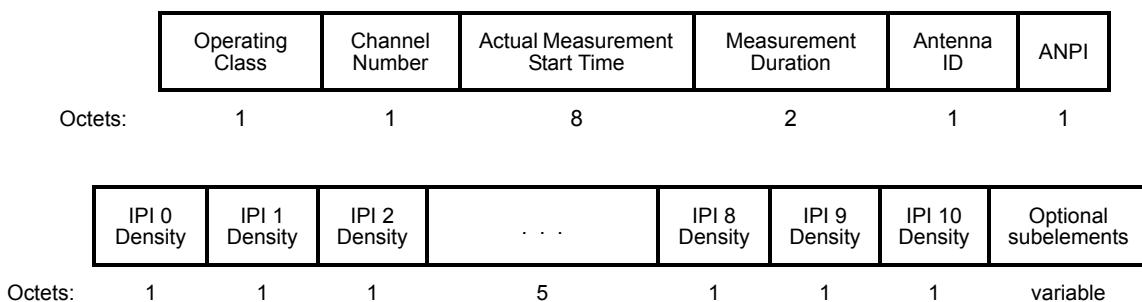

Figure 9-198—Measurement Report field format for Noise Histogram report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel

Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

Actual Measurement Start Time is set to the value of the measuring STA's TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Noise Histogram report was measured, in units of TUs.

Antenna ID is set to the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 9.4.2.40.

ANPI is set to the average noise plus interference power value measured during the indicated measurement duration while the indicated channel is idle as described in 11.11.9.4.

The Noise Histogram report contains the IPI densities, as defined in 11.11.9.4, observed in the channel for the eleven IPI levels defined in Table 9-110.

Table 9-110—IPI Definitions for a Noise Histogram report

| IPI Level | IPI Measured Power (dBm) |
|-----------|-----------------------------|
| 0 | $\text{IPI} \leq -92$ |
| 1 | $-92 < \text{IPI} \leq -89$ |
| 2 | $-89 < \text{IPI} \leq -86$ |
| 3 | $-86 < \text{IPI} \leq -83$ |
| 4 | $-83 < \text{IPI} \leq -80$ |
| 5 | $-80 < \text{IPI} \leq -75$ |
| 6 | $-75 < \text{IPI} \leq -70$ |
| 7 | $-70 < \text{IPI} \leq -65$ |
| 8 | $-65 < \text{IPI} \leq -60$ |
| 9 | $-60 < \text{IPI} \leq -55$ |
| 10 | $-55 < \text{IPI}$ |

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-111.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

Table 9-111—Optional subelement IDs for Noise Histogram report

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.7 Beacon report

The format of the Measurement Report field corresponding to a Beacon report is shown in Figure 9-199.

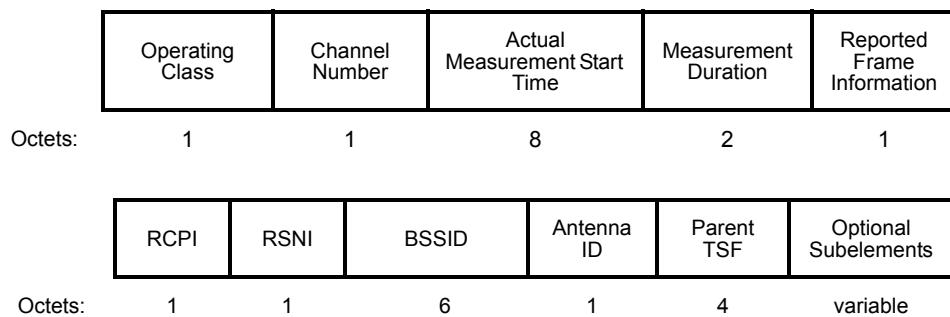

Figure 9-199—Measurement Report field format for Beacon report

The Operating Class field indicates the operating class that identifies the channel set of the received Beacon or Probe Response frame. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing of the received Beacon or Probe Response frame. Valid operating classes are listed in Annex E.

The Channel Number field indicates the channel number of the received Beacon or Probe Response frame. Channel number is defined within an operating class as shown in Annex E.

If the PPDU carrying the received frame comprises noncontiguous frequency segments, the Operating Class and Channel Number fields identify the center frequency of frequency segment 0, and a Wide Bandwidth Channel Switch subelement is included to identify the center frequency of frequency segment 1 (the other fields in the subelement indicate 80+80 bandwidth and the same center frequency of frequency segment 0 as the Operating Class and Channel Number fields); otherwise the Wide Bandwidth Channel Switch subelement is not included.

