NOTE—For example, if there are 4 BSSs which share the same antenna connector and their BSSIDs end with 16, 24, 30 and 31, and the range of MAC addresses ending with 16-31 inclusive are not assigned to other BSSs using a different antenna connector, then this list of 4 BSSIDs can be indicated with a value of 5 in the MaxBSSID Indicator field. Otherwise, the MaxBSSID Indicator field is set to zero and the BSSIDs are listed separately.

9.4.2.22.11 Transmit Stream/Category Measurement report

The Transmit Stream/Category Measurement applies to TIDs for Traffic Streams associated with TSPECs and also to TIDs for Traffic Categories for QoS traffic without TSPECs. The format of the Measurement Report field corresponding to a Transmit Stream/Category Measurement report is shown in Figure 9-225.

| | | | | | |
|-------------------------------|----------------------|---------------------------|-------------------------|---------------------|------------------------|
| Actual Measurement Start Time | Measurement Duration | Peer STA Address | Traffic Identifier | Reporting Reason | Transmitted MSDU Count |
| Octets: | 8 | 2 | 6 | 1 | 1 |
| | | | | | |
| MSDU Discarded Count | MSDU Failed Count | MSDU Multiple Retry Count | QoS CF-Polls Lost Count | Average Queue Delay | Average Transmit Delay |
| Octets: | 4 | 4 | 4 | 4 | 4 |
| | | | | | |
| Bin 0 Range | Bin 0 | Bin 1 | Bin 2 | Bin 3 | Bin 4 |
| Octets: | 1 | 4 | 4 | 4 | 4 |
| | | | | | |
| Optional Subelements | | | | | |
| | | | | | |

Figure 9-225—Measurement Report field format for Transmit Stream/Category Measurement report

Actual Measurement Start Time is set to the TSF at the time at which the measurement started, or for a triggered Transmit Stream/Category Measurement report, the TSF value at the reporting QoS STA when the trigger condition was met.

Measurement Duration is set to the duration over which the Transmit Stream/Category Measurement report was measured, in units of TUs. In a triggered Transmit Stream/Category Measurement report, metrics are reported over a number of transmitted MSDUs rather than a duration; hence Measurement Duration is set to 0; see 11.11.9.8.

The Peer STA Address contains a MAC address indicating the RA for the measured frames.

The Traffic Identifier field contains the TID subfield as shown in Figure 9-172. The TID subfield indicates the TC or TS for which traffic was measured.

The Reporting Reason field is a bit field indicating the reason that the measuring QoS STA sent the transmit stream/category measurement report. The Reporting Reason field is shown in Figure 9-226.

| | B0 | B1 | B2 | B3 | B7 |
|-----------------|---------------------|---------------|----------|----|----|
| Average Trigger | Consecutive Trigger | Delay Trigger | Reserved | | |
| Bits: | 1 | 1 | 1 | 5 | |

Figure 9-226—Reporting Reason field

- The Average Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the Average Error trigger.
- The Consecutive Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the Consecutive Error trigger.
- The Delay Trigger bit set to 1 indicates that the Transmit Stream/Category Measurement report was generated as a triggered report due to the delay exceeding the Delay Threshold.

When a Transmit Stream/Category Measurement report is sent as a direct response to a Transmit Stream/Category Measurement request and not as a triggered Transmit Stream/Category Measurement report, all bit fields in the Reporting Reason field are set to 0. This is termed a requested Transmit Stream/Category Measurement report. Within a triggered Transmit Stream/Category Measurement report, more than one bit field in the Reporting Reason field might be set to 1 if more than one trigger condition was met.

The Transmitted MSDU Count, MSDU Failed Count, MSDU Discarded Count, MSDU Multiple Retry Count, QoS CF-Polls Lost Count, Average Queue Delay, Average Transmit Delay, and delay histogram fields relate to transmissions to the QoS STA given in the Peer STA Address field. Metrics are reported over the Measurement Duration, or for triggered transmit stream/category measurements, over the Measurement Count. Any counter that increments to a value of $2^{32}-1$ terminates the measurement.

The Transmitted MSDU Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted.

The MSDU Discarded Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due either to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate), or due to the MSDU lifetime having been reached.

The MSDU Failed Count field contains the number of MSDUs for the TC or the TS specified by the TID that were discarded due to the number of transmit attempts exceeding dot11ShortRetryLimit or dot11LongRetryLimit (as appropriate).

The MSDU Multiple Retry Count field contains the number of MSDUs for the TC or the TS specified by the TID that were successfully transmitted after more than one retransmission attempt.

The QoS CF-Polls Lost Count field contains the number of QoS (+)CF-Poll frames that were transmitted where there was no response from the QoS STA. QoS CF-Polls Lost Count are returned only if the reporting QoS STA is contained within an AP and the TID is for a TS. This field is set to 0 when QoS CF-Polls Lost Count is not returned.

Average Queue Delay is the average queuing delay of the frames (MSDUs) that are passed to the MAC for the indicated peer STA address and the indicated traffic identifier. Queue Delay is expressed in TUs and is measured from the time the MSDU is passed to the MAC until the point at which the first or only fragment begins transmission.

Average Transmit Delay is the average delay of the frames (MSDUs) that are successfully transmitted for the indicated Peer STA Address and TID. Average Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. Average Transmit delay is expressed in units of TUs.

Bin 0 Range field value indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, in units of TUs. It is also used to calculate the delay ranges of the other five bins making up the histogram. The delay range for each bin increases in a binary exponential fashion as follows:

$$\begin{aligned} \text{Bin 0 range: } & 0 \leq \text{Delay} < B_0 = \text{Bin 0 Range field value} \\ \text{Bin } i \text{ range: } & 2^{i-1} \times B_0 \leq \text{Delay} < 2^i \times B_0, \quad \text{for } 1 \leq i \leq 4 \\ \text{Bin 5 range: } & 16 \times B_0 \leq \text{Delay} \end{aligned}$$

For example, if Bin 0 Range field value is 10 TUs, the bin delay ranges are as defined in Table 9-117.

Table 9-117—Delay definitions for a Transmit Stream/Category Measurement report for a Bin 0 Range field value of 10 TU

| Bin | Measured MSDU Transmit Delay (TUs) |
|-----|------------------------------------|
| 0 | Delay < 10 |
| 1 | 10 ≤ Delay < 20 |
| 2 | 20 ≤ Delay < 40 |
| 3 | 40 ≤ Delay < 80 |
| 4 | 80 ≤ Delay < 160 |
| 5 | 160 ≤ Delay |

To compute the value reported in Bin i (i.e., B_i for $i = 0, 1\dots5$ of the Transmit Delay Histogram), the STA initializes all bin values to 0. For each MSDU successfully transmitted, the measured MSDU Transmit Delay determines which bin is to be incremented. If the measured delay has a duration time t within Bin i , then Bin i is increased by one. MSDU Transmit Delay is measured from the time the MSDU is passed to the MAC until the point at which the entire MSDU has been successfully transmitted, including receipt of the final Ack frame from the peer STA if the QoSAck service class is being used. The sum of the values in all six bins is equal to the value reported in the Transmitted MSDU Count.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-118.

Table 9-118—Optional subelement IDs for Transmit Stream/Category Measurement report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.22.12 Multicast Diagnostics report

The format of the Measurement Report field of a Multicast Diagnostics report is shown in Figure 9-227.

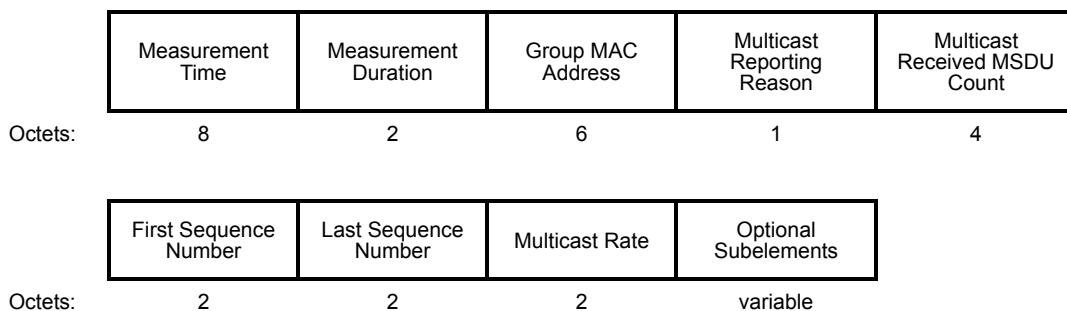

Figure 9-227—Measurement Report field format for a Multicast Diagnostics report

The Measurement Time field is the value of the STA TSF timer at the time the measurement started. In a triggered Multicast Diagnostics report, this is the TSF value at the reporting STA when the trigger condition was met. When the reason for sending the report is Performance Measurement and the Multicast Received MSDU Count is nonzero, the Measurement Time field is the value of the STA TSF timer at the time of the first group addressed MSDU received during the measurement interval.

The Measurement Duration field specifies the period over which the Multicast Diagnostic report was generated, in units of TUs.

The Group MAC Address field contains the value from the Group MAC Address field from the Multicast Diagnostics request to which the report relates.

The Multicast Reporting Reason field indicates the reason why the measuring STA sent the Multicast Diagnostics report. The Multicast Reporting Reason field is shown in Figure 9-228.

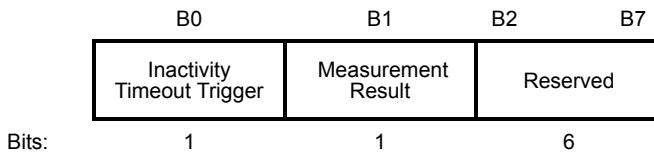

Figure 9-228—Multicast Reporting Reason field

The subfields of the Multicast Reporting Reason field are defined as follows:

- The Inactivity Timeout Trigger field set to 1 indicates that Multicast Diagnostics report was generated as a triggered report due to the timeout of the multicast diagnostic timer.
- The Measurement Result field set to 1 indicates that the Multicast Diagnostic report contains the result of completing a Multicast Diagnostic request that did not contain a Multicast Triggered Reporting subelement.

All of the bits in the Multicast Reporting Reason field are independent.

The Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received during the measurement duration. For a triggered multicast diagnostics measurement, the Multicast Received MSDU Count field contains the total number of group addressed MSDUs with the indicated multicast MAC address that were received between the acceptance of the multicast diagnostics measurement request and the occurrence of the trigger condition.

When the LSB of the first octet of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the First Sequence Number field contain the sequence number of the first frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the First Sequence Number field contain the sequence number of the first group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the First Sequence Number field are set to 0.

When the LSB of the first octet of the Multicast MAC address field in the Multicast Diagnostics request is 1, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last frame received with destination address equal to the value in the Multicast MAC address field during the measurement period. When the LSB of the first octet of the Multicast MAC address field in the Multicast Diagnostics request is 0, the twelve LSBs of the Last Sequence Number field contain the sequence number of the last group addressed frame, that does not have the broadcast MAC address as its destination, received during the measurement period. The four most significant bits of the Last Sequence Number field are set to 0.

The First Sequence Number field and the Last Sequence Number field are set to 0 if the Multicast Received MSDU Count is 0.

The Multicast Rate field specifies the highest data rate, in 0.5 Mb/s units, at which the STA has received a group addressed frame during the measurement period. The Multicast Rate field is encoded with the MSB set to 1 to indicate that the data rate is in the basic rate set, and set to 0 to indicate that the data rate is not in the basic rate set. The remaining 15 bit value is multiplied by 0.5 Mb/s to indicate the data rate. The Multicast Rate field is 0 by the STA to indicate that it has not received a group addressed frame during the measurement period.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-119.

Table 9-119—Optional subelement IDs for Multicast Diagnostics report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

The summary of fields used in the STA Multicast Diagnostics report is shown in Table 9-120.

Table 9-120—Summary of fields used in the STA Multicast Diagnostics report

| Field | Measurement Result | Triggered Report |
|-------------------------------|--------------------|------------------|
| Measurement Time | Yes | Yes |
| Measurement Duration | Yes | Yes |
| Group MAC Address | Yes | Yes |
| Multicast Reporting Reason | Yes | Yes |
| Multicast Received MSDU Count | Yes | Yes |
| First Sequence Number | Yes | Yes |
| Last Sequence Number | Yes | Yes |
| Multicast Rate | Yes | Yes |
| Optional Subelements | Optional | Optional |

The use of Multicast Diagnostics report is defined in 11.11.19.

9.4.2.22.13 Location Civic report

The Location Civic report includes the location information defined in civic format for the location subject provided in the Location Civic request, as shown in Figure 9-229.

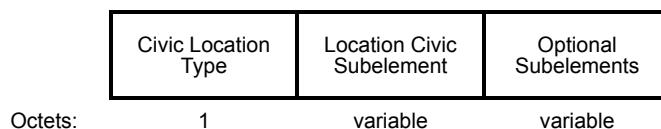

Figure 9-229—Location Civic report field format

The Civic Location Type field contains the format of location information in the Civic Location field, as indicated in Table 9-100.

The subelement IDs of the Location Civic report are defined in Table 9-121.

Table 9-121—Subelement IDs for Location Civic report

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Location Civic | |
| 1 | Originator Requesting STA MAC Address | |
| 2 | Target MAC Address | |
| 3 | Location Reference | |
| 4 | Location Shape | |
| 5 | Map Image | |
| 6 | Reserved | |
| 7 | Co-Located BSSID List | Yes |
| 8–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Location Civic Subelement field contains a Location Civic subelement. The Location Civic subelement of the Location Civic report (see Figure 9-229) is formatted according to Figure 9-230.

Figure 9-230—Location Civic subelement format

The Subelement ID is equal to Location Civic as defined in Table 9-121.

The Location Civic field contains the location information in the format as indicated in the Civic Location Type field. When the Civic Location Type field is IETF RFC 4776:

- Location Civic field is formatted according to IETF RFC 4776 starting at the country code field (i.e., excluding the GEOCONF_CIVIC/ OPTION_GEOCONF_CIVIC, N/option-len and what fields)
- An unknown civic location is indicated by a subelement Length of 0 and a zero-length Location Civic field
- The Civic Location field follows the little-endian octet ordering

When the Civic Location Type field is IETF RFC 4776, the Optional Subelements field optionally includes the Location Reference, Location Shape, Map Image, and Vendor Specific subelements as defined in Table 9-121.

When the Civic Location Type field value is Vendor Specific, a Vendor Specific subelement is included in the Optional Subelements field that identifies the Organization Identifier corresponding to the Civic Location Type field.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-121. The subelement format and ordering of subelements are defined in 9.4.3.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Civic request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-170.

The format of the Location Reference subelement is shown in Figure 9-231.

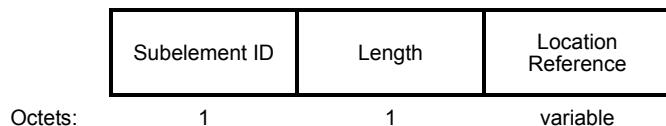

Figure 9-231—Location Reference subelement format

The Location Reference is an ASCII string that defines a position on a floor from which the relative location contained in the Location Shape subelement is offset. A Location Reference value of 0 length indicates that the position of the Location Shape is top north west corner (i.e., 0,0) of the floor plan on which the Location Shape is defined.

The format of the Location Shape subelement is shown in Figure 9-232.

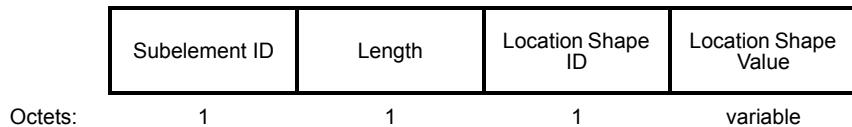

Figure 9-232—Location Shape subelement format

The Location Shape subelement defines the position in meters, including uncertainty, of the entity being located. A Shape is specified with respect to either a 2-Dimensional or 3-Dimensional Coordinate Reference System where each point in the shape defines the direction from the Location Reference starting point. A positive X-axis value corresponds to an easterly direction relative to the Location Reference; a negative X-axis value corresponds to a westerly direction relative to the Location Reference; a positive Y-axis value corresponds to a northerly direction relative to the Location Reference; a negative Y-axis value corresponds to a southerly direction relative to the Location Reference and the Z-axis value corresponds to the altitude above the horizontal plane at the Location Reference.

The Location Shape ID field contains a one-octet identifier that defines the shape contained in the subelement and is one of the values defined in Table 9-122.

The Location Shape Value field contains the location shape value for each corresponding Location Shape ID. The formats of Location Shape Values are described in the following text.

All shape field value units that are 4-octet single precision floating point values are in meters and are represented by binary32 floating point values as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field.

Table 9-122—Location Shape IDs

| Location Shape ID | Name |
|-------------------|-------------------|
| 0 | Reserved |
| 1 | 2-Dimension Point |
| 2 | 3-Dimension Point |
| 3 | Circle |
| 4 | Sphere |
| 5 | Polygon |
| 6 | Prism |
| 7 | Ellipse |
| 8 | Ellipsoid |
| 9 | Arclband |
| 10–255 | Reserved |

The format of the 2-Dimension Point Location Shape Value is defined in Figure 9-233.

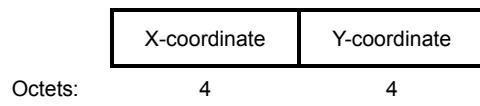

Figure 9-233—2-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The format of the 3-Dimension Point Location Shape Value is defined in Figure 9-234.

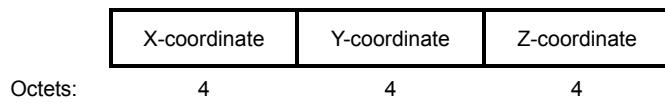

Figure 9-234—3-Dimension Point Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The format of the Circle Location Shape Value is defined in Figure 9-235.

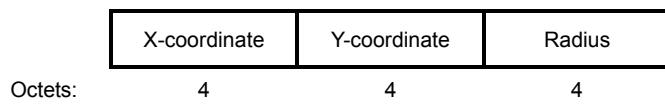

Figure 9-235—Circle Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Sphere Location Shape Value is defined in Figure 9-236.

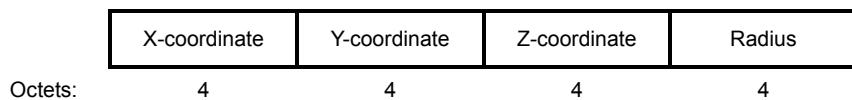

Figure 9-236—Sphere Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Radius field contains a 4-octet single precision floating point value.

The format of the Polygon Location Shape Value is defined in Figure 9-237.

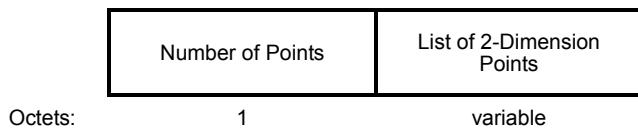

Figure 9-237—Polygon Location Shape Value format

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the polygon. The value 0 is reserved.

The List of 2-Dimension Points is a sequence of 2D Point field values that define the closed polygon.

The format of the Prism Location Shape Value is defined in Figure 9-238.

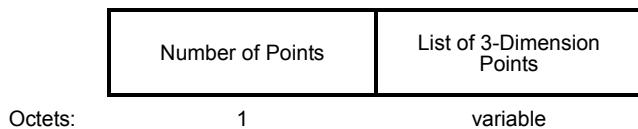

Figure 9-238—Prism Location Shape Value format

The Number of Points field is a 1 octet unsigned integer that specifies the number of points defined in the prism. The value 0 is reserved.

The List of 3-Dimension Points is a sequence of 3-Dimension Point field values that define the closed prism.

The format of the Ellipse Location Shape Value is defined in Figure 9-239.

| | X-coordinate | Y-coordinate | Angle | Semi-Major Axis | Semi-Minor Axis |
|---------|--------------|--------------|-------|-----------------|-----------------|
| Octets: | 4 | 4 | 2 | 4 | 4 |

Figure 9-239—Ellipse Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains a 2-octet unsigned integer between 0 and 359°.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The format of the Ellipsoid Location Shape Value is defined in Figure 9-240.

| | X-coordinate | Y-coordinate | Z-coordinate | Angle | Semi-Major Axis | Semi-Minor Axis | Semi-Vertical Axis |
|---------|--------------|--------------|--------------|-------|-----------------|-----------------|--------------------|
| Octets: | 4 | 4 | 4 | 2 | 4 | 4 | 4 |

Figure 9-240—Ellipsoid Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Z-coordinate field contains a 4-octet single precision floating point value.

The Angle field contains a 2-octet unsigned integer between 0 and 359°.

The Semi-Major Axis field contains a 4-octet single precision floating point value.

The Semi-Minor Axis field contains a 4-octet single precision floating point value.

The Semi-Vertical Axis field contains a 4-octet single precision floating point value.

The format of the Arcband Location Shape Value is defined in Figure 9-241.

| | X-coordinate | Y-coordinate | Inner Radius | Outer Radius | Start Angle | Opening Angle |
|---------|--------------|--------------|--------------|--------------|-------------|---------------|
| Octets: | 4 | 4 | 4 | 4 | 2 | 2 |

Figure 9-241—Arcband Location Shape Value format

The X-coordinate field contains a 4-octet single precision floating point value.

The Y-coordinate field contains a 4-octet single precision floating point value.

The Inner Radius field contains a 4-octet single precision floating point value.

The Outer Radius field contains a 4-octet single precision floating point value.

The Start Angle field contains a 2-octet unsigned integer between 0 and 359.

The Opening Angle field contains a 2-octet unsigned integer between 0 and 359.

The Map Image subelement contains a map reference that is used in combination with the Location Reference and Location Shape subelements. The format of the Map Image subelement is shown in Figure 9-242.

| | Subelement ID | Length | Map Type | Map URL |
|---------|---------------|--------|----------|----------|
| Octets: | 1 | 1 | 1 | variable |

Figure 9-242—Map Image subelement format

The Map Type field is a 1-octet unsigned integer that defines the type of map referred to by the Map URL field, as defined in Table 9-123.

Table 9-123—Map Types

| Map Type Value | Name |
|----------------|-------------|
| 0 | URL Defined |
| 1 | Png |
| 2 | Gif |
| 3 | Jpeg |
| 4 | Svg |
| 5 | dxf |
| 6 | Dwg |
| 7 | Dwf |
| 8 | cad |
| 9 | Tiff |
| 10 | gml |
| 11 | Kml |
| 12 | Bmp |
| 13 | Pgm |
| 14 | ppm |
| 15 | Xbm |
| 16 | Xpm |
| 17 | ico |
| 18–255 | Reserved |

The Map Type field value “URL Defined” indicates the Map URL field value has a file extension, defined as a mime type and is self-descriptive.

The Map URL field is a variable-length field formatted in accordance with IETF RFC 3986 and provides the location of a floor map.

The Co-Located BSSID List subelement is used to report the list of BSSIDs of the BSSs that share the same antenna connector with the reporting STA. The Co-Located BSSID List subelement is described in 9.4.2.22.10.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.22.14 Location Identifier report

The Location Identifier report includes an indirect reference to the location information for the location subject provided in the Location Identifier request, as shown in Figure 9-243.

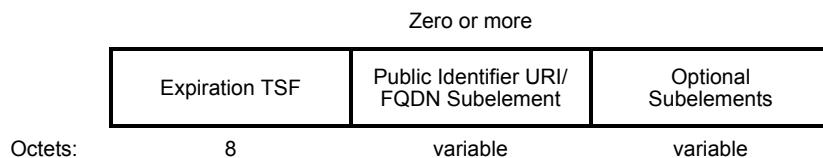

Figure 9-243—Location Identifier report field format

The Expiration TSF field is the value of the TSF when the Public Identifier URI/FQDN subelement(s) that indicate a location object are no longer valid. The Expiration TSF field set to 0 indicates the Public Identifier URI/FQDN subelement(s) that indicate a location object do not expire.

The Public Identifier URI/FQDN Subelement field contains zero or more Public Identifier URI/FQDN subelements.

The subelement IDs for the Location Identifier report are shown in Table 9-124.

Table 9-124—Subelement IDs for Location Identifier report

| Subelement ID | Name | Extensible |
|---------------|---------------------------------------|------------|
| 0 | Public Identifier URI/FQDN | |
| 1 | Originator Requesting STA MAC Address | |
| 2 | Target MAC Address | |
| 3–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Public Identifier URI/FQDN subelement of the Location Identifier report (see Figure 9-243) is formatted according to Figure 9-244.

| | | | |
|---------------|--------|---------------------|----------------------------|
| Subelement ID | Length | URI/FQDN Descriptor | Public Identifier URI/FQDN |
| Octets: | 1 | 1 | 1 variable |

Figure 9-244—Public Identifier URI/FQDN subelement format

The Subelement ID is equal to Public Identifier URI/FQDN as defined in Table 9-124.

The URI/FQDN Descriptor field describes the Public Identifier URI/FQDN field. The URI/FQDN Descriptor field is defined in Table 9-125.

Table 9-125—URI/FQDN Descriptor field values

| Value | Usage |
|-------|---|
| 0 | Reserved |
| 1 | The uniform resource locator (URI) of the Hypertext Transfer Protocol (HTTP) enabled location delivery (HELD) location object [IETF RFC 5985] |
| 2 | Fully qualified domain name of D-SLP SUPL server (excludes port number) [OMA OMA-TS-ULP-V2_0_1] (or higher version) |
| 3–255 | Reserved |

The Public Identifier URI/FQDN field contains a URI encoded using UTF-8 and formatted in accordance with IETF RFC 3986 that points to a location object or an FQDN that identifies a location server.

A Public Identifier URI/FQDN field that points to a location object can be used to return the location value for the requesting STA. The format of the location value returned when the URI is dereferenced is dependent on the provider of the URI as indicated by the URI/FQDN Descriptor field. The Public Identifier URI field confirms the validity of the location estimate to an external agent when a STA forwards a location estimate to that agent. The protocol used to query the infrastructure for a location report based on the Public Identifier URI field is beyond the scope of this standard.

A Public Identifier URI/FQDN field that points to a location server can be used to discover the location server and establish communications with it. The protocol used with the location server is indicated by the URI/FQDN Descriptor field.

The Optional Subelements field contains zero or more subelements with subelement ID greater than or equal to 1 as listed in Table 9-124. The subelement format and ordering of subelements are defined in 9.4.3.

The Originator Requesting STA MAC Address subelement contains the MAC address of the STA that requested the Location Information and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Originator Requesting STA MAC Address subelement is shown in Figure 9-169.

The Target MAC Address subelement contains the MAC address of the STA whose Location Information was requested and it is present whenever the Location Subject field in the corresponding Location Identifier request was set to 2. The format of the Target MAC Address subelement is shown in Figure 9-170.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.22.15 Directional Channel Quality report

The format of the Measurement Report field of a Directional Channel Quality report is shown in Figure 9-245.

| | | | | | |
|----------------------|---------------------------|------------------------------|----------|------------------------------|------------------------|
| Operating Class | Channel Number | AID | Reserved | Measurement Method | Measurement Start Time |
| Octets: | 1 | 1 | 1 | 1 | 8 |
| Measurement Duration | Number of Time Blocks (N) | Measurement for Time Block 1 | ... | Measurement for Time Block N | Optional Subelements |
| Octets: | 2 | 1 | 1 | 1 | Variable |

Figure 9-245—Measurement report field format for Directional Channel Quality report

Operating Class field indicates the channel set for which the measurement report applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement report applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

The AID field indicates the Target STA.

The Measurement Method field indicates the method used by the STA to carry out this measurement request and the format of the Measurement for Time Block field(s). If this field is set to 0, it indicates that the Measurement for Time Block fields are expressed in ANIPI. If this field is set to 1, it indicates that the Measurement for Time Block fields are expressed in RSNI. Other values are reserved.

Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration field is set to the duration of the measurement, in units of TUs.

The Number of Time Blocks field indicates the number of time blocks within the measurement duration. The ratio (Measurement Duration/Number of Time Blocks) provides the duration of an individual measurement unit.

The Measurement for Time Block fields are set to the ANIPI or average RSNI value measured during each (Measurement Duration/Number of Time Blocks) measurement units. The measurement units are set in the report in increasing order of start times. ANIPI is set to the average noise plus interference power value measured during the indicated Measurement Duration using the same units and accuracy as defined for ANPI in 11.11.9.4. Average RSNI is set according to 9.4.2.41, where RCPI is defined in 9.4.2.38.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-126.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the list of Optional Subelements.

Table 9-126—Optional subelement IDs for Directional Channel Quality report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

9.4.2.22.16 Directional Measurement report

The format of the Measurement Report field of a Directional Measurement report is shown in Figure 9-246.

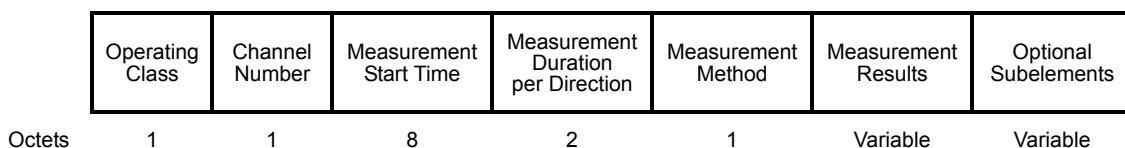

Figure 9-246—Measurement Report field format for Directional Measurement report

Operating Class field indicates the channel set for which the measurement report applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement report applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA’s TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TU.

The Measurement Method field indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement for Direction fields. If this field is set to 0, it indicates that the values in the Measurement for Direction fields are expressed in ANIPI. If this field is set to 1, it indicates that the values in the Measurement for Direction fields are expressed in RCPI. If this field is set to 2, it indicates that the values in the Measurement for Direction fields are expressed in Channel Load. Other values are reserved. ANIPI is defined in 9.4.2.22.15. RCPI is a logarithmic indication of the received channel power of the corresponding Link Measurement Request frame, as defined in 9.4.2.38.

The format of the Measurement Results field is shown in Figure 9-247. The Measurement for Direction fields are set to the format of values specified in the Measurement Method field.

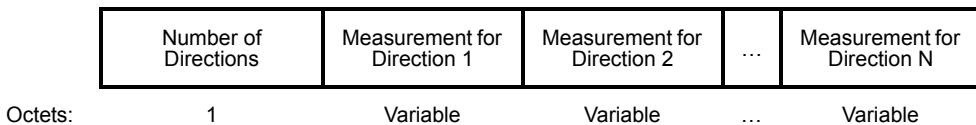

Figure 9-247—Measurement Results field format

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-127.

Table 9-127—Optional subelement IDs for Directional Measurement report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the list of Optional Subelements.

9.4.2.22.17 Directional Statistics report

The format of the Measurement Report field of a Directional Statistics report is shown in Figure 9-248.

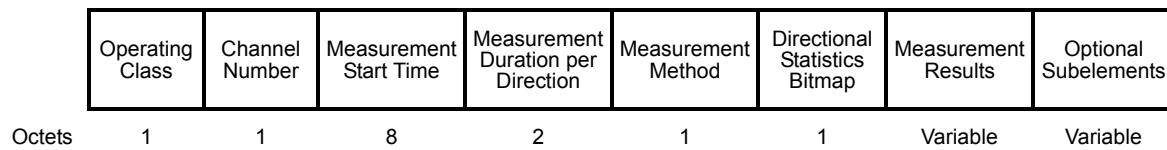

Figure 9-248—Measurement Report field format for Directional Statistics report

Operating Class field indicates the channel set for which the measurement report applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the measurement report applies. Valid values of Operating Class are shown in Annex E.

Channel Number field indicates the channel number for which the measurement report applies. Channel Number is defined within an Operating Class as shown in Annex E.

The Measurement Start Time field is set to the value of the measuring STA's TSF timer at the time the measurement started.

The Measurement Duration per Direction field is set to the duration of the measurement in each receiving direction, in units of TUs.

The Measurement Method field indicates the method used by the STA to carry out the measurement request and the format of values in the Measurement Results field. If this field is set to 0, it indicates that the values in the Measurement Results field are expressed in ANIPI. If this field is set to 1, it indicates that the values in the Measurement Results field are expressed in RCPI. If this field is set to 2, it indicates that the values in the Measurement Results field are expressed in Channel Load. Other values are reserved.

The Directional Statistics Bitmap field format is described in 9.4.2.21.18. When the Maximum field is set, it indicates that the maximum measurement result among all directions is included in the Measurement Results field. When the Minimum field is set, it indicates that the minimum measurement result among all directions is included in the Measurement Results field. If the Average field is set, it indicates that the average

measurement result among all directions is included in the Measurement Results field. If the Variance field is set, it indicates that the variance of measurement results among all directions is included in the Measurement Results field. Other bits are reserved.

The Measurement Results field is set based on the values in the Measurement Method field and the Directional Statistics Bitmap field. If two or more subfields in the Directional Statistics Bitmap are set to 1, the corresponding measurement results are included in the Measurement Results field in the same sequence as they appear in the Directional Statistics Bitmap field.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-128.

Table 9-128—Optional subelement IDs for Directional Statistics report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the list of Optional Subelements.

9.4.2.22.18 Fine Timing Measurement Range report

The format of the Measurement Report field corresponding to a Fine Timing Measurement Range report is shown in Figure 9-249.

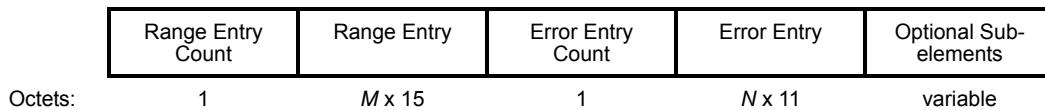

Figure 9-249—Measurement Report field format for a Fine Timing Measurement Range report

The Range Entry Count field indicates the number of Range Entry fields (i.e., M in Figure 9-249).

The Range Entry field indicates parameters relating to a successful range measurement with a single AP and is formatted according to Figure 9-250.

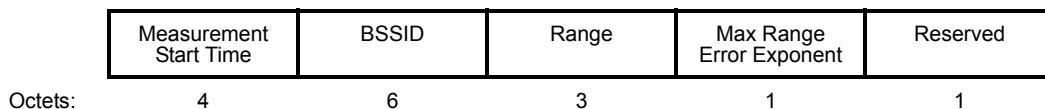

Figure 9-250—Range Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time ($\pm 32 \mu\text{s}$) at which the initial Fine Timing Measurement frame was transmitted where the timestamps of both the frame and response frame were successfully measured.

The BSSID field contains the BSSID of the AP whose range is being reported.

The Range field indicates the estimated range between the requested STA and the AP using the FTM procedure, in units of 1/4096 m. A value of $2^{24}-1$ indicates a range of $(2^{24}-1)/4096$ m or higher. See 11.11.9.11.

The Max Range Error Exponent field contains an upper bound for the error in the value specified in the Range field. A value of zero indicates an unknown error. A nonzero value indicates a maximum range error of $2^{(\text{Max Range Error Exponent} - 13)}$ m. The Max Range Error Exponent field has a maximum value of 25. Values in the range 26–255 are reserved. A value of 25 indicates a maximum range error of 4096 m or higher. For example, a value of 14 in the Max Range Error Exponent field indicates that the value in the Range field has a maximum error of ± 2 m.

The Error Entry Count field indicates the number of Error Entry fields (i.e., N in Figure 9-249).

The Error Entry field indicates parameters relating to a failed range measurement with a single AP and is formatted according to Figure 9-251.

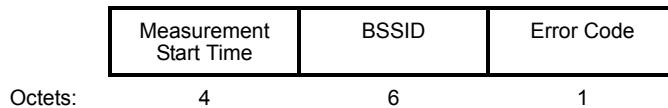

Figure 9-251—Error Entry field format

The Measurement Start Time field contains the least significant 4 octets of the TSF (synchronized with the associated AP) at the time ($\pm 32 \mu\text{s}$) at which the FTM failure was first detected.

The BSSID field contains the BSSID of the AP whose range was attempted to be measured.

The Error Code field is defined in Table 9-129.

Table 9-129—Error Code field values

| Error Code | Meaning |
|------------|--|
| 0–1 | Reserved |
| 2 | AP reported “Request incapable” |
| 3 | AP reported “Request failed. Do not send new request for a specified period” |
| 4–7 | Reserved |
| 8 | Unable to successfully transmit to AP |
| 9–255 | Reserved |

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-130.

Table 9-130—Optional subelement IDs for Fine Timing Measurement Range report

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements can be included in the list of Optional Subelements.

9.4.2.23 Quiet element

The Quiet element defines an interval during which no transmission occurs in the current channel. This interval might be used to assist in making channel measurements without interference from other STAs in the BSS. The format of the Quiet element is shown in Figure 9-252.

| Element ID | Length | Quiet Count | Quiet Period | Quiet Duration | Quiet Offset |
|------------|--------|-------------|--------------|----------------|--------------|
| Octets: | 1 | 1 | 1 | 1 | 2 |

Figure 9-252—Quiet element format

The Element ID and Length fields are defined in 9.4.2.1.

The Quiet Count field is set to the number of TBTTs until the beacon interval during which the next quiet interval starts. A value of 1 indicates the quiet interval starts during the beacon interval starting at the next TBTT. A value of 0 is reserved.

The Quiet Period field is set to the number of beacon intervals between the start of regularly scheduled quiet intervals defined by this Quiet element. A value of 0 indicates that no periodic quiet interval is defined.

The Quiet Duration field is set to the duration of the quiet interval, expressed in TUs.

The Quiet Offset field is set to the offset of the start of the quiet interval from the TBTT specified by the Quiet Count field, expressed in TUs. The value of the Quiet Offset field is less than one beacon interval.

The Quiet element is optionally present in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11. The use of Quiet elements is described in 11.9.3.

9.4.2.24 IBSS DFS element

The IBSS DFS element contains information for DFS operation in an IBSS. The format of the IBSS DFS element is shown in Figure 9-253.

| Element ID | Length | DFS Owner | DFS Recovery Interval | Channel Map (see Figure 9-254) |
|------------|--------|-----------|-----------------------|--------------------------------|
| Octets: | 1 | 1 | 6 | 1 $2 \times n$ |

Figure 9-253—IBSS DFS element format

The Element ID and Length fields are defined in 9.4.2.1.

The DFS Owner field is set to the individual IEEE MAC address of the STA that is the currently known DFS Owner in the IBSS.

The DFS Recovery Interval field indicates the time interval that is used for DFS owner recovery, expressed as an integer number of beacon intervals. The DFS Recovery Interval value is static throughout the lifetime of the IBSS and is determined by the STA that starts the IBSS.

The Channel Map field shown in Figure 9-254 contains a Channel Number field and a Map field (see 9.4.2.22.2) for each channel supported by the STA transmitting the IBSS DFS element. Note that n in Figure 9-253 is the number of channels supported by the STA.

| | | |
|----------------|-----|--|
| Channel Number | Map | n tuples, one for each supported channel |
| Octets: | 1 | 1 |

Figure 9-254—Channel Map field format

The IBSS DFS element is optionally present in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11. The use of IBSS DFS elements is described in 11.9.8.3.

9.4.2.25 RSNE

9.4.2.25.1 General

The RSNE contains the information required to establish an RSNA. The format of the RSNE is defined in Figure 9-255.

| Element ID | Length | Version | Group Data Cipher Suite | Pairwise Cipher Suite Count | Pairwise Cipher Suite List |
|------------|-----------------|---------------------|-------------------------|-----------------------------|-------------------------------|
| Octets: | 1 | 1 | 2 | 0 or 4 | 0 or 2 |
| Octets: | 0 or 2 | 0 or $(4 \times n)$ | 0 or 2 | 0 or 2 | 0 or $(4 \times m)$ |
| | AKM Suite Count | AKM Suite List | RSN Capabilities | PMKID Count | PMKID List |
| | 0 or 2 | 0 or $(4 \times n)$ | 0 or 2 | 0 or 2 | 0 or $(4 \times m)$ |
| | | | | | Group Management Cipher Suite |
| | | | | | 0 or 4 |

Figure 9-255—RSNE format

The Element ID and Length fields are defined in 9.4.2.1.

The size of the RSNE is limited by the size of an element, which is 255 octets. Therefore, the number of pairwise cipher suites, AKM suites, and PMKIDs is limited.

In Figure 9-255, m denotes the pairwise cipher suite count, n the AKM suite count, and s is the PMKID count.

All fields use the bit convention from 9.2.2. The RSNE contains up to and including the Version field. All fields after the Version field are optional. If any nonzero-length field is absent, then none of the subsequent fields is included.

The Version field indicates the version number of the RSN protocol. Version 1 is defined in this standard. Other values are reserved.

NOTE—The following represent sample elements:

802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP not allowed):

```

30, // element id, 48 expressed as hexadecimal value
14, // length in octets, 20 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
00 00 // No capabilities

```

802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104 and TKIP not allowed), preauthentication supported:

```

30, // element id, 48 expressed as hexadecimal value
14, // length in octets, 20 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
01 00 // Preauthentication capabilities

```

802.1X authentication, Use GTK for pairwise cipher suite, WEP-40 group data cipher suites, optional RSN Capabilities field omitted:

```

30, // element id, 48 expressed as hexadecimal value
12, // length in octets, 18 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 01, // WEP-40 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 00, // Use group cipher suite as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication

```

802.1X authentication, Use CCMP-128 for pairwise cipher suite, CCMP-128 group data cipher suites, preauthentication and a PMKID:

```

30, // element id, 48 expressed as hexadecimal value
26 // length in octets, 38 expressed as hexadecimal value
01 00, // Version 1
00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
01 00 // Preauthentication capabilities
01 00 // PMKID Count
01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F 10 // PMKID

```

802.1X authentication, CCMP-128 pairwise and group data cipher suites (WEP-40, WEP-104, and TKIP are not allowed), and management frame protection with AES-128-CMAC as the group management suite selector.

```

30, // element id, 48 expressed as hexadecimal value
1A, // length in octets, 26 expressed as hexadecimal value
01 00, // Version 1

```

```

00 0F AC 04, // CCMP-128 as group data cipher suite
01 00, // pairwise cipher suite count
00 0F AC 04, // CCMP-128 as pairwise cipher suite
01 00, // authentication count
00 0F AC 01 // IEEE 802.1X authentication
80 00 // management frame protection is enabled but not required
00 00 // No PMKIDs
00 0F AC 06, // BIP-CMAC-128 as the broadcast/multicast management cipher suite
    
```

9.4.2.25.2 Cipher suites

The Group Data Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed frames.

The Pairwise Cipher Suite Count field indicates the number of pairwise cipher suite selectors that are contained in the Pairwise Cipher Suite List field. The value 0 is reserved.

The Pairwise Cipher Suite List field contains a series of cipher suite selectors that indicate the pairwise cipher suites.

The Group Management Cipher Suite field contains the cipher suite selector used by the BSS to protect group addressed robust Management frames.

When management frame protection is negotiated, the negotiated pairwise cipher suite is used to protect individually addressed robust Management frames, and the group management cipher suite is used to protect group addressed robust Management frames. Use of AES-128-CMAC is not valid as a data cipher suite.

A suite selector has the format shown in Figure 9-256.

Figure 9-256—Suite selector format

The OUI field contains an OUI or CID. The order of the OUI (organizationally unique identifier) field is described in 9.2.2.

Table 9-131 provides the cipher suite selectors defined by this standard.

Table 9-131—Cipher suite selectors

| OUI | Suite type | Meaning |
|----------|------------|------------------------|
| 00-0F-AC | 0 | Use group cipher suite |
| 00-0F-AC | 1 | WEP-40 |
| 00-0F-AC | 2 | TKIP |
| 00-0F-AC | 3 | Reserved |
| 00-0F-AC | 4 | CCMP-128 |
| 00-0F-AC | 5 | WEP-104 |
| 00-0F-AC | 6 | BIP-CMAC-128 |

Table 9-131—Cipher suite selectors (continued)

| OUI | Suite type | Meaning |
|------------------|------------|-------------------------------------|
| 00-0F-AC | 7 | Group addressed traffic not allowed |
| 00-0F-AC | 8 | GCMP-128 |
| 00-0F-AC | 9 | GCMP-256 |
| 00-0F-AC | 10 | CCMP-256 |
| 00-0F-AC | 11 | BIP-GMAC-128 |
| 00-0F-AC | 12 | BIP-GMAC-256 |
| 00-0F-AC | 13 | BIP-CMAC-256 |
| 00-0F-AC | 14–255 | Reserved |
| Other OUI or CID | Any | Vendor-specific |

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default group cipher suite for Data frames when the Group Data Cipher Suite field is not included in the RSNE.

In non-DMG RSNA, the cipher suite selector 00-0F-AC:4 (CCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default group cipher suite for Data frames when the Group Data Cipher Suite field is not included in the RSNE.

In DMG RSNA, the cipher suite selector 00-0F-AC:8 (GCMP-128) is the default pairwise cipher suite when the Pairwise Cipher Suite List field is not included in the RSNE.

In an RSNA with management frame protection enabled, the cipher suite selector 00-0F-AC:6 (BIP-CMAC-128) is the default group cipher suite for Management frames when the Group Management Cipher Suite field is not included in the RSNE.

The cipher suite selectors 00-0F-AC:1 (WEP-40) and 00-0F-AC:5 (WEP-104) are only valid as a group cipher suite in a transition security network (TSN) to allow pre-RSNA STAs to join an IBSS or to associate with an infrastructure BSS.

Use of any group cipher suite other than TKIP, WEP-104, or WEP-40 with TKIP as the pairwise cipher suite is not supported.

The cipher suite selector 00-0F-AC:0 (Use group cipher suite) is valid only as the pairwise cipher suite. An AP specifies the selector 00-0F-AC:0 (Use group cipher suite) for a pairwise cipher suite if it does not support any pairwise cipher suites. If an AP specifies 00-0F-AC:0 (Use group cipher suite) as the pairwise cipher selection, this is the only pairwise cipher selection the AP advertises.

If any cipher suite other than TKIP, WEP-104, or WEP-40 is enabled, then the AP supports pairwise keys, and thus the suite selector 00-0F-AC:0 (Use group cipher suite) is not a valid option.

Table 9-132 indicates the circumstances under which each cipher suite is used.

Table 9-132—Cipher suite usage

| Cipher suite selector | GTK | PTK | IGTK |
|------------------------|-----|-----|------|
| Use group cipher suite | No | Yes | No |
| WEP-40 | Yes | No | No |
| WEP-104 | Yes | No | No |
| TKIP | Yes | Yes | No |
| CCMP-128 | Yes | Yes | No |
| BIP-CMAC-128 | No | No | Yes |
| GCMP-128 | Yes | Yes | No |
| GCMP-256 | Yes | Yes | No |
| CCMP-256 | Yes | Yes | No |
| BIP-GMAC-128 | No | No | Yes |
| BIP-GMAC-256 | No | No | Yes |
| BIP-CMAC-256 | No | No | Yes |

9.4.2.25.3 AKM suites

The AKM Suite Count field indicates the number of AKM suite selectors that are contained in the AKM Suite List field. The value 0 is reserved.

The AKM Suite List field contains a series of AKM suite selectors. In an IBSS only a single AKM suite selector is specified because IBSS STAs use the same AKM suite and because there is no mechanism to negotiate the AKMP in an IBSS (see 12.6.5).

Each AKM suite selector specifies an AKMP. Table 9-133 gives the AKM suite selectors defined by this standard. An AKM suite selector has the format shown in Figure 9-256.

Table 9-133—AKM suite selectors

| OUI | Suite type | Meaning | | |
|----------|------------|---|---|-------------------------------------|
| | | Authentication type | Key management type | Key derivation type |
| 00-0F-AC | 0 | Reserved | Reserved | Reserved |
| 00-0F-AC | 1 | Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3 | RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3 | Defined in 12.7.1.2 |
| 00-0F-AC | 2 | PSK | RSNA key management as defined in 12.7, using PSK | Defined in 12.7.1.2 |
| 00-0F-AC | 3 | FT authentication negotiated over IEEE Std 802.1X | FT key management as defined in 12.7.1.7 | Defined in 12.7.1.7.2 using SHA-256 |

Table 9-133—AKM suite selectors (continued)

| OUI | Suite type | Meaning | | |
|------------------|------------|---|---|-------------------------------------|
| | | Authentication type | Key management type | Key derivation type |
| 00-0F-AC | 4 | FT authentication using PSK | FT key management as defined in 12.7.1.7 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 5 | Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3 | RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 6 | PSK | RSNA Key Management as defined in 12.7 using PSK | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 7 | TDLS | TPK handshake | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 8 | SAE authentication with SHA-256 or using PMKSA caching as defined in 12.6.10.3 | RSNA key management as defined in 12.7, PMKSA caching as defined in 12.6.10.3 or authenticated mesh peering exchange as defined in 14.5 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 9 | FT authentication over SAE | FT key management defined in 12.7.1.7 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 10 | APPeerKey Authentication with SHA-256 or using PMKSA caching as defined in 12.6.10.3 | RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 11 | Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3 using a Suite B compliant EAP method supporting SHA-256 | RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3 | Defined in 12.7.1.7.2 using SHA-256 |
| 00-0F-AC | 12 | Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3 using a Suite B compliant EAP method supporting SHA-384 | RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3 | Defined in 12.7.1.7.2 using SHA-384 |
| 00-0F-AC | 13 | FT authentication negotiated over IEEE Std 802.1X | FT key management as defined in 12.7.1.7 | Defined in 12.7.1.7.2 using SHA-384 |
| 00-0F-AC | 14–255 | Reserved | Reserved | Reserved |
| Other OUI or CID | Any | Vendor-specific | Vendor-specific | Vendor-specific |

The AKM suite selector value 00-0F-AC:1 (i.e., Authentication negotiated over IEEE Std 802.1X with RSNA key management as defined in 12.7 or using PMKSA caching as defined in 12.6.10.3) is the default AKM suite when the AKM Suite List field is not included in the RSNE.

NOTE—The selector value 00-0F-AC:1 specifies only that IEEE Std 802.1X-2010 is used as the authentication transport. IEEE Std 802.1X-2010 selects the authentication mechanism.

The AKM suite selector value 00-0F-AC:8 (i.e., SAE authentication with SHA-256 or using PMKSA caching as defined in 12.6.10.3 with SHA-256 key derivation) is used when either a password or PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:8 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:2 (PSK) is used when an alternate form of PSK is used with RSNA key management.

NOTE—Selector values 00-0F-AC:1 and 00-0F-AC:2 can simultaneously be enabled by an Authenticator.

The AKM suite selector value 00-0F-AC:11 is used only with cipher suite selector values 00-0F-AC:8 (GCMP-128) and 00-0F-AC:11 (BIP-GMAC-128). The AKM suite selector value 00-0F-AC:12 is used only with cipher suite selector values 00-0F-AC:9 (GCMP-256), 00-0F-AC:10 (CCMP-256), 00-0F-AC:13 (BIP-CMAC-256), and 00-0F-AC:12 (BIP-GMAC-256). The AKM suite selector value 00-0F-AC:13 is used only with cipher suite selector values 00-0F-AC:9 (GCMP-256), 00-0F-AC:10 (CCMP-256), 00-0F-AC:13 (BIP-CMAC-256), and 00-0F-AC:12 (BIP-GMAC-256).

9.4.2.25.4 RSN capabilities

The RSN Capabilities field indicates requested or advertised capabilities. If the RSN Capabilities field is not present, the default value of 0 is used for all of the capability subfields.

The length of the RSN Capabilities field is 2 octets. The format of the RSN Capabilities field is as illustrated in Figure 9-257 and described after the figure.

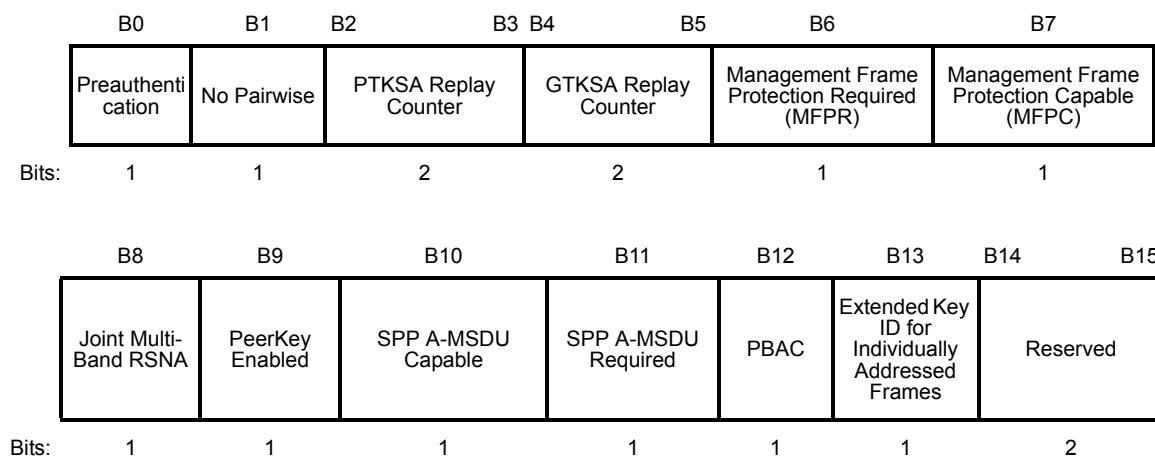

Figure 9-257—RSN Capabilities field format

- Bit 0: Preattentiation. An AP sets the Preattentiation subfield of the RSN Capabilities field to 1 to signal it supports preauthentication (see 12.6.10.2) and sets the subfield to 0 when it does not support preauthentication. A non-AP STA sets the Preattentiation subfield to 0.

- Bit 1: No Pairwise. If a STA supports WEP default key 0 simultaneously with a pairwise key (see 12.7.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 0.
 If a STA does not support WEP default key 0 simultaneously with a pairwise key (see 12.7.1), then the STA sets the No Pairwise subfield of the RSN Capabilities field to 1.
 The No Pairwise subfield describes a capability of a non-AP STA. IBSS STAs and APs set the No Pairwise subfield to 0.
 The No Pairwise subfield is set to 1 only in a TSN and when the pairwise cipher suite selected by the STA is TKIP.
- Bits 2–3: PTKSA Replay Counter. A STA sets the PTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberOfPTKSARelayCounters. The least significant bit (LSB) of dot11RSNAConfigNumberOfPTKSARelayCounters is put in bit 2. See 12.5.2.6 and 12.5.3.4.4. The meaning of the value in the PTKSA/GTKSA/STKSA Replay Counter subfield is defined in Table 9-134. The number of replay counters per STKSA is the same as the number of replay counters per PTKSA.

Table 9-134—PTKSA/GTKSA/STKSA replay counters usage

| Replay counter value | Meaning |
|----------------------|--|
| 0 | 1 replay counter per PTKSA/GTKSA/STKSA |
| 1 | 2 replay counters per PTKSA/GTKSA/STKSA |
| 2 | 4 replay counters per PTKSA/GTKSA/STKSA |
| 3 | 16 replay counters per PTKSA/GTKSA/STKSA |

- Bits 4–5: GTKSA Replay Counter. A STA sets the GTKSA Replay Counter subfield of the RSN Capabilities field to the value contained in dot11RSNAConfigNumberOfGTKSARelayCounters. The LSB of dot11RSNAConfigNumberOfGTKSARelayCounters is put in bit 4. See 12.5.2.6 and 12.5.3.4.4. The meaning of the value in the GTKSA Replay Counter subfield is defined in Table 9-134.
- Bit 6: Management Frame Protection Required (MFPR). A STA sets this bit to 1 to advertise that protection of robust Management frames is mandatory. A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true and dot11RSNAUnprotectedManagementFramesAllowed is false; otherwise it sets this bit to 0. If a STA sets this bit to 1, then that STA only allows RSNAs with STAs that provide Management Frame Protection.
- Bit 7: Management Frame Protection Capable (MFPC). A STA sets this bit to 1 when dot11RSNAProtectedManagementFramesActivated is true to advertise that protection of robust Management frames is enabled.
- Bit 8: Joint Multi-band RSNA. A STA sets the Joint Multi-band RSNA subfield to 1 to indicate that it supports the Joint Multi-band RSNA (12.6.22). Otherwise, this subfield is set to 0.
- Bits 9: PeerKey Enabled. An AP STA sets the PeerKey Enabled subfield of the RSN Capabilities field to 1 to signal it supports PeerKey handshake (see 12.7.8). Otherwise, this subfield is set to 0.
- Bit 10: SPP A-MSDU Capable. A STA sets the SPP A-MSDU Capable subfield of the RSN Capabilities field to 1 to signal that it supports signaling and payload protected A-MSDUs (SPP A-MSDUs) (see 11.19). Otherwise, this subfield is set to 0.
- Bit 11: SPP A-MSDU Required. A STA sets the SPP A-MSDU Required subfield of the RSN Capabilities field to 1 when it allows only SPP A-MSDUs (i.e., does not send or receive payload protected A-MSDUs (PP A-MSDUs) (see 11.19). Otherwise, this subfield is set to 0.
- Bit 12: PBAC (protected block ack agreement capable). A STA sets the PBAC subfield of RSN Capabilities field to 1 to indicate it is PBAC. Otherwise, this subfield is set to 0.

- Bit 13: Extended Key ID for Individually Addressed Frames. This subfield is set to 1 to indicate that the STA supports Key ID values in the range 0 to 1 for a PTKSA and STKSA when the cipher suite is CCMP or GCMP. A value of 0 indicates that the STA only supports Key ID 0 for a PTKSA and STKSA.
- Bits 14–15: Reserved. The remaining subfields of the RSN Capabilities field are reserved.

9.4.2.25.5 PMKID

The PMKID Count and List fields are used only in the RSNE in the (Re)Association Request frame to an AP and in FT authentication sequence frames.

The PMKID Count field indicates the number of PMKIDs that are contained in the PMKID List field. The PMKID List field contains a series (possibly empty) of PMKIDs that the STA believes to be valid for the destination AP. The PMKID can refer to

- a) A cached PMKSA that has been obtained through preauthentication with the target AP
- b) A cached PMKSA from an EAP or SAE authentication
- c) A PMKSA derived from a PSK for the target AP
- d) A PMK-R0 security association derived as part of an FT initial mobility domain association
- e) A PMK-R1 security association derived as part of an FT initial mobility domain association or as part of a fast BSS transition.

See 12.7.1.3 for the construction of the PMKID, 13.8 for the population of PMKID for fast BSS transitions, and 12.7.1.7 for the construction of PMKR0Name and PMKR1Name.

NOTE—A STA need not insert a PMKID in the PMKID List field if the STA will not be using that PMKSA.

9.4.2.26 Vendor Specific element

The Vendor Specific element is used to carry information not defined in this standard within a single defined format, so that reserved element IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The element is in the format shown in Figure 9-258.

| Octets: | 1 | 1 | j | variable |
|---------|------------|--------|-------------------------|-------------------------|
| | Element ID | Length | Organization Identifier | Vendor-specific content |

Figure 9-258—Vendor Specific element format

The Element ID and Length fields are defined in 9.4.2.1.

The Organization Identifier field identifies (see 9.4.1.32) the entity that has defined the content of the particular Vendor Specific element. See 9.4.1.32 for the definition of j .

9.4.2.27 Extended Capabilities element

The Extended Capabilities element carries information about the capabilities of a STA that augment the capabilities specified in the Capability Information field. The format of this element is shown in Figure 9-259.

| | | | |
|---------|------------|--------|-----------------------|
| Octets: | 1 | 1 | n |
| | Element ID | Length | Extended Capabilities |

Figure 9-259—Extended Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The Extended Capabilities field is a bit field indicating the extended capabilities being advertised by the STA transmitting the element. The length of the Extended Capabilities field is a variable n . The Extended Capabilities field is shown in Table 9-135.

Table 9-135—Extended Capabilities field

| Bit | Information | Notes |
|-----|--|--|
| 0 | 20/40 BSS Coexistence Management Support | The 20/40 BSS Coexistence Management Support field indicates support for the 20/40 BSS Coexistence Management frame and its use. The 20/40 BSS Coexistence Management Support field is set to 1 to indicate support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame. The 20/40 BSS Coexistence Management Support field is set to 0 to indicate a lack of support for the communication of STA information through the transmission and reception of the 20/40 BSS Coexistence Management frame. |
| 1 | Reserved | |
| 2 | Extended Channel Switching | The Extended Channel Switching field is 1 to indicate support for the communication of channel switching information through the transmission and reception of the Extended Channel Switch Announcement element and Management frame, as described in 9.6.8.7. The Extended Channel Switching field is 0 to indicate a lack of support for extended channel switching. |
| 3 | Reserved | |
| 4 | PSMP Capability | This field indicates support for PSMP operation. See 10.29. Set to 0 if the STA does not support PSMP operation Set to 1 if the STA supports PSMP operation. |
| 5 | Reserved | |
| 6 | S-PSMP Support | Indicates support for scheduled PSMP. When the PSMP Capability field is equal to 0, the S-PSMP Support field is set to 0. When the PSMP Capability field is equal to 1, the S-PSMP Support field is defined as follows: Set to 0 if STA does not support S-PSMP Set to 1 if STA supports S-PSMP |
| 7 | Event | The STA sets the Event field to 1 when dot11EventsActivated is true, and sets it to 0 otherwise. See 11.24.2. |
| 8 | Diagnostics | The STA sets the Diagnostics field to 1 when dot11DiagnosticsActivated is true, and sets it to 0 otherwise. See 11.24.3. |
| 9 | Multicast Diagnostics | The STA sets the Multicast Diagnostics field to 1 when dot11MulticastDiagnos-ticsActivated is true, and sets it to 0 otherwise. See 11.24.3. |

Table 9-135—Extended Capabilities field (continued)

| Bit | Information | Notes |
|------------|-----------------------------------|---|
| 10 | Location Tracking | The STA sets the Location Tracking field to 1 when dot11LocationTrackingActivated is true, and sets it to 0 otherwise. See 11.24.4. |
| 11 | FMS | The STA sets the FMS field to 1 when dot11FMSActivated is true, and sets it to 0 otherwise. See 11.2.3.16 and 11.24.8. |
| 12 | Proxy ARP Service | The AP sets the Proxy ARP Service field to 1 when dot11ProxyARPAutowired is true, and sets it to 0 otherwise. See 11.24.14. A non-AP STA sets the Proxy ARP Service field to 0. |
| 13 | Collocated Interference Reporting | The STA sets the Collocated Interference Reporting field to 1 when dot11CoLocIntfReportingActivated is true, and sets it to 0 otherwise. See 11.24.9. |
| 14 | Civic Location | The STA sets the Civic Location field to 1 when dot11RMCivicConfigured is true, and sets it to 0 otherwise. See 11.11.9.9. |
| 15 | Geospatial Location | The STA sets the Geospatial Location field to 1 when dot11RMLCICConfigured is true, and sets it to 0 otherwise. See 11.11.9.6. |
| 16 | TFS | The STA sets the TFS field to 1 when dot11TFSActivated is true, and sets it to 0 otherwise. See 11.24.12. |
| 17 | WNM Sleep Mode | The STA sets the WNM Sleep Mode field to 1 when dot11WNMSleepModeActivated is true, and sets it to 0 otherwise. See 11.2.3.18. |
| 18 | TIM Broadcast | The STA sets the TIM Broadcast field to 1 when dot11TIMBroadcastActivated is true, and sets it to 0 otherwise. See 11.2.3.17. |
| 19 | BSS Transition | The STA sets the BSS Transition field to 1 when dot11BSSTransitionActivated is true, and sets it to 0 otherwise. See 11.24.7. |
| 20 | QoS Traffic Capability | The STA sets the QoS Traffic Capability field to 1 when dot11QoSTrafficCapabilityActivated is true, and sets it to 0 otherwise. See 11.24.10. |
| 21 | AC Station Count | The STA sets the AC Station Count field to 1 when dot11ACStationCountActivated is true, and sets it to 0 otherwise. See 11.24.11. |
| 22 | Multiple BSSID | The STA sets the Multiple BSSID field to 1 when dot11MultiBSSIDActivated is true, and sets it to 0 otherwise. See 11.11.14 and 11.1.3.8. |
| 23 | Timing Measurement | The STA sets the Timing Measurement field to 1 when dot11TimingMsmtActivated is true, and sets it to 0 otherwise. See 11.24.5. |
| 24 | Channel Usage | The STA sets the Channel Usage field to 1 when dot11ChannelUsageActivated is true and sets it to 0 otherwise. See 11.24.15. |
| 25 | SSID List | The STA sets the SSID List field to 1 when dot11SSIDListActivated is true, and sets it to 0 otherwise. See 11.1.4. |
| 26 | DMS | The STA sets the DMS field to 1 when dot11DMSActivated is true and sets it to 0 otherwise. See 11.24.16. |
| 27 | UTC TSF Offset | The STA sets the UTC TSF Offset field to 1 when dot11UTCTSOffsetActivated is true and sets it to 0 otherwise. See 11.22.3. |

Table 9-135—Extended Capabilities field (continued)

| Bit | Information | Notes |
|------------|-----------------------------------|--|
| 28 | TPU Buffer STA Support | The TPU Buffer STA Support subfield indicates support for the TPU buffer STA function, as defined in 11.2.3.15. When dot11TDLSPeerUAPSDBufferSTAActivated is true, and to indicate support for TPU on this link, the TPU Buffer STA Support subfield is set to 1. Otherwise, the TPU Buffer STA Support subfield is set to 0 to indicate that this capability is not supported on this link. |
| 29 | TDLS Peer PSM Support | The TDLS Peer PSM Support subfield indicates support for TDLS peer PSM, as defined in 11.2.3.14. When dot11TDLSPeerPSMActivated is true, and to indicate support for TDLS peer PSM on this link, the TDLS Peer PSM Support subfield is set to 1. Otherwise, the TDLS Peer PSM Support subfield is set to 0 to indicate that this capability is not supported on this link. |
| 30 | TDLS channel switching | When dot11TDLSChannelSwitchingActivated is true, and to indicate that the STA supports TDLS with TDLS Channel Switching on this link as described in 11.23, the TDLS Channel Switching capability subfield is set to 1. Otherwise, the TDLS Channel Switching subfield is set to 0 to indicate that this capability is not supported on this link. |
| 31 | Interworking | When dot11InterworkingServiceActivated is true, the Interworking field is set to 1 to indicate the STA supports interworking service as described in 11.25. When dot11InterworkingServiceActivated is false, the Interworking field is set to 0 to indicate the STA does not support this capability. |
| 32 | QoS Map | When dot11QosMapActivated is true, the QoS Map field is set to 1 to indicate the STA supports QoS Map service as described in 11.25.9. When dot11QosMapActivated is false, the QoS Map field is set to 0 to indicate the STA does not support this capability. |
| 33 | EBR | When dot11EBRActivated is true, the EBR field is set to 1 to indicate the STA supports EBR operation as described in 11.4. When dot11EBRActivated is false, the EBR field is set to 0 to indicate the STA does not support this capability. |
| 34 | SSPN Interface | When dot11SSPNInterfaceActivated is true, the SSPN Interface field is set to 1 to indicate the AP supports SSPN Interface service as described in 11.25.5. When dot11SSPNInterfaceActivated is false, the SSPN Interface is set to 0 to indicate the AP does not support this capability. Non-AP STAs set this field to 0. |
| 35 | Reserved | |
| 36 | MSGCF Capability | When dot11MSGCFActivated is true, the MSGCF Capability field is set to 1 to indicate the non-AP STA supports the MSGCF in 6.4. When dot11MSGCFActivated is false, the MSGCF Capability is set to 0 to indicate the non-AP STA does not support this capability. APs set this field to 0. |
| 37 | TDLS Support | The TDLS Support subfield indicates support for TDLS, as defined in 11.23. When dot11TunneledDirectLinkSetupImplemented is true, this field is set to 1 to indicate support for TDLS. The field is set to 0 otherwise, to indicate that TDLS is not supported. |
| 38 | TDLS Prohibited | The TDLS Prohibited subfield indicates whether the use of TDLS is prohibited. The field is set to 1 to indicate that TDLS is prohibited and to 0 to indicate that TDLS is allowed. |
| 39 | TDLS Channel Switching Prohibited | The TDLS Channel Switching Prohibited subfield indicates whether the use of TDLS Channel Switching is prohibited. The field is set to 1 to indicate that TDLS Channel Switching is prohibited and to 0 to indicate that TDLS Channel Switching is allowed. |

Table 9-135—Extended Capabilities field (continued)

| Bit | Information | Notes |
|------------|------------------------------|--|
| 40 | Reject Unadmitted Frame | <p>When dot11RejectUnadmittedTraffic is true, the Reject Unadmitted Frame bit is set to 1 to indicate that the STA rejects MA-UNITDATA.request primitives for frames belonging to an unadmitted TS.</p> <p>When dot11RejectUnadmittedTraffic is false, the Reject Unadmitted Frame bit is set to 0 to indicate that the STA is not required to reject MA-UNITDATA.request primitives for frames belonging to an unadmitted TS.</p> <p>When dot11RejectUnadmittedTraffic is not present, the Reject Unadmitted frame bit is set to 0.</p> |
| 41-43 | Service Interval Granularity | <p>Duration of the shortest service interval (SI). Used for scheduled PSMP only.</p> <p>This field is defined when the S-PSMP Support field is set to 1; otherwise, it is reserved.</p> <p>See 11.4.6.</p> <p>Set to 0 for 5 ms Set to 1 for 10 ms Set to 2 for 15 ms Set to 3 for 20 ms Set to 4 for 25 ms Set to 5 for 30 ms Set to 6 for 35 ms Set to 7 for 40 ms</p> |
| 44 | Identifier Location | The STA sets the Identifier Location field to 1 when dot11RMIdentifierMeasurementActivated is true, and sets it to 0 otherwise. See 11.11.9.10. |
| 45 | U-APSD Coexistence | The STA sets the U-APSD Coexistence field to 1 when dot11UAPSDCoexistenceActivated is true and sets it to 0 otherwise. See 11.2.3.5.2. |
| 46 | WNM Notification | The STA sets the WNM Notification field to 1 when dot11WNMNotificationActivated is true and sets it to 0 otherwise. See 11.24.17. |
| 47 | QAB Capability | Set to 1 if AP supports QAB Set to 0 otherwise |
| 48 | UTF-8 SSID | The SSID in this BSS is interpreted using UTF-8 encoding |
| 49 | QMFActivated | The STA sets the QMFActivated field to 1 when dot11QMFActivated is true and sets it to 0 otherwise. See 11.26. |
| 50 | QMFRerconfigurationActivated | The STA sets the QMFRerconfigurationActivated field to 1 when dot11QMFRerconfigurationActivated is true and sets it to 0 otherwise. See 11.26. |
| 51 | Robust AV Streaming | The STA sets the Robust AV Streaming field to 1 when dot11RobustAVStreamingImplemented is true and sets it to 0 otherwise. See 11.27. |
| 52 | Advanced GCR | The STA sets the Advanced GCR field to 1 when dot11AdvancedGCRActivated is true and sets it to 0 otherwise. See 11.24.16.3. |
| 53 | Mesh GCR | The STA sets the mesh GCR field to 1 when dot11MeshGCRActivated is true and sets it to 0 otherwise. See 11.24.16.3. |
| 54 | SCS | The STA sets the SCS field to 1 when dot11SCSActivated is true and sets it to 0 otherwise. See 11.27.2. |

Table 9-135—Extended Capabilities field (continued)

| Bit | Information | Notes |
|------------|------------------------------------|---|
| 55 | QLoad Report | The STA sets the QLoad Report field to 1 when dot11QLoadReportActivated is true and sets it to 0 otherwise. See 11.28.2. |
| 56 | Alternate EDCA | The STA sets the Alternate EDCA field to 1 when dot11AlternateEDCAActivated is true and sets it to 0 otherwise. See 10.2.4.2. |
| 57 | Unprotected TXOP Negotiation | The STA sets the Unprotected TXOP Negotiation field to 1 when dot11PublicTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.28.3. |
| 58 | Protected TXOP Negotiation | The STA sets the Protected TXOP Negotiation field to 1 when dot11ProtectedTXOPNegotiationActivated is true and sets it to 0 otherwise. See 11.28.3. |
| 59 | Reserved | |
| 60 | Protected QLoad Report | The STA sets the Protected QLoad Report field to 1 when dot11ProtectedQLoadReportActivated is true and sets it to 0 otherwise. See 11.28.2. |
| 61 | TDLS Wider Bandwidth | The TDLS Wider Bandwidth subfield indicates whether the STA supports a wider bandwidth than the BSS bandwidth for a TDLS direct link with a primary channel equal to the primary or only channel of the base channel. The field is set to 1 to indicate that the STA supports a wider bandwidth and to 0 to indicate that the STA does not support a wider bandwidth. A 160 MHz bandwidth is defined to be identical to an 80+80 MHz bandwidth (i.e., one is not wider than the other). |
| 62 | Operating Mode Notification | If dot11OperatingModeNotificationImplemented is true, the Operating Mode Notification field is set to 1 to indicate support for reception of the Operating Mode Notification element and the Operating Mode Notification frame. If dot11OperatingModeNotificationImplemented is false or not present, the Operating Mode Notification field is set to 0 to indicate lack of support for reception of the Operating Mode Notification element and the Operating Mode Notification frame. |
| 63–64 | Max Number Of MSDUs In A-MSDU | Indicates the maximum number of MSDUs in an A-MSDU that the STA is able to receive from a VHT STA: Set to 0 to indicate that no limit applies. Set to 1 for 32. Set to 2 for 16. Set to 3 for 8 Reserved if A-MSDU is not supported or if the STA is not an HT STA. |
| 65 | Channel Schedule Management | The STA sets the Channel Schedule Management field to 1 when dot11ChannelScheduleManagementActivated is true and sets it to 0 otherwise. See 11.44.5. |
| 66 | Geodatabase Inband Enabling Signal | The STA sets the Geodatabase Inband Enabling Signal field to 1 when dot11GDDActivated is true and the STA permits GDD dependent STAs to operate. See 11.44.2. |
| 67 | Network Channel Control | The STA sets the Network Channel Control field to 1 when dot11NetworkChannelControlActivated is true and sets it to 0 otherwise. See 11.44.7. |
| 68 | White Space Map | The STA sets the White Space Map field to 1 when dot11WhiteSpaceMapActivated is true and sets it to 0 otherwise. See 11.44.9. |
| 69 | Channel Availability Query | The STA sets the Channel Availability Query field to 1 when dot11GDDActivated is true and sets it to 0 otherwise. See 11.44.4. |

Table 9-135—Extended Capabilities field (continued)

| Bit | Information | Notes |
|----------|--------------------------------------|--|
| 70 | Fine Timing Measurement Responder | The STA sets the Fine Timing Measurement Responder field to 1 when dot11FineTimingMsmtRespActivated is true and sets it to 0 otherwise. See 11.24.6. |
| 71 | Fine Timing Measurement Initiator | The STA sets the Fine Timing Measurement Initiator field to 1 when dot11FineTimingMsmtInitActivated is true and sets it to 0 otherwise. See 11.24.6. |
| 73 | Extended Spectrum Management Capable | The STA sets the Extended Spectrum Management Capable field to 1 when dot11ExtendedSpectrumManagementImplemented is true and dot11VHTOptionImplemented is false, and sets it to 0 otherwise. |
| 74 | Future Channel Guidance | The STA sets the Future Channel Guidance field to 1 when dot11FutureChannelGuidanceActivated is true and sets it to 0 otherwise. See 11.9.10. |
| 72, 75–n | Reserved | |

If a STA does not support any of capabilities defined in the Extended Capabilities element, then the STA is not required to transmit the Extended Capabilities element.

NOTE—The fields of the Extended Capabilities element are not dynamic. They are determined by the parameters of the MLME-START.request or MLME-JOIN.request primitive that caused the STA to start or join its current BSS, and they remain unchanged until the next MLME-START.request or MLME-JOIN.request primitive.

9.4.2.28 BSS Load element

The BSS Load element contains information on the current STA population and traffic levels in the BSS. The element information format is defined in Figure 9-260. This element might be used by the STA for vendor-specific AP selection algorithm when roaming.

| Element ID | Length (5) | Station Count | Channel Utilization | Available Admission Capacity |
|------------|------------|---------------|---------------------|------------------------------|
| Octets: | 1 | 1 | 2 | 1 |

Figure 9-260—BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Count field is interpreted as an unsigned integer that indicates the total number of STAs currently associated with this BSS.

The Channel Utilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP sensed the medium was busy, as indicated by either the physical or virtual carrier sense (CS) mechanism. When more than one channel is in use for the BSS, the Channel Utilization field value is calculated only for the primary channel. This percentage is computed using the formula,

$$\text{Channel Utilization} = \left\lfloor \frac{\text{channel busy time}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \right\rfloor$$

where

channel busy time is defined to be the number of microseconds during which the CS mechanism, as defined in 10.3.2.1, has indicated a channel busy indication,
dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the channel busy time is measured. The default value of dot11ChannelUtilizationBeaconIntervals is defined in Annex C.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the remaining amount of medium time available via explicit admission control, in units of 32 μ s/s. The field is helpful for roaming STAs to select an AP that is likely to accept future admission control requests, but it does not represent an assurance that the HC admits these requests.

9.4.2.29 EDCA Parameter Set element

The EDCA Parameter Set element provides information needed by STAs for proper operation of the QoS facility during the CP. The format of the EDCA Parameter Set element is defined in Figure 9-261.

| Element ID | Length (18) | QoS Info | Reserve d | AC_BE Parameter Record | AC_BK Parameter Record | AC_VI Parameter Record | AC_VO Parameter Record |
|------------|-------------|----------|-----------|------------------------|------------------------|------------------------|------------------------|
| Octets: | 1 | 1 | 1 | 1 | 4 | 4 | 4 |

Figure 9-261—EDCA Parameter Set element

The Element ID and Length fields are defined in 9.4.2.1.

For an infrastructure BSS, the EDCA Parameter Set element is used by the AP to establish policy (by changing default MIB attribute values), to change policies when accepting new STAs or new traffic, or to adapt to changes in offered load. The most recent EDCA parameter set element received by a STA is used to update the appropriate MIB values.

The format of the QoS Info field is defined in 9.4.1.17. The QoS Info field contains the EDCA Parameter Set Update Count subfield, which is initially set to 0 and is incremented each time any of the AC parameters changes. This subfield is used by non-AP STAs to determine whether the EDCA parameter set has changed and requires updating the appropriate MIB attributes.

The formats of AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record fields are identical and are illustrated in Figure 9-262.

| ACI / AIFSN | ECWmin / ECWmax | TXOP Limit |
|-------------|-----------------|------------|
| Octets: | 1 | 1 |

Figure 9-262—AC_BE, AC_BK, AC_VI, and AC_VO Parameter Record field format

The format of the ACI/AIFSN field is illustrated in Figure 9-263.

| B0 | B3 | B4 | B5 | B6 | B7 |
|-------|----|----|----|----|----|
| Bits: | 4 | 1 | 2 | 1 | |

Figure 9-263—ACI/AIFSN field

The value of the AC index (ACI) references the AC to which all parameters in this record correspond. The mapping between ACI and AC is defined in Table 9-136. The ACM (admission control mandatory) subfield indicates that admission control is required for the AC. If the ACM subfield is equal to 0, then there is no admission control for the corresponding AC. If the ACM subfield is set to 1, admission control has to be used prior to transmission using the access parameters specified for this AC. The AIFSN subfield indicates the number of slots after a SIFS a STA defers before either invoking a backoff or starting a transmission. The minimum value of the AIFSN subfield is 2.

Table 9-136—ACI-to-AC coding

| ACI | AC | Description |
|-----|-------|-------------|
| 0 | AC_BE | Best effort |
| 1 | AC_BK | Background |
| 2 | AC_VI | Video |
| 3 | AC_VO | Voice |

The ECWmin and ECWmax fields are illustrated in Figure 9-264.

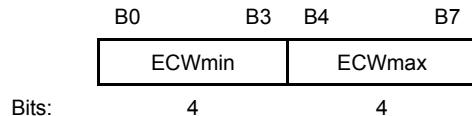

Figure 9-264—ECWmin and ECWmax fields

The ECWmin and ECWmax fields encode the values of CWmin and CWmax, respectively, in an exponent form. The ECWmin and ECWmax values are defined so that

$$CW_{min} = 2^{ECW_{min}} - 1$$

$$CW_{max} = 2^{ECW_{max}} - 1$$

Hence the minimum encoded value of CWmin and CWmax is 0, and the maximum value is 32 767.