Actual Measurement Start Time is set to the value of the measuring STA's TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Beacon report was measured, in units of TUs.

The Reported Frame Information field contains two subfields as shown in Figure 9-200.

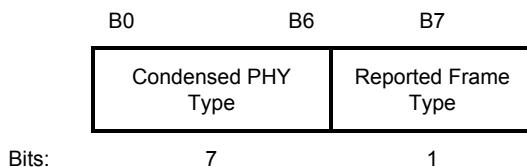

Figure 9-200—Reported Frame Information field

Condensed PHY Type indicates the physical medium type on which the Beacon, Measurement Pilot, or Probe Response frame being reported was received. It has an integer value between 0 and 127 coded according to dot11PHYType.

Reported Frame Type indicates the type of frame reported. A value of 0 indicates a Beacon or Probe Response frame; a value of 1 indicates a Measurement Pilot frame.

RCPI indicates the received channel power of the Beacon, Measurement Pilot, or Probe Response frame, which is a logarithmic function of the received signal power, as defined 9.4.2.38.

RSNI indicates the received signal-to-noise indication for the Beacon, Measurement Pilot, or Probe Response frame, as described in 9.4.2.41.

The BSSID field contains the BSSID from the Beacon, Measurement Pilot, or Probe Response frame being reported.

The Antenna ID field contains the identifying number for the antenna(s) used for this measurement. Antenna ID is defined in 9.4.2.40.

The Parent TSF field contains the lower 4 octets of the measuring STA's TSF timer value at the start of reception of the first octet of the timestamp field of the reported Beacon, Measurement Pilot, or Probe Response frame at the time the Beacon, Measurement Pilot, or Probe Response frame being reported was received.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-112.

Table 9-112—Optional subelement IDs for Beacon report

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | Reserved | |
| 1 | Reported Frame Body | |
| 2–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Reported Frame Body subelement contains the requested fields and elements of the frame body of the reported Beacon, Measurement Pilot, or Probe Response frame. If the Reporting Detail subelement of the corresponding Beacon request equals 0, the Reported Frame Body subelement is not included in the Beacon report. If the Reporting Detail subelement equals 1, all fixed fields and any elements identified in a Request element or Extended Request element in the corresponding Beacon request are included in the Reported Frame Body subelement, in the order that they appeared in the reported frame. If the Reporting Detail field equals 2, all fixed fields and elements are included in the order they appeared in the reported frame. Reported TIM elements are truncated such that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. Reported IBSS dynamic frequency selection (DFS) elements are truncated so that only the lowest and highest channel number map are reported and the element Length field is modified to indicate the truncated length of 13. Reported RSNEs are truncated so that only the first 4 octets of the element are reported and the element Length field is modified to indicate the truncated length of 4. If the length of the Reported Frame Body subelement would cause the Measurement Report element to exceed the maximum element size, then the Reported Frame Body subelement is truncated so that the last element in the Reported Frame Body subelement is a complete element.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.8 Frame report

The format of the Measurement Report field corresponding to a Frame report is shown in Figure 9-201.

| Operating Class | Channel Number | Actual Measurement Start Time | Measurement Duration | Optional Subelements |
|-----------------|----------------|-------------------------------|----------------------|----------------------|
| Octets: 1 | 1 | 8 | 2 | variable |

Figure 9-201—Measurement Report field format for Frame report

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class that identifies the channel set for which the measurement report applies. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for which the measurement report applies. Valid operating classes are listed in Annex E, excluding operating classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the channel number for which the measurement report applies. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the channel for which the measurement report applies, and the Operating Class and Channel Number fields together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

Actual Measurement Start Time is set to the value of the measuring STA's TSF timer at the time the measurement started.

Measurement Duration is set to the duration over which the Frame report was measured, in units of TUs.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-113.

Table 9-113—Optional subelement IDs for Frame report

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|------------|
| 0 | Reserved | |
| 1 | Frame Count Report | |
| 2–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Frame Count Report subelement is used to report information about frames sent by a transmitter. The Frame Count Report subelement is as shown in Figure 9-202.

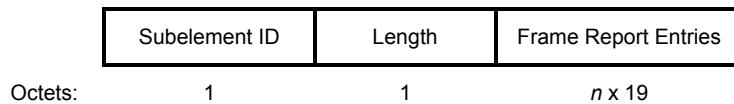

Figure 9-202—Frame Count Report subelement format

The Subelement ID field is defined in Table 9-113.

The Length field is defined in 9.4.3.

The Frame Report Entries field contains zero or more frame report entries. The structure of a frame report entry is shown in Figure 9-203.

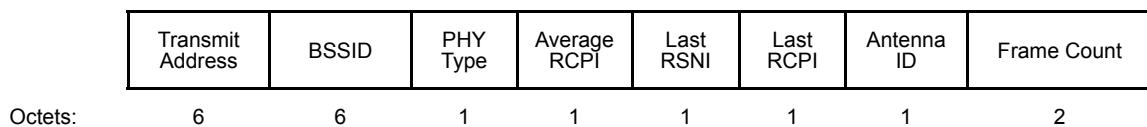

Figure 9-203—Frame Report Entry field format

The Transmit Address field contains the Transmitter Address (TA) from the frames being reported.

The BSSID field contains the BSSID from the frames being reported.

PHY Type indicates the physical medium type for the frame(s) being reported. Valid entries are coded according to dot11PHYType.

Average RCPI indicates the average value for the received channel power of frames received and counted in this Frame Report Entry field, as described in 11.11.9.2. Average RCPI is a logarithmic function of the received signal power, as defined 9.4.2.38.

Last RSNI indicates the received signal-to-noise indication of the most recently measured frame counted in this Frame Report Entry field, as described in 9.4.2.41.

Last RCPI indicates the received channel power of the most recently measured frame counted in this Frame Report Entry field. Last RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.38.

The Antenna ID field contains the identifying number for the antenna(s) used to receive the most recently measured frame counted in this Frame Report Entry field. Antenna ID is defined in 9.4.2.40.

Frame Count is a count of the Data and Management frames received with the indicated transmit address and BSSID during the measurement duration. The value 65 535 indicates a count of 65 535 or more.

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161), with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.9 STA Statistics report

The format of the Measurement Report field of a STA Statistics report is shown in Figure 9-204.

| Measurement Duration | Group Identity | Statistics Group Data | Optional Subelements |
|----------------------|----------------|-----------------------|----------------------|
| Octets: 2 | 1 | variable | variable |

Figure 9-204—Measurement Report field format for STA Statistics report

The STA Statistics report reports the change in the requested Statistics Group Data values measured within the Measurement Duration. When the Measurement Duration is equal to 0 the current values of the requested Statistics Group Data is reported, rather than the change.

The Measurement Duration is set to the duration over which the change in Statistics Group Data was measured and reported, in units of TUs. A Measurement Duration value of 0 indicates a report of the current values of the Statistics Group Data.

Group Identity indicates the requested statistics group describing the Statistics Group Data according to Table 9-114.

Statistics Group Data contains the requested statistics from the MIB in Annex C related to the interface on which the request was received according to Table 9-114. Units used for reporting a statistic or change in statistic are the units used to define the statistic in Annex C. When Measurement Duration value is nonzero, the reported data values for statistics that are not counters are the current values of the statistics data at the end of the Measurement Duration.