The value of the TXOP Limit field is specified as an unsigned integer, in units of 32 µs. A TXOP Limit field value of 0 has a special meaning (see 10.22.2.8).

Table 9-137 defines the default EDCA parameter values used by a non-AP STA if dot11OCBActivated is false.²⁴

²⁴The default values for TXOP limit are expressed in milliseconds and are multiples of 32 µs.

Table 9-137—Default EDCA Parameter Set element parameter values if dot11OCBActivated is false

| AC | CWmin | CWmax | AIFSN | TXOP limit | | | |
|-------|------------------|------------------|-------|---|--|---|------------|
| | | | | For PHYs defined in Clause 15 and Clause 16 | For PHYs defined in Clause 17, Clause 18, Clause 19, and Clause 21 | For PHY defined in Clause 22 | Other PHYs |
| AC_BK | aCWmin | aCWmax | 7 | 3.264 ms | 2.528 ms | 0 | 0 |
| AC_BE | aCWmin | aCWmax | 3 | 3.264 ms | 2.528 ms | 0 | 0 |
| AC_VI | (aCWmin+1)/2 – 1 | aCWmin | 2 | 6.016 ms | 4.096 ms | 22.56 ms (BCU: 6 or 7 MHz), 16.92 ms (BCU: 8 MHz) | 0 |
| AC_VO | (aCWmin+1)/4 – 1 | (aCWmin+1)/2 – 1 | 2 | 3.264 ms | 2.080 ms | 11.28 ms (BCU: 6 or 7 MHz), 8.46 ms (BCU: 8 MHz) | 0 |

If dot11OCBActivated is true, the default EDCA parameter set for STAs transmitting QoS frames is given in Table 9-138.

Table 9-138—Default EDCA parameter set for STA operation if dot11OCBActivated is true

| AC | CWmin | CWmax | AIFSN | TXOP limit |
|-------|----------------|----------------|-------|------------|
| AC_BK | aCWmin | aCWmax | 9 | 0 |
| AC_BE | aCWmin | aCWmax | 6 | 0 |
| AC_VI | (aCWmin+1)/2–1 | aCWmin | 3 | 0 |
| AC_VO | (aCWmin+1)/4–1 | (aCWmin+1)/2–1 | 2 | 0 |

9.4.2.30 TSPEC element

The TSPEC element contains the set of parameters that define the characteristics and QoS expectations of a traffic flow, in the context of a particular STA, for use by the HC or PCP and STA(s) or a mesh STA and its peer mesh STAs in support of QoS traffic transfer using the procedures defined in 11.4 and 11.24.16.3. The element information format comprises the items as defined in this subclause, and the structure is defined in Figure 9-265.

The TSPEC allows a set of parameters more extensive than might be needed, or might be available, for any particular instance of parameterized QoS traffic. Unless indicated otherwise, fields that follow the TS Info field are set to 0 for any unspecified parameter values. STAs set the value of any parameters to unspecified if they have no information for setting that parameter.

| | | | | | | | | | |
|---------|--------------------|-------------------|----------------|-------------------|-------------------|--------------------------|--------------------------|-----------------------------|---------------------|
| | Element ID | Length (55) | TS Info | Nominal MSDU Size | Maximum MSDU Size | Minimum Service Interval | Maximum Service Interval | Inactivity Interval | Suspension Interval |
| Octets: | 1 | 1 | 3 | 2 | 2 | 4 | 4 | 4 | 4 |
| | Service Start Time | Minimum Data Rate | Mean Data Rate | Peak Data Rate | Burst Size | Delay Bound | Minimum PHY Rate | Surplus Bandwidth Allowance | Medium Time |
| Octets: | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 2 | 2 |

Figure 9-265—TSPEC element format

The structure of the TS Info field is defined in Figure 9-266.

| | | | | | | | | | | | | |
|--------------|------|-----------|---------------|-------------|------|---------------|-------------------|----------|----------|-----|-----|-----|
| B0 | B1 | B4 B5 | B6 B7 | B8 | B9 | B10 | B11 | B13 B14 | B15 | B16 | B17 | B23 |
| Traffic Type | TSID | Direction | Access Policy | Aggregation | APSD | User Priority | TSInfo Ack Policy | Schedule | Reserved | | | |
| Bits: | 1 | 4 | 2 | 2 | 1 | 1 | 3 | 2 | 1 | 7 | | |

Figure 9-266—TS Info field

The subfields of the TS Info field are defined as follows:

- The Traffic Type subfield is a single bit and is set to 1 for a periodic traffic pattern (e.g., isochronous TS of MSDUs or A-MSDUs, with constant or variable sizes, that are originated at fixed rate) or set to 0 for an aperiodic, or unspecified, traffic pattern (e.g., asynchronous TS of low-duty cycles).
- The TSID subfield is 4 bits in length and contains a value that is a TSID. Note that the MSB (bit 4 in TS Info field) of the TSID subfield is always set to 1 when the TSPEC element is included within an ADDTS Response frame.
- The Direction subfield specifies the direction of data carried by the TS as defined in Table 9-139.

Table 9-139—Direction subfield encoding

| Bit 5 | Bit 6 | Usage |
|-------|-------|--|
| 0 | 0 | Uplink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the non-AP STA to HC — DMG BSS: MSDUs or A-MSDUs are sent by the non-AP originator of the ADDTS Request frame |
| 1 | 0 | Downlink, defined as follows: — Non-DMG BSS: MSDUs or A-MSDUs are sent from the HC to the non-AP STA — DMG BSS: MSDUs or A-MSDUs are sent by the non-AP recipient of the ADDTS Request frame |
| 0 | 1 | Direct link (MSDUs or A-MSDUs are sent from the non-AP STA to another non-AP STA) |
| 1 | 1 | Bidirectional link (equivalent to a downlink request plus an uplink request, each direction having the same parameters). The fields in the TSPEC element specify resources for a single direction. Double the specified resources are required to support both streams. |

- The Access Policy subfield is 2 bits in length, specifies the access method to be used for the TS, and is defined in Table 9-140.

Table 9-140—Access Policy subfield

| Bit 7 | Bit 8 | Usage |
|--------------|--------------|---|
| 0 | 0 | Reserved |
| 1 | 0 | Contention based channel access (EDCA) |
| 0 | 1 | Controlled channel access (HCCA for non-DMG STAs and SPCA for DMG STAs) |
| 1 | 1 | Controlled and contention based channel access (HCCA, EDCA mixed mode (HEMM) for non-DMG STAs; SPCA, EDCA mixed mode (SEMM) for DMG STAs) |

- The Aggregation subfield is 1 bit in length. The Aggregation subfield is valid only when the access method is HCCA or SPCA or when the access method is EDCA and the Schedule subfield is equal to 1. It is set to 1 by a non-AP STA to indicate that an aggregate schedule is required. It is set to 1 by the AP if an aggregate schedule is being provided to the STA. It is set to 0 otherwise. In all other cases, the Aggregation subfield is reserved.
- The APSD subfield is a single bit and is set to 1 to indicate that automatic PS delivery is to be used for the traffic associated with the TSPEC and set to 0 otherwise.
- The UP subfield is 3 bits and indicates the actual value of the UP to be used for the transport of MSDUs or A-MSDUs belonging to this TS when relative prioritization is required. When the TCLAS element is present in the request, the UP subfield in TS Info field of the TSPEC element is reserved.
- The TS Info Ack Policy subfield is 2 bits in length and indicates whether MAC acknowledgments are required for MPDUs or A-MSDUs belonging to this TSID and the form of those acknowledgments. The encoding of the TS Info Ack Policy subfield is shown in Table 9-141.

Table 9-141—TS Info Ack Policy subfield encoding

| Bit 14 | Bit 15 | Usage |
|---------------|---------------|--|
| 0 | 0 | Normal Acknowledgment The addressed recipient returns an Ack or QoS +CF-Ack frame after a SIFS, according to the procedures defined in 10.3.2.9, 10.4.4, and 10.22.3.5. |
| 1 | 0 | No Ack: The recipient(s) do not acknowledge the transmission. |
| 0 | 1 | Reserved |
| 1 | 1 | Block Ack: A separate block ack mechanism described in 10.24 is used. |

- The Schedule subfield is 1 bit in length and specifies the requested type of schedule. The setting of the subfield when the access policy is EDCA is shown in Table 9-142. When the Access Policy subfield is equal to any value other than EDCA, the Schedule subfield is reserved. When the Schedule and APSD subfields are equal to 1, the AP sets the aggregation bit to 1, indicating that an aggregate schedule is being provided to the STA.

Table 9-142—Setting of Schedule subfield

| APSD | Schedule | Usage |
|------|----------|--------------------------|
| 0 | 0 | No Schedule |
| 1 | 0 | Unscheduled APSD |
| 0 | 1 | Scheduled PSMP or GCR-SP |
| 1 | 1 | Scheduled APSD |

The Nominal MSDU Size field is 2 octets long and contains an unsigned integer that specifies the nominal size, in octets, of MSDUs or (where A-MSDU aggregation is employed) A-MSDUs belonging to the TS under this TSPEC and is defined in Figure 9-267. If the Fixed subfield is equal to 1, then the size of the MSDU or A-MSDU is fixed and is indicated by the Size subfield. If the Fixed subfield is equal to 0, then the size of the MSDU or A-MSDU might not be fixed and the Size subfield indicates the nominal MSDU size. If both the Fixed and Size subfields are equal to 0, then the nominal MSDU or A-MSDU size is unspecified.

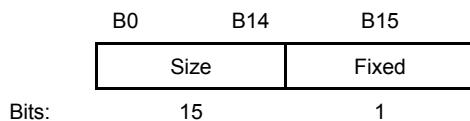

Figure 9-267—Nominal MSDU Size field

The Maximum MSDU Size field is 2 octets long and contains an unsigned integer that specifies the maximum size, in octets, of MSDUs or A-MSDUs belonging to the TS under this TSPEC.

The Minimum Service Interval field is 4 octets long and contains an unsigned integer that specifies the minimum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Minimum Service Interval field value of 0 indicates that SPs up to the maximum service interval are requested, including the continuous SP used by the GCR-A delivery method.

The Maximum Service Interval field is 4 octets long and contains an unsigned integer that, when the TSPEC is for the admitting of HCCA streams, specifies the maximum interval, in microseconds, between the start of two successive SPs. If the TSPEC element is intended for EDCA Admission Control, the Maximum Service Interval field is used to indicate a latency limit, which limits the amount of aggregation (A-MSDU or A-MPDU) used, so that excessive latency does not occur (see K.4.2.1). The Maximum Service Interval field is greater than or equal to the Minimum Service Interval field. If the TSPEC element is included within a GCR Request subelement that has the GCR delivery method equal to GCR-SP, a Maximum Service Interval field value of 0 indicates that the continuous SP used by the GCR-A delivery method is requested.

K.4.2.2 provides guidance on the use of the Maximum Service Interval to determine the limit of aggregation of nominal MSDUs.

The Inactivity Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MPDU belonging to the TS before this TS is deleted by the MAC entity at the HC.

The Suspension Interval field is 4 octets long and contains an unsigned integer that specifies the minimum amount of time, in microseconds, that can elapse without arrival or transfer of an MSDU belonging to the TS before the generation of successive QoS(+)CF-Poll is stopped for this TS. A value of $4\ 294\ 967\ 295$ ($= 2^{32} - 1$) disables the suspension interval, indicating that polling for the TS is not to be interrupted based on inactivity. The value of the suspension interval is always less than or equal to the inactivity interval.

The Service Start Time field is 4 octets and contains an unsigned integer that specifies the time, expressed in microseconds, when the first scheduled SP starts. The service start time indicates to the AP the time when a STA first expects to be ready to send frames and a power-saving STA needs to be awake to receive frames. This might help the AP to schedule service so that the MSDUs encounter small delays in the MAC and help the power-saving STAs to reduce power consumption. The field represents the four lower order octets of the TSF timer at the start of the SP. If APSD and Schedule subfields are 0, this field is also set to 0 (unspecified).

The Minimum Data Rate field is 4 octets long and indicates the lowest data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The field is encoded as a piecewise linear function described as follows:

$$R_{min} = \begin{cases} F_{min}, & F_{min} \leq 2^{31} \\ 1024 \times (F_{min} - 2^{31}) + 2^{31}, & F_{min} > 2^{31} \end{cases}$$

where

- R_{min} is the minimum data rate (in units of bits per second)
- F_{min} is the value of the Minimum Data Rate field

The Mean Data Rate²⁵ field is 4 octets long and indicates the average data rate specified at the MAC SAP, for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The field is encoded as a piecewise linear function described as follows:

$$R_{mean} = \begin{cases} F_{mean}, & F_{mean} \leq 2^{31} \\ 1024 \times (F_{mean} - 2^{31}) + 2^{31}, & F_{mean} > 2^{31} \end{cases}$$

where

- R_{mean} is the mean data rate (in units of bits per second)
- F_{mean} is the value of the Mean Data Rate field

The Peak Data Rate field is 4 octets long and indicates the maximum allowable data rate specified at the MAC SAP for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC. The field is encoded as a piecewise linear function described as follows:

$$R_{peak} = \begin{cases} F_{peak}, & F_{peak} \leq 2^{31} \\ 1024 \times (F_{peak} - 2^{31}) + 2^{31}, & F_{peak} > 2^{31} \end{cases}$$

where

- R_{peak} is the peak data rate (in units of bits per second)
- F_{peak} is the value of the Peak Data Rate field

If p is the peak rate in bits per second, then the maximum amount of data, belonging to this TS, arriving in any time interval $[t1, t2]$, where $t1 < t2$ and $t2 - t1 > 1$ TU, does not exceed $p \times (t2 - t1)$ bits.

²⁵The mean data rate, the peak data rate, and the burst size are the parameters of the token bucket model, which provides standard terminology for describing the behavior of a traffic source. The token bucket model is described in IETF RFC 2212 [B29], IETF RFC 2215 [B30], and IETF RFC 3290 [B37].

The Minimum, Mean and Peak Data Rates do not include the MAC and PHY overheads incurred in transporting the MSDUs or A-MSDUs, with the exception of the MAC overheads specific to A-MSDUs (A-MSDU subframe header and padding). K.4.3 provides guidance on how to determine the standard deviation of the TS and how to calculate the total traffic when there are multiple TSs.

The Burst Size field is 4 octets long and contains an unsigned integer that specifies the maximum burst, in octets, of the MSDUs or A-MSDUs belonging to this TS that arrive at the MAC SAP at the peak data rate. A value of 0 indicates that there are no bursts.

The Delay Bound field is 4 octets long and contains an unsigned integer that specifies the maximum amount of time, in microseconds, allowed to transport an MSDU or A-MSDU belonging to the TS in this TSPEC, measured between the time marking the arrival of the MSDU, or the first MSDU of the MSDUs constituting an A-MSDU, at the local MAC sublayer from the local MAC SAP and the time of completion of the successful transmission or retransmission of the MSDU or A-MSDU to the destination. The completion of the MSDU or A-MSDU transmission includes the relevant acknowledgment frame transmission time, if present.

The Minimum PHY Rate field is 4 octets long and indicates the minimum PHY rate for transport of MSDUs or A-MSDUs belonging to this TS within the bounds of this TSPEC.²⁶ See 11.4.2 for constraints on the selection of this field. The field is encoded as a piecewise linear function described as follows:

$$R_{minphy} = \begin{cases} F_{minphy}, & F_{minphy} \leq 2^{31} \\ 1024 \times (F_{minphy} - 2^{31}) + 2^{31}, & F_{minphy} > 2^{31} \end{cases}$$

where

R_{minphy} is the minimum PHY rate (in units of bits per second)

F_{minphy} is the value of the Minimum PHY Rate field

The Surplus Bandwidth Allowance field is 2 octets long and specifies the excess allocation of time (and bandwidth) over and above the stated application rates required to transport an MSDU or A-MSDU belonging to the TS in this TSPEC. This field is represented as an unsigned binary number and, when specified, is greater than 0. The 13 least significant bits (LSBs) indicate the decimal part while the three MSBs indicate the integer part of the number. This field takes into account the retransmissions, as the rate information does not include retransmissions. It represents the ratio of over-the-air bandwidth (i.e., time that the scheduler allocates for the transmission of MSDUs or A-MSDUs at the required rates) to bandwidth of the transported MSDUs or A-MSDUs required for successful transmission (i.e., time that would be necessary at the minimum PHY rate if there were no errors on the channel) to meet throughput and delay bounds under this TSPEC, when specified. As such, it should be greater than unity. A value of 1 indicates that no additional allocation of time is requested. K.4.1 provides guidance on how to calculate the value for Surplus Bandwidth Allowance.

The Medium Time field is a 16-bit unsigned integer and contains the amount of time admitted to access the medium, in units of 32 μ s. This field is reserved in the ADDTS Request frame and is set by the HC in the ADDTS Response frame. The derivation of this field is described in K.2.2. This field is not used for controlled channel access.

²⁶This rate information is intended to confirm that the TSPEC parameter values resulting from an admission control negotiation are sufficient to provide the required throughput for the TS. In a typical implementation, a TS is admitted only if the defined traffic volume can be accommodated at the specified rate within an amount of WM occupancy time that the admissions control entity is willing to allocate to this TS.

The UP, Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, Minimum PHY Rate, and Delay Bound fields in a TSPEC element express the QoS expectations requested by a STA, if this TSPEC was issued by that STA, or provided by the HC, if this TSPEC was issued by the HC, when these fields are specified with nonzero values. Unspecified parameters in these fields as indicated by a value of 0 indicate that the STA does not have specific requirements for these parameters if the TSPEC was issued by that STA or that the HC does not provide any specific values for these parameters if the TSPEC was issued by the HC. Annex K provides guidance on the use of the TSPEC and the settings of values of the various fields.

The DMG Attributes field is defined in Figure 9-268. The DMG Attributes field is present in a TSPEC when the BSS to which the TSPEC applies is a DMG BSS; otherwise absent.

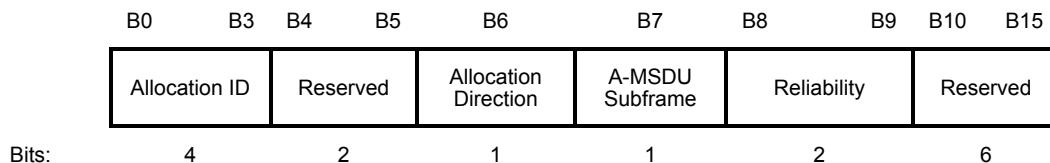

Figure 9-268—DMG Attributes field format

- The Allocation ID subfield is 4 bits in length. Traffic streams can share an allocation through TSPEC aggregation (see Annex V). The Allocation ID subfield is used as follows:
 - When setting up a TS, the DMG STA that transmits an ADDTS Request frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation it requires to carry the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID.
 - When setting up a TS, the DMG STA that transmits the ADDTS Response frame containing the TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value that identifies the allocation carrying the TS. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate any CBAP allocation with the broadcast AID as Source AID and Destination AID.
 - When deleting a TS, the DMG STA that transmits the DELTS frame containing a TSPEC or PTP TSPEC element sets the Allocation ID subfield to a nonzero value to identify the allocation that is carrying the TS to be deleted. Alternatively, the same DMG STA sets the Allocation ID subfield to 0 to indicate no allocation exists to carry the TS to be deleted.
- The Allocation Direction subfield is 1 bit in length. It is equal to 1 when the originator of the ADDTS request is also the source of the allocation identified by the Allocation ID subfield and is equal to 0 otherwise. The Allocation Direction subfield is equal to 0 when the Allocation ID subfield is equal to 0.
- The A-MSDU Subframe subfield is 1 bit in length and contains a value that indicates the A-MSDU subframe structure to be used for this TS. The A-MSDU Subframe subfield is set to 0 to indicate the Basic A-MSDU subframe structure and set to 1 to indicate the Short A-MSDU subframe structure.
- The Reliability subfield is 2 bits in length and contains an expected reliability index. The reliability index refers to the PHY PER (PSDU error rate as in 20.3.3.8). The relation between the reliability index and the PER is shown in Table 9-143.

The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to downlink or in an ADDTS Response frame that has the Direction field set to uplink indicates the expectation of the PER of the destination DMG STA for this TS. The Reliability subfield in an ADDTS Request frame that has the Direction subfield set to uplink or in an ADDTS Response frame that has the Direction field set to downlink is reserved. The reliability information is provided by the SME using the MLME-ADDTs.request primitive and MLME-ADDTs.response primitives. Together with the link margin (10.39) and other implementation-specific information, this value can be used by the source DMG STA of this TS to estimate the MCS to be used for this particular TS.

Table 9-143—Reliability subfield values

| Reliability index | PER |
|-------------------|---------------|
| 0 | Not specified |
| 1 | 10^{-2} |
| 2 | 10^{-3} |
| 3 | 10^{-4} |

9.4.2.31 TCLAS element

The TCLAS element contains a set of parameters necessary to identify various kinds of PDU or incoming MSDU (from a higher layer in all STAs or from the DS in an AP) that belong to a particular TS. The TCLAS element is also used when the traffic does not belong to a TS, for example, by the FMS, DMS, and TFS services. If required, the TCLAS element is provided in ADDTS Request and ADDTS Response frames only for the downlink or bidirectional links. The TCLAS element is always included when a PTP TSPEC is transmitted to a peer STA via an AP or PCP. The structure of this element is shown in Figure 9-269.

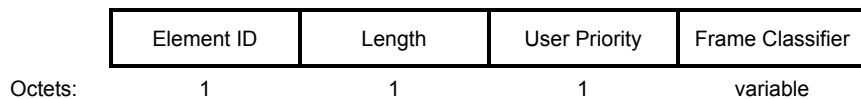

Figure 9-269—TCLAS element format

The Element ID and Length fields are defined in 9.4.2.1.

When the UP field contains a value that is less than or equal to 7, the value specifies the UP of the associated MSDUs. When the UP field contains a value that is greater than or equal to 8 and less than or equal to 11, the value specifies the access category of the associated MPDUs. The UP field value 255 is reserved and indicates that the UP of the MSDU and the access category of the MPDU are not compared as part of the traffic filter. The encoding of the contents of the User Priority field of an TCLAS element is specified in Table 9-144.

Table 9-144—User Priority field of TCLAS element

| User Priority | Meaning |
|---------------|---|
| 0–7 | The User Priority value of an MSDU |
| 8 | The AC value of an MPDU is AC-VO |
| 9 | The AC value of an MPDU is AC-VI |
| 10 | The AC value of an MPDU is AC-BE |
| 11 | The AC value of an MPDU is AC-BK |
| 12–254 | Reserved |
| 255 | The User Priority field is not used for comparison. |

The Frame Classifier field is 3–255 octets in length and is defined in Figure 9-270.

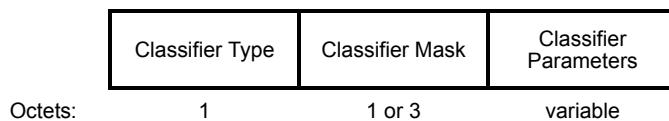

Figure 9-270—Frame Classifier field

The Frame Classifier field comprises the following subfields: Classifier Type, Classifier Mask, and Classifier Parameters. The Classifier Type subfield is 1 octet in length and specifies the type of classifier parameters in this TCLAS as defined in Table 9-145.

Table 9-145—Frame classifier type

| Classifier type | Classifier parameters |
|-----------------|-----------------------------------|
| 0 | Ethernet parameters |
| 1 | TCP/UDP IP parameters |
| 2 | IEEE 802.1Q parameters |
| 3 | Filter Offset parameters |
| 4 | IP and higher layer parameters |
| 5 | IEEE 802.1D/Q parameters |
| 6 | IEEE 802.11 MAC header parameters |
| 7–255 | Reserved |

When the Classifier type is a value less than or equal to 5, the Classifier Mask subfield specifies a bitmap in which bits that have the value 1 identify a subset of the classifier parameters whose values need to match those of the corresponding parameters in a given MSDU for that MSDU to be classified to the TS of the affiliated TSPEC. The bitmap is ordered from the LSB to the MSB, with each bit pointing to one of the classifier parameters of the same relative position as shown in this subclause based on classifier type. When there are more bits in the bitmap than classifier parameters that follow, the MSBs that do not point to any classifier parameters are reserved.

When the Classifier Type is equal to 6, the Classifier Mask subfield is three octets in length. It contains a sequence of nine two-bit Classifier Mask Control subfields. Each Classifier Mask Control subfield applies to a specific target field of the MAC header. It determines whether the target field is included in the comparison and whether an additional bitmask (the target field filter mask) is present. When the target field filter mask is present, it determines which bits of the target field are used in the comparison. Table 9-146 specifies the interpretation of the Classifier Mask Control subfield.

Table 9-146—Interpretation of the Classifier Mask Control subfield values

| Value of the Classifier Mask Control subfield | Description | Is the target subfield filter mask present? | Size of Match Specification field (as a multiplier to the size of the target subfield) |
|--|--|--|---|
| 0 | Target field is not included in classification | No | 0 |
| 1 | Target field is included in classification. Match based on target field bitwise = target field filter specification | No | 1 |
| 2 | Reserved | | |
| 3 | Target subfield is included in classification. Match criteria: if the bit with the same bit position in target filter mask subfield is set to 1, the bit value in the target field = target field filter specification; if the bit with the same bit position in target filter mask subfield is set to 0, the bit in the target field match specification need not be compared. | Yes | 2 |

The map from the location of the Classifier Mask subfield to the target subfield is defined in Table 9-147.

Table 9-147—Map from location of Classifier Mask subfield to target subfield

| Bit number | Target field |
|-------------------|---------------------|
| 0–1 | Frame Control |
| 2–3 | Duration/ID |
| 4–5 | Address 1 |
| 6–7 | Address 2 |
| 8–9 | Address 3 |
| 10–11 | Sequence Control |
| 12–13 | Address 4 |
| 14–15 | QoS Control |
| 16–17 | HT Control |
| 18–23 | Reserved |

For Classifier Type 0, the classifier parameters are the following parameters contained in an Ethernet frame header: Source Address, Destination Address, and Type (“Ethernet” [B12]). The endianness of the Type field is as defined in Ethernet [B12]. The Frame Classifier field for Classifier Type 0 is defined in Figure 9-271. It has a length of 16 octets.

| | | | | | |
|---------|---------------------|-----------------|----------------|---------------------|------|
| Octets: | 1 | 1 | 6 | 6 | 2 |
| | Classifier Type (0) | Classifier Mask | Source Address | Destination Address | Type |

Figure 9-271—Frame Classifier field of Classifier Type 0

For Classifier Type 1, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-272 and Figure 9-273, and distinguished by the Version field. Use of Classifier Type 1 for IPv6 is deprecated and replaced by Classifier Type 4. The subfields in the classifier parameters are represented and transmitted in the big-endian format. The classifier parameters are the following parameters:

- In a TCP or UDP header: Source Address, Destination Address, Source Port, Destination Port, and Version, plus
- One of the following:
 - In an IPv4 header: Differentiated Services Code Point (DSCP) (IETF RFC 2474 [B31]) and Protocol, or
 - In an IPv6 header: Flow Label.

| | | | | | | | | | | |
|---------|---------------------|-----------------|---------|-------------------|------------------------|-------------|------------------|------|----------|----------|
| Octets: | 1 | 1 | 1 | 4 | 4 | 2 | 2 | 1 | 1 | 1 |
| | Classifier Type (1) | Classifier Mask | Version | Source IP Address | Destination IP Address | Source Port | Destination Port | DSCP | Protocol | Reserved |

Figure 9-272—Frame Classifier field of Classifier Type 1 for traffic over IPv4

| | | | | | | | | |
|----------|---------------------|-----------------|---------|-------------------|------------------------|-------------|------------------|------------|
| Octet s: | 1 | 1 | 1 | 16 | 16 | 2 | 2 | 3 |
| | Classifier Type (1) | Classifier Mask | Version | Source IP Address | Destination IP Address | Source Port | Destination Port | Flow Label |

Figure 9-273—Frame Classifier field of Classifier Type 1 for traffic over IPv6

The DSCP field contains the value in the 6 LSBs, and the 2 MSBs are set to 0. The 2 MSBs of the DSCP field are ignored for frame classification.

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 2460.

For Classifier Type 2, the Classifier Parameter is the IEEE 802.1Q-2003 VLAN Tag TCI. The endianness of the IEEE 802.1Q VLAN TCI field is as defined in IEEE Std 802.1Q for the VLAN Tag TCI. The Frame Classifier field for Classifier Type 2 is defined in Figure 9-274.

| | | | |
|---------|---------------------|-----------------|-----------------|
| Octets: | 1 | 1 | 2 |
| | Classifier Type (2) | Classifier Mask | 802.1Q VLAN TCI |

Figure 9-274—Frame Classifier field of Classifier Type 2

For Classifier Type 3, the classifier parameters are defined by a Filter Offset subfield, a Filter Value subfield and a Filter Mask subfield. The Frame Classifier subfield of Classifier Type 3 is defined in Figure 9-275. It has a variable length.

| Classifier Type (3) | Classifier Mask | Filter Offset | Filter Value | Filter Mask |
|------------------------|-----------------|---------------|--------------|----------------------|
| Octets: | 1 | 1 | 2 | variable variable |

Figure 9-275—Frame Classifier field of Classifier Type 3

The Classifier Mask subfield is reserved.

The value of the Filter Offset subfield is the number of octets from the beginning of the MSDU or MMPDU at which the Filter Value is compared.

The length of the Filter Value and Filter Mask subfields is $(Length - 5)/2$, where *Length* is the value in the Length field of the TCLAS element.

The Filter Value subfield is an octet string that is compared to the MSDU or MMPDU content, beginning at the octet indicated by the Filter Offset.

The Filter Mask subfield is an octet string that is used to indicate which bits in the Filter Value subfield are compared. The length of the Filter Mask subfield is equal to the length of the Filter Value subfield. A bit in the Filter Value subfield is compared only if the matching bit in the Filter Mask subfield is 1.

For Classifier Type 4, frame classifier is defined for both IPv4 and IPv6, shown in Figure 9-276 (with the Classifier Type subfield set to 4) and Figure 9-277, and distinguished by the Version subfield. The classifier parameters represent corresponding values in a received IPv4 or IPv6 frame and are defined in Table 9-148. The subfields in the classifier parameters are represented and transmitted in big-endian format.

Table 9-148—Classifier parameters for Classifier Type 4

| Subfield | Included in IPv4 | IPv4 field length (octets) | Included in IPv6 | IPv6 field length (octets) |
|------------------------|------------------|----------------------------|------------------|----------------------------|
| Version | Yes | 1 | Yes | 1 |
| Source IP Address | Yes | 4 | Yes | 16 |
| Destination IP Address | Yes | 4 | Yes | 16 |
| Source Port | Yes | 2 | Yes | 2 |
| Destination Port | Yes | 2 | Yes | 2 |
| DSCP | Yes | 1 | Yes | 1 |
| Protocol | Yes | 1 | No | n/a |
| Next Header | No | n/a | Yes | 1 |
| Flow Label | No | n/a | Yes | 3 |

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv4 is shown in Figure 9-276.

| | | | | | |
|---------|------------------------|------------------|------------|-------------------|------------------------|
| | Classifier Type (4) | Classifier Mask | Version(4) | Source IP Address | Destination IP Address |
| Octets: | 1 | 1 | 1 | 4 | 4 |
| Octets: | 2 | 2 | 1 | 1 | 1 |
| | Source Port | Destination Port | DSCP | Protocol | Reserved |

Figure 9-276—Frame Classifier subfield of Classifier Type 4 for traffic over IPv4

The Frame Classifier subfield of Classifier Type 4 for traffic over IPv6 is shown in Figure 9-277.

| | | | | | |
|---------|------------------------|------------------|------------|-------------------|------------------------|
| | Classifier Type (4) | Classifier Mask | Version(6) | Source IP Address | Destination IP Address |
| Octets: | 1 | 1 | 1 | 16 | 16 |
| Octets: | 2 | 2 | 1 | 1 | 3 |
| | Source Port | Destination Port | DSCP | Next Header | Flow Label |

Figure 9-277—Frame Classifier subfield of Classifier Type 4 for traffic over IPv6

NOTE—Frame classification when extension headers are used is supported only if the TCLAS does not classify on ports (Classifier Mask has the Source and Destination Port bits set to 0).

The value in the Version subfield is the value specified in IETF RFC 791 or IETF RFC 2460.

The DSCP subfield contains the value as described in IETF RFC 2474 in the 6 least significant bits. The 2 most significant bits are reserved.

The Next Header subfield contains the next encapsulated protocol and is compatible with the values specified for the IPv4 Protocol subfield. In the presence of options in the IPv6 header, the Next Header subfield specifies the presence of one or more out of six extension headers as defined in IETF RFC 2460.

The Flow Label subfield contains the value in the 20 least significant bits. The 4 most significant bits are reserved.

NOTE—For example, the flow label 0x12345 is represented as the octet sequence 0x01, 0x23, 0x45.

A TCLAS element is valid when the Classifier Mask Version bit is 1.

For Classifier Type 5 when used to match an IEEE 802.1D-2004 frame [B23], the classifier parameter is only the User Priority, and the DEI and VID parameters are ignored. For Classifier Type 5 when used to match an IEEE 802.1Q frame, the classifier parameters are: Priority Code Point, Drop Eligibility Indicator (DEI), and VLAN ID (VID).

The Frame Classifier field for Classifier Type 5 is defined in Figure 9-278.

| | | | | |
|---------------------|-----------------|---|------------|------------|
| Classifier Type (5) | Classifier Mask | 802.1D UP/ 802.1Q Priority Code Point | 802.1Q DEI | 802.1Q VID |
| Octets: | 1 | 1 | 1 | 2 |

Figure 9-278—Frame Classifier field of Classifier Type 5

The subfields in the classifier parameters are represented and transmitted in big-endian format.

The 802.1D UP/802.1Q Priority Code Point subfield contains the value to be matched to the appropriate type frame header in the 4 LSBs; the 4 MSBs are reserved.

The 802.1Q DEI subfield contains the value to match against an IEEE 802.1Q frame header, in the LSB; the 7 MSBs are reserved. When matching an IEEE 802.1D-2004 frame header, this subfield is ignored.

The 802.1Q VID subfield contains the value to match against an IEEE 802.1Q frame header, in the 12 LSBs; the 4 MSBs are reserved. When matching an IEEE 802.1D-2004 frame header, this subfield is ignored.

For Classifier Type 6, the format of the Frame Classifier field of an TCLAS element is illustrated in Figure 9-279.

| | | | | | |
|-------------------------------|--------------------------------|-----------------------------------|------------------------------|-------------------------------|-------------------------------|
| Classifier Type (6) | Classifier Mask | Frame Control Match Specification | Duration Match Specification | Address 1 Match Specification | Address 2 Match Specification |
| Octets: | 1 | 3 | 0 or 2 or 4 | 0 or 2 or 4 | 0 or 6 or 12 |
| Address 3 Match Specification | Sequence Control Specification | Address 4 Specification | QoS Control Specification | HT Control Specification | |
| 0 or 6 or 12 | 0 or 2 or 4 | 0 or 6 or 12 | 0 or 2 or 4 | 0 or 4 or 8 | |

Figure 9-279—Frame Classifier field of Classifier Type 6

For Classifier Type 6, the formats of the Frame Control Match Specification subfield, Duration/ID Match Specification subfield, Address 1 Match Specification subfield, Address 2 Match Specification subfield, Address 3 Match Specification subfield, Sequence Control Match Specification subfield, Address 4 Match Specification subfield, QoS Control Match Specification subfield and HT Control Match Specification subfield of the Frame Classifier field of a TCLAS element are shown in Figure 9-280, Figure 9-281, Figure 9-282, Figure 9-283, Figure 9-284, Figure 9-285, Figure 9-286, Figure 9-287, and Figure 9-288, respectively. The Match Specification subfield contains the match specification (i.e., the parameters) of the corresponding MAC header field with which an MPDU is compared. When the corresponding Filter Mask is not present, every bit in a Match Specification is compared; otherwise, only the bits with the same bit positions as the bits that are equal to 1 in the corresponding Filter Mask subfield are compared.

| | |
|-----------------------------------|---------------------------|
| Frame Control Match Specification | Frame Control Filter Mask |
| Octets: | 2 |

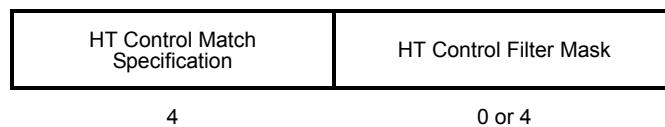

Figure 9-288—HT Control Match Specification subfield of Classifier Type 6

9.4.2.32 TS Delay element

The TS Delay element is used in an ADDTS Response frame transmitted by an HC and indicates the time after which the ADDTS can be retried; see 11.4.7. The TS Delay element is defined in Figure 9-289.

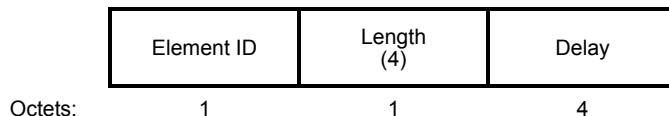

Figure 9-289—TS Delay element

The Element ID and Length fields are defined in 9.4.2.1.

The Delay field is 4 octets long and specifies the amount of time, in TUs, a STA should wait before it reinitiates setup of a TS.

The Delay field is set to 0 when an AP does not expect to serve any TSPECs for an indeterminate time and does not know this time a priori.

9.4.2.33 TCLAS Processing element

The TCLAS Processing element is present in ADDTS Request, ADDTS Response, FMS Request, FMS Response, DMS Request, DMS Response, TFS Request and SCS Descriptor frames if there are multiple TCLAS elements associated with the request, response or descriptor. It is optionally present in the ADDTS Request and ADDTS Response frames if there are no TCLAS elements. Together with the TCLAS element(s), if present, it indicates how a PDU or MSDU should be processed by the classifier. The TCLAS Processing element is defined in Figure 9-290.

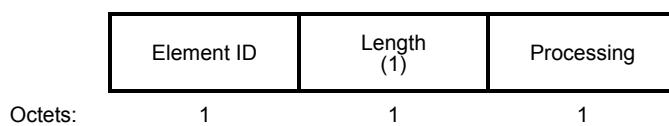

Figure 9-290—TCLAS Processing element

The Element ID and Length fields are defined in 9.4.2.1.

The Processing subfield is 1 octet long. The encoding of the Processing subfield is shown in Table 9-149.

Table 9-149—Encoding of Processing subfield

| Processing subfield value | Meaning |
|---------------------------|--|
| 0 | PDU contents or MSDU parameters have to match to the parameters in all of the associated TCLAS elements. |
| 1 | PDU contents or MSDU parameters have to match to at least one of the associated TCLAS elements. |
| 2 | PDUs or MSDUs that do not belong to any other TS are classified to the TS for which this TCLAS Processing element is used. In this case, there are no associated TCLAS elements. |
| 3–255 | Reserved |

9.4.2.34 Schedule element

The Schedule element is transmitted by the HC to a STA to announce the schedule that the HC/AP follows for admitted streams originating from or destined to that STA, or GCR-SP streams destined to that STA, in the future. The information in this element might be used by the STA for power management, internal scheduling, or any other purpose. The element information format is shown in Figure 9-291.

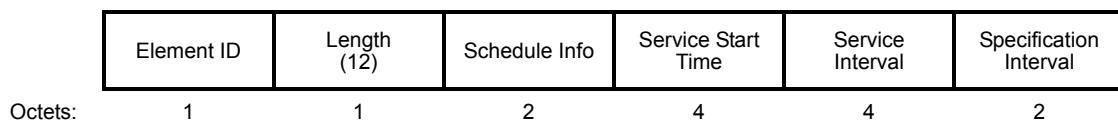

Figure 9-291—Schedule element

The Element ID and Length fields are defined in 9.4.2.1.

The Schedule Info field is shown in Figure 9-292.

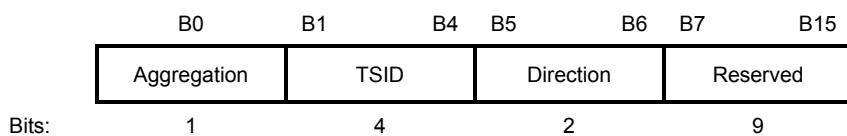

Figure 9-292—Schedule Info field

The Aggregation subfield is set to 1 if the schedule is an aggregate schedule for all TSIDs associated with the STA to which the frame is directed. It is set to 0 otherwise. The TSID subfield contains a value allowed for a TSID, as defined in 9.2.4.5.2, and indicates the TSID for which this schedule applies. The TSID subfield is reserved when the Schedule element is included within a GCR Response subelement. The Direction subfield is as defined in 9.4.2.30 and defines the direction of the TSPEC associated with the schedule. In a Schedule element sent within a GCR Response subelement, the Direction subfield is set to “Downlink.” The TSID and Direction subfields are valid only when the Aggregation subfield is 0. If the Aggregation subfield is 1, the TSID and Direction subfields are reserved.

The Service Start Time field is 4 octets and indicates the anticipated time, expressed in microseconds, when service starts and represents the lower order 4 octets of the TSF timer value at the start of the first SP. The AP uses this field to confirm or modify the service start time indicated in the TSPEC request.

The Service Interval field is 4 octets and indicates the time, expressed in microseconds, between two successive SPs and represents the measured time from the start of one SP to the start of the next SP. If the

Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, a value of 0 in the Service Interval field indicates the delivery method is GCR-A.

The Specification Interval field is 2 octets long and contains an unsigned integer that specifies the time interval, in TUs, to verify schedule compliance.

The HC can set the Service Start Time field and the Service Interval field to 0 (unspecified) for nonpowersaving STAs, except when the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP (see 11.24.16.3.8). When the Schedule element is included within a GCR Response subelement that has the GCR delivery method equal to GCR-SP, the Service Start Time field is not set to 0 and the Service Interval field might be set to 0.

9.4.2.35 QoS Capability element

The QoS Capability element contains a number of subfields that are used to advertise optional QoS capabilities at a QoS STA. The QoS Capability element is present in Beacon frames that do not contain the EDCA Parameter Set element and in (Re)Association Request frames. The QoS Capability element is defined in Figure 9-293.

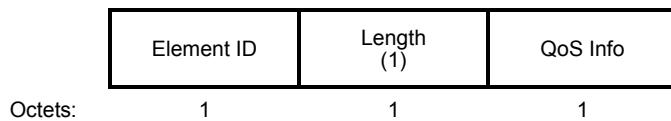

Figure 9-293—QoS Capability element format

The Element ID and Length fields are defined in 9.4.2.1.

The QoS Info field is 1 octet in length and is defined in 9.4.1.17.

9.4.2.36 AP Channel Report element

The AP Channel Report element contains a list of channels where a STA is likely to find an AP. The format of the AP Channel Report element is shown in Figure 9-294. See 11.11.18 for details.

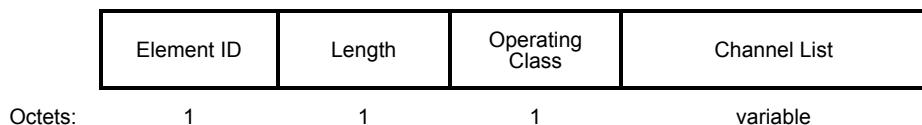

Figure 9-294—AP Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1. The minimum value of the Length field is 1 (based on a minimum length for the channel list field of 0 octets).

Operating Class contains an enumerated value from Annex E, specifying the operating class in which the Channel List is valid. An AP Channel Report only reports channels for a single operating class. Multiple AP Channel Report elements are present when reporting channels in more than one operating class.

The Channel List contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on Operating Class according to Annex E.

9.4.2.37 Neighbor Report element

The format of the Neighbor Report element is shown in Figure 9-295.

| Element ID | Length | BSSID | BSSID Information | Operating Class | Channel Number | PHY Type | Optional Subelements |
|------------|--------|-------|-------------------|-----------------|----------------|----------|----------------------|
| Octets: | 1 | 1 | 6 | 4 | 1 | 1 | variable |

Figure 9-295—Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

Each Report element describes an AP and consists of BSSID, BSSID Information, Channel Number, Operating Class, PHY Type, and optionally includes optional subelements. The minimum value of the Length field is 13 (i.e., with no optional subelements in the Neighbor Report element).

The BSSID is the BSSID of the BSS being reported. The subsequent fields in the Neighbor Report element pertain to this BSS.

The BSSID Information field can be used to help determine neighbor service set transition candidates. It is 4 octets in length and contains the subfields as shown in Figure 9-296.

| B0 | B1 | B2 | B3 | B4 | B9 | B10 | B11 | B12 | B13 | B14 | B31 |
|-----------------|----------|-----------|--------------|-----------------|-----------------|----------------------|-----|----------|-----|-----|-----|
| AP Reachability | Security | Key Scope | Capabilities | Mobility Domain | High Throughput | Very High Throughput | FTM | Reserved | | | |
| Bits: | 2 | 1 | 1 | 6 | 1 | 1 | 1 | 1 | 1 | 18 | |

Figure 9-296—BSSID Information field

The AP Reachability field indicates whether the AP identified by this BSSID is reachable by the STA that requested the neighbor report. For example, the AP identified by this BSSID is reachable for the exchange of preauthentication frames as described in 12.6.10.2. The values are shown in Table 9-150.

Table 9-150—Reachability field

| Value | Reachability | Usage |
|-------|---------------|---|
| 0 | Reserved | Not used. |
| 1 | Not Reachable | A station sending a preauthentication frame to the BSSID will not receive a response even if the AP indicated by the BSSID is capable of preauthentication. |
| 2 | Unknown | The AP is unable to determine if the value Reachable or Not Reachable is to be returned. |
| 3 | Reachable | The station sending a preauthentication frame to the BSSID can receive a response from an AP that is capable of preauthentication. |

The Security bit, if 1, indicates that the AP identified by this BSSID supports the same security provisioning as used by the STA in its current association. If the bit is 0, it indicates either that the AP does not support the same security provisioning or that the security information is not available at this time.

The Key Scope bit, when set, indicates the AP indicated by this BSSID has the same authenticator as the AP sending the report. If this bit is 0, it indicates a distinct authenticator or the information is not available.

The Capabilities subfield contains selected capability information for the AP indicated by this BSSID. The bit fields within this subfield have the same meaning and are set to the equivalent bits within the Capability Information field (see 9.4.1.4) being sent in the beacons by the AP being reported. The format of the Capabilities subfield is as in Figure 9-297.

| B4 | B5 | B6 | B7 | B8 | B9 |
|---------------------|-----|------|-------------------|-------------------|---------------------|
| Spectrum Management | QoS | APSD | Radio Measurement | Delayed Block Ack | Immediate Block Ack |
| Bits: | 1 | 1 | 1 | 1 | 1 |

Figure 9-297—Capabilities subfield

The Mobility Domain bit is set to 1 to indicate that the AP represented by this BSSID is including an MDE in its Beacon frames and that the contents of that MDE are identical to the MDE advertised by the AP sending the report.

The High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is an HT AP including the HT Capabilities element in its Beacons, and that the contents of that HT Capabilities element are identical to the HT Capabilities element advertised by the AP sending the report.

The Very High Throughput bit is set to 1 to indicate that the AP represented by this BSSID is a VHT AP and that the VHT Capabilities element, if included as a subelement in the report, is identical in content to the VHT Capabilities element included in the AP's Beacon.

The FTM field is set to 1 to indicate that the AP represented by this BSSID is an AP that has set the Fine Timing Measurement Responder field of the Extended Capabilities element to 1. The FTM field is set to 0 to indicate either that the reporting AP has dot11FineTimingMsmtRespActivated equal to false, or the reported AP has not set the Fine Timing Measurement Responder field of the Extended Capabilities element to 1 or that the Fine Timing Measurement Responder field of the reported AP is not available to the reporting AP at this time.

Bits 14–31 are reserved.

The Operating Class field indicates the channel set of the AP indicated by this BSSID. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the channel on which the Beacon frames are being transmitted for the BSS being reported. Valid operating classes are listed in Annex E.

The Channel Number field indicates the last known primary channel of the AP indicated by this BSSID. Channel number is defined within an operating class as shown in Annex E.

The PHY Type field indicates the PHY type of the AP indicated by this BSSID. It is an integer value coded according to the value of the dot11PHYType.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-151.

Table 9-151—Optional subelement IDs for Neighbor report

| Subelement ID | Name | Extensible |
|---------------|-------------------------------------|-------------|
| 0 | Reserved | |
| 1 | TSF Information | Yes |
| 2 | Condensed Country String | Yes |
| 3 | BSS Transition Candidate Preference | |
| 4 | BSS Termination Duration | |
| 5 | Bearing | |
| 6 | Wide Bandwidth Channel | Yes |
| 7–38 | Reserved | |
| 39 | Measurement Report | Subelements |
| 40–44 | Reserved | |
| 45 | HT Capabilities subelement | Yes |
| 46–60 | Reserved | |
| 61 | HT Operation subelement | Yes |
| 62 | Secondary Channel Offset subelement | |
| 63–65 | Reserved | |
| 66 | Measurement Pilot Transmission | Subelements |
| 67–69 | Reserved | |
| 70 | RM Enabled Capabilities | Yes |
| 71 | Multiple BSSID | Subelements |
| 72–190 | Reserved | |
| 191 | VHT Capabilities | Yes |
| 192 | VHT Operation | Yes |
| 193–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The TSF subelement contains TSF Offset and Beacon Interval subfields as shown in Figure 9-298.

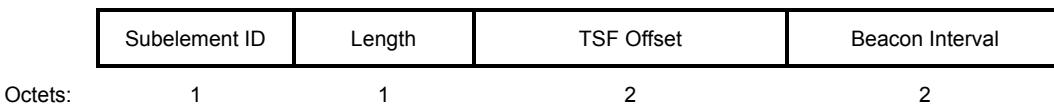

Figure 9-298—TSF subelement format

The Length field is defined in 9.4.3.

The TSF Offset subfield is 2 octets long and contains the neighbor AP's TSF timer offset. This is the time difference, in TU units, between the serving AP and a neighbor AP. This offset is given modulo the neighbor AP's Beacon Interval and rounded to the nearest TU boundary.

The Beacon Interval field is the beacon interval of the Neighbor AP indicated by this BSSID. This field is defined in 9.4.1.3 and illustrated in Figure 9-67.

The Condensed Country String subelement is set to the first two octets of the value contained in dot11CountryString. This subelement is present only if the country of the neighbor AP indicated by the BSSID differs from the country of the AP that sent this neighbor report.

The Measurement Pilot Transmission subelement has the same format as the Measurement Pilot Transmission element (see 9.4.2.42). The Measurement Pilot Interval subelement is not included if the reported AP is not transmitting Measurement Pilot frames or if the Measurement Pilot Interval of the reported AP is unknown.

A Measurement Report subelement with the Measurement Type field equal to LCI (see Table 9-107) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to LCI. The subelement indicates the LCI of the neighbor STA and further includes the Z subelement, or the subelement indicates an unknown LCI (see 11.24.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS which is co-located with the reporting BSS.

A Measurement Report subelement with the Measurement Type field equal to Location Civic (see Table 9-107) is optionally present. If present, the subelement has the same format as the Measurement Report element with Measurement Type field equal to Location Civic, and the subelement indicates the civic address of the transmitting STA or an unknown civic address (see 11.24.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report subelement of the Neighbor Report element, when there is at least one other BSS which is co-located with the reporting BSS. When a Measurement Report subelement with Measurement Type field equal to LCI that includes a Co-Located BSSID List subelement is present, the Co-Located BSSID List subelement is not present in the Measurement Report subelement with Measurement Type field equal to Location Civic.

The HT Capabilities subelement is the same as the HT Capabilities element as defined in 9.4.2.56.

The HT Operation subelement is the same as the HT Operation element as defined in 9.4.2.57.

The Secondary Channel Offset subelement is the same as the Secondary Channel Offset element as defined in 9.4.2.20.

The RM Enabled Capabilities subelement has the same format as the RM Enabled Capabilities element (see 9.4.2.45).

The Multiple BSSID subelement has the same format as the Multiple BSSID element (see 9.4.2.46). The reference BSSID for the Multiple BSSID subelement is the BSSID field in the Neighbor Report element. This subelement is not present if the neighbor AP is not a member of a multiple BSSID set with two or more members or its membership is unknown. (see 11.11.14).

The format of the BSS Transition Candidate Preference subelement is shown in Figure 9-299.

| Octets: | Subelement ID | Length | Preference |
|---------|---------------|--------|------------|
| | 1 | 1 | 1 |

Figure 9-299—BSS Transition Candidate Preference subelement format

The Length field is defined in 9.4.3.

The Preference field indicates the network preference for BSS transition to the BSS listed in this BSS Transition Candidate List Entries field in the BSS Transition Management Request frame, BSS Transition Management Query frame, and BSS Transition Management Response frame. The Preference field value is a number ranging from 0 to 255, as defined in Table 9-152, indicating an ordering of preferences for the BSS transition candidates for this STA. Additional details describing use of the Preference field are provided in 11.24.7.

Table 9-152—Preference field values

| Preference field value | Description |
|------------------------|---|
| 0 | Excluded BSS; reserved when present in the BSS Transition Management Query or BSS Transition Management Response frames. |
| 1–255 | Relative values used to indicate the preferred ordering of BSSs, with 255 indicating the most preferred candidate and 1 indicating the least preferred candidate. |

The BSS Termination TSF field contained in the BSS Termination Duration subelement is the TSF time of the BSS transmitting the neighbor report that corresponds to the time when termination of the neighbor BSS occurs. How the BSS determines the neighbor BSS termination time is out of scope of the standard. The format of the BSS Termination Duration subelement is shown in Figure 9-300.

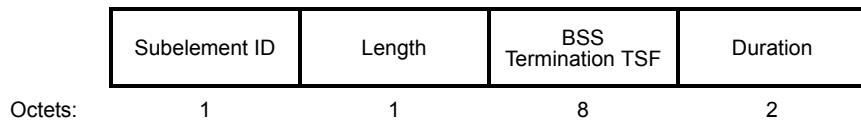

Figure 9-300—BSS Termination Duration subelement format

The Length field is defined in 9.4.3.

The BSS Termination TSF field indicates the value of the TSF timer when BSS termination will occur in the future. A BSS Termination TSF field value of 0 indicates that termination of the BSS will occur imminently. Prior to termination of the BSS, all associated STAs are disassociated by the AP.

The Duration field is an unsigned 2-octet integer that indicates the number of minutes for which the BSS is not present. The Duration field value of 0 is reserved. The Duration field value is 65 535 when the BSS is terminated for a period longer than or equal to 65 535 minutes.

The format of the Bearing subelement is shown in Figure 9-301.

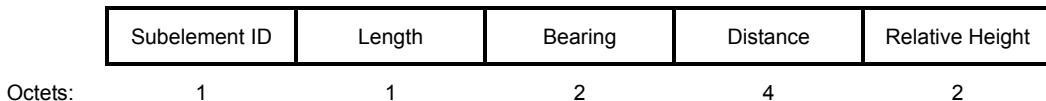

Figure 9-301—Bearing subelement format

The Length field is defined in 9.4.3.

The Bearing field specifies the direction that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned, relative to the reporting BSS and defined in relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the subelement is not included.

The Distance field specifies the distance that the neighbor, specified by the BSSID field in the Neighbor Report element, is positioned relative to the reporting BSS as a 4-octet single precision floating point value represented by a binary32 floating point value as defined in IEEE Std 754-2008, with the least significant bit of the fraction occurring in bit 0 of the field, in meters. If the Distance field value is unknown the field is set to 0.

The Relative Height field, defined by a 2-octet signed integer, specifies the relative height in meters that the neighbor is positioned, relative to the reporting BSS. If the Relative height is unknown or at the same height as the reporting BSS, the field is 0.

The format of the Wide Bandwidth Channel subelement is shown in Figure 9-302.

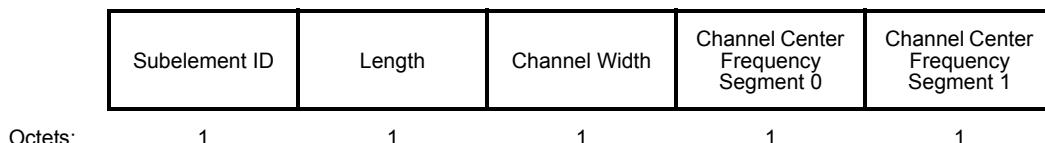

Figure 9-302—Wide Bandwidth Channel subelement format

The Length field is defined in 9.4.3.

The Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 subfields are defined in Table 9-153.

Table 9-153—HT/VHT Operation Information subfields

| Field | Definition | Encoding |
|------------------------------------|--|--|
| Channel Width | This field defines the BSS bandwidth (see 11.40.1). | Set to 0 for 20 MHz BSS bandwidth. Set to 1 for 40 MHz BSS bandwidth. Set to 2 for 80 MHz BSS bandwidth. Set to 3 for 160 MHz BSS bandwidth. Set to 4 for 80+80 MHz operating channel width. Values in the range 5 to 255 are reserved. |
| Channel Center Frequency Segment 0 | Defines the channel center frequency for an HT or VHT BSS or the frequency segment 0 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14. | For 20, 40, 80, or 160 MHz BSS bandwidth, indicates the channel center frequency index for the channel on which the HT or VHT BSS operates. For 80+80 MHz BSS bandwidth, indicates the channel center frequency index for the 80 MHz channel of frequency segment 0 on which the VHT BSS operates. |
| Channel Center Frequency Segment 1 | Defines the frequency segment 1 channel center frequency for an 80+80 MHz VHT BSS. See 21.3.14. | For an 80+80 MHz BSS bandwidth, indicates the channel center frequency index of the 80 MHz channel of frequency segment 1 on which the VHT BSS operates. The channel center frequency index of segment 1 differs by more than 16 from the channel center frequency index of segment 0 (i.e., the channel center frequencies are more than 80 MHz apart). Reserved otherwise. |

The VHT Capabilities subelement is the same as the VHT Capabilities element as defined in 9.4.2.158.

The VHT Operation subelement is the same as the VHT Operation element as defined in 9.4.2.159.

The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.38 RCPI element

The RCPI element indicates the received frame power level at the receiving STA as shown in Figure 9-303.

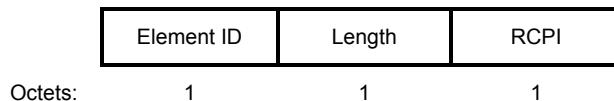

Figure 9-303—RCPI element format

The Element ID and Length fields are defined in 9.4.2.1.

The RCPI field contains an RCPI value, which is an indication of the received RF power in the selected channel for a received frame.

RCPI is a monotonically increasing, logarithmic function of the received power level. The allowed values for the RCPI field are defined in Table 9-154, where P is the received power level in dBm.

Table 9-154—RCPI values

| RCPI Value | Description |
|------------|---|
| 0 | Represents $P < -109.5$ dBm |
| 1–219 | Power levels in the range $-109.5 \leq P < 0$ are represented by $\text{RCPI} = \lfloor 2 \times (P + 110) \rfloor$ |
| 220 | Represents $P \geq 0$ dBm |
| 221–254 | Reserved |
| 255 | Measurement not available |

9.4.2.39 BSS Average Access Delay element

The BSS Average Access Delay element contains the AP Average Access Delay, which is a measure of load in the BSS and is available in both QoS APs and non-QoS APs. The format of the BSS Average Access Delay element is defined in Figure 9-304.

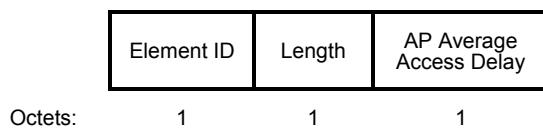

Figure 9-304—BSS Average Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Average Access Delay is a scalar indication of the relative level of loading at an AP. A low value indicates more available capacity than a higher value. If the AP is not currently transmitting any DCF or EDCAF traffic, the AP Average Access Delay is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for all DCF and EDCAF transmitted frames measured from the time the DCF or EDCAF MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. Non-QoS APs average the access delays for all DCF transmitted frames. QoS APs average the access delays for all EDCA transmitted frames of all ACs. The AP Average Access Delay values are scaled as follows:

| | |
|----------------|--|
| 0: | Access Delay < 8 μ s |
| 1: | 8 μ s ≤ Access Delay < 16 μ s |
| 2 ≤ n ≤ 14: | n × 8 μ s ≤ Access Delay < (n + 1) × 8 μ s |
| 15: | 120 μ s ≤ Access Delay < 128 μ s |
| 16: | 128 μ s ≤ Access Delay < 144 μ s |
| 17 ≤ n ≤ 106: | (n × 16) – 128 μ s ≤ Access Delay < ((n + 1) × 16) – 128 μ s |
| 107: | 1 584 μ s ≤ Access Delay < 1 600 μ s |
| 108: | 1 600 μ s ≤ Access Delay < 1 632 μ s |
| 109 ≤ n ≤ 246: | (n × 32) – 1 856 μ s ≤ Access Delay < ((n + 1) × 32) – 1 856 μ s |
| 247: | 6 048 μ s ≤ Access Delay < 6 080 μ s |
| 248: | 6 080 μ s ≤ Access Delay < 8 192 μ s |
| 249: | 8 192 μ s ≤ Access Delay < 12 288 μ s |
| 250: | 12 288 μ s ≤ Access Delay < 16 384 μ s |
| 251: | 16 384 μ s ≤ Access Delay < 20 480 μ s |
| 252: | 20 480 μ s ≤ Access Delay < 24 576 μ s |
| 253: | 24 576 μ s ≤ Access Delay |
| 254: | Service unable to access channel |
| 255: | Measurement not available |

The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the DCF is or the EDCAFs are currently unable to access the channel due to continuous carrier sense mechanism deferral and that no frames were transmitted during the measurement window. The AP measures and averages the medium access delay for all transmit frames using the DCF or the EDCAFs over a continuous 30 s measurement window. See 11.11.16 for accuracy requirements.

9.4.2.40 Antenna element

The Antenna element contains the Antenna ID field as shown in Figure 9-305.

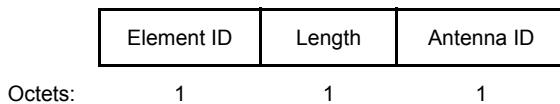

Figure 9-305—Antenna element format

The Element ID and Length fields are defined in 9.4.2.1.

The Antenna ID field contains the identifying number for the relevant antenna(s). The Antenna ID identifies the antenna(s) used to transmit the frame the Antenna element is contained in. A specific antenna has an Antenna ID between 1 and 254. The value 0 indicates that the antenna identifier is unknown. The value 255 indicates that this transmission was made with multiple antennas, i.e., antennas were switched during the transmission. If during frame reception, different antennas are used to receive the preamble and body, the antenna ID identifies the antenna that receives the frame body. In these cases, the value 255 is not used. The value 1 is the only value used for a STA with only one antenna. STAs with more than one antenna assign Antenna IDs to each antenna and each antenna configuration as consecutive, positive integers starting with 1. Each Antenna ID number represents a unique antenna or unique configuration of multiple antennas characterized by a fixed relative position, a fixed relative direction, and a fixed peak gain for that position and direction.

9.4.2.41 RSNI element

The RSNI element contains an RSNI value, as shown in Figure 9-306.

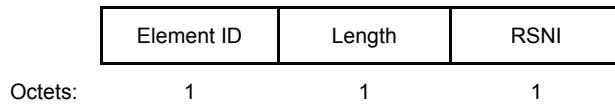

Figure 9-306—RSNI element format

The Element ID and Length fields are defined in 9.4.2.1.

RSNI is in steps of 0.5 dB. RSNI is calculated by the ratio of the received signal power (RCPI-ANPI) to the noise plus interference power (ANPI) using the expression:

$$\text{RSNI} = (10 \times \log_{10}((\text{RCPI}_{\text{power}} - \text{ANPI}_{\text{power}}) / \text{ANPI}_{\text{power}}) + 10) \times 2$$

where $\text{RCPI}_{\text{power}}$ and $\text{ANPI}_{\text{power}}$ indicate power domain values for RCPI and ANPI and not dB domain values. RSNI in dB is scaled in steps of 0.5 dB to obtain 8-bit RSNI values, which cover the range from -10 dB to $+117$ dB. The value 255 indicates that RSNI is not available. See 11.11.9.4 for details and procedures for measuring ANPI.

9.4.2.42 Measurement Pilot Transmission element

The Measurement Pilot Transmission element contains a Measurement Pilot Transmission field as shown in Figure 9-307.

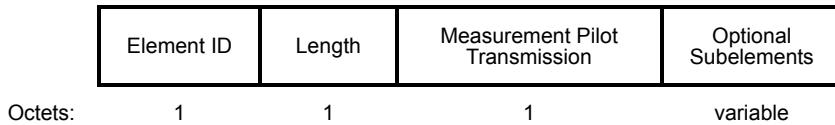

Figure 9-307—Measurement Pilot Transmission element format

The Element ID field is equal to the Measurement Pilot Transmission value in Table 9-77.

The Element ID and Length fields are defined in 9.4.2.1.

The Measurement Pilot Transmission field contains the Measurement Pilot Interval as specified in 9.4.1.18.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-155.

Table 9-155—Optional subelement IDs for Measurement Pilot Transmission

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

9.4.2.43 BSS Available Admission Capacity element

The BSS Available Admission Capacity element contains a list of Available Admission Capacity fields at different User Priorities and Access Categories as shown in Figure 9-308.

NOTE—The BSS Available Admission Capacity element is helpful for roaming QoS STAs to select a QoS AP that is likely to accept future admission control requests, but it does not provide an assurance that the HC will admit these requests.

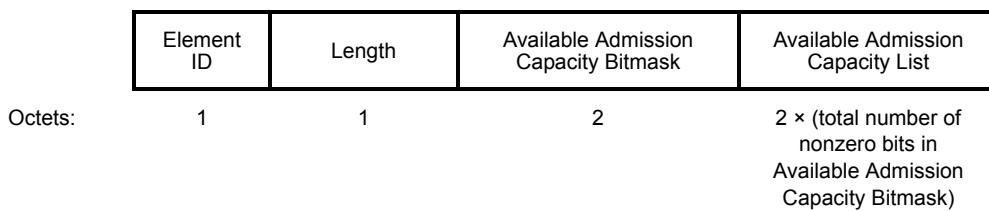

Figure 9-308—BSS Available Admission Capacity element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to $2 + 2N_{nz}$, where N_{nz} equals the total number of nonzero bits in Available Admission Capacity Bitmask.

The Available Admission Capacity Bitmask field indicates the UP values that have an Available Admission Capacity specified in the Available Admission Capacity List field. The format of the Available Admission Capacity Bitmask is defined in Table 9-156.

Each bit in the Available Admission Capacity Bitmask is set to 1 to indicate that the Available Admission Capacity for the corresponding traffic type is present in the Available Admission Capacity List field. The bit is set to 0 to indicate that the Available Admission Capacity for the corresponding traffic type is not present in the Available Admission Capacity List field.

Table 9-156—Available Admission Capacity Bitmask definition

| Bit | Available Admission Capacity Reported |
|-------|---------------------------------------|
| 0 | UP 0 |
| 1 | UP 1 |
| 2 | UP 2 |
| 3 | UP 3 |
| 4 | UP 4 |
| 5 | UP 5 |
| 6 | UP 6 |
| 7 | UP 7 |
| 8 | AC 0 |
| 9 | AC 1 |
| 10 | AC 2 |
| 11 | AC 3 |
| 12–15 | Reserved |

The Available Admission Capacity List comprises a sequence of Available Admission Capacity fields corresponding respectively to the nonzero bits in the Available Admission Capacity Bitmask field.

The Available Admission Capacity field is 2 octets long and contains an unsigned integer that specifies the amount of medium time available using explicit admission control for the corresponding UP or AC traffic, in units of 32 μ s per 1 s. See 11.11.17 for further details.

9.4.2.44 BSS AC Access Delay element

The BSS AC Access Delay element contains an Access Category Access Delay field, as shown in Figure 9-309.

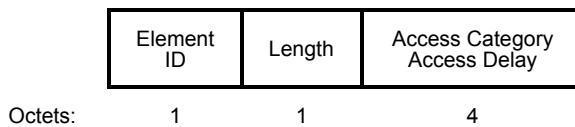

Figure 9-309—BSS AC Access Delay element format

The Element ID and Length fields are defined in 9.4.2.1.

The AC Access Delay field is formatted as four subfields as shown in Figure 9-310. The AC Access Delay is a scalar indication of the average access delay at a QoS AP for services for each of the indicated access categories. If the QoS AP is not currently transmitting any traffic using the indicated AC, the Average Access Delay for that AC is set to 255. The values between 1 and 252 are a scaled representation of the average medium access delay for transmitted frames in the indicated AC measured from the time the EDCA MPDU is ready for transmission (i.e., begins CSMA/CA access) until the actual frame transmission start time. The AC Access Delay values are scaled as follows:

| | |
|----------------|--|
| 0: | Access Delay < 8 μ s |
| 1: | 8 μ s ≤ Access Delay < 16 μ s |
| 2 ≤ n ≤ 14: | $n \times 8 \mu$ s ≤ Access Delay < $(n + 1) \times 8 \mu$ s |
| 15: | 120 μ s ≤ Access Delay < 128 μ s |
| 16: | 128 μ s ≤ Access Delay < 144 μ s |
| 17 ≤ n ≤ 106: | $(n \times 16) - 128 \mu$ s ≤ Access Delay < $((n + 1) \times 16) - 128 \mu$ s |
| 107: | 1584 μ s ≤ Access Delay < 1600 μ s |
| 108: | 1600 μ s ≤ Access Delay < 1632 μ s |
| 109 ≤ n ≤ 246: | $(n \times 32) - 1856 \mu$ s ≤ Access Delay < $((n + 1) \times 32) - 1856 \mu$ s |
| 247: | 6048 μ s ≤ Access Delay < 6080 μ s |
| 248: | 6080 μ s ≤ Access Delay < 8192 μ s |
| 249: | 8192 μ s ≤ Access Delay < 12 288 μ s |
| 250: | 12 288 μ s ≤ Access Delay < 16 384 μ s |
| 251: | 16 384 μ s ≤ Access Delay < 20 480 μ s |
| 252: | 20 480 μ s ≤ Access Delay < 24 576 μ s |
| 253: | 24 576 μ s ≤ Access Delay |
| 254: | Service unable to access channel |
| 255: | Measurement not available |

The values 0–253 indicate Average Access Delay when one or more frames were transmitted during the measurement window. The value 254 indicates that the EDCAF is currently unable to access the channel due to continuous carrier sense mechanism deferral to higher priority AC transmissions and that no frames were transmitted during the measurement window. The QoS AP measures and averages the medium access delay for all transmit frames of the indicated AC using EDCA mechanism over a continuous 30 s measurement window. See 11.11.16 for accuracy requirements.

| Average Access Delay for Best Effort (AC_BE) | Average Access Delay for Background (AC_BK) | Average Access Delay for Video (AC_VI) | Average Access Delay for Voice (AC_VO) |
|--|---|--|--|
| Octets: 1 | 1 | 1 | 1 |

Figure 9-310—Access Category Access Delay subfields

9.4.2.45 RM Enabled Capabilities element

The RM Enabled Capabilities element signals support for radio measurements in a STA. The element is shown in Figure 9-311.

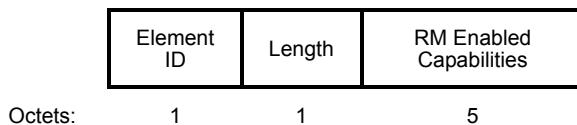

Figure 9-311—RM Enabled Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The RM Enabled Capabilities field is an octet string. Each subfield of this field indicates whether the corresponding capability listed in Table 9-157 is enabled.

Table 9-157—RM Enabled Capabilities definition

| Bit position in the RM Enabled Capabilities field | Field name | Notes |
|---|--|--|
| 0 | Link Measurement Capability Enabled | A STA sets the Link Measurement Capability Enabled field to 1 when dot11RMLinkMeasurementActivated is true and sets it to 0 otherwise. |
| 1 | Neighbor Report Capability Enabled | A STA sets the Neighbor Report Capability Enabled field to 1 when dot11RMNeighborReportActivated is true and sets it to 0 otherwise. |
| 2 | Parallel Measurements Capability Enabled | A STA sets the Parallel Measurements Capability Enabled field to 1 when dot11RMParallelMeasurementsActivated is true and sets it to 0 otherwise. |
| 3 | Repeated Measurements Capability Enabled | A STA sets the Repeated Measurements Capability Enabled field to 1 when dot11RMRepeatedMeasurementsActivated is true and sets it to 0 otherwise. |
| 4 | Beacon Passive Measurement Capability Enabled | A STA sets the Beacon Passive Measurement Capability Enabled field to 1 when dot11RMBeaconPassiveMeasurementActivated is true and sets it to 0 otherwise. |
| 5 | Beacon Active Measurement Capability Enabled | A STA sets the Beacon Active Measurement Capability Enabled field to 1 when dot11RMBeaconActiveMeasurementActivated is true and sets it to 0 otherwise. |
| 6 | Beacon Table Measurement Capability Enabled | A STA sets the Beacon Table Measurement Capability Enabled field to 1 when dot11RMBeaconTableMeasurementActivated is true and sets it to 0 otherwise. |
| 7 | Beacon Measurement Reporting Conditions Capability Enabled | A STA sets the Beacon Measurement Reporting Conditions Capability Enabled field to 1 when dot11RMBeaconMeasurementReportingConditionsActivated is true and sets it to 0 otherwise. |
| 8 | Frame Measurement Capability Enabled | A STA sets the Frame Measurement Capability Enabled field to 1 when dot11RMFrameMeasurementActivated is true and sets it to 0 otherwise. |

Table 9-157—RM Enabled Capabilities definition (continued)

| Bit position in the RM Enabled Capabilities field | Field name | Notes |
|--|---|---|
| 9 | Channel Load Measurement Capability Enabled | A STA sets the Channel Load Measurement Capability Enabled field to 1 when dot11RMChannelLoadMeasurementActivated is true and sets it to 0 otherwise. |
| 10 | Noise Histogram Measurement Capability Enabled | A STA sets the Noise Histogram Measurement Capability Enabled field to 1 when dot11RMNoiseHistogramMeasurementActivated is true and sets it to 0 otherwise. |
| 11 | Statistics Measurement Capability Enabled | A STA sets the Statistics Measurement Capability Enabled field to 1 when dot11RMStatisticsMeasurementActivated is true and sets it to 0 otherwise. |
| 12 | LCI Measurement Capability Enabled | A STA sets the LCI Measurement Capability Enabled field to 1 when dot11RMLCIMeasurementActivated is true and sets it to 0 otherwise. |
| 13 | LCI Azimuth Capability Enabled | A STA sets the LCI Azimuth Capability Enabled field to 1 when dot11RMLCIAzimuthActivated is true and sets it to 0 otherwise. |
| 14 | Transmit Stream/Category Measurement Capability Enabled | A STA sets the Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise. |
| 15 | Triggered Transmit Stream/Category Measurement Capability Enabled | A STA sets the Triggered Transmit Stream/Category Measurement Capability Enabled field to 1 when dot11RMTriggeredTransmitStreamCategoryMeasurementActivated is true and sets it to 0 otherwise. |
| 16 | AP Channel Report Capability Enabled | A STA sets the AP Channel Report Capability Enabled field to 1 when dot11RMAPChannelReportActivated is true and sets it to 0 otherwise. |
| 17 | RM MIB Capability Enabled | A STA sets the RM MIB Capability Enabled field to 1 when dot11RMMIBActivated is true and sets it to 0 otherwise. |
| 18–20 | Operating Channel Max Measurement Duration | A STA sets the Operating Channel Max Measurement Duration field to equal dot11RMMaxMeasurementDuration. See 11.11.4. |
| 21–23 | Nonoperating Channel Max Measurement Duration | A STA sets the Nonoperating Channel Max Measurement Duration field to equal dot11RMNonOperatingChannelMaxMeasurementDuration. See 11.11.4. |
| 24–26 | Measurement Pilot Capability | A STA sets the Measurement Pilot Capability field to equal dot11RMMeasurementPilotActivated. See Table 11-10 in 11.11.15. |
| 27 | Measurement Pilot Transmission Information Capability Enabled | A STA sets the Measurement Pilot Transmission Capability Enabled field to 1 when dot11RMMeasurementPilotTransmissionInformationActivated is true and sets it to 0 otherwise. |
| 28 | Neighbor Report TSF Offset Capability Enabled | A STA sets the Neighbor Report TSF Offset Capability Enabled field to 1 when dot11RMNeighborReportTSFOffsetActivated is true and sets it to 0 otherwise. |

Table 9-157—RM Enabled Capabilities definition (continued)

| Bit position in the RM Enabled Capabilities field | Field name | Notes |
|---|---|--|
| 29 | RCPI Measurement Capability Enabled | A STA sets the RCPI Measurement Capability Enabled field to 1 when dot11RMRCPIMeasurementActivated is true and sets it to 0 otherwise. |
| 30 | RSNI Measurement Capability Enabled | A STA sets the RSNI Measurement Capability Enabled field to 1 when dot11RMRSNIMeasurementActivated is true and sets it to 0 otherwise. |
| 31 | BSS Average Access Delay Capability Enabled | A STA sets the BSS Average Access Delay Capability Enabled field to 1 when dot11RMBSSAverageAccessDelayActivated is true and sets it to 0 otherwise (see NOTE). |
| 32 | BSS Available Admission Capacity Capability Enabled | A STA sets the BSS Available Admission Capacity Capability Enabled field to 1 when dot11RMBSSAvailableAdmissionCapacityActivated is true and sets it to 0 otherwise. |
| 33 | Antenna Capability Enabled | A STA sets the Antenna Capability Enabled field to 1 when dot11RMAntennaInformationActivated is true and sets it to 0 otherwise. |
| 34 | FTM Range Report Capability Enabled | A STA sets the FTM Range Report Capability Enabled field to 1 when dot11RMFineTimingMsmtRangeRepActivated is true and sets it to 0 otherwise. |
| 35 | Civic Location Measurement Capability Enabled | A STA sets the Civic Location Measurement Capability Enabled field to 1 when dot11RMCivicMeasurementActivated is true and sets it to 0 otherwise. |
| 36–39 | Reserved | |

NOTE—At a QoS AP dot11RMBSSAverageAccessDelayActivated is true indicates that the AP BSS AC Access Delay capability is also enabled.

9.4.2.46 Multiple BSSID element

The format of the Multiple BSSID element is shown in Figure 9-312.

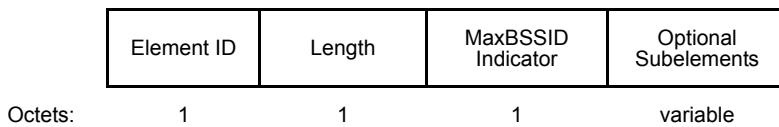

Figure 9-312—Multiple BSSID element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max BSSID Indicator field contains a value assigned to n , where 2^n is the maximum number of BSSIDs in the multiple BSSID set, including the reference BSSID (see 11.11.14). The actual number of BSSIDs in the multiple BSSID set is not explicitly signaled. The BSSID(i) value corresponding to the i^{th} BSSID in the multiple BSSID set is derived from a reference BSSID (REF_BSSID) as follows:

$$\text{BSSID}(i) = \text{BSSID_A} \mid \text{BSSID_B}$$

where

BSSID_A is a BSSID with (48-n) MSBs equal to the (48-n) MSBs of the REF_BSSID and n LSBs equal to 0

BSSID_B is a BSSID with (48-n) MSBs equal to 0 and n LSBs equal to [(n LSBs of REF_BSSID) + i] mod 2ⁿ

When the Multiple BSSID element is transmitted in a Beacon, DMG Beacon, or Probe Response frame, the reference BSSID is the BSSID of the frame. More than one Multiple BSSID element can be included in a Beacon or DMG Beacon frame. The AP or DMG STA determines the number of Multiple BSSID elements. The AP or DMG STA does not fragment a nontransmitted BSSID profile subelement for a single BSSID across two Multiple BSSID elements unless the length of the nontransmitted BSSID profile subelement exceeds 255 octets. When the Multiple BSSID element is transmitted as a subelement in a Neighbor Report element, the reference BSSID is the BSSID field in the Neighbor Report element.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-158.