Table 9-114—Group Identity for a STA Statistics report

| Group Identity Requested | Statistics Group Data field length (octets) | Statistics Returned |
|---------------------------------|--|--|
| 0 | 28 | dot11Counters Group for the Interface on which the STA Statistics request was received (with the exception of WEPUndecryptableCount and those counters listed in Group Identity 1): dot11TransmittedFragmentCount (Counter32), dot11GroupTransmittedFrameCount (Counter32), dot11FailedCount (Counter32), dot11ReceivedFragmentCount (Counter32), dot11GroupReceivedFrameCount (Counter32), dot11FCSErrorCount (Counter32), dot11TransmittedFrameCount (Counter32) |
| 1 | 24 | dot11MACStatistics Group for the Interface on which the STA Statistics request was received: dot11RetryCount (Counter32), dot11MultipleRetryCount (Counter32), dot11FrameDuplicateCount (Counter32), dot11RTSSuccessCount (Counter32), dot11RTSFailureCount (Counter32), dot11AckFailureCount (Counter32) |
| 2 | 52 | dot11QosCounters Group for UP0 for the Interface on which the STA Statistics request was received: dot11QosTransmittedFragmentCount (Counter32), dot11QosFailedCount (Counter32), dot11QosRetryCount (Counter32), dot11QosMultipleRetryCount (Counter32), dot11QosFrameDuplicateCount (Counter32), dot11QosRTSSuccessCount (Counter32), dot11QosRTSFailureCount (Counter32), dot11QosAckFailureCount (Counter32), dot11QosReceivedFragmentCount (Counter32), dot11QosTransmittedFrameCount (Counter32), dot11QosDiscardedFrameCount (Counter32), dot11QosMPDUsReceivedCount (Counter32), dot11QosRetriesReceivedCount (Counter32) |
| 3 | 52 | dot11QosCounters Group for UP1 for the Interface on which the STA Statistics request was received: dot11QosTransmittedFragmentCount (Counter32), dot11QosFailedCount (Counter32), dot11QosRetryCount (Counter32), dot11QosMultipleRetryCount (Counter32), dot11QosFrameDuplicateCount (Counter32), dot11QosRTSSuccessCount (Counter32), dot11QosRTSFailureCount (Counter32), dot11QosAckFailureCount (Counter32), dot11QosReceivedFragmentCount (Counter32), dot11QosTransmittedFrameCount (Counter32), dot11QosDiscardedFrameCount (Counter32), dot11QosMPDUsReceivedCount (Counter32), dot11QosRetriesReceivedCount (Counter32) |

Table 9-114—Group Identity for a STA Statistics report (continued)

Figure 9-212—Data field of the Reporting Reason subelement for RSNA Counters

In a nontriggered STA Statistics report, all subfields of the Data field of the Reporting Reason subelement are set to 0.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.10 LCI report (Location configuration information report)

An LCI report for a known LCI includes latitude, longitude, altitude, and related information. An unknown LCI is indicated by the Length field of the LCI subelement being set to 0 and there being no following subelements. The LCI report field format is shown in Figure 9-213.

| | | |
|---------|----------------|----------------------|
| Octets: | 2 or 18 | variable |
| | LCI Subelement | Optional Subelements |

Figure 9-213—Format of Location Configuration Information Report

The subelements in the LCI report are defined in Table 9-116.

Table 9-116—Subelement IDs for LCI Report

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|-------------|
| 0 | LCI | |
| 1 | Azimuth Report | Yes |
| 2 | Originator Requesting STA MAC Address | |
| 3 | Target MAC Address | |
| 4 | Z | Subelements |
| 5 | Relative Location Error | Yes |
| 6 | Usage Rules/Policy | Yes |
| 7 | Co-Located BSSID List | Yes |
| 8–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The LCI Subelement field contains an LCI subelement. The LCI subelement is formatted as shown in Figure 9-214.

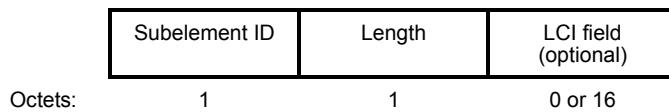

Figure 9-214—LCI subelement format

The Subelement ID field is equal to the value for LCI in Table 9-116.

The Length field is defined in 9.4.3.

The LCI field is formatted as shown in Figure 9-215.

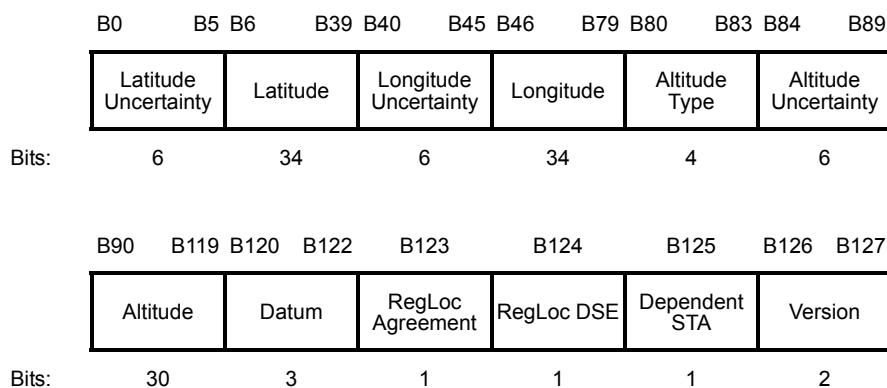

Figure 9-215—LCI field format

The definitions of fields within the LCI field are as specified in Section 2.2 of IETF RFC 6225 (July 2011) or as defined herein. This structure and information fields are based on the LCI format described in IETF RFC 6225.