Table 9-158—Optional subelement IDs for Multiple BSSID

| Subelement ID | Name | Extensible |
|---------------|------------------------------|------------|
| 0 | Nontransmitted BSSID Profile | |
| 1–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The Nontransmitted BSSID Profile subelement contains a list of elements for one or more APs or DMG STAs that have nontransmitted BSSIDs and is defined as follows:

- For each nontransmitted BSSID, the Nontransmitted BSSID Capability element (see 9.4.2.72) is the first element included, followed by a variable number of elements, in the order defined in 9-27.
- The SSID and multiple BSSID-index subelements are included in the Nontransmitted BSSID Profile subelement.
- The FMS Descriptor element is included in the Nontransmitted BSSID Profile subelement if the Multiple BSSID element is included in a Beacon frame and if the TIM field indicates there are buffered group addressed frames for this nontransmitted BSSID.
- The Timestamp and Beacon Interval fields, DSSS Parameter Set, IBSS Parameter Set, Country, Channel Switch Announcement, Extended Channel Switch Announcement, Wide Bandwidth Channel Switch, Transmit Power Envelope, Supported Operating Classes, IBSS DFS, ERP Information, HT Capabilities, HT Operation, VHT Capabilities, and VHT Operation elements are not included in the Nontransmitted BSSID Profile subelement; the values of these elements for each nontransmitted BSSID are always the same as the corresponding transmitted BSSID element values.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of optional subelements.

The Multiple BSSID element is included in Beacon frames (as described in 9.3.3.3), in DMG Beacon frames (as described in 9.3.4.2), and Probe Response frames (as described in 9.3.3.11). The use of the Multiple BSSID element is described in 11.11.14. Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

9.4.2.47 Mobility Domain element (MDE)

The MDE contains the MDID (Mobility Domain Identifier) field and the FT Capability and Policy field. The AP uses the MDE to advertise that it is included in the group of APs that constitute a mobility domain, to advertise its support for FT capability, and to advertise its FT policy information. The format for this element is given in Figure 9-313.

| | | | |
|---------|---|---|---|
| Octets: | 1 | 1 | 2 |
| | | | 1 |

Figure 9-313—Mobility Domain element format

The Element ID and Length fields are defined in 9.4.2.1.

The MDID field is a 2-octet value that follows the ordering conventions defined in 9.2.2.

The FT Capability and Policy field is 1 octet. The FT Capability and Policy field is defined in Figure 9-314.

| | | | |
|-----------------------------|--------------------------------------|----------|----|
| B0 | B1 | B2 | B7 |
| Fast BSS Transition over DS | Resource Request Protocol Capability | Reserved | |
| Bits: | 1 | 1 | 6 |

Figure 9-314—FT Capability and Policy field

Bits 0–1 of the FT Capability and Policy field control the behavior of STAs performing fast BSS transitions (see 13.3). The STA might use information from the MDE to determine the transition methods recommended by the AP and protocols supported by the AP. The choice of executing any specific transition method is outside the scope of this standard.

If the Resource Request Protocol Capability subfield is 1, then the STA might perform the FT resource request protocol as described in 13.6.

When sent by a STA to a target AP, the FT Capability and Policy field matches the value advertised by that target AP. See 13.8.

9.4.2.48 Fast BSS Transition element (FTE)

The FTE includes information needed to perform the FT authentication sequence during a fast BSS transition in an RSN. This element is shown in Figure 9-315.

| | | | | | | | |

| | | | | | | | |

Figure 9-315—FTE format

The Element ID and Length fields are defined in 9.4.2.1.

The MIC Control field is two octets and is defined in Figure 9-316.

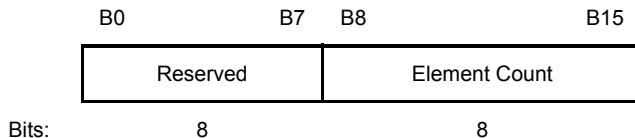

Figure 9-316—MIC Control field

The Element Count subfield of the MIC Control field contains the number of elements that are included in the message integrity code (MIC) calculation. A value of 0 indicates no MIC is present.

The MIC field contains a MIC that is calculated using the algorithm specified in 13.8.4 and 13.8.5.

The ANonce field contains a value chosen by the R1KH. It is encoded following the conventions in 9.2.2.

The SNonce field contains a value chosen by the S1KH. It is encoded following the conventions in 9.2.2.

The format of the Optional Parameter(s) field is shown in Figure 9-317.

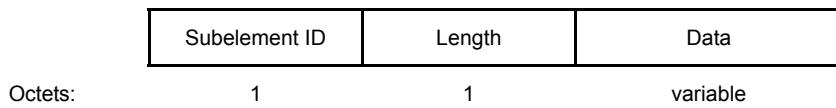

Figure 9-317—Optional Parameter(s) field

The Subelement ID field is defined in Table 9-159:

Table 9-159—Subelement IDs

| Value | Contents of Data field |
|-------|--|
| 0 | Reserved |
| 1 | PMK-R1 key holder identifier (R1KH-ID) |
| 2 | GTK subelement |
| 3 | PMK-R0 key holder identifier (R0KH-ID) |
| 4 | IGTK |
| 5–255 | Reserved |

R1KH-ID indicates the identity of the R1KH, which is used by the S0KH and the R0KH for deriving the PMK-R1s. It is encoded following the conventions in 9.2.2.

The GTK subelement contains the group temporal key, which is encrypted (see procedures in 13.8.5) and is defined in Figure 9-318.

| Subelement ID | Length | Key Info | Key Length | RSC | Wrapped Key |
|---------------|--------|----------|------------|-----|-------------|
| Octets: | 1 | 1 | 2 | 1 | 8 24–40 |

Figure 9-318—GTK subelement format

The GTK subelement Key Info subfield is defined in Figure 9-319.

| | | | |
|--------|----|----------|-----|
| B0 | B1 | B2 | B15 |
| Key ID | | Reserved | |
| Bits: | 2 | 14 | |

Figure 9-319—GTK subelement's Key Info subfield

Key Length field is the length of the Key field in octets, not including any padding (see 13.8.5).

RSC field contains the receive sequence counter (RSC) for the GTK being installed. Delivery of the RSC field value allows a STA to identify replayed MPDUs. If the RSC field value is less than 8 octets in length, the remaining octets are set to 0. The least significant octet of the transmit sequence counter (TSC) or packet number (PN) is in the first octet of the RSC field. See Table 12-5.

For WEP, the RSC value is reserved.

The Wrapped Key field contains the encrypted GTK as described in 13.8.5.

When sent by a non-AP STA, the R0KH-ID indicates the R0KH with which the S0KH negotiated the PMK-R0 it is using for this transition. When sent by an AP, the R0KH-ID indicates the R0KH that the S0KH will be using to generate a PMK-R0 security association. It is encoded following the conventions from 9.2.2.

The IGTK field contains the Integrity GTK, used for protecting robust Management frames. The IGTK subelement format is shown in Figure 9-320.

| Subelement ID | Length | Key ID | IPN | Key Length | Wrapped Key |
|---------------|--------|--------|-----|------------|-------------|
| Octets: | 1 | 1 | 2 | 6 | 1 24 |

Figure 9-320—IGTK subelement format

The Key ID field indicates the value of the BIP key identifier.

The IPN field indicates the receive sequence counter for the IGTK being installed, to allow a STA to identify replayed protected group addressed robust Management frames.

The Key Length field is the length of IGTK in octets, not including any padding (see 13.8.5).

The Wrapped Key field contains the wrapped IGTK being distributed. The length of the resulting AES-Key-wrapped IGTK in the Wrapped Key field is Key Length + 8 octets.

9.4.2.49 Timeout Interval element (TIE)

The TIE specifies time intervals and timeouts. Figure 9-321 shows this element.

| Element ID | Length | Timeout Interval Type | Timeout Interval Value |
|------------|--------|-----------------------|------------------------|
| Octets: | 1 | 1 | 1 4 |

Figure 9-321—TIE format

The Element ID and Length fields are defined in 9.4.2.1.

The Timeout Interval Type field is defined in Table 9-160.

Table 9-160—Timeout Interval Type field value

| Timeout Interval Type | Meaning | Units |
|-----------------------|---------------------------------|------------------|
| 0 | Reserved | |
| 1 | Reassociation deadline interval | Time units (TUs) |
| 2 | Key lifetime interval | Seconds |
| 3 | Association Comeback time | Time units (TUs) |
| 4 | Time-to-Start (see 11.33.2.1) | Time units (TUs) |
| 5–255 | Reserved | |

The Timeout Interval Value field contains an unsigned 32-bit integer. It is encoded according to the conventions in 9.2.2.

A reassociation deadline interval value of 0 indicates no deadline exists. A key lifetime interval value of 0 is reserved.

9.4.2.50 RIC Data element (RDE)

The RIC refers to a collection of elements that are used to express a resource request and to convey responses to the corresponding requests.

A RIC is a sequence of one or more Resource Requests, or a sequence of one or more Resource Responses. Each Resource Request or Response consists of an RDE, followed by one or more elements that describe that resource. See 13.11 for examples and procedures.

The RDE format is shown in Figure 9-322.

| Element ID | Length | RDE Identifier | Resource Descriptor Count | Status Code |
|------------|--------|----------------|---------------------------|-------------|
| Octets: | 1 | 1 | 1 1 | 2 |

Figure 9-322—RDE format

The Element ID and Length fields are defined in 9.4.2.1.

The RDE Identifier field has an arbitrary 8-bit value, chosen by the resource requester to uniquely identify the RDE within the RIC.

The Resource Descriptor Count field indicates the number of alternative Resource Descriptors that follow this RDE.

The Status Code field is used in Resource Responses to indicate the result of the request. Valid values for the Status Code field are given in 9.4.1.9. When an RDE is included in a Resource Request, the Status Code field is reserved.

9.4.2.51 RIC Descriptor element

The RIC Descriptor element is used with an RDE during a fast BSS transition to negotiate resources that are not otherwise described by elements. See 13.11 for procedures for including this element in a RIC.

Figure 9-323 shows the format of this element.

| | | | | |
|---------|---|---|---|----------|
| Octets: | 1 | 1 | 1 | variable |
|---------|---|---|---|----------|

Figure 9-323—RIC Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The Resource Type field is defined in Table 9-161.

Table 9-161—Resource type code in RIC Descriptor element

| Resource type value | Meaning | Variable parameters |
|---------------------|-----------|---|
| 1 | Block Ack | Block Ack Parameter Set field value as defined in 9.4.1.14, Block Ack Timeout field value as defined in 9.4.1.15, and Block Ack Starting Sequence Control subfield value as defined in 9.3.1.8. |
| 0, 2–255 | Reserved | |

Variable parameters contain any additional data based on the resource type.

9.4.2.52 DSE Registered Location element

A DSE Registered Location element includes DSE location configuration information (LCI), which contains latitude, longitude, and altitude information. The DSE Registered Location element format is shown in Figure 9-324.

| | | | |
|---|---|---|----|
| Octets: | 1 | 1 | 20 |
| Element ID Length DSE Registered Location Information | | | |

Figure 9-324—DSE Registered Location element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure and information fields are based on the LCI format described in IETF RFC 6225.

The DSE Registered Location Information field is shown in Figure 9-325.

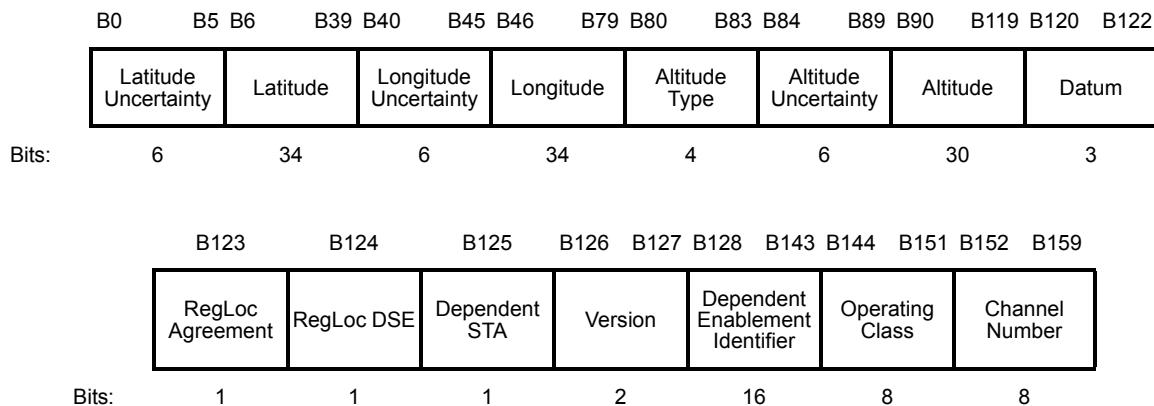

Figure 9-325—DSE Registered Location Information field format

The fields within the DSE Registered Location Information field are defined in Section 2.2 of IETF RFC 6225 (July 2011) except as defined in this standard.

With an Altitude Type field value of 3 (i.e., height above ground is in meters), the altitude is defined to be in meters and is formatted in 2s complement, fixed-point, 22-bit integer part with 8-bit fraction.

The Datum field is a 3-bit field defined in IETF RFC 6225, and the codes used are as defined in IETF RFC 6225.

The RegLoc Agreement bit field is set to 1 to report that the STA is operating within a national policy area or an international agreement area near a national border (see 11.12.3); otherwise, it is 0.

The RegLoc DSE bit field is set to 1 to report that the enabling STA is enabling the operation of STAs with DSE; otherwise, it is 0.

The Dependent STA bit field is set to 1 to report that the STA is operating with the enablement of the enabling STA whose LCI is being reported; otherwise, it is 0.

The Version field is a 2-bit field defined in IETF RFC 6225, and the use is described in IETF RFC 6225.

The Dependent Enablement Identifier field is a 16-bit field with a value set by the enabling STA via the DSE Enablement frame; otherwise, it is set to 0.

The Operating Class field indicates the channel set for which the enablement request, report, or announcement applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the report applies. Valid values for the Operating Class field are shown in Annex E.

The Channel Number field indicates the channel number for which the enablement request, report, or announcement applies. The channel number is defined within an operating class as shown in Annex E.

9.4.2.53 Extended Channel Switch Announcement element

The Extended Channel Switch Announcement element is used by an AP, IBSS STA, or mesh STA to advertise when the BSS is changing to a new channel or a new channel in a new operating class. The announcement includes both the operating class and the channel number of the new channel. The element is present only when an extended channel switch is pending. The format of the Extended Channel Switch Announcement element is shown in Figure 9-326.

| Element ID | Length | Channel Switch Mode | New Operating Class | New Channel Number | Channel Switch Count |
|------------|--------|---------------------|---------------------|--------------------|----------------------|
| Octets: | 1 | 1 | 1 | 1 | 1 |

Figure 9-326—Extended Channel Switch Announcement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Channel Switch Mode field indicates any restrictions on transmission until a channel switch. An AP or an IBSS STA sets the Channel Switch Mode field to either 0 or 1 on transmission as specified in 11.9.8.2 and 11.9.8.3. The Channel Switch Mode field is reserved in an MBSS.

The New Operating Class field is set to the number of the operating class after the channel switch, as defined in Annex E.

The New Channel Number field is set to the number of the channel after the channel switch. The channel number is a channel from the STA's new operating class as defined in Annex E.

For nonmesh STAs, the Channel Switch Count field indicates either the number of target beacon transmission times (TBTTs) until the STA sending the Channel Switch Count field switches to the new channel or a value of 0. A value of 1 indicates that the switch occurs immediately before the next TBTT. A value of 0 indicates that the switch occurs any time after the frame containing the Channel Switch Count field is transmitted.

For mesh STAs, the Channel Switch Count field is encoded as an octet with bits 6 to 0 set to the time, in units of 2 TU when the MSB (bit 7) is 0, or in units of 100 TU when the MSB (bit 7) is 1, until the mesh STA sending the Channel Switch Count field switches to the new channel. A value of 0 for bits 6 to 0 indicates that the switch occurs at any time after the frame containing the Channel Switch Count field is transmitted. For example, a 200 TU channel switch time is encoded as X'82' and a 10 TU channel switch time is encoded as X'05'.

9.4.2.54 Supported Operating Classes element

The Supported Operating Classes element is used by a STA to advertise the operating classes that it is capable of operating with in this country. The format of the Supported Operating Classes element is shown in Figure 9-327.

| Element ID | Length | Current Operating Class | Operating Classes | Current Operating Class Extension Sequence (optional) | Operating Class Duple Sequence (optional) |
|------------|--------|-------------------------|-------------------|---|---|
| Octets: | 1 | 1 | variable | variable | variable |

Figure 9-327—Supported Operating Classes element format

The Element ID and Length fields are defined in 9.4.2.1.

The Current Operating Class field, concatenated with the Current Operating Class Extension field within the Current Operating Class Extension Sequence field if present, indicates the operating class in use for transmission and reception. If the operating class in use is a single octet, the Current Operating Class Extension Sequence field is not present. If the operating class in use is more than a single octet, then the Current Operating Class Extension Sequence field is present, and the concatenation of the Current Operating Class field with the Current Operating Class Extension Sequence field comprises N (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E).

The Operating Classes field lists, in descending order of preference, all single-octet operating classes that the STA is capable of operating with in this country. The Operating Classes field terminates immediately before a OneHundredAndThirty Delimiter (see Figure 9-328), a Zero Delimiter (see Figure 9-329), or the end of the element.

The format of the optional Current Operating Class Extension Sequence field is shown in Figure 9-328.

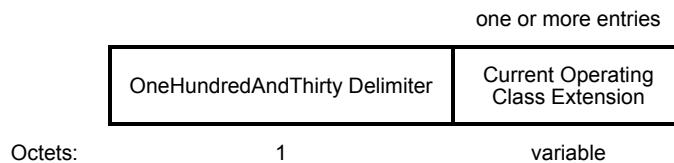

Figure 9-328—Current Operating Class Extension Sequence field format

The OneHundredAndThirty Delimiter field is set to 130.

The Current Operating Class Extension field comprises N (where $N \geq 0$) Operating Class octets with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E).

The format of the Operating Class Duple Sequence field is shown in Figure 9-329.

Figure 9-329—Operating Class Duple Sequence field format

The Zero Delimiter is set to 0.

The Operating Class Duple List subfield lists all two-octet operating classes that the STA is capable of operating with in this country. Each operating class in the Operating Class Duple List subfield contains an Operating Class octet with an 80+ behavior limit followed by one Operating Class octet without an 80+ behavior limit (as defined in Annex E). Operating classes are transmitted in ascending order using the first octet in the operating class as the primary sort key and then the second octet in the operating class as the secondary sort key. If there are no two-octet operating classes that the STA is capable of operating with in this country, then the Operating Class Duple Sequence field is omitted from the Supported Operating Classes element. The Operating Class Duple List subfield terminates immediately before another zero octet or the end of the element.

The use of this element is described in 11.10.2 and 11.11.9.1.

9.4.2.55 Management MIC element

The Management MIC element (MME) provides message integrity and protects group addressed robust Management frames from forgery and replay. Figure 9-330 shows the MME format.

| | | | | | |
|---------|------------|--------|--------|-----|---------|
| Octets: | 1 | 1 | 2 | 6 | 8 or 16 |
| | Element ID | Length | Key ID | IPN | MIC |

Figure 9-330—Management MIC element format

The Element ID and Length fields are defined in 9.4.2.1.

The Key ID field identifies the IGTK used to compute the MIC. Bits 0–11 define a value in the range 0–4095. Bits 12–15 are reserved. The IGTK Key ID is either 4 or 5. The remaining Key IDs are reserved.

The IPN field contains a 6 octet value, interpreted as a 48-bit unsigned integer and used to detect replay of protected group addressed robust Management frames.

The MIC field contains a message integrity code calculated over the robust Management frame as specified in 12.5.4.5 and 12.5.4.6. The length of the MIC field depends on the specific cipher negotiated and is either 8 octets (for BIP-CMAC-128) or 16 octets (for BIP-CMAC-256, BIP-GMAC-128, and BIP-GMAC-256).

9.4.2.56 HT Capabilities element

9.4.2.56.1 HT Capabilities element structure

An HT STA declares that it is an HT STA by transmitting the HT Capabilities element.

The HT Capabilities element contains a number of fields that are used to advertise optional HT capabilities of an HT STA. The HT Capabilities element is present in Beacon, Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request, Probe Response, Mesh Peering Open, and Mesh Peering Close frames. The HT Capabilities element is defined in Figure 9-331.

| | | | | | | | | |
|---------|------------|--------|---------------------------|-------------------|-------------------|--------------------------|-----------------------------------|-------------------|
| Octets: | 1 | 1 | 2 | 1 | 16 | 2 | 4 | 1 |
| | Element ID | Length | HT Capability Information | A-MPDU Parameters | Supported MCS Set | HT Extended Capabilities | Transmit Beamforming Capabilities | ASEL Capabilities |

Figure 9-331—HT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

9.4.2.56.2 HT Capability Information field

The HT Capability Information field of the HT Capabilities element is 2 octets in length, and contains capability information bits. The structure of this field is defined in Figure 9-332.

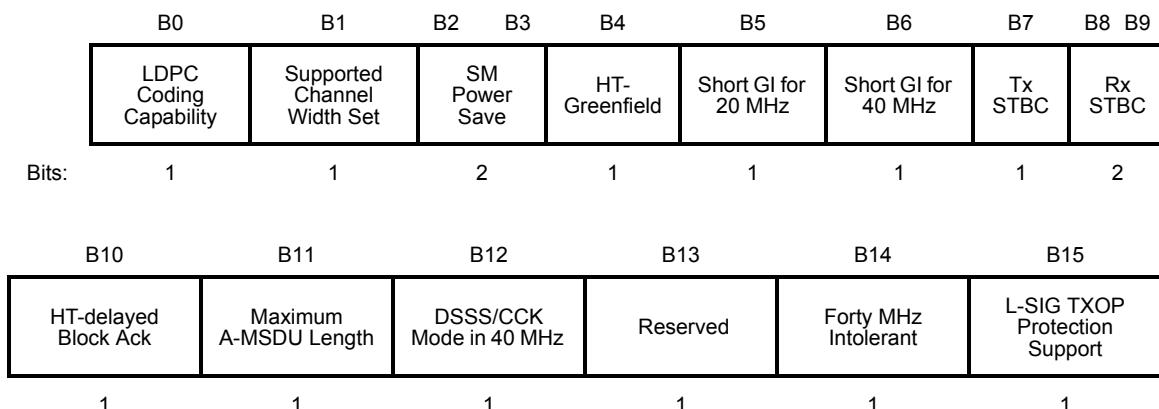

Figure 9-332—HT Capability Information field

The subfields of the HT Capability Information field are defined in Table 9-162.

Table 9-162—Subfields of the HT Capability Information field

| Subfield | Definition | Encoding |
|-----------------------------|--|---|
| LDPC Coding Capability | Indicates support for receiving LDPC coded packets | Set to 0 if not supported Set to 1 if supported |
| Supported Channel Width Set | Indicates the channel widths supported by the STA. See 11.16. | Set to 0 if only 20 MHz operation is supported Set to 1 if both 20 MHz and 40 MHz operation is supported This field is reserved when the transmitting or receiving STA is operating in an operating class that includes 20 in the Channel spacing (MHz) column of the appropriate table in Annex E. |
| SM Power Save | Indicates the spatial multiplexing power save mode that is in operation immediately after (re)association. See 11.2.6. | Set to 0 for static SM power save mode Set to 1 for dynamic SM power save mode Set to 3 for SM power save disabled or not supported The value 2 is reserved Only valid in a (Re)Association Request frame sent to an AP. Otherwise this subfield is set to 0 or 3 upon transmission and is ignored upon reception. NOTE—This subfield indicates the operational state immediately after (re)association as well as (if not set to 3) a capability. |
| HT-Greenfield | Indicates support for the reception of PPDUs with HT-greenfield format. See 19.1.4. | Set to 0 if not supported Set to 1 if supported |
| Short GI for 20 MHz | Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW20 | Set to 0 if not supported Set to 1 if supported |

Table 9-162—Subfields of the HT Capability Information field (continued)

| Subfield | Definition | Encoding |
|-------------------------------|---|---|
| Short GI for 40 MHz | Indicates short GI support for the reception of packets transmitted with TXVECTOR parameter CH_BANDWIDTH equal to HT_CBW40 | Set to 0 if not supported Set to 1 if supported |
| Tx STBC | Indicates support for the transmission of PPDUs using STBC | Set to 0 if not supported Set to 1 if supported |
| Rx STBC | Indicates support for the reception of PPDUs using STBC | Set to 0 for no support Set to 1 for support of one spatial stream Set to 2 for support of one and two spatial streams Set to 3 for support of one, two and three spatial streams |
| HT-delayed Block Ack | Indicates support for HT-delayed block ack operation. See 10.24.8. | Set to 0 if not supported Set to 1 if supported Support indicates that the STA is able to accept an ADDBA request for HT-delayed Block Ack |
| Maximum A-MSDU Length | Indicates maximum A-MSDU length. See 10.12. | Set to 0 for 3839 octets Set to 1 for 7935 octets |
| DSSS/CCK Mode in 40 MHz | Indicates use of DSSS/CCK mode in a 20/40 MHz BSS. See 11.16. | In Beacon and Probe Response frames: Set to 0 if the BSS does not allow use of DSSS/CCK in 40 MHz Set to 1 if the BSS does allow use of DSSS/CCK in 40 MHz Otherwise: Set to 0 if the STA does not use DSSS/CCK in 40 MHz Set to 1 if the STA uses DSSS/CCK in 40 MHz See 11.16.8 for operating rules |
| Forty MHz Intolerant | Indicates whether APs receiving this information or reports of this information are required to prohibit 40 MHz transmissions (see 11.16.12). | Set to 1 by an HT STA to prohibit a receiving AP from operating that AP's BSS as a 20/40 MHz BSS; otherwise, set to 0. |
| L-SIG TXOP Protection Support | Indicates support for the L-SIG TXOP protection mechanism (see 10.26.5) | Set to 0 if not supported Set to 1 if supported |

The following subfields are reserved for a mesh STA: Tx STBC, Rx STBC.

9.4.2.56.3 A-MPDU Parameters field

The structure of the A-MPDU Parameters field of the HT Capabilities element is shown in Figure 9-333.

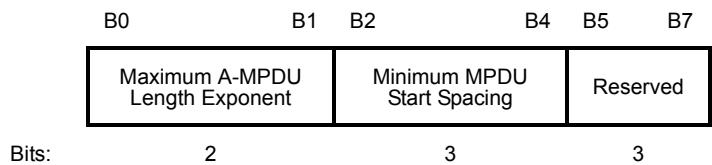

Figure 9-333—A-MPDU Parameters field

The subfields of the A-MPDU Parameters field are defined in Table 9-163.

Table 9-163—Subfields of the A-MPDU Parameters field

| Subfield | Definition | Encoding |
|--------------------------------|---|--|
| Maximum A-MPDU Length Exponent | Indicates the maximum length of A-MPDU that the STA can receive. | This field is an integer in the range 0 to 3. The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets. |
| Minimum MPDU Start Spacing | Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. See 10.13.3. | Set to 0 for no restriction Set to 1 for 1/4 μ s Set to 2 for 1/2 μ s Set to 3 for 1 μ s Set to 4 for 2 μ s Set to 5 for 4 μ s Set to 6 for 8 μ s Set to 7 for 16 μ s |

9.4.2.56.4 Supported MCS Set field

The Supported MCS Set field of the HT Capabilities element indicates which HT MCSs a STA supports.

An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 76. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the HT PHY, see 19.5.

The structure of the MCS Set field is defined in Figure 9-334.

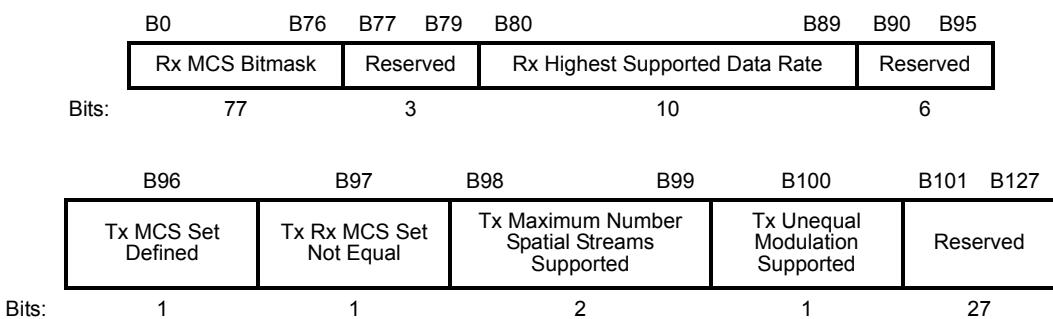

Figure 9-334—Supported MCS Set field

The Rx MCS Bitmask subfield of the Supported MCS Set field defines a set of MCS index values, where bit B0 corresponds to MCS 0 and bit B76 corresponds to MCS 76.

NOTE—An HT STA includes the mandatory MCS values defined in 19.1 in the Rx MCS Bitmask subfield.

The Rx Highest Supported Data Rate subfield of the Supported MCS Set field defines the highest HT PPDU data rate that the STA is able to receive, in units of 1 Mb/s in the range 1 to 1023. If the maximum data rate expressed in Mb/s is not an integer, then the value is rounded down to the next integer. The value 0 indicates that this subfield does not specify the HT PPDU highest data rate that the STA is able to receive; see 10.7.6.5.3.

The Tx MCS Set Defined, Tx Rx MCS Set Not Equal, Tx Maximum Number Spatial Streams Supported, and Tx Unequal Modulation Supported subfields of the Supported MCS Set field indicate the transmit-supported MCS set, as defined in Table 9-164.

Table 9-164—Transmit MCS Set

| Condition | Tx MCS Set Defined | Tx Rx MCS Set Not Equal | Tx Maximum Number Spatial Streams Supported | Tx Unequal Modulation Supported |
|--|--------------------|-------------------------|---|--|
| No Tx MCS set is defined | 0 | 0 | 0 | 0 |
| The Tx MCS set is defined and is equal to the Rx MCS set | 1 | 0 | 0 | 0 |
| The Tx MCS set is defined and is not necessarily equal to the Rx MCS set | 1 | 1 | Indicates the maximum number of spatial streams supported when transmitting: Set to 0 for 1 spatial stream Set to 1 for 2 spatial streams Set to 2 for 3 spatial streams Set to 3 for 4 spatial streams | Indicates whether transmit unequal modulation (UEQM) is supported: Set to 0 for UEQM not supported Set to 1 for UEQM supported |

9.4.2.56.5 HT Extended Capabilities field

The structure of the HT Extended Capabilities field of the HT Capabilities element is defined in Figure 9-335.

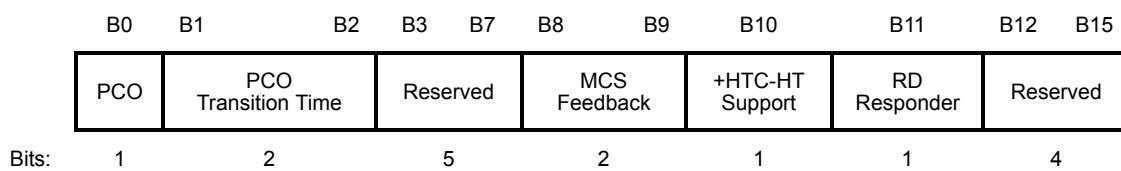

Figure 9-335—HT Extended Capabilities field

The subfields of the HT Extended Capabilities field are defined in Table 9-165.

Table 9-165—Subfields of the HT Extended Capabilities field

| Subfield | Definition | Encoding |
|---------------------|---|---|
| PCO | <p>Indicates support for PCO.</p> <p>When transmitted by an AP: indicates whether the AP can operate its BSS as a PCO BSS.</p> <p>When transmitted by a non-AP STA: indicates whether the STA can operate as a PCO active STA when the Transition Time subfield in its HT Extended Capabilities field meets the intended transition time of the PCO capable AP.</p> <p>The PCO mechanism is obsolete. Consequently, this subfield might be reserved in a later revision of this standard.</p> | <p>Set to 0 if not supported Set to 1 if supported</p> |
| PCO Transition Time | <p>When transmitted by a non-AP STA: indicates that the STA can switch between 20 MHz channel width and 40 MHz channel width within the specified time.</p> <p>When transmitted by an AP: indicates the PCO Transition Time to be used during PCO operation. The value contained in this field is dynamic when transmitted by an AP, i.e., the value of this field might change at any time during the lifetime of the association of a STA with the AP. See 11.17.3.</p> | <p>If the PCO subfield is equal to 0, this field is reserved.</p> <p>Otherwise:</p> <ul style="list-style-type: none"> Set to 1 for 400 μs Set to 2 for 1.5 ms Set to 3 for 5 ms <p>Set to 0 for no transition. In this case, the PCO active STA does not change its operating channel width and is able to receive 40 MHz PPDUs during the 20 MHz phase (see 11.17).</p> |
| MCS Feedback | Indicates whether the STA can provide MFB | <p>Set to 0 (No Feedback) if the STA does not provide MFB</p> <p>Set to 2 (Unsolicited) if the STA provides only unsolicited MFB</p> <p>Set to 3 (Both) if the STA can provide MFB in response to MRQ (either Delayed or Immediate, see 10.31.1) as well as unsolicited MFB</p> <p>The value 1 is reserved</p> |
| +HTC-HT Support | Indicates support of the HT variant HT Control field. See 10.9 | <p>Set to 0 if not supported Set to 1 if supported</p> |
| RD Responder | Indicates support for acting as a reverse direction responder, i.e., the STA might use an offered RDG to transmit data to an RD initiator using the reverse direction protocol described in 10.28. | <p>Set to 0 if not supported Set to 1 if supported</p> |

The following subfield is reserved for a mesh STA: PCO.

9.4.2.56.6 Transmit Beamforming Capabilities

The structure of the Transmit Beamforming Capabilities field is defined in Figure 9-336.

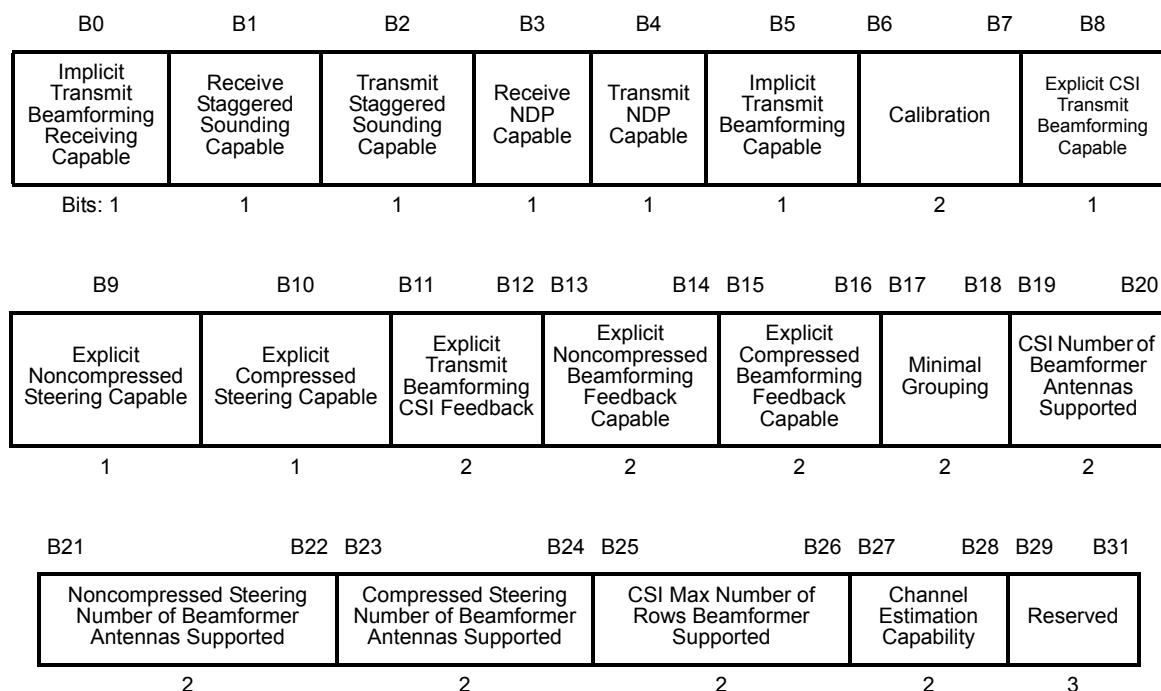

Figure 9-336—Transmit Beamforming Capabilities field

The subfields of the Transmit Beamforming Capabilities field are defined in Table 9-166.

Table 9-166—Subfields of the Transmit Beamforming Capabilities field

| Subfield | Definition | Encoding |
|---|--|--|
| Implicit Transmit Beamforming Receiving Capable | Indicates whether this STA can receive Transmit Beamforming steered frames using implicit feedback | Set to 0 if not supported Set to 1 if supported |
| Receive Staggered Sounding Capable | Indicates whether this STA can receive staggered sounding frames. | Set to 0 if not supported Set to 1 if supported |
| Transmit Staggered Sounding Capable | Indicates whether this STA can transmit staggered sounding frames. | Set to 0 if not supported Set to 1 if supported |
| Receive NDP Capable | Indicates whether this receiver can interpret null data packets as sounding frames. | Set to 0 if not supported Set to 1 if supported |
| Transmit NDP Capable | Indicates whether this STA can transmit null data packets as sounding frames. | Set to 0 if not supported Set to 1 if supported |
| Implicit Transmit Beamforming Capable | Indicates whether this STA can apply implicit transmit beamforming. | Set to 0 if not supported Set to 1 if supported |

Table 9-166—Subfields of the Transmit Beamforming Capabilities field (continued)

| Subfield | Definition | Encoding |
|--|---|--|
| Calibration | Indicates whether the STA can participate in a calibration procedure initiated by another STA that is capable of generating an immediate response sounding PPDU and can provide a CSI report in response to the receipt of a sounding PPDU. | Set to 0 if not supported Set to 1 if the STA can respond to a calibration request using the CSI report, but cannot initiate calibration The value 2 is reserved Set to 3 if the STA can both initiate and respond to a calibration request |
| Explicit CSI Transmit Beamforming Capable | Indicates whether this STA can apply transmit beamforming using CSI explicit feedback in its transmission | Set to 0 if not supported Set to 1 if supported |
| Explicit Noncompressed Steering Capable | Indicates whether this STA can apply transmit beamforming using noncompressed beamforming feedback matrix explicit feedback in its transmission | Set to 0 if not supported Set to 1 if supported |
| Explicit Compressed Steering Capable | Indicates whether this STA can apply transmit beamforming using compressed beamforming feedback matrix explicit feedback in its transmission | Set to 0 if not supported Set to 1 if supported |
| Explicit Transmit Beamforming CSI Feedback | Indicates whether this receiver can return CSI explicit feedback. | Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback |
| Explicit Noncompressed Beamforming Feedback Capable | Indicates whether this receiver can return noncompressed beamforming feedback matrix explicit feedback. | Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback |
| Explicit Compressed Beamforming Feedback Capable | Indicates whether this receiver can return compressed beamforming feedback matrix explicit feedback. | Set to 0 if not supported Set to 1 for delayed feedback Set to 2 for immediate feedback Set to 3 for delayed and immediate feedback |
| Minimal Grouping | Indicates the minimal grouping used for explicit feedback reports | Set to 0 if the STA supports groups of 1 (no grouping) Set to 1 indicates groups of 1, 2 Set to 2 indicates groups of 1, 4 Set to 3 indicates groups of 1, 2, 4 |
| CSI Number of Beamformer Antennas Supported | Indicates the maximum number of beamformer antennas the HT beamformee can support when CSI feedback is required | Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding |
| Noncompressed Steering Number of Beamformer Antennas Supported | Indicates the maximum number of beamformer antennas the HT beamformee can support when noncompressed beamforming feedback matrix is required | Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding |

Table 9-166—Subfields of the Transmit Beamforming Capabilities field (continued)

| Subfield | Definition | Encoding |
|---|--|---|
| Compressed Steering Number of Beamformer Antennas Supported | Indicates the maximum number of beamformer antennas the HT beamformee can support when compressed beamforming feedback matrix is required | Set to 0 for single Tx antenna sounding Set to 1 for 2 Tx antenna sounding Set to 2 for 3 Tx antenna sounding Set to 3 for 4 Tx antenna sounding |
| CSI Max Number of Rows Beamformer Supported | Indicates the maximum number of rows of CSI explicit feedback from the HT beamformee or calibration responder or transmit ASEL responder that an HT beamformer or calibration initiator or transmit ASEL initiator can support when CSI feedback is required. | Set to 0 for a single row of CSI Set to 1 for 2 rows of CSI Set to 2 for 3 rows of CSI Set to 3 for 4 rows of CSI |
| Channel Estimation Capability | Indicates the maximum number of space-time streams (columns of the MIMO channel matrix) for which channel dimensions can be simultaneously estimated when receiving an NDP sounding PPDU or the extension portion of the HT Long Training fields (HT-LTFs) in a staggered sounding PPDU. See NOTE. | Set 0 for 1 space-time stream Set 1 for 2 space-time streams Set 2 for 3 space-time streams Set 3 for 4 space-time streams |

NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.

9.4.2.56.7 ASEL Capability field

The structure of the ASEL Capability field of the HT Capabilities element is defined in Figure 9-337.

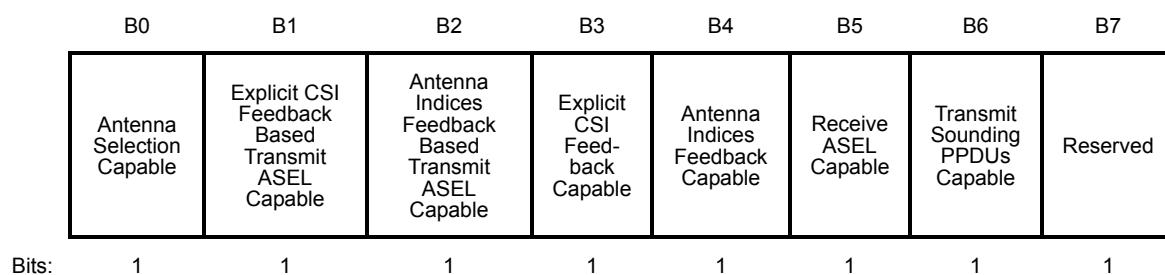

Figure 9-337—ASEL Capability field

The subfields of the ASEL Capability field are defined in Table 9-167.

Table 9-167—ASEL Capability field subfields

| Subfield | Definition | Encoding |
|--|--|--|
| Antenna Selection Capable | Indicates whether this STA supports ASEL | Set to 0 if not supported Set to 1 if supported |
| Explicit CSI Feedback Based Transmit ASEL Capable | Indicates whether this STA supports transmit ASEL based on explicit CSI feedback | Set to 0 if not supported Set to 1 if supported |
| Antenna Indices Feedback Based Transmit ASEL Capable | Indicates whether this STA supports transmit ASEL based on antenna indices feedback | Set to 0 if not supported Set to 1 if supported |
| Explicit CSI Feedback Capable | Indicates whether this STA can compute CSI and provide CSI feedback in support of ASEL | Set to 0 if not supported Set to 1 if supported |
| Antenna Indices Feedback Capable | Indicates whether this STA can compute an antenna indices selection and return an antenna indices selection in support of ASEL | Set to 0 if not supported Set to 1 if supported |
| Receive ASEL Capable | Indicates whether this STA supports receive ASEL | Set to 0 if not supported Set to 1 if supported |
| Transmit Sounding PPDUs Capable | Indicates whether this STA can transmit sounding PPDUs for ASEL training on request | Set to 0 if not supported Set to 1 if supported |

9.4.2.57 HT Operation element

The operation of HT STAs in the BSS is controlled by the HT Operation element. The structure of this element is defined in Figure 9-338.

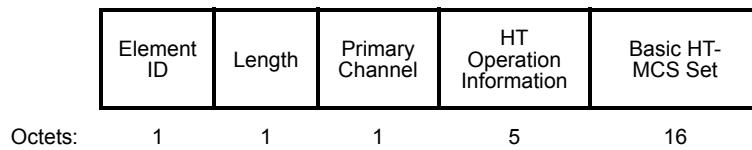

Figure 9-338—HT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the HT Operation Information field is shown in Figure 9-339.

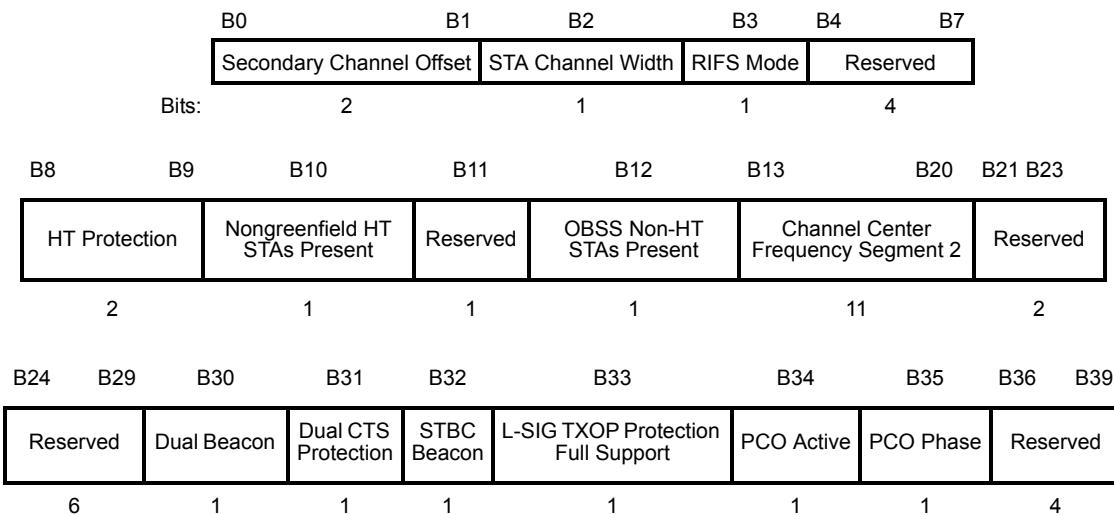

Figure 9-339—HT Operation Information field

The Primary Channel field, subfields of the HT Operation Information field, and the Basic HT-MCS Set field are defined in Table 9-168. The “Reserved in IBSS?” column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an IBSS. The “Reserved in MBSS?” column indicates whether each field is reserved (Y) or not reserved (N) when this element is present in a frame transmitted within an MBSS.

Table 9-168—HT Operation element fields and subfields

| Field | Definition | Encoding | Reserved in IBSS? | Reserved in MBSS? |
|--------------------------|---|---|-------------------|-------------------|
| Primary Channel | Indicates the channel number of the primary channel. See 11.16.2. | Channel number of the primary channel | N | N |
| Secondary Channel Offset | Indicates the offset of the secondary channel relative to the primary channel. | Set to 1 (SCA) if the secondary channel is above the primary channel Set to 3 (SCB) if the secondary channel is below the primary channel Set to 0 (SCN) if no secondary channel is present The value 2 is reserved | N | N |
| STA Channel Width | Defines the channel widths that can be used to transmit to the STA. See 11.16.12 | Set to 0 for a 20 MHz channel width Set to 1 allows use of any channel width in the Supported channel width set This field is reserved when the transmitting or receiving STA is operating in an operating class that does not include a value of PrimaryChannelLowerBehavior or PrimaryChannelUpperBehavior in the behavior limits set as specified in Annex E. See NOTE 1. | N | N |

Table 9-168—HT Operation element fields and subfields (continued)

| Field | Definition | Encoding | Reserved in IBSS? | Reserved in MBSS? |
|------------------------------------|--|--|-------------------|-------------------|
| RIFS Mode | Indicates whether the use of reduced interframe space is permitted within the BSS. See 10.3.2.3.2 and 10.26.3.3 | Set to 0 if use of RIFS is prohibited Set to 1 if use of RIFS is permitted | Y | Y |
| HT Protection | Indicates protection requirements of HT transmissions. See 10.26.3. | Set to 0 for no protection mode Set to 1 for nonmember protection mode Set to 2 for 20 MHz protection mode Set to 3 for non-HT mixed mode | Y | N |
| Nongreenfield HT STAs Present | AP indicates if any HT STAs that are not HT-greenfield capable have associated. Mesh STA indicates if it establishes a mesh peering with an HT STA that is not HT-greenfield capable. Determines when a non-AP STA should use HT-greenfield protection. Present in Beacon and Probe Response frames transmitted by an AP or mesh STA. Otherwise reserved. See 10.26.3.1. | Set to 0 if all HT STAs that are associated are HT-greenfield capable or all HT peer mesh STAs are HT-greenfield capable Set to 1 if one or more HT STAs that are not HT-greenfield capable are associated or one or more HT peer mesh STAs are not HT-greenfield capable | Y | N |
| OBSS Non-HT STAs Present | Indicates if the use of protection for non-HT STAs by overlapping BSSs is determined to be desirable. If the BSS is operating in an operating class for which the behavior limits set listed in Annex E includes the DFS_50_100_Behavior, this field indicates if there exist any non-HT OBSSs and whether HT-greenfield transmissions are allowed. Present in Beacon and Probe Response frames transmitted by an AP. Otherwise reserved. See 10.26.3.4 and 11.9.8.5. | If not operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if the use of protection for non-HT STAs by OBSSs is determined to be desirable. See NOTE 2. Set to 0 otherwise. If operating in an operating class for which the behavior limits set listed in Annex E includes the value DFS_50_100_Behavior: Set to 1 if there exists one or more non-HT OBSSs. Indicates that HT-greenfield transmissions are disallowed in the BSS. Set to 0 otherwise. | Y | Y |
| Channel Center Frequency Segment 2 | Defines the channel center frequency for a 160 or 80+80 MHz BSS bandwidth with NSS support less than Max VHT NSS. See 21.3.14 and 9.4.2.158.3. | For a STA with dot11VHTExtendedNSSBW-Capable equal to true: See Table 9-250, otherwise this field is set to 0. NOTE—This subfield is not used in a non-VHT HT STA. | N | N |

Table 9-168—HT Operation element fields and subfields (continued)

| Field | Definition | Encoding | Reserved in IBSS? | Reserved in MBSS? |
|------------------------------------|--|---|--------------------------|--------------------------|
| Dual Beacon | Indicates whether the AP transmits an STBC beacon. The use of the dual beacon mechanism is deprecated. | Set to 0 if no STBC beacon is transmitted Set to 1 if an STBC beacon is transmitted by the AP | Y | Y |
| Dual CTS Protection | Dual CTS protection is used by the AP to set a NAV at STAs that do not support STBC and at STAs that can associate solely through the STBC beacon. See 10.3.2.8. The use of the dual CTS mechanism is deprecated. | Set to 0 if dual CTS protection is not required Set to 1 if dual CTS protection is required | Y | Y |
| STBC Beacon | Indicates whether the beacon containing this element is a primary or an STBC beacon. The STBC beacon has half a beacon period shift relative to the primary beacon. Defined only in a Beacon frame transmitted by an AP. Otherwise reserved. See 11.1.3.2. | Set to 0 in a primary beacon Set to 1 in an STBC beacon | Y | Y |
| L-SIG TXOP Protection Full Support | Indicates whether all HT STA in the BSS support L-SIG TXOP protection. See 10.26.5. | Set to 0 if one or more HT STA in the BSS do not support L-SIG TXOP protection Set to 1 if all HT STA in the BSS support L-SIG TXOP protection | Y | Y |
| PCO Active | Indicates whether PCO is active in the BSS Present in Beacon/Probe Response frames transmitted by an AP. Otherwise reserved. Non-PCO STAs regard the BSS as a 20/40 MHz BSS and might associate with the BSS without regard to this field. See 11.17. | Set to 0 if PCO is not active in the BSS Set to 1 if PCO is active in the BSS | Y | Y |
| PCO Phase | Indicates the PCO phase of operation Defined only in a Beacon and Probe Response frames when PCO Active is 1. Otherwise reserved. See 11.17. | Set to 0 indicates switch to or continue 20 MHz phase Set to 1 indicates switch to or continue 40 MHz phase | Y | Y |

Table 9-168—HT Operation element fields and subfields (continued)

| Field | Definition | Encoding | Reserved in IBSS? | Reserved in MBSS? |
|------------------|--|---|-------------------|-------------------|
| Basic HT-MCS Set | Indicates the HT MCS values that are supported by all HT STAs in the BSS. Present in Beacon, Probe Response, Mesh Peering Open and Mesh Peering Confirm frames. Otherwise reserved. | A bitmap where a bit is set to 1 to indicate support for that MCS and 0 otherwise, where bit 0 corresponds to MCS 0. MCS values are defined in 9.4.2.56.4. | N | N |

NOTE 1—Any change of STA Channel Width field value does not impact the value of the HT Protection field.
 NOTE 2—Examples of when this bit might be set to 1 include, but are not limited to, the following situations:
 — One or more non-HT STAs are associated
 — A non-HT BSS is overlapping (a non-HT BSS might be detected by the reception of a Beacon or Probe Response frame that does not include an HT Capabilities element)

9.4.2.58 20/40 BSS Intolerant Channel Report element

The 20/40 BSS Intolerant Channel Report element contains a list of channels on which a STA has found conditions that disallow the use of a 20/40 MHz BSS. The format of the 20/40 BSS Intolerant Channel Report element is shown in Figure 9-340.

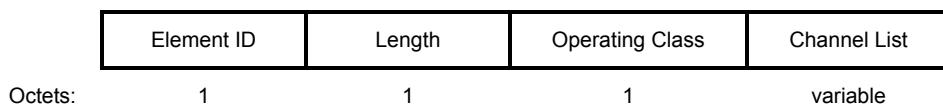

Figure 9-340—20/40 BSS Intolerant Channel Report element format

The Element ID and Length fields are defined in 9.4.2.1. The minimum value of the Length field is 1 (based on a minimum length for the Channel List field of 0 octets).

Operating Class field of the 20/40 MHz BSS Intolerant Channel Report element contains an enumerated value from Annex E, encoded as an unsigned integer, specifying the operating class in which the channel list is valid. If the operating class is “unknown” as described in 11.16.12, the Operating Class field is set to 0. A 20/40 BSS Intolerant Channel Report only reports channels for a single operating class. Multiple 20/40 BSS Intolerant Channel Report elements are used to report channels in more than one operating class.

The Channel List field of the 20/40 MHz BSS Intolerant Channel Report element contains a variable number of octets, where each octet describes a single channel number. Channel numbering is dependent on operating class according to Annex E.

A 20/40 BSS Intolerant Channel Report element includes only channels that are valid for the regulatory domain in which the STA transmitting the element is operating and that are consistent with the Country element transmitted by the AP of the BSS of which it is a member.

9.4.2.59 Overlapping BSS Scan Parameters element

The Overlapping BSS Scan Parameters element is used by an AP to indicate the values to be used by BSS members when performing OBSS scan operations. The format of the Overlapping BSS Scan Parameters element is shown in Figure 9-341.

| Element ID | Length | OBSS Scan Passive Dwell | OBSS Scan Active Dwell | BSS Channel Width Trigger Scan Interval | OBSS Scan Passive Total Per Channel | OBSS Scan Active Total Per Channel | BSS Width Channel Transition Delay Factor | OBSS Scan Activity Threshold |
|------------|--------|-------------------------|------------------------|---|-------------------------------------|------------------------------------|---|------------------------------|
| Octets: | 1 | 1 | 2 | 2 | 2 | 2 | 2 | 2 |

Figure 9-341—Overlapping BSS Scan Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The OBSS Scan Passive Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveDwell as described in 11.16.5.

The OBSS Scan Active Dwell field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveDwell as described in 11.16.5.

The BSS Channel Width Trigger Scan Interval field contains a value in seconds, encoded as an unsigned integer, that a receiving STA uses to set dot11BSSWidthTriggerScanInterval as described in 11.16.5.

The OBSS Scan Passive Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanPassiveTotalPerChannel as described in 11.16.5.

The OBSS Scan Active Total Per Channel field contains a value in TUs, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActiveTotalPerChannel as described in 11.16.5.

The BSS Width Channel Transition Delay Factor field contains an integer value that a receiving STA uses to set dot11BSSWidthChannelTransitionDelayFactor as described in 11.16.5.

The OBSS Scan Activity Threshold field contains a value in hundredths of percent, encoded as an unsigned integer, that a receiving STA uses to set dot11OBSSScanActivityThreshold as described in 11.16.5.

The use of each of these parameters is described in 11.16.5.

9.4.2.60 20/40 BSS Coexistence element

The 20/40 BSS Coexistence element is used by STAs to exchange information that affects 20/40 BSS coexistence.

The 20/40 BSS Coexistence element is formatted as shown in Figure 9-342.

| Element ID | Length | 20/40 BSS Coexistence Information field |
|------------|--------|---|
| Octets: | 1 | 1 |

Figure 9-342—20/40 BSS Coexistence element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the 20/40 BSS Coexistence Information field is shown in Figure 9-343.

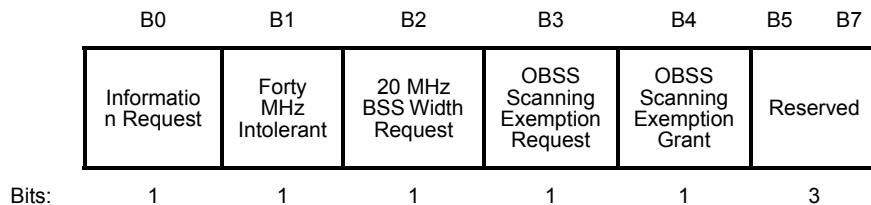

Figure 9-343—20/40 BSS Coexistence Information field

The Information Request field is used to indicate that a transmitting STA is requesting the recipient to transmit a 20/40 BSS Coexistence Management frame with the transmitting STA as the recipient.

The Forty MHz Intolerant field is set to 1 to prohibit an AP that receives this information or reports of this information from operating a 20/40 MHz BSS. When equal to 0, it does not prohibit a receiving AP from operating a 20/40 MHz BSS. This field is used for inter-BSS communication. The definition of this field is the same as the definition of the Forty MHz Intolerant field in the HT Capabilities element (see 9.4.2.56), and its operation is described in 11.16.11.

The 20 MHz BSS Width Request field is set to 1 to prohibit a receiving AP from operating its BSS as a 20/40 MHz BSS. Otherwise, it is set to 0. This field is used for intra-BSS communication. The operation of this field is described in 11.16.12.

The OBSS Scanning Exemption Request field is set to 1 to indicate that the transmitting non-AP STA is requesting the BSS to allow the STA to be exempt from OBSS scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Request field is reserved when transmitted by an AP. The OBSS Scanning Exemption Request field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

The OBSS Scanning Exemption Grant field is set to 1 by an AP to indicate that the receiving STA is exempted from performing OBSS Scanning. Otherwise, it is set to 0. The OBSS Scanning Exemption Grant field is reserved when transmitted by a non-AP STA. The OBSS Scanning Exemption Grant field is reserved when a 20/40 BSS Coexistence element is included in a group addressed frame.

9.4.2.61 Time Advertisement element

The Time Advertisement element, shown in Figure 9-344, specifies fields describing the source of time corresponding to a time standard, an external clock (external time source), an estimate of the offset between that time standard and the TSF timer, and an estimate of the standard deviation of the error in the offset estimate. This information is used by a receiving STA to align its own estimate of the time standard based on that of another STA.

Figure 9-344—Time Advertisement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Timing Capabilities field specifies the STA's source and encoding of the Time Value field. The encoding of the Timing Capabilities field is specified in Table 9-169.

Table 9-169—Encoding of the Timing Capabilities field

| Value | Usage |
|-------|---|
| 0 | No standardized external time source |
| 1 | Timestamp offset based on UTC [see ITU-R Recommendation TF.460-4(2002) [B51]]. The Timestamp offset value in nanoseconds is defined to be 0 at the beginning of the first nanosecond of the first day of the year 1958. |
| 2 | UTC time at which the TSF timer is 0. |
| 3–255 | Reserved |

When the value of the Timing Capabilities field is 0, only the Element ID, Length, and Timing Capabilities fields are included in the Time Advertisement element.

When the value of the Timing Capabilities is 1, the following additional fields are included in the Time Advertisement element:

- Time Value field, a 2s complement integer in nanoseconds that, when added to the Timestamp present in the same transmitted frame, gives the receiving STA an estimate of the time standard at the time the frame was transmitted. The Timestamp is derived from the TSF Timer as defined in 11.22.
- Time Error field, which is set to an unsigned integer in nanoseconds that defines the standard deviation of the error in the Time Value estimate. The value of all 1s is used to indicate that the error is unknown.

When the Timing Capabilities field is 2, the following fields are included in the Time Advertisement element:

- The Time Value field is the UTC time at which the TSF Timer is 0, given that the TSF Timer units are 1 microsecond units as defined in 11.1.3. The format, including all subfields is shown in Table 9-170. For any subfield not known in the Time Value field, the subfield value is 0.
- The Time Error field is an unsigned integer in milliseconds that defines the standard deviation of the error in the Time Value estimate.
- The Time Update Counter field is a modulo 256 counter that increments each time the AP updates the Time Value UTC at which the TSF Timer is 0.

Table 9-170—Time Value field format when Timing Capabilities is 2

| Octet | Description |
|-------|----------------------|
| 0–1 | Year (0–65 534) |
| 2 | Month (0–12) |
| 3 | Day of month (0–31) |
| 4 | Hours (0–23) |
| 5 | Minutes (0–59) |
| 6 | Seconds (0–59) |
| 7–8 | Milliseconds (0–999) |
| 9 | Reserved |

9.4.2.62 Link Identifier element

The Link Identifier element contains information that identifies a TDLS direct link. The element information format is defined in Figure 9-345.

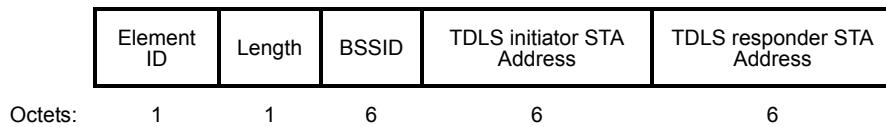

Figure 9-345—Link Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

The BSSID field is set to the BSSID of the BSS to which the TDLS initiator STA is associated.

The TDLS initiator STA Address field is set to the TDLS initiator STA's MAC address.

The TDLS responder STA Address field is set to the TDLS responder STA's MAC address.

9.4.2.63 Wakeup Schedule element

The Wakeup Schedule element contains information regarding the periodic wakeup schedule for TDLS peer PSM. The element format is defined in Figure 9-346.

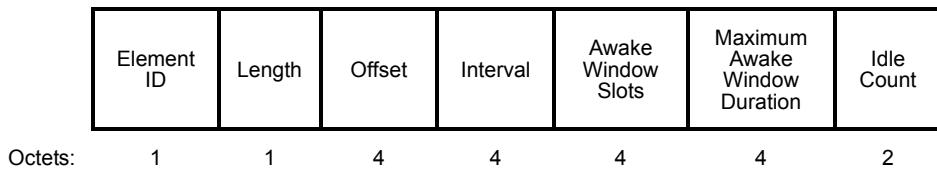

Figure 9-346—Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Offset field is the time in microseconds between TSF 0 and the start of a first Awake Window. See 11.2.3.14.

The Interval field is set to the time in microseconds between the start of two successive Awake Windows. See 11.2.3.14.

The Awake Window Slots field is set to the duration of the Awake Window in units of backoff slots (see 10.22.2.4). See 11.2.3.14.

The Maximum Awake Window Duration field is set to the maximum duration of the Awake Window, in units of microseconds. See 11.2.3.14.

The Idle Count field is set to the number of consecutive Awake Windows during which no individually addressed frame is received from the TDLS peer STA before a TDLS peer STA deletes the wakeup schedule. See 11.2.3.14.

9.4.2.64 Channel Switch Timing element

The Channel Switch Timing element contains information regarding the channel switch timing. The element is defined in Figure 9-347.

| | | | |
|------------|--------|------------|----------------|
| Element ID | Length | SwitchTime | Switch Timeout |
| Octets: | 1 | 1 | 2 |

Figure 9-347—Channel Switch Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Switch Time field is set to the time it takes for a STA sending the Channel Switch Timing element to switch channels, in units of microseconds.

The Switch Timeout field is set to a time in units of microseconds. The STA sending the Channel Switch Timing element waits for the first Data frame exchange on the off-channel for Switch Timeout microseconds before switching back to base channel. The time is measured from the end of the last symbol of the Ack frame that is transmitted in response to TDLS Channel Switch Response frame, as seen on the WM.

9.4.2.65 PTI Control element

The PTI Control element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is optionally included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-348.

| | | | |
|------------|--------|-----|------------------|
| Element ID | Length | TID | Sequence Control |
| Octets: | 1 | 1 | 1 |

Figure 9-348—PTI Control element format

The Element ID and Length fields are defined in 9.4.2.1.

The TID field contained in the PTI Control element is set to the TID of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.15.

The Sequence Control field is defined in 9.2.4.4. The Sequence Control field contained in the PTI Control element is set to the sequence number of the latest MPDU that has been transmitted over the TDLS direct link to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication frame that contains the PTI Control element. See 11.2.3.15.

9.4.2.66 TPU Buffer Status element

The TPU Buffer Status element contains information regarding the traffic buffered at the TPU buffer STA for the TPU sleep STA at the time a TDLS Peer Traffic Indication frame is transmitted by the TPU buffer STA. The element is included in the TDLS Peer Traffic Indication frame. The element is defined in Figure 9-349.

| | | | | | |
|---------|------------|--------|-------------------------------|---|--|
| | Element ID | Length | TPU Buffer Status Information | | |
| Octets: | 1 | 1 | 1 | 1 | |

Figure 9-349—TPU Buffer Status element format

The Element ID and Length fields are defined in 9.4.2.1.

The TPU Buffer Status Information field is defined in Figure 9-350

| B0 | B1 | B2 | B3 | B4 | B7 |
|-------------------------|-------------------------|-------------------------|-------------------------|----------|----|
| AC_BK traffic available | AC_BE traffic available | AC_VI traffic available | AC_VO traffic available | Reserved | |
| Bits: 1 | 1 | 1 | 1 | 1 | 4 |

Figure 9-350—TPU Buffer Status Information field

The AC_BK traffic available field is one bit in size and is set to 1 if AC_BK contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_BE traffic available field is one bit in size and is set to 1 if AC_BE contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VI traffic available field is one bit in size and is set to 1 if AC_VI contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

The AC_VO traffic available field is one bit in size and is set to 1 if AC_VO contains traffic buffered for the TPU sleep STA to which the TPU Buffer Status element will be transmitted and is set to 0 otherwise.

9.4.2.67 Event Request element

9.4.2.67.1 Event Request definition

The Event Request element contains a request to the receiving STA to perform the specified event action. The format of the Event Request element is shown in Figure 9-351.

| Element ID | Length | Event Token | Event Type | Event Response Limit | Event Request |
|------------|--------|-------------|------------|----------------------|---------------|
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-351—Event Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is a nonzero number that is unique among the Event Request elements sent to each destination MAC address for which a corresponding Event Report element has not been received.

The Event Type field is a number that identifies the type of event request. The values of the Event Type field are defined in Table 9-171.

Table 9-171—Event Type field definitions for event requests and reports

| Name | Event Type |
|-------------------|------------|
| Transition | 0 |
| RSNA | 1 |
| Peer-to-peer link | 2 |
| WNM log | 3 |
| Reserved | 4–220 |
| Vendor Specific | 221 |
| Reserved | 222–255 |

The Event Response Limit field contains the maximum number of requested Event Reports to be included in the Event Report element. A value of 0 indicates that no limit is set on the number of Event Reports to be included in the Event Report element.

The Event Request field contains the event request corresponding to the Event Type, as described in 9.4.2.67.2 to 9.4.2.67.4. The Event Request field is not present when requesting a WNM log report.

The Event Request element is included in an Event Request frame, as described in 9.6.14.2. The use of the Event Request element and Event Request frame is described in 11.24.2.

9.4.2.67.2 Transition event request

The Event Request field corresponding to the Transition event request contains zero or more Transition Event Request subelements. A transition event is a STA movement or attempted movement from one BSS (the source BSS) in one ESS to another BSS (the target BSS) within the same ESS.

The Transition Event subelements specify the conditions in which a Transition Event Report is sent by a STA. The set of valid Transition Event Request subelements is defined in Table 9-172.

Table 9-172—Transition Event Request subelement

| Transition Event Request subelement | Subelement ID |
|-------------------------------------|---------------|
| Transition Target BSSID | 0 |
| Transition Source BSSID | 1 |
| Transition Time Threshold | 2 |
| Transition Result | 3 |
| Frequent Transition | 4 |
| Reserved | 5–255 |

The Transition Target BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the target BSSID is equal to the specific BSSID in the Target BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all target BSSIDs. The format of the Transition Target BSSID subelement is shown in Figure 9-352.

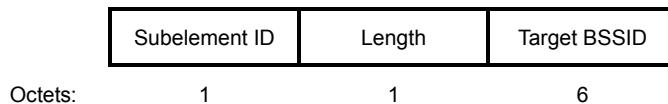

Figure 9-352—Transition Target BSSID subelement format

The Subelement ID field is equal to the Transition Target BSSID value in Table 9-172.

The Length field is defined in 9.4.3.

The Target BSSID field contains a 6-octet BSSID.

The Transition Source BSSID subelement is used to request that a Transition Event Report includes the transition event entry when the source BSSID is equal to the BSSID specified in the Source BSSID field. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the Transition Source BSSID subelement is shown in Figure 9-353.

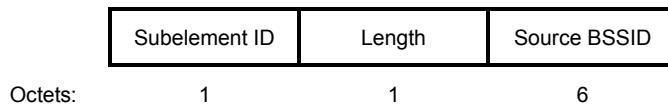

Figure 9-353—Transition Source BSSID subelement format

The Subelement ID field is equal to the Transition Source BSSID value in Table 9-172.

The Length field is defined in 9.4.3.

The Source BSSID field contains a 6-octet BSSID.

The Transition Time Threshold subelement is used to request that a Transition Event Report includes the transition event entry when the transition time is greater than or equal to the Transition Time Threshold value. The format of the Transition Time Threshold subelement is shown in Figure 9-354.

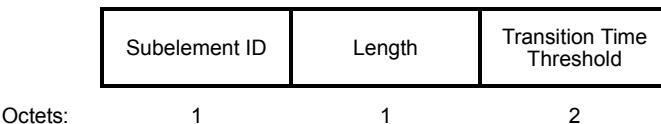

Figure 9-354—Transition Time Threshold subelement format

The Subelement ID field is equal to the Transition Time Threshold value in Table 9-172.

The Length field is defined in 9.4.3.

The Transition Time Threshold field contains a value representing the Transition Time to be used as the threshold value for the Transition Time condition in TUs. The Transition Time is defined in 11.24.2.2.

The Transition Result subelement is used to request that a Transition Event Report includes the transition event entry that matches the transition result defined by this subelement. The format of Transition Result subelement is shown in Figure 9-355.

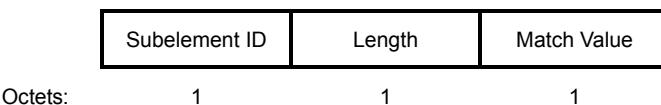

Figure 9-355—Transition Result subelement format

The Subelement ID field is equal to the Transition Result value in Table 9-172.

The Length field is defined in 9.4.3.

The Match Value field is set with each bit as defined in Figure 9-356 to request that the specified transition results that match the bit descriptions are included in the Transition Event report.

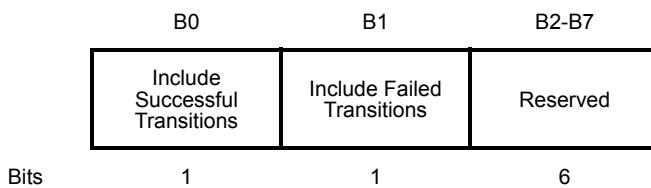

Figure 9-356—Match Value field definitions

The Frequent Transition subelement is used to request that an alerting Transition Event report be generated when the total transition count during the specified time period is greater than or equal to the value given in Frequent Transition Count Threshold field. The format of the Frequent Transition subelement is shown in Figure 9-357.

The Subelement ID field is equal to the Frequent Transition value in Table 9-172.

The Length field is defined in 9.4.3.

| | | | |
|---------------|--------|-------------------------------------|---------------|
| Subelement ID | Length | Frequent Transition Count Threshold | Time Interval |
| Octets: | 1 | 1 | 1 2 |

Figure 9-357—Frequent Transition subelement format

The Frequent Transition Count Threshold field is a 1-octet field containing the number of transitions in the measurement duration after which a Transition Event Report is generated.

The Time Interval field is the time interval in TUs during which the STA determines if the Frequent Transition Count Threshold is exceeded.

9.4.2.67.3 RSNA event request

The Event Request field corresponding to an RSNA event request contains zero or more RSNA Event Request subelements.

The subelement format and ordering of subelements are defined in 9.4.3. The set of valid RSNA Event Request subelements is defined in Table 9-173.

Table 9-173—RSNA Event Request subelement

| RSNA Event Request subelement | Subelement ID |
|-------------------------------|---------------|
| RSNA Target BSSID | 0 |
| Authentication Type | 1 |
| EAP Method | 2 |
| RSNA Result | 3 |
| Reserved | 4–255 |

The RSNA subelements specify reporting conditions for RSNA Event Reports.

The RSNA Target BSSID subelement identifies the BSS at which an RSNA Event establishment was attempted. Excluding this subelement from the Event Request element indicates a request for transition events for all source BSSIDs. The format of the RSNA Target BSSID subelement is shown in Figure 9-358.

| | | |
|---------------|--------|--------------|
| Subelement ID | Length | Target BSSID |
| Octets: | 1 | 1 6 |

Figure 9-358—RSNA Target BSSID subelement format

The Subelement ID field is equal to the RSNA Target BSSID value in Table 9-173.

The Length field is defined in 9.4.3.

The Target BSSID field contains a 6-octet BSSID.

The Authentication Type subelement is used to request that an RSNA Event Report includes the RSNA event entry when the Authentication Type is equal to the authentication type specified in the Authentication Type field. The format of the Authentication Type subelement is shown in Figure 9-359.

| | | |
|---------------|--------|---------------------|
| Subelement ID | Length | Authentication Type |
| Octets: | 1 | 1 |

Figure 9-359—Authentication Type subelement format

The Subelement ID field is equal to the Authentication Type value in Table 9-173.

The Length field is defined in 9.4.3.

The Authentication Type field contains one of the AKM suite selectors defined in Table 9-133 in 9.4.2.25.3.

The EAP Method subelement is used to request that an RSNA Event Report includes the RSNA event entry when the EAP Method is equal to the EAP method specified in the EAP Method field. The format of the EAP Method subelement is shown in Figure 9-360.

| | | | | |
|---------------|--------|----------|--------------------------|----------------------------|
| Subelement ID | Length | EAP Type | EAP Vendor ID (optional) | EAP Vendor Type (optional) |
| Octets: | 1 | 1 | 1 | 0 or 3 |

Figure 9-360—EAP Method subelement format

The Subelement ID field is equal to the EAP Method value in Table 9-173.

The Length field is defined in 9.4.3.

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

The RSNA Result subelement is used to request that an RSNA Event Report includes the RSNA event entry that matches the transition result defined by this subelement. The format of RSNA Result subelement is shown in Figure 9-361.

| | | |
|---------------|--------|-------------|
| Subelement ID | Length | Match Value |
| Octets: | 1 | 1 |

Figure 9-361—RSNA Result subelement format

The Subelement ID field is equal to the RSNA Result value in Table 9-173.

The Length field is defined in 9.4.3.

The Match Value field bits are set as defined in Figure 9-362 to request that the specified RSNA results that match that bit descriptions are included in the RSNA Event report.

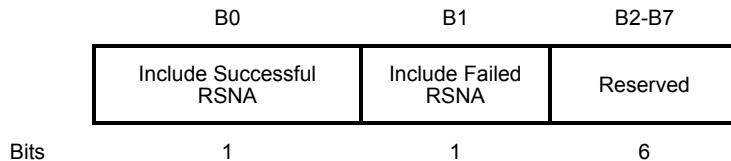

Figure 9-362—Match Value field definitions

9.4.2.67.4 Peer-to-peer link event request

The Event Request field corresponding to peer-to-peer link event request contains zero or more Peer-to-Peer Link Event Request subelements.

The Peer-to-Peer Link Event Request subelements are defined to have a common format consisting of a 1 octet Subelement ID field, a 1 octet Length field, and a variable-length subelement specific information field. The set of valid Peer-to-Peer Link Event Request subelements is defined in Table 9-174.

Table 9-174—Peer-to-Peer Link Event Request subelement

| Peer-to-Peer Link Event Request subelement | Subelement ID |
|--|---------------|
| Peer Address | 0 |
| Channel Number | 1 |
| Reserved | 2–255 |

The Peer-to-Peer Link subelements specify reporting conditions for peer-to-peer link event reporting.

The Peer Address subelement identifies the peer STA, BSS, or IBSS of the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any peer STA, any BSS, and any IBSS. The format of the Peer Address subelement is shown in Figure 9-363.

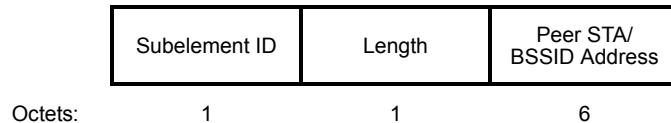

Figure 9-363—Peer Address subelement format

The Subelement ID field is equal to the Peer Address value in Table 9-174.

The Length field is defined in 9.4.3.

The Peer STA/BSSID Address field contains a 6-octet MAC address of a peer STA or a BSSID for peer-to-peer links in an IBSS. If the indicated address matches the Address 1 field of the MAC header contents (see Table 9-26), then the address is a peer STA address for a TDLS or IBSS. If the indicated address matches the Address 3 field of the MAC header contents, then the address is a BSSID for the Direct Link in an infrastructure BSS or for the IBSS.

The Channel Number subelement(s) identify the channel for the peer-to-peer links to be reported. Excluding this subelement from the Event Request element indicates a request for peer-to-peer link events for any channel. The format of the Channel Number subelement is shown in Figure 9-364. The identified channel is indicated by $N+1$ Channel Number subelements where the first N subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

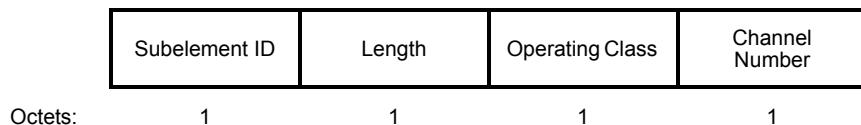

Figure 9-364—Channel Number subelement format

The Subelement ID field is equal to the Channel Number value in Table 9-174.

The Length field is defined in 9.4.3.

The Operating Class field indicates the channel set of the peer-to-peer link to be used for the Peer-to-Peer Link event report. Operating Classes are defined in Annex E.

The Channel Number field indicates the channel number or (if the corresponding operating class in Annex E has “—” in the channel set column) the center frequency index of the frequency segment containing the primary channel of the peer-to-peer link events requested and included in the peer-to-peer link event report. A Channel Number of 0 in all $N+1$ Channel Number subelements indicates a request to report any peer-to-peer link event for any supported channel in the specified filtering Operating Class.

9.4.2.67.5 Vendor Specific event request

The Event Request field corresponding to Vendor Specific event request contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.68 Event Report element

9.4.2.68.1 Event Report Definition

The Event Report element is used by a STA to report an event. The format of the Event Report element is shown in Figure 9-365.

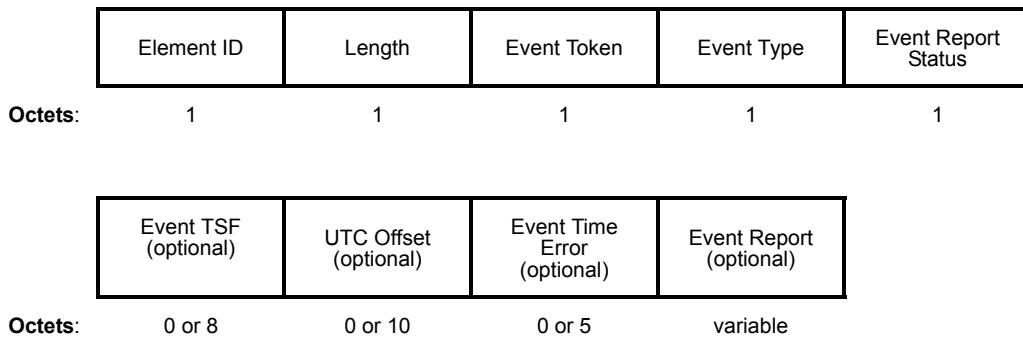

Figure 9-365—Event Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Event Token field is the Event Token in the corresponding Event Request element. If the Event Report element is being sent autonomously then the Event Token is 0.

The Event Type field is a number that identifies the type of event report. The Event Types are shown in Table 9-171.

The Event Report Status field is a value in Table 9-175, indicating the STA's response to the Event Request.

Table 9-175—Event Report Status

| Event Report Status | Description |
|---------------------|------------------------------|
| 0 | Successful |
| 1 | Request failed |
| 2 | Request refused |
| 3 | Request incapable |
| 4 | Detected frequent transition |
| 5–255 | Reserved |

The Event TSF, UTC Offset, Event Time Error, and Event Report fields are present only when the Event Report Status field is 0.

The Event TSF field is TSF value when the STA logged the event.

The UTC Offset field is the UTC value that corresponds to the UTC time when the TSF timer is equal to 0. If the UTC Offset is unknown, the field is 0.

The Event Time Error field is the UTC standard deviation, as described in 9.4.2.61, that corresponds to the TSF value logged for the event. If the Event Time Error is unknown, the field is 0.

The Event Report field contains the specification of a single event report, as described in 9.4.2.68.2 to 9.4.2.68.5.

The Event Report element is included in an Event Report frame, as described in 9.6.14.3. The use of the Event Report element and frame is described in 11.24.2.

9.4.2.68.2 Transition event report

The format of the Event Report field corresponding to a Transition event report is shown in Figure 9-366.

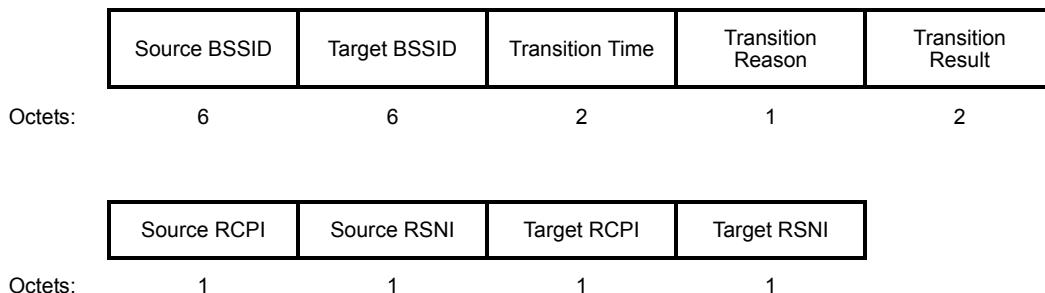

Figure 9-366—Event Report format for Transition event

The Source BSSID field contains the 6-octet BSSID address of the associated AP prior to the attempted transition.

The Target BSSID field contains the 6-octet BSSID address of the AP that is the target of the attempted Transition.

The Transition Time field contains the transition time in TUs. The transition time is defined in 11.24.2.2.

The Transition Reason field indicates the reason why a transition attempt occurred and contains one of the values in Table 9-176.

Table 9-176—Transition and Transition Query reasons

| Transition Reason value | Description |
|-------------------------|---|
| 0 | Unspecified |
| 1 | Excessive frame loss rates and/or poor conditions |
| 2 | Excessive delay for current traffic streams |
| 3 | Insufficient QoS capacity for current traffic streams (TSPEC rejected) |
| 4 | First association to ESS (the association initiated by an Association Request frame instead of a Reassociation Request frame) |
| 5 | Load balancing |
| 6 | Better AP found |
| 7 | Deauthenticated or Disassociated from the previous AP |
| 8 | AP failed IEEE 802.1X EAP Authentication |
| 9 | AP failed 4-way handshake |
| 10 | Received too many replay counter failures |
| 11 | Received too many data MIC failures |

Table 9-176—Transition and Transition Query reasons (continued)

| Transition Reason value | Description |
|-------------------------|---|
| 12 | Exceeded maximum number of retransmissions |
| 13 | Received too many broadcast disassocations |
| 14 | Received too many broadcast deauthentications |
| 15 | Previous transition failed |
| 16 | Low RSSI |
| 17 | Roam from a non-IEEE-802.11 system |
| 18 | Transition due to received BSS Transition Request frame |
| 19 | Preferred BSS transition candidate list included |
| 20 | Leaving ESS |
| 21–255 | Reserved |

The Transition Result field contains the result of the attempted transition and is one of the status codes specified in Table 9-46 in 9.4.1.9.

The Source RCPI field indicates the received channel power of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.38.

The Source RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Source BSSID before the STA reassociates to the Target BSSID. The Source RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.41.

The Source BSSID, Source RCPI, and Source RSNI fields are set to 0 if the transition is initiated by an Association Request frame.

The Target RCPI field indicates the received channel power of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RCPI field indicates the received channel power of the most recently measured frame from the Target BSSID. The Target RCPI is a logarithmic function of the received signal power, as defined in 9.4.2.38.

The Target RSNI field indicates the received signal-to-noise indication of the first measured frame just after the STA reassociates to the Target BSSID. If association with the Target BSSID failed, the Target RSNI field indicates the received signal-to-noise indication of the most recently measured frame from the Target BSSID. The Target RSNI is a logarithmic function of the signal-to-noise ratio, as defined in 9.4.2.41.

9.4.2.68.3 RSNA event report

The format of the Event Report field corresponding to an RSNA event report is shown in Figure 9-367.

| Target BSSID | Authentication Type | EAP Method | RSNA Result | RSNE |
|--------------|---------------------|------------|-------------|---------------|
| Octets: | 6 | 4 | 1 or 8 | 2 variable |

Figure 9-367—Event Report format for RSNA event

The Target BSSID field contains the 6-octet BSSID address of the AP accepting the authentication attempt.

The Authentication Type field contains the Authentication type in use at the time of the authentication attempt and is one of the AKM suite selectors defined in Table 9-133 in 9.4.2.25.3.

When the Authentication Type field is the value of either 00-0F-AC:1 (Authentication negotiated over IEEE Std 802.1X or using PMKSA caching as defined in 12.6.10.3) or 00-0F-AC:3 (AKM suite selector for fast BSS transition as defined in 12.6.3), the EAP Method field contains the IANA assigned EAP type. The EAP type contains either the legacy type (1 octet) or the expanded type (1 octet type = 254, 3-octet Vendor ID, 4-octet Vendor-Type). The EAP Method field is 0 otherwise. The EAP Method field is a single octet set to 0 otherwise.

The RSNA Result field contains the result of the RSNA establishment attempt and is one of the status codes specified in Table 9-46 in 9.4.1.9.

The RSNE field contains the entire contents of the negotiated RSNE at the time of the authentication attempt. The maximum length of the RSNE field is less than the maximum length of an RSNE, as defined in 9.4.2.25. If the length of the RSNE included here exceeds the maximum length of the RSNE field, the RSNE is truncated to the maximum length allowed for the RSNE field.

9.4.2.68.4 Peer-to-peer link event report

The format of the Event Report field corresponding to a Peer-to-Peer Link event report is shown in Figure 9-368.

| Peer STA/ BSSID Address | Operating Class | Channel Number | STA Tx Power | Connection Time | Peer Status |
|-------------------------------|--------------------|-------------------|-----------------|--------------------|-------------|
| Octets: | 6 | 1 | 1 | 1 | 3 1 |

Figure 9-368—Event Report format for peer-to-peer link event

A peer-to-peer link is defined to be either a Direct Link within a QoS BSS, a TDLS, or a STA-to-STA communication in an IBSS.

The Peer STA/BSSID Address field contains a 6-octet MAC address. If this event is for a peer-to-peer link in an infrastructure BSS, this field contains the MAC address of the peer STA. If this event is for a peer-to-peer link in an IBSS, this field contains the BSSID of the IBSS.

The Operating Class field indicates the channel set of the Peer-to-Peer link. Valid values of the Operating Class are shown in Annex E.

The Channel Number field indicates the peer-to-peer channel number of the peer-to-peer link. The Channel Number is defined within an Operating Class as shown in Annex E.

The STA Tx Power field indicates the target transmit power at the antenna (i.e., EIRP) in dBm with a tolerance of ± 5 dB of the lowest basic rate of the reporting STA.

The Connection Time field contains the connection time in seconds. If the Peer Status is 0, this field indicates the duration of the Direct Link. If the Peer Status is 1, this field indicates the time difference from the time the Direct Link was established to the time at which the reporting STA generated the event report. If the Peer Status is 2, this field indicates the duration of the IBSS membership. If the Peer Status is 3, this field indicates the time difference from the time the STA joined the IBSS to the time at which the reporting STA generated the event report. See 11.24.2.4.

The Peer Status field indicates the Peer link connection status as indicated in Table 9-177.

Table 9-177—Peer Status definitions

| Peer Status | Description |
|-------------|----------------------------|
| 0 | Direct Link terminated |
| 1 | Direct Link active |
| 2 | IBSS membership terminated |
| 3 | IBSS membership active |
| 4–255 | Reserved |

9.4.2.68.5 WNM log event report

The format of the Event Report field corresponding to a WNM log event report is shown in Figure 9-369.

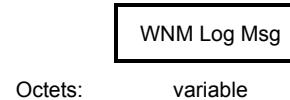

Figure 9-369—Event Report format for WNM log event

The WNM Log Msg field contains the entire syslog message, consisting of the PRI, HEADER, and MSG portion of a WNM log message as described in IETF RFC 5424. The TAG field of the MSG portion of the message is a 17 octet string containing the ASCII representation of the STA MAC address using hexadecimal notation with colons between octets. The octet containing the Individual/Group bit occurs last, and that bit is in the least significant position within that octet. See 11.24.2.5.

NOTE—For example, the TAG field for a STA with MAC address AC-DE-48-12-7B-80 is "80:7B:12:48:DE:AC" or "80:7b:12:48:de:ac".

9.4.2.68.6 Vendor Specific event report

The Event Report field corresponding to Vendor Specific event report contains zero or more Vendor Specific subelements. The Vendor Specific subelement has the same format as the Vendor Specific element (see 9.4.2.26).

9.4.2.69 Diagnostic Request element

9.4.2.69.1 Diagnostic Request definition

The Diagnostic Request element contains a request that the receiving STA undertake the specified diagnostic action. The format of the Diagnostic Request element is shown in Figure 9-370.

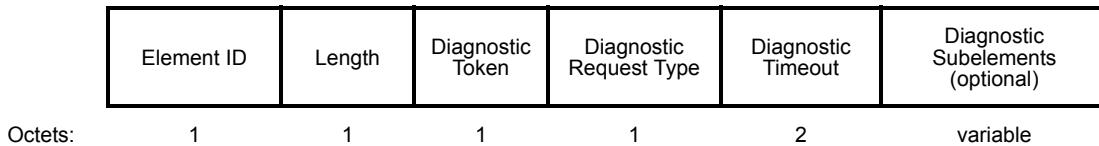

Figure 9-370—Diagnostic Request element format

The Element ID and Length fields are defined in 9.4.2.1. The minimum value of the Length field is 4 (based on a minimum length for the Diagnostic Subelements field of 0 octets).

The Diagnostic Token field is a number that is unique among the Diagnostic Request elements sent to each destination MAC address for which a corresponding Diagnostic Report element has not been received.

The Diagnostic Request Type field is a number that identifies a type of diagnostic request. The values of Diagnostic Request Types are shown in Table 9-178.

Table 9-178—Diagnostic Request/Report Type definitions

| Name | Diagnostic Type values |
|---------------------------------------|------------------------|
| Cancel Diagnostic Request | 0 |
| Manufacturer Information STA Report | 1 |
| Configuration Profile | 2 |
| Association Diagnostic | 3 |
| IEEE 802.1X Authentication Diagnostic | 4 |
| Reserved | 5–220 |
| Vendor Specific | 221 |
| Reserved | 222–255 |

The Diagnostic Timeout field contains the time, in seconds, after which no response is returned.

The Diagnostic Subelements field contains zero or more diagnostic subelements depending on the specific Diagnostic Request Type, as defined in 9.4.2.69.2 to 9.4.2.69.4.

The Cancel Diagnostic Request, Manufacturer Information STA Report, and Configuration Profile Diagnostic Request elements carry no Diagnostic subelements.

The Diagnostic Request element is included in a Diagnostic Request frame, as described in 9.6.14.4. The use of Diagnostic Request element and frames is described in 11.24.3.

9.4.2.69.2 Association Diagnostic request

The Diagnostic Subelements field corresponding to an Association Diagnostic request type is shown in Table 9-179. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-179—Association Diagnostic request contents

| Order | Subelement |
|-------|---------------|
| 1 | AP Descriptor |
| 2 | Profile ID |

9.4.2.69.3 IEEE 802.1X Authentication Diagnostic request

The Diagnostic Subelements field corresponding to an IEEE 802.1X Authentication Diagnostic request type is shown in Table 9-180. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-180—IEEE 802.1X Authentication Diagnostic request contents

| Order | Subelement |
|-------|-----------------|
| 1 | AP Descriptor |
| 2 | EAP Method |
| 3 | Credential Type |
| 4 | Profile ID |

9.4.2.69.4 Vendor Specific diagnostic request

The Diagnostic Subelements field corresponding to a Diagnostic Request element of type Vendor Specific diagnostic request contains zero or more Vendor Specific subelements. The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26).

9.4.2.69.5 Diagnostic subelement descriptions

The following text describes the various subelements that are optionally included in Diagnostic Subelements field of a Diagnostic Request element (9.4.2.69) or a Diagnostic Report element (9.4.2.70). The format of a Diagnostic subelement is shown in Figure 9-371.

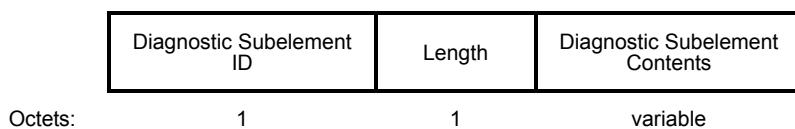

Figure 9-371—Diagnostic subelement format

The Diagnostic Subelement ID field indicates the Diagnostic subelement ID and is any allocated value in Figure 9-181.

Table 9-181—Diagnostic subelement ID values

| Subelement ID | Subelement name |
|---------------|-----------------------------------|
| 0 | Credential Type |
| 1 | AKM Suite |
| 2 | AP Descriptor |
| 3 | Antenna Type |
| 4 | Cipher Suite |
| 5 | Collocated Radio Type |
| 6 | Device Type |
| 7 | EAP Method |
| 8 | Firmware Version |
| 9 | MAC Address |
| 10 | Manufacturer ID String |
| 11 | Manufacturer Model String |
| 12 | Manufacturer OI |
| 13 | Manufacturer Serial Number String |
| 14 | Power Save Mode |
| 15 | Profile ID |
| 16 | Supported Operating Classes |
| 17 | Status Code |
| 18 | SSID |
| 19 | Tx Power Capability |
| 20 | Certificate ID |
| 21–220 | Reserved |
| 221 | Vendor Specific |
| 221–255 | Reserved |

The Length field is the length in octets of the Diagnostic Subelement Contents field.

The values of the Diagnostic Subelement Contents field are described in the following paragraphs.

The format for the Credential Type subelement is shown in Figure 9-372.

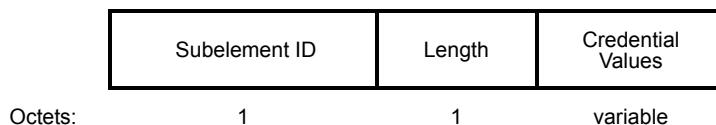

Figure 9-372—Credential Type subelement format

The Credentials Values field indicates one or more types of credential. Each value is chosen from those shown in Table 9-182.

Table 9-182—Credentials values

| Value | Description |
|-------|-----------------------|
| 0 | None |
| 1 | Preshared key |
| 2 | Username and password |
| 3 | X.509 certificate |
| 4 | Other certificate |
| 5 | One time password |
| 6 | Token |
| 7–255 | Reserved |

The format for the AKM Suite subelement is shown in Figure 9-373.

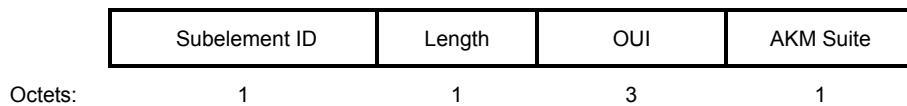

Figure 9-373—AKM Suite subelement format

The OUI and AKM Suite fields identify the authentication method, and the AKM suite selector is one of the values in Table 9-133 in 9.4.2.25.3.

The format of the AP descriptor subelement is described in Figure 9-374.

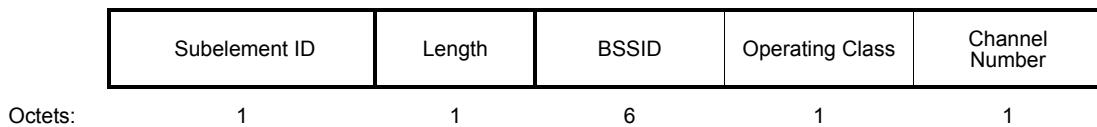

Figure 9-374—AP Descriptor subelement format

The set of current operating classes and channel widths of the AP is indicated by $N+1$ AP descriptor subelements where the first N subelements contain an Operating Class octet with an 80+ behavior limit and the last subelement contains an Operating Class octet without an 80+ behavior limit (as defined in Annex E).

NOTE—An 80+80 MHz AP sends four AP descriptor subelements for 20/40 MHz, 80 MHz, 80+ MHz (for the secondary 80 MHz frequency segment), and 80 MHz (for the primary 80 MHz frequency segment).

The BSSID field is a 6-octet field, as described in 9.2.4.3.4, that identifies the BSS indicated in the AP Descriptor subelement.

The Operating Class field contains an enumerated value from Annex E that identifies the mapping from Channel Number to frequency.

The Channel Number field indicates a current operating channel or (if the corresponding operating class in Annex E has “—” in the channel set column) the center frequency index of the frequency segment containing the primary channel, of the AP identified by the BSSID in the AP Descriptor.

The format for the Antenna Type subelement is shown in Figure 9-375.

| | Subelement ID | Length | Antenna Count | Antenna Gain | Antenna Type |
|---------|---------------|--------|---------------|--------------|--------------|
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-375—Antenna Type subelement format

The Antenna Count field contains a 1-octet field indicating the number of antennas of the indicated antenna type and antenna gain pair. The Antenna Count field value 0 is reserved.

The Antenna Gain field contains the peak gain, in dBi, of the antenna.

The Antenna Type field contains an ASCII string (truncated to 251 octets if required) describing the manufacturer’s type information (i.e., a series of letters/numbers) of the antenna(s) connected to the wireless adapter.

NOTE—Beamforming antennas might have several Antenna IDs, depending on antenna bearing.

The format for the Cipher Suite subelement is shown in Figure 9-376.

| | Subelement ID | Length | OUI | Suite Type |
|---------|---------------|--------|-----|------------|
| Octets: | 1 | 1 | 3 | 1 |

Figure 9-376—Cipher Suite subelement format

The OUI and Suite Type fields identify the cipher suite, and the cipher suite selector is one of the values in Table 9-131.

The format for the Collocated Radio Type subelement is shown in Figure 9-377.

| | Subelement ID | Length | Collocated Radio Type |
|---------|---------------|--------|-----------------------|
| Octets: | 1 | 1 | 1 |

Figure 9-377—Collocated Radio Type subelement format

The Collocated Radio Type subelement contains a 1-octet field indicating the type of collocated radio and is one of the values in Table 9-183. The method that a STA uses to obtain the information on the Collocated Radio is out of the scope of this standard.

Table 9-183—Collocated Radio Type

| Collocated Radio Type | Value |
|----------------------------|--------|
| Reserved | 0 |
| Cellular | 1 |
| Cordless | 2 |
| GPS | 3 |
| IEEE 802.11™ | 4 |

| Digital Video Broadcasting | 10 |
| Reserved | 11–255 |

The Device Type subelement reports the type of device in which the IEEE 802.11 STA resides. The format of the Device Type subelement is shown in Figure 9-378.

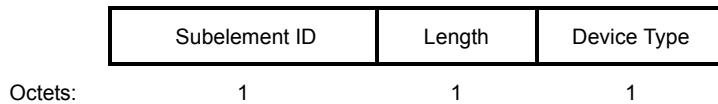

Figure 9-378—Device Type subelement format

The Device Type field is a 1-octet field indicating the category of device.²⁷ The numerical assignment to each device type category is defined in Table 9-184.

Table 9-184—Device Type definitions

| Device Type | Value |
|--|-------|
| Reserved | 0 |
| Reference Design | 1 |
| Access Point or Wireless Router for Home or Small Office | 2 |
| Enterprise Access Point | 3 |
| Cable, DSL or Other Broadband Gateway | 4 |
| Digital Still Camera | 5 |

²⁷The category of device is based on the Wi-Fi Alliance category definitions found at http://www.wi-fi.org/knowledge_center/insist-on-wifi-certified.

Table 9-184—Device Type definitions (continued)

| Device Type | Value |
|--|---------|
| Portable Video Camera | 6 |
| Networked Web Camera | 7 |
| Digital Audio—Stationary | 8 |
| Digital Audio—Portable | 9 |
| Set-Top Box, Media Extender, Media Server (includes players & recorders) | 10 |
| Display Device (television, monitor, picture frame) | 11 |

| Reserved | 26-220 |
| Other devices | 221 |
| Reserved | 222-255 |

The format for the EAP Method subelement is shown in Figure 9-379.

Figure 9-379—EAP Method subelement format

The EAP Type field contains a value that identifies a single EAP method and is any valid IANA assigned EAP type.

The EAP Vendor ID field contains a value that identifies the EAP Vendor. The EAP Vendor ID field is included when EAP Type field is 254 and is excluded otherwise.

The EAP Vendor Type field contains a value that identifies the EAP Type as defined by the vendor. The EAP Vendor Type field is included when EAP Type field is 254 and is excluded otherwise.

The format for the Firmware Version subelement is shown in Figure 9-380.

| Subelement ID | Length | Firmware Version |
|---------------|--------|------------------|
| Octets: 1 | 1 | variable |

Figure 9-380—Firmware Version subelement format

This Firmware Version field contains an ASCII string identifying the version of firmware currently installed on the wireless network adaptor.

The format for the MAC Address subelement is shown in Figure 9-381.

| Subelement ID | Length | MAC Address |
|---------------|--------|-------------|
| Octets: 1 | 1 | 6 |

Figure 9-381—MAC Address subelement format

This MAC Address field contains the 6-octet IEEE 802 MAC address of the STA.

The format for the Manufacturer ID String subelement is shown in Figure 9-382.

| Subelement ID | Length | ID |
|---------------|--------|----------|
| Octets: 1 | 1 | variable |

Figure 9-382—Manufacturer ID String subelement format

The ID field contains an ASCII string indicating the manufacturer identifier of the wireless network adaptor.

The format for the Manufacturer Model String subelement is shown in Figure 9-383.

| Subelement ID | Length | Model |
|---------------|--------|----------|
| Octets: 1 | 1 | variable |

Figure 9-383—Manufacturer Model String subelement format

The Model field contains an ASCII string indicating the model of the wireless network adaptor.

The format for the Manufacturer OI subelement is shown in Figure 9-384.

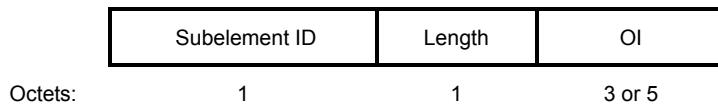

Figure 9-384—Manufacturer OI subelement format

The OI field contains an organization identifier, as defined in 9.4.1.32.

The format for the Manufacturer Serial Number String subelement is shown in Figure 9-385.

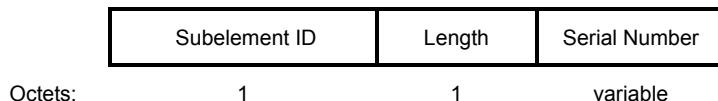

Figure 9-385—Manufacturer Serial Number String subelement format

The Serial Number field contains an ASCII string indicating the serial number of the wireless network adaptor.

The format for the Power Save Mode subelement is shown in Figure 9-386.

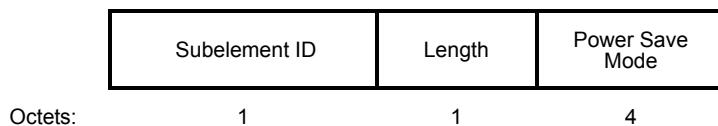

Figure 9-386—Power Save Mode subelement format

The Power Save Mode field is a bitmap field that indicates the power save mode(s) in use by the STA, as defined in Table 9-185.

Table 9-185—Power Save Mode definition

| Power Save Mode | Bit |
|--------------------------------------|-----|
| Unknown | 0 |
| None | 1 |
| PS mode (ReceiveDTIMs=1, see 11.2.3) | 2 |
| PS mode (ReceiveDTIMs=0, see 11.2.3) | 3 |
| U-APSD (see 11.2.3.5) | 4 |
| S-APSD (see 11.2.3.5) | 5 |
| U-PSMP (see 10.29) | 6 |
| S-PSMP (see 10.29) | 7 |
| SM power save (see 11.2.6) | 8 |
| WNM sleep mode (see 11.2.3.18) | 9 |
| FMS (see 11.2.3.16) | 10 |
| TIM broadcast (see 11.2.3.17) | 11 |

Table 9-185—Power Save Mode definition (continued)

| Power Save Mode | Bit |
|-------------------------------|-------|
| TFS (see 11.24.12) | 12 |
| TPU (see 11.2.3.15) | 13 |
| TDLS peer PSM (see 11.2.3.14) | 14 |
| TXOP power save mode | 15 |
| Reserved | 16–31 |

The format for the Profile ID subelement is shown in Figure 9-387.

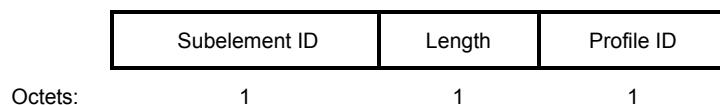

Figure 9-387—Profile ID subelement format

The Profile ID field contains a unique identifier for referencing a configuration profile available on a device. The value of the identifier is uniquely associated to a single configuration profile on the device sending the identifier.

The format for the Supported Operating Classes subelement is shown in Figure 9-388.

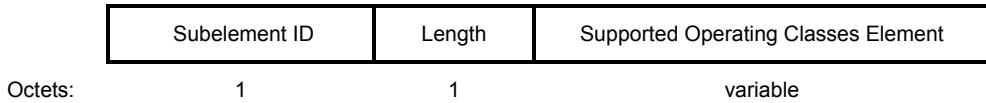

Figure 9-388—Supported Operating Classes subelement format

The Supported Operating Classes Element field contains the Supported Operating Classes element, as defined in 9.4.2.54.

The format for the Status Code subelement is shown in Figure 9-389.

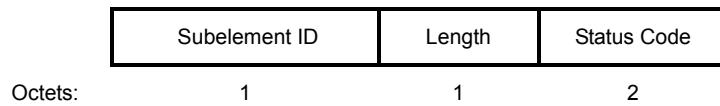

Figure 9-389—Status Code subelement format

The Status Code field contains the final IEEE 802.11 Status code, as defined in Table 9-46 in 9.4.1.9, received at the end of the applicable operation.

The format for the SSID subelement is shown in Figure 9-390.

| | | | |
|---------|---------------|--------|---------|
| | Subelement ID | Length | SSID |
| Octets: | 1 | 1 | 0 to 32 |

Figure 9-390—SSID subelement format

The SSID field contains a Service Set Identifier with a maximum length of 32 octets, as defined in 9.4.2.2.

The format for the Tx Power Capability subelement is shown in Figure 9-391.

| | | | | |
|---------|---------------|--------|---------------|----------|
| | Subelement ID | Length | Tx Power Mode | Tx Power |
| Octets: | 1 | 1 | 1 | variable |

Figure 9-391—Tx Power Capability subelement format

The Tx Power Mode field identifies the transmit power mode of the non-AP STA and is one of the values in Table 9-186.

Table 9-186—Tx Power Modes

| Tx Power Mode | Value |
|---------------|-------|
| Discrete | 0 |
| Range | 1 |
| Reserved | 2–255 |

The Tx Power field indicates the target transmit power level(s) at the antenna(s) (i.e., EIRP), where the actual power is within ± 5 dB to the target. Each transmit power level is encoded in a single octet as a 2s complement value in dBm, rounded to the nearest integer. If the Tx Power Mode field is 0 then the Tx Power field contains one or more transmit power levels in increasing numerical order. If the Tx Power Mode field is 1, the Tx Power field contains the STA's minimum and nonzero maximum transmit power levels, in that order.

The format for the Certificate ID subelement is shown in Figure 9-392.

| | | | |
|---------|---------------|--------|----------------|
| | Subelement ID | Length | Certificate ID |
| Octets: | 1 | 1 | variable |

Figure 9-392—Certificate ID subelement format

The Certificate ID field contains an UTF-8 string indicating an identifier assigned to the STA in a manner outside the scope of the standard. The Certificate ID typically takes the form of “WFA3991” and might be used by a receiving STA to look up the certificate assigned to that ID.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26).

9.4.2.70 Diagnostic Report element

9.4.2.70.1 Diagnostic report definition

The Diagnostic Report element contains a Diagnostic report. The format of the Diagnostic Report element is shown in Figure 9-393.

| Element ID | Length | Diagnostic Token | Diagnostic Report Type | Diagnostic Status | Diagnostic Subelements |
|------------|--------|------------------|------------------------|-------------------|------------------------|
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-393—Diagnostic Report element format

The Element ID and Length fields are defined in 9.4.2.1. The minimum value of the Length field is 3.

The Diagnostic Token field is the Diagnostic Token in the corresponding Diagnostic Request element.

The Diagnostic Report Type field is a number that identifies the Diagnostic report. The Diagnostic Report Types are defined in Table 9-178.

The Diagnostic Status field is a value in Table 9-175 (see 9.4.2.68), indicating the STA's response to the diagnostic request indicated by the diagnostic token.

The Diagnostic Subelements field contains the results of the diagnostic request.

The Diagnostic Subelements field contains the diagnostic subelement values, defined in 9.4.2.69.5 corresponding to the Diagnostic Report Type field value.

The Diagnostic Report element is included in a Diagnostic Report frame, as described in 9.6.14.5. The use of Diagnostic Report element and frames is described in 11.24.3.

9.4.2.70.2 Manufacturer Information STA Report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Manufacturer Information STA Report is shown in Table 9-187. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-187—Manufacturer Information STA report contents

| Order | Subelement |
|-------|-----------------------------------|
| 1 | Manufacturer OI |
| 2 | Manufacturer ID string |
| 3 | Manufacturer model string |
| 4 | Manufacturer serial number string |
| 6 | Firmware Version |
| 7 | Antenna Type |

Table 9-187—Manufacturer Information STA report contents (continued)

| Order | Subelement |
|-------|-----------------------|
| 8 | Collocated Radio Type |
| 9 | Device Type |
| 10 | Certificate ID |

9.4.2.70.3 Configuration Profile report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Configuration Profile is shown in Table 9-188. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-188—Configuration Profile report contents

| Order | Subelement |
|-------|-----------------------------|
| 1 | Profile ID |
| 2 | Supported Operating Classes |
| 3 | Tx Power |
| 4 | Cipher Suite |
| 5 | AKM Suite |
| 6 | EAP Method |
| 7 | Credential Type |
| 8 | SSID |
| 9 | Power Save Mode |

9.4.2.70.4 Association Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type Association Diagnostic is shown in Table 9-189. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-189—Association Diagnostic report contents

| Order | Subelement |
|-------|---------------|
| 1 | AP Descriptor |
| 2 | Status Code |

9.4.2.70.5 IEEE 802.1X Authentication Diagnostic report

The contents of the Diagnostic Subelements field of a Diagnostic Report element of type IEEE 802.1X Authentication Diagnostic is shown in Table 9-190. The corresponding Diagnostic subelements are defined in 9.4.2.69.5.

Table 9-190—IEEE 802.1X Authentication Diagnostic report contents

| Order | Subelement |
|-------|-----------------|
| 1 | AP Descriptor |
| 2 | EAP Method |
| 3 | Credential Type |
| 4 | Status Code |

9.4.2.70.6 Vendor Specific diagnostic report

The contents of the Diagnostic subelements field of a Diagnostic Report element of type Vendor Specific contains zero or more Vendor Specific subelements that have the same formats as Vendor Specific elements in 9.4.2.26.

9.4.2.71 Location Parameters element

9.4.2.71.1 Location Parameters definition

The Location Parameters element is used for location services. The format of this element is shown in Figure 9-394.

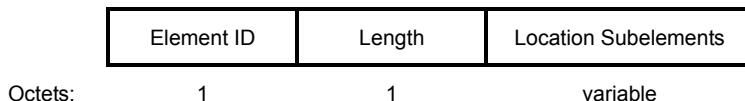

Figure 9-394—Location Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The Location Subelements field contains one or more Location subelements described in Table 9-191.

Table 9-191—Optional subelement IDs for Location Parameters

| Subelement ID | Subelement name |
|---------------|---|
| 1 | Location Indication Parameters (see 9.4.2.71.2) |
| 2 | Location Indication Channels (see 9.4.2.71.3) |
| 3 | Location Status (see 9.4.2.71.4) |
| 4 | Radio (see 9.4.2.71.5) |

Table 9-191—Optional subelement IDs for Location Parameters (continued)

| Subelement ID | Subelement name |
|---------------|--|
| 5 | Motion (see 9.4.2.71.6) |
| 6 | Location Indication Broadcast Data Rate (see 9.4.2.71.7) |
| 7 | Time of Departure (see 9.4.2.71.8) |
| 8 | Location Indication Options (see 9.4.2.71.9) |
| 9–220 | Reserved |
| 221 | Vendor Specific (see 9.4.2.26) |
| 222–255 | Reserved |

The Location Parameters element is included in Location Configuration Request frames, as described in 9.6.14.6; Location Configuration Response frames, as described in 9.6.14.7; and Location Track Notification frames, as described in 9.6.8.17. The use of the Location Parameters element is described in 11.24.4.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26). Multiple Vendor Specific subelements are optionally present in the list of Optional subelements.

9.4.2.71.2 Location Indication Parameters subelement

The Location Indication Parameters subelement contains STA location reporting characteristics. The format of the Location Indication Parameters subelement is shown in Figure 9-395.

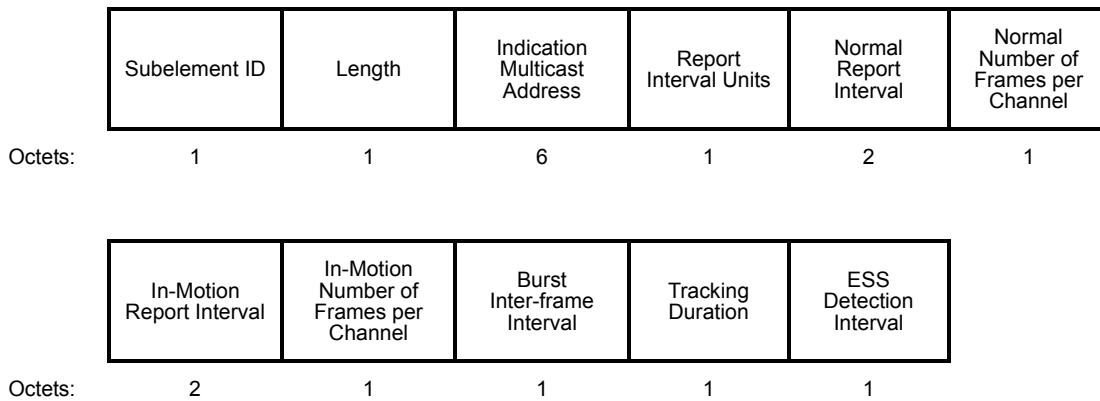

Figure 9-395—Location Indication Parameters subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

Except in Location Track Notification frames sent in an IBSS, the Indication Multicast Address field specifies the destination address to which the Location Track Notification frames are sent. The value of this field is a locally administered group address formed according to the procedure defined in 11.24.4.1. The field is reserved when Location Track Notification frames are transmitted in an IBSS.

The Report Interval Units field contains the units used for the Normal Report Interval field and In-Motion Report Interval field, as indicated in Table 9-192.

Table 9-192—Report Interval Units field

| Report Interval Units | Description |
|-----------------------|--------------|
| 0 | Hours |
| 1 | Minutes |
| 2 | Seconds |
| 3 | Milliseconds |
| 4–255 | Reserved |

The Normal Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the reporting STA is expected to transmit one or more Location Track Notification frames if either dot11MotionDetectionActivated is false or the STA is stationary. The STA does not transmit Location Track Notification frames when the Normal Report Interval is 0.

The Normal Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each Normal Report Interval.

Motion is the act or process of moving, or a particular action or movement relative to the point at which the STA is configured to send Location Track Notification frames. Motion might be detected using one of the following criteria:

- Detection of speed that is greater or equal to 0.5 m/sec.
- Detection of movement or vibration, for example by a ball-in-tube sensor or accelerometer or other means.

The exact criteria and mechanism to detect motion is out of scope for this standard.

The In-Motion Report Interval is the time interval, expressed in the units indicated in the Report Interval Units field, at which the STA reports its location by sending a Location Track Notification frame when the reporting STA is in motion. If dot11MotionDetectionActivated is false, this field is 0.

The In-Motion Number of Frames per Channel is the number of Location Track Notification frames per channel sent or expected to be sent by the STA at each In-Motion Report Interval. If dot11MotionDetectionActivated is false, this field is 0.

The Burst Inter-frame Interval is the target time interval, expressed in milliseconds, between the transmissions of each of the Normal or In-Motion frames on the same channel. The Burst Inter-frame interval value is 0 to indicate that frames are transmitted with no target inter-frame delay.

The Tracking Duration is the amount of time, in minutes, that a STA sends the Location Track Notification frames. The duration starts as soon as the STA sends a Location Configuration Response frame with a Location Status value of Success. If the Tracking Duration value is a nonzero value the STA sends Location Track Notification frames, based on the Normal and In-Motion Report Interval field values, until the duration ends. If the Tracking Duration is 0 the STA continuously sends Location Track Notification frames as defined by Normal and In-Motion Report Interval field values until transmission is terminated based on the procedures detailed in 11.24.4.2.

The ESS Detection Interval is the periodicity, in minutes, that a STA checks for beacons transmitted by one or more APs belonging to the same ESS that configured the STA. If no beacons from the ESS are received for this period, the STA terminates transmission of Location Track Notification frames, as described in the procedures detailed in 11.24.4.2. The ESS Detection Interval field is not used when the ESS Detection Interval field value is 0.

9.4.2.71.3 Location Indication Channels subelement

The Location Indication Channels subelement contains location reporting channel information. The format of the Location Indication Channels subelement format is shown in Figure 9-396.

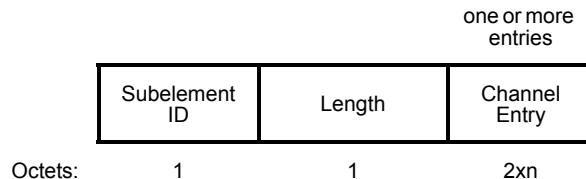

Figure 9-396—Location Indication Channels subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Channel Entry field includes one or more Operating Class and Channel fields (see Figure 9-88).

The Operating Class subfield of the Operating Class and Channel field indicates the frequency band on which a STA transmits Location Track Notification frames.

The Channel subfield of the Operating Class and Channel field indicates a channel number on which a STA sends or an ESS expects to receive Location Track Notification frames.

The Operating Class and Channel fields can be grouped together to identify a noncontiguous channel. A noncontiguous channel is indicated by a group of $N+1$ Operating Class and Channel fields where the first N Operating Class and Channel fields contain an Operating Class subfield with an 80+ behavior limit and the last Operating Class and Channel field in the group contains an Operating Class subfield without an 80+ behavior limit (as defined in Annex E).

9.4.2.71.4 Location Status subelement

The Location Status subelement provides the result of a Location Request or Location Configuration Request frame. The format of the Location Status subelement is shown in Figure 9-397.

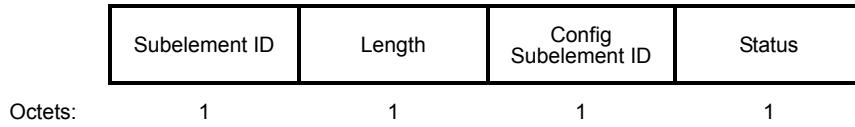

Figure 9-397—Location Status subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Config Subelement ID field is a specific Location Parameters subelement ID transmitted in a Location Configuration Request frame as defined in Table 9-191.

A Location Status subelement is included for each configuration subelement in the Location Configuration Request frame, except when all status values are the same. When all status values are the same, one Location Status subelement is included with the Config subelement ID set to 0 in the Location Configuration Response frame.

The Status field identifies the result of the Location Request frame and is one of the values in Table 9-175.

9.4.2.71.5 Radio subelement

The Radio subelement contains radio information. The format of the Radio subelement is shown in Figure 9-398.

| Subelement ID | Length | Transmit Power | Antenna ID | Antenna Gain | RSNI | RCPI |
|---------------|--------|----------------|------------|--------------|------|------|
| Octets: | 1 | 1 | 1 | 1 | 1 | 1 |

Figure 9-398—Radio subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Transmit Power field is the transmit power used to transmit the current Location Track Notification frame containing the Location Parameters element with the Radio subelement and is a signed integer, 1 octet in length, reported as an EIRP in dBm. A value of –128 indicates that the transmit power is unknown. The tolerance for the transmit power value reported in the Radio subelement is ± 5 dB. This tolerance is defined as the maximum possible difference, in decibels, between the reported power value and the total transmitted power across all antennas of the STA, which are measured when transmitting Location Request frames.

The Antenna ID field is the identifying number for the antenna used to transmit the Location Request frame. The Antenna ID is defined in 9.4.2.40.

The Antenna Gain field is the antenna gain of the antenna (or group of antennas) over which the Location Track Notification frame is transmitted and is a signed integer, 1 octet in length, reported in dB. A value of –128 indicates that the antenna gain is unknown.

The RSNI field contains the RSNI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RSNI value is defined in 9.4.2.41. A value of 255 indicates that the RSNI value is unknown or is not used.

The RCPI field contains the RCPI value measured against the most recently received Location Configuration Request frame requesting that a Radio subelement be included in the Location Track Notification frame. The RCPI value is defined in 9.4.2.38. A value of 255 indicates that the RCPI value is unknown or is not used.

9.4.2.71.6 Motion subelement

The Motion subelement contains motion information. The format of the Motion subelement is shown in Figure 9-399.

| | | | | | | |
|---------------|--------|------------------|---------|-------------|------------------|----------------|
| Subelement ID | Length | Motion Indicator | Bearing | Speed Units | Horizontal Speed | Vertical Speed |
| Octets: | 1 | 1 | 1 | 2 | 1 | 2 |

Figure 9-399—Motion subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Motion Indicator field is defined in Table 9-193. The mechanism that a STA uses to determine the value or transitions from one value to another of the Motion Indicator field is beyond the scope of the standard.

Table 9-193—Motion Indicator field

| Motion Indicator value | Description |
|------------------------|--|
| 0 | Stationary: the device is stationary and not in motion. |
| 1 | Start of motion: the device was stationary and is now in motion. |
| 2 | In motion: the device is and has been in motion. |
| 3 | End of motion: the device was in motion and is now stationary. |
| 4 | Unknown: information related to motion is unknown. |
| 5–255 | Reserved |

The Bearing field, defined by a 2-octet unsigned integer, specifies the direction that the STA is traveling with relation to true north, increasing clockwise, measured in degrees from 0° to 359°. If the Bearing value is unknown, the field is 65 535.

The Speed Units field contains the units for both Horizontal and Vertical Speed field, as defined in Table 9-194.

Table 9-194—Speed Units

| Speed Units Value | Description |
|-------------------|------------------------|
| 0 | Centimeters per second |
| 1 | Meters per second |
| 2–255 | Reserved |

The Horizontal Speed field contains the horizontal speed of the STA expressed in the units indicated in the Speed Units field. If the Horizontal Speed value is unknown, the field is 65 535.

The Vertical Speed field is a 2s complement signed integer indicating the vertical speed of the STA expressed in the units indicated in the Speed Units field. If the Vertical Speed value is unknown or greater than 32 766, the field is 32 767. If the Vertical Speed value is less than –32 767, the field is –32 768.

The Motion subelement field values are valid at the time of transmission of the Location Track Notification frame containing the subelement.

9.4.2.71.7 Location Indication Broadcast Data Rate subelement

The Location Indication Broadcast Data Rate subelement contains location reporting transmission rate information. The format of the Location Indication Broadcast Data Rate subelement format is shown in Figure 9-400.

| | | |
|---------------|--------|----------------------------|
| Subelement ID | Length | Broadcast Target Data Rate |
| Octets: | 1 | 1 |

Figure 9-400—Location Indication Broadcast Data Rate subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Broadcast Target Data Rate field specifies the target data rate at which the STA transmits Location Track Notification frames. The Broadcast Target Data Rate field format is specified by the Rate Identification field defined in 9.4.1.33. A value of 0 indicates the STA transmits Location Track Notification frames at a rate chosen by the STA transmitting the Location Track Notification frames.

9.4.2.71.8 Time of Departure subelement

The Time of Departure subelement contains time of departure information for the Location Track Notification frame including the subelement. The format of the Time of Departure subelement is shown in Figure 9-401.

| | | | | |
|---------------|--------|---------------|---------|----------------|
| Subelement ID | Length | TOD Timestamp | TOD RMS | TOD Clock Rate |
| Octets: | 1 | 1 | 4 | 2 |

Figure 9-401—Time of Departure subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The TOD Timestamp field specifies when the first frame energy is sent by the transmitting port in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field. The reported TOD timestamp value is determined from the TIME_OF_DEPARTURE parameter within the PHY-TXSTART.confirm primitive.

The TOD RMS field specifies the RMS time of departure error in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field, where the time of departure error equals the difference between the TOD Timestamp field and the time of departure measured by a reference entity using a clock synchronized to the start time and mean frequency of the local PHY entity's clock. The TOD RMS field is determined from aTxPHYTxStartRMS in units equal to 1/TOD Clock Rate, where the TOD Clock Rate is specified in the TOD Clock Rate field.

The TOD Clock Rate field contains the clock rate used to generate the TOD timestamp value reported in the TOD Timestamp field, and it is specified in units of MHz.

9.4.2.71.9 Location Indication Options subelement

The Location Indication Options subelement contains the options for the STA when transmitting the Location Track Notification frame. The format of the Location Indication Options subelement is shown in Figure 9-402.

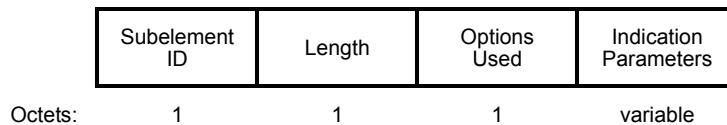

Figure 9-402—Location Indication Options subelement

The Subelement ID field is defined in Table 9-191.

The Length field is defined in 9.4.3.

The Options Used field specifies which Indication Parameter fields in the Location Indication Options subelement are used. The format of the Options Used field is shown in Figure 9-403.

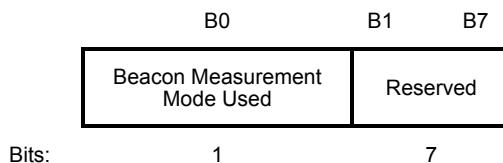

Figure 9-403—Options Used field format

The Indication Parameters field defines a sequence of optional fields that are included in the Location Indication Options subelement based on the Options Used field value. The value of the Indication Parameters field is defined in Table 9-195.

Table 9-195—Indication Parameter values

| Order | Field length | Field | Description |
|-------|--------------|-------------------------|---|
| 1 | 1 | Beacon Measurement Mode | The Beacon Measurement Mode field is the mode of beacon measurement, as defined in Table 9-87. The results of the beacon measurement are included in the Location Track Notification frame, as described in 9.6.8.17 and 11.24.4.2. |
| 2–8 | | Reserved | |

9.4.2.72 Nontransmitted BSSID Capability element

The format of the Nontransmitted BSSID Capability element is shown in Figure 9-404.

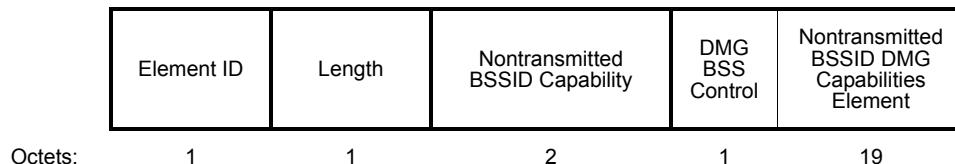

Figure 9-404—Nontransmitted BSSID Capability element format

When transmitted by a DMG STA, the Nontransmitted BSSID Capability element includes the DMG BSS Control and the Nontransmitted BSSID DMG Capabilities Element fields. These fields are not present if this element is transmitted by non-DMG STAs.

The Element ID and Length fields are defined in 9.4.2.1.

The Nontransmitted BSSID Capability field contains the contents of the Capability Information field in beacons for the BSS when transmitted by a non-DMG STA. When transmitted by a DMG STA, the Nontransmitted BSSID Capability field is reserved.

The Nontransmitted BSSID Capability element is included in the Nontransmitted BSSID Profile subelement of the Multiple BSSID element defined in 9.4.2.46. The use of the Multiple BSSID element is described in 11.11.14 and Nontransmitted BSSID advertisement procedures are described in 11.1.3.8.

The DMG BSS Control field is defined in Figure 9-405.

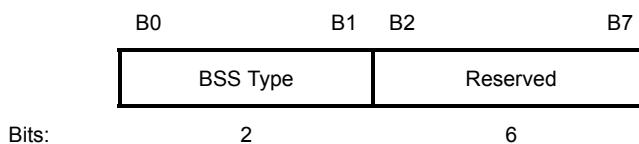

Figure 9-405—DMG BSS Control field format

The BSS Type field is as defined in 9.4.1.47.

The Nontransmitted BSSID DMG Capabilities Element field contains the DMG Capabilities element of the DMG STA.

9.4.2.73 SSID List element

The format of the SSID List element is shown in Figure 9-406.

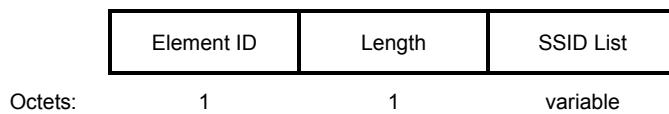

Figure 9-406—SSID List element format

The Element ID and Length fields are defined in 9.4.2.1.

The SSID List field is a list of SSID elements for which the STA is requesting information.

The SSID List element is included in Probe Request frames, as described in 9.3.3.10. The use of the SSID List element and frames is described in 11.1.4.

9.4.2.74 Multiple BSSID-Index element

The format of the Multiple BSSID-Index element is shown in Figure 9-407.

| | | | | | |
|---------|------------|--------|-------------|------------------------|-----------------------|
| Octets: | 1 | 1 | 1 | 0 or 1 | 0 or 1 |
| | Element ID | Length | BSSID Index | DTIM Period (optional) | DTIM Count (optional) |

Figure 9-407—Multiple BSSID-Index element format

The Element ID and Length fields are defined in 9.4.2.1. The value of the Length field is 1 octet when the Multiple BSSID-Index element is included in the Probe Response frame and otherwise is three octets.

The BSSID Index field is a value between 1 and $2^n - 1$ that identifies the nontransmitted BSSID, where n is a nonzero, positive integer value.

The DTIM Period field indicates the DTIM period for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The DTIM Count field indicates the DTIM count for the BSSID. This field is not present when the Multiple BSSID-Index element is included in the Probe Response frame.

The Multiple BSSID-index element is included in the nontransmitted BSSID profile element, as described in 11.1.3.8. The use of the Multiple BSSID element and frames is described in 11.11.14.

9.4.2.75 FMS Descriptor element

The FMS Descriptor element defines information about group addressed BUs buffered at the AP. It is present in the Beacon frames when dot11FMSActivated is true. The format of the FMS Descriptor element is shown in Figure 9-408.

| | | | | | |
|---------|------------|--------|------------------------|--------------|--------|
| Octets: | 1 | 1 | 1 | n | m |
| | Element ID | Length | Number of FMS Counters | FMS Counters | FMSIDs |

zero or more FMS Counters zero or more FMSIDs

Figure 9-408—FMS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The Number of FMS Counters field defines the number of FMS Counters fields that are contained in the FMS Descriptor element.

The FMS Counters field contains zero or more FMS Counters. The format of the FMS Counter is shown in Figure 9-409. When one or more FMS streams are accepted at the AP, at least one FMS counter is present in the FMS Descriptor element. A maximum of eight FMS counters are permitted. The FMS counters are used

by the non-AP STA to identify the DTIM beacon after which group addressed BUs assigned to a particular delivery interval are transmitted. A single FMS Counter is shared by all FMS streams that use the same delivery interval.

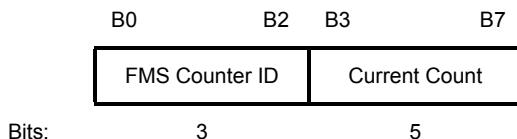

Figure 9-409—FMS Counter format

The FMS Counter ID field is a 3-bit value that represents the counter ID assigned by the AP for a particular FMS stream.

The Current Count field indicates how many DTIM Beacon frames (including the current one) appear before the next DTIM Beacon frame after which the group addressed BUs assigned to a particular delivery interval are scheduled to be transmitted.

The FMSIDs field contains zero or more FMSIDs. Each FMSID is a 1-octet identifier assigned by the AP.

Inclusion of an FMSID indicates the AP has buffered BUs for the corresponding group addressed stream that is scheduled for transmission immediately after the DTIM Beacon frame.

The FMS Descriptor element is included in Beacon frames, as described in 9.3.3.3. The use of the FMS Descriptor element and frames is described in 11.2.3.16.

9.4.2.76 FMS Request element

The FMS Request element defines information about the group addressed frames being requested by the non-AP STA. The format of FMS Request element is shown in Figure 9-410.

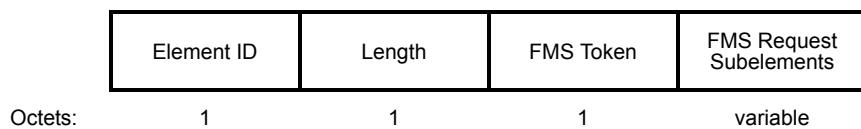

Figure 9-410—FMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field contains a unique identifier for the FMS Stream Set that is the set of FMS subelements specified in the request. If this is a new request, then the FMS Token field is set to 0. Otherwise, the FMS Token field is set to the value assigned by the AP in the FMS Response element.

The FMS Request Subelements field contains one or more FMS Request subelements described in Table 9-196.

The format of the FMS subelement is shown in Figure 9-411.

The Subelement ID field is 1 to uniquely identify this subelement as the FMS subelement.

The Length field is defined in 9.4.3.

Table 9-196—Optional subelement IDs for FMS Request subelements

| Subelement ID | Subelement name |
|---------------|----------------------------|
| 0 | Reserved |
| 1 | FMS subelement |
| 2–220 | Reserved |
| 221 | Vendor Specific subelement |
| 222–255 | Reserved |

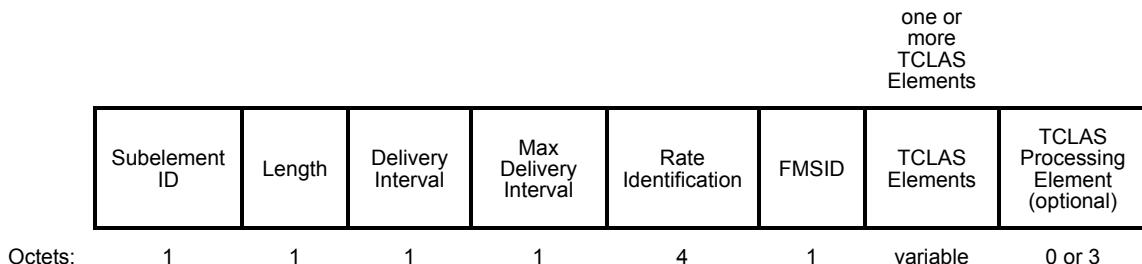

Figure 9-411—FMS subelement format

The Delivery Interval field defines the periodicity of stream transmission in units of DTIMs. The default value is 1. The value set to 0 indicates that requesting non-AP STA does not use the FMS stream identified by the TCLAS elements anymore.

The Max Delivery Interval field defines the maximum delivery interval the non-AP STA supports for the requested stream in units of DTIMs. The value set to 0 indicates that the non-AP STA is willing to accept any maximum delivery interval supported by the AP.

The Rate Identification field specifies the data rate as described in 9.4.1.33, at which the STA requests to receive group addressed frames. If the STA does not request a particular multicast rate, the Rate Identification field is 0.

The FMSID field contains a unique identifier for this stream. If this is a new request, the FMSID field is reserved. Otherwise, the FMSID is set to the value assigned by the AP in the FMS Response element.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.31. The number of TCLAS elements is limited and the total size of the FMS Request element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.33.

The FMS Request element is included in FMS Request frames, as described in 9.6.14.11. The use of the FMS Request element and frames is described in 11.2.3.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26).

9.4.2.77 FMS Response element

The FMS Response element provides information about the delivery of group addressed frames. The format of the FMS Response element is shown in Figure 9-412.

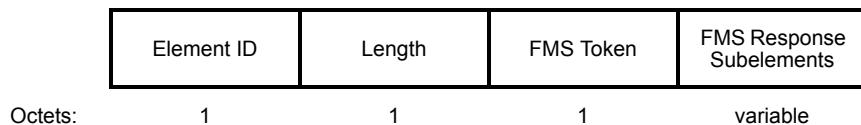

Figure 9-412—FMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The FMS Token field is assigned by the AP for the set of FMS streams that share the counter identified by the FMS Counter ID maintained in the AP.

The FMS Response Subelements field contains one or more FMS Response subelements described in Table 9-197.

Table 9-197—Optional subelement IDs for FMS Response subelements

| Subelement ID | Subelement name |
|---------------|----------------------------|
| 0 | Reserved |
| 1 | FMS Status subelement |
| 2 | TCLAS Status subelement |
| 3–220 | Reserved |
| 221 | Vendor Specific subelement |
| 222–255 | Reserved |

The format of the FMS Status subelement is shown in Figure 9-413.

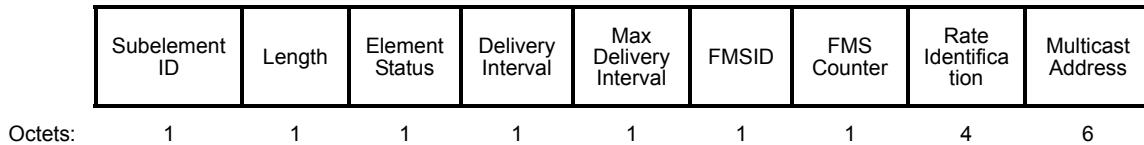

Figure 9-413—FMS Status subelement format

The Subelement ID field is 1 to uniquely identify this subelement as the FMS Status subelement.

The Length field is defined in 9.4.3.

The Element Status field indicates the status of STA's requested delivery interval, as indicated in Table 9-198, provided by the AP.

Table 9-198—FMS Element Status and TFS Response Status definition

| Value | Description |
|--------------|--|
| 0 | Accept |
| 1 | Deny, due to request format error or ambiguous classifier. |
| 2 | Deny, due to lack of resources on the AP. |
| 3 | Deny, due to requested classifier(s) matching 2 or more existing streams on different intervals. |
| 4 | Deny, by policy, requested stream or filter is not permitted to participate in the service. |
| 5 | Deny, reason unspecified. |
| 6 | Alternate proposed, due to existing stream with different delivery interval. |
| 7 | Alternate proposed, due to policy limits on the AP. |
| 8 | Alternate proposed, because the AP changed the delivery interval. |
| 9 | Multicast rate changes not allowed. |
| 10 | Terminate, due to an AP policy change. |
| 11 | Terminate, due to lack of resources of the AP. |
| 12 | Terminate, due to other FMS stream with higher priority. |
| 13 | Alternate proposed, because the AP changed the maximum delivery interval. |
| 14 | Alternate proposed, because the AP is unable to provide requested TCLAS-based classifiers. |
| 15–255 | Reserved |

The Delivery Interval field defines the minimum integer of DTIM periods between successive transmissions of frames for the stream corresponding to that FMSID.

The Max Delivery Interval field defines the maximum delivery interval the AP uses for the stream corresponding to FMSID. The value set to 0 indicates that the AP has no maximum delivery interval for the stream identified by FMSID.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The format of the FMS Counter field is shown in Figure 9-409. The FMS Counter ID field of the FMS Counter field is defined in 9.4.2.75. The Current Count field of the FMS Counter field is reserved in the FMS Status subelement.

The Rate Identification field specifies the data rate as described in 9.4.1.33 to be used for the multicast service. If the value of the Rate Identification field is 0 then the data rate is undefined.

The Multicast MAC Address field contains the MAC address of the multicast traffic to which this FMS response relates.

The format of the TCLAS Status subelement is shown in Figure 9-414.

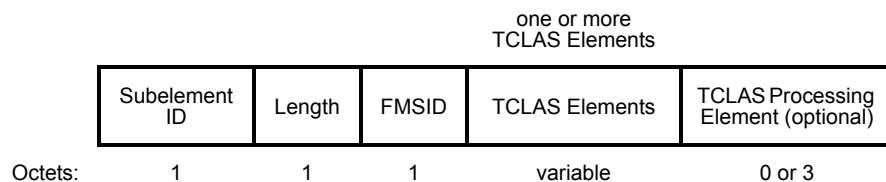

Figure 9-414—TCLAS Status subelement format

The Subelement ID field is 2 to uniquely identify this subelement as the TCLAS Status subelement.

The Length field is defined in 9.4.3.

The FMSID field is assigned by the AP and provides a unique identifier for this stream within the BSS.

The TCLAS Elements field contains one or more TCLAS elements to specify the traffic filter as defined in 9.4.2.31. The number of TCLAS elements is limited and the total size of the FMS Response element is less than or equal to 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.33.

The FMS Response element is included in FMS Response frames, as described in 9.6.14.12. The use of the FMS Response element and frames is described in 11.2.3.16.

The Vendor Specific subelements have the same format as their corresponding elements (see 9.4.2.26).

9.4.2.78 QoS Traffic Capability element

The QoS Traffic Capability element provides information about types of traffic generated by a non-AP QoS STA and is used by a QoS AP to indicate the access categories of associated non-AP QoS STAs. The format of the QoS Traffic Capability element is shown in Figure 9-415.

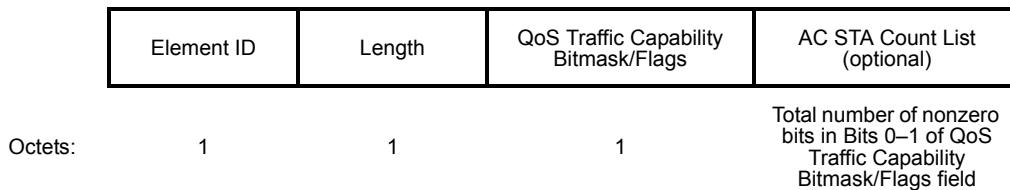

Figure 9-415—QoS Traffic Capability element format

The Element ID and Length fields are defined in 9.4.2.1. The value of the Length field is $1 + n$, where n equals the total number of nonzero bits in Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field.

The format of QoS Traffic Capability Bitmask/Flags field is defined in Table 9-199.

Bits 0–1 serve as QoS Traffic Capability Bitmask. The bitmask indicates the AC values that have the station count specified in the following AC STA Count List. An AP sets the bit to 1 to indicate that the station count for the corresponding AC is present in the AC STA Count List field. An AP sets the bit to 0 to indicate that the station count for the corresponding AC is not present in the AC STA Count List field. Bits 0–1 are reserved in a transmission to an AP.

Table 9-199—QoS Traffic Capability Bitmask/Flags definition

| Bit | Description |
|-----|--------------|
| 0 | AC_VO |
| 1 | AC_VI |
| 2 | Reserved |
| 3 | Reserved |
| 4 | UP 4 Traffic |
| 5 | UP 5 Traffic |
| 6 | UP 6 Traffic |
| 7 | Reserved |

Bits 4–6 serve as QoS Traffic Capability Flags. Each of Bits 4–6 serves as a flag for a non-AP STA to indicate application requirements about the user priorities of the traffic it generates. A non-AP STA sets the bit to 1 to indicate the existence of an application that requires generation of traffic belonging to the corresponding user priority (UP). A non-AP STA sets the bit to 0 to indicate that such application does not exist. Bits 4–6 are reserved in a transmission from an AP.

Bits 2–3 and Bit 7 are reserved.

The AC STA Count List comprises a sequence of STA Count fields corresponding to the nonzero bits in the Bits 0–1 of the QoS Traffic Capability Bitmask/Flags field. The STA Count field is 1 octet long and contains an unsigned integer, encoded according to 9.2.2. The STA Count field specifies the number of associated QoS STAs that have indicated QoS traffic capability of the corresponding AC. If the number of STAs is greater than 255, the STA Count field is 255. The AC STA Count List field is present only when the QoS AP transmits the QoS Traffic Capability element.

The QoS Traffic Capability element is included in Beacon frames, as described in 9.3.3.3; Probe Response frames, as described in 9.3.3.11; Association Request frames, as described in 9.3.3.6; and Reassociation Request frames, as described in 9.3.3.8.

9.4.2.79 BSS Max Idle Period element

The BSS Max Idle Period element contains the time period a non-AP STA can refrain from transmitting frames to the AP before the AP disassociates the STA due to inactivity. The format of the BSS Max Idle Period element is shown in Figure 9-416.

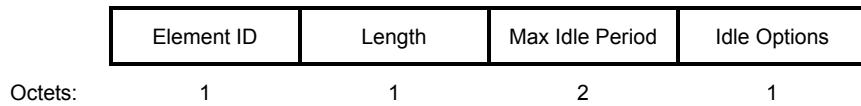

Figure 9-416—BSS Max Idle Period element format

The Element ID and Length fields are defined in 9.4.2.1.

The Max Idle Period field indicates the idle timeout limit, as described in 11.24.13.

The Idle Options field indicates the options associated with the BSS Idle capability. The Idle Options field is shown in Figure 9-417.

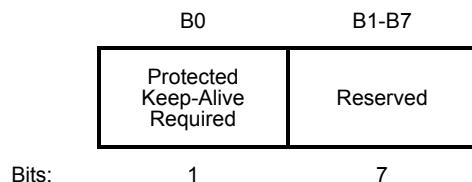

Figure 9-417—Idle Options field

The Protected Keep-Alive Required subfield is set to 1 to indicate that only a protected frame indicates activity. The Protected Keep-Alive Required subfield is set to 0 to indicate that either an unprotected or a protected frame indicates activity.

The BSS Max Idle Period element is included in Association Response frames, as described in 9.3.3.7, and Reassociation Response frames, as described in 9.3.3.9. The use of the BSS Max Idle Period element and frames is described in 11.24.13.

9.4.2.80 TFS Request element

The TFS Request element defines information about the traffic filters that are enabled at the AP for the requesting non-AP STA. The format of the TFS Request element is defined in Figure 9-418.

Figure 9-418—TFS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field is assigned by the STA and provides a unique identifier for the traffic filter set specified by the TFS Request Subelements field.

The TFS Action Code field defines the actions taken at the AP when a frame matches a traffic filter set. The functions of the bits in this field are shown in Table 9-200.

Table 9-200—TFS Action Code field values

| Bit(s) | Name | Notes |
|--------|--------------------|---|
| 0 | Delete After Match | Setting this field to 1 for any traffic filter set indicates all traffic filter sets established at the AP for the non-AP STA are deleted when a frame matches any of the traffic filter sets established for the non-AP STA. A value of 0 for this field indicates no deletion of the traffic filter set upon a match. |
| 1 | Notify | Setting this field to 1 indicates the STA is to be sent a TFS Notify frame upon the first frame matching to the traffic filter set or the first frame match after the AP receives a Notify Response frame containing the corresponding TFS ID. Setting this field to 0 indicates the AP does not send TFS Notify frame to the requesting STA. |
| 2–7 | Reserved | All other bits are reserved. |

The TFS Request Subelements field contains one or more TFS Request subelements described in Table 9-201. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-201. Each TFS Request subelement specifies one traffic filter. Using multiple TFS Request subelements in a TFS Request element is the equivalent to a logical AND operation on the match conditions of each TFS Request subelement.

Table 9-201—Optional subelement IDs for TFS Request parameters

| Subelement ID | Subelement name |
|-------------------------|----------------------------|
| 1 | TFS subelement |
| 221 | Vendor Specific subelement |
| 0, 2 to 220, 222 to 255 | Reserved |

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

The format of the TFS subelement is shown in Figure 9-419.

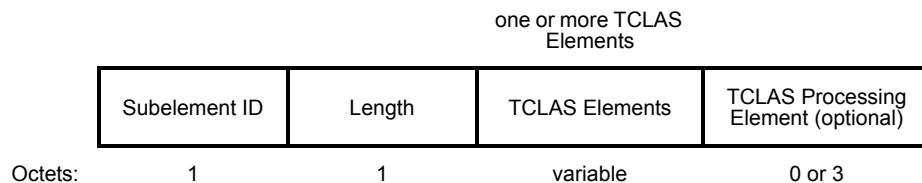

Figure 9-419—TFS subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS subelement.

The Length field is defined in 9.4.3.

The TCLAS Elements field contains one or more TCLAS elements, each specifying a set of filtering parameters as defined in 9.4.2.31. The number of TCLAS elements is limited and the total size of the TFS Request element is less than 255 octets.

The TCLAS Processing Element field is optionally present and defines how multiple TCLAS elements are processed as defined in 9.4.2.33.

The format of the Vendor Specific subelement for a TFS Request element is shown in Figure 9-420.

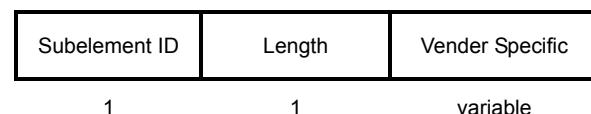

Figure 9-420—TFS Request Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Request subelement.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

The TFS Request element is included in TFS Request frames, as described in 9.6.14.15, and WNM Sleep Mode Request frames, as described in 9.6.14.19. The use of the TFS Request element and frames is described in 11.24.12.

9.4.2.81 TFS Response element

The TFS Response element defines information about the status of the requested filtering parameters. The format of the TFS Response element is defined in Figure 9-421.

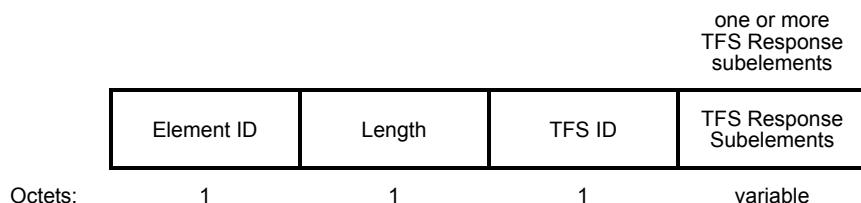

Figure 9-421—TFS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The TFS ID field indicates the unique ID for the TFS traffic filter set.

The TFS Response Subelements field contains one or more TFS Response subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-202.

In a TFS Response element, the number of the response subelements is the same as the number of the TFS Request subelements in the corresponding TFS Request element, where the TFS Response subelements appear in the same order as the corresponding TFS Request subelements in the corresponding TFS Request frame.

Table 9-202—Optional subelement IDs for TFS Response parameters

| Subelement ID | Subelement name |
|-------------------|----------------------------|
| 1 | TFS Status subelement |
| 221 | Vendor Specific subelement |
| 0, 2–220, 222–255 | Reserved |

A TFS Status subelement contains the information as defined in Figure 9-422.

| | | | |
|---------------|--------|---------------------|----------------------------|
| Subelement ID | Length | TFS Response Status | TFS Subelements (optional) |
| Octets: | 1 | 1 | 1 variable |

Figure 9-422—TFS Status subelement format

The Length field is defined in 9.4.3.

The TFS Response Status field indicates the status returned by the AP responding to the STA's requested traffic filter, as indicated in Table 9-198.

If present, the TFS Subelements field contains one or more TFS Request subelements containing the alternative filtering parameters preferred by the AP.

The format of the Vendor Specific subelement for a TFS Response element is shown in Figure 9-423.

| | | |
|---------------|--------|-----------------|
| Subelement ID | Length | Vendor Specific |
| Octets: | 1 | 1 variable |

Figure 9-423—TFS Response Vendor Specific subelement format

The Subelement ID field uniquely identifies this subelement to be the TFS Response subelement.

The Length field is defined in 9.4.3.

The Vendor Specific field contains the vendor specific information.

The TFS Response element is included in TFS Response frames, as described in 9.6.14.16, and WNM Sleep Mode Response frames, as described in 9.6.14.20. The use of the TFS Response element and frames is described in 11.24.12.

9.4.2.82 WNM Sleep Mode element

The WNM Sleep Mode element is used to enter and exit the WNM sleep mode. The format of the WNM Sleep Mode element is shown in Figure 9-424.

| | | | | |
|------------|--------|-------------|--------------------------------|--------------------|
| Element ID | Length | Action Type | WNM Sleep Mode Response Status | WNM Sleep Interval |
| Octets: | 1 | 1 | 1 | 2 |

Figure 9-424—WNM Sleep Mode element format

The Element ID and Length fields are defined in 9.4.2.1.

The Action Type field is a number that identifies the type of WNM sleep mode request and response. The Action Types are shown in Table 9-203.

Table 9-203—Action Type definitions

| Name | Action Type value |
|----------------------|-------------------|
| Enter WNM sleep mode | 0 |
| Exit WNM sleep mode | 1 |
| Reserved | 2–255 |

The WNM Sleep Mode Response Status field indicates the status returned by the AP responding to the non-AP STA's WNM sleep mode request as defined in Table 9-204. This field is valid only in the WNM Sleep Mode element in a WNM Sleep Mode Response frame and is reserved otherwise.

Table 9-204—WNM Sleep Mode Response Status definition

| Value | Description |
|-------|---|
| 0 | Enter/Exit WNM sleep mode Accept. |
| 1 | Exit WNM sleep mode Accept, GTK/IGTK update required. |
| 2 | Denied. The AP is unable to perform the requested action. |
| 3 | Denied temporarily. The AP is unable to perform the requested action at the current time. The request can be submitted again at a later time. |
| 4 | Denied. Due to the pending key expiration. |
| 5 | Denied. The requested action was not granted due to other WNM services in use by the requesting STA. |
| 6–255 | Reserved |

The WNM Sleep Interval field is reserved if the Action Type field is 1.

The WNM Sleep Interval field indicates to the AP how often a STA in WNM sleep mode wakes to receive Beacon frames, defined as the number of DTIM intervals. The value set to 0 indicates that the requesting non-AP STA does not wake up at any specific interval.

The WNM Sleep Mode element is included in WNM Sleep Mode Request frames, as described in 9.6.14.19, and WNM Sleep Mode Response frames, as described in 9.6.14.20. The use of the WNM Sleep Mode element and frames is described in 11.2.3.18.

9.4.2.83 TIM Broadcast Request element

The TIM Broadcast Request element contains information about the periodic TIM broadcast being requested by the non-AP STA. The format of the TIM Broadcast Request element is shown in Figure 9-425.

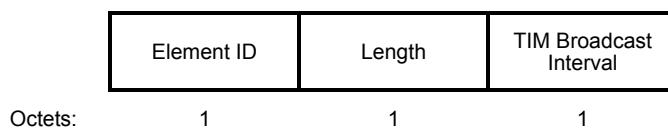

Figure 9-425—TIM Broadcast Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The TIM Broadcast Interval field is the number of beacon periods between TIM frame transmissions. A value of 0 terminates the use of TIM Broadcast for the requesting station.

The TIM Broadcast Request element is included in TIM Broadcast Request frames, as described in 9.6.14.21; Association Request frames, as described in 9.3.3.6; and Reassociation Request frames, as described in 9.3.3.8. The use of the TIM Broadcast Request element and frames is described in 11.2.3.17.

9.4.2.84 TIM Broadcast Response element

The TIM Broadcast Response element contains information about the periodic TIM broadcast by the AP. The format of the TIM Broadcast Response element is shown in Figure 9-426.

| Element ID | Length | Status | TIM Broadcast Interval (optional) | TIM Broadcast Offset (optional) | High Rate TIM Rate (optional) | Low Rate TIM Rate (optional) |
|------------|--------|--------|-----------------------------------|---------------------------------|-------------------------------|------------------------------|
| Octets: | 1 | 1 | 1 | 0 or 1 | 0 or 4 | 0 or 2 |

Figure 9-426—TIM Broadcast Response element format

The Element ID and Length fields are defined in 9.4.2.1. The value of the Length field is 1 or 10, depending on the presence of a TIM Broadcast schedule (TIM Broadcast Interval, TIM Broadcast Offset, High Rate TIM Rate, and Low Rate TIM Rate fields).

The Status field indicates the status of the AP responding to the STA's requested delivery interval, as indicated in Table 9-205.

Table 9-205—Status field values

| Field value | Description |
|-------------|---|
| 0 | Accept |
| 1 | Accept, valid timestamp present in TIM frames |
| 2 | Denied |
| 3 | Overridden |
| 4 | Overridden, valid timestamp present in TIM frames |
| 5–255 | Reserved |

When the Status field is 0, 1, 3 or 4, the TIM Broadcast Interval field, TIM Broadcast Offset field, High Rate TIM Rate field, and Low Rate TIM Rate field are included in the TIM Broadcast Response element.

The TIM Broadcast Interval field contains the number of beacon periods between scheduled TIM frame transmissions.

The TIM Broadcast Offset field contains the offset in microseconds with a tolerance of $\pm 4 \mu\text{s}$ relative to the TBTT for which a TIM frame is scheduled for transmission. The field contains a signed integer.

The High Rate TIM Rate field provides an indication of the rate that is used to transmit the high data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the high rate TIM frame is not transmitted.

The Low Rate TIM Rate field provides an indication of the rate that is used to transmit the low data rate TIM frame, in units of 0.5 Mb/s. A value of 0 indicates that the low rate TIM frame is not transmitted.

The TIM Broadcast Response element is included in TIM Broadcast Response frames, as described in 9.6.14.22; Association Response frames, as described in 9.3.3.7; and Reassociation Response frames, as described in 9.3.3.9. The use of the TIM Broadcast Response element and frames is described in 11.2.3.17.

9.4.2.85 Collocated Interference Report element

The Collocated Interference Report element contains some characteristics of the reported collocated interference. The Collocated Interference Report element is defined in Figure 9-427.