NOTE—This example shows how to encode the coordinates of the Sydney Opera House using the encoding defined in IETF RFC 6225. The building is a polygon with the following (latitude, longitude) coordinates:

```
(-33.856 625°, +151.215 906°)
(-33.856 299°, +151.215 343°)
(-33.856 326°, +151.214 731°)
(-33.857 533°, +151.214 495°)
(-33.857 720°, +151.214 613°)
(-33.857 369°, +151.215 375°)
```

Latitude ranges from -33.857 720° to -33.856 299°; longitude ranges from +151.214 495° to +151.215 906°.

For this example, the point that is encoded is chosen by finding the middle of each range, that is (-33.857 009 5°, +151.215 200 5°), which is encoded as (1110111100010010010011011000001101,

0100101110011011100010111011000011) (2s complement, 9 bits before binary point, 25 after, MSB first).

These values can be derived as $2^{34} - \text{Round}(33.857\ 009\ 5 \times 2^{25})$ and $\text{Round}(151.215\ 200\ 5 \times 2^{25})$, respectively.

The latitude uncertainty (LatUnc) is given by inserting the difference between the center value and the outer value into the formula from Section 2.3.2 of IETF RFC 6225. This gives:

$$\text{LatUnc} = 8 - \lceil \log_2(-33.8570095 - (-33.857720)) \rceil. \text{ The result is 18, which is encoded as 010010.}$$

Similarly, longitude uncertainty (LongUnc) is given by the formula:

$$\text{LongUnc} = 8 - \lceil \log_2(151.2152005 - 151.214495) \rceil. \text{ The result is also 18, which is encoded as 010010.}$$

The top of the building is 67.4 meters above sea level, and a starting altitude of 0 meters above sea level is assumed. At the GPS coordinates of the Sydney Opera House, the sea level is approximately 22.5 m below the WGS84 ellipsoid. Therefore, the lowest altitude of the building is -22.5 m, while the highest altitude is (67.4 - 22.5)=44.9 m from the WGS84 ellipsoid. The middle of the range is $(44.9 - 22.5)/2=11.2$ m, which is encoded as 00000000000000000101100110011 (22 bits before binary point, 8 after, MSB first).

Altitude uncertainty is given by the height of the building. Since the building is 67.4 m above sea level and basement is assumed to be at sea level, the uncertainty to be encoded is half of 67.4 m.

Altitude uncertainty (AltUnc) uses the formula from Section 2.4.5 from IETF RFC 6225:

$$\text{AltUnc} = 21 - \lceil \log_2(33.7 - 0) \rceil, \text{ the result is 15, which is encoded as 001111 (MSB first).}$$

The Altitude Type field is set to 1, indicating that the altitude is specified in meters.

The Datum field is set to 1, indicating WGS84 coordinates.

The RegLoc Agreement field is set to 0 for this example.

The RegLoc DSE field is set to 0 for this example.

The Dependent STA field is set to 0 for this example.

The Version field is set to 1, as that is the only value currently defined in IETF RFC 6225.

The LCI configuration information report for this example is encoded as (where underscores are used as field or octet delimiters):

```
010010_1110111100010010010011011000001101_010010_010010111001101100010111011000011_0001
_001111_0000000000000000000000101100110011_001_0_0_0_01 (binary, MSB first per field)

```

The RegLoc Agreement field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.12.3); otherwise, it is 0.

The RegLoc DSE field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.

The Version field is a 2-bit field defined in IETF RFC 6225, and the use is described in IETF RFC 6225.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-116. The subelement format and ordering of subelements are defined in 9.4.3.

The Azimuth Report subelement is used to report an azimuth. The Azimuth Report subelement is as shown in Figure 9-216.

| | | | |
|---------|---------------|--------|----------------|
| | Subelement ID | Length | Azimuth Report |
| Octets: | 1 | 1 | 2 |

Figure 9-216—Azimuth Report subelement format

The Subelement ID field is defined in Table 9-116.

The Length field is defined in 9.4.3.

The Azimuth Report field of an Azimuth Report subelement contains three subfields as shown in Figure 9-217.

| B0 | B1 | B2 | B3 | B6 | B7 | B15 |
|----------|--------------|--------------------|---------|----|----|-----|
| Reserved | Azimuth Type | Azimuth Resolution | Azimuth | | | |
| Bits: | 2 | 1 | 4 | | 9 | |

Figure 9-217—Azimuth Report subfield

Azimuth Type is set to 1 to report the Azimuth of the bearing of the requester with respect to the responder and is set to 0 to report the Azimuth of front surface of the reporting STA.