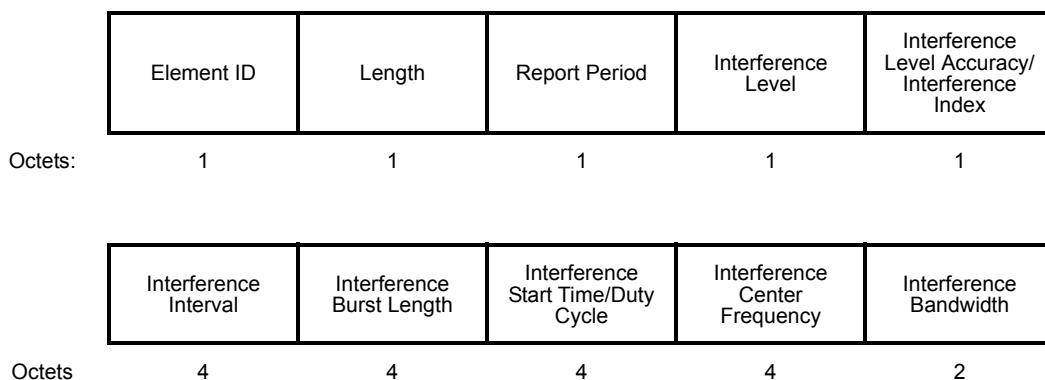

Figure 9-427—Collocated Interference Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Period field contains an unsigned integer value in units of 200 TUs. If the Report Period field is a value that is greater than 0, then the reporting is periodic, and the field contains the period of sending the report. If the Report Period field is 0, then the reporting is not periodic, and a report is generated when the STA knows of a change in the collocated interference. See 11.24.9 for further details.

The Interference Level field is a 2s complement signed integer indicating the maximum level of the collocated interference power in units of dBm over all receive chains averaged over a 4 μ s period during an interference period and across interference bandwidth. When the interference level is unknown, the field is +127 dBm. When the interference level is equal or greater than 126 dBm, the field is +126 dBm. If no collocated interference is present the field is -128 dBm. When the interference level is equal or lower than -127 dBm, the field is -127 dBm. The interference level is referenced to the antenna connector (see “antenna connector” in 3.1) used for reception, like RCPI.

The Interference Level Accuracy/Interference Index field is shown in Figure 9-428.

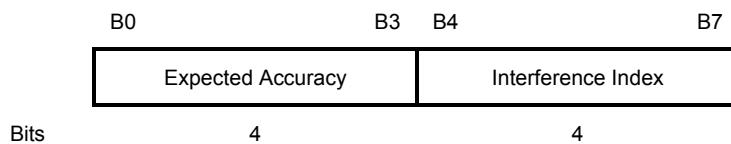

Figure 9-428—Interference Level Accuracy/Interference Index field format

The Expected Accuracy field represents an unsigned integer indicating the expected accuracy of the estimate of interference in dB with 95% confidence interval. If the Interference Level field is X (dBm) and the expected accuracy field is Y (dB), the actual interference level is in the range X – Y to X +Y with the probability of 95%. The range of expected accuracy is from 0 dB to 14 dB. If accuracy is unknown or greater than 14 dB, then the Expected Accuracy field is 15.

The Interference Index field indicates the interference index that is unique for each type of interference source. The field set to 0 indicates that no collocated interference is present. See 11.24.9 for further details.

The Interference Interval field indicates the interval between two successive periods of interference in microseconds. When the interval between two successive periods of interference is variable the field is $2^{32}-1$. When the interval between two successive periods of interference is equal or greater than $2^{32}-2$ the field is $2^{32}-2$. If no collocated interference is present, the field is 0.

The Interference Burst Length field indicates the duration of each period of interference in microseconds. When the duration of each period of interference is variable the field is $2^{32}-1$. When the duration of each period of interference is equal or greater than $2^{32}-2$ the field is $2^{32}-2$. If no collocated interference is present, the field is 0.

The Interference Start Time/Duty Cycle field contains the least significant 4 octets (i.e., B0–B31) of the TSF timer at the start of the interference burst. When either the Interference Interval or the Interference Burst Length fields are set to $2^{32}-1$, this field indicates the average duty cycle. The average duty cycle value is defined as follows:

$$\text{Average duty cycle} = \left\lfloor (2^{32}-2) \times \frac{T_B}{T_I} + 0.5 \right\rfloor$$

where

- T_B is the average interference burst length
- T_I is the average interference interval

When the interference is nonperiodic or no collocated interference is present, the Interference Start Time field is 0.

The Interference Center Frequency field indicates the center frequency of interference in units of 5 kHz. When center frequency is unknown, the center frequency of the STA's operating channel is reported. If no collocated interference is present the field is 0.

The Interference Bandwidth field indicates the bandwidth in units of 5 kHz at the –3 dB roll-off point of the interference signal. When bandwidth of the interference signal is unknown, the field is 65 535. When bandwidth of the interference signal is equal or greater than 65 534 the field is 65 534. If no collocated interference is present, the field is 0.

9.4.2.86 Channel Usage element

The Channel Usage element defines the channel usage information for BSSs that are not infrastructure BSSs or an off channel TDLS direct link. The format of the Channel Usage element is shown in Figure 9-429.

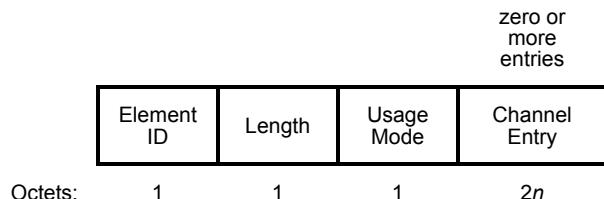

Figure 9-429—Channel Usage element format

The Element ID and Length fields are defined in 9.4.2.1.

The Usage Mode field is a number that identifies the usage of the recommended channels listed in the Operating Class/Channel Number pair fields. The Usage Mode definitions are shown in Table 9-206.

Table 9-206—Usage Mode definitions

| Value | Usage Mode |
|-------|---------------------------------------|
| 0 | Noninfrastructure IEEE 802.11 network |
| 1 | Off-channel TDLS direct link |
| 2–255 | Reserved |

The Channel Entry field includes zero or more Operating Class and Channel fields. The format of the Operating Class and Channel fields is defined in 9.4.1.22. Operating Class and Channel fields can be grouped together to identify a noncontiguous channel as described in 9.4.2.71.3.

The Channel Usage element can be included in Probe Request frames, as described in 9.3.3.10; Probe Response frames, as described in 9.3.3.11; Channel Usage Request frames, as described in 9.6.14.24; and Channel Usage Response frames, as described in 9.6.14.25. The use of the Channel Usage element and frames is described in 11.24.15.

9.4.2.87 Time Zone element

The Time Zone element contains the local time zone of the AP. The format of the Time Zone element is shown in Figure 9-430.

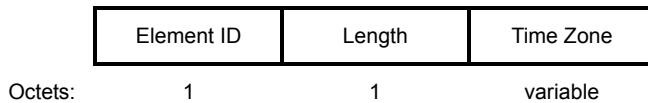

Figure 9-430—Time Zone element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Time Zone field is as specified in 8.3 of IEEE Std 1003.1-2004:

stdoffset[dst[offset][,start[/time],end[/time]]]

The length of the field is no less than 4 octets and no more than TZNAME_MAX, as defined in IEEE Std 1003.1-2004. The Time Zone field represents the time zone at the AP's location. The encoding of the field is in ASCII characters as shown in the following Example-1.

Example-1: EST5

Example-2: EST5EDT4,M3.2.0/02:00,M11.1.0/02:00

In the Example-2, the string is interpreted as a time zone that is normally five hours behind UTC, and four hours behind UTC during daylight saving time (DST), which runs from the second Sunday in March at 02:00 local time through the first Sunday in November at 02:00 local time. Normally, the time zone is abbreviated "EST" but during DST it is abbreviated "EDT."

9.4.2.88 DMS Request element

The DMS Request element defines information about the group addressed frames to be transmitted as individual addressed frames. The format of the DMS Request element is shown in Figure 9-431.

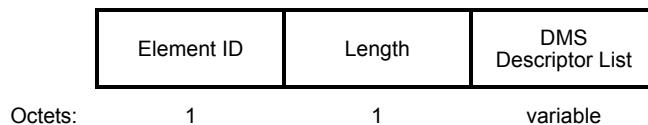

Figure 9-431—DMS Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMS Descriptor List field contains one or more DMS Descriptors. The format of the DMS Descriptor is defined in Figure 9-432.

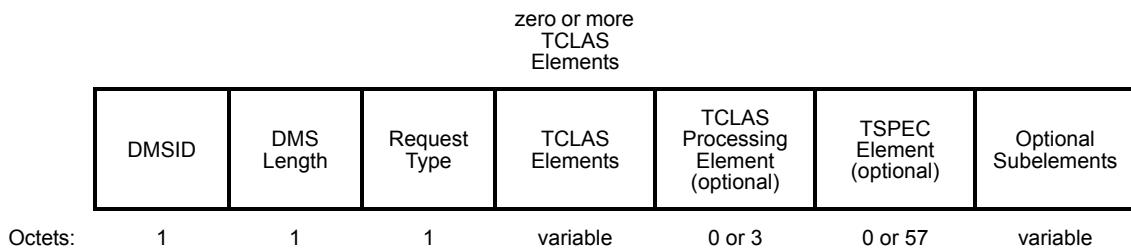

Figure 9-432—DMS Descriptor

The DMSID field is set to 0 when the Request Type field is "Add" as defined in Table 9-207; otherwise, the DMSID field is set to the nonzero value assigned by the AP STA to identify the DMS traffic flow.

The DMS Length field is set to $1 + n$, where n indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Descriptor field. The maximum value of the DMS Length field is 253.

The Request Type field identifies the type of DMS request. The encoding of the Request Type field is shown in Table 9-207.

Table 9-207—DMS Request Type field

| Description | Request Type field value |
|-------------|--------------------------|
| Add | 0 |
| Remove | 1 |
| Change | 2 |
| Reserved | 3–255 |

When the Request Type field contains “Add,” the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.31. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to “Add,” the TCLAS Elements field contains at least a TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.31. When the Request Type field contains any value other than “Add,” the TCLAS Elements field contains zero TCLAS elements.

When the Request Type field contains “Add” and when there are two or more TCLAS elements present, the TCLAS Processing Element field contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.33. Otherwise, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Request Type field contains “Add” or “Change,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.30. When a GCR Request subelement is included in the DMS Descriptor and the Request Type field is equal to “Add” or “Change,” the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-208.

Table 9-208—Optional subelement IDs for DMS Descriptor

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0 | Reserved | |
| 1 | GCR Request | Yes |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

Each DMS Descriptor contains zero or one GCR Request subelements. If present and the Request Type field is equal to “Add” or “Change,” the GCR Request subelement indicates a request by a STA to respectively add or change the GCR service for a group addressed stream identified by the TCLAS element or by the DMSID in the DMS Descriptor. The format of the GCR Request subelement is shown in Figure 9-433.

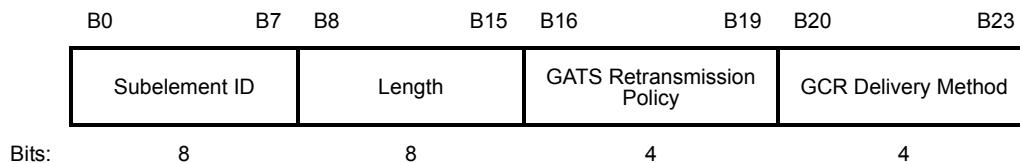

Figure 9-433—GCR Request subelement format

The Length field is defined in 9.4.3.

The GATS Retransmission Policy field is set to indicate the STA's preferred retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-209.

Table 9-209—GATS Retransmission Policy field values

| Value | GATS retransmission policy | Notes |
|--------------|-----------------------------------|-------------------|
| 0 | No preference | |
| 1 | DMS | See 11.24.16.2. |
| 2 | GCR unsolicited retry | See 11.24.16.3.6. |
| 3 | GCR Block Ack | See 11.24.16.3.7. |
| 4–15 | Reserved | |

The GCR Delivery Method field is set to indicate the STA's preferred delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-210.

Table 9-210—GCR Delivery Method field values

| Value | GCR delivery method | Notes |
|--------------|----------------------------|-------------------|
| 0 | No preference | |
| 1 | Non-GCR-SP | See 11.24.16.3.1. |
| 2 | GCR-SP | See 11.24.16.3.8. |
| 3–15 | Reserved | |

The DMS Request element is included in DMS Request frames, as described in 9.6.14.26, and Reassociation Request frames, as described in 9.3.3.8. The use of the DMS Request element and frames is described in 11.24.16.

9.4.2.89 DMS Response element

The DMS Response element provides the status information about the requested group addressed frames. The format of the DMS Response element is shown in Figure 9-434.

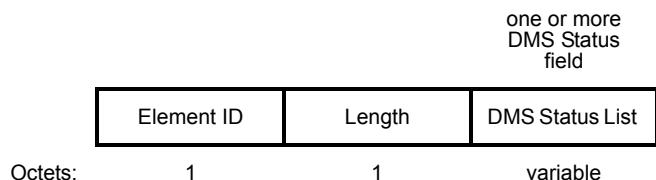

Figure 9-434—DMS Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMS Status List field contains one or more DMS Status field. The format of the DMS Status field is defined in Figure 9-435.

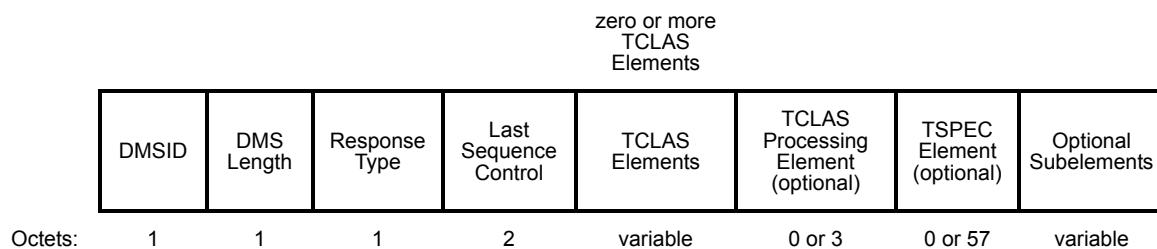

Figure 9-435—DMS Status field format

The DMSID field is assigned by the AP and provides a unique identifier within the BSS for the DMS traffic flow identified by the TCLAS Elements, TCLAS Processing Element, and TSPEC Element fields. The uniqueness of the identifier is independent of the ordering of the TCLAS elements. In a mesh BSS, the DMSID field is assigned by a mesh STA that responds to a GCR request and is unique among all existing DMSIDs used by the mesh STA for its current GCR agreements.

The value of the DMS Length field is set to $3 + n$, where n indicates the total length in octets of all of the TCLAS Elements, optional TCLAS Processing Element, optional TSPEC Element, and Optional Subelements fields contained in the DMS Status field. When the Response Type field is set to “Terminate,” the value of the DMS Length field is set to 3. The maximum value of the DMS Length field is 253.

The Response Type field indicates the response type returned by the AP responding to the non-AP STA’s request or by a mesh STA responding to its peer mesh STA’s request or indicates the DMS Status is an advertisement of an existing GCR service, as indicated in Table 9-211.

Table 9-211—Response Type field values

| Field value | Description | Notes |
|-------------|---------------|---|
| 0 | Accept | STA accepts the DMS or GCR request |
| 1 | Denied | STA rejects the DMS or GCR request |
| 2 | Terminate | STA terminates DMS previously accepted DMS or GCR request |
| 3 | GCR Advertise | STA advertises a group addressed stream subject to an existing GCR agreement. |
| 4–255 | Reserved | |

When the Last Sequence Control field is not supported the Last Sequence Control field is set to 65 535. When the Last Sequence Control field is supported and the Response Type field does not contain “Terminate” or “GCR Advertise,” the Last Sequence Control field is reserved.

When the Response Type field is “Terminate” and the Last Sequence Control field is supported, Bit 0 to Bit 3 of the Last Sequence Control field is 0, and Bit 4 to Bit 15 of the Last Sequence Control field contains the sequence number of the last group addressed frame that the AP delivered to the non-AP STA that is the recipient of the DMS Response frame. If the Response Type field is “Terminate” and the last frame received by the non-AP STA prior to DMS termination has not also been sent using a group addressed frame, the Last Sequence Control field is set to 65 534.

When the Response Type field contains “Accept” or “Denied” and a GCR Response subelement is not included in the DMS Status field, the TCLAS Elements field contains one or more TCLAS elements to specify group addressed frames as defined in 9.4.2.31. When the Response Type field is equal to “Accept,” “Denied,” or “GCR Advertise” and a GCR Response subelement is included in the DMS Status field, the TCLAS Elements field contains at least one TCLAS element with frame classifier type set to 0 (Ethernet parameters) to specify a destination group address as defined in 9.4.2.31. Otherwise, the TCLAS Elements field contains zero TCLAS elements.

When the Response Type field contains “Accept” or “Denied,” the TCLAS Processing Element field optionally contains one TCLAS Processing element to define how these TCLAS elements are to be processed, as defined in 9.4.2.33. When the Response Type field contains “Terminate” or when there is only one TCLAS element, the TCLAS Processing Element field contains zero TCLAS Processing elements.

When the Response Type field contains “Accept” or “Denied,” the TSPEC Element field optionally contains one TSPEC element to specify the characteristics and QoS expectations of the corresponding traffic flow as defined in 9.4.2.30. When a GCR Response subelement is included in the DMS Status field and the Response Type field is equal to “Accept,” “Denied,” or “GCR Advertise,” the TSPEC Element field contains one TSPEC element. Otherwise, the TSPEC Element field contains zero TSPEC elements.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-212.

Table 9-212—Optional subelement IDs for DMS Status

| Subelement ID | Name | Extensible |
|---------------|-----------------|-------------|
| 0 | Reserved | |
| 1 | GCR Response | Subelements |
| 2–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The GCR Response subelement contains one of the following:

- A response by an AP to a GCR request by a non-AP STA for GCR service for a group address
- A response by a mesh STA to a GCR request by a peer mesh STA for GCR service for a group address
- An unsolicited advertisement for the parameters of a group addressed stream subject to the GCR service

The format of the GCR Response subelement is shown in Figure 9-432.

| Subelement ID | Length | GATS Retransmission Policy | GCR Delivery Method | GCR Concealment Address | Schedule Element |
|---------------|--------|----------------------------|---------------------|-------------------------|------------------|
| Octets: | 1 | 1 | 0 or 1 | 0 or 1 | 0 or 6 |

Figure 9-436—GCR Response subelement format

The GATS Retransmission Policy, GCR Delivery Method, and GCR Concealment Address fields are present when the Response Type field is not equal to “Denied”; otherwise, they are omitted. The Schedule Element field is optionally present when the Response Type field is not equal to “Denied.”

The GATS Retransmission Policy field is set to indicate the current GCR retransmission policy for the group address for which the GCR service is requested. The values are shown in Table 9-209.

The GCR Delivery method field is set to indicate the current GCR Delivery method for the group address for which the GCR service is requested. The values are shown in Table 9-210.

The GCR Concealment Address field, when present, indicates the GCR concealment address, as described in 11.24.16.3.5.

The Schedule Element field is present if the GCR delivery method is equal to GCR-SP. It indicates the current SP schedule for the group addressed stream (see 9.4.2.34).

The DMS Response element is included in DMS Response frames, as described in 9.6.14.27, and Reassociation Response frames, as described in 9.3.3.9. The use of the DMS Response element and frames is described in 11.24.16.

9.4.2.90 Destination URI element

The Destination URI element contains URI and ESS Detection Interval values from the requesting STA that the responding STA can be used to deliver Event or Diagnostic Report frames. The format of the Destination URI element is given in Figure 9-437.

| Element ID | Length | ESS Detection Interval | URI |
|------------|--------|------------------------|-------|
| Octets: | 1 | 1 | 1–253 |

Figure 9-437—Destination URI element format

The Element ID and Length fields are defined in 9.4.2.1.

The ESS Detection Interval field is defined in 9.4.2.71.2 and its use for Event and Diagnostic requests is described in 11.24.2 and 11.24.3.

The URI field specifies the destination URI for Event and Diagnostic reports using the format defined in IETF RFC 3986. The URI field value is limited to 253 octets.

The Destination URI element is included as the last element in an Event or Diagnostic Request frame.

The Destination URI element is included in Event Request frames, as described in 9.6.14.2, or Diagnostic Request frames, as described in 9.6.14.4.

Use of the Destination URI element in an Event Request frame is described in 11.24.2.1. Use of the Destination URI element in a Diagnostic Request frame is described in 11.24.3.1.

9.4.2.91 U-APSD Coexistence element

The U-APSD coexistence provides the duration of requested transmission during a U-APSD service period. The format of the U-APSD Coexistence element is shown in Figure 9-438.

| Element ID | Length | TSF 0 Offset | Interval/ Duration | Optional Subelements |
|------------|--------|--------------|-----------------------|-------------------------|
| Octets: | 1 | 1 | 8 | 4 variable |

Figure 9-438—U-APSD Coexistence element format

The Element ID and Length fields are defined in 9.4.2.1.

A nonzero value of the TSF 0 Offset field is the number of microseconds since TSF time 0 when the non-AP STA knew the start of interference. The AP uses the TSF 0 Offset field together with the Interval/Duration field to enqueue frames for transmission to the non-AP STA using the procedures as described in 11.2.3.5.2.

A TSF 0 Offset field value of 0 indicates the non-AP STA requests the AP transmit frames to the non-AP STA using the procedure described in 11.2.3.5.2 for the case where TSF 0 Offset is equal to 0.

The Interval/Duration field is defined as follows:

- When the TSF 0 Offset is 0, the Interval/Duration field is the number of microseconds during the U-APSD service period when the AP transmits frames to the non-AP STA as described in 11.2.3.5.2.
- When the TSF 0 Offset is nonzero, the Interval/Duration field is the number of microseconds between the start of consecutive interference bursts.

The Interval/Duration field value of 0 is reserved.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-213.

Table 9-213—Optional subelement IDs for U-APSD coexistence

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

9.4.2.92 Interworking element

The Interworking element contains information about the interworking service capabilities of a STA as shown in Figure 9-439.

| Element ID | Length | Access Network Options | Venue Info (optional) | HESSID (optional) |
|------------|--------|------------------------|-----------------------|-------------------|
| Octet s: | 1 | 1 | 1 | 0 or 2 |

Figure 9-439—Interworking element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Access Network Options field is shown in Figure 9-440.

| Bits: | B0 | B3 | B4 | B5 | B6 | B7 |
|-------|---------------------|----------|------|-----|------|----|
| | Access Network Type | Internet | ASRA | ESR | UESA | |

Figure 9-440—Access Network Options field format

A non-AP STA sets Internet, ASRA, ESR, and UESA fields to 0 when including the Interworking element in the Probe Request frame. A non-AP STA sets the Internet, ASRA and ESR bits to 0 when including the Interworking element in (Re)Association Request frames. A mesh STA sets the Internet bit to 0 when including the Interworking element in Mesh Peering Open frames. In (Re)Association Request frames, a non-AP STA sets the UESA bit according to the procedures in 11.3.5. The access network types are shown in Table 9-214. The Access Network Type field is set by the AP or the mesh STA to advertise its access network type to non-AP STAs. A non-AP STA uses this field to indicate the desired access network type in an active scan. See R.2 for informative text on usage of fields contained within the Interworking element.

Table 9-214—Access network type

| Access network type | Meaning | Description |
|---------------------|-----------------------------------|--|
| 0 | Private network | Nonauthorized users are not permitted on this network. Examples of this access network type are home networks and enterprise networks, which might employ user accounts. Private networks do not necessarily employ encryption. |
| 1 | Private network with guest access | Private network but guest accounts are available. Example of this access network type is enterprise network offering access to guest users. |
| 2 | Chargeable public network | The network is accessible to anyone, however, access to the network requires payment. Further information on types of charges might be available through other methods (e.g., IEEE Std 802.21, http/https redirect or DNS redirection). Examples of this access network type is a hotspot in a coffee shop offering internet access on a subscription basis or a hotel offering in-room internet access service for a fee. |
| 3 | Free public network | The network is accessible to anyone and no charges apply for the network use. An example of this access network type is an airport hotspot or municipal network providing free service. |
| 4 | Personal device network | A network of personal devices. An example of this type of network is a camera attaching to a printer, thereby forming a network for the purpose of printing pictures. |
| 5 | Emergency services only network | A network dedicated and limited to accessing emergency services. |

Table 9-214—Access network type (continued)

| Access network type | Meaning | Description |
|---------------------|----------------------|---|
| 6 to 13 | Reserved | Reserved |
| 14 | Test or experimental | The network is used for test or experimental purposes only. |
| 15 | Wildcard | Wildcard access network type |

Bit 4 is the Internet field. The AP or mesh STA sets this field to 1 if the network provides connectivity to the Internet; otherwise it is set to 0 indicating that it is unspecified whether the network provides connectivity to the Internet.

Bit 5 is the Additional Step Required for Access (ASRA) field. It is set to 1 by the AP to indicate that the network requires a further step for access. For more information, refer to Network Authentication Type Information in 9.4.5.6. A mesh STA uses the ASRA field as an emergency indicator. If a mesh STA requires emergency services, the ASRA field is set to 1; otherwise it is set to 0. See 11.25.6.

Bit 6 is the ESR (emergency services reachable) field. It is set to 1 by the AP or mesh STA to indicate that emergency services are reachable through the AP or mesh STA; otherwise it is set to 0 indicating that it is unable to reach the emergency services. See 11.25.6.

Bit 7 is the UESA (unauthenticated emergency service accessible) field. When set to 0, this field indicates that no unauthenticated emergency services are reachable through this AP or mesh STA. When set to 1, this field indicates that higher layer unauthenticated emergency services are reachable through this AP or mesh STA. A STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to a BSS to access emergency services. A mesh STA uses the Interworking element with the UESA bit set to 1 to gain unauthenticated access to another mesh STA to access emergency services. See 11.3.5.

The Venue Info field is defined in 9.4.1.35.

The HESSID field, which is the identifier for a homogeneous ESS, specifies the value of HESSID; see 11.25.2. A STA uses this field to indicate the target HESSID in an active scan per 11.1.4. The HESSID field for an AP is set to dot11HESSID. This optional field is not used by mesh STAs.

9.4.2.93 Advertisement Protocol element

The Advertisement Protocol element contains information that identifies a particular advertisement protocol and its corresponding Advertisement Control. The Advertisement Protocol element format is shown in Figure 9-441.

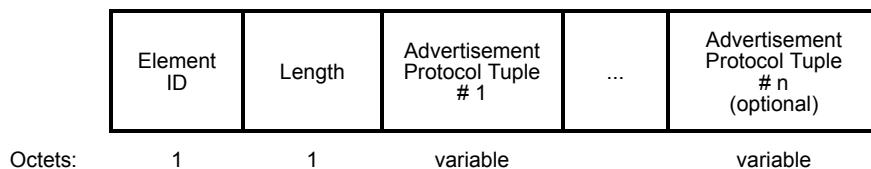

Figure 9-441—Advertisement Protocol element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of Advertisement Protocol Tuple field is shown in Figure 9-442.

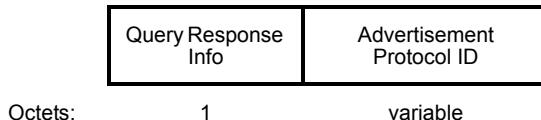

Figure 9-442—Advertisement Protocol Tuple field format

The format of Query Response Info field is shown in Figure 9-443.

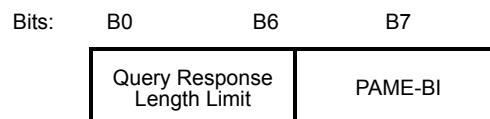

Figure 9-443—Query Response Info field format

The Query Response Info field is defined as follows:

- The Query Response Length Limit field indicates the maximum number of octets a STA will transmit in the Query Response field contained within one or more GAS Comeback Response frames. If the value of the Query Response Length Limit field is larger than the maximum MMPDU size, the Query Response will span multiple MMPDUs. The Query Response Length Limit field is encoded as an integer number of 256 octet units. A value of 0 is not permitted. A value of 0x7F means the maximum limit enforced is determined by the maximum allowable number of fragments in the GAS Query Response Fragment ID (see 9.4.1.34). The Query Response Length Limit field is reserved in a transmission from the requesting STA to the responding STA.
- Bit 7, the Preassociation Message Exchange BSSID Independent (PAME-BI) bit, is used by an AP to indicate whether the Advertisement Server, which is the non-AP STA's peer for this Advertisement Protocol, returns a Query Response that is independent of the BSSID used for the GAS frame exchange. This bit is set to 1 to indicate the Query Response is independent of the BSSID; it is set to 0 to indicate that the Query Response may be dependent on the BSSID. See 11.25.3.2 for further information. Bit 7 is reserved for non-AP STAs.

The Advertisement Protocol ID is a variable-length field. When this field contains a vendor-specific Advertisement Protocol ID, then this field will be structured per the Vendor Specific element defined in 9.4.2.26, where the Element ID of the Vendor Specific element of 9.4.2.26 is the first octet of the field and contains the vendor-specific value for Advertisement Protocol ID defined in Table 9-215; otherwise its length is 1 octet and its value is one of the values in Table 9-215. When one or more vendor-specific tuples are included in the Advertisement Protocol element, their total length needs to be constrained such that the total length of all of the Advertisement Protocol Tuple fields (both vendor specific and otherwise) is less than or equal to 255 octets.

Table 9-215—Advertisement protocol ID definitions

| Name | Value |
|--------------------------------------|-------|
| Access network query protocol (ANQP) | 0 |
| MIH Information Service | 1 |

Table 9-215—Advertisement protocol ID definitions

| Name | Value |
|---|---------|
| MIH Command and Event Services Capability Discovery | 2 |
| Emergency Alert System (EAS) | 3 |
| Registered location query protocol (RLQP) | 4 |
| Reserved | 5–220 |
| Vendor Specific | 221 |
| Reserved | 222–255 |

- ANQP supports information retrieval from an Advertisement Server. ANQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA might respond to queries with or without proxying the query to a server in an external network). See 11.25.3.3 for information on ANQP procedures.
- MIH Information Service is a service defined in IEEE Std 802.21-2008 to support information retrieval from an information repository.
- MIH Command and Event Services capability discovery is a mechanism defined in IEEE Std 802.21 (see IEEE Std 802.21-2008) to support discovering capabilities of command service and event service entities in a STA or an external network.
- The EAS allows a network to disseminate emergency alert notifications from an external network to non-AP STAs. EAS uses the message format as defined in OASIS EDXL.
- The RLQP supports information retrieval from a RLSS. RLQP is a protocol used by a requesting STA to query another STA (i.e., the receiving STA can respond to queries with and without proxying the query to a server in an external network). 11.25 for information on RLQP procedures.
- Advertisement Protocol ID 221 is reserved for Vendor Specific Advertisement Protocols. When the Advertisement Protocol ID is equal to 221, the format of the Advertisement Protocol ID subfield follows the format of the Vendor Specific element in 9.4.2.26.

9.4.2.94 Expedited Bandwidth Request element

The Expedited Bandwidth Request element is transmitted from a non-AP STA to an AP in an ADDTS Request frame containing a TSPEC element and provides usage information for the bandwidth request. The Expedited Bandwidth Request element format is shown in Figure 9-444.

| Element ID | Length | Precedence Level |
|------------|--------|------------------|
| Octets: | 1 | 1 |

Figure 9-444—Expedited Bandwidth Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Precedence Level field is provided in Table 9-216.

The precedence levels are derived from the 3rd Generation Partnership Project (3GPP) document 3GPP TS 22.067 [B3].

Table 9-216—Precedence Level field description

| Precedence level value | Description |
|------------------------|--|
| 0–15 | Reserved |
| 16 | Emergency call, defined in NENA 08-002 [B56] |
| 17 | First responder (public) |
| 18 | First responder (private) |
| 19 | MLPP Level A |
| 20 | MLPP Level B |
| 21 | MLPP Level 0 |
| 22 | MLPP Level 1 |
| 23 | MLPP Level 2 |
| 24 | MLPP Level 3 |
| 25 | MLPP Level 4 |
| 26–255 | Reserved |

The first responders (public) in Table 9-216 are government agencies or entities acting on behalf of the government, and the first responders (private) are private entities, such as individuals or companies.

9.4.2.95 QoS Map element

The QoS Map element is transmitted from an AP to a non-AP STA in a (Re)Association Response frame or a QoS Map Configure frame and provides the mapping of higher layer quality-of-service constructs to User Priorities defined by transmission of Data frames in this standard. This element maps the higher layer priority from the DSCP field used with the Internet Protocol to User Priority as defined by this standard. The QoS Map element is shown in Figure 9-445.

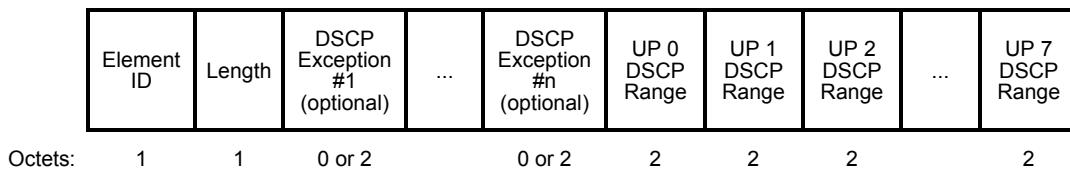

Figure 9-445—QoS Map element format

The Element ID and Length fields are defined in 9.4.2.1. The Length field is set to $16+2\times n$, where n is the number of DSCP Exception fields in the QoS Map element.

DSCP Exception fields are optionally included in the QoS Map element. If included, the QoS Map element has a maximum of 21 DSCP Exception fields. The format of the exception field is shown in Figure 9-446.

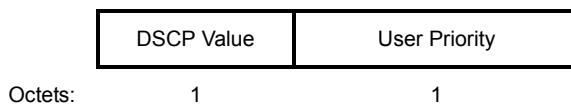

Figure 9-446—DSCP Exception format

The DSCP value in the DSCP Exception field is in the range 0 to 63, or 255; the User Priority value is in the range 0 to 7.

- When a non-AP STA begins transmission of a Data frame containing the Internet Protocol, it matches the DSCP field in the IP header to the corresponding DSCP value contained in this element. The non-AP STA first attempts to match the DSCP value to a DSCP exception field and uses the UP from the corresponding UP in the same DSCP exception field if successful; if no match is found then the non-AP STA attempts to match the DSCP field to a UP n DSCP Range field, and uses the n as the UP if successful; and otherwise uses a UP of 0.
- Each DSCP Exception field has a unique DSCP Value.

| | | | |
|-------------------------------------|---------|---|---|
| | Octets: | 1 | 1 |
| DSCP Low Value DSCP High Value | | | |

Figure 9-447—DSCP Range description

The QoS Map element has a DSCP Range field corresponding to each of the 8 user priorities. The format of the range field is shown in Figure 9-447. The DSCP Range value is between 0 and 63 inclusive, or 255.

- The DSCP range for each user priority is nonoverlapping.
- The DSCP High Value is greater than or equal to the DSCP Low Value.
- If the DSCP Range high value and low value are both equal to 255, then the corresponding UP is not used.

9.4.2.96 Roaming Consortium element

The Roaming Consortium element contains information identifying the roaming consortium and/or SSP whose security credentials can be used to authenticate with the AP transmitting this element; see 11.25.8. The element's format is shown in Figure 9-448.

| | | | | | | |
|------------|--------|--------------------|----------------------|----------|------------------|------------------|
| Element ID | Length | Number of ANQP OIs | OI #1 and #2 Lengths | OI #1 | OI #2 (optional) | OI #3 (optional) |
| Octets: | 1 | 1 | 1 | variable | variable | variable |

Figure 9-448—Roaming Consortium element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Number of ANQP OIs field is a one-octet unsigned integer whose value is the number of additional roaming consortium organization identifiers (OIs) obtainable via ANQP. A value of 0 means that no additional OIs are returned in response to an ANQP request for the Roaming Consortium list. A value of 255 means that 255 or more additional OIs are obtainable via ANQP.

The OI #1 and #2 Lengths field format is shown in Figure 9-449.

- The value of the OI #1 Length subfield is the length in octets of the OI #1 field.
- The value of the OI #2 Length subfield is the length in octets of the OI #2 field. If the OI #2 field is not present, the value of the OI #2 Length subfield is set to 0.

NOTE—When there are three OIs, the OI #3 Length is calculated by subtracting sum of 2 plus the value of the OI #1 Length subfield plus the value of the OI #2 Length subfield from the value of the Length field.

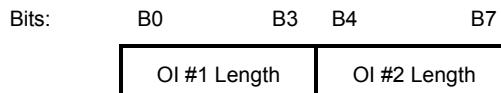

Figure 9-449—OI #1 and #2 Lengths field format

The OI field is defined in 9.4.1.32. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP. The value of the OI(s) in this table are equal to the value of the first 3 OIs in the dot11RoamingConsortiumTable. If fewer than 3 values are defined in the dot11RoamingConsortiumTable, then only as many OIs as defined in the table are populated in this element. The values of the OIs in this element are equal to the values of the first OIs, up to 3, from the table.

9.4.2.97 Emergency Alert Identifier element

The Emergency Alert Identifier element provides a hash to identify instances of the active EAS messages that are currently available from the network. The hash allows the non-AP STA to assess whether an EAS message advertised by an AP has been previously received and therefore whether it is necessary to download from the network. The format of the Emergency Alert Identifier element is provided in Figure 9-450.

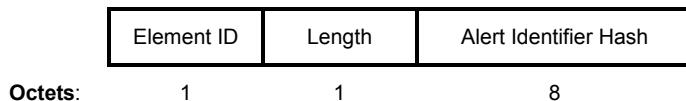

Figure 9-450—Emergency Alert Identifier element format

The Element ID and Length fields are defined in 9.4.2.1.

The Alert Identifier Hash (AIH) is an 8-octet field. It is a unique value used to indicate an instance of an EAS message. The value of this field is the hash produced by the HMAC-SHA-1-64 hash algorithm operating on the EAS message.

$$\text{AIH} = \text{HMAC-SHA-1-64}(\text{"ES_ALERT"}, \text{Emergency_Alert_Message})$$

where

“ES_ALERT” is an ASCII string.

Emergency_Alert_Message is the EAS message itself.

9.4.2.98 Mesh Configuration element

9.4.2.98.1 General

The Mesh Configuration element shown in Figure 9-451 is used to advertise mesh services. It is contained in Beacon frames and Probe Response frames transmitted by mesh STAs and is also contained in Mesh Peering Open and Mesh Peering Confirm frames.

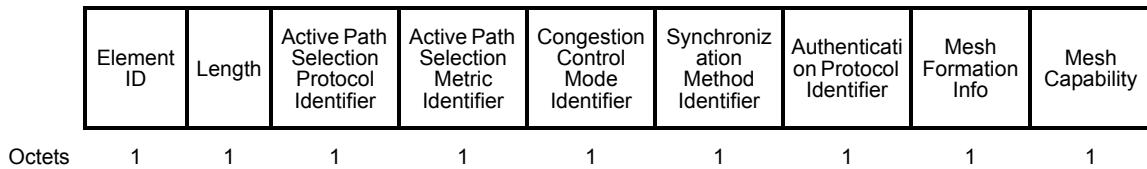

Figure 9-451—Mesh Configuration element format

The Element ID and Length fields are defined in 9.4.2.1.

The remainder of the fields are described in the following subclauses.

9.4.2.98.2 Active Path Selection Protocol Identifier

The Active Path Selection Protocol Identifier field indicates the path selection protocol that is currently activated in the MBSS. Table 9-217 provides path selection protocol identifier values defined by this standard.

Table 9-217—Active Path Selection Protocol Identifier field values

| Value | Meaning |
|-------|--|
| 0 | Reserved |
| 1 | Hybrid wireless mesh protocol (default path selection protocol) defined in 14.10 (default path selection protocol) |
| 2–254 | Reserved |
| 255 | Vendor specific (The active path selection protocol is specified in a Vendor Specific element) |

When the Active Path Selection Protocol Identifier field is 255, the active path selection protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

9.4.2.98.3 Active Path Selection Metric Identifier

The Active Path Selection Metric Identifier field indicates the path metric that is currently used by the active path selection protocol in the MBSS. Table 9-218 provides the path selection metric identifier values defined by this standard.

Table 9-218—Active Path Selection Metric Identifier field values

| Value | Meaning |
|-------|--|
| 0 | Reserved |
| 1 | Airtime link metric defined in 14.9 (default path selection metric) |
| 2–254 | Reserved |
| 255 | Vendor specific (The active metric is specified in a Vendor Specific element) |

When the Active Path Selection Metric Identifier field is 255, the active path metric is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

9.4.2.98.4 Congestion Control Mode Identifier

The Congestion Control Mode Identifier field indicates the congestion control protocol that is currently activated in the MBSS. Table 9-219 provides the congestion control mode identifier values defined by this standard.

Table 9-219—Congestion Control Mode Identifier field values

| Value | Meaning |
|-------|---|
| 0 | Congestion control is not activated (default congestion control mode) |
| 1 | Congestion control signaling protocol defined in 14.12.2 |
| 2–254 | Reserved |
| 255 | Vendor specific (The active congestion control protocol is specified in a Vendor Specific element) |

The congestion mode identifier value of 0 indicates the mesh STA has no active congestion control protocol and is set as the default value for the congestion control mode identifier in the MBSS.

When the Congestion Control Mode Identifier field is 255, the active congestion control protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

9.4.2.98.5 Synchronization Method Identifier

The Synchronization Method Identifier field indicates the synchronization method that is currently activated in the MBSS. Table 9-220 provides the synchronization method identifier values defined by this standard.

Table 9-220—Synchronization Method Identifier field values

| Value | Meaning |
|-------|--|
| 0 | Reserved |
| 1 | Neighbor offset synchronization method defined in 14.13.2.2 (default synchronization method) |
| 2–254 | Reserved |
| 255 | Vendor specific (The active synchronization method is specified in a Vendor Specific element) |

The neighbor offset synchronization method is defined as the default synchronization method among mesh STAs. The details of the neighbor offset synchronization method are described in 14.13.2.2.

When the Synchronization Method Identifier field is 255, the active synchronization method is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

9.4.2.98.6 Authentication Protocol Identifier

The Authentication Protocol Identifier field indicates the type of authentication protocol that is currently used to secure the MBSS. Table 9-221 provides the authentication protocol identifier values defined by this standard.

Table 9-221—Authentication Protocol Identifier field values

| Value | Meaning |
|-------|---|
| 0 | No authentication method is required to establish mesh peerings within the MBSS |
| 1 | SAE defined in 12.4 |
| 2 | IEEE 802.1X authentication |
| 3–254 | Reserved |
| 255 | Vendor specific (The active authentication protocol is specified in a Vendor Specific element) |

When the Authentication Protocol Identifier field is 255, the active authentication protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

9.4.2.98.7 Mesh Formation Info

The format of the Mesh Formation Info field is shown in Figure 9-452.

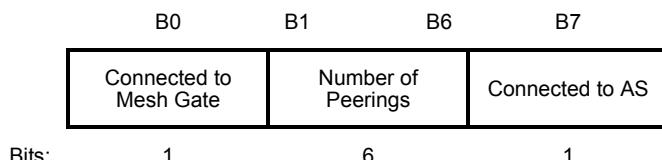

Figure 9-452—Mesh Formation Info field

The Connected to Mesh Gate subfield is set to 1, if the mesh STA has a mesh path to a mesh gate that announces its presence using GANN elements, RANN elements, or PREQ elements, and set to 0 otherwise.

The Number of Peerings subfield contains an unsigned integer that indicates the number of mesh peerings currently maintained by the mesh STA or 63, whichever is smaller.

The Connected to AS subfield is set to 1 if the Authentication Protocol Identifier field in the Mesh Configuration element is set to 2 (indicating IEEE 802.1X authentication) and the mesh STA has an active connection to an AS.

NOTE—When an AS is collocated with an IEEE 802.1X Authenticator an active connection is implicitly true.

9.4.2.98.8 Mesh Capability

The Mesh Capability field comprises a set of values indicating whether a mesh STA is a possible candidate for mesh peering establishment. The details of the Mesh Capability field are shown in Figure 9-453.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 |
|------------------------------------|----------------|--------------|------------|--------------|----------------|-----------------------|----------|
| Accepting Additional Mesh Peerings | MCCA Supported | MCCA Enabled | Forwarding | MBCA Enabled | TBTT Adjusting | Mesh Power Save Level | Reserved |
| Bits: | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Figure 9-453—Mesh Capability field

The Accepting Additional Mesh Peerings subfield is set to 1 if the mesh STA is willing to establish additional mesh peerings with other mesh STAs and set to 0 otherwise (i.e., the Accepting Additional Mesh Peerings subfield is set in accordance with dot11MeshAcceptingAdditionalPeerings). When the Mesh Configuration element is included in the Mesh Peering Open frame and in the Mesh Peering Confirm frame, the Accepting Additional Mesh Peerings subfield is set to 1.

The MCCA Supported subfield is set to 1 if the mesh STA implements MCCA and set to 0 otherwise (i.e., the MCCA Supported subfield is set in accordance with dot11MCCAImplemented).

The MCCA Enabled subfield is set to 1 if the mesh STA is using the MCCA and set to 0 otherwise (i.e., the MCCA Enabled subfield is set in accordance with dot11MCCAAactivated).

The Forwarding subfield is set to 1 if the mesh STA forwards MSDUs and set to 0 otherwise (i.e., the Forwarding subfield is set in accordance with dot11MeshForwarding).

The MBCA Enabled subfield is set to 1 if the mesh STA is using MBCA and is set to 0 otherwise (i.e., the MBCA Enabled subfield is set in accordance with dot11MBCAAactivated). (See 14.13.4.)

The TBTT Adjusting subfield is set to 1 while the TBTT adjustment procedure is ongoing and is set to 0 otherwise. (See 14.13.4.4.3.)

The Mesh Power Save Level subfield is set to 1 if at least one of the peer-specific mesh power management modes is deep sleep mode and set to 0 otherwise. The Mesh Power Save Level subfield is reserved when the Power Management subfield in the Frame Control field is set to 0. See 9.2.4.5.11.

9.4.2.99 Mesh ID element

The Mesh ID element is used to advertise the identification of an MBSS and is described in 14.2.2. The format of the Mesh ID element is shown in Figure 9-454. The Mesh ID element is transmitted in Mesh Peering Open frames, Mesh Peering Confirm frames, Mesh Peering Close frames, Beacon frames, and Probe Request and Response frames.

| | | |
|------------|--------|-----------|
| Element ID | Length | Mesh ID |
| Octets: | 1 | 1 0–32 |

Figure 9-454—Mesh ID element format

The Element ID and Length fields are defined in 9.4.2.1.

A Mesh ID field of length 0 indicates the wildcard Mesh ID, which is used within Probe Request frame.

Detailed usage of the Mesh ID element is described in 14.2.2.

9.4.2.100 Mesh Link Metric Report element

The Mesh Link Metric Report element is transmitted by a mesh STA to a neighbor peer mesh STA to indicate the quality of the link between the transmitting mesh STA and the neighbor peer mesh STA. The format of the Mesh Link Metric Report element is shown in Figure 9-455.

| | | | | |
|---------|------------|--------|-------|-------------|
| | Element ID | Length | Flags | Link Metric |
| Octets: | 1 | 1 | 1 | variable |

Figure 9-455—Mesh Link Metric Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-456.

| | | |
|-------|----------|----|
| B0 | Request | B1 |
| | Reserved | |
| Bits: | 1 | 7 |

Figure 9-456—Flags field

The Flags field is set as follows:

- Bit 0: Request subfield (0 = not a request, 1 = link metric report request). A Request subfield equal to 1 indicates that the recipient of Mesh Link Metric Report element is requested to send a link metric report to the transmitter of the Mesh Link Metric Report element.
- Bit 1–7: Reserved.

The Link Metric field indicates the value of the link metric associated with the mesh link between the peer mesh STA transmitting the Mesh Link Metric Report and the neighbor mesh STA receiving the Mesh Link Metric report. The length and the data type of the Link Metric field are determined by the active path selection metric identifier (see 9.4.2.98.3). The length and the data type for the airtime link metric are given in Table 14-5 in 14.9.

9.4.2.101 Congestion Notification element

The Congestion Notification element is used to indicate the congestion status of the mesh STA per mesh destination and AC, and the duration for which the STA expects the congestion to last. The format of the Congestion Notification element is shown in Figure 9-457. The Congestion Notification element is included in Congestion Control Notification frames, as described in 9.6.17.5.

The Element ID and Length fields are defined in 9.4.2.1.

The Destination Mesh STA Address field is represented as a 48-bit MAC address and is set to the address of the mesh destination for which the intra-mesh congestion control is applied. It is set to the broadcast address if the intra-mesh congestion control is applied to all destinations.

| | | | | | | |
|------------|--------|------------------------------|--|--|--|--|
| Element ID | Length | Destination Mesh STA Address | Congestion Notification Duration Timer (AC_BK) | Congestion Notification Duration Timer (AC_BE) | Congestion Notification Duration Timer (AC_VI) | Congestion Notification Duration Timer (AC_VO) |
| Octets: | 1 | 1 | 6 | 2 | 2 | 2 |

Figure 9-457—Congestion Notification element format

The element contains four Congestion Notification Duration fields for the four EDCA access categories to indicate the estimated congestion duration per AC at the mesh STA transmitting the congestion notification. The congestion notification duration values are encoded as unsigned integers in units of 100 μ s.

9.4.2.102 Mesh Peering Management element

The Mesh Peering Management element is used to manage a mesh peering with a neighbor mesh STA. The format of the Mesh Peering Management element is shown in Figure 9-458.

| | | | | | | |
|------------|--------|----------------------------------|---------------|-------------------------|------------------------|-----------------------|
| Element ID | Length | Mesh Peering Protocol Identifier | Local Link ID | Peer Link ID (optional) | Reason Code (optional) | Chosen PMK (optional) |
| Octets: | 1 | 1 | 2 | 2 | 0 or 2 | 0 or 16 |

Figure 9-458—Mesh Peering Management element format

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Peering Protocol Identifier field indicates the type of mesh peering protocol that is currently used to establish mesh peerings. Table 9-222 provides the mesh peering protocol identifier values defined by this standard.

Table 9-222—Mesh Peering Protocol Identifier field values

| Value | Meaning |
|------------|---|
| 0 | Mesh peering management protocol |
| 1 | Authenticated mesh peering exchange protocol |
| 2–254 | Reserved |
| 255 | Vendor specific (The active mesh peering protocol is specified in a Vendor Specific element) |
| 256–65 535 | Reserved |

When the Mesh Peering Protocol Identifier field is 255, the active mesh peering protocol is specified by a Vendor Specific element that is present in the frame. The content of the Vendor Specific element is beyond the scope of this standard. (See 9.4.2.26.)

The Local Link ID field is the unsigned integer value generated by the local mesh STA to identify the mesh peering instance.

The conditional components of the Mesh Peering Management element are present depending on the Action field value of the frame in which the Mesh Peering Management element is conveyed.

The Peer Link ID field is the unsigned integer value generated by the peer mesh STA to identify the mesh peering instance. This field is not present for the Mesh Peering Open frame, is present for the Mesh Peering Confirm frame, and is optionally present for the Mesh Peering Close frame. The presence or absence of the Peer Link ID in a Mesh Peering Close is inferred by the Length field.

The Reason Code field enumerates reasons for sending a Mesh Peering Close. It is present for the Mesh Peering Close frame and is not present for Mesh Peering Open or Mesh Peering Confirm frames. The reason code is defined in 9.4.1.7.

The Chosen PMK field is present when `dot11MeshSecurityActivated` is true and a PMK is shared between the transmitter and receiver of the frame containing the element. It contains the PMKID that identifies the PMK used to protect the mesh peering Management frame.

Detailed usage of the Mesh Peering Management element is described in 14.3.6, 14.3.7, 14.3.8, and 14.5.5.

9.4.2.103 Mesh Channel Switch Parameters element

The Mesh Channel Switch Parameters element is used together with Channel Switch Announcement element and Extended Channel Switch Announcement element by a mesh STA to advertise to other mesh STAs when it is changing to a new operating channel and/or operating class. The format of the Mesh Channel Switch Parameters element is shown in Figure 9-459.

| Element ID | Length | Time To Live | Flags | Reason Code | Precedence Value |
|------------|--------|--------------|-------|-------------|------------------|
| Octets: | 1 | 1 | 1 | 2 | 2 |

Figure 9-459—Mesh Channel Switch Parameters element format

The Element ID and Length fields are defined in 9.4.2.1.

The Time To Live field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Flags field indicates the attribute of this channel switch attempt. The format of the Flags field is shown in Figure 9-460.

| B0 | B1 | B2 | B3 | B7 |
|-------------------|-----------|--------|----------|----|
| Transmit Restrict | Initiator | Reason | Reserved | |
| Bits: | 1 | 1 | 1 | 5 |

Figure 9-460—Flags field

The Transmit Restrict subfield is set to 1 when the mesh STA asks neighboring peer mesh STAs not to transmit further frames except frames containing Mesh Channel Switch Parameters element on the current channel until the scheduled channel switch. The Transmit Restrict subfield is set to 0 otherwise.

The Initiator subfield is set to 1 when the mesh STA initiates this channel switch attempt. The Initiator subfield is set to 0 when this channel switch attempt is initiated by another mesh STA and propagated by the current mesh STA.

The Reason subfield indicates the validity of the Reason Code field. It is set to 1 if the Reason Code field is valid and is set to 0 otherwise. When the Reason subfield is 0, the content of the Reason Code field is reserved.

The Reason Code field specifies the reason for the mesh channel switch. The Reason Code is defined in 9.4.1.7. The content of the Reason Code field is valid only when Reason subfield of Flags field is set to 1 and is reserved otherwise.

The Precedence Value field is coded as unsigned integer and is set to a random value drawn from a uniform distribution in the range 0 to 65 535 determined by the initiator of this channel switch attempt.

The Mesh Channel Switch Parameters element is included in Channel Switch Announcement frames, as described in 9.6.2.6, and Extended Channel Switch Announcement frames, as described in 9.6.8.7. During MBSS channel switching, the Mesh Channel Switch Parameters element is included in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11, until the scheduled channel switch.

9.4.2.104 Mesh Awake Window element

The Mesh Awake Window element is present in DTIM Beacon frames and is optionally present in Beacon and Probe Response frames. The format of the Mesh Awake Window element is shown in Figure 9-461.

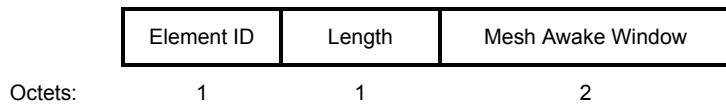

Figure 9-461—Mesh Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Mesh Awake Window field is 2 octets long and contains an unsigned integer that indicates the duration of the mesh awake window in TUs.

9.4.2.105 Beacon Timing element

The Beacon Timing element is used to advertise the beacon timing information of neighbor STAs (mesh STAs, IBSS APs, or IBSS STAs). The format of the Beacon Timing element is shown in Figure 9-462.

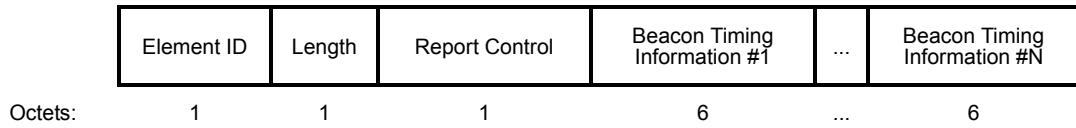

Figure 9-462—Beacon Timing element format

The Element ID and Length fields are defined in 9.4.2.1.

The Report Control field is used to signal information about the beacon timing information tuple contained in the Beacon Timing element. The structure of the Report Control field is defined in Figure 9-463.

The Status Number subfield is set to the status number of the beacon timing information set. The status number is managed as described in 14.13.4.2.4.

| | | |
|---------------|------------------------------|-----------------------------|
| Status Number | Beacon Timing Element Number | More Beacon Timing Elements |
| Bits: | 4 | 3 |

Figure 9-463—Report Control field

The Beacon Timing Element Number subfield is an unsigned integer that indicates the index of the beacon timing information tuple contained in this Beacon Timing element. The Beacon Timing Element Number is set to 0 in the Beacon Timing element for the first or only tuple of the beacon timing information and is incremented by one for each successive tuple of the beacon timing information. The beacon timing information tuples are managed as described in 14.13.4.2.5.

The More Beacon Timing Element subfield is set to 1 if a successive tuple of beacon timing information exists, and set to 0 otherwise.

The Beacon Timing Information field contains the beacon timing information of a neighbor STA. When the mesh STA reports multiple beacon timing information, multiple Beacon Timing Information fields are included in the Beacon Timing element. The structure of the Beacon Timing Information field is defined in Figure 9-464.

| | | |
|-----------------|---------------|--------------------------|
| Neighbor STA ID | Neighbor TBTT | Neighbor Beacon Interval |
| Octets: | 1 | 3 |

Figure 9-464—Beacon Timing Information field

The Neighbor STA ID subfield is an unsigned integer that indicates the identification of the neighbor STA corresponding to this beacon timing information. When a mesh peering is established with this neighbor STA, the MSB of this field is set to 0, and the rest of this field is set to the last 7 digits (7 LSBs) of the AID value assigned to this neighbor mesh STA. When a mesh peering is not established with this neighbor STA, the MSB of this field is set to 1, and the rest of this field is set to the last 7 digits (7 LSBs, taking the I/G bit as the MSB) of the 48-bit MAC address of this neighbor STA.

NOTE—Since the Neighbor STA ID subfield is provided in abbreviated form, it is possible that the same Neighbor STA ID value appears in multiple Beacon Timing Information fields.

The Neighbor TBTT subfield is an unsigned integer that indicates a TBTT of the corresponding neighbor STA, measured in the local TSF timer of the mesh STA. The value is indicated in multiples of 32 µs. When the active synchronization method is the neighbor offset synchronization method, the TBTT is calculated as described in 14.13.4.2.2. The B5 to the B28 (taking the B0 as the LSB) of the calculated TBTT are contained in this subfield.

The Neighbor Beacon Interval subfield is an unsigned integer that indicates the beacon interval being used by the corresponding neighbor STA. The unit of the Neighbor Beacon Interval subfield is TU.

Detailed usage of the Beacon Timing element is described in 14.13.4.2.

9.4.2.106 MCCAOP Setup Request element

9.4.2.106.1 General

The MCCAOP Setup Request element is used to make an MCCAOP reservation. This element is transmitted in individually addressed MCCA Setup Request frames or in group addressed MCCA Setup

Request frames. The mesh STA transmitting the MCCA Setup Request element is the MCCAOP owner of the MCCAOPs that will be scheduled with this reservation setup request. The receivers of the MCCAOP Setup Request frame are the MCCAOP responders. The format of the element is shown in Figure 9-465.

| | | | | |
|--------|------------|--------|-----------------------|--------------------|
| | Element ID | Length | MCCAOP Reservation ID | MCCAOP Reservation |
| Octets | 1 | 1 | 1 | 5 |

Figure 9-465—MCCAOP Setup Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation. It is determined by the MCCAOP owner. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation. If this MCCAOP Setup Request element is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127 and the MCCAOP Setup Request element is transmitted in an individually addressed frame to the intended responder. If this MCCAOP Setup Request element is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254 and the MCCAOP Setup Request element is transmitted in a group addressed frame. The value 255 is not used to identify a single MCCAOP reservation.

The MCCAOP Reservation field is described in 9.4.2.106.2.

9.4.2.106.2 MCCAOP Reservation field

The MCCAOP Reservation field is a 5 octet field specifying a schedule for frame transmissions called *MCCAOPs*. The MCCAOP Reservation field consists of three subfields and its format is shown in Figure 9-466.

| | | | |
|---------|-----------------|--------------------|---------------|
| | MCCAOP Duration | MCCAOP Periodicity | MCCAOP Offset |
| Octets: | 1 | 1 | 3 |

Figure 9-466—MCCAOP Reservation field

The MCCAOP Duration subfield is 1 octet in length and contains an unsigned integer. It specifies the duration of the MCCAOPs in multiples of 32 μ s.

The MCCAOP Periodicity subfield is 1 octet in length and contains a positive integer. It specifies the number of MCCAOPs scheduled in each DTIM interval.

The MCCAOP Offset subfield is three octets in length and contains an unsigned integer. It specifies the beginning of the first MCCAOP in each DTIM interval. The value is specified in multiples of 32 μ s. The sum of MCCAOP Offset plus MCCAOP Duration is constrained to be smaller than the duration of the DTIM interval divided by MCCAOP Periodicity.

9.4.2.107 MCCAOP Setup Reply element

The MCCAOP Setup Reply element is used to reply to an MCCAOP Setup Request. This element is transmitted in individually addressed MCCA Setup Reply frames. The mesh STA transmitting the MCCA Setup Reply element is the MCCAOP responder of the MCCAOPs scheduled in this reservation setup. The

receiver of the MCCAOP Setup Reply is the MCCAOP owner. The format of the element is shown in Figure 9-467.

| | | | | | |
|---------|------------|--------|-----------------------|-----------------|--------------------|
| Octets: | 1 | 1 | 1 | 1 | 0 or 5 |
| | Element ID | Length | MCCAOP Reservation ID | MCCA Reply Code | MCCAOP Reservation |

Figure 9-467—MCCAOP Setup Reply element format

The Element ID and Length fields are defined in 9.4.2.1.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the requested series of MCCAOPs. It is determined by the MCCAOP owner and copied from the MCCAOP Setup Request element. When used in combination with the MAC address of the MCCAOP owner, the MCCAOP Reservation ID uniquely identifies the MCCAOP reservation.

The MCCA Reply Code field is a 1 octet field that contains the reply code used in an MCCAOP Setup Reply element. The reply codes are defined in Table 9-223.

Table 9-223—MCCA Reply Code field values

| MCCA reply code | Meaning |
|-----------------|---|
| 0 | Accept |
| 1 | Reject: MCCAOP reservation conflict |
| 2 | Reject: MAF limit exceeded |
| 3 | Reject: MCCA track limit (dot11MCCAMaxTrackStates) exceeded |
| 4–255 | Reserved |

The MCCAOP Reservation field includes an alternative to the MCCAOP reservation specified in the MCCAOP Setup Request frame. Its format is described in 9.4.2.106.2. When the MCCA Reply Code is 1, the MCCAOP Reservation field might be present. When the MCCA Reply Code is set to other values, the MCCAOP Reservation field is not present.

9.4.2.108 MCCAOP Advertisement Overview element

The MCCAOP Advertisement Overview element is used by a mesh STA to advertise its MCCA Information and information about its MCCAOP Advertisement elements, representing its MCCAOP advertisement set, to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the MCCAOP Advertisement Overview element is shown in Figure 9-468.

| | | | | | | | |
|--------|------------|--------|-----------------------------------|-------|----------------------|-----------|-------------------------------|
| Octets | 1 | 1 | 1 | 1 | 1 | 1 | 2 |
| | Element ID | Length | Advertisement Set Sequence Number | Flags | MCCA Access Fraction | MAF Limit | Advertisement Elements Bitmap |

Figure 9-468—MCCAOP Advertisement Overview element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement Overview element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The format of the Flags field is shown in Figure 9-469.

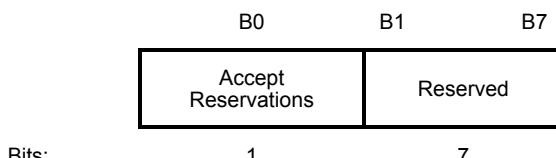

Figure 9-469—Flags field format

The Flags field is set as follows:

- Bit 0: Accept Reservations subfield. The Accept Reservations subfield is set to 1 if the mesh STA accepts additional reservations. It is set to 0 otherwise.
- Bit 1–7: Reserved

The MCCA Access Fraction field is an eight bit unsigned integer. The MCCA Access Fraction field is set to the current value of the MCCA access fraction at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The MAF Limit field is an eight bit unsigned integer. The MAF Limit field is set to the maximum MCCA access fraction allowed at the mesh STA rounded down to the nearest multiple of (1/255) of the DTIM interval length.

The Advertisement Elements Bitmap field is 2 octets in length and indicates the MCCAOP Advertisement elements that are part of this MCCAOP advertisement set. The Advertisement Elements Bitmap field is a bitmap. Bit i in this bitmap equals 1 if the MCCAOP Advertisement element with MCCAOP Advertisement Element Index equal to i is part of this MCCAOP advertisement set, and it equals 0 otherwise.

9.4.2.109 MCCAOP Advertisement element

9.4.2.109.1 General

The MCCAOP Advertisement element is used by a mesh STA to advertise MCCAOP reservations to its neighbors. This element is transmitted in MCCA Advertisement frames and optionally present in Beacon frames. The format of the element is shown in Figure 9-470.

| Element ID | Length | Advertisement Set Sequence Number | MCCAOP Advertisement Element Information | TX-RX Periods Report | Broadcast Periods Report | Interference Periods Report |
|------------|--------|-----------------------------------|--|----------------------|--------------------------|-----------------------------|
| Octets: | 1 | 1 | 1 | variable | variable | variable |

Figure 9-470—MCCAOP Advertisement element format

The Element ID and Length fields are defined in 9.4.2.1.

The Advertisement Set Sequence Number field is 1 octet in length and is coded as an unsigned integer. It is set to the advertisement set sequence number of the current MCCAOP advertisement set. The Advertisement Set Sequence Number, together with the MAC address of the transmitter of the MCCAOP Advertisement element, identifies an MCCAOP advertisement set and provides an identifier and a chronological order of different MCCAOP advertisement sets of the same mesh STA.

The MCCAOP Advertisement Element Information field is 1 octet in length. It is described in 9.4.2.109.2.

The TX-RX Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.109.3. This field is present when the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The TX-RX Periods Report field is described in 10.23.3.7.2.

The Broadcast Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.109.3. This field is present when the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Broadcast Periods Report field is described in 10.23.3.7.2.

The Interference Periods Report field is a variable-length field that contains an MCCAOP Reservation Report field, as described in 9.4.2.109.3. This field is present when the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is equal to 1; it is not present otherwise. The Interference Periods Report field is described in 10.23.3.7.2.

9.4.2.109.2 MCCAOP Advertisement Element Information field

The MCCAOP Information field is 1 octets in length and provides information on the MCCAOP reservations. The field consists of four subfields and its format is shown in Figure 9-471.

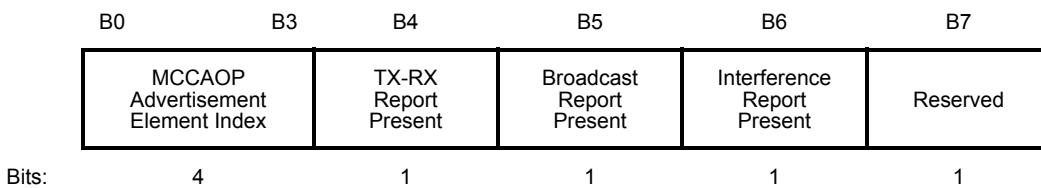

Figure 9-471—MCCAOP Advertisement Element Information field

The MCCAOP Advertisement Element Index subfield is a 4-bit unsigned integer. It identifies the MCCAOP Advertisement element.

The TX-RX Report Present subfield is 1 bit in length. It is set to 1 if the TX-RX Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no TX-RX Periods Report field is present.

The Broadcast Report Present subfield is 1 bit in length. It is set to 1 if the Broadcast Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Broadcast Periods Report field is present.

The Interference Report Present subfield is 1 bit in length. It is set to 1 if the Interference Periods Report field is present in the MCCAOP Advertisement element and set to 0 if no Interference Periods Report field is present.

9.4.2.109.3 MCCAOP Reservation Report field

The MCCAOP Reservation Report field is of variable length and is used to report a number of MCCAOP reservations. The field consists of a variable number of subfields and its format is shown in Figure 9-472.

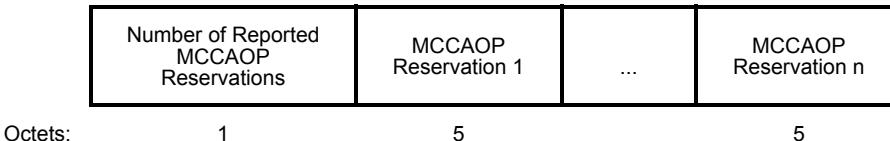

Figure 9-472—MCCAOP Reservation Report field

The Number of Reported MCCAOP reservations is a field of 1 octet with an unsigned integer that specifies the number, n, of MCCAOP Reservations reported in this MCCAOP Reservation Report field.

The MCCAOP Reservation 1 through MCCAOP Reservation n fields specify the MCCAOP reservations reported. Each MCCAOP Reservation field is 5 octets in length and its format is shown in Figure 9-466 in 9.4.2.106.2.

9.4.2.110 MCCAOP Teardown element

The MCCAOP Teardown element is used to announce the teardown of an MCCAOP reservation. The MCCAOP Teardown element is transmitted in individually addressed MCCA Teardown frames or in group addressed MCCA Teardown frames. Its format is shown in Figure 9-473.

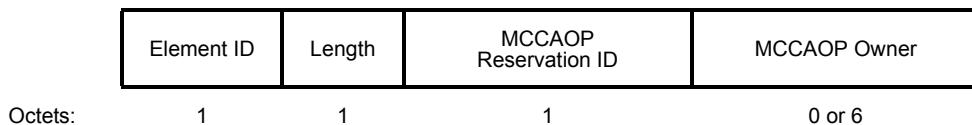

Figure 9-473—MCCAOP Teardown element format

The Element ID and Length fields are defined in 9.4.2.1.

An MCCAOP Teardown element is transmitted by either the MCCAOP owner or the MCCAOP responder of a MCCAOP reservation to tear down the MCCAOP reservation.

The MCCAOP Reservation ID field is an eight bit unsigned integer that represents the ID for the MCCAOP reservation.

The MCCAOP Owner field is an optional field. It is 6 octets long and indicates the 48-bit MAC address of the MCCAOP owner. This field is included if the element is transmitted by the MCCAOP responder; it is not included otherwise.

9.4.2.111 GANN element

The GANN (gate announcement) element is used for announcing the presence of a mesh gate in the MBSS. The GANN element is transmitted in a Gate Announcement frame (see 9.6.17.4). The format of the GANN element is shown in Figure 9-474.

| | | | | | | | | |
|------------|--------|-------|-----------|-------------|-------------------|----------------------|----------|---|
| Element ID | Length | Flags | Hop Count | Element TTL | Mesh Gate Address | GANN Sequence Number | Interval | |
| Octets: | 1 | 1 | 1 | 1 | 1 | 6 | 4 | 2 |

Figure 9-474—GANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The Flags field is reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating mesh gate to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Mesh Gate Address field is represented as a 48-bit MAC address and is set to the MAC address of the mesh gate.

The GANN Sequence Number field is coded as an unsigned integer and is set to a GANN Sequence Number specific for the originating mesh gate.

The Interval field is coded as an unsigned integer and is set to the number of seconds between the periodic transmissions of Gate Announcements by the mesh gate.

Detailed usage of the GANN element is described in 14.11.2.

9.4.2.112 RANN element

The RANN (root announcement) element is used for announcing the presence of a mesh STA configured as root mesh STA with dot11MeshHWMPRootMode set to rann (4). RANN elements are sent out periodically by such a root mesh STA. The RANN element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.17.3). The format of the RANN element is shown in Figure 9-475.

| | | | | | | | | |
|------------|--------|-------|-----------|-------------|-----------------------|----------------------|----------|--------|
| Element ID | Length | Flags | Hop Count | Element TTL | Root Mesh STA Address | HWMP Sequence Number | Interval | Metric |
| Octets: | 1 | 1 | 1 | 1 | 1 | 6 | 4 | 4 |

Figure 9-475—RANN element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-476.

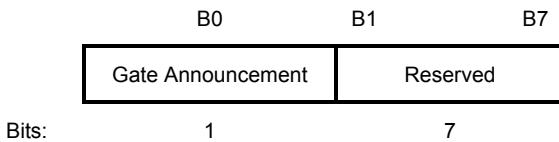

Figure 9-476—Flags field format

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Root Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1–7: Reserved.

The Hop Count field is coded as an unsigned integer and indicates the number of hops from the originating root mesh STA to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Root Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the root mesh STA.

The HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP sequence number (SN) specific to the root mesh STA.

The Interval field is coded as an unsigned integer and is set to the number of TUs between the periodic transmissions of Root Announcements.

The Metric field is set to the cumulative metric from the originating root mesh STA to the mesh STA transmitting the announcement.

Detailed usage of the RANN element is described in 14.10.12.

9.4.2.113 PREQ element

The PREQ (path request) element is used for discovering a path to one or more target mesh STAs, maintaining a path (optional), building a proactive (reverse) path selection tree to the root mesh STA, and confirming a path to a target mesh STA (optional). The PREQ element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.17.3). The format of the PREQ element is shown in Figure 9-477.

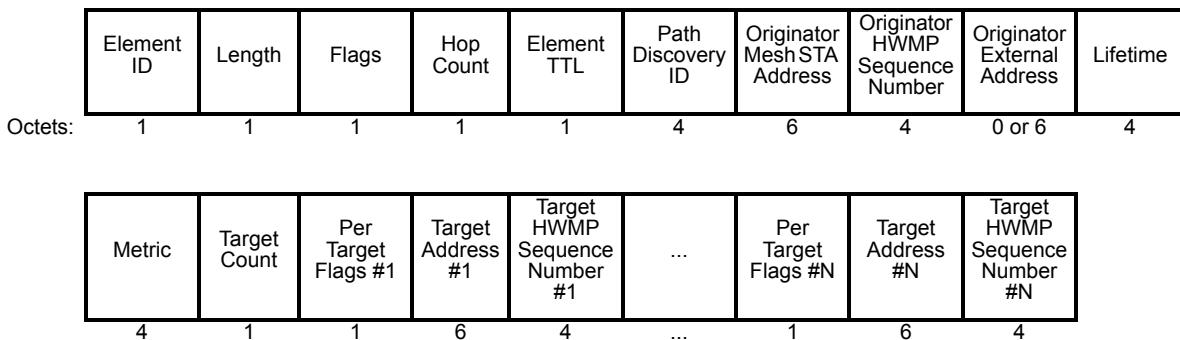

Figure 9-477—PREQ element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-478.

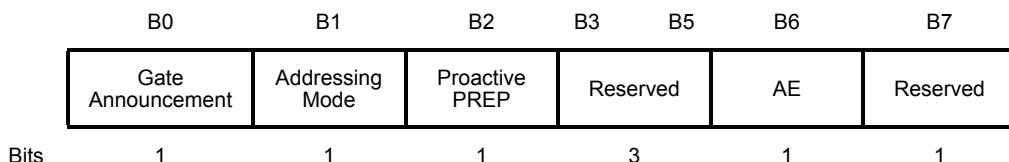

Figure 9-478—Flags field format

The Flags field is set as follows:

- Bit 0: Gate Announcement subfield (0 = gate announcement protocol not activated, 1 = gate announcement protocol activated). A Gate Announcement subfield equal to 1 indicates that the Originator Mesh STA Address is a mesh gate with dot11MeshGateAnnouncements equal to true.
- Bit 1: Addressing Mode subfield (0 = group addressed, 1 = individually addressed). When the Addressing Mode subfield is 0, the PREQ element is sent in an HWMP Mesh Path Selection frame that is group addressed to all neighbor peer mesh STAs. When the Addressing Mode subfield is 1, the PREQ element is sent in an HWMP Mesh Path Selection frame that is individually addressed to a neighbor peer mesh STA. Detailed addressing information is provided in 14.10.7.
- Bit 2: Proactive PREP subfield (0 = off, 1 = on). The Proactive PREP subfield is of relevance only if the Target Address is the broadcast address (all 1s). If equal to 1, every recipient of a PREQ element with Target Address equal to the broadcast address replies with a PREP element. If equal to 0, a recipient replies only under certain conditions (see 14.10.4.2) and does not reply otherwise.
- Bit 3–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1= external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Originator External Address is present, and that the originator mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the originator to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Path Discovery ID field is coded as an unsigned integer and is set to some unique ID for this PathDiscovery.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the originator MAC address.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN specific to the originator.

The Originator External Address field is the MAC address of an external STA proxied by the Originator. This field is present only if the AE subfield in the Flags field is set to 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREQ element consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field is set to the cumulative metric from the originator to the mesh STA transmitting the PREQ element.

The Target Count N field is coded as an unsigned integer and gives the number of targets (N) contained in this PREQ element. The maximum value of N is 20. The Per Target Flags field, the Target Address field, and the Target HWMP Sequence Number field are repeated N times in the element.

The format of the Per Target Flags field is shown in Figure 9-479.

| | B0 | B1 | B2 | B3 | B7 |
|-------|----|----------|-----|----------|----|
| Bits: | 1 | 1 | 1 | 5 | |
| | TO | Reserved | USN | Reserved | |

Figure 9-479—Per Target Flags field format

The Per Target Flags field is set as follows:

- Bit 0: TO (Target Only) subfield: The TO subfield defines which mesh STA responds with a PREP element to the PREQ element containing an individual target address. If TO = 1, only the target mesh STA responds. If TO = 0, intermediate mesh STAs with active forwarding information to the target mesh STA also respond. See 14.10.10.3.
- Bit 1: Reserved.
- Bit 2: USN (Unknown Target HWMP Sequence Number) subfield: The USN subfield indicates whether the Target HWMP Sequence Number field of the corresponding target is interpreted as HWMP SN (USN = 0) or not (USN = 1), the latter meaning that a target HWMP SN is unknown at the originator mesh STA.
- Bit 3–7: Reserved.

The Target Address field is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is the latest known HWMP SN received in the past by the originator mesh STA for any path toward the target. If such a target HWMP SN is not known, the USN subfield is set to 1 and Target HWMP Sequence Number field is reserved.

Detailed usage of the PREQ element is described in 14.10.9.

9.4.2.114 PREP element

The PREP (path reply) element is used to establish a forward path to a target and to confirm that a target is reachable. The PREP element is issued in response to a PREQ element. The PREP element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.17.3). The format of the PREP element is shown in Figure 9-480.

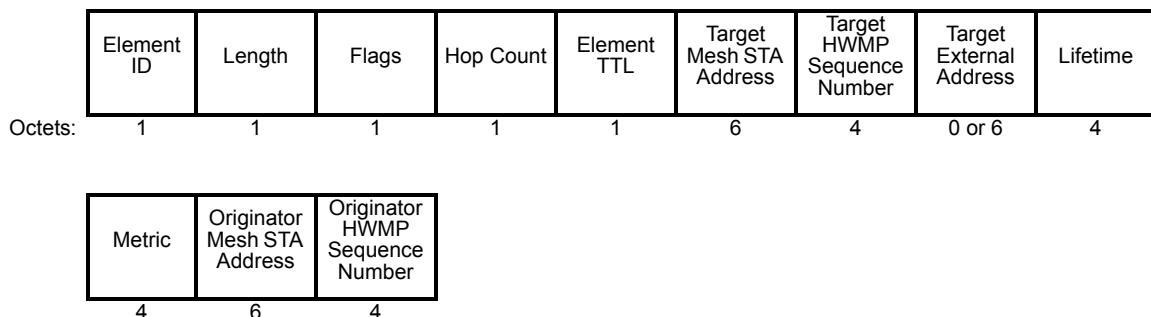

Figure 9-480—PREP element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Flags field is shown in Figure 9-481.

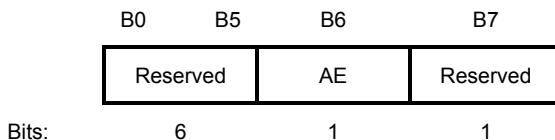

Figure 9-481—Flags field format

The Flags field is set as follows:

- Bit 0–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1 = external address present, 0 = otherwise). An AE subfield equal to 1 indicates that the field Target External Address is present, and that the target mesh STA is a proxy for this external address.
- Bit 7: Reserved.

The Hop Count field is coded as an unsigned integer and is set to the number of hops from the path target to the mesh STA transmitting this element.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Target Mesh STA Address is the MAC address of the target mesh STA or target proxy mesh gate and is represented as a 48-bit MAC address.

The Target HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the target mesh STA (if the AE subfield in the Flags field is set to 0) or target proxy mesh gate (if the AE subfield in the Flags field is set to 1).

The Target External Address field is set to the external address on behalf of which the PREP element is sent. This field is present only if Bit 6 (AE subfield) in Flags field equals 1 and is represented as a 48-bit MAC address.

The Lifetime field is coded as an unsigned integer and is set to the time for which mesh STAs receiving the PREP element consider the forwarding information to be valid. The lifetime is measured in TUs.

The Metric field indicates the cumulative metric from the path target to the mesh STA transmitting this element.

The Originator Mesh STA Address field is represented as a 48-bit MAC address and is set to the MAC address of the originator, which is contained in the PREQ element.

The Originator HWMP Sequence Number field is coded as an unsigned integer and is set to the HWMP SN of the originator mesh STA contained in the PREQ element.

The detailed usage of the PREP element is described in 14.10.10.

9.4.2.115 PERR element

The PERR (path error) element is used for announcing an unreachable destination. The PERR element is transmitted in an HWMP Mesh Path Selection frame (see 9.6.17.3). The format of the PERR element is shown in Figure 9-482.

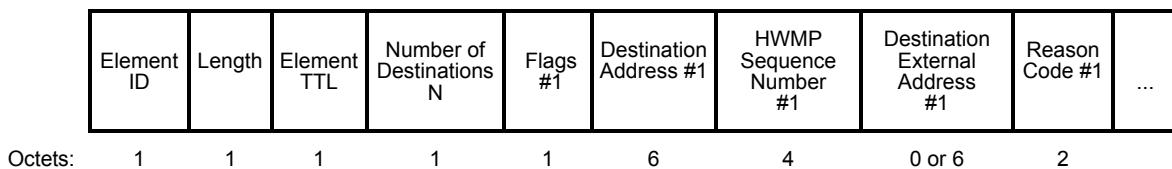

Figure 9-482—PERR element format

The Element ID and Length fields are defined in 9.4.2.1.

The Element TTL field is coded as an unsigned integer and indicates the remaining number of hops allowed for this element.

The Number of Destinations N field is coded as an unsigned integer and indicates the number of announced destinations in PERR. The maximum value of N is 19. The Flags field, the Destination Address field, the HWMP Sequence Number field, the Destination External Address field, and the Reason Code field are repeated N times in the element.

The format of the Flags field is shown in Figure 9-483.

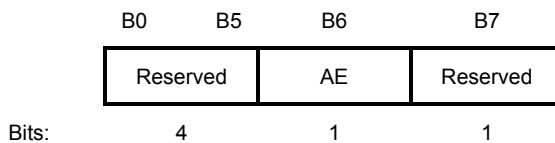

Figure 9-483—Flags field format

The Flags field is set as follows:

- Bit 0–5: Reserved.
- Bit 6: AE (Address Extension) subfield (1 = destination external address is present, 0 = otherwise).
- Bit 7: Reserved.

The Destination Address field is represented as a 48-bit MAC address and indicates the detected unreachable destination MAC address.

The HWMP Sequence Number field is coded as an unsigned integer and indicates the HWMP SN for the invalidated destination, if applicable. Otherwise, the HWMP Sequence Number field is reserved depending on the reason code.

The Destination External Address field is set to the external address, on behalf of which the PERR is sent. This field is present only if Bit 6 (AE subfield) in the Flags field equals 1 and is represented as a 48-bit MAC address.

The Reason Code field specifies the reason for sending a PERR element. The Reason Code is defined in 9.4.1.7.

The detailed usage of the PERR element is described in 14.10.11.

9.4.2.116 PXU element

The PXU (proxy update) element is used to inform the destination mesh STA of the proxy information at the originator mesh STA. The PXU element is transmitted in a Proxy Update frame (see 9.6.18.2). The format of the PXU element is shown in Figure 9-484.

| Element ID | Length | PXU ID | PXU Originator MAC Address | Number of Proxy Information (N) | Proxy Information #1 | ... | Proxy Information #N |
|------------|--------|--------|----------------------------|---------------------------------|----------------------|-------------------|----------------------|
| Octets: | 1 | 1 | 1 | 6 | 1 | 11, 15, 17, or 21 | 11, 15, 17, or 21 |

Figure 9-484—PXU element format

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is coded as an unsigned integer and is set to the sequence number of the PXU. The source mesh STA sets the PXU ID field in the PXU element to a value from a single modulo 256 counter that is incremented by 1 for each new PXU element.

The PXU Originator MAC Address field is represented as a 48-bit MAC address and is the MAC address of the mesh STA that originates this PXU element.

The Number of Proxy Information fields is coded as an unsigned integer and is set to the number N of Proxy Information field that follow this field and that are reported to the destination mesh STA. The maximum value of N is 22.

The Proxy Information field contains a single proxy information (see 14.11.4.2). The length of the Proxy Information field depends on the settings of the subfields in the Flags subfield and is 11, 15, 17, or 21 octets.

The format of the Proxy Information field is defined in Figure 9-485.

| Flags | External MAC Address | Proxy Information Sequence Number | Proxy MAC Address | Proxy Information Lifetime |
|---------|----------------------|-----------------------------------|-------------------|----------------------------|
| Octets: | 1 | 6 | 4 | 0 or 6 |

Figure 9-485—Proxy Information field

The format of the Flags subfield is shown in Figure 9-486.

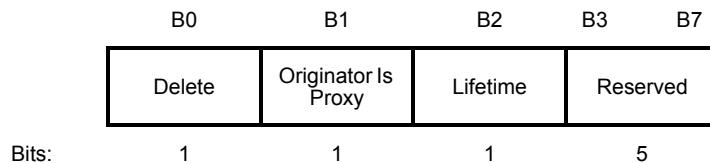

Figure 9-486—Flags subfield

The Flags subfield is set as follows:

- Bit 0: The Delete subfield indicates whether this proxy information is to be deleted. It is set to 1 if the proxy information is to be deleted, and set to 0 otherwise.
- Bit 1: The Originator Is Proxy subfield indicates that the originator mesh STA of the PXU element is the proxy mesh gate of this proxy information when set to 1. In this case, there is no Proxy MAC Address subfield present in this Proxy Information field. When the Originator Is Proxy subfield is 0, the Proxy MAC Address subfield is present in this Proxy Information field.
- Bit 2: The Lifetime subfield indicates that the Proxy Information Lifetime subfield is present in this Proxy Information field when set to 1.
- Bit 3–7: Reserved.

The External MAC Address subfield is represented as a 48-bit MAC address and is the MAC address of the external STA proxied by the proxy mesh gate.

The Proxy Information Sequence Number field is coded as an unsigned integer and is set to the sequence number of the proxy information. The sequence number of the proxy information defines a chronological order of the proxy information for the external STA at this proxy mesh gate.

The Proxy MAC Address subfield is represented as a 48-bit MAC address and is set to the MAC address of proxy mesh gate. It is present if the Originator Is Proxy subfield of the Flags subfield is 0; it is not present otherwise.

The Proxy Information Lifetime subfield is coded as an unsigned integer and is set to the time for which the mesh STA receiving this PXU considers this proxy information to be valid. The proxy information lifetime is measured in TUs. It is present if the Lifetime subfield of the Flags subfield is 1; it is not present otherwise.

9.4.2.117 PXUC element

The PXUC (proxy update confirmation) element is used to confirm the previously received PXU. The PXUC element is transmitted in a Proxy Update Confirmation frame (see 9.6.18.3). The format of PXUC element is shown in Figure 9-487.

Figure 9-487—PXUC element format

The Element ID and Length fields are defined in 9.4.2.1.

The PXU ID field is coded as an unsigned integer and is the PXU ID of the received PXU that is being confirmed.

The PXU Recipient MAC Address is represented as a 48-bit MAC address and is set to the MAC address of the recipient of the PXU, i.e., the originator of the PXUC element.

9.4.2.118 Authenticated Mesh Peering Exchange element

The Authenticated Mesh Peering Exchange element includes information needed to perform the authentication sequence during an authenticated mesh peering exchange. This element is shown in Figure 9-488.

| Octets | 1 | 1 | 4 | 32 | 32 | 8 | variable | variable |
|--------|------------|--------|--------------------------------|-------------|------------|-------------------------------|--------------------|---------------------|
| | Element ID | Length | Selected Pairwise Cipher Suite | Local Nonce | Peer Nonce | Key Replay Counter (optional) | GTKdata (optional) | IGTKdata (optional) |

Figure 9-488—Authenticated Mesh Peering Exchange element format

The Element ID and Length fields are defined in 9.4.2.1.

The Selected Pairwise Cipher Suite field contains a pairwise cipher suite selector, as defined in 9.4.2.25.2, indicating a cipher suite to be used to secure the link.

The Local Nonce field contains a nonce value chosen by the mesh STA that is sending the element. It is encoded following the conventions from 9.2.2.

The Peer Nonce field contains a nonce value that was chosen by the peer mesh STA or candidate peer mesh STA to which the element is being sent. It is encoded following the conventions from 9.2.2.

The Key Replay Counter field is optional. It is used only for the Mesh Group Key Inform frame (see 14.6.3) and the Mesh Group Key Acknowledge frame (see 14.6.4). It is represented as an unsigned integer.

The GTKdata field is optional. When present, it contains the bit string of {GTK || Key RSC || GTKExpirationTime} as the GTK data material. When present, the GTKdata field is protected by the exchange in which it is contained (see 14.5). The Key RSC denotes the last TSC or PN sent using the GTK and is specified in Table 12-5 of 12.7.2. GTKExpirationTime denotes the key lifetime of the GTK in seconds and the format is specified in Figure 12-40 of 12.7.2.

The IGTKdata field is present when dot11RSNAProtectedManagementFramesActivated equals true. When present, it contains the Key ID, IPN and IGTK used with BIP for management frame protection. The format of the IGTKdata field is specified in Figure 12-42 of 12.7.2.

Detailed usage of the Authenticated Mesh Peering Exchange element is described in 14.5.5 and in 14.6.

9.4.2.119 MIC element

The MIC element provides message integrity to mesh peering Management frames. The format of the MIC element is shown in Figure 9-489.

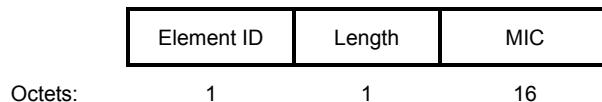

Figure 9-489—MIC element format

The Element ID and Length fields are defined in 9.4.2.1.

The MIC field contains a message integrity code calculated over the mesh peering Management frame (as specified in 14.5) and the mesh group key handshake frame (as specified in 14.6).

9.4.2.120 Quality-of-Service Management Frame Policy element

The Quality-of-Service Management Frame (QMF) Policy element defines a QMF access category mapping (QACM) of Management frames and is used to advertise and exchange QMF policy between STAs. The use of the QMF Policy element is given in 11.26. See Figure 9-490.

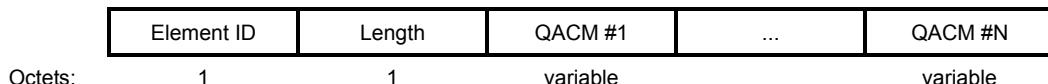

Figure 9-490—QMF Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The QACM field specifies a group of Management frames and their associated access categories. See Figure 9-491 and see 11.26.3.

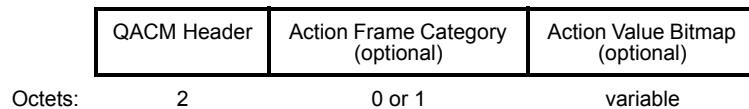

Figure 9-491—QACM field format

The format of the QACM Header subfield of the QACM field is defined in Figure 9-492.

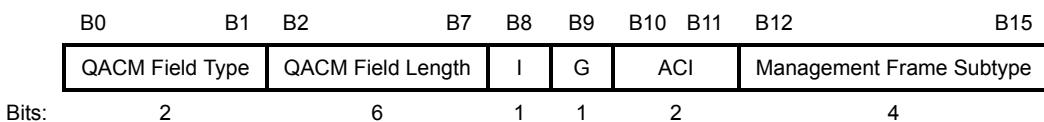

Figure 9-492—QACM Header subfield

The QACM Field Type subfield is 2 bits in length and defines the structure of the QACM field. Its value is 0. Values 1, 2, and 3 are reserved.

The QACM Field Length subfield is 6 bits in length and defines the length in octets of the QACM field excluding the QACM Header subfield.

The Individually Addressed subfield (I) is 1 bit in length. When the QACM applies to individually addressed Management frames, the value of the Individually Addressed subfield is 1. Otherwise, it is 0.

The Group Addressed subfield (G) is 1 bit in length. When the QACM applies to group addressed Management frames, the value of the Group Addressed subfield is 1. Otherwise, it is 0.

The combination of I = 0 and G = 0 is not allowed.

The ACI subfield is 2 bits in length. Each Management frame that is listed in the QACM Header subfield is transmitted using the access category identified by the accompanying ACI subfield.

The Management Frame Subtype subfield is 4 bits in length. It indicates the subtype of Management frames that are sent using the access category indicated in the ACI subfield. The valid values for this subfield are the subtypes in Table 9-1 that correspond to Management frames.

The Action Frame Category subfield is 1 octet in length and indicates the category of the Action frame, as defined in 9.4.1.1, of Action frames that are sent using the access category indicated in the ACI subfield. The Action Frame Category subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype as specified in 11.26.3.

The Action Value Bitmap subfield is included when the QACM Policy is specified for a subset of Action frame types in a Action Frame Category. The Action Value Bitmap subfield is of variable length and indicates the action values, as defined in 9.6, for the corresponding Action frame category that are sent using the access category indicated in the ACI subfield. The Action Value Bitmap subfield is included only when the Management Frame Subtype subfield indicates Action or Action No Ack subtype and the QACM Field Length subfield is greater than or equal to 2. Each bit in the Action Value Bitmap subfield is mapped to the corresponding action value. The Action Value Bitmap subfield is zero padded to complete any incomplete octet. When included, the size in octets of the Action Value Bitmap field is found by subtracting 1 from the value of the QACM Field Length subfield.

9.4.2.121 Intra-Access Category Priority element

The Intra-Access Category Priority element provides information from a non-AP STA to an AP on the relative priorities of streams within an AC, as described in 10.2.4.2 and 11.27.2. This element is optionally present in ADDTS Request, QoS Map Configure, or SCS Request frames. The Intra-Access Category Priority element is defined in Figure 9-493.

| Element ID | Length | Intra-Access Priority |
|------------|--------|-----------------------|
| Octets: | 1 | 1 |

Figure 9-493—Intra-Access Category Priority element format

The Element ID and Length fields are defined in 9.4.2.1.

The Intra-Access Priority field is defined in Figure 9-494.

| B0 | B2 | B3 | B4 | B5 | B7 |
|---------------|-----------------|------------------|----------|----|----|
| User Priority | Alternate Queue | Drop Eligibility | Reserved | | |
| Bits: | 3 | 1 | 1 | 3 | |

Figure 9-494—Intra-Access Priority field format

The User Priority subfield indicates the UP of MSDUs or A-MSDUs of the stream to which this Intra-Access Category Priority element relates.

The Alternate Queue subfield indicates the intended primary or alternate EDCA queue that is used for this stream. When dot11AlternateEDCAActivated is false, this subfield is reserved. When the Alternate Queue

subfield is set to 0, the primary EDCA queue for this AC is used. When the Alternate Queue subfield is equal to 1, the Alternate EDCA queue for this AC (see 10.2.4.2) is used.

The Drop Eligibility subfield is 1 bit in length and is used to indicate the suitability of this TS to be discarded if there are insufficient resources. If there are insufficient resources, a STA should discard the MSDUs or A-MSDUs of a TS with a Drop Eligibility subfield equal to 1, in preference to MSDUs or A-MSDUs of a TS whose Drop Eligibility subfield is equal to 0. See 11.26.2. The mechanisms for determining whether the resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

9.4.2.122 SCS Descriptor element

The SCS Descriptor element defines information about the stream that is being classified using the procedures defined in 11.27.2. The format of the SCS Descriptor element is shown in Figure 9-495.

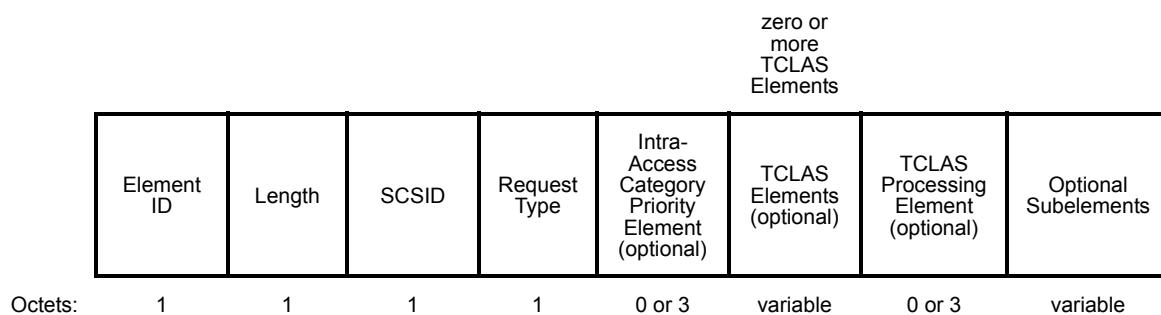

Figure 9-495—SCS Descriptor element format

The Element ID and Length fields are defined in 9.4.2.1.

The SCSID field is set to a nonzero value chosen by the non-AP STA identifying the SCS stream specified in this SCS Descriptor element.

The Request Type field is set to a number to identify the type of SCS request. The Request Types are shown in Table 9-224.

Table 9-224—SCS Request Type definitions

| Name | Value |
|----------|-------|
| Add | 0 |
| Remove | 1 |
| Change | 2 |
| Reserved | 3–255 |

The Intra-Access Category Priority Element field is present when Request Type field is equal to “Add” or “Change” and is defined in 9.4.2.121.

The TCLAS Elements field contains zero or more TCLAS elements to specify how incoming MSDUs are classified as part of this SCS stream, as defined in 9.4.2.31. One or more TCLAS elements are present when Request Type field is equal to “Add” or “Change,” and no TCLAS elements are present when Request Type field is equal to “Remove.”

The TCLAS Processing Element field is present when more than one TCLAS element is present in the TCLAS Elements field and contains a TCLAS Processing element that defines how the multiple TCLAS elements are to be processed, as defined in 9.4.2.33.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Optional Subelement ID field values for the defined subelements are shown in Table 9-225.

Table 9-225—Optional subelement IDs for SCS Descriptor element

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

The SCS Descriptor element is included in SCS Request frames, as described in 9.6.19.2. The use of the SCS Descriptor element and SCS Request frames is described in 11.27.2.

9.4.2.123 QLoad Report element

9.4.2.123.1 QLoad Report element format

The QLoad Report element contains the set of parameters necessary to support OBSS management. The format of the QLoad Report element is provided in Figure 9-496.

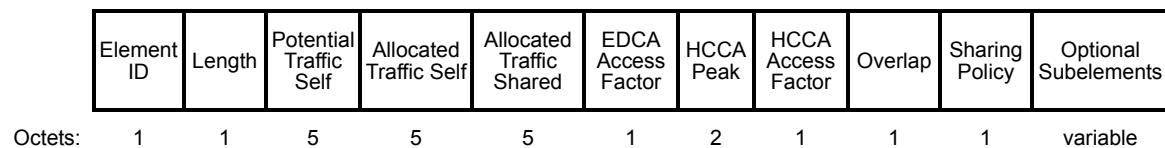

Figure 9-496—QLoad Report element format

The Element ID and Length fields are defined in 9.4.2.1.

Potential Traffic Self, Allocated Traffic Self, and Allocated Traffic Shared fields use the QLoad field format as described in 9.4.2.123.2.

The Potential Traffic Self field represents the peak composite QoS traffic for this BSS if all of the potential admission control and HCCA TSPECs from the non-AP STAs are active. The methods for gathering the total potential TSPEC information are described in 11.28.2.

The Allocated Traffic Self field represents the composite QoS traffic for this BSS based upon all of the admission control and HCCA TSPECs admitted within the same BSS, as described in 11.28.2.

The Allocated Traffic Shared field represents the sum of the Allocated Traffic Self field values that have been received or obtained from other APs whose beacons have been detected or obtained within the last 100 beacon periods, plus the Allocated Traffic Self field value of the AP itself. Computation of the values represented in the Allocated Traffic Shared field is described in 11.28.2.

As described in 11.28.2, the EDCA Access Factor field value is the sum of the Potential Traffic Self field values that have been received or obtained from other APs, plus the Potential Traffic Self field value of the AP itself, minus the sum of the HCCA Peak field values that have been received or obtained from overlapping APs, minus the HCCA Peak field value of the AP itself. The EDCA Access Factor is expressed as a fraction rounded down to a multiple of 1/64. When the EDCA Access Factor is greater than 254/64, the EDCA Access Factor field is set to 255.

The HCCA Peak field is the total peak HCCA TXOP requirement, over a period of 1 s, for the AP and BSS, for all of the HCCA TSPECs that are included in the QLoad. HCCA Peak is expressed in multiples of 32 μ s over a period of 1 s. The HCCA Peak field is reserved if HCCA is not supported.

NOTE—Because the HCCA peak is calculated over 1 s periods, its value might be an underestimate of the instantaneous peak of interactive variable bit rate (VBR) flows.

The HCCA Access Factor field value is the sum of the HCCA Peak field values in the QLoad Report elements that have been received from the APs of OBSSs, plus the HCCA Peak field value of the AP itself, as described in 11.28.2. It is expressed as a fraction rounded down to a multiple of 1/64. When the HCCA Access Factor is greater than 254/64, the HCCA Access Factor field is set to 255.

The Overlap field indicates the number of other APs that are sharing the same channel and whose beacons have been detected or obtained within the last 100 beacon periods by the AP issuing this beacon.

The Sharing Policy field contains the currently active sharing policy. The values for the Sharing Policy field are described in Table 9-226.

Table 9-226—Sharing Policy definitions

| Sharing Policy field value | Current sharing policy |
|----------------------------|------------------------|
| 0 | Not specified |
| 1 | Static |
| 2 | Dynamic |
| 3–220 | Reserved |
| 221 | Vendor Specific |
| 222–255 | Reserved |

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-227.

Table 9-227—Optional subelement IDs for QLoad Report element

| Subelement ID | Name | Extensible |
|---------------|-----------------|------------|
| 0–220 | Reserved | |
| 221 | Vendor Specific | |
| 222–255 | Reserved | |

9.4.2.123.2 QLoad field format

The QLoad field format is described in Figure 9-497.

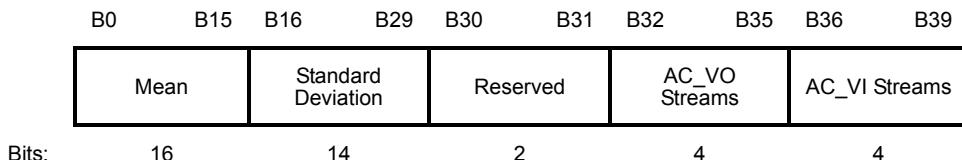

Figure 9-497—QLoad field format

The Mean subfield represents the amount of time admitted, or the amount of time scheduled traffic requires to access the medium, in units of 32 µs per second. In the case of EDCA admission control, this value is the sum of the admitted medium times, and for HCCA it is the total TXOP time required per second (see T.2.2). If the mean medium time is larger than 2 097 088 µs ($65\ 534 \times 32$), the Mean subfield is set to 0xFFFF. The Mean subfield is set to 0xFFFF to indicate that the mean medium time is unknown.

The Standard Deviation subfield indicates the standard deviation from the mean medium time, in units of 32 µs per second. If the standard deviation is larger than 8128 µs (254×32), the Standard Deviation subfield is set to 0x3FFE. The Standard Deviation subfield is set to 0x3FFF to indicate that the standard deviation from the mean is unknown.

The AC_VO Streams subfield indicates the number of TSs using explicit admission control for AC_VO in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of admitted AC_VO streams is larger than 14, the AC_VO Streams subfield is set to 0xE. The AC_VO Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VO is unknown.

The AC_VI Streams subfield indicates the number of TSs using explicit admission control for AC_VI in the QoS traffic load report. Bidirectional streams are counted as two streams. If the number of TSs using explicit admission control for AC_VI is larger than 14, the AC_VI Streams subfield is set to 0xE. The AC_VI Streams subfield is set to 0xF to indicate that the number of TSs using explicit admission control for AC_VI is unknown.

See 11.28.2 and Annex T.

9.4.2.124 HCCA TXOP Update Count element

The HCCA TXOP Update Count element is used by an AP to advertise its change in TXOP schedule. The format is provided in Figure 9-498.

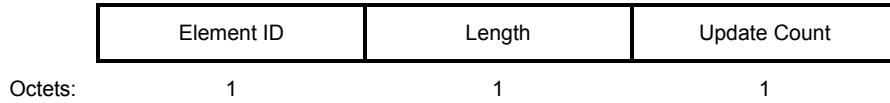

Figure 9-498—HCCA TXOP Update Count element format

The Element ID and Length fields are defined in 9.4.2.1.

The Update Count field is described in 11.28.3 and is used to indicate that a change has occurred in the number of active HCCA or HEMM TSs.

9.4.2.125 Higher Layer Stream ID element

The Higher Layer Stream ID element identifies a stream from a higher layer protocol. This element is used to bind messages that are exchanged in order to complete a procedure, e.g., messages exchanged in an AP-initiated TS setup procedure. See 11.4.4.3. The format is provided in Figure 9-499.

| Element ID | Length | Protocol ID | Organization Identifier | Higher Layer Stream ID |
|------------|--------|-------------|-------------------------|------------------------|
| Octets: | 1 | 1 | 1 | 0, 3, or 5 variable |

Figure 9-499—Higher Layer Stream ID element format

The Element ID and Length fields are defined in 9.4.2.1.

The Protocol ID field identifies the higher layer protocol to which the stream belongs. The values defined for the Protocol ID field are described in Table 9-228.

Table 9-228—Protocol ID definitions

| Protocol ID | Protocol | Description |
|-------------|-----------------|--|
| 0 | Reserved | |
| 1 | IEEE 802.1Q SRP | Protocol is IEEE 802.1Q SRP, and the corresponding Stream ID is 8 octets long. |
| 2–220 | Reserved | |
| 221 | Vendor Specific | Corresponding Organization Identifier field is included in the element. |
| 222–255 | Reserved | |

The Organization Identifier field is present when the Protocol ID field is equal to 221 and contains a organization identifier assigned by IEEE. The identifier is specified in 9.4.1.32. The order of the Organization Identifier field is described in 9.2.2.

The Higher Layer Stream ID field is an octet string and is defined by the higher layer protocol specified in the Protocol ID field.

9.4.2.126 GCR Group Address element

The GCR Group Address element defines information about group addressed frames to be transmitted using the GCR service. The format of the GCR Group Address element is shown in Figure 9-500.

| Element ID | Length | GCR Group Address |
|------------|--------|-------------------|
| Octets: | 1 | 1 |

Figure 9-500—GCR Group Address element format

The Element ID and Length fields are defined in 9.4.2.1.

GCR Group Address field is the MAC address of the GCR group.

9.4.2.127 DMG BSS Parameter Change element

The DMG BSS Parameter Change element is defined in Figure 9-501.

| Element ID | Length | Change Type Bitmap | TBTT Offset | BI Duration |
|------------|--------|--------------------|-------------|-------------|
| Octets: | 1 | 1 | 1 | 4 2 |

Figure 9-501—DMG BSS Parameter Change element format

The Element ID and Length fields are defined in 9.4.2.1.

The Change Type Bitmap field indicates the type of the parameter change to the BSS. This field is defined in Figure 9-502.

| | | | |
|-------|------|----------|----|
| B0 | B1 | B2 | B7 |
| Move | Size | Reserved | |
| Bits: | 1 | 1 | 6 |

Figure 9-502—Change Type Bitmap field format

If the Move subfield is set to 1, it indicates a change in the TBTT of the BSS. The TBTT is not changed if the Move field is set to 0. If the Size subfield is set to 1, it indicates a change in the beacon interval duration. The beacon interval duration is not changed if the Size subfield is set to 0.

The TBTT Offset field contains a value expressed in microseconds. In any DMG BSS Parameter Change element included in the DMG Beacon and/or Announce frame, the value of the TBTT Offset field represents the lower order 4 octets of the AP or PCP TSF timer of the first changed TBTT.

The BI Duration field value indicates the beacon interval, expressed in TUs, following the indicated DMG BSS parameter change. The BI Duration field is reserved if the Size bit of the Change Type Bitmap field is set to 0.

9.4.2.128 DMG Capabilities element

9.4.2.128.1 General

The DMG Capabilities element contains a STA identifier and several fields that are used to advertise the support of optional DMG capabilities of a DMG STA. The element is present in Association Request, Association Response, Reassociation Request, Reassociation Response, Probe Request and Probe Response frames and can be present in DMG Beacon, Information Request, and Information Response frames. The DMG Capabilities element is formatted as defined in Figure 9-503.

| Element ID | Length | STA Address | AID | DMG STA Capability Information | DMG AP Or PCP Capability Information | DMG STA BeamTracking TimeLimit | Extended SC MCS Capabilities | Maximum Number Of Basic A-MSDU Subframes In A-MSDU | Maximum Number Of Short A-MSDU Subframes In A-MSDU |
|------------|--------|-------------|-----|--------------------------------|--------------------------------------|--------------------------------|------------------------------|--|--|
| Octets: | 1 | 1 | 6 | 1 | 8 | 2 | 2 | 1 | 1 |

Figure 9-503—DMG Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The STA Address field contains the MAC address of the STA.

The AID field contains the AID assigned to the STA by the AP or PCP. The AID field is reserved in Association Request, Reassociation Request and Probe Request frames and when used in an IBSS.

9.4.2.128.2 DMG STA Capability Information field

The DMG STA Capability Information field, shown in Figure 9-504, represents the transmitting STA capabilities irrespective of the role of the STA.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B13 | |
|-------------------|------------------------------------|--------------------|----------------------------------|------------------------------|----------------------|-------------------------|----------|-----|-----|
| Reverse Direction | Higher Layer Timer Synchronization | TPC | SPSH and Interference Mitigation | Number of RX DMG Antennas | Fast Link Adaptation | Total Number of Sectors | | | |
| Bit: | 1 | 1 | 1 | 1 | 2 | 1 | 7 | | |
| B14 | B19 | B20 | B21 | B26 | B27 | B28 | B51 | B52 | |
| RXSS Length | DMG Antenna Reciprocity | A-MPDU Parameters | BA with Flow Control | Supported MCS Set | DTP Supported | | | | |
| Bit: | 6 | 1 | 6 | 1 | 24 | 1 | | | |
| B53 | B54 | B55 | B56 | B57 | B59 | B60 | B61 | B62 | B63 |
| A-PPDU Supported | Heartbeat | Supports Other_AID | Antenna Pattern Reciprocity | Heartbeat Elapsed Indication | Grant Ack Supported | RXSSTxRate Supported | Reserved | | |
| Bit: | 1 | 1 | 1 | 1 | 3 | 1 | 1 | 2 | |

Figure 9-504—DMG STA Capability Information field format

The Reverse Direction subfield is set to 1 if the STA supports RD as defined in 10.28 and is set to 0 otherwise.

The Higher Layer Timer Synchronization subfield is set to 1 if the STA supports Higher Layer Timer Synchronization as defined in 11.6 and is set to 0 otherwise.

The TPC subfield is set to 1 if the STA supports the TPC as defined in 11.8 and is set to 0 otherwise.

The SPSH (spatial sharing) and Interference Mitigation subfield is set to 1 if the STA is capable of performing the function of SPSH and Interference Mitigation and if dot11RadioMeasurementActivated is true and is set to 0 otherwise (see 11.32).

The Number of RX DMG Antennas subfield indicates the total number of receive DMG antennas of the STA. The value of this subfield is in the range 1 to 4, with the value being equal to the bit representation plus 1.

The Fast Link Adaptation subfield is set to 1 to indicate that the STA supports the fast link adaptation procedure described in 10.39.3. Otherwise, it is set to 0.

The Total Number of Sectors subfield indicates the total number of transmit sectors the STA uses in a transmit sector sweep combined over all DMG antennas, including any LBIFS required for DMG antenna switching (see 10.38). The value of this subfield is in the range 1 to 128, with the value being equal to the bit representation plus 1.

The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS required for DMG antenna switching (see 10.38). The value represented by this subfield is in the range 2 to 128 and is given by $(RXSS\ Length + 1) \times 2$.

The DMG Antenna Reciprocity subfield is set to 1 to indicate that the best transmit DMG antenna of the STA is the same as the best receive DMG antenna of the STA and vice versa. Otherwise, this subfield is set to 0.

The A-MPDU Parameters subfield is shown in Figure 9-505.

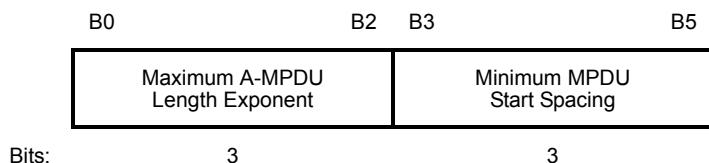

Figure 9-505—A-MPDU parameters subfield format

The subfields of the A-MPDU Parameters subfield are defined in Table 9-229.

Table 9-229—Subfields of the A-MPDU Parameters subfield

| Subfield | Definition | Encoding |
|--------------------------------|---|--|
| Maximum A-MPDU Length Exponent | Indicates the maximum length of A-MPDU that the STA can receive. | This subfield is an integer in the range 0 to 5. The length defined by this subfield is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets. |
| Minimum MPDU Start Spacing | Determines the minimum time between the start of adjacent MPDUs within an A-MPDU that the STA can receive, measured at the PHY SAP. | Set to 0 for no restriction Set to 1 for 16 ns Set to 2 for 32 ns Set to 3 for 64 ns Set to 4 for 128 ns Set to 5 for 256 ns Set to 6 for 512 ns Set to 7 for 1024 ns |

The BA with Flow Control subfield is set to 1 if the STA supports BA with flow control as defined in 10.39 and is set to 0 otherwise.

The Supported MCS Set subfield indicates which MCSs a STA supports. An MCS is identified by an MCS index, which is represented by an integer in the range 0 to 31 or by one of the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. The interpretation of the MCS index (i.e., the mapping from MCS to data rate) is PHY dependent. For the DMG PHY, see Clause 20. The structure of the Supported MCS Set subfield is defined in Figure 9-506.

| B0 | B4 | B5 | B9 | B10 | B14 | B15 | B19 | B20 | B21 | B22 | B23 |
|-------------------|---------------------|-------------------|---------------------|-----------------------------|-----------------|----------|-----|-----|-----|-----|-----|
| Maximum SC Rx MCS | Maximum OFDM Rx MCS | Maximum SC Tx MCS | Maximum OFDM Tx MCS | Low-Power SC Mode Supported | Code Rate 13/16 | Reserved | | | | | |

Bits: 5 5 5 5 1 1 2

Figure 9-506—Supported MCS Set subfield format

The Maximum SC Rx MCS subfield contains the value of the maximum MCS index the STA supports for reception of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-19. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.128.5.

The Maximum OFDM Rx MCS subfield contains the value of the maximum MCS index the STA supports for reception of OFDM frames. If this subfield is set to 0, it indicates that the STA does not support reception of OFDM frames. Values 1–17 of this subfield are reserved. Possible values for this subfield are described in 20.5.3.1.2.

The Maximum SC Tx MCS subfield contains the value of the maximum MCS index the STA supports for transmission of single-carrier frames. Values 0-3 of this subfield are reserved. Possible values for this subfield are shown in Table 20-19. This subfield does not indicate support for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6. Support for these MCSs is indicated using the Extended SC MCS Capabilities field; see 9.4.2.128.5.

The Maximum OFDM Tx MCS subfield contains the value of the maximum MCS index the STA supports for transmission of OFDM frames. If this subfield is set to 0, it indicates that the STA does not support transmission of OFDM frames. Values 1–17 of this subfield are reserved. Possible values for this subfield are described 20.5.3.1.2.

The Low-Power SC Mode Supported subfield is set to 1 to indicate that the STA supports the DMG low-power SC mode (20.7). Otherwise, it is set to 0. If the STA supports the low-power SC mode, it supports all low-power SC mode MCSs indicated in Table 20-23.

The Code Rate 13/16 subfield specifies whether the STA supports rate 13/16. It is set to 1 to indicate that the STA supports rate 13/16 and is set to 0 otherwise. If this subfield is 0, MCSs with 13/16 code rate specified in Table 20-14 and Table 20-19 are not supported regardless of the value in Maximum SC/OFDM Tx/Rx MCS subfields.

The DTP Supported subfield is set to 1 to indicate that the STA supports DTP as described in 10.40 and 20.5.3.2.4.6.3. Otherwise, it is set to 0.

The A-PPDU Supported subfield is set to 1 to indicate that the STA supports A-PPDU aggregation as described in 10.15. Otherwise, it is set to 0.

The Supports Other_AID subfield is set to 1 to indicate that the STA sets its AWV configuration according to the Other_AID subfield in the BRP Request field during the BRP procedure as described in 10.38.6.4.4 and 20.10.2.2.6, if the value of the Other_AID subfield is different from zero. Otherwise, this subfield is set to 0.

The Heartbeat subfield is set to 1 to indicate that the STA expects to receive a frame from the AP or PCP during the ATI (10.36.3) and expects to receive a frame with the DMG Control modulation from a source DMG STA at the beginning of an SP (10.36.6.2) or TXOP (10.22.2). Otherwise, it is set to 0.

The Antenna Pattern Reciprocity subfield is set to 1 to indicate that the transmit antenna pattern associated with an AWV is the same as the receive antenna pattern for the same AWV. Otherwise, this subfield is set to 0.

The Heartbeat Elapsed Indication subfield is used to calculate the value of the Heartbeat Elapsed Time. The Heartbeat Elapsed Time is computed according to the following equation:

$$T_{HE} = \begin{cases} 0, & F_{HE} = 0 \\ \frac{2^{F_{HE}}}{4}, & F_{HE} > 0 \end{cases}$$

where

T_{HE} is the Heartbeat Elapsed Time (in milliseconds)

F_{HE} is the value of the Heartbeat Elapsed Indication subfield

The Grant Ack Supported subfield is set to 1 to indicate that the STA is capable of responding to a Grant frame with a Grant Ack frame. Otherwise, this subfield is set to 0.

The RXSSTxRate Supported subfield is set to 1 to indicate that the STA can perform an RXSS with SSW frames transmitted at MCS 1 of the DMG SC modulation class. Otherwise, it is set to 0.

9.4.2.128.3 DMG AP Or PCP Capability Information field

The DMG AP Or PCP Capability Information field, illustrated in Figure 9-507, represents the capabilities when the transmitting STA performs in the role of AP or PCP and that are in addition to the capabilities in the DMG STA Capability Information field.

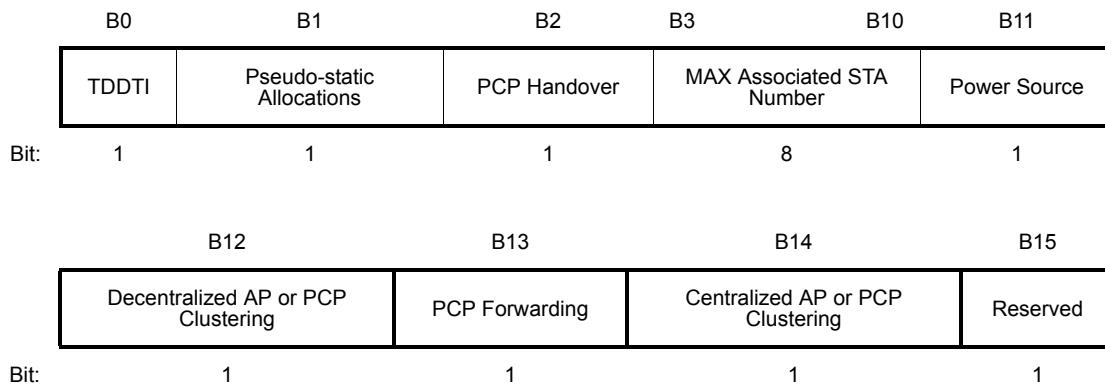

Figure 9-507—DMG AP Or PCP Capability Information field format

The TDDTI (time division data transfer interval) subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing channel access as defined in 10.36.6 and 11.4 and is set to 0 otherwise.

The Pseudo-static Allocations subfield is set to 1 if the STA, while operating as an AP or PCP, is capable of providing pseudo-static allocations as defined in 10.36.6.4 and is set to 0 otherwise. The Pseudo-static Allocations subfield is set to 1 only if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 1. The Pseudo-static Allocations subfield is reserved if the TDDTI subfield in the DMG AP Or PCP Capability Information field is set to 0.

The PCP Handover subfield is set to 1 if the STA, while operating as a PCP, is capable of performing a PCP Handover as defined in 11.29.2 and is set to 0 if the STA does not support PCP Handover.

The MAX Associated STA Number subfield indicates the maximum number of STAs that the STA can perform association with if operating as an AP or PCP. The value of this subfield includes the STAs, if any, that are co-located with the AP or PCP.

The Power Source subfield is set to 0 if the STA is battery powered and is set to 1 otherwise.

The Decentralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing decentralized AP or PCP clustering and is set to 0 otherwise.

The PCP Forwarding subfield is set to 1 if the STA, while operating as a PCP, is capable of forwarding frames it receives from a non-PCP STA and destined to another non-PCP STA in the PBSS. This subfield is set to 0 otherwise.

The Centralized AP or PCP Clustering subfield is set to 1 if the STA, when operating as an AP or PCP, is capable of performing centralized AP or PCP clustering and is set to 0 otherwise. An AP or PCP that is incapable of performing centralized AP or PCP clustering is subject to requirements as described in 10.37.2.2.

9.4.2.128.4 DMG STA Beam Tracking Time Limit field

The BeamTrackingTimeLimit subfield contains the value of dot11BeamTrackingTimeLimit. The resulting value of dot11BeamTrackingTimeLimit of beam link established between peer STA's is negotiated following rules presented in Table 9-230.

Table 9-230—Beam Tracking Time Limit negotiation

| DMG STA BeamTrackingTimeLimit (STA-A) | DMG STA BeamTrackingTimeLimit (STA-B) | dot11BeamTracking TimeLimit (STA-A) vs. dot11BeamTracking TimeLimit (STA-B) | Result |
|--|--|--|--|
| 0 | 0 | NA | Beam tracking is not supported |
| >0 | 0 | NA | |
| 0 | >0 | NA | |
| >0 and < 65 535 | >0 and < 65 535 | >, = | dot11BeamTrackingTimeLimit (STA-A) |
| >0 and < 65 535 | >0 and < 65 535 | < | dot11BeamTrackingTimeLimit (STA-B) |
| 65 535 | >0 and < 65 535 | NA | dot11BeamTrackingTimeLimit (STA-B) |
| >0 and < 65 535 | 65 535 | NA | dot11BeamTrackingTimeLimit (STA-A) |
| 65 535 | 65 535 | NA | Default dot11BeamTrackingTimeLimit value |

NOTE—In Table 9-230 STA-A and STA-B refer to any of the STAs performing the Beam Tracking Time Limit negotiation procedure in no particular order.

9.4.2.128.5 Extended SC MCS Capabilities field

The Extended SC MCS Capabilities field (see Figure 9-508) advertises the support of the STA for MCSs 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6.

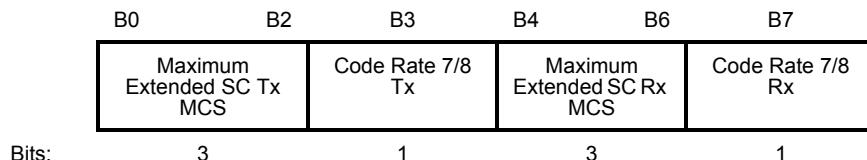

Figure 9-508—Extended SC MCS Capabilities field

The Maximum Extended SC Tx MCS subfield indicates the maximum transmit extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-231.

Table 9-231—Mapping of Extended SC MCS to Maximum Supported Rx/Tx MCS subfield values

| Extended MCS name | Value in Maximum Extended SC Rx/Tx MCS field |
|-------------------|--|
| None | 0 |
| MCS 9.1 | 1 |
| MCS 12.1 | 2 |
| MCS 12.2 | 3 |
| MCS 12.3 | 4 |
| MCS 12.4 | 5 |
| MCS 12.5 | 6 |
| MCS 12.6 | 7 |

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to k supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by k . A STA that indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Tx MCS subfield shall set the value of the Maximum SC Tx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for transmission of an extended SC MCS by setting the value in the Maximum Extended SC Tx MCS subfield to k supports all extended SC MCSs with values lower than or equal to k .

The Maximum Extended SC Rx MCS subfield indicates the maximum receive extended SC MCS supported by the STA. The values in the subfield are ordered as shown in Table 9-231.

A STA indicates support for transmission of code rate 7/8 by setting the Code Rate 7/8 Tx subfield to 1. If a STA indicates that it does not support code rate 7/8, then the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Tx MCS subfield is greater than 1 or 3 respectively. A STA that

indicates support for MCSs with a data rate higher than the data rate of MCS 9.1 in the Maximum Extended SC Rx MCS subfield shall set the value of the Maximum SC Rx MCS subfield of the Supported MCS Set subfield to 12.

A STA that indicates support for reception of an extended SC MCS by setting the value in the Maximum Extended SC Rx MCS subfield to k supports the subset of MCSs {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6} that have a data rate lower than or equal to the data rate of the MCS indicated by k .

A STA indicates support for reception of code rate 7/8 by setting the Code Rate 7/8 Rx subfield to 1. If a STA indicates that it does not support code rate 7/8, the STA does not support MCS 9.1 or 12.2 even if the value in the Maximum Extended SC Rx MCS field is greater than 1 or 3 respectively.

9.4.2.128.6 Maximum number of A-MSDU subframes in an A-MSDU

The Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield is defined in Table 9-232 and indicates the maximum number of Basic A-MSDU subframes in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-232—Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield

| Value | Meaning |
|-------|--|
| 0 | No limit on the maximum number of Basic A-MSDU subframes supported |
| 1 | A maximum of 4 Basic A-MSDU subframes are supported |
| 2 | A maximum of 8 Basic A-MSDU subframes are supported |
| 3 | A maximum of 16 Basic A-MSDU subframes are supported |
| 4 | A maximum of 32 Basic A-MSDU subframes are supported |
| 5 | A maximum of 64 Basic A-MSDU subframes are supported |
| 6 | A maximum of 128 Basic A-MSDU subframes are supported |
| 7 | A maximum of 256 Basic A-MSDU subframes are supported |
| 8–255 | Reserved |

The Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield is defined in Table 9-233 and indicates the maximum number of Short A-MSDU subfields in an A-MSDU that the DMG STA is able to receive from another DMG STA.

Table 9-233—Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield

| Value | Meaning |
|-------|--|
| 0 | No limit on the maximum number of Short A-MSDU subframes supported |
| 1 | A maximum of 32 Short A-MSDU subframes are supported |
| 2 | A maximum of 64 Short A-MSDU subframes are supported |
| 3 | A maximum of 128 Short A-MSDU subframes are supported |

**Table 9-233—Maximum Number Of Short A-MSDU Subframes
 In A-MSDU subfield (continued)**

| Value | Meaning |
|-------|--|
| 4 | A maximum of 256 Short A-MSDU subframes are supported |
| 5 | A maximum of 512 Short A-MSDU subframes are supported |
| 6 | A maximum of 1024 Short A-MSDU subframes are supported |
| 7–255 | Reserved |

9.4.2.129 DMG Operation element

The operational parameters of a BSS provided by the AP or PCP are determined by the DMG Operation element defined in Figure 9-509.

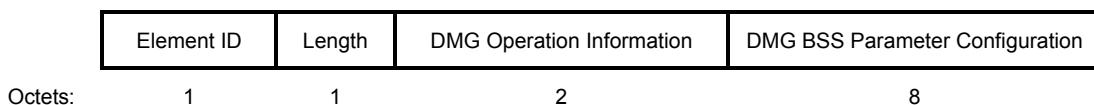

Figure 9-509—DMG Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Operation Information field is shown in Figure 9-510.

Figure 9-510—DMG Operation Information field format

The TDDTI subfield is set to 1 if the AP or PCP provides time division channel access as defined in 10.36.6 and is set to 0 otherwise.

The Pseudo-static allocations subfield is set to 1 if the AP or PCP provides pseudo-static allocations as defined in 10.36.6.4 and is set to 0 otherwise. The Pseudo-static allocations subfield is set to 1 only if the TDDTI subfield in the DMG Operation Information field is 1. The Pseudo-static allocations subfield is reserved if the TDDTI subfield in the DMG Operation Information field is 0.

The PCP Handover subfield is set to 1 if the PCP provides PCP Handover as defined in 11.29.2 and is set to 0 if the PCP does not provide PCP Handover.

The DMG BSS Parameter Configuration field is defined in Figure 9-511.

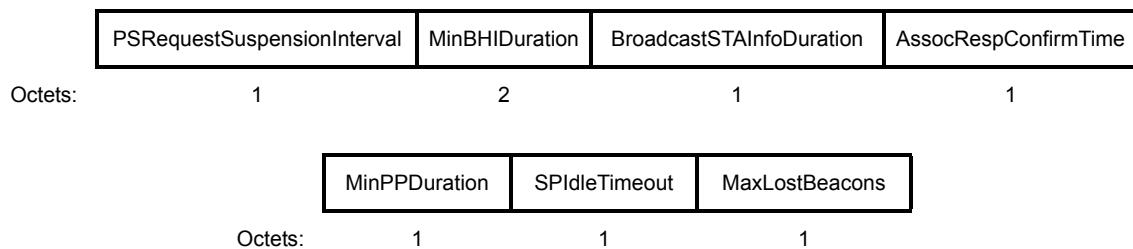

Figure 9-511—DMG BSS Parameter Configuration field format

The PSRequestSuspensionInterval subfield indicates the power save suspension interval and is specified in number of beacon intervals.

The MinBHDuration subfield indicates the minimum duration of the BHI, which can include the BTI, A-BFT, and ATI and is specified in microseconds.

The BroadcastSTAInfoDuration subfield indicates the amount of time that the AP or PCP expects to take to transmit information about associated STAs and is specified in number of beacon intervals.

The AssocRespConfirmTime subfield indicates the amount of time that the AP or PCP expects to take to respond to association requests and is specified in units of 50 milliseconds. A non-PCP and non-AP STA that receives a DMG Operation element can use the value of this field to set dot11AssociationResponseTimeOut.

The MinPPDuration subfield indicates the minimum duration of the PP and GP as part of the dynamic allocation of service period mechanism and is specified in microseconds.

The SPIdleTimeout subfield indicates time during which a STA expects to receive a frame from its peer STA and is specified in microseconds.

The MaxLostBeacons subfield contains the value of dot11MaxLostBeacons.

9.4.2.130 DMG Beam Refinement element

The DMG Beam Refinement element is defined as shown in Figure 9-512.

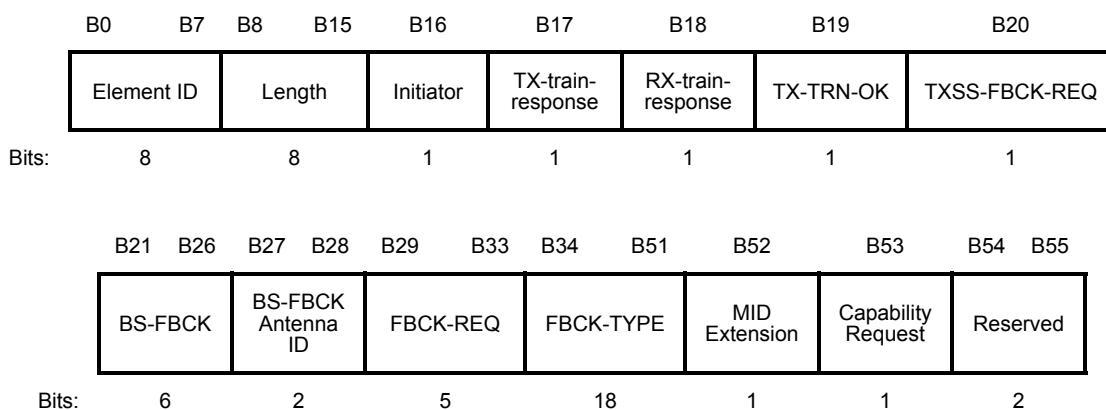

Figure 9-512—DMG Beam Refinement element format

The Element ID and Length fields are defined in 9.4.2.1.

A value of 1 in the Initiator field indicates that the sender is the beam refinement initiator. Otherwise, this field is set to 0.

A value of 1 in the TX-train-response field indicates that this packet is the response to a TX training request. Otherwise, this field is set to 0.

A value of 1 in the RX-train-response field indicates that the packet serves as an acknowledgment for a RX training request. Otherwise, this field is set to 0.

A value of 1 in the TX-TRN-OK field confirms a previous training request received by a STA. Otherwise, this field is set to 0.

A value of 1 in the TXSS-FBCK-REQ field indicates a request for transmit sector sweep feedback.

The BS-FBCK field indicates the index of the TRN-T field that was received with the best quality in the last received BRP-TX PPDU, where the first TRN-T field in the PPDU is defined as having an index equal to 1. If the last received PPDU was not a BRP-TX PPDU, this field is set to 0. The determination of best quality is implementation dependent.

The BS-FBCK Antenna ID field specifies the antenna ID corresponding to the sector indicated by the BF-FBCK field.

The FBCK-REQ field is defined in Figure 9-513 and is described in Table 9-234.

| | B29 | B30 | B31 | B32 | B33 |
|---------------|-------------------------------|--------------------------|---------------------------|-----|-----|
| SNR Requested | Channel Measurement Requested | Number of Taps Requested | Sector ID Order Requested | | |
| Bits: | 1 | 1 | 2 | 1 | |

Figure 9-513—FBCK-REQ field format

Table 9-234—FBCK-REQ field description

| Subfield | Meaning |
|-------------------------------|--|
| SNR Requested | If set to 1, the SNR subfield is requested as part of the channel measurement feedback. Otherwise, set to 0. |
| Channel Measurement Requested | If set to 1, the Channel Measurement subfield is requested as part of the channel measurement feedback. Otherwise, set to 0. |
| Number of Taps Requested | Number of taps in each channel measurement: 0x0 – 1 tap 0x1 – 5 taps 0x2 – 15 taps 0x3 – 63 taps |
| Sector ID Order Requested | If set to 1, the Sector ID Order subfield is requested as part of the channel measurement feedback. Otherwise, set to 0. |

The FBCK-TYPE field is defined in Figure 9-514 and is described in Table 9-235. When both N_{meas} and N_{beam} in this field are equal to 0, the Channel Measurement Feedback element is not present.

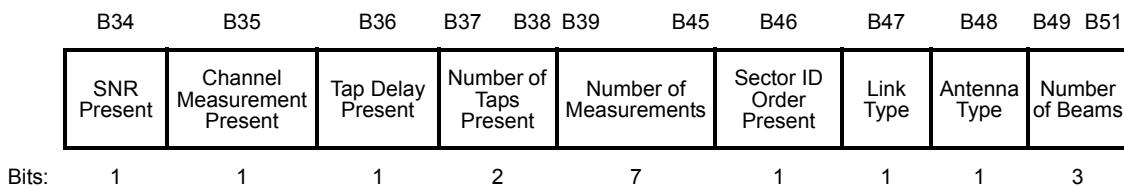

Figure 9-514—FBCK-TYPE field format

Table 9-235—FBCK-TYPE field description

| Subfield | Meaning |
|-----------------------------|--|
| SNR Present | Set to 1 to indicate that the SNR subfield is present as part of the channel measurement feedback. Set to 0 otherwise. |
| Channel Measurement Present | Set to 1 to indicate that the Channel Measurement subfield is present as part of the channel measurement feedback. Set to 0 otherwise. |
| Tap Delay Present | Set to 1 to indicate that the Tap Delay subfield is present as part of the channel measurement feedback. Set to 0 otherwise. |
| Number of Taps Present | Number of taps in each channel measurement: 0x0 – 1 tap 0x1 – 5 taps 0x2 – 15 taps 0x3 – 63 taps |
| Number of Measurements | Number of measurements in the SNR subfield and the Channel Measurement subfield. It is equal to the number of TRN-T subfields in the BRP-TX packet on which the measurement is based, or the number of received sectors if TXSS result is reported by setting the TXSS-FBCK-REQ subfield to 1. |
| Sector ID Order Present | Set to 1 to indicate that the Sector ID Order subfield is present as part of the channel measurement feedback. Set to 0 otherwise. |
| Link Type | Set to 0 for the initiator link and to 1 for the responder link |
| Antenna Type | Set to 0 for the transmitter antenna and to 1 for the receiver antenna |
| Number of Beams | Indicates the number of beams in the Sector ID Order subfield for the MIDC subphase |

A value of 1 in the MID Extension field indicates the intention to continue transmitting BRP-RX packets during the MID subphases. Otherwise, this field is set to 0.

A value of 1 in the Capability Request field indicates that the transmitter of the frame requests the intended receiver to respond with a BRP frame that includes the BRP Request field. Otherwise, this field is set to 0.

9.4.2.131 DMG Wakeup Schedule element

The DMG Wakeup Schedule element is defined in Figure 9-515.

| Element ID | Length | BI Start Time | Sleep Cycle | Number of Awake BIs |
|------------|--------|---------------|-------------|---------------------|
| Octets: | 1 | 1 | 4 | 2 |

Figure 9-515—DMG Wakeup Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Wakeup Schedule element is used to communicate the wakeup schedule (WS) of DMG STAs.

The BI Start Time field indicates the lower order 4 octets of the TSF timer at the start of the first awake BI in the WS defined by the DMG Wakeup Schedule element. A transmitted BI Start Time field points to a TBTT not more than 2^{31} μ s minus aDMGDWSValidPeriod before, and not more than $(2^{31} - 1)$ μ s after the TBTT of the beacon interval during which the BI Start Time field is transmitted.

NOTE—The delay between the moment a STA receives a DMG Wakeup Schedule element over the air and the moment the STA interprets the value of the BI Start Time field in the element can be large, to the extent that the beacon interval during which the BI Start Time field is interpreted is different from the beacon interval during which the DMG Wakeup Schedule element is received. Excluding an interval from the range of BI Start Time values at transmission enables the receiving STA to be able to correctly interpret any received value for the BI Start Time field of the DMG Wakeup Schedule element belonging to a STA in PS mode without having to remember the beacon interval during which the DMG Wakeup Schedule element was received, as long as the beginning of the beacon interval at the time of interpretation has not advanced more than aDMGDWSValidPeriod relative to the beginning of the beacon interval at the time of reception.

The Sleep Cycle field indicates the sleep cycle duration in beacon intervals, i.e., the sum of awake BIs and doze BIs that make up the sleep cycle.

The Number of Awake BIs field indicates the number of awake BIs at the beginning of each sleep cycle. A value of 0 for this field indicates that all BIs in the WS are doze BIs.

9.4.2.132 Extended Schedule element

The Extended Schedule element is defined in Figure 9-516. Because the length parameter supports only 255 octets of information in an element, the AP or PCP can split the Allocation fields into more than one Extended Schedule element entry in the same DMG Beacon or Announce frame. Despite this splitting, the set of Extended Schedule element entries conveyed within a DMG Beacon and Announce frame is considered to be a single schedule for the beacon interval, and in this standard referred to simply as Extended Schedule element unless otherwise noted. The Allocation fields are ordered by increasing allocation start time with allocations beginning at the same time arbitrarily ordered.

| Element ID | Length | Allocation 1 | Allocation 2 | ... | Allocation n |
|------------|--------|--------------|--------------|-----|--------------|
| Octets: | 1 | 1 | 15 | 15 | ... |

Figure 9-516—Extended Schedule element format

The Element ID and Length fields are defined in 9.4.2.1.

The Allocation field is formatted as illustrated in Figure 9-517.

| Allocation Control | BF Control | Source AID | Destination AID | Allocation Start | Allocation Block Duration | Number of Blocks | Allocation Block Period | |
|--------------------|------------|------------|-----------------|------------------|---------------------------|------------------|-------------------------|---|
| Octets: | 2 | 2 | 1 | 1 | 4 | 2 | 1 | 2 |

Figure 9-517—Allocation field format

The Allocation Control subfield is defined in Figure 9-518.

| | | | | | | | | | | |
|---------------|-----------------|---------------|-------------|------------|------------|------------|----------|-----|-----|-----|
| B0 | B3 | B4 | B6 | B7 | B8 | B9 | B10 | B11 | B12 | B15 |
| Allocation ID | Allocation Type | Pseudo-static | Truncatable | Extendable | PCP Active | LP SC Used | Reserved | | | |
| Bits: | 4 | 3 | 1 | 1 | 1 | 1 | 1 | 1 | 4 | |

Figure 9-518—Allocation Control subfield format

The Allocation ID subfield, when set to a nonzero value, identifies an airtime allocation from Source AID to Destination AID. Except for CBAP allocations with broadcast Source AID and broadcast Destination AID, the tuple (Source AID, Destination AID, Allocation ID) uniquely identifies the allocation. For CBAP allocations with broadcast Source AID and broadcast Destination AID, the Allocation ID subfield is set to zero.

The AllocationType subfield defines the channel access mechanism during the allocation, with possible values listed in Table 9-236.

Table 9-236—AllocationType subfield values

| Bit 4 | Bit 5 | Bit 6 | Meaning |
|------------------------|-------|----------|-----------------|
| 0 | 0 | 0 | SP allocation |
| 1 | 0 | 0 | CBAP allocation |
| All other combinations | | Reserved | |

The Pseudo-static subfield is set to 1 to indicate that this allocation is pseudo-static (10.36.6.4) and set to 0 otherwise.

For an SP allocation, the Truncatable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP truncation and set to 0 otherwise. For a CBAP allocation, the Truncatable subfield is reserved.

For an SP allocation, the Extendable subfield is set to 1 to indicate that the source DMG STA and destination DMG STA can request SP extension and set to 0 otherwise. For a CBAP allocation, the Extendable subfield is reserved.

For a PCP in active mode (see 11.2.7), or when applied to a CBAP or SP in a PCP awake BI, a value of 1 for the PCP Active subfield indicates that the PCP is available to transmit or receive during the CBAP or SP, and a value of 0 indicates the PCP unavailability to transmit or receive. The PCP Active subfield is set to 1 at least in the following cases:

- The PCP transmitting the subfield is the source or destination of the CBAP or SP
- At least one of the Truncatable or Extendable subfields is set to 1
- The subfield is transmitted by an AP

The value of the PCP Active subfield is ignored when it applies to a CBAP or SP that resides in a PCP doze BI.

The BF Control subfield is defined in 9.5.5.

The Source AID subfield is set to the AID of the STA that initiates channel access during the SP or CBAP allocation or, in the case of a CBAP allocation, can also be set to the broadcast AID if all STAs are allowed to transmit during the CBAP allocation.

The Destination AID subfield is set to the AID of the STA that the source STA targets during the allocation, or to the broadcast AID if the source STA targets more than one STA during the allocation. If both Source AID and Destination AID subfields for an SP allocation are set to the broadcast AID, then during the SP a non-AP and non-PCP STA does not transmit unless it receives a Poll or Grant frame from the AP or PCP.

The Allocation Start subfield contains the lower 4 octets of the TSF at the time the SP or CBAP starts. The Allocation Start subfield can be specified at a future beacon interval when the pseudo-static subfield is set to 1.

The Allocation Block Duration subfield indicates the duration, in microseconds, of a time block for which the SP or CBAP allocation is made and cannot cross beacon interval boundaries. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation.

The Number of Blocks subfield contains the number of time blocks making up the allocation.

The Allocation Block Period subfield contains the time, in microseconds, between the start of two consecutive time blocks belonging to the same allocation. The Allocation Block Period subfield is reserved when the Number of Blocks subfield is set to 1.

The LP SC Used subfield is set to 1 to indicate that the low-power SC mode described in 20.7 is used in this SP. Otherwise, it is set to 0.

9.4.2.133 STA Availability element

The STA Availability element is used by a non-AP and non-PCP STA to inform an AP or PCP about the STA availability during the subsequent CBAPs (10.36.5) and to indicate participation in the dynamic allocation of service periods (10.36.7). The AP or PCP uses the STA Availability element to inform the non-AP and non-PCP STAs of other STAs availability during subsequent CBAPs and participation of other STAs in the Dynamic allocation of service periods.

The format of the STA Availability element is defined in Figure 9-519.

Figure 9-519—STA availability element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the STA Info field is shown in Figure 9-520.

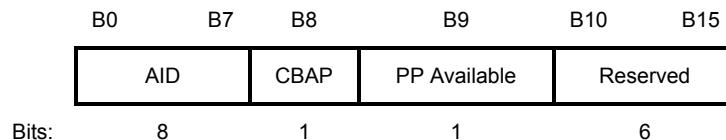

Figure 9-520—STA Info field format

The AID subfield contains the AID of the STA for which availability is indicated.

The CBAP subfield is set to 1 to indicate that the STA is available to receive transmissions during CBAPs and set to 0 otherwise.

The PP Available subfield is set to 1 to indicate that the STA is available during PPs (10.36.7) and is set to 0 otherwise.

9.4.2.134 DMG TSPEC element

The DMG TSPEC element is present in the ADDTS Request frame sent by a non-AP and non-PCP DMG STA and contains the set of parameters needed to create or modify an airtime allocation. The DMG TSPEC element is also present in the ADDTS Response frame sent by a DMG AP or PCP and reflects the parameters, possibly modified, by which the allocation was created. The format of the DMG TSPEC element is shown in Figure 9-521.

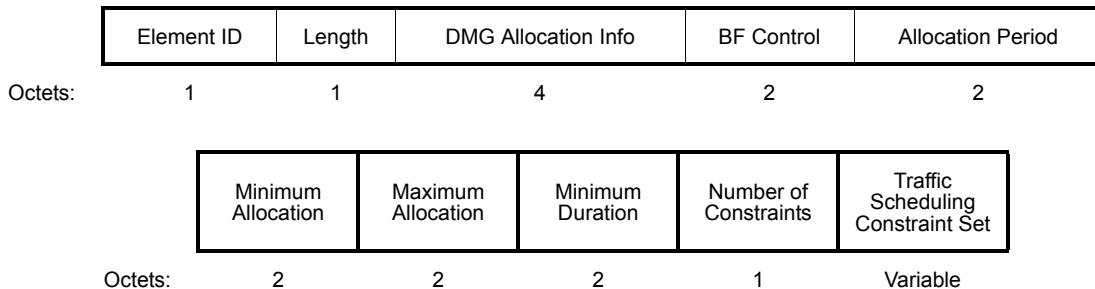

Figure 9-521—DMG TSPEC element format

The Element ID and Length fields are defined in 9.4.2.1.

The DMG Allocation Info field is formatted as shown in Figure 9-522.

The Allocation ID subfield identifies an allocation if set to a nonzero value and is used as follows:

- The STA that transmits an ADDTS Request frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to create a new allocation or modify an existing allocation.
- The STA that transmits an ADDTS Response frame containing the DMG TSPEC element sets the Allocation ID subfield to a nonzero value to identify a created or modified allocation or sets it to 0 if creating or modifying the allocation failed.

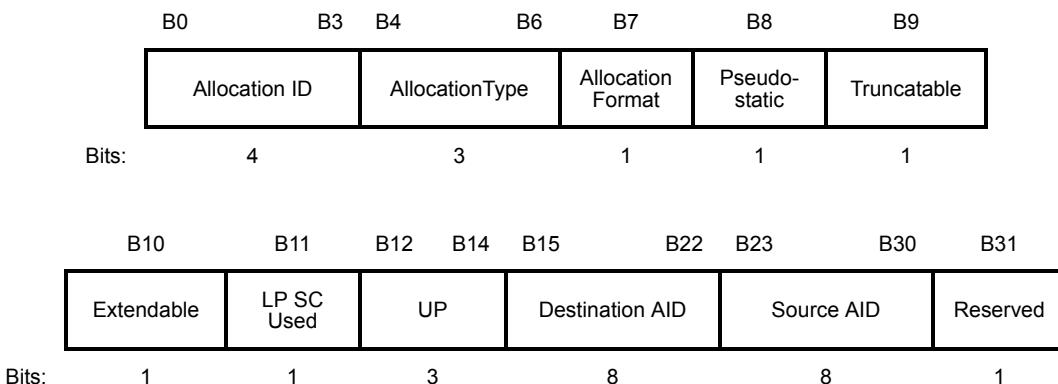

Figure 9-522—DMG Allocation Info field format

The AllocationType subfield defines the channel access mechanism used during the allocation, with values listed in Table 9-236.

The Allocation Format field values are listed in Table 9-237.

Table 9-237—Allocation Format subfield values

| Allocation Format subfield value | Description |
|----------------------------------|--------------------------------|
| 1 | Isochronous allocation format |
| 0 | Asynchronous allocation format |

The Pseudo-static subfield is set to 1 for a pseudo-static allocation and set to 0 otherwise.

For an SP allocation, the Truncatable subfield is set to 1 if the STA expects to truncate the SP, as described in 10.36.8. If the STA does not expect to truncate the SP, the Truncatable subfield is set to 0. The subfield is reserved for CBAP allocations.

For an SP allocation, the Extendable subfield is set to 1 if the STA expects to extend the SP, as described in 10.36.9. If the STA does not expect to extend the SP, the Extendable subfield is set to 0. The subfield is reserved for CBAP allocations.

The LP SC Used subfield is defined in 9.4.2.132.

The UP subfield indicates the lowest priority UP to be used for possible transport of MSDUs belonging to TCs with the same source and destination of the allocation.

The Destination AID subfield contains the AID of a STA that the requesting STA targets during the allocation.

The Source AID subfield contains the AID of the STA that initiates channel access during the allocation.

The BF Control subfield is defined in 9.5.5.

The Allocation Period is specified as a fraction or multiple of the beacon interval (BI) as defined in Table 9-238.

Table 9-238—Allocation Period field values

| B0–B14 | B15 | Meaning |
|----------|-----|---|
| 0 | 0 | Reserved |
| 0 | 1 | Not periodic or periodicity unknown |
| 1–32 767 | 0 | The allocation period is a multiple of the BI, i.e., allocation period = $n \times$ BI where n is the value represented by B0–B14 |
| 1–32 767 | 1 | The allocation period is a fraction of the BI, i.e., allocation period = BI/ n where n is the value represented by B0–B14. |

For isochronous allocation format requests the Allocation Period, Minimum Allocation and Maximum Allocation fields are set as follows:

- The Allocation Period field indicates the period over which the allocation repeats.
- The Minimum Allocation field is set to the minimum acceptable allocation in microseconds in each allocation period.
- The Maximum Allocation field is set to the requested allocation in microseconds in each allocation period.

For asynchronous allocation format requests the Maximum Allocation field is reserved, and the Allocation Period and Minimum Allocation fields are set as follows:

- The Allocation Period field indicates the period over which the minimum allocation applies. The Allocation Period is an integer multiple of the beacon interval.
- The Minimum Allocation field specifies the minimum allocation in microseconds that the STA expects within the allocation period.

The Minimum Duration field specifies the minimum acceptable duration in microseconds. Possible values range from 1 to 32 767 for an SP allocation and 1 to 65 535 for a CBAP allocation. A value of 0 indicates no minimum specified.

The Number of Constraints field indicates the number of Constraint subfields contained in the element. The value of this field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields (see Figure 9-523).

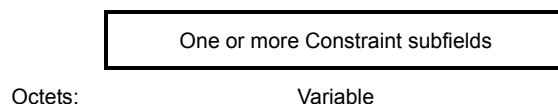

Figure 9-523—Traffic Scheduling Constraint Set field format

The Constraint subfield is defined as illustrated in Figure 9-524.

| TSCONST Start Time | TSCONST Duration | TSCONST Period | Interferer MAC address |
|--------------------|------------------|----------------|------------------------|
| Octets: | 4 | 2 | 2 |

Figure 9-524—Constraint subfield format

The TSCONST Start Time subfield contains the lower 4 octets of the TSF at the time the scheduling constraint starts.

The TSCONST Duration subfield indicates the time, in microseconds, for which the scheduling constraint is specified.

The TSCONST Period subfield is specified as a fraction or multiple of the beacon interval (BI) as defined in Table 9-239. This subfield is used to indicate a periodic scheduling constraint by specifying the temporal gap between two consecutive scheduling constraints.

Table 9-239—TSCONST Period values

| B0–B14 | B15 | Meaning |
|----------|-----|---|
| 0 | 0 | Reserved |
| 0 | 1 | Not periodic or periodicity unknown |
| 1–32 767 | 0 | The TSCONST period is a multiple of the BI, i.e., TSCONST period = n x BI where n is the value represented by B0–B14. |
| 1–32 767 | 1 | The TSCONST period is a fraction of the BI, i.e., TSCONST period = BI/n where n is the value represented by B0–B14. |

The Interferer MAC Address subfield is set to the value of the TA field within a frame received during the interval of time indicated by this Constraint subfield. If the value is unknown, the Interferer MAC Address subfield is set to the broadcast MAC address.

9.4.2.135 Next DMG ATI element

The Next DMG ATI element indicates the earliest start time for the next ATI in a subsequent beacon interval. See Figure 9-525.

| Element ID | Length | Start Time | ATI Duration |
|------------|--------|------------|--------------|
| Octets: | 1 | 1 | 4 |

Figure 9-525—Next DMG ATI element format

The Element ID and Length fields are defined in 9.4.2.1.

The Start Time field contains the low-order 4 octets of the TSF for the earliest time at which the next ATI in a subsequent beacon interval starts.

The ATI Duration field contains the duration, in microseconds, of the next ATI in a subsequent beacon interval.

9.4.2.136 Channel Measurement Feedback element

The Channel Measurement Feedback element is used to carry the channel measurement feedback data that the STA has measured on the TRN-T fields of the BRP packet that contained the Channel Measurement request, to provide a list of sectors identified during a sector sweep, or during beam combination (10.38.6.3). The format and size of the Channel Measurement Feedback element are defined by the parameter values specified in the accompanying DMG Beam Refinement element.

The Channel Measurement Feedback element, as shown in Table 9-240, is composed of 4 subfields: the SNR subfield, the Channel Measurement subfield, the Tap Delay subfield, and the Sector ID Order subfield.

Table 9-240—Channel Measurement Feedback element format

| Field | Size | | Meaning |
|---------------------|---------------------------------|---------------------------|---|
| Element ID | 8 bits | | |
| Length | 8 bits | | |
| SNR | SNR_1 | 8 bits | SNR as measured in the first TRN-T field or at the first sector from which SSW frame is received. |
| | SNR_2 | 8 bits | SNR as measured in the second TRN-T field or at the second sector from which SSW frame is received. |
| | : | | |
| | $SNR_{N_{meas}}$ | 8 bits | SNR as measured in the N_{meas} TRN-T field or at sector N_{meas} from which SSW frame is received. |
| Channel Measurement | Channel Measurement 1 | $N_{taps} \times 16$ bits | Channel measurement for the first TRN-T field |
| | Channel Measurement 2 | $N_{taps} \times 16$ bits | Channel measurement for the second TRN-T field |
| | : | | |
| | Channel Measurement N_{meas} | $N_{taps} \times 16$ bits | Channel measurement for the N_{meas} TRN-T field |
| Tap Delay | Relative Delay Tap #1 | 8 bits | The delay of Tap #1 in units of T_c relative to the path with the shortest delay detected. |
| | Relative Delay Tap #2 | 8 bits | The delay of Tap #2 in units of T_c relative to the path with the shortest delay detected. |
| | : | | |
| | Relative Delay Tap $\#N_{taps}$ | 8 bits | The delay of Tap $\#N_{taps}$ in units of T_c relative to the path with the shortest delay detected. |

Table 9-240—Channel Measurement Feedback element format (continued)

| Field | Size | | Meaning |
|-----------------|--|--------|--|
| Sector ID Order | Sector ID ₁ | 6 bits | Sector ID for SNR ₁ being obtained, or sector ID of the first detected beam. |
| | Antenna ID ₁ | 2 bits | Antenna ID corresponding to sector ID ₁ . |
| | Sector ID ₂ | 6 bits | Sector ID for SNR ₂ being obtained, or sector ID of the second detected beam. |
| | Antenna ID ₂ | 2 bits | Antenna ID corresponding to sector ID ₂ . |
| | ⋮ | | |
| | Sector ID _{N_{meas}} or sector ID _{N_{beam}} | 6 bits | Sector ID for SNR _{N_{meas}} being obtained, or sector ID of the detected beam N_{beam} . |
| | Antenna ID _{N_{meas}} or Antenna ID _{N_{beam}} | 2 bits | Antenna ID corresponding to sector ID _{N_{meas}} or sector ID _{N_{beam}} |

The Element ID and Length fields are defined in 9.4.2.1.

The number of channel/SNR measurements reported, N_{meas} , is equal to the number of TRN-T subfields that were appended to the packet on which the measurements were performed. If the measurement reports the result of an SLS or of an MID, it is equal to the number of frames received during the sector sweep, or the number of packets used during the MID subphase.

The SNR subfield levels are unsigned integers referenced to a level of –8 dB. Each step is 0.25 dB. SNR values less than or equal to –8 dB are represented as 0. SNR values greater than or equal to 55.75 dB are represented as 0xFF.

The format of each channel measurement is specified in Table 9-241.

Table 9-241—Channel measurement

| Field | Size | Meaning |
|---------------------------------------|--------|--|
| Relative I Component Tap #1 | 8 bits | The in-phase component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured. |
| Relative Q Component Tap #1 | 8 bits | The quadrature component of impulse response for Tap #1, relative to the amplitude of the strongest tap measured. |
| Relative I Component Tap #2 | 8 bits | The in-phase component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured. |
| Relative Q Component Tap #2 | 8 bits | The quadrature component of impulse response for Tap #2, relative to the amplitude of the strongest tap measured. |
| ⋮ | | |
| Relative I Component Tap # N_{taps} | 8 bits | The in-phase component of impulse response for Tap # N_{taps} , relative to the amplitude of the strongest tap measured. |
| Relative Q Component Tap # N_{taps} | 8 bits | The quadrature component of impulse response for Tap # N_{taps} , relative to the amplitude of the strongest tap measured. |

Each channel measurement contains N_{taps} channel impulse taps. The channel impulse response reported for all N_{meas} measurements correspond to a common set of relative tap delays. If the Tap Delay subfield is not present, then the N_{taps} channel taps is interpreted as consecutive time samples, separated by T_c . The delay values in the Tap Delay subfield, when present, correspond to the strongest taps and are unsigned integers, in increments of T_c , starting from 0. Each channel tap is reported as an in-phase and quadrature component pair, with each component value represented as a 2s complement number between –128 and 127. Unless all in-phase and quadrature component values are reported as zero, they are scaled such that the two most significant bits for at least one of the component values equal 01 or 10 (binary).

The Sector ID Order subfield indicates the TX sector IDs corresponding to the SNRs in the SNR subfield when the SNR Present subfield is set to 1 and Sector ID Order Present subfield is set to 1, in response to a BRP packet with the SNR Requested subfield set to 1. The Sector ID Order subfield indicates the TX sector IDs ranked in the decreasing order of link quality, determined in an implementation dependent manner, when the SNR Present subfield is set to 0 and the Sector ID Order Present subfield is set to 1 in response to setting the SNR Requested subfield to 0 and the Sector ID Order Requested subfield to 1. The FBCK-REQ field and the FBCK TYPE field in the DMG Beam Refinement element are used by the transmitter and receiver to, respectively, request for and indicate the sector IDs and their order.

9.4.2.137 Awake Window element

The Awake Window element is defined as shown in Figure 9-526.