Azimuth Resolution is 4 bits, indicating the number of valid most significant bits in the Azimuth.

Azimuth is a 9-bit unsigned integer value in degrees from true north, of the type defined by the Azimuth Type field.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding LCI request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding LCI request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-170.

The Z subelement is used to report the floor and location of the STA with respect to the floor level. The format of the Z subelement is shown in Figure 9-218.

| | | | | |
|---------------|--------|----------------|------------------------|------------------------------------|
| Subelement ID | Length | STA Floor Info | STA Height Above Floor | STA Height Above Floor Uncertainty |
| Octets: | 1 | 1 | 2 | 3 |

Figure 9-218—Z subelement format

The Subelement ID field is equal to the value for Z in Table 9-116.

The Length field is defined in 9.4.3.

The format of the STA Floor Info field is defined in Figure 9-218.

| | | | |
|------------------|----|------------------|-----|
| B0 | B1 | B2 | B15 |
| Expected to Move | | STA Floor Number | |
| Bits: | 2 | 14 | |

Figure 9-219—STA Floor Info field format

The Expected to Move field indicates whether the STA is expected to change its location. The value 1 indicates that the STA is expected to change its location. The value 0 indicates that the STA is not expected to change its location. The value 2 indicates that the STA’s movement patterns are unknown. The value 3 is reserved.

NOTE—Examples of STAs that are expected to move include a) battery-powered STAs, b) STAs installed within trains/vehicles, c) STAs installed for temporary events.

The STA Floor Number field indicates the floor number of the STA. A higher value indicates a higher floor, and the integer approximates the floor number labels used at the venue (e.g., in stairwells and elevators, if present). The field is encoded as a 2s complement integer with units of 1/16-th of a floor. The value –8 192 indicates an unknown floor number. The value 8 191 indicates the STA’s floor is 8 191/16 floors or more. The value –8 191 indicates the STA’s floor is –8 191/16 floors or less.

NOTE—For example, a building with floors labeled as Basement 1, Ground, Mezzanine, 1, and 2 might have the floors identified by STA Floor Number values equal -16, 0, 8, 16 and 32 respectively.

The STA Height Above Floor field indicates the height of the STA above the floor. The field is coded as a 2s complement integer with units of 1/4096 m. The value –8 388 608 indicates an unknown STA height above floor. The value –8 388 607 indicates the height of the STA above the floor is –8 388 607/4096 m or less. The value 8 388 607 indicates the height of the STA above the floor is 8 388 607/4096 m or more.

A STA Height Above Floor Uncertainty value of 0 indicates an unknown STA height above floor uncertainty. Values 25 or higher are reserved. A value from 1 to 24 indicates that the actual STA height above floor, a , is bounded according to:

$$h - 2^{11-u} \leq a \leq h + 2^{11-u}$$

where

- h is the value in units of 1/4096 m of the STA Height Above Floor field
- u is the value of the STA Height Above Floor Uncertainty field

If the STA Height Above Floor field indicates an unknown STA height above floor, the STA Height Above Floor Uncertainty field is set to 0.

The Relative Location Error subelement is used to report the location error of STAs with respect to a reference STA (rather than with respect to an absolute geographic location). The format of the Relative Location Error subelement is defined in Figure 9-220.

| | Subelement ID | Length | Reference STA | Relative Location Error |
|---------|---------------|--------|---------------|-------------------------|
| Octets: | 1 | 1 | 6 | 1 |

Figure 9-220—Relative Location Error subelement format

The Subelement ID field is equal to the value for Relative Location Error in Table 9-116.

The Length field is defined in 9.4.3.

The Reference STA field contains the MAC address of the reference STA.

The format of the Relative Location Error field is defined in Figure 9-221.

| B0 | B3 | B4 | B7 |
|-------------------------------|----|-----------------------------|----|
| Power of Two Horizontal Error | | Power of Two Vertical Error | |
| Bits: | 4 | 4 | |

Figure 9-221—Relative Location Error field format

The Power Of Two Horizontal Error field contains an upper bound on the error between the horizontal location of the Reference STA and the Latitude and Longitude fields in the LCI subelement. The Power Of Two Horizontal Error field indicates a relative horizontal error of 2^{p-8} m, where p is the value of the Power of Two Horizontal Error field in the range 0 to 13. The value 14 indicates a relative horizontal error of greater than 32 m. The value 15 indicates an unknown relative horizontal error.