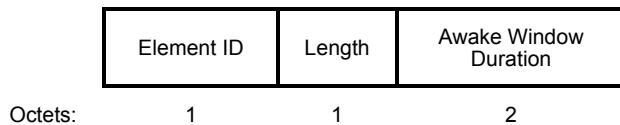

Figure 9-526—Awake Window element format

The Element ID and Length fields are defined in 9.4.2.1.

The Awake Window Duration field is 2 octets in length and contains the duration of the Awake Window in microseconds.

9.4.2.138 Multi-band element

The Multi-band element indicates that the STA transmitting this element (the transmitting STA) is within a multi-band device capable of operating in a frequency band or operating class or channel other than the one in which this element is transmitted and that the transmitting STA is able to accomplish a session transfer from the current channel to a channel using another STA in the same device, in the other or same band. The format of the Multi-band element is shown in Figure 9-527.

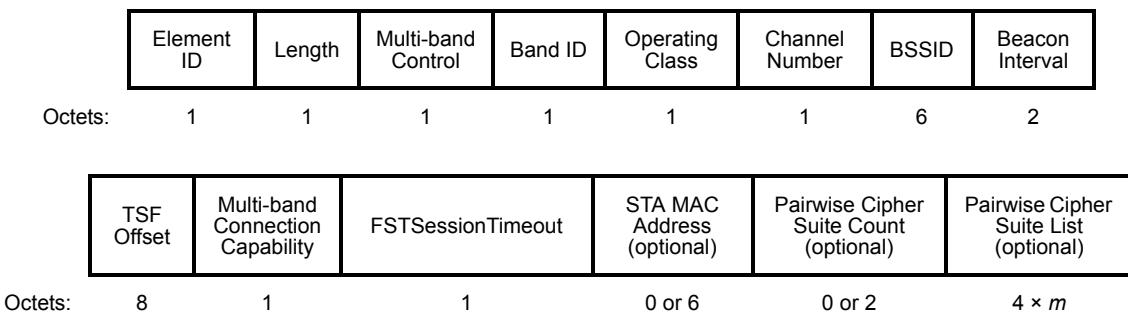

Figure 9-527—Multi-band element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Multi-band Control field is shown in Figure 9-528.

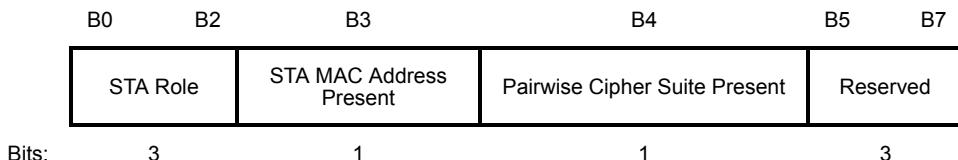

Figure 9-528—Multi-band Control field format

The STA Role subfield specifies the role the transmitting STA plays on the channel of the operating class indicated in this element. The possible values of the STA Role subfield are indicated in Table 9-242. If the STA Role subfield is set to IBSS STA, the BSSID subfield contains the BSSID of the IBSS.

Table 9-242—STA Role subfield values

| STA role | Value |
|------------------------|-------|
| AP | 0 |
| TDLS STA | 1 |
| IBSS STA | 2 |
| PCP | 3 |
| Non-PCP and Non-AP STA | 4 |
| Reserved | 5–7 |

NOTE—A STA can perform in more than one role in a channel, and the STA Role subfield identifies the role that is most relevant for the STA for that channel.

The STA MAC Address Present subfield indicates whether the STA MAC Address subfield is present in the Multi-band element. If the present subfield is set to 1, the STA MAC Address subfield is present. If the STA MAC Address Present subfield is set to 0, the STA MAC Address subfield is not present.

The Pairwise Cipher Suite Present subfield indicates whether the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present in the Multi-band element. If the Pairwise Cipher Suite Present subfield is set to 1, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are present. If the Pairwise Cipher Suite Present subfield is set to 0, the Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are not present.

The Band ID field provides the identification of the frequency band related to the Operating Class and Channel Number fields. The Band ID field is defined in 9.4.1.46.

Operating Class indicates the channel set for which the Multi-band element applies. Operating Class and Channel Number together specify the channel frequency and spacing for which the Multi-band element applies. Valid values of Operating Class are shown in Annex E. This field is set to 0 to indicate all operating classes within the frequency band specified by the value of the Band ID field.

The Channel Number field is set to the number of the channel the transmitting STA is operating on or intends to operate on. This field is set to 0 to indicate all channels within the frequency band specified by the value of the Band ID field.

The BSSID field specifies the BSSID of the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields.

The Beacon Interval field specifies the size of the beacon interval for the BSS operating on the channel and frequency band indicated by the Channel Number and Band ID fields. This field is set to 0 if no BSS is in operation in the indicated channel and frequency band.

If the transmitting STA is a member of a PBSS or infrastructure BSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the time offset of the TSF of the PBSS or infrastructure BSS of which the transmitting STA is member on the channel indicated in this element relative to the TSF of the PBSS or infrastructure BSS corresponding to the BSSID indicated in the Address 3 field of the MPDU in which this element is transmitted. The value of the TSF Offset field is specified as a 2s complement integer in microsecond units. If the transmitting STA is not a member of an infrastructure BSS or PBSS on both the channel indicated in this element and the channel on which the element is transmitted, then the TSF Offset field contains the value 0.

The Multi-band Connection Capability field is defined in Figure 9-529. The Multi-band Connection Capability field indicates the connection capabilities supported by the STA on the channel and band indicated in this element.

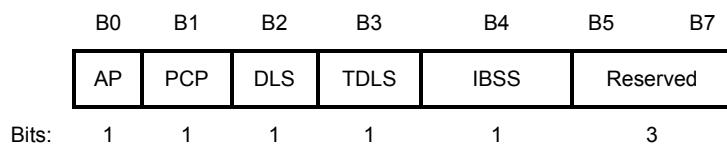

Figure 9-529—Multi-band Connection Capability field format

The AP subfield specifies whether the STA can function as an AP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as an AP, and it is set to 0 otherwise.

The PCP subfield specifies whether the STA can function as a PCP on the channel and band indicated in the element. It is set to 1 when the STA is capable to function as a PCP, and it is set to 0 otherwise.

The DLS subfield is set to 1 to indicate that the STA can perform a DLS on the channel and band indicated in the element. Otherwise, it is set to 0.

The TDLS subfield is set to 1 to indicate that the STA can perform a TDLS on the channel and band indicated in the element. Otherwise, it is set to 0.

The IBSS subfield is set to 1 to indicate that the STA is able to support IBSS on the channel and band indicated in the element. Otherwise, it is set to 0.

The FSTSessionTimeout field is used in the FST Setup Request frame to indicate the timeout value for FST session setup protocol as defined in 11.33.1. The FSTSessionTimeout field contains the duration, in TUs, after which the FST setup is terminated.

The STA MAC Address field contains the MAC address that the transmitting STA uses while operating on the channel indicated in this element. The STA MAC Address field is not present in this element if the STA MAC Address Present field is set to 0.

The Pairwise Cipher Suite Count field and the Pairwise Cipher Suite List field are defined in 9.4.2.25. These fields are not present in this element if the Pairwise Cipher Suite Present subfield is set to 0.

9.4.2.139 ADDBA Extension element

The ADDBA Extension element is shown in Figure 9-530.

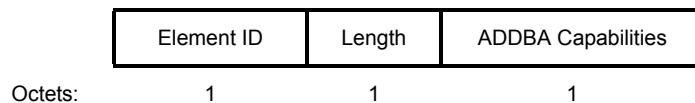

Figure 9-530—ADDBA Extension element format

The Element ID and Length fields are defined in 9.4.2.1.

The ADDBA Capabilities field is shown in Figure 9-531.

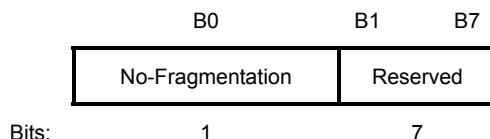

Figure 9-531—ADDBA Capabilities field format

The ADDBA Extension element can be included in the ADDBA Request and Response frames.

The No-Fragmentation subfield determines whether a fragmented MSDU can be carried in the MPDU sent under the block ack agreement. When this subfield set to 1 in the ADDBA Request frame, it indicates that the originator is not fragmenting sent MSDUs. When this subfield set to 1 in the ADDBA Response frame, it indicates that the recipient is not capable of receiving fragmented MSDUs.

9.4.2.140 Next PCP List element

The Next PCP List element contains one or more AID of NextPCP i fields as shown in Figure 9-532.

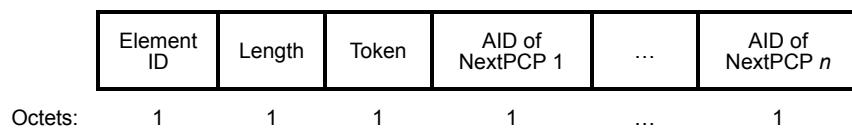

Figure 9-532—Next PCP List element format

The Element ID and Length fields are defined in 9.4.2.1.

The Token field is set to 0 when the PBSS is initialized and incremented each time the sequence of AID of NextPCP i fields is updated.

Each AID of NextPCP i field contains the AID value of a STA. The AID values are listed in the order described in 11.29.2.

9.4.2.141 PCP Handover element

The PCP Handover element is used to indicate which STA becomes the new PCP following an explicit or implicit handover procedure. The PCP Handover element is defined in Figure 9-533.

| | | | | |
|------------|--------|-----------|-----------------|---------------|
| Element ID | Length | Old BSSID | New PCP Address | Remaining BIs |
| Octets: | 1 | 1 | 6 | 6 |

Figure 9-533—PCP Handover element format

The Element ID and Length fields are defined in 9.4.2.1.

The Old BSSID field contains the BSSID of the PBSS from which control is being handed over.

The New PCP Address field indicates the MAC address of the new PCP following a handover.

The Remaining BIs field indicates the number of beacon intervals, from the beacon interval in which this element is transmitted, remaining until the handover takes effect.

9.4.2.142 DMG Link Margin element

9.4.2.142.1 General

The format of the DMG Link Margin element is shown in Figure 9-534. The DMG Link Margin element is included in a Link Measurement Report frame.

| | | | | | | |
|------------|--------|----------|-----|-------------|-----|---------------------|
| Element ID | Length | Activity | MCS | Link Margin | SNR | Reference Timestamp |
| Octets: | 1 | 1 | 1 | 1 | 1 | 4 |

Figure 9-534—DMG Link Margin element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to a preferred action that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame execute. The method by which the sending STA determines a suitable action for the peer STA is implementation specific. The Activity field is defined in 9.4.2.142.2.

The MCS field is set to an integer representation of the MCS that the STA sending this element recommends that the peer STA indicated in the RA field of the Link Measurement Report frame use to transmit frames to this STA. The reference PER for selection of the MCS is 10^{-2} for an MPDU length of 4096 octets. The method by which the sending STA determines a suitable MCS for the peer STA is implementation specific. Values 0–31 indicate MCS 0 to MCS 31. Values 133, 134, 135, 136, 137, 138, 140 indicate MCSs 12.1, 9.1, 12.3, 12.4, 12.5, 12.2 and 12.6, respectively.

The Link Margin field contains the measured link margin of Data frames received from the peer STA indicated in the RA field of the Link Measurement Report frame and is coded as a 2s complement signed integer in units of decibels. A value of –128 indicates that no link margin is provided. The method used to measure the link margin is beyond the scope of this standard.

The SNR field indicates the SNR measured during the reception of a PHY packet. Values are from –13 dB to 50.75 dB in 0.25 dB steps.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.142.2 Activity field

The Activity field values are defined in Table 9-243.

Table 9-243—Activity field values

| Preferred Action value | Meaning |
|------------------------|-----------------------------|
| 0 | No change preferred |
| 1 | Change(d) MCS |
| 2 | Decrease(d) transmit power |
| 3 | Increase(d) transmit power |
| 4 | Fast session transfer (FST) |
| 5 | Power conserve mode |
| 6 | Perform SLS |
| 7–255 | Reserved |

9.4.2.143 DMG Link Adaptation Acknowledgment element

The format of the DMG Link Adaptation Acknowledgment element is shown in Figure 9-535. The DMG Link Adaptation Acknowledgment element is carried in the Optional Subelements field of the Link Measurement Report frame.

| Element ID | Length | Activity | Reference Timestamp |
|------------|--------|----------|---------------------|
| Octets: | 1 | 1 | 4 |

Figure 9-535—DMG Link Adaptation Acknowledgment element format

The Element ID and Length fields are defined in 9.4.2.1.

The Activity field is set to the action that the STA sending this element has executed following the reception of the recommended activity in a Link Measurement Report frame. The method by which the sending STA determines the action is described in 10.39 and the Activity field is defined in 9.4.2.142.2.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the MAC received the PHY-CCA.indication(IDLE) primitive that corresponds to the end of the reception of the PPDU that was used to generate the feedback information contained in the Link Measurement Report frame.

9.4.2.144 Switching Stream element

The Switching Stream element indicates the streams that the transmitting STA requests to be switched to a new frequency band or operating class or channel. The format of the Stream Switching element is shown in Figure 9-536.

| Element ID | Length | Old Band ID | New Band ID | Non-QoS Data Frames | Number of Streams Switching | Switching Parameters |
|------------|--------|-------------|-------------|---------------------|-----------------------------|---|
| Octets: | 1 | 1 | 1 | 1 | 1 | $2 \times \text{Number of Streams Switching}$ |

Figure 9-536—Switching Stream element format

The Element ID and Length fields are defined in 9.4.2.1.

The Old Band ID field specifies the frequency band to which the information carried in this element is related. This field is defined in 9.4.1.46.

The New Band ID field specifies the frequency band to which the information contained in the Stream ID In New Band subfield of this element is related. This field is defined in 9.4.1.46.

The Non-QoS Data Frames field specifies whether non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is set to 0, non-QoS Data frames cannot be transmitted in the frequency band indicated in the New Band ID field. If the Non-QoS Data Frames field is set to 1, non-QoS Data frames can be transmitted in the frequency band indicated in the New Band ID field.

The Number of Streams Switching field specifies the number of streams to be switched.

The format of Switching Parameters field is shown in Figure 9-537.

| B0 | B3 | B4 | B5 | B8 | B9 | B10 | B11 | B12 | B15 |
|-----------------------|-----------|-----------------------|-----------|-----------------------------|----|----------|----------|-----|-----|
| Stream ID In Old Band | | Stream ID In New Band | | Stream ID In New Band Valid | | LLT Type | Reserved | | |
| Bits: | 4 | 1 | 4 | 1 | 1 | 1 | 4 | | |
| TID | Direction | TID | Direction | | | | | | |

Figure 9-537—Switching parameters field format

The Stream ID In Old Band and Stream ID In New Band subfields are comprised of the TID and Direction subfields. The subfields within the Stream ID In New Band subfield are reserved if the Stream ID In New Band Valid subfield is set to 0.

The TID subfield specifies the stream in the corresponding band.

The Direction subfield specifies whether the STA transmitting this element is the source or destination of the corresponding TID. It is set to 0 to indicate that the STA transmitting this element is the source of the TID, and it is set to 1 otherwise.

The Stream ID In New Band Valid subfield is set to 1 if the information contained in the Stream ID In New Band subfield is valid, that is, the TID specified within the Stream ID In New Band subfield has been established in the band identified in the New Band ID field. The Stream ID In New Band Valid subfield is set to 0 otherwise.

The LLT Type subfield is set to 1 to indicate that the streambased Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. The LLT Type subfield is set to 0 to indicate that the STA-based Link Loss Countdown is used for the stream identified by the Stream ID In Old Band subfield. This subfield is reserved when the LLT field within the FST Setup Request or FST Setup Response frame containing this element is set to 0.

9.4.2.145 Session Transition element

The Session Transition element is defined in Figure 9-538.

| Element ID | Length | FSTS ID | Session Control | New Band | | | Old Band | | |
|------------|--------|---------|-----------------|----------|-------|-----------|----------|-------|-----------|
| | | | | Band ID | Setup | Operation | Band ID | Setup | Operation |
| Octets: | 1 | 1 | 4 | 1 | 1 | 1 | 1 | 1 | 1 |

Figure 9-538—Session Transition element format

The Element ID and Length fields are defined in 9.4.2.1.

The FSTS ID (fast session transfer session identifier) field contains the identification of the FST session established between a pair of STAs as allocated by the initiator (10.32).

The Session Control field is defined in Figure 9-539.

| B0 | B3 | B4 | B5 | B7 |
|------|--------------|---------------|----------|----|
| Bit: | 4 | 1 | 3 | |
| | Session Type | Switch Intent | Reserved | |

Figure 9-539—Session Control field format

The Session Type subfield is defined as shown in Table 9-244 and indicates the type of connection/session that is intended to be set up in the new band for this FST session.

Table 9-244—Session Type subfield values

| Value | Session type |
|-------|--------------------|
| 0 | Infrastructure BSS |
| 1 | IBSS |
| 2 | DLS |
| 3 | TDLS |
| 4 | PBSS |
| 5–255 | Reserved |

When the Session Type subfield is set to IBSS and the STA Role subfield within the Multi-band element is set to IBSS STA, the BSSID field within the Multi-band element contains the MAC address of the BSSID of

the IBSS. This indicates that the transmitting STA is not associated with an AP on the band and channel indicated in the Multi-band element.

The Switch Intent subfield is set to 1 to indicate that the FST Initiator that transmitted the FST Setup Request frame intends to switch to the band/channel indicated within the Band ID subfield of the FST Setup Request frame and in the Multi-band element, even if the FST transition does not succeed. Otherwise, this subfield is set to 0. This subfield is reserved when transmitted within an FST Setup Response frame.

The New Band and Old Band subfields are used for the signaling described in 11.33.1. Both the New Band and Old Band subfields contain a Band ID subfield, a Setup subfield, and an Operation subfield.

The Band ID subfield is defined in 9.4.1.46. If a Multi-band element is present in the frame containing this Session Transition element, the Band ID subfield refers to the Operating Class and Channel Number fields within the Multi-band element provided the value of both of these fields are nonzero.

The Setup subfield is set to 1 to indicate that the STA transmitting this element has an FST session established with the STA that the frame containing this element is addressed and in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

The Operation subfield is set to 1 to indicate that the STA is operating in the band indicated within the Band ID subfield. Otherwise, it is set to 0. Other values are reserved.

9.4.2.146 Dynamic Tone Pairing (DTP) Report element

The DTP Report element is included in the DTP Response frame. The format of the DTP Report element is shown in Table 9-245.

Table 9-245—DTP Report element format

| Field | Length | Meaning |
|---------------------------|--------|--|
| Element ID | 8 bits | |
| Length | 8 bits | |
| GroupPairIndex(0) | 6 bits | Index of DTP group pair n in the range 0 to N_G-1 , for $n = 0, 1, 2, \dots, N_G-1$ where $N_G=42$ |
| GroupPairIndex(1) | 6 bits | |
| ... | ... | |
| GroupPairIndex(N_G-1) | 6 bits | |
| Zero pad | 4 bits | Zero padding to make the DTP Feedback element length a multiple of 8 bits |

The Element ID and Length fields are defined in 9.4.2.1.

GroupPairIndex(n) subfields for $n=0, 1, \dots, N_G-1$ (where $N_G=42$) indicate DTP groups, which in turn determines how pairs of SQPSK symbols are mapped to OFDM tones when DTP is enabled, as described in 20.5.3.2.4.6.3. Valid values of GroupPairIndex(n) are in the range 0 to N_G-1 . Furthermore valid values of GroupPairIndex(0), GroupPairIndex(1), ..., GroupPairIndex(N_G-1) are distinct and therefore represent a permutation of integers 0 to N_G-1 .

All numeric fields are encoded as unsigned integers.

9.4.2.147 Cluster Report element

The format of the Cluster Report element is shown in Figure 9-540. The Cluster Report element is included Action frames, such as Announce and Information Response frames, transmitted to the AP or PCP of the BSS. Because the Length field supports only 255 octets of information in an element, the STA can split the content of the Extended Schedule Element field, as described in 9.4.2.132, in different Cluster Report elements. The value of n in Figure 9-540 is given by the following equation:

$$n = 255 - (2 + S_{RB} + S_{RT} + S_{CC} + S_{EPE} + S_{TSCONST})$$

where

- S_{RB} is the size of the Reported BSSID field in octets
- S_{RT} is the size of the Reference Timestamp field in octets
- S_{CC} is the size of the Clustering Control field in octets
- S_{EPE} is the size of the ECAPC Policy Element field in octets
- $S_{TSCONST}$ is the size of the Traffic Scheduling Constraint Set field in octets

| | Element ID | Length | Cluster Report Control | Reported BSSID | Reference Timestamp | Clustering Control |
|---------|----------------------|---------------------------|------------------------|-----------------------------------|---------------------|--------------------|
| Octets: | 1 | 1 | 1 | 0 or 6 | 0 or 4 | 0 or 8 |
| | | | | | | |
| Octets: | ECAPC Policy Element | Extended Schedule Element | Number of Constraints | Traffic Scheduling Constraint Set | | |
| | | | | | | |
| Octets: | 0, 13 or 17 | 0 or 17 – n | 1 | Variable | | |

Figure 9-540—Cluster Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Cluster Report Control field is defined in Figure 9-541.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 |
|-----------------|----------------|------------------|-----------------|-----------------------|----------------------|----------|----|
| Cluster Request | Cluster Report | Schedule Present | TSCONST Present | ECAPC Policy Enforced | ECAPC Policy Present | Reserved | |
| | | | | | | | |
| Bits: | 1 | 1 | 1 | 1 | 1 | 1 | 2 |

Figure 9-541—Cluster Report Control field format

The Cluster Request subfield is set to 1 to indicate that the STA is requesting the AP or PCP to start AP or PCP clustering (10.37). Otherwise, it is set to 0.

The Cluster Report subfield is set to 1 to indicate that this element contains a cluster report. If this subfield is set to 1, the Reported BSSID, Reference Timestamp and Clustering Control fields are present in this element. Otherwise, if the Cluster Report subfield is set to 0, none of the Reported BSSID, Reference Timestamp, Clustering Control, Extended Schedule Element, and Traffic Scheduling Constraint Set fields is present in this element.

The Schedule Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The Schedule present subfield is set to 1 to indicate that the Extended Schedule Element field is present in this element. Otherwise, the Extended Schedule Element field is not present in this element.

The TSCONST Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The TSCONST Present subfield is set to 1 to indicate that the Number of Constraints field and the Traffic Scheduling Constraint Set field are present in this element. Otherwise, these fields are not present in this element.

The ECAPC Policy Enforced subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Enforced subfield is defined in 9.3.4.2 and contains the ECAPC Policy Enforced subfield received in the DMG Beacon frame that generated this report.

The ECAPC Policy Present subfield is valid only if the Cluster Report subfield is set to 1; otherwise, it is reserved. The ECAPC Policy Present subfield is set to 1 to indicate that the ECAPC Policy Present Element field is present in this element. Otherwise, the ECAPC Policy Present Element field is not present in this element.

The Reported BSSID field contains the BSSID of the DMG Beacon frame that triggered this report.

The Reference Timestamp field contains the lower 4 octets of the TSF timer value sampled at the instant that the STA's MAC received a DMG Beacon frame that triggered this report.

The Clustering Control field is defined in 9.3.4.2 and contains the Clustering Control received in the DMG Beacon frame that triggered this report.

The ECAPC Policy Element field is defined in 9.4.2.151 and contains the ECAPC Policy element obtained from the AP or PCP that sent the DMG Beacon frame that generated this report (see 10.37.4).

The Extended Schedule Element field is defined in 9.4.2.132 and contains a single Extended Schedule element received in the DMG Beacon frame that generated this report. If an Extended Schedule element is not present in the received DMG Beacon, this field is set to all 0s.

The Number of Constraints field indicates the number of Constraint subfields contained in the Traffic Scheduling Constraint Set field. The value of this field ranges from 0 to 15. Other values are reserved.

The Traffic Scheduling Constraint Set field contains one or more Constraint subfields as defined in 9.4.2.134 and specifies periods of time with respect to the TBTT of the beacon interval of the BSS the STA participates where the STA experiences poor channel conditions, such as due to interference.

9.4.2.148 Relay Capabilities element

A STA that intends to participate in relay operation (11.36) advertises its capabilities through the Relay Capabilities element. The Relay Capabilities element is defined in Figure 9-542.

| Element ID | Length | Relay Capabilities Information |
|------------|--------|--------------------------------|
| Octets: | 1 | 1 |

Figure 9-542—Relay Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Capability Information field is defined in Figure 9-543.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B15 |
|-----------------|--------------|------------------|-----------|------------------|--------|-------------|----------|----|-----|
| Relay Supporter | Relay Client | Relay Permission | A/C Power | Relay Preference | Duplex | Cooperation | Reserved | | |
| Bits: | 1 | 1 | 1 | 1 | 1 | 2 | 1 | 8 | |

Figure 9-543—Relay Capability Information field format

The Relay Supporter subfield indicates whether the STA is capable of relaying by transmitting and receiving frames between a pair of other STAs. A STA capable of relaying is called a *relay* STA. This subfield is set to 1 if the STA supports relaying; otherwise, it is set to 0.

The Relay Client subfield indicates whether the STA is capable of using frame-relaying through a relay STA. It is set to 1 if the STA supports transmission and reception of frames through a relay STA; otherwise, it set to 0.

The Relay Permission subfield indicates whether the AP or PCP allows relay operation (11.36) to be used within the AP's or PCP's BSS. It is set to 0 if relay operation is not allowed in the BSS; otherwise, it is set to 1. This subfield is reserved when transmitted by a non-AP and non-PCP STA.

The A/C Power subfield indicates whether the STA is capable of obtaining A/C power. It is set to 1 if the STA is capable of being supplied by A/C power; otherwise, it is set to 0.

The Relay Preference subfield indicates whether the STA prefers to become RDS rather than REDS. It is set to 1 if a STA prefers to be RDS; otherwise, it is set to 0.

The Duplex subfield indicates whether the STA is capable of full-duplex/amplify-and-forward (FD-AF) or half-duplex/decode-and-forward (HD-DF). It is set to 1 if the STA is not capable of HD-DF but is capable of only FD-AF. It is set to 2 if the STA is capable of HD-DF but is not capable of FD-AF. It is set to 3 if the STA is capable of both HD-DF and FD-AF. The value 0 is reserved.

The Cooperation subfield indicates whether a STA is capable of supporting link cooperation. It is set to 1 if the STA supports both link cooperation and link switching. It is set to 0 otherwise.

9.4.2.149 Relay Transfer Parameter Set element

A source REDS that intends to transfer frames via an RDS advertises the parameters for the relay operation with the transmission of a Relay Transfer Parameter Set element (11.36). The Relay Transfer Parameter Set element is defined in Figure 9-544.

| | | |
|------------|--------|--------------------------|
| Element ID | Length | Relay Transfer Parameter |
| Octets: | 1 | 8 |

Figure 9-544—Relay Transfer Parameter Set element format

The Element ID and Length fields are defined in 9.4.2.1.

The Relay Transfer Parameter field is defined in Figure 9-545.

| B0 | B1 | B2 | B3 | B7 | B8 | B15 | B16 | B23 | B24 | B39 | B40 | B55 | B56 | B63 |
|-------------|------------------|---------|----------|----|----------------------|-------------------|-----|--------------|---------------|-----|-----|-----|-----|----------|
| Duplex-Mode | Cooperation-Mode | Tx-Mode | Reserved | | Link Change Interval | Data Sensing Time | | First Period | Second Period | | | | | Reserved |
| Bits: | 1 | 1 | 1 | 5 | 8 | 8 | | 16 | 16 | | | | | 8 |

Figure 9-545—Relay Transfer Parameter field format

The Duplex-Mode subfield indicates that the source REDS set the duplex mode of the RDS involved in RLS. The Duplex-Mode subfield value is set to 0 if the RDS operates in HD-DF mode. It is set to 1 if the RDS operates in FD-AF mode.

The Cooperation-Mode subfield indicates whether the source REDS sets the link cooperation of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link cooperation and Duplex-Mode subfield is set to 0. Otherwise, this subfield is reserved. The Cooperation-Mode subfield value is set to 0 if the RDS operates in link switching. It is set to 1 if the RDS operates in link cooperation.

The Tx-Mode subfield indicates that the source REDS sets the transmission mode of the RDS involved in RLS. This subfield is valid only when the RDS is capable of link switching and the Duplex-Mode subfield is set to 1. Otherwise, this subfield is reserved. The Tx-Mode subfield value is set to 0 if a group of three STAs involved in the RLS operates in Normal mode and is set to 1 if the group operates in Alternation mode.

The Link Change Interval subfield indicates when the link of frame transmission between source REDS and destination REDS is changed. From the start position of one reserved continuous SP, every time instant of link change interval can have an opportunity to change the link. Within one link change interval, only one link is used for frame transfer. The unit of this subfield is microseconds. This subfield is used only when the group involved in the RLS operates in link switching.

The Data Sensing Time subfield indicates the defer time offset from the time instant of the next link change interval when the link switching occurs. By default, it is set to SIFS plus SBIFS. This subfield is used only when the STAs involved in the RLS operate in link switching with Tx-Mode that is 0.

The First Period subfield indicates the period of the source REDS-RDS link in which the source REDS and RDS exchange frames. This subfield is used only when HD-DF RDS operates in link switching.

The Second Period subfield indicates the period of the RDS-destination REDS link in which the RDS and destination REDS exchange frames and the following period of the RDS-source REDS link in which the RDS informs the source REDS of finishing one frame transfer. This subfield is used only when HD-DF RDS operates in link switching.

9.4.2.150 Quiet Period Request element

The Quiet Period Request element defines a periodic sequence of quiet intervals that the requester AP requests the responder AP to schedule. The format of the Quiet Period Request element is shown in Figure 9-546.

| Element ID | Length | Request Token | Quiet Period Offset | Quiet Period | Quiet Duration | Repetition Count | Target BSSID |
|------------|--------|---------------|---------------------|--------------|----------------|------------------|--------------|
| Octets: | 1 | 1 | 2 | 2 | 4 | 2 | 6 |

Figure 9-546—Quiet Period Request element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to a nonzero value chosen by the requester AP.

The Quiet Period Offset field is set to the offset of the start of the first quiet interval from the QAB Request frame that contains this element, expressed in TUs. The reference time is the start of the preamble of the PPDU that contains this element.

The Quiet Period field is set to the spacing between the start of two consecutive quiet intervals, expressed in TUs.

The Quiet Duration field is set to duration of the quiet time, expressed in TUs.

The Repetition Count field is set to the number of requested quiet intervals.

NOTE—The periodic sequence of quiet intervals ends after the start of preamble of the PPDU containing the QAB IE + Quiet Period Offset + (Repetition Count-1)×Quiet Period + Quiet Duration (in TUs).

The Target BSSID field is set to the responder AP's MAC address.

9.4.2.151 Quiet Period Response element

The Quiet Period Response element defines the feedback information from the AP that received the Quiet Period Request element. The format of the Quiet Period Response element is shown in Figure 9-547.

| | | | | | |
|---------|------------|--------|---------------|-------|-------------|
| Octets: | Element ID | Length | Request Token | BSSID | Status Code |
| | 1 | 1 | 2 | 6 | 2 |

Figure 9-547—Quiet Period Response element format

The Element ID and Length fields are defined in 9.4.2.1.

The Request Token field is set to the value of the Request Token field of the corresponding received Quiet Period Request element.

The BSSID field is set to the value of the Target BSSID field of the corresponding received Quiet Period Request element.

The Status Code field is defined in 9.4.1.9.

9.4.2.152 BeamLink Maintenance element

The format of the BeamLink Maintenance element is shown in Figure 9-548. The BeamLink Maintenance element is included in Action frames, such as Probe, Announce and the Information Request and Response frames, transmitted between a non-AP and non-PCP DMG STA and a DMG AP or PCP. The element is included in the Probe and Information Request and Response frames transmitted between non-AP and non-PCP DMG STAs.

| | | | |
|---------|------------|--------|-----------------------------|
| Octets: | Element ID | Length | Beamformed Link Maintenance |
| | 1 | 1 | 1 |

Figure 9-548—BeamLink Maintenance element format

The Element ID and Length fields are defined in 9.4.2.1.

The Beamformed Link Maintenance field is defined in 9.5.6.

9.4.2.153 Multiple MAC Sublayers (MMS) element

The format of Multiple MAC Sublayers (MMS) element is shown in Figure 9-549. The MMS element is included in Action frames, such as Probe Request, Association Request, Information Request, Announce, and Information Response frames, transmitted to the peer STA and the AP or PCP of the BSS.

| | | | | | |
|------------|--------|-------------|-----------------|-----------------------|-------------------------|
| Element ID | Length | MMS Control | STA MAC Address | Interface Address(es) | |
| Octets: | 1 | 1 | 1 | 6 | $6 \times n$ (variable) |

Figure 9-549—MMS element format

The Element ID and Length fields are defined in 9.4.2.1.

The MMS Control field is defined in Figure 9-550.

| B0 | B1 | B2 | B3 | B4 | B5 | B7 |
|-------------------|------------|-------------------|------------------|----------|----|----|
| MMS Element Owner | Single AID | MM-SME Power Mode | BeamLink Cluster | Reserved | | |
| Bit: | 2 | 1 | 1 | 1 | 3 | |

Figure 9-550—MMS Control field format

The MMS Element Owner subfield is encoded as shown in Table 9-246. If the MMS Element Owner field is set to No Owner, then the Interface address(es) field in the MMS element is reserved.

Table 9-246—MMS Element Owner subfield definition

| MMS Element Owner subfield value | | Meaning |
|----------------------------------|----|--------------------------------|
| B0 | B1 | |
| 0 | 0 | No Owner |
| 1 | 0 | Non-AP and Non-PCP MMS element |
| 0 | 1 | PCP MMS element |
| 1 | 1 | AP MMS element |

The Single AID subfield is one bit in length and is encoded as defined in Table 9-247.

Table 9-247—Single AID subfield definition

| MMS element sent from | MMS element sent to | MMS Element Owner | | Single AID | Meaning |
|------------------------|---------------------|-------------------|----|------------|---|
| | | B0 | B1 | | |
| Non-AP and non-PCP STA | AP or PCP | 1 | 0 | 1 | Request to allocate single AID for MAC addresses included in the MMS element |
| Non-AP and non-PCP STA | AP or PCP | 1 | 0 | 0 | Do not allocate single AID for MAC addresses included in the MMS element |
| AP or PCP | Non-PCP, non-AP STA | 1 | 0 | 1 | Single AID is allocated for all MAC addresses in the MMS element |
| AP or PCP | Non-PCP, non-AP STA | 1 | 0 | 0 | Single AID is not allocated for all MAC addresses in the MMS element |
| Non-AP and non-PCP STA | Non-PCP, non-AP STA | 1 | 0 | 1 | Single AID is allocated for all MAC addresses in the MMS element |
| Non-AP and non-PCP STA | Non-PCP, non-AP STA | 1 | 0 | 0 | Single AID is not allocated for all MAC addresses in the MMS element |
| AP or PCP | Non-PCP, non-AP STA | 0 | 1 | 1 | Single AID is allocated for all MAC addresses in the non-AP and non-PCP STA MMS element |
| AP or PCP | Non-PCP, non-AP STA | 0 | 1 | 0 | Single AID is not allocated for all MAC addresses in the non-AP and non-PCP STA MMS element |

The MM-SME Power Mode subfield is one bit in length and is set to 1 to indicate that when a STA advertised in the MMS element sent by the STA coordinated by an MM-SME moves from the awake to the doze state, then all other STAs advertised in the MMS element sent by the STA move to the doze state. The STA coordinated by the MM-SME moves to the awake state only when all STAs advertised in the MMS element move to the awake state. The MM-SME Power Mode subfield is set to 0 to indicate that when a STA advertised in the MMS element sent by the STA moves from the doze to the awake state, then all other STAs advertised in the MMS element sent by the STA coordinated by the MM-SME move to the awake state. The STA coordinated by the MM-SME moves to the doze state only when all STAs advertised in the MMS element move to the doze state.

The BeamLink Cluster subfield is one bit in length and is set to 1 if the DMG STA intends to maintain the same beamformed link for all of the links within the MMSL cluster. Otherwise, this subfield is set to 0.

The STA MAC Address field contains the MAC address of the STA.

When present in the element, the Interface Address(es) field contains one or more MAC addresses that can be used to identify the STAs in addition to the STA MAC address, coordinated by the same MM-SME (see 11.34).

9.4.2.154 U-PID element

The format of the Upper Layer Protocol Identification (U-PID) element is described in Figure 9-551.

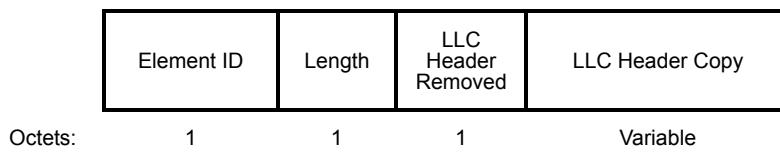

Figure 9-551—U-PID element format

The Element ID and Length fields are defined in 9.4.2.1.

The LLC Header Removed field is set to 1 to indicate that MSDUs do not contain the LLC (Logical Link Control) header over the WM. It is set to 0 otherwise.

The content and corresponding size of the LLC Header Copy field are specified in Table 9-248.

Table 9-248—LLC Header Copy field size

| LLC Header Copy field contents | LLC Header Copy field size (octets) |
|---|-------------------------------------|
| LLC header with 8-bit control field without SNAP | 3 |
| LLC header with 8-bit control field with SNAP | 8 |
| LLC header with 16-bit control field without SNAP | 4 |
| LLC header with 16-bit content field with SNAP | 9 |

NOTE—The structure of the LLC header is defined in IEEE Std 802.2-1998. The structure of the LLC with SNAP extension is defined in IEEE Std 802.2-1998.

9.4.2.155 ECAPC Policy element

The format of the ECAPC Policy element is shown in Figure 9-552.

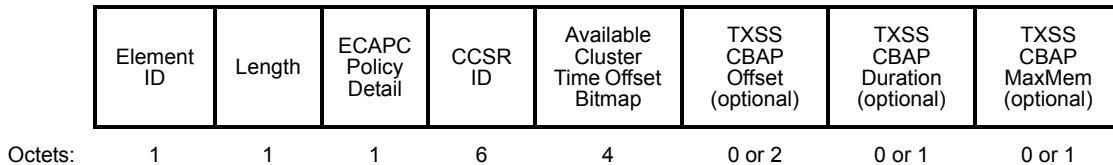

Figure 9-552—ECAPC Policy element format

The Element ID and Length fields are defined in 9.4.2.1.

The ECAPC Policy Detail field is defined in Figure 9-553.

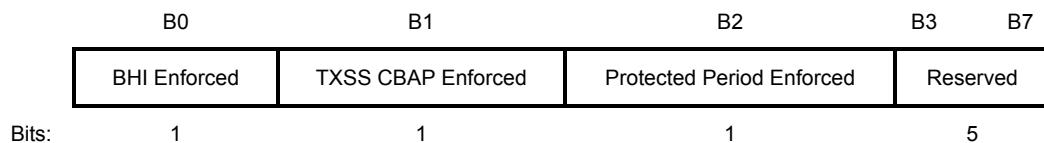

Figure 9-553—ECAPC Policy Detail field format

The BHI Enforced subfield set to 1 indicates that an AP or PCP in a centralized AP or PCP cluster completes the BHI for the current beacon interval before $TBTT + (8 \times \text{Beacon SP duration})$, as described in 10.37.3.4. The BHI Enforced subfield set to 0 indicates that an AP or PCP within a cluster does not have to complete the BHI for the current beacon interval before $TBTT + (8 \times \text{Beacon SP duration})$.

The TXSS CBAP Enforced subfield set to 1 indicates that a STA in a centralized AP or PCP cluster performs each of its TXSSs in the DTI within one or more TXSS CBAPs, as described in 10.37.3.4. The TXSS CBAP Enforced subfield set to 0 indicates that a STA within a centralized AP or PCP cluster does not have to perform each of its TXSSs in the DTI within one or more TXSS CBAPs.

The Protected Period Enforced subfield indicates that every scheduled SP in the BSS is a DMG protected period as specified in 10.36.6.6. The Protected Period Enforced subfield set to 0 indicates that a scheduled SP in the BSS does not have to be a DMG protected period.

The CCSR ID field is set to the MAC address of the CCSR within the ECAPC that the AP or PCP belongs to. The AP or PCP is the transmitter of the frame containing the ECAPC Policy element except when the ECAPC Policy element is transmitted in a Cluster Report element, where the AP or PCP is the transmitter that triggered the Cluster report.

The Available Time Cluster Offset Bitmap field is a bitmap where the bit $n-1$, $n = 1$ to 32, indicates the availability of the n^{th} Beacon SP. Values of $n = 1$ and greater than ClusterMaxMem are reserved (i.e., bit 0 and bits ClusterMaxMem+1 to 31 inclusive). Bit $n-1$ set to 0 indicates that ClusterTimeOffset _{$n-1$} is determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC. Bit $n-1$ set to 1 indicates that ClusterTimeOffset _{$n-1$} is not determined to be already in use by a neighboring AP or PCP, excluding the recipient if sent within an individually addressed frame, in the ECAPC.

If TXSS CBAP Enforced field is set to 0, then the TXSS CBAP Offset field, the TXSS CBAP Duration field, and the TXSS CBAP MaxMem field are not present in the element; otherwise, they are present in the element.

The TXSS CBAP Offset field is the delay of the first TXSS CBAP in a beacon interval from the TBTT, in units of 8 μs .

The TXSS CBAP Duration field indicates the duration of each TXSS CBAP, in units of 8 μs .

The TXSS CBAP MaxMem field is the number of TXSS CBAPs per beacon interval.

9.4.2.156 Cluster Time Offset element

The format of the Cluster Time Offset element is shown in Figure 9-554.

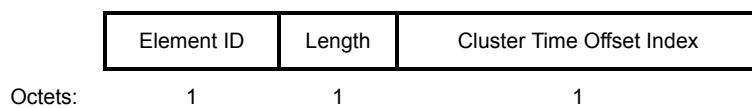

Figure 9-554—Cluster Time Offset element format

The Element ID and Length fields are defined in 9.4.2.1.

The Cluster Time Offset Index field is set to $n-1$ for a member AP or member PCP of a centralized AP or PCP cluster that adopted the n^{th} Beacon SP (see 10.37). Values equal to 0 and greater than ClusterMaxMem are reserved.

9.4.2.157 Antenna Sector ID Pattern element

The format of the Antenna Sector ID Pattern element is shown in Figure 9-555.

| B0 | B7 | B8 | B15 | B16 | B19 | B20 | B25 | B26 | B31 | B32 | B39 | B40 | B47 |
|------------|--------|------|-----|-----|-----|-------|-----|---------|-----|-------|-----|---------|-----|
| Element ID | Length | Type | | | | Tap 1 | | State 1 | | Tap 2 | | State 2 | |
| Bits: | 8 | 8 | 4 | | 6 | | 6 | | 8 | | 8 | | |

Figure 9-555—Antenna Sector ID Pattern element format

The Element ID and Length fields are defined in 9.4.2.1.

The Type field is set to 0 for Random Sequence Generator. Values 1 to 3 are reserved.

The Tap 1 field indicates the taps for Sequence Generator 1.

The State 1 field indicates the state for Sequence Generator 1.

The Tap 2 field indicates the taps for Sequence Generator 2.

The State 2 field indicates the state for Sequence Generator 2.

Sequence Generator 1 is shown in Figure 9-556 and is defined as follows:

- Generate the sector IDs for subsequent DMG Beacons by advancing the Sequence Generator 1, which is initialized using the values of the Tap 1 and State 1 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.
- Advance the Sequence Generator 1 by one shift for each anticipated DMG Beacon frame transmission thereafter.
- After advancing the Sequence Generator 1, if the next state equals the initial state for the second time, overwrite the state with an all-zero state. The next state following the state following all zero-state uses the first 6 bits of the state of Sequence Generator 2 as the initial state.
- If the STA’s total number of transmit sectors is not equal to the period of the Sequence Generator 1, ignore state(s) greater than or equal total number of transmit sectors and continue advancing Sequence Generator 1 until the state is less than the total number of transmit sectors.

NOTE—The taps are selected from the set of sequences with maximal length property.

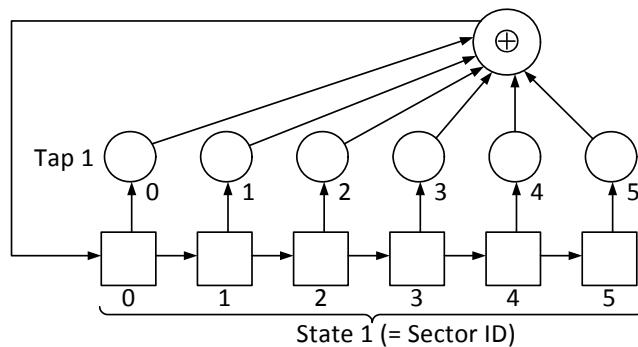

Figure 9-556—Sequence Generator 1

Sequence Generator 2 is shown in Figure 9-557 and is defined as follows:

- Sequence Generator 2 is initiated with the value of the Tap 2 and State 2 fields contained in the Antenna Sector ID Pattern element received from the AP or PCP.
- Sequence Generator 2 is advanced by one shift when a new initial state is needed from Sequence Generator 1.

NOTE—The taps are selected from the set of the sequences with maximal length property.

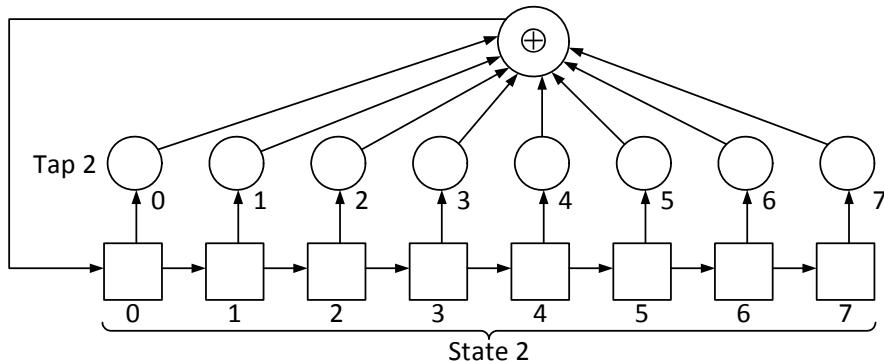

Figure 9-557—Sequence Generator 2

9.4.2.158 VHT Capabilities element

9.4.2.158.1 VHT Capabilities element structure

A VHT STA declares that it is a VHT STA by transmitting the VHT Capabilities element.

The VHT Capabilities element contains a number of fields that are used to advertise the VHT capabilities of a VHT STA. The VHT Capabilities element is defined in Figure 9-558.

| Element ID | Length | VHT Capabilities Info | Supported VHT-MCS and NSS Set |
|------------|--------|-----------------------|-------------------------------|
| Octets: 1 | 1 | 4 | 8 |

Figure 9-558—VHT Capabilities element format

The Element ID and Length fields are defined in 9.4.2.1.

9.4.2.158.2 VHT Capabilities Information field

The structure of the VHT Capabilities Information field is defined in Figure 9-559.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B10 | B11 | B12 | B13 | B15 |
|-------------------------------|-----------------------------|-----------------------|--------------------------------------|--------------------------------|--------------------------------|-----------------------------|--------------------------------|--------------------------------|---------------------------|-----|-----|-----|-----|
| Maximum MPDU Length | Supported Channel Width Set | Rx LDPC | Short GI for 80 MHz/ TVHT_MODE_4C | Short GI for 160 and 80+80 MHz | Tx STBC | Rx STBC | SU Beamformer Capable | SU Beamformee Capable | Beamformee STS Capability | | | | |
| Bits: | 2 | 2 | 1 | 1 | 1 | 1 | 3 | 1 | 1 | 1 | 1 | 3 | |
| B16 | B18 | B19 | B20 | B21 | B22 | B23 | B25 | B26 | B27 | B28 | B29 | B30 | B31 |
| Number Of Sounding Dimensions | MU Beamformer Capable | MU Beamformee Capable | TXOP PS | +HTC-VHT Capable | Maximum A-MPDU Length Exponent | VHT Link Adaptation Capable | Rx Antenna Pattern Consistency | Tx Antenna Pattern Consistency | Extended NSS BW Support | | | | |
| 3 | 1 | 1 | 1 | 1 | 3 | 2 | 1 | 1 | 2 | | | | |

Figure 9-559—VHT Capabilities Information field

The subfields of the VHT Capabilities Information field are defined in Table 9-249.

Table 9-249—Subfields of the VHT Capabilities Information field

| Subfield | Definition | Encoding |
|--------------------------------------|--|--|
| Maximum MPDU Length | Indicates the maximum MPDU length that the STA is capable of receiving (see 10.12). | Set to 0 for 3895 octets. Set to 1 for 7991 octets. Set to 2 for 11 454 octets. The value 3 is reserved. |
| Supported Channel Width Set | Together with the Extended NSS BW Support subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA. See 11.40. | In a non-TVHT STA, see Table 9-250. In a TVHT STA, the field is structured into subfields as defined in Figure 9-560. In a TVHT STA, set the TVHT_MODE_2C Support subfield to 1 if it supports TVHT_MODE_2C; otherwise set the subfield to 0. In a TVHT STA, set the TVHT_MODE_2N Support subfield to 1 if it supports TVHT_MODE_2N; otherwise set the subfield to 0. |
| Rx LDPC | Indicates support for receiving LDPC encoded packets. | Set to 0 if not supported. Set to 1 if supported. |
| Short GI for 80 MHz/ TVHT_MODE_4C | In a non-TVHT STA, indicates short GI support for the reception of packets transmitted with TXVECTOR parameters FORMAT equal to VHT and CH_BANDWIDTH equal to CBW80. In a TVHT STA, indicates support for TVHT_MODE_4C. | In a non-TVHT STA, set to 1 if Short GI for 80 MHz is supported. In a TVHT STA, set to 1 if TVHT_MODE_4C is supported. Otherwise set to 0. |

Table 9-249—Subfields of the VHT Capabilities Information field (continued)

| Subfield | Definition | Encoding |
|--------------------------------|---|--|
| Short GI for 160 and 80+80 MHz | Indicates short GI support for the reception of packets transmitted with TXVECTOR parameters FORMAT equal to VHT and CH_BANDWIDTH equal to CBW160 or CBW80+80. | Set to 0 if not supported. Set to 1 if supported. In a TVHT STA, set to 1 if it supports TVHT_MODE_4N. |
| Tx STBC | Indicates support for the transmission of at least 2x1 STBC. | Set to 0 if not supported. Set to 1 if supported. |
| Rx STBC | Indicates support for the reception of PPDUs using STBC. | Set to 0 for no support. Set to 1 for support of one spatial stream. Set to 2 for support of one and two spatial streams. Set to 3 for support of one, two, and three spatial streams. Set to 4 for support of one, two, three, and four spatial streams. The values 5, 6, 7 are reserved. See NOTE 3. |
| SU Beamformer Capable | Indicates support for operation as an SU beamformer (see 10.34.5). | Set to 0 if not supported. Set to 1 if supported. |
| SU Beamformee Capable | Indicates support for operation as an SU beamformee (see 10.34.5). | Set to 0 if not supported. Set to 1 if supported. |
| Beamformee STS Capability | Indicates the maximum number of space-time streams that the STA can receive in a VHT NDP and the maximum value of N_r that the STA transmits in a VHT Compressed Beamforming frame. | If the SU Beamformee Capable field is set to 1, set to maximum number of space-time streams that the STA can receive in a VHT NDP minus 1. Otherwise, reserved. |
| Number of Sounding Dimensions | Beamformer's capability indicating the maximum value of the TXVECTOR parameter NUM_STS for a VHT NDP. | If the SU Beamformer Capable field is set to 1, set to the maximum supported value of the TXVECTOR parameter NUM_STS minus 1. Otherwise, reserved. |
| MU Beamformer Capable | Indicates support for operation as an MU beamformer (see 10.34.5). | Set to 0 if not supported or if SU Beamformer Capable is set to 0 or if sent by a non-AP STA. Set to 1 if supported and SU Beamformer Capable is set to 1. |
| MU Beamformee Capable | Indicates support for operation as an MU beamformee (see 10.34.5). | Set to 0 if not supported or if SU Beamformee Capable is set to 0 or if sent by an AP. Set to 1 if supported, SU Beamformee Capable is set to 1 and not sent by an AP. |
| TXOP PS | Indicates whether the AP supports TXOP power save mode or whether the non-AP STA has enabled TXOP power save mode. | Set to 0 if the AP does not support TXOP power save mode. Set to 1 if the AP supports TXOP power save mode. Set to 0 if the non-AP STA does not enable TXOP power save mode. Set to 1 if the non-AP STA enables TXOP power save mode. |

Table 9-249—Subfields of the VHT Capabilities Information field (continued)

| Subfield | Definition | Encoding |
|---|--|--|
| +HTC-VHT Capable | Indicates whether the STA supports receiving a VHT variant HT Control field. | Set to 0 if not supported. Set to 1 if supported. |
| Maximum A-MPDU Length Exponent | Indicates the maximum length of an A-MPDU pre-EOF padding that the STA can receive. | This field is an integer in the range 0 to 7. The length defined by this field is equal to $2^{(13 + \text{Maximum A-MPDU Length Exponent})} - 1$ octets. |
| VHT Link Adaptation Capable | Indicates whether the STA supports link adaptation using VHT variant HT Control field. | If +HTC-VHT Capable is 1: Set to 0 (No Feedback) if the STA does not provide VHT MFB. Set to 2 (Unsolicited) if the STA provides only unsolicited VHT MFB. Set to 3 (Both) if the STA can provide VHT MFB in response to VHT MRQ and if the STA provides unsolicited VHT MFB. The value 1 is reserved. Reserved if +HTC-VHT Capable is 0. |
| Rx Antenna Pattern Consistency | Indicates the possibility of a receive antenna pattern change. | Set to 0 if the receive antenna pattern might change during the lifetime of the current association. Set to 1 if the receive antenna pattern does not change during the lifetime of the current association. See 11.40.6. |
| Tx Antenna Pattern Consistency | Indicates the possibility of a transmit antenna pattern change. | Set to 0 if the transmit antenna pattern might change during the lifetime of the current association. Set to 1 if the transmit antenna pattern does not change during the lifetime of the current association. See 11.40.6. |
| Extended NSS BW Support | Together with the Supported Channel Width Set subfield and Supported VHT-MCS and NSS Set field, indicates the channel widths and maximum NSS values per width supported by the STA (for non-TVHT VHT STAs). See 11.40. | In a non-TVHT STA, see Table 9-250. In a TVHT STA, the field is reserved. In a STA with dot11VHTExtendedNSSBWCapable equal to false or not present, this field is set to 0. |
| NOTE 1—An AP that sets MU Beamformer Capable to 1 can transmit a VHT MU PPDU with only one nonzero TXVECTOR parameter NUM_STS[p], for $0 \leq p \leq 3$. However, a STA that sets MU Beamformee Capable to 0 is not required to be able to demodulate a VHT MU PPDU with only one nonzero RXVECTOR parameter NUM_STS[p], for $0 \leq p \leq 3$. | | |
| NOTE 2—The value of the Maximum MPDU Length subfield of the VHT Capabilities Information field imposes a constraint on the allowed value in the Maximum MPDU Length subfield of the HT Capabilities element carried in the same frame (see 10.12). | | |
| NOTE 3—Subject to any extended NSS BW support constraint. | | |

Table 9-250—Setting of the Supported Channel Width Set subfield and Extended NSS BW Support subfield at a STA transmitting the VHT Capabilities Information field

| Transmitted VHT Capabilities Information field | | NSS Support of STA transmitting the VHT Capabilities Information field as a function of the PPDU bandwidth (\times Max VHT NSS) (see requirements R1 and R2) | | | | | Location of 160 MHz channel center frequency if BSS bandwidth is 160 MHz | Location of 80+80 MHz center frequency if BSS bandwidth is 80+80 MHz |
|--|-------------------------|---|--------|--------|---------|-----------|--|--|
| Supported Channel Width Set | Extended NSS BW Support | 20 MHz | 40 MHz | 80 MHz | 160 MHz | 80+80 MHz | | |
| 0 | 0 | 1 | 1 | 1 | | | | |
| 0 | 1 | 1 | 1 | 1 | 1/2 | | CCFS2 | |
| 0 | 2 | 1 | 1 | 1 | 1/2 | 1/2 | CCFS2 | CCFS2 |
| 0 | 3 | 1 | 1 | 1 | 3/4 | 3/4 | CCFS2 | CCFS2 |
| 1 | 0 | 1 | 1 | 1 | 1 | | CCFS1 | |
| 1 | 1 | 1 | 1 | 1 | 1 | 1/2 | CCFS1 | CCFS2 |
| 1 | 2 | 1 | 1 | 1 | 1 | 3/4 | CCFS1 | CCFS2 |
| 1 | 3 | 2 | 2 | 2 | 2 | 1 | CCFS1 | CCFS1 |
| 2 | 0 | 1 | 1 | 1 | 1 | 1 | CCFS1 | CCFS1 |
| 2 | 3 | 2 | 2 | 2 | 1 | 1 | CCFS1 | CCFS1 |

R1: NSS support shall be rounded down to the nearest integer.
 R2: The maximum NSS support shall be 8.

NOTE 1—Max VHT NSS is defined per MCS in 9.4.2.158.3.

NOTE 2—1/2 \times or 3/4 \times Max VHT NSS support might end up being 0, indicating no support.

NOTE 3—Any other combination than the ones listed in this table is reserved.

NOTE 4—CCFS1 refers to the value of the Channel Center Frequency Segment 1 field of the most recently transmitted VHT Operation element.

NOTE 5—CCFS2 refers to the value of the Channel Center Frequency Segment 2 field of the most recently transmitted HT Operation element.

NOTE 6—CCFS1 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is at least Max VHT NSS. CCFS2 is zero in this case.

NOTE 7—CCFS2 is nonzero when the current BSS bandwidth is 160 MHz or 80+80 MHz and the NSS support is less than Max VHT NSS. CCFS1 is zero in this case.

NOTE 8—at most one of CCFS1 and CCFS2 is nonzero.

NOTE 9—A supported multiple of Max VHT NSS applies to both transmit and receive.

NOTE 10—2 \times Max VHT NSS support might be used for HT PPDU (at 20 or 40 MHz PPDU bandwidth).

NOTE 11—A receiving STA in which dot11VHTExtendedNSSCapable is false will ignore the Extended NSS BW Support subfield and effectively evaluate this table only at the entries where Extended NSS BW Support is 0.

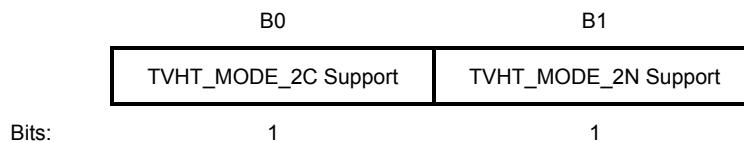

Figure 9-560—Supported Channel Width Set field (TVHT)

Support for short GI for the reception of packets with TXVECTOR parameter CH_BANDWIDTH equal to CBW20 or CBW40 is indicated in the HT Capabilities Info field of the HT Capabilities element.

9.4.2.158.3 Supported VHT-MCS and NSS Set field

The Supported VHT-MCS and NSS Set field is used to convey the combinations of VHT-MCSs and spatial streams that a STA supports for reception and the combinations that it supports for transmission. The structure of the field is shown in Figure 9-561.

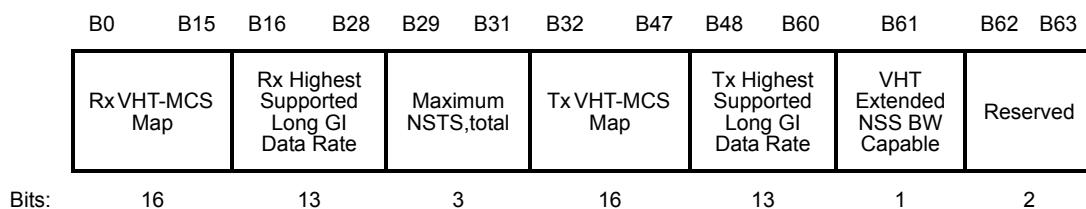

Figure 9-561—Supported VHT-MCS and NSS Set field

The Supported VHT-MCS and NSS Set field's subfields are defined in Table 9-251.

Table 9-251—Supported VHT-MCS and NSS Set subfields

| Subfield | Definition | Encoding |
|----------------|---|--|
| Rx VHT-MCS Map | If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, it indicates the maximum value of the RXVECTOR parameter MCS of a PPDU that can be received at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of the Operating Mode field determines the maximum value of the RXVECTOR parameter MCS of a PPDU as described in 9.4.2.158.2 and 9.4.1.53. | The format and encoding of this subfield are defined in Figure 9-562 and the associated description. |

Table 9-251—Supported VHT-MCS and NSS Set subfields (continued)

| Subfield | Definition | Encoding |
|--|--|---|
| Rx Highest Supported Long GI Data Rate | Indicates the highest long GI VHT PPDU data rate that the STA is able to receive. | The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s the STA is able to receive (see 10.7.12.1). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to receive. |
| Maximum NSTS, _{total} | Indicates the maximum value for $N_{STS,\text{total}}$ that can be sent to the STA in a VHT MU PPDU. | If MU beamformee capable and different from 0, indicates the maximum value for $N_{STS,\text{total}}$ minus 1 that can be sent to the STA in a VHT MU PPDU. NOTE—This value is greater than or equal to the value in the Beamformee STS Capability subfield of the VHT Capabilities Information field. If MU Beamformee capable and equal to 0, indicates that the maximum value for $N_{STS,\text{total}}$ is equal to the value in the Beamformee STS Capability subfield of the VHT Capabilities Information field. Otherwise reserved. |
| Tx VHT-MCS Map | If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is not true, indicates the maximum value of the TXVECTOR parameter MCS of a PPDU that can be transmitted at all channel widths supported by this STA for each number of spatial streams. If transmitted by a STA in which dot11VHTExtendedNSSBWCapable is true, this field combined with the Extended NSS BW Support subfield and the 160/80+80 BW subfield of an Operating Mode field determines the maximum value of the TXVECTOR parameter MCS of a PPDU as described in 9.4.2.158.2 and 9.4.1.53. | The format and encoding of this subfield are defined in Figure 9-562 and the associated description. |
| Tx Highest Supported Long GI Data Rate | Indicates the highest long GI VHT PPDU data rate that the STA is able to transmit at. | The largest integer value less than or equal to the highest long GI VHT PPDU data rate in Mb/s that the STA is able to transmit (see 10.7.12.2). The value 0 indicates that this subfield does not specify the highest long GI VHT PPDU data rate that the STA is able to transmit. |
| VHT Extended NSS BW Capable | Indicates whether the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field. | If dot11VHTExtendedNSSBWCapable is true, then this field is set to 1 to indicate that the STA is capable of interpreting the Extended NSS BW Support subfield of the VHT Capabilities Information field. Set to 0 otherwise. |

The Rx VHT-MCS Map subfield and the Tx VHT-MCS Map subfield have the structure shown in Figure 9-562.

| B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----|----|-----|-----|-----|-----|-----|-----|
| Max VHT-MCS For 1 SS | Max VHT-MCS For 2 SS | Max VHT-MCS For 3 SS | Max VHT-MCS For 4 SS | Max VHT-MCS For 5 SS | Max VHT-MCS For 6 SS | Max VHT-MCS For 7 SS | Max VHT-MCS For 8 SS | | | | | | | | |
| Bits: | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |

Figure 9-562—Rx VHT-MCS Map and Tx VHT-MCS Map subfields and Basic VHT-MCS And NSS Set field

The Max VHT-MCS For n SS subfield (where $n = 1, \dots, 8$) is encoded as follows:

- 0 indicates support for VHT-MCS 0-7 for n spatial streams
- 1 indicates support for VHT-MCS 0-8 for n spatial streams
- 2 indicates support for VHT-MCS 0-9 for n spatial streams
- 3 indicates that n spatial streams is not supported

The value of Max VHT NSS for a given MCS is equal to the smaller of:

- the maximum value of n for which the Max VHT-MCS for n SS has a value that indicates support for that MAC (0, 1 or 2 for MCS 0-7, 1 or 2 for MCS 8, 2 for MCS 9)
- the maximum supported NSS as indicated by the value of the Rx NSS field of the Operating Mode Notification frame if the value of RX NSS Type is 0

NOTE—A VHT-MCS indicated as supported in the VHT-MCS Map fields for a particular number of spatial streams might not be valid at all bandwidths (see 21.5), might be limited by the declaration of Tx Highest Supported Long GI Data Rates and Rx Highest Supported Long GI Data Rates, and might be affected by 10.7.12.3 and the value of the Extended NSS BW Support field of the VHT Capabilities Information field in 9.4.2.158.2 and the 160/80+80 BW subfield of the Operating Mode field in 9.4.1.53.

9.4.2.159 VHT Operation element

The operation of VHT STAs in the BSS is controlled by the HT Operation element and the VHT Operation element. The format of the VHT Operation element is defined in Figure 9-563.

| | | | |
|------------|--------|---------------------------|---------------------------|
| Element ID | Length | VHT Operation Information | Basic VHT-MCS And NSS Set |
| Octets: | 1 | 1 | 3 |

Figure 9-563—VHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the VHT Operation Information field is defined in Figure 9-564.

| | | |
|---------------|------------------------------------|------------------------------------|
| Channel Width | Channel Center Frequency Segment 0 | Channel Center Frequency Segment 1 |
| Octets: | 1 | 1 |

Figure 9-564—VHT Operation Information field

The VHT STA gets the primary channel information from the HT Operation element. The subfields of the VHT Operation Information field are defined in Table 9-252.

Table 9-252—VHT Operation Information subfields

| Subfield | Definition | Encoding |
|------------------------------------|--|---|
| Channel Width | This field, together with the HT Operation element STA Channel Width field, defines the BSS bandwidth (see 11.40.1). | Set to 0 for 20 MHz or 40 MHz BSS bandwidth. Set to 1 for 80 MHz, 160 MHz or 80+80 MHz BSS bandwidth. Set to 2 for 160 MHz BSS bandwidth (deprecated). Set to 3 for non-contiguous 80+80 MHz BSS bandwidth (deprecated). Values in the range 4 to 255 are reserved. |
| Channel Center Frequency Segment 0 | Defines a channel center frequency for an 80, 160, or 80+80 MHz VHT BSS. See 21.3.14. | For 80 MHz BSS bandwidth, indicates the channel center frequency index for the 80 MHz channel on which the VHT BSS operates. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel center frequency index of the 80 MHz channel segment that contains the primary channel. For 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, indicates the channel center frequency index of the 160 MHz channel on which the VHT BSS operates. For 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel center frequency index for the primary 80 MHz channel of the VHT BSS. Reserved otherwise. |
| Channel Center Frequency Segment 1 | Defines a channel center frequency for a 160 or 80+80 MHz VHT BSS. See 21.3.14. | For a 20, 40, or 80 MHz BSS bandwidth, this subfield is set to 0. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 1, indicates the channel center frequency index of the 160 MHz channel on which the VHT BSS operates. For a 160 MHz BSS bandwidth and the Channel Width subfield equal to 2, this field is set to 0. For an 80+80 MHz BSS bandwidth and the Channel Width subfield equal to 1 or 3, indicates the channel center frequency index of the secondary 80 MHz channel of the VHT BSS. See Table 9-253. Reserved otherwise. |

The Basic VHT-MCS And NSS Set field indicates the VHT-MCSs for each number of spatial streams in VHT PPDUs that are supported by all VHT STAs in the BSS (including IBSS and MBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; each 2 bits indicates the supported VHT-MCS set for N_{SS} from 1 to 8. The Basic VHT-MCS And NSS Set field is defined in Figure 9-562.

Table 9-253—BSS bandwidth when the VHT Operation Information field Channel Width subfield is 1

| Channel Center Frequency Segment 1 subfield value | BSS bandwidth |
|--|--|
| CCFS1 = 0 | 80 MHz or less |
| CCFS1 > 0 and CCFS1 – CCFS0 = 8 (40 MHz apart) | 160 MHz (CCFS0: center frequency of the 80 MHz channel segment that contains the primary channel) (CCFS1: center frequency of the 160 MHz channel) |
| CCFS1 > 0 and CCFS1 – CCFS0 > 16 (> 80 MHz apart) | 80+80 MHz (CCFS0: center frequency of the primary 80 MHz channel) (CCFS1: center frequency of the secondary 80 MHz channel) |
| CCFS1 > 0 and CCFS1 – CCFS0 < 8 (< 40 MHz apart) | Reserved |
| CCFS1 > 0 and 8 < CCFS1 – CCFS0 ≤ 16 (> 40 MHz and ≤ 80 MHz apart) | Reserved |
| NOTE 1—CCFS0 represents the value of the Channel Center Frequency Segment 0 subfield. NOTE 2—CCFS1 represents the value of the Channel Center Frequency Segment 1 subfield. | |

9.4.2.160 Extended BSS Load element

The Extended BSS Load element reported by the AP contains information on MIMO spatial stream underutilization and bandwidth utilization. The element format is defined in Figure 9-565. A STA receiving the element might use the information it conveys in an implementation-specific AP selection algorithm.

| Element ID | Length | MU-MIMO Capable STA Count | Spatial Stream Underutilization | Observable Secondary 20 MHz Utilization | Observable Secondary 40 MHz Utilization | Observable Secondary 80 MHz Utilization |
|------------|--------|---------------------------|---------------------------------|---|---|---|
| Octets: | 1 | 1 | 2 | 1 | 1 | 1 |

Figure 9-565—Extended BSS Load element format

The Element ID and Length fields are defined in 9.4.2.1.

The MU-MIMO Capable STA Count field indicates the total number of STAs currently associated with this BSS that have a 1 in the MU Beamformee Capable field of their VHT Capabilities element.

The Spatial Stream Underutilization field is defined as the percentage of time, linearly scaled with 255 representing 100%, that the AP has underutilized spatial domain resources for given busy time of the medium. The spatial stream underutilization is calculated only for the primary channel. This percentage is computed using the formula,

$$\text{Spatial Stream Underutilization} = \left\lfloor \frac{N_{\max_SS} \times T_{\text{busy}} - T_{\text{utilized}}}{N_{\max_SS} \times T_{\text{busy}}} \times 255 \right\rfloor$$

where

- N_{\max_SS} is the maximum number of spatial streams supported by the AP.
- T_{busy} is the number of microseconds during which CCA indicated the channel was busy during the measurement duration. The resolution of the CCA busy measurement is in microseconds.
- T_{utilized} is $\sum_{i=1}^N N_{SS,i} T_i$, where T_i is the time interval, in units of microseconds, during which the primary 20 MHz channel is busy due to the transmission of one or more spatial streams by the AP to MU beamformee capable STAs; $N_{SS,i}$ is the number of spatial streams transmitted during the time interval T_i ; and N is the number of busy events that occurred during the total measurement time which is less than or equal to dot11ChannelUtilizationBeaconIntervals consecutive beacon intervals.

If T_{busy} is 0, the Spatial Stream Underutilization field is reserved.

The measurement of the observable loading on each of the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel in conjunction with the measurement on the primary 20 MHz channel provides a STA with the loading on the 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels.

The Observable Secondary 20 MHz Utilization, Observable Secondary 40 MHz Utilization, and Observable Secondary 80 MHz Utilization fields are defined using Equation (9-3).

$$\text{Observable Secondary } W1 \text{ Utilization} = \frac{T_{\text{busy}, W1}}{\text{dot11ChannelUtilizationBeaconIntervals} \times \text{dot11BeaconPeriod} \times 1024} \times 255 \quad (9-3)$$

where

- dot11ChannelUtilizationBeaconIntervals represents the number of consecutive beacon intervals during which the secondary channel busy time is measured.
- $T_{\text{busy}, W1}$ is computed as the sum of the times from PHY-CCA.indication(BUSY, {W2}) to the next issue of a PHY-CCA.indication primitive and that overlap the measurement interval, for $W1 = 20, 40, or 80, and where W2 equals secondary, secondary40, or secondary80 for $W1 = 20, 40, or 80, respectively.$$

If the AP indicates a channel width of 20 MHz, 40 MHz, or 80 MHz in the STA Channel Width field in the HT Operation element and in the Channel Width field in the VHT Operation element, then the Observable Secondary 80 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz or 40 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 40 MHz Utilization field is reserved. If the AP indicates a channel width of 20 MHz in the STA Channel Width field in the HT Operation element, then the Observable Secondary 20 MHz Utilization field is reserved.

9.4.2.161 Wide Bandwidth Channel Switch element

The Wide Bandwidth Channel Switch element is included in Channel Switch Announcement frames, as described in 9.6.2.6, Extended Channel Switch Announcement frames, as described in 9.6.8.7, and TDLS Channel Switch Request frames, as described in 9.6.13.7. The format of the Wide Bandwidth Channel Switch element is shown in Figure 9-566.

| | | | | |
|------------|--------|-------------------|--|--|
| Element ID | Length | New Channel Width | New Channel Center Frequency Segment 0 | New Channel Center Frequency Segment 1 |
| Octets: 1 | 1 | 1 | 1 | 1 |

Figure 9-566—Wide Bandwidth Channel Switch element format

The Element ID and Length fields are defined in 9.4.2.1.

The subfields New Channel Width, New Channel Center Frequency Segment 0, and New Channel Center Frequency Segment 1 have the same definition, respectively, as Channel Width, Channel Center Frequency Segment 0, and Channel Center Frequency Segment 1 in the VHT Operation Information field, described in Table 9-252.

9.4.2.162 Transmit Power Envelope element

The Transmit Power Envelope element conveys the local maximum transmit power for various transmission bandwidths. The format of the Transmit Power Envelope element is shown in Figure 9-567.

| | | | | | | |
|------------|--------|----------------------------|---|---|---|--|
| Element ID | Length | Transmit Power Information | Local Maximum Transmit Power For 20 MHz | Local Maximum Transmit Power For 40 MHz | Local Maximum Transmit Power For 80 MHz | Local Maximum Transmit Power For 160/80+80 MHz |
| Octets: | 1 | 1 | 1 | 1 | 0 or 1 | 0 or 1 |

Figure 9-567—Transmit Power Envelope element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Transmit Power Information field is defined in Figure 9-568.

| B0 | B2 | B3 | B5 | B6 | B7 |
|------------------------------------|--|----------|----|----|----|
| Local Maximum Transmit Power Count | Local Maximum Transmit Power Unit Interpretation | Reserved | | | |

Bits: 3 3 2

Figure 9-568—Transmit Power Information field

The Local Maximum Transmit Power Count subfield indicates the number of Local Maximum Transmit Power For X MHz fields (where $X = 20, 40, 80$, or $160/80+80$) minus 1 in the Transmit Power Envelope element, as shown in Table 9-254.

Table 9-254—Meaning of Local Maximum Transmit Power Count subfield

| Value | Field(s) present |
|-------|---|
| 0 | Local Maximum Transmit Power For 20 MHz. |
| 1 | Local Maximum Transmit Power For 20 MHz and Local Maximum Transmit Power For 40 MHz. |
| 2 | Local Maximum Transmit Power For 20 MHz, Local Maximum Transmit Power For 40 MHz, and Local Maximum Transmit Power For 80 MHz. |
| 3 | Local Maximum Transmit Power For 20 MHz, Local Maximum Transmit Power For 40 MHz, Local Maximum Transmit Power For 80 MHz, and Local Maximum Transmit Power For 160/80+80 MHz. For TVHT STAs, reserved. |
| 4–7 | Reserved |

The Local Maximum Transmit Power Unit Interpretation subfield provides additional interpretation for the units of the Local Maximum Transmit Power For X MHz fields (where $X = 20, 40, 80$, or $160/80+80$) and is defined in Table 9-255. Allowed values are further constrained as defined in Annex E.

Table 9-255—Definition of Local Maximum Transmit Power Unit Interpretation subfield

| Value | Unit interpretation of the Local Maximum Transmit Power For X MHz fields |
|--|--|
| 0 | EIRP |
| 1–7 | Reserved |
| NOTE—This table is expected to be updated only if regulatory domains mandate the use of transmit power control with limits that cannot be converted into an EIRP value per transmission bandwidth. | |

Local Maximum Transmit Power For X MHz fields (where $X = 20, 40, 80$, or $160/80+80$) define the local maximum transmit power limit of X MHz PPDUs. Each Local Maximum Transmit Power For X MHz field is encoded as an 8-bit 2's complement signed integer in the range -64 dBm to 63 dBm with a 0.5 dB step. The value of 63.5 dBm indicates 63.5 dBm or higher (i.e., no local maximum transmit power constraint).

In frames transmitted by a TVHT STA the Local Maximum Transmit Power for 20 MHz field indicates the Local Maximum Transmit Power for TVHT_W bandwidth; the Local Maximum Transmit Power for 40 MHz field indicates the Local Maximum Transmit Power for TVHT_2W or TVHT_W+W bandwidth; the Local Maximum Transmit Power for 80 MHz field indicates the Local Maximum Transmit Power for TVHT_4W or TVHT_2W+2W bandwidth; the Local Maximum Transmit Power for 160/80+80 MHz field is not included in the Transmit Power Envelope element.

9.4.2.163 Channel Switch Wrapper element

The Channel Switch Wrapper element contains subelements that indicate characteristics of the BSS after a channel switch. The format of the Channel Switch Wrapper element is defined in Figure 9-569. Procedures related to the inclusion of subelements in the Channel Switch Wrapper element are defined in 11.40.4.

| Element ID | Length | New Country subelement (optional) | Wide Bandwidth Channel Switch subelement (optional) | New Transmit Power Envelope subelement (optional) |
|------------|--------|-----------------------------------|---|---|
| Octets: | 1 | 1 | variable | variable |

Figure 9-569—Channel Switch Wrapper element format

The Element ID and Length fields are defined in 9.4.2.1.

The New Country subelement is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this subelement is not present. The format of the New Country subelement is defined to be the same as the format of the Country element (see 9.4.2.9), except that no Subband Triplet fields are present in the New Country subelement. The Country String field in the New Country subelement indicates the Country and Operating Class Table of the BSS after extended channel switching, and Operating Triplet fields within the New Country subelement indicate the operating classes of the BSS after extended channel switching (see 11.40.1).

The Wide Bandwidth Channel Switch subelement is present under the following conditions:

- Channel switching to a BSS bandwidth of 40 MHz or wider
- Extended channel switching to a BSS bandwidth of 80 MHz or wider

The Wide Bandwidth Channel Switch subelement is optionally present if extended channel switching to a BSS bandwidth of 40 MHz. The Wide Bandwidth Channel Switch subelement is not present if channel switching to a 20 MHz BSS bandwidth.

The format of the Wide Bandwidth Channel Switch subelement is the same as the Wide Bandwidth Channel Switch element (see 9.4.2.161) except for the following:

- A value 0 in the New Channel Width field signifies only a 40 MHz BSS bandwidth.
- When switching to a 40 MHz BSS bandwidth, the New Channel Center Frequency Segment 0 field indicates the channel center frequency index for the 40 MHz channel after the channel switch.

If present, the Wide Bandwidth Channel Switch subelement indicates the BSS bandwidth after channel switching (see 11.40.1). For example, when switching to a 40 MHz BSS bandwidth on channel indices 36 and 40, the New Channel Width field is set to 0, and the New Channel Center Frequency Segment 0 field is set to 38.

Each New Transmit Power Envelope subelement that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.162) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. Each New Transmit Power Envelope subelement indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.40.1).

If transmitted by a TVHT STA, the Wide Bandwidth Channel Switch subelement is present when the STA is switching channels to a BSS bandwidth of TVHT_2W or TVHT_W+W bandwidth or wider; if switching to a TVHT_W bandwidth BSS bandwidth then this subelement is not present.