The Power Of Two Vertical Error field contains an upper bound on the error between the vertical location of the Reference STA and the Altitude field in the LCI subelement. The Power Of Two Vertical Error field indicates a relative vertical error of 2^{p-8} m, where p is the value of the Power Of Two Vertical Error field in the range 0 to 13. The value 14 indicates a relative vertical error of greater than 32 m. The value 15 indicates an unknown relative vertical error.

The Usage Rules/Policy subelement is used to report the usage rules of the reporting STA and whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The format of the Usage Rules/Policy subelement is defined in Figure 9-222.

| | | | |
|---------------|--------|--|---|
| Subelement ID | Length | Usage Rules/ Policy Param- eters | Retention Expires Rela- tive (optional) |
| Octets: | 1 | 1 | 1 0 or 2 |

Figure 9-222—Usage Rules/Policy subelement format

The Subelement ID field is equal to the value for Usage Rules/Policy in Table 9-116.

The Length field is defined in 9.4.3.

The Usage Rules/Policy Parameters field is defined in Figure 9-223.B1

| B0 | B1 | B2 | B3 | B7 |
|---------------------------|---------------------------------------|------------------------|----------|----|
| Retransmission Allowed | Retention Expires Relative Present | STA Location Policy | reserved | |
| Bits: | 1 | 1 | 1 | 5 |

Figure 9-223—Usage Rules/Policy Parameters field format

The Retransmission Allowed field definition is the same as the definition for the retransmission-allowed element in IETF RFC 4119, except that the “no” and “yes” text encoding specified in IETF RFC 4119 is replaced by 0 and 1 respectively.

The Retention Expires Relative Present field indicates whether Retention Expires Relative field is present. The value 1 indicates that the Retention Expires Relative field is present; otherwise the Retention Expires Relative field is not present. If the Retention Expires Relative field is not present, it indicates that the retention duration of the LCI report field is unbounded.

The STA Location Policy field indicates whether additional STA or neighboring STA location information is available if the additional information can be transferred more securely. The security of the transfer is (from lowest to highest): unassociated, associated without RSNA established, associated with RSNA established but without management frame protection negotiated, and associated with both RSNA established and management frame protection negotiated. The additional information might be one or more of: 1) the STA’s location with reduced uncertainty and 2) the location of additional neighbor APs, if the STA Location Policy field is carried within a Neighbor Report Response frame. A value of 1 indicates additional STA or neighboring STA location information is available. A value of 0 indicates no additional STA or neighboring STA location information is available.

The definition of the Retention Expires Relative field is the same as the definition for the retention-expires element in IETF RFC 4119, except that the absolute time text encoding specified in IETF RFC 4119 is replaced by a relative binary encoding: the Retention Expires Relative field is encoded as a number of hours in the future relative to the time of transmission of the Usage Rules/Policy subelement.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

The Co-Located BSSID List subelement is used to report the list of BSSIDs of the BSSs which share the same antenna connector with the reporting STA.

The format of the Co-Located BSSID List subelement is shown in Figure 9-224

| | | | | | |
|---------------|--------|--------------------|---------------------|-----|---------------------|
| Subelement ID | Length | MaxBSSID Indicator | BSSID #1 (optional) | ... | BSSID #n (optional) |
| Octets: | 1 | 1 | 1 | 6 | 6 |

Figure 9-224—Co-Located BSSID List subelement format

The Subelement ID field is equal to the value for Co-Located BSSID list in Table 9-116.

The Length field is defined in 9.4.3.

The MaxBSSID Indicator field is as defined in 9.4.2.26. When set to a nonzero value, it indicates the maximum possible number of BSSs, including the reference BSS, which share the same antenna connector and have the same 48-(MaxBSSID indicator field) MSBs of the BSSIDs. When the BSSIDs of the co-located BSSs are configured at the reporting STA but not represented by the MaxMBSSID Indicator field, the BSSID fields are present in the Co-located BSSID List subelement to provide an explicit list of such BSSID values.

When the MaxBSSID Indicator field is equal to zero, the BSSID fields contain an explicit list of the BSSID values of the BSSs which share the same antenna connector with the reporting STA.