9.4.2.164 AID element

The AID element includes the AID assigned by an AP during association that represents the 16-bit ID of a STA. The format of the AID element is shown in Figure 9-570.

Figure 9-570—AID element format

The Element ID and Length fields are defined in 9.4.2.1.

The AID field is defined in 9.4.1.8.

9.4.2.165 Quiet Channel element

The Quiet Channel element is used to indicate that the secondary 80 MHz channel of a VHT BSS is to be quieted during a quiet interval, and, in an infrastructure BSS, to indicate if the primary 80 MHz channel of a VHT BSS can be used during the quiet interval. A quiet interval is established using either a Quiet element (see 9.4.2.23) or, in an infrastructure BSS, the Quiet Channel element if its AP Quiet Mode field is equal to 1.

The Quiet Channel element is optionally present in Beacon frames, as described in 9.3.3.3, and Probe Response frames, as described in 9.3.3.11. The use of Quiet Channel elements is described in 11.9.3.

The format of the Quiet Channel element is shown in Figure 9-571.

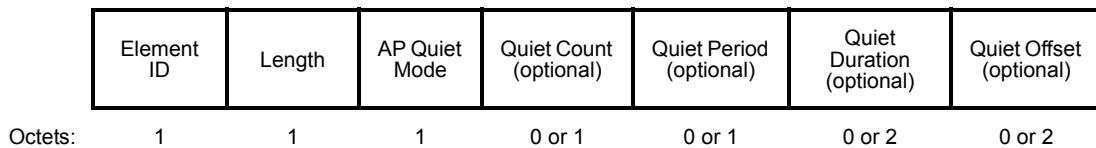

Figure 9-571—Quiet Channel element format

The Element ID and Length fields are defined in 9.4.2.1.

The AP Quiet Mode field specifies STA behavior in an infrastructure BSS during the quiet intervals. When communications to the AP are allowed within the primary 80 MHz channel, then the AP Quiet Mode field is set to 1. Otherwise, the AP Quiet Mode field is set to 0.

If the AP Quiet Mode field is 1, then the Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field are present in the Quiet Channel element; otherwise, these fields are not present in the Quiet Channel element.

The Quiet Count field, Quiet Period field, Quiet Duration field, and Quiet Offset field have the same definition as described in 9.4.2.23.

9.4.2.166 Operating Mode Notification element

The Operating Mode Notification element is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference. The format of the Operating Mode Notification element is defined in Figure 9-572.

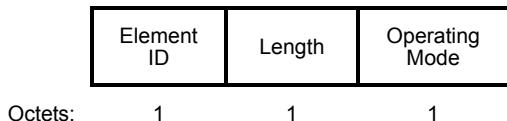

Figure 9-572—Operating Mode Notification element

The Element ID and Length fields are defined in 9.4.2.1.

The Operating Mode field is defined in 9.4.1.53.

9.4.2.167 UPSIM element

The UPSIM element is defined as shown in Figure 9-573.

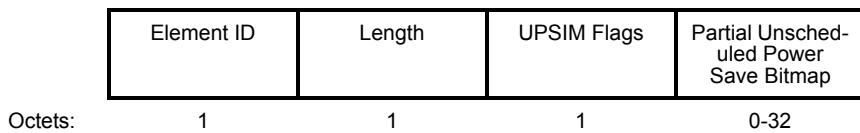

Figure 9-573—UPSIM element format

The Element ID and Length fields are defined in 9.4.2.1.

The Length field for this element is constrained as described below.

The UPSIM Flags field is defined in Figure 9-574.

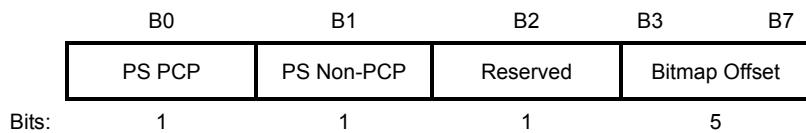

Figure 9-574—UPSIM Flags field format

The PS PCP field is set to 1 if the PCP is in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The PS PCP field is set to 0 in infrastructure BSS. The PS Non-PCP field is set to 1 if all non-AP and non-PCP STAs are in unscheduled PS mode at the time of UPSIM element transmission and is set to 0 otherwise. The Bitmap Offset field defines the octet offset into a virtual bitmap maintained by the AP or PCP, as described below.

The AP or PCP maintains an unscheduled power save indication virtual bitmap that is 256 bits in length and is organized into 32 octets such that bit number N ($0 \leq N \leq 255$) in the bitmap corresponds to bit number $(N \bmod 8)$ in octet number $\lfloor N / 8 \rfloor$, where the low order bit of each octet is bit number 0, and the high order bit is bit number 7. Bit N in the bitmap is set to 1 if there is an associated DMG STA with AID equal to N and the STA is in unscheduled PS mode and is set to 0 if there is no associated DMG STA with AID equal to N or the STA is not in unscheduled PS mode. Bit 0 is set to 0 in the infrastructure BSS. Bit 255 is set to 0.

The Partial Unscheduled Power Save Bitmap field is not present when bits numbered 1 to 254 of the unscheduled power save indication virtual bitmap all have the same value at the time of UPSIM element transmission. In this case, the Length field is set to 1 and the Bitmap Offset field is set to 0.

When there are two bits in the unscheduled power save indication virtual bitmap with numbers between 1 and 254 and different values, the Partial Unscheduled Power Save Bitmap field consists of octets numbered $N1$ to $N2$ of the unscheduled power save indication virtual bitmap, where $N1$ is the largest integer such that bits numbered 1 to $(N1 \times 8) - 1$ in the unscheduled power save indication virtual bitmap are all 0, and $N2$ is the smallest number such that bits numbered $(N2 + 1) \times 8$ to 255 in the unscheduled power save indication virtual bitmap are all 0. In this case, the Length field is set to $(N2 - N1) + 2$ and the Bitmap Offset subfield is set to $N1$.

NOTE—The Partial Unscheduled Power Save Bitmap field does not need to include bit 0 of the unscheduled power save indication virtual bitmap even if that bit is set.

9.4.2.168 Fine Timing Measurement Parameters element

The Fine Timing Measurement Parameters element contains a number of fields that are used to advertise the requested or allocated FTM configuration from one STA to another. The Fine Timing Measurement Parameters element is included in the initial Fine Timing Measurement Request frame, as described in 9.6.8.32, and the initial Fine Timing Measurement frame, as described in 9.6.8.33. The use of the Fine Timing Measurement Parameters element is described in 11.24.6.

The format of the Fine Timing Measurement Parameters element is shown in 9-575.

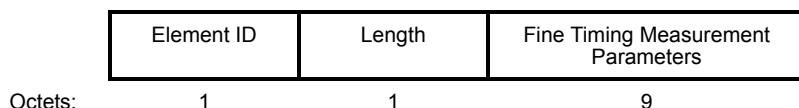

Figure 9-575—Fine Timing Measurement Parameters element format

The format of the Fine Timing Measurement Parameters field is shown in 9-576.

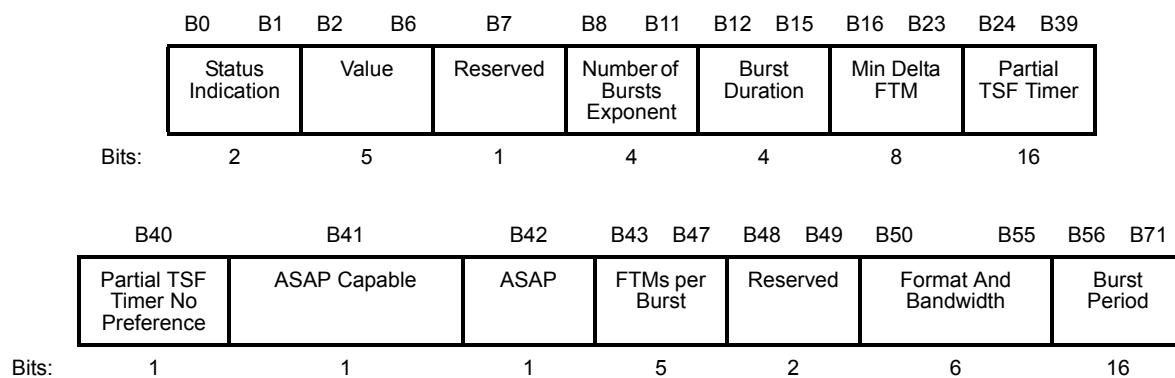

Figure 9-576—Fine Timing Measurement Parameters field format

The Element ID and Length fields are defined in 9.4.2.1.

The Status Indication field indicates the responding STA's response to the Fine Timing Request. The encoding of the Status Indication field is shown in Table 9-256.

Table 9-256—Status Indication field values

| Value | Description |
|-------|--|
| 0 | Reserved |
| 1 | Successful (some requested parameters might have been overridden). Measurement exchanges are about to begin. |
| 2 | Request incapable. Do not send same request again. FTM session ends. |
| 3 | Request failed. Do not send new request for Value seconds. FTM session ends. |

The Status Indication field and Value field are reserved in the initial Fine Timing Measurement Request frame. When the Status Indication field is set to 3 by the responding STA, the Value field contains a duration in units of seconds; otherwise the Value field is reserved.

The Number of Bursts Exponent field indicates how many burst instances, defined in 11.24.6.4, are requested for the FTM session if included in an initial Fine Timing Measurement Request frame, or allocated for the FTM session if included in an initial Fine Timing Measurement frame respectively, where the number of burst instances is $2^{\text{Number of Bursts Exponent}}$. The value 15 in an initial Fine Timing Measurement Request frame indicates no preference by the initiating STA and is valid (indicating 2^{15} burst instances) when set by the responding STA.

The Burst Duration field indicates the duration of a burst instance. The value 15 in the initial Fine Timing Measurement Request indicates no preference by the initiating STA and is not used by the responding STA. Table 9-257 shows the encoding of this field.

Table 9-257—Burst Duration field encoding

| Value | Represents |
|-------|---------------|
| 0-1 | Reserved |
| 2 | 250 µs |
| 3 | 500 µs |
| 4 | 1 ms |
| 5 | 2 ms |
| 6 | 4 ms |
| 7 | 8 ms |
| 8 | 16 ms |
| 9 | 32 ms |
| 10 | 64 ms |
| 11 | 128 ms |
| 12–14 | Reserved |
| 15 | No preference |

The Min Delta FTM field indicates the minimum time between consecutive Fine Timing Measurement frames. It is measured from the start of a Fine Timing Measurement frame to the start of following Fine

Timing Measurement frame, in units of 100 μ s. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

The Partial TSF Timer field in an initial Fine Timing Measurement frame indicates the partial value of the responding STA's TSF timer at the start of the first burst instance of an FTM session. The responding STA's TSF timer at the start of the first burst instance of an FTM session is limited to less than 62/64 of 65 536 TUs (<63 488 TUs) ahead of the TSF time at which the STA transmits the Fine Timing Measurement frame and 1/64 of 65 536 TUs earlier (inclusive) (≥ 1024 TUs) than the TSF time at which the STA transmits the Fine Timing Measurement frame, as shown in Figure 9-577. The Partial TSF Timer value is derived as follows, so as to have units of TUs: from the 64 TSF timer bits at the start of the first burst instance of an FTM session, where the 10 least significant bits equal 0, remove the most significant 38 bits and the least significant 10 bits.

NOTE—1024 TUs out of the full range of the Partial TSF Timer field are not used in order to allow the recipient to resolve ambiguity arising from 1) imperfect synchronization between the initiating and responding STAs, and 2) retries of the initial Fine Timing Measurement Request frame or retransmissions of the initial Fine Timing Measurement frame.

The initiating STA indicates a preferred time for the start of the first burst instance by setting the Partial TSF Timer No Preference field to 0 and by setting the Partial TSF Timer field to indicate the preferred start of the first burst instance. Otherwise the Partial TSF Timer No Preference field is set to 1 and the Partial TSF Timer field is reserved. The Partial TSF Timer No Preference field is reserved when the FTM Parameters element is included in an initial Fine Timing Measurement frame.

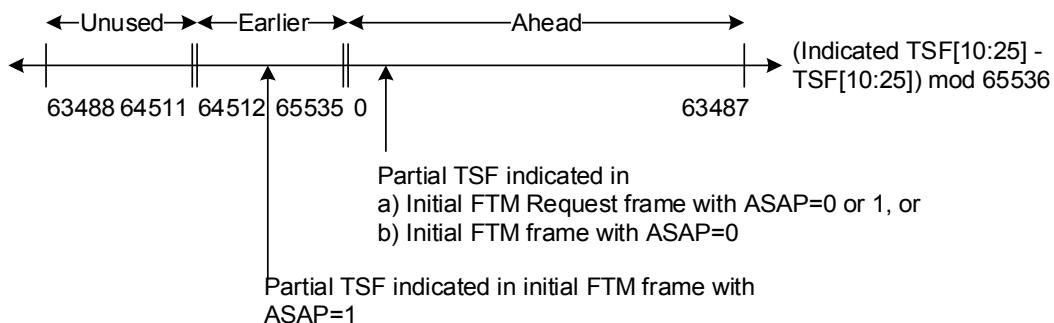

Figure 9-577—Calculation of Partial TSF Timer field

The ASAP Capable field indicates that the responding STA is capable of sending a Fine Timing Measurement frame as soon as possible; that is, the STA is capable of capturing timestamps associated with an initial Fine Timing Measurement frame and sending them in the following Fine Timing Measurement frame. This field is reserved in the initial Fine Timing Measurement Request frame.

The ASAP field indicates the initiating STA's request to start the first burst instance of the FTM session as soon as possible. When the ASAP field is set to 0 and the Partial TSF Timer No Preference field is set to 0 by an initiating STA, the initiating STA requests the start of the first burst instance specified by the Partial TSF Timer field in the initial Fine Timing Measurement Request frame. When the ASAP field is set to 1 and the Partial TSF Timer No Preference field is set to 0 by an initiating STA, the Partial TSF Timer field in the Fine Timing Measurement Request frame indicates the requested start of the first burst instance if the ASAP field is set to 0 in the initial Fine Timing Measurement frame. The ASAP field is also used by the responding STA to signal whether that request has been honored or not. When the ASAP field is set to 0 by the responding STA, the Partial TSF Timer field in the initial Fine Timing Measurement frame indicates the start time of the first burst instance and the earliest time the Fine Timing Measurement Request frame (see 11.24.6.4) should be sent by the initiating STA. When the ASAP field is set to 1 by the responding STA, the Partial TSF Timer field in the initial Fine Timing Measurement frame indicates the start time of the first burst instance and the earliest time the initial Fine Timing Measurement frame will be sent. The responding

STA sets the ASAP field to 1 to indicate the STA's intent to send a Fine Timing Measurement frame as soon as possible.

The FTMs per Burst field indicates how many successfully transmitted Fine Timing Measurement frames are requested per burst instance by the initial Fine Timing Measurement Request frame, or allocated by the initial Fine Timing Measurement frame, respectively. The value 0 indicates no preference by the initiating STA and is not used by the responding STA.

The Format And Bandwidth field indicates the requested or allocated PPDU format and bandwidth that can be used by Fine Timing Measurement frames in an FTM session and is shown in Table 9-258. The value 0 indicates no preference by the initiating STA in the associated state and is not used by the responding STA. The value 0 is not used by the initiating STA in the unassociated state.

Table 9-258—Format And Bandwidth field

| Field value | Format | Bandwidth (MHz) |
|-------------|--|-----------------|
| 0 | No preference | No preference |
| 1-3 | Reserved | Reserved |
| 4 | Non-HT | 5 |
| 5 | Reserved | Reserved |
| 6 | Non-HT | 10 |
| 7 | Reserved | Reserved |
| 8 | Non-HT, excluding Clause 15 and Clause 16 | 20 |
| 9 | HT mixed | 20 |
| 10 | VHT | 20 |
| 11 | HT mixed | 40 |
| 12 | VHT | 40 |
| 13 | VHT | 80 |
| 14 | VHT | 80+80 |
| 15 | VHT (two separate RF LOs) | 160 |
| 16 | VHT (single RF LO) | 160 |
| 17-30 | Reserved | Reserved |
| 31 | DMG | 2160 |
| 32-63 | Reserved | Reserved |

NOTE—See 21.3.17.3 regarding the usage of two separate RF LOs.

The Burst Period field indicates the interval between two consecutive burst instances, in units of 100 ms. The value 0 indicates no preference by the initiating STA. This field is reserved when the Number of Bursts Exponent field is set to 0.

9.4.2.169 Device Location element

A Device Location element includes the location configuration information (LCI), which contains latitude, longitude, and altitude information. The Device Location element format is shown in Figure 9-578.

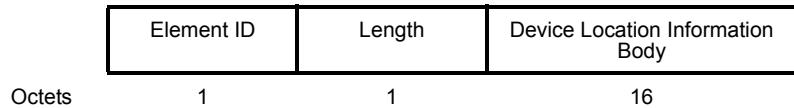

Figure 9-578—Device Location element format

The Element ID and Length fields are defined in 9.4.2.1.

The format of the Device Location Information Body is defined in 9.4.1.56.

9.4.2.170 White Space Map element

The White Space Map element includes available radio frequency information obtained from a GDB. The format of the WSM Information field is determined by the value of the WSM Type field. The format of the White Space Map Announcement element is shown in Figure 9-579.

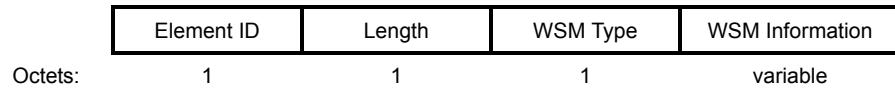

Figure 9-579—WSM element format

The Element ID and Length fields are defined in 9.4.2.1.

The format and values of WSM Type and WSM Information fields are defined in 9.4.1.57.

9.4.2.171 Reduced Neighbor Report element

The Reduced Neighbor Report element contains channel and other information related to neighbor APs. The format of the Reduced Neighbor Report element is shown in Figure 9-580.

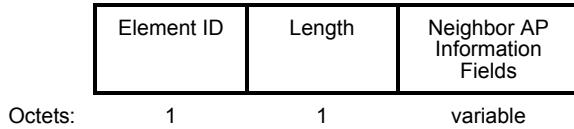

Figure 9-580—Reduced Neighbor Report element format

The Element ID and Length fields are defined in 9.4.2.1.

The Neighbor AP Information Fields field contains one or more of the Neighbor AP Information field described in 9.4.2.171.1.

9.4.2.171.1 Neighbor AP Information field

The Neighbor AP Information field specifies TBTT and other information related to a group of neighbor APs on one channel. See Figure 9-581.

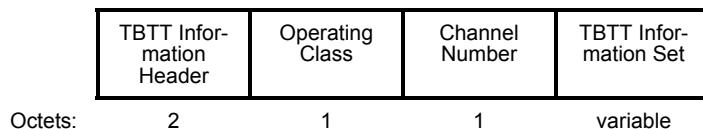

Figure 9-581—Neighbor AP Information field format

The format of TBTT Information Header subfield is defined in Figure 9-582.

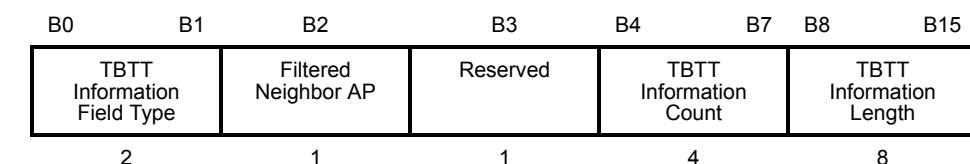

Figure 9-582—TBTT Information Header subfield

The TBTT Information Field Type subfield is 2 bits in length and defines the structure of the TBTT Information field. Its value is 0. Values 1, 2, and 3 are reserved.

The Filtered Neighbor AP subfield is 1 bit in length. It is set to 1 if the SSID of APs in this Neighbor AP Information field matches the specific SSID in the Probe Request frame. It is set to 0 otherwise. This field is valid only in the Reduced Neighbor Report element in a Probe Response frame and is reserved otherwise.

The TBTT Information Count subfield is 4 bits in length and contains the number of TBTT Information fields that are included in the Neighbor AP Information field, minus one. A value of 0 indicates one TBTT Information field is present.

The TBTT Information Length subfield is 1 octet in length and contains the length in octets of each TBTT Information field that is included in the Neighbor AP Information field.

The Operating Class field is 1 octet in length and indicates a channel starting frequency that, together with the Channel Number field, indicates the primary channel of the BSSs of the APs in this Neighbor AP Information field. Values of Operating Class are shown in Table E-4, of which operating classes that, together with the channel number, indicate the primary channel is valid (see 11.44.8).

NOTE—The Operating Class field and Channel Number tuple indicate the primary channel in order to assist with passive scanning.

The Channel Number field is 1 octet in length and indicates the last known primary channel of the APs in this Neighbor AP Information field. Channel Number is defined within an Operating Class as shown in Table E-4.

The TBTT Information Set field contains one or more TBTT Information fields. The TBTT Information field is defined in Figure 9-583.

Figure 9-583—TBTT Information field

The Neighbor AP TBTT Offset subfield is 1 octet in length and indicates the offset in TUs, rounded down to nearest TU, to the next TBTT of an AP from the immediately prior TBTT of the AP that transmits this element. The value 254 indicates an offset of 254 TUs or higher. The value 255 indicates an unknown offset value.

9.4.2.172 TVHT Operation element

The operation of TVHT STAs in the BSS is controlled by the TVHT Operation element. The format of the TVHT Operation element is defined in Figure 9-584.

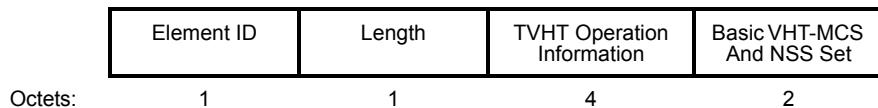

Figure 9-584—TVHT Operation element format

The Element ID and Length fields are defined in 9.4.2.1.

The structure of the TVHT Operation Information field is defined in Figure 9-585.

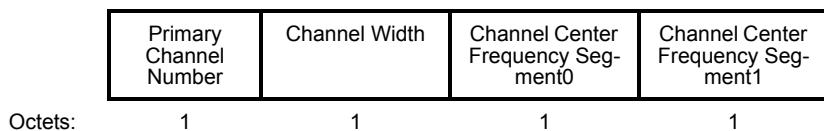

Figure 9-585—TVHT Operation Information field

The subfields of the TVHT Operation Information field are defined in Table 9-259.

Table 9-259—TVHT Operation Information subfields

| Field | Definition | Encoding |
|------------------------|--|---|
| Primary Channel Number | Indicates the channel number of the primary channel (see 11.43). | Channel number of the primary channel. |
| Channel Width | This field defines the BSS bandwidth (see 11.43). | Set to 0 for TVHT_W BSS bandwidth. Set to 1 for TVHT_2W BSS bandwidth. Set to 2 for TVHT_W+W BSS bandwidth. Set to 3 for TVHT_4W BSS bandwidth. Set to 4 for non-contiguous TVHT_2W+2W BSS bandwidth. Values in the range 5 to 255 are reserved. |

Table 9-259—TVHT Operation Information subfields (continued)

| Field | Definition | Encoding |
|-----------------------------------|--|---|
| Channel Center Frequency Segment0 | Defines the channel center frequency for a TVHT_W, TVHT_2W, and TVHT_4W TVHT BSS and the segment 0 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14. | For TVHT_W or TVHT_2W or TVHT_4W BSS bandwidth, indicates the center frequency of the lowest TV channel index for the TVHT_W or TVHT_2W or TVHT_4W channel on which the TVHT BSS operates. For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index for the TVHT_W or TVHT_2W channel of frequency segment 0 on which the TVHT BSS operates. Reserved otherwise. |
| Channel Center Frequency Segment1 | Defines the segment 1 channel center frequency for a TVHT_W+W and TVHT_2W+2W TVHT BSS. See 22.3.14. | For TVHT_W+W or TVHT_2W+2W BSS bandwidth, indicates the lowest TV channel index in the segment for the TVHT_W or TVHT_2W channel of frequency segment 1 on which the TVHT BSS operates. Reserved otherwise. |

The Basic VHT-MCS And NSS Set field indicates the MCSs for each spatial stream in VHT PPDU in TVWS bands that are supported by all TVHT STAs in the BSS (including IBSS). The Basic VHT-MCS And NSS Set field is a bitmap of size 16 bits; B8-B9, B10-B11, B12-B13, and B14-B15 are set to 3. For B0-B7, each 2 bits indicates the supported MCS set for N_{SS} from 1 to 4. The Basic VHT-MCS And NSS Set field is defined as B0-B7 of Rx VHT-MCS Map subfield in 9.4.2.158.3.

9.4.2.173 FTM Synchronization Information element

The format of the FTM Synchronization Information element is defined in Figure 9-586.

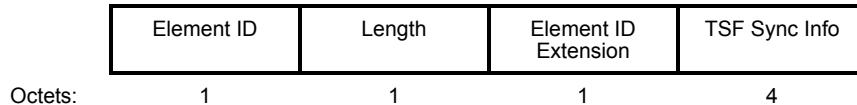

Figure 9-586—FTM Synchronization Information element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The TSF Sync Info field is set to the 4 least significant octets of the value of TSF.

9.4.2.174 Estimated service parameters element

The Estimated Service Parameters element is used by a STA to provide information to another STA which can then use the information as input to an algorithm to generate an estimate of throughput between the two STAs.

The format of the Estimated Service Parameters element is shown in Figure 9-587.

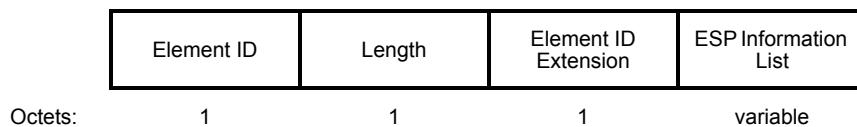

Figure 9-587—Estimated Service Parameters element format

The Element ID, Length, and Element ID Extension fields are defined in 9.4.2.1.

The ESP Information List field contains from 1 to 4 ESP Information fields, each corresponding to an access category for which estimated service parameters information is provided.

The format of the ESP Information field is shown in Figure 9-588.

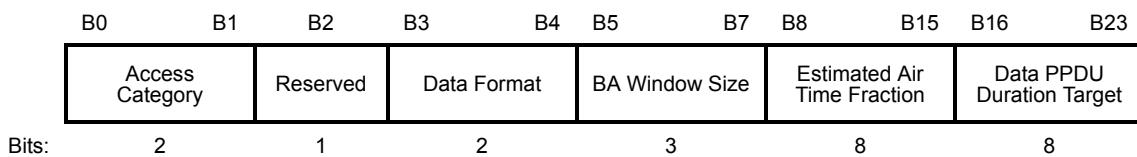

Figure 9-588—ESP Information field format

The Access Category subfield is two bits in length and indicates the access category to which the remaining parameters of the ESP Information field apply. The encoding of the Access Category subfield is given in Table 9-260. When parameters for more than one access category are present in an Estimated Service Parameters element the ESP Information fields for the access categories appear in order of Access Category subfield value, with the ESP Information field with the lowest Access Category subfield value appearing first.

Table 9-260—Access Category subfield encoding

| Value | Access Category |
|-------|-----------------|
| 0 | AC_BK |
| 1 | AC_BE |
| 2 | AC_VI |
| 3 | AC_VO |

The Data format subfield is two bits in length and has the meaning indicated in Table 9-261.

Table 9-261—Data Format subfield encoding

| Value | Description |
|-------|---|
| 0 | No aggregation is expected to be performed for MSDUs or MPDUs with the Type subfield equal to Data for the corresponding AC |
| 1 | A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC, but A-MPDU aggregation is not expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC |
| 2 | A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC, but A-MSDU aggregation is not expected to be performed for MSDUs for the corresponding AC |
| 3 | A-MSDU aggregation is expected to be performed for MSDUs for the corresponding AC and A-MPDU aggregation is expected to be performed for MPDUs with the Type subfield equal to Data for the corresponding AC |

The BA Window Size subfield is three bits in length and indicates the size of the Block Ack window that is expected for the corresponding access category as defined in Table 9-262. When the Block Ack window size expected to be used by the transmitter of the element does not match any of the values shown in the table, the transmitter uses the next lower value in the table.

Table 9-262—BA Window Size subfield encoding

| Value | Expected block ack window size |
|-------|-----------------------------------|
| 0 | Block Ack not expected to be used |
| 1 | 2 |
| 2 | 4 |
| 3 | 6 |
| 4 | 8 |
| 5 | 16 |
| 6 | 32 |
| 7 | 64 |

The Estimated Air Time Fraction subfield is 8 bits in length and contains an unsigned integer that represents the predicted percentage of time, linearly scaled with 255 representing 100%, that a new STA joining the BSS will be allocated for PPDUs that contain only MPDUs with the Type subfield equal to Data of the corresponding access category for that STA.

The Data PPDU Duration Target field is 8 bits in length and is an unsigned integer that indicates the expected target duration of PPDUs that contain only MPDUs with the Type subfield equal to Data for the corresponding access category in units of 50 μ s.

9.4.2.175 Future Channel Guidance element

Future Channel Guidance element is used by an AP, IBSS STA, mesh STA, or PCP to guide STAs about the likely future channel if the sending STA changes channels of operation. The format of the Future Channel Guidance element is shown in Figure 9-589.

| Element ID | Length | Element ID Extension | New Channel Number | Secondary Channel Offset element | Mesh Channel Switch Parameters element | Wide Bandwidth Channel Switch element | New Transmit Power Envelope element |
|------------|--------|----------------------|--------------------|----------------------------------|--|---------------------------------------|-------------------------------------|
| Octets: | 1 | 1 | 1 | 4 | 0 or 3 | 0 or 6 | 0 or 5 |

Figure 9-589—Future Channel Guidance element format

The Element ID, Length and Element ID Extension fields are defined in 9.4.2.1.

The New Channel Number field is set to the number of the channel to which the STA will be moving in the event of a channel switch (as defined in 17.3.8.4.3).

The Secondary Channel Offset element is defined in 9.4.2.20. This element is present when switching to a 40 MHz or wider channel. It is optionally present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN). See 11.40.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.103. This element is present when a mesh STA performs MBSS channel switch. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.161. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.162 and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.40.1).

The Future Channel Guidance procedure is defined in 11.9.10.

9.4.3 Subelements

Subelements are defined to have a common general format consisting of a 1-octet element-specific Subelement ID field, a 1-octet Length field, and a variable-length subelement-specific Data field. Each subelement is assigned a subelement ID that is unique within the containing element or subelement. The Length field specifies the number of octets in the Data field. See Figure 9-590.

| Subelement ID | Length | Data |
|---------------|--------|---------------|
| Octets: | 1 | 1 variable |

Figure 9-590—Subelement format

At the location in this standard that a subelement is defined, the definition might indicate if the subelement is extensible, typically using a table column called “Extensible” in the table in which subelement IDs are defined. A subelement that is indicated as extensible (typically with “Yes” in the “Extensible” column) might be extended in future revisions or amendments of this standard. A subelement that is indicated as extensible through subelements (typically with “Subelements” in the “Extensible” column) might be extended in future revisions or amendments of this standard by defining (additional) subelements within the subelement.

If the definition of a subelement does not indicate whether it is extensible (e.g., there is no “Extensible” column in a table defining it) that subelement is not extensible.

A subelement that is not defined as extensible will not be extended in future revisions or amendments of this standard.

Subelements within an element are ordered by nondecreasing Subelement ID. See 10.27.9.

9.4.4 TLV encodings

9.4.4.1 General

The following TLV encodings are used to convey parameters within MAC Management frames (9.3.3, 9.4, and 9.6). TLV tuples with type values that are unknown, not specified in this subclause, or specified as “reserved” are discarded upon receipt. The form of TLVs is shown in Table 9-263.

Table 9-263—General TLV format

| Name | Type | Length (octets) | Value | Scope/ Country code |
|---------------------|------|-----------------|---|------------------------|
| The name of the TLV | 1 | variable | Single Octet, Single Value, or Compound TLV tuples. | |

NOTE—This standard is complete regarding the endianness of multi-octet fields as they are covered by 9.2.2. Be aware that most protocols above the MAC operate in the opposite endianness.

Name is the name of the TLV tuple.

The ‘*m.n*’ syntax in the Type field means that the TLV has type *n*, an unsigned 1-octet integer, and is embedded in the Value field of a TLV of type *m*. The length of the Type field is 1 octet.

The format of the Length field is an unsigned number of size 1 octet, and the value in the Length field specifies the number of octets in the Value field.

A single octet TLV has a Value field that is a single octet, a single value TLV has a Value field larger than 1-octet, and a compound TLV has a Value field that represents more than 1-octet fields.

When a Scope field entry contains two characters, it identifies the country or other entity to which the STA’s operation is bound. If the two-character value stands for a country or other entity, then the value matches a code defined in ISO 3166-1. When a Scope field entry contains more than two characters, it identifies a scope for the TLV tuple.

9.4.4.2 Common TLVs

The general form of common TLVs is shown in Table 9-263 and is used in 9.4.4.2.1 to 9.4.4.2.5.

9.4.4.2.1 Device Class

This parameter contains the intended class of device for operation in TVWS band after it receives the available channel list at its location. The Device Class field format is shown in Table 9-264.

Table 9-264—Device Class field definition

| Name | Type | Length (octets) | Value | Scope/ Country code |
|--------------|------|-----------------|---|-------------------------------|
| Device Class | 2 | 1 | The Device Class field contains an integer that indicates the device's TVWS band mode of operation as follows: 0: GDD non-AP STA 1: GDD geolocated non-AP STA 2: GDD AP 3: GDD fixed STA 4–255: Reserved | CAQ, GDENABLE MENT, WSM |

9.4.4.2.2 Device Identification Information

This parameter contains the identification information of the device initiating the channel availability query. The Device Identification Information field format is shown in Table 9-265 and related Device Identification Information Value fields tables in E.2 for specific regulatory domains.

Table 9-265—Device Identification Information field definition

| Name | Type | Length (octets) | Value | Scope/ Country code |
|-----------------------------------|------|-----------------|--|-------------------------------|
| Device Identification Information | 3 | variable | One or more TLV fields as defined in Table E-8 for a specific regulatory domain. | CAQ, GDENABLE MENT, CSM |

9.4.4.2.3 Device Location Information

This parameter contains the location information of the device initiating the channel availability query. The Device Location Information field format is shown in Table 9-266.

Table 9-266—Device Location Information field definition

| Name | Type | Length (octets) | Value | Scope/ Country code |
|-----------------------------|------|-----------------|---|------------------------|
| Device Location Information | 10 | 16 | The Device Location Information field contains the latitude, longitude, and altitude information of the device in the format specified by the Device Location Information Body fields in Figure 9-121. When the Device Type subfield (see Table 9-264) is not GDD fixed STA, the altitude information (Altitude Type, Altitude Uncertainty, and Altitude subfields) of the Device Location Information field remain unused. | CAQ |

9.4.4.2.4 Channel Schedule Descriptor

This parameter contains the channel number associated with channel schedule information used for channel schedule management. The Channel Schedule Descriptor Tuple attribute format is shown in Table 9-267 and Table 9-268. Channel Schedule Descriptor field is constructed with either Channel Availability Starting Time field or Channel Availability Starting Timestamp field present or neither of these two fields present.

Table 9-267—Channel Schedule Descriptor Tuple attribute definition

| Name | Type | Length (octets) | Value | Scope/ Country code |
|-----------------------------|------|-----------------|-------------------------------|------------------------|
| Channel Schedule Descriptor | 11 | variable | Compound TLVs in Table 9-268. | CSM |

Table 9-268—Channel Schedule Descriptor Value fields

| Name | Subtype | Length (octets) | Value | Scope/ Country code |
|------------------------------------|---------|-----------------|---|------------------------|
| Operating Class | 1 | 1 | The Operating Class field is the number of the operating class of the channel, which is defined in E.1. | CSM |
| Channel Number | 2 | 1 | The Channel Number field is the number of the channel, which is the subject of the value of Channel Schedule Management Mode field. If the Channel Schedule Management Mode field indicates the schedule information is based on WLAN channels, the Channel Number is a channel from the STA's operating class as defined in E.1; otherwise, the Operating Class compound TLV is not present, and the Channel Number is a positive integer value as defined in D.1 to indicate the available TV channel for WLAN operation. | CSM |
| Channel Availability Starting Time | 3 | 8 | The Channel Availability Starting Time field indicates the starting time in Coordinated Universal Time (UTC) from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Timestamp is present, the STA takes the time that the response element is received as the starting time of the channel availability. NOTE—The Channel Availability Starting Time field follows the UTC time definition of the Time Value field of the Time Advertisement element in 9.4.2.61, and the first 6 octets are used to indicate the UTC time until minutes. The left 2 octets are reserved. | CSM |

Table 9-268—Channel Schedule Descriptor Value fields (continued)

| Name | Subtype | Length (octets) | Value | Scope/ Country code |
|---|---------|-----------------|--|------------------------|
| Channel Availability Starting Timestamp | 4 | 8 | The Channel Availability Starting Timestamp field indicates the starting timestamp from when the channel indicated in the Channel Number field is available for operation. When neither this field nor a Channel Availability Starting Time field is present, the STA takes the time that the response element is received as the starting time of the channel availability. | CSM |
| Channel Availability Offset Time | 5 | 2 | The Channel Availability Offset Time field indicates the offset of channel availability time with respect to the time that the Channel Schedule Descriptor is received. This field is present when the Channel Availability Starting Time field is not present in the response TLV and the channel is not available at the moment the TLV is received. | CSM |
| Channel Availability Duration | 6 | 2 | The Channel Availability Duration field indicates the duration in minutes of the availability of the channel that indicated in the Channel Number field. | CSM |

9.4.4.2.5 WSM information values

The format of the WSM information values is shown in Table 9-269. If the value of WSM Type field of the White Space Map element (9.4.1.57) is 1, the WSM Information field specifies available channel information for TVWS, which is country-specific.

Table 9-269—WSM information values

| Name | Type | Length (octets) | Value | Scope/ Country code |
|-----------------|------|-----------------|--|------------------------|
| WSM Information | 12 | variable | Single value TLV comprising fields in related table in E.2 for a specific regulatory domain. | WSM |

The format of the WSM Information Value fields is shown in Table 9-270.

Table 9-270—WSM Information Value fields

| Name | Length (octets) | Value | Scope/ Country code |
|---------------------------|-----------------|---|------------------------|
| Device Class | 1 | Single octet TLV comprising fields in Table 9-264. | WSM |
| Map ID | 1 | Bit 0: Type bit indicates whether the following channel list is a full channel list or a partial channel list. If the Type bit is 1, the following channel list is a full channel list; and if the Type bit is 0, the following channel list is a partial channel list. Bits 1–7: Map version identifies the version of the WSM. | WSM |
| Channel Number | 1 | Channel Number field in related WSM Information Value fields table in E.2. | WSM |
| Maximum Power Level | 1 | Maximum Power Level field in related WSM Information Value fields table in E.2. | WSM |
| Validity | 1 | The Validity field indicates the time duration in minutes for which the Channel Number is available with the allowed maximum power level, where the Validity field is provided for each available Channel Number. | WSM, UK |
| Maximum Channel Bandwidth | 2 | Limits on the maximum contiguous and maximum noncontiguous instantaneous bandwidths of STA specified as $n \times 0.1$ MHz, where $n > 0$. | WSM, UK |

The Device Class field is defined in 9.4.4.2.1 and identifies the device class used by the WSM. It determines the length of the channel availability tuple consisting of the Channel Number, Maximum Power Level, and Validity fields, which is repeated as indicated by the Length field of the WSM element. If the Device Class field is 0, the Validity field in WSM Information Value field is not present. Otherwise, the Validity field exists in the WSM Information Value field.

9.4.5 Access network query protocol (ANQP) elements

9.4.5.1 General

ANQP-elements are defined to have a common format consisting of a 2-octet Info ID field (information identifier), a 2-octet Length field, and a variable-length ANQP-element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The ANQP-element format is shown in Figure 9-591. See R.2 for informative text on ANQP usage.

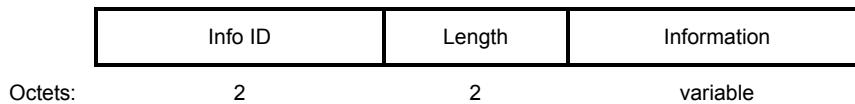

Figure 9-591—ANQP-element format

Each ANQP-element in 9.4.5 is assigned a unique 2-octet Info ID. The set of valid Info IDs are defined in Table 9-271. The 2-octet Info ID field is encoded following the conventions given in 9.2.2.

Table 9-271—ANQP-element definitions

| ANQP-element name | InfoID | ANQP-element (subclause) |
|--|--------|--------------------------|
| Reserved | 0–255 | n/a |
| Query List | 256 | 9.4.5.2 |
| Capability List | 257 | 9.4.5.3 |
| Venue Name | 258 | 9.4.5.4 |
| Emergency Call Number | 259 | 9.4.5.5 |
| Network Authentication Type | 260 | 9.4.5.6 |
| Roaming Consortium | 261 | 9.4.5.7 |
| IP Address Type Availability | 262 | 9.4.5.9 |
| NAI Realm | 263 | 9.4.5.10 |
| 3GPP Cellular Network | 264 | 9.4.5.11 |
| AP Geospatial Location | 265 | 9.4.5.12 |
| AP Civic Location | 266 | 9.4.5.13 |
| AP Location Public Identifier URI/FQDN | 267 | 9.4.5.14 |
| Domain Name | 268 | 9.4.5.15 |
| Emergency Alert Identifier URI | 269 | 9.4.5.16 |
| TDLS Capability | 270 | 9.4.5.18 |
| Emergency NAI | 271 | 9.4.5.17 |
| Neighbor Report | 272 | 9.4.5.19 |
| Venue URL | 277 | 9.4.5.20 |
| Advice of Charge | 278 | 9.4.5.21 |
| Local Content | 279 | 9.4.5.22 |
| Network Authentication Type with Timestamp | 280 | 9.4.5.23 |

Table 9-271—ANQP-element definitions (continued)

| ANQP-element name | InfoID | ANQP-element (subclause) |
|-------------------|------------------------|--------------------------|
| Reserved | 273–276, 281–56 796 | n/a |
| Vendor Specific | 56 797 | 9.4.5.8 |
| Reserved | 56798–65 535 | n/a |

The Length field specifies the number of octets in the Information field and is encoded following the conventions given in 9.2.2.

The ANQP-elements that can be configured are shown in Table 9-271. If information is not configured for a particular ANQP-element, then a query for that element will return that element with all optional fields not present.

9.4.5.2 Query List ANQP-element

The Query List ANQP-element provides a list of identifiers of ANQP-elements for which the requesting STA is querying; see 11.25.3.3.2.

The format of the Query List ANQP-element is provided in Figure 9-592.

Figure 9-592—Query List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP Query IDs field contains one or more 2-octet ANQP Query ID subfields.

Each ANQP Query ID subfield value is an Info ID drawn from Table 9-271. Including an Info ID in the Query List ANQP-element declares that the STA performing the ANQP request is requesting the ANQP-element corresponding to that Info ID be returned in the ANQP response. The Info IDs included in the Query List ANQP-element are ordered by monotonically increasing Info ID value. The ANQP response is defined in 11.25.3.3.1.

9.4.5.3 Capability List ANQP-element

The Capability List ANQP-element provides a list of information/capabilities that has been configured on a STA. The Capability List ANQP-element is returned in response to a Query List ANQP-element containing the Info ID of the Capability List ANQP-element.

The format of the Capability List ANQP-element is provided in Figure 9-593.

| Info ID | Length | ANQP Capabilities | Vendor Specific ANQP-elements |
|---------|--------|-------------------|-------------------------------|
| Octets: | 2 | 2 | variable |

Figure 9-593—Capability List ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The ANQP Capabilities field contains one or more 2-octet ANQP Capability subfields.

Each ANQP Capability subfield value is an Info ID drawn from Table 9-271. If included in the Capability List ANQP-element, it declares that a Query List ANQP-element including that Info ID will return the requested ANQP-element. The Info ID for Capability List ANQP-element is always included in the Capability List ANQP-element returned in a GAS Query Response. The list does not include any duplicate Info IDs, except possibly the Info ID for each Vendor Specific ANQP-element. The Info IDs returned in the Capability List ANQP-element are ordered by nondecreasing Info ID value.

The Vendor Specific ANQP-elements field contains one or more variable length Vendor Specific ANQP-elements.

The Vendor Specific ANQP-element is defined in 9.4.5.8. The Vendor Specific ANQP-element is structured such that the first 2 octets of the Vendor Specific ANQP-element is the Info ID whose value corresponds to the Vendor Specific ANQP-element (see Table 9-271). When a Vendor Specific ANQP-element is present in the Capability List ANQP-element, the Vendor Specific ANQP-element contains the capabilities of that vendor-specific query protocol.

9.4.5.4 Venue Name ANQP-element

The Venue Name ANQP-element provides zero or more venue names associated with the BSS. The format of the Venue Name ANQP-element is shown in Figure 9-594. The Venue Name ANQP-element might be used to provide additional metadata on the BSS. For example, the information might be used to assist a user in selecting the appropriate BSS with which to associate. Zero or more Venue Name fields can be included in the same or different languages.

| Info ID | Length | Venue Info | Venue Name Tuples |
|---------|--------|------------|-------------------|
| Octets: | 2 | 2 | 2 variable |

Figure 9-594—Venue Name ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Venue Info field is a 2-octet field and is defined in 9.4.1.35.

The Venue Name Tuples field contains zero or more variable length Venue Name Tuple subfields.

The format of the Venue Name Tuple subfield is shown in Figure 9-595.

- The Length field is a 1-octet field whose value is equal to 3 plus the number of octets in the Venue Name field.
- The Language Code field is a 3-octet ISO 14962:1997 encoded string field that defines the language used in the Venue Name field. The Language Code field is a two or three character language code

selected from ISO 639. A two character language code has 0 (“null” in ISO 14962:1997) appended to make it 3 octets in length.

- The Venue Name field is a variable-length UTF-8 encoded field containing the venue’s name. The maximum length of this field is 252 octets.

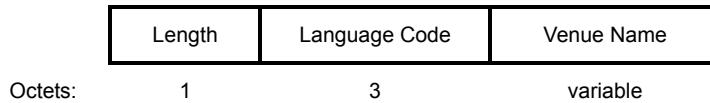

Figure 9-595—Venue Name Tuple subfield

A URL associated with the Venue Name field can be specified by the Venue URL ANQP-element defined in 9.4.5.20.

9.4.5.5 Emergency Call Number ANQP-element

The Emergency Call Number ANQP-element provides a list of emergency phone numbers to an emergency responder, such as directed by a public safety answering point (PSAP), that is used in the geographic location of the STA. The format of the Emergency Call Number ANQP-element is provided in Figure 9-596.

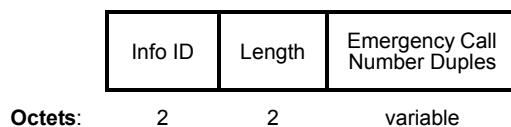

Figure 9-596—Emergency Call Number ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Call Number Duples field contains zero or more variable length Emergency Call Number Duples subfields.

Each Emergency Call Number Duple subfield has the structure shown in Figure 9-597.

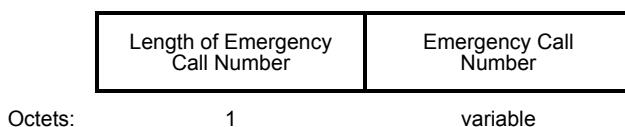

Figure 9-597—Emergency Call Number Duple subfield format

The Length of Emergency Call Number field is a 1-octet field whose value is set to the length of the Emergency Call Number field.

The Emergency Call Number field is a variable-length UTF-8 encoded field containing information, used to reach emergency services, from the network (e.g., dialed digits, emergency service URN label [B46]).

9.4.5.6 Network Authentication Type ANQP-element

The Network Authentication Type ANQP-element provides a list of authentication types when ASRA is set to 1. The format of the Network Authentication Type ANQP-element is shown in Figure 9-598.

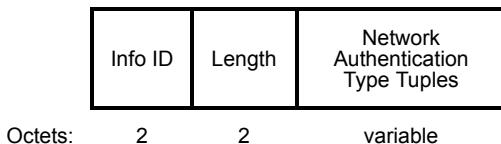

Figure 9-598—Network Authentication Type ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Type Tuples field contains zero or more variable length Network Authentication Type Tuple subfields.

Each Network Authentication Type Tuple subfield has the structure shown in Figure 9-599.

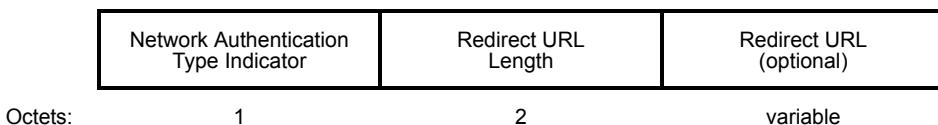

Figure 9-599—Network Authentication Type Tuple subfield format

The Network Authentication Type Indicator field is a 1-octet field and has one of the values shown in Table 9-272.

Table 9-272—Network Authentication Type Indicator definitions

| Value | Meaning |
|-------|------------------------------------|
| 0 | Acceptance of terms and conditions |
| 1 | On-line enrollment supported |
| 2 | http/https redirection |
| 3 | DNS redirection |
| 4–255 | Reserved |

Each Network Authentication Type Indicator defines additional information that can be communicated.

If the Network Authentication Type Indicator is 0, the network requires the user to accept terms and conditions. The Redirect URL can be used by the non-AP STA to obtain the terms and conditions. If the Redirect URL is not present, then the Redirect URL Length is set to 0.

If the Network Authentication Type Indicator is 1, the network supports on-line enrollment. Higher layer protocols on the non-AP STA might indicate to the user that accounts might be created. When the Network Authentication Type Indicator is 1, the Redirect URL Length is set to 0 and the Redirect URL is not present.

If the Network Authentication Type Indicator is 2, the network infrastructure performs http/https redirect. The Redirect URL is used by the non-AP STA to perform additional steps required for network access.

If the Network Authentication Type Indicator is 3, the network supports DNS redirection. Higher layer software on the non-AP STA exchanges credentials with the network, the Redirect URL Length is set to 0 and the Redirect URL is not present.

The Redirect URL Length field is a 2-octet field whose value is the length of the Redirect URL. The value of the Redirect URL Length field is set to 0 whenever the Redirect URL is not present.

The Redirect URL field is a variable-length field that is optionally included if the Network Authentication Type Indicator is either 0 or 2. If the Network Authentication Type Indicator is other than 0 or 2, a Redirect URL is not included. The URL is formatted in accordance with IETF RFC 3986.

9.4.5.7 Roaming Consortium ANQP-element

The Roaming Consortium ANQP-element provides a list of information about the Roaming Consortium and/or SSPs whose networks are accessible via this AP. This list can be returned in response to a GAS Query using procedures in 11.25.3.3.3. The format of the Roaming Consortium ANQP-element is provided in Figure 9-600.

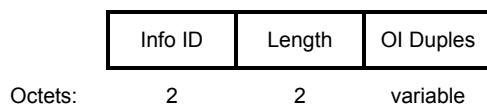

Figure 9-600—Roaming Consortium ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

OIs contained within the Roaming Consortium element (see 9.4.2.96) are also included in this ANQP-element. The value of the OI subfield(s) in this ANQP-element are equal to the values of the OI(s) in the dot11RoamingConsortiumTable.

The OI Duples field contains zero or more variable length OI Duple subfields.

The format of the OI Duple subfield is provided in Figure 9-601.

- The value of the OI Length field is equal to the number of octets in the OI field.
- The OI field is defined in 9.4.1.32. Each OI identifies a roaming consortium (group of SSPs with inter-SSP roaming agreement) or a single SSP.

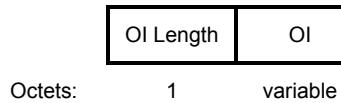

Figure 9-601—OI Duple subfield format

9.4.5.8 Vendor Specific ANQP-element

The Vendor Specific ANQP-element is used to query for information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and interoperability is more easily achieved in the presence of nonstandard information. The ANQP-element is in the format shown in Figure 9-602.

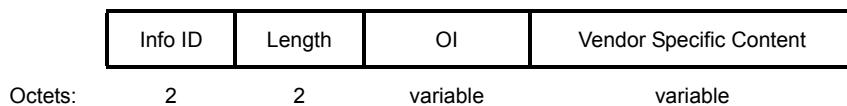

Figure 9-602—Vendor Specific ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The OI field is defined in 9.4.1.32.

The Vendor Specific Content field is a variable-length field whose content is defined by the entity identified in the OI field.

9.4.5.9 IP Address Type Availability ANQP-element

The IP Address Type Availability ANQP-element provides STA with the information about the availability of IP address version and type that could be allocated to the STA after successful association. The format of the IP Address Type Availability ANQP-element is shown in Figure 9-603.

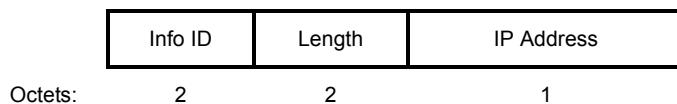

Figure 9-603—IP Address Type Availability ANQP-element

The Info ID and Length fields are defined in 9.4.5.1.

The format of the IP Address field shown in Figure 9-604.

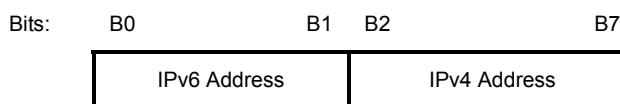

Figure 9-604—IP Address field format

The IPv6 Address field values are shown in Table 9-273.

Table 9-273—IPv6 Address field values

| Address value | Meaning |
|---------------|--|
| 0 | Address type not available |
| 1 | Address type available |
| 2 | Availability of the address type not known |
| 3 | Reserved |

The IPv4 Address field values are shown in Table 9-274.

Table 9-274—IPv4 Address field values

| Address value | Meaning |
|---------------|--|
| 0 | Address type not available |
| 1 | Public IPv4 address available |
| 2 | Port-restricted IPv4 address available |
| 3 | Single NATed private IPv4 address available |
| 4 | Double NATed private IPv4 address available |
| 5 | Port-restricted IPv4 address and single NATed IPv4 address available |
| 6 | Port-restricted IPv4 address and double NATed IPv4 address available |
| 7 | Availability of the address type is not known |
| 8–63 | Reserved |

9.4.5.10 NAI Realm ANQP-element

The NAI Realm ANQP-element provides a list of network access identifier (NAI) realms corresponding to SSPs or other entities whose networks or services are accessible via this AP; optionally included for each NAI realm is a list of one or more EAP Method subfields, which that NAI realm uses for authentication. The format of the NAI Realm ANQP-element is provided in Figure 9-605.

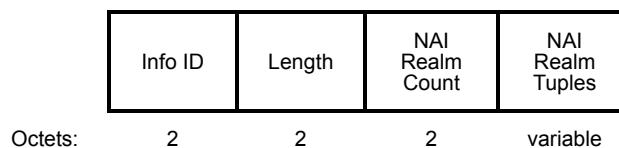

Figure 9-605—NAI Realm ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The NAI Realm Count field is a 2-octet field that specifies the number of NAI realms included in the NAI Realm ANQP-element.

The NAI Realm Tuples field contains zero or more variable length NAI Realm Tuple subfields.

The format of the NAI Realm Tuple subfield is shown in Figure 9-606.

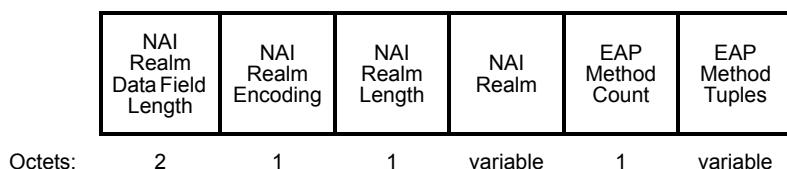

Figure 9-606—NAI Realm Tuple subfield format

The NAI Realm Data Field Length is a 2-octet subfield whose value is equal to 3 plus the length of the NAI Realm subfield plus the sum of the lengths of the EAP Method subfields.

The NAI Realm Encoding is a 1-octet subfield whose format is shown in Figure 9-607.

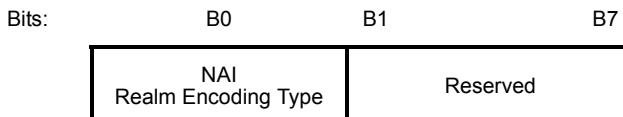

Figure 9-607—NAI Realm Encoding subfield format

The NAI Realm Encoding Type is a 1-bit subfield. It is set to 0 to indicate that the NAI Realm in the NAI Realm subfield is formatted in accordance with IETF RFC 4282. It is set to 1 to indicate it is a UTF-8 encoded character string that is not formatted in accordance with IETF RFC 4282.

NOTE—This encoding is to facilitate roaming consortium or other entities that use nonstandard NAI Realm formats.

NAI Realm Length subfield is a 1-octet subfield whose value is the length in octets of the NAI Realm subfield.

The NAI Realm subfield is one or more NAI Realms formatted as defined in the NAI Realm Encoding Type bit of the NAI Realm Encoding subfield. If there is more than one NAI Realm in this subfield, the NAI Realms are delimited by a semicolon character (i.e., “;”, which is encoded in UTF-8 format as 0x3B). All of the realms included in the NAI Realm subfield support all of the EAP methods identified by the EAP Method subfields, if present. The maximum length of this subfield is 255 octets.

The EAP Method Count specifies the number of EAP methods subfields for the NAI realm. If the count is 0, there is no EAP method information provided for the NAI realm.

The EAP Method Tuples field contains zero or more variable length EAP Method Tuple subfields.

The format of the optional EAP Method Tuple subfield is shown in Figure 9-608. Each EAP Method subfield contains a set of Authentication Parameters associated with the EAP-Method.

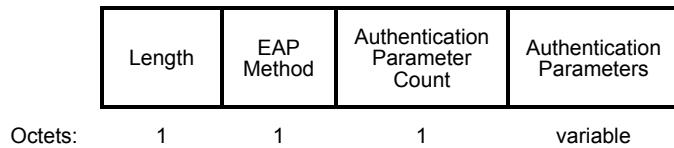

Figure 9-608—EAP Method Tuple subfield format

The Length subfield is a 1-octet subfield whose value is equal to 2 plus the length of the Authentication Parameter subfields.

The EAP method subfield is a 1-octet subfield that is set to the EAP Type value as given in IANA EAP Method Type Numbers.

The Authentication Parameter Count indicates how many additional Authentication Parameter subfields are specified for the supported EAP Method. If the Authentication Parameters Count subfield is 0, there are no Authentication Parameters subfields present, meaning no additional Authentication Parameters are specified for the EAP Method.

The Authentication Parameters field contains zero or more variable length Authentication Parameter subfields.

The format of the Authentication Parameter subfield is shown in Figure 9-609.

Figure 9-609—Authentication Parameter subfield format

The ID subfield is a 1-octet subfield that indicates the type of authentication information provided.

The Length subfield is a 1-octet subfield whose value is set to the length of the Authentication Parameter Value subfield.

The Authentication Parameter Value subfield is a variable-length subfield containing the value of the parameter indicated by the ID.

The ID and its associated formats are specified in Table 9-275. Each ID indicates a different type of information. Use of multiple Authentication Parameter subfields allows all of the required authentication parameter requirements to be provided.

Table 9-275—Authentication Parameter types

| Authentication information | ID | Description | Length (octets) |
|--|---------|--|-----------------|
| Reserved | 0 | | |
| Expanded EAP Method | 1 | Expanded EAP Method Subfield | 7 |
| Non-EAP Inner Authentication Type | 2 | Enum (0 - Reserved, 1 - PAP, 2 - CHAP, 3 - MSCHAP, 4 - MSCHAPV2) | 1 |
| Inner Authentication EAP Method Type | 3 | Value drawn from IANA EAP Method Type Numbers | 1 |
| Expanded Inner EAP Method | 4 | Expanded EAP Method Subfield | 7 |
| Credential Type | 5 | Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softtoken, 6 - Certificate, 7 - username/password, 8 - none (See NOTE), 9 - Reserved, 10 - Vendor Specific) | 1 |
| Tunneled EAP Method Credential Type | 6 | Enum (1 - SIM, 2 - USIM, 3 - NFC Secure Element, 4 - Hardware Token, 5 - Softtoken, 6 - Certificate, 7 - username/password, 8 - Reserved, 9 - Anonymous, 10 - Vendor Specific) | 1 |
| Reserved | 7–220 | | |
| Vendor Specific | 221 | Variable | variable |
| Reserved | 222–255 | | |
| NOTE—None means server-side authentication only. | | | |

If the EAP Method type is an Expanded EAP type (the EAP Method value is 254), the Authentication Parameter is used to specify additional information on the EAP method. Table 9-276 describes the

Authentication Parameter format for the Expanded EAP method; values for the Vendor ID and Vendor Type are specified in IETF RFC 3748. The Vendor ID and Vendor Type fields are expressed in big endian octet order.

Table 9-276—Authentication Parameter format for the Expanded EAP method

| Parameters | Length (octets) |
|-------------|-----------------|
| ID | 1 |
| Length | 1 |
| Vendor ID | 3 |
| Vendor Type | 4 |

The Non-EAP Inner Authentication Type is specified as single enumerated value given in Table 9-275. This Authentication Information type is used for non-EAP Inner Authentication methods. The possible values are PAP (as specified in IETF RFC 1334), CHAP (as specified in IETF RFC 1994), MSCHAP (as specified in IETF RFC 2433), and MSCHAPv2 (as specified in IETF RFC 2759).

The Inner Authentication EAP Method Type is specified as the EAP number as defined in IANA EAP Method Type Numbers. This Authentication Information type is used when the Inner Authentication method is an EAP method. If the Inner Authentication EAP Method Type is equal to 254 indicating an Expanded EAP Type, then the Expanded EAP Method Authentication Parameter is included.

A Credential Type is specified as a single enumerated value as shown in Table 9-275. If the value is equal to the “Vendor Specific” value, then a Vendor-Specific Authentication Parameter is included.

Vendor-Specific Authentication Parameters are specified as shown in Table 9-277.

Table 9-277—Vendor Specific Authentication Parameters

| Parameters | Length (octets) |
|--------------------------------|-------------------------|
| ID | 1 |
| Length | 1 |
| OI | variable |
| Authentication Parameter Value | Vendor-specific content |

9.4.5.11 3GPP Cellular Network ANQP-element

The 3GPP Cellular Network ANQP-element contains cellular information such as network advertisement information e.g., network codes and country codes to assist a 3GPP non-AP STA in selecting an AP to access 3GPP networks. The format of the 3GPP Cellular Network ANQP-element is shown in Figure 9-610.

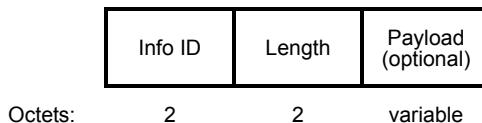

Figure 9-610—3GPP Cellular Network ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Payload field is a variable-length field and is a generic container. An example of the format and content is defined in Annex H of 3GPP TS 24.302.

9.4.5.12 AP Geospatial Location ANQP-element

The AP Geospatial Location ANQP-element provides the AP’s location in LCI format; see 9.4.2.22.10. This information is taken from dot11APLCITable. The Z and Usage Rules/Policy subelements are optionally presented in the Location Configuration Report field, when it is used in the AP Geospatial Location ANQP element. The Co-Located BSSID List subelement is present when there is at least one other BSS which is co-located with the reporting BSS.

The format of the AP Geospatial Location ANQP-element is provided in Figure 9-611.

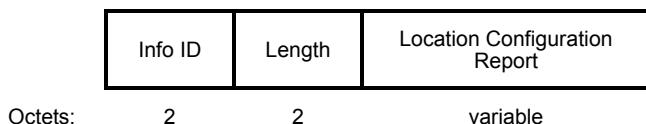

Figure 9-611—AP Geospatial Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Configuration Report field is of variable length and defined in 9.4.2.22.10. The Z and Usage Rules/Policy subelements are optionally present in the Location Configuration Report field, when it is used in the AP Geospatial Location ANQP element. The Co-Located BSSID List subelement is present when there is at least one other BSS which is co-located with the reporting BSS.

9.4.5.13 AP Civic Location ANQP-element

The AP Civic Location ANQP-element provides the AP’s location in civic format. The format of the AP Civic Location ANQP-element is provided in Figure 9-612.

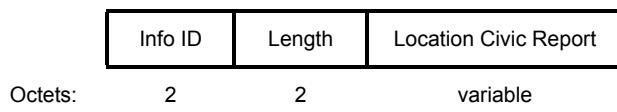

Figure 9-612—AP Civic Location ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Location Civic Report is a variable-length field and the format is provided in 9.4.2.22.13. This information is taken from dot11APCivicLocationTable. The Co-Located BSSID List subelement is present when there is at least one other BSS which is co-located with the reporting BSS and the Co-Located BSSID List subelement is not present in the Geospatial Location ANQP-element; this subelement is not present otherwise.

9.4.5.14 AP Location Public Identifier URI/FQDN ANQP-element

The AP Location Public Identifier URI/FQDN ANQP-element provides an indirect reference to the location information for the AP. This list element can be returned in response to a GAS Query using the procedures in 11.25.3.3. The format of the AP Location Public Identifier URI/FQDN ANQP-element is provided in Figure 9-613.

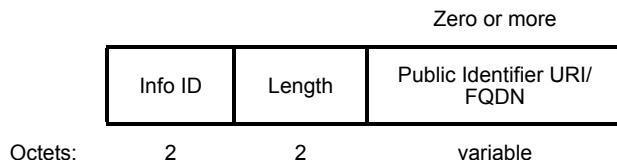

Figure 9-613—AP Location Public Identifier URI/FQDN ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Public Identifier URI/FQDN field is a variable-length field containing zero or more Public Identifier URI/FQDN subelements, as defined in 9.4.2.22.14.

9.4.5.15 Domain Name ANQP-element

The Domain Name ANQP-element provides a list of one or more domain names of the entity operating the IEEE 802.11 access network. Domain Names in this ANQP-element are taken from dot11DomainNameTable. The format of the Domain Name ANQP-element is provided in Figure 9-614.

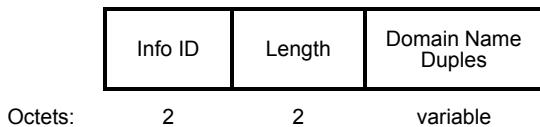

Figure 9-614—Domain Name ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Domain Name Duples field contains zero or more variable length Domain Name Duple subfields.

The format of the Domain Name Duple subfield is shown in Figure 9-615.

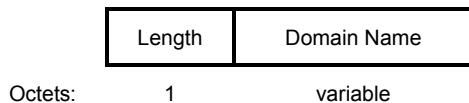

Figure 9-615—Domain Name Duple subfield format

The Length subfield is a 1-octet subfield whose value is set to the length in octets of the Domain Name subfield.

The Domain Name subfield is of variable length and contains a domain name compliant with the “Preferred Name Syntax” as defined in IETF RFC 1035. The maximum length of this field is 255 octets.

9.4.5.16 Emergency Alert URI ANQP-element

The Emergency Alert URI ANQP-element provides a URI for EAS message retrieval.

The format of the Emergency Alert URI ANQP-element is provided in Figure 9-616.

| | | | |
|---------|---------|--------|---------------------|
| | Info ID | Length | Emergency Alert URI |
| Octets: | 2 | 2 | variable |

Figure 9-616—Emergency Alert URI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency Alert URI field is a variable-length field used to indicate the URI at which an EAS message can be retrieved as described in 11.25.7. The Emergency Alert URI field is formatted in accordance with IETF RFC 3986.

9.4.5.17 Emergency NAI ANQP-element

The Emergency NAI ANQP-element contains an emergency string, which is available for use by a STA as its identity to indicate emergency access request. The format of the Emergency NAI ANQP-element is provided in Figure 9-617.

| | | | |
|---------|---------|--------|---------------------------|
| | Info ID | Length | Emergency NAI Information |
| Octets: | 2 | 2 | variable |

Figure 9-617—Emergency NAI ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Emergency NAI Information field is a variable-length field encoded using UTF-8 and formatted in accordance with IETF RFC 4282.

9.4.5.18 TDLS Capability ANQP-element

The TDLS Capability ANQP-element is used by a STA to discover the TDLS capabilities of a peer STA. The format of the TDLS Capability is provided in Figure 9-618.

| | | | |
|---------|---------|--------|------------------|
| | Info ID | Length | Peer Information |
| Octets: | 2 | 2 | variable |

Figure 9-618—TDLS Capability ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Peer Information field is a variable-length field containing information that a STA can use to establish a TDLS link and is defined as an XML schema (see R.6). An example of the peer information is described in 11.25.3.3.10.

9.4.5.19 Neighbor Report ANQP-element

The Neighbor Report ANQP-element provides zero or more neighbor reports about neighboring APs. This is of benefit to a STA in a preassociated state. The format of the Neighbor Report ANQP-element is defined in Figure 9-619.

| | | |
|---------|--------|------------------------------------|
| Info ID | Length | Neighbor Report element (optional) |
| Octets: | 2 | 2 |

Figure 9-619—Neighbor Report ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The format of the Neighbor Report element is shown in Figure 9-295 defined in 9.4.2.37. The Element ID and the Length fields of the Neighbor Report element, as shown in Figure 9-295, are not included. The Co-Located BSSID List subelement is present when there is at least one other BSS which is co-located with the reporting BSS.

9.4.5.20 Venue URL ANQP-element

The Venue URL ANQP-element provides a list of one or more URLs which can be used for web page advertising services or providing information, particular to a venue’s BSS, to a STA. The format of the Venue URL ANQP-element is defined in Figure 9-620.

| | | |
|---------|--------|------------------|
| Info ID | Length | Venue URL Duples |
| Octets: | 2 | 2 |

Figure 9-620—Venue URL ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Venue URL Duples field contains one or more Venue URL Duple fields as shown in Figure 9-621.

| | | |
|---------|--------------|-----------|
| Length | Venue Number | Venue URL |
| Octets: | 1 | 1 |

Figure 9-621—Venue URL Duple field

The Length field is a 1-octet field whose value is set to 1 plus the number of octets in the Venue URL field.

The Venue Number field is a 1-octet field whose value corresponds to the implicit returned order value of the corresponding Venue Name Duple returned in a Venue Name ANQP-element, as defined in 9.4.5.4. If no Venue Name Tuple subfield was returned in the Venue Name ANQP-element then this value is 0.

The Venue URL field is a variable-length field that indicates the URL at which information relevant to the corresponding Venue Name Tuple subfield, indicated by the Venue Number, might be retrieved. This is further described in 11.25.3.3.11. If no Venue URL is provided this field is left empty. The Venue URL field is formatted in accordance with IETF RFC 3986.

9.4.5.21 Advice of Charge ANQP-element

The Advice of Charge ANQP-element provides a list of one or more financial advice of charges related to access to a BSS. The format of the Advice of Charge ANQP-element is defined in Figure 9-622.

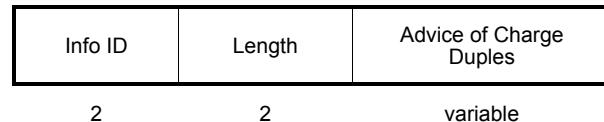

Figure 9-622—Advice of Charge ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Advice of Charge Duples field contains one or more Advice of Charge Duple fields as shown in Figure 9-623.

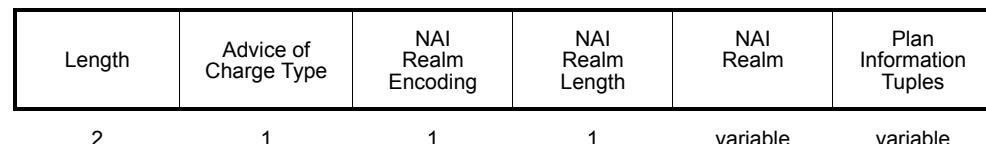

Figure 9-623—Advice of Charge Duple field

The Length field is a 2-octet field whose value is set to 3 plus the number of octets in the NAI Realm and Plan Information Tuples fields.

The Advice of Charge Type field is a 1-octet field with the values defined in Table 9-278.

Table 9-278—Advice of Charge Type field values

| Advice of Charge Type Value | Description |
|-----------------------------|----------------------------|
| 0 | Time-based |
| 1 | Data-volume-based |
| 2 | Time-and-data-volume-based |
| 3 | Unlimited |
| 4–255 | Reserved |

The NAI Realm Encoding, NAI Realm Length and NAI Realm fields are defined in 9.4.5.10.

The format of the Plan Information Tuples field is defined in Figure 9-624.

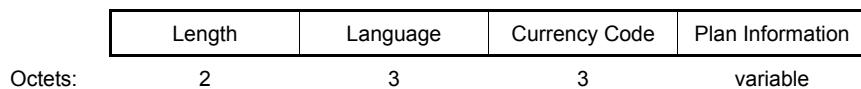

Figure 9-624—Plan Information Tuple field

The Length field is a 2-octet field whose value is set to the number of octets in the Language, Currency Code, and Plan Information fields.

The Language Code field is a 3-octet ISO 14962:1997 encoded string field that defines the language used in the Cost Information field. The Language Code field is a two or three character language code selected from ISO 639. A two character language code has 0 (“null” in ISO 14962:1997) appended to make it 3 octets in length.

The Currency Code field is a 3-octet string (e.g., “USD”) representing an ISO 4217 currency numeric code.

The Plan Information field is a variable length UTF-8 formatted field that carries an XML description of an Advice of Charge plan. The schema and semantics of this description are outside the scope of this standard.

9.4.5.22 Local Content ANQP-element

The Local Content ANQP-element provides a list of one or more URLs which can be used to display local content related to the BSS. The format of the Local Content ANQP-element is defined in Figure 9-625.

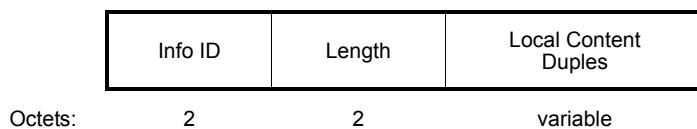

Figure 9-625—Local Content ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Local Content Duples field contains one or more Local Content Duple fields as shown in Figure 9-626.

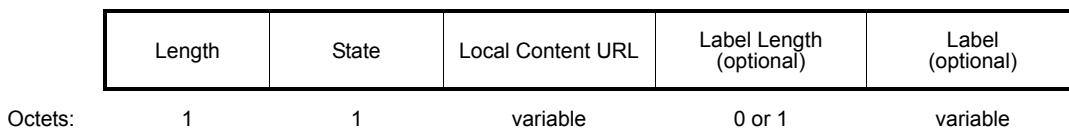

Figure 9-626—Local Content Duple field

The Length field is a 1-octet field whose value is set to 1 plus the number of octets in the Local Content URL, Label Length and Label fields.

The State field is a 1-octet field whose value is defined in Table 9-279.

Table 9-279—Local Content State values

| State | Name |
|-------|-------------------------------|
| 0 | Not authenticated |
| 1 | Authenticated |
| 2 | Failure during authentication |
| 3 | Incorrect credentials |
| 4 | Credentials expired |
| 5–255 | Reserved |

The Local Content URL field is a variable-length field containing a URL that is used for directing the device to local content. The Local Content URL field is formatted in accordance with IETF RFC 3986.

The Label Length field is a 1 octet field that contains the value of the length of the Label field in octets. If the Label is not used, this field is also not used.

The Label field is a variable-length field containing a description of the URL. It provides the type and potential usage of the URL. This is a UTF-8 formatted string.

9.4.5.23 Network Authentication Type with Timestamp ANQP-element

The Network Authentication Type with Timestamp ANQP-element provides similar information to that of the Network Authentication Type as defined in 9.4.5.6. In addition, a timestamp field is optionally provided to indicate to the requesting STA a timestamp corresponding to the time at which the received terms and conditions were most recently modified. With this timestamp, the requesting STA can determine if previously received information is stale.

The format of the Network Authentication Type with Time ANQP-element is shown in Figure 9-627.

| | | |
|---------|--------|--|
| Info ID | Length | Network Authentication Timestamp Tuples |
| Octets: | 2 | 2 |

Figure 9-627—Network Authentication Type with Timestamp ANQP-element format

The Info ID and Length fields are defined in 9.4.5.1.

The Network Authentication Timestamp Tuples field contains zero or more variable length Network Authentication Timestamp Tuple subfields.

Each Network Authentication Timestamp Tuple subfield has the structure shown in Figure 9-628.

| | | | |
|--|------------------------|----------------------------|--------------------------|
| Network Authentication Type Indicator | Redirect URL Length | Redirect URL (optional) | Time Value (optional) |
| Octets: | 1 | 1 | variable |

Figure 9-628—Network Authentication Timestamp Tuple subfield format

The Network Authentication Type Indicator field is defined in 9.4.5.6

The Redirect URL Length field and the Redirect URL field are defined in 9.4.5.6.

The Time Value field is defined in Table 9-170 using the Timing Capability equal to 2 encoding. This field is used by the responding STA to set a time of the ANQP response.

9.4.6 Registered location query protocol (RLQP) elements

9.4.6.1 General

RLQP-elements are defined to have a common format consisting of a 2-octet Info ID field, a 2-octet Length field, and a variable-length RLQP-element-specific Information field. Each element is assigned a unique Info ID as defined in this standard. The RLQP-element format is shown in Figure 9-629.

| | | | | |
|--|---------|---------|--------|-------------|
| | Octets: | Info ID | Length | Information |
| | | 2 | 2 | variable |

Figure 9-629—RLQP-element format

Each RLQP-element in 9.4.6 is assigned a unique 2-octet Info ID. The set of valid Info IDs is defined in Table 9-629. The 2-octet Info ID field is encoded following the conventions given in 9.2.2.

The Length field is a 2-octet field that indicates the number of octets in the Information field and is encoded following the conventions given in 9.2.2.

The RLQP-elements are shown in Table 9-280. Info ID 56 797 stands for Vendor Specific information.

Table 9-280—RLQP-element definitions

| RLQP-element name | Info ID | RLQP-element (subclause) |
|-----------------------------|---------------|--------------------------|
| Reserved | 0–272 | N/A |
| Channel Availability Query | 273 | 9.4.6.2 |
| Channel Schedule Management | 274 | 9.4.6.3 |
| Network Channel Control | 275 | 9.4.6.4 |
| Reserved | 276–56 796 | N/A |
| Vendor Specific | 56 797 | 9.4.6.5 |
| Reserved | 56 798–65 535 | N/A |

9.4.6.2 Channel Availability Query RLQP-element

The Channel Availability Query element is used to exchange the requests and responses for the channel availability query process using the GAS protocol. The Channel Availability Query RLQP-element is included in a GAS Query Request or returned in a response to a GAS Query Request.

The element is in the format shown in Figure 9-630.

| | | | | | | | | | | |
|---------|---------|--------|-----------------------|-----------------------|--------------------|--------------------|--------------|-----------------------------------|-----------------------------|-----------------|
| | Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Channel Query Info | Device Class | Device Identification Information | Device Location Information | WSM Information |
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | variable | variable | variable | variable |

Figure 9-630—Channel Availability Query RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the channel query process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that responds to the channel query requesting STA. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a channel availability query was generated. It also indicates the result of the query as successful or not and the reason when the query is not successful. The length of the Reason Result Code field is 1 octet. The Reason Result Code field values that have been allocated are shown in Table 9-281.

Table 9-281—Reason Result Code field values

| Reason Result Code field value | Name | Description |
|--------------------------------|-----------------------------|---|
| 0 | | Reserved. |
| 1 | | Channel availability list requested. |
| 2 | SUCCESS | Success with the available channel list result for a Device Location Information field. |
| 3 | SUCCESS_MULTIPLE | Success with an available channel list result for a bounded geographic area defined by multiple Device Location Information fields. |
| 4 | REFUSED | Request declined. |
| 5 | DEVICE_VERIFICATION_FAILURE | Request not successful because of device identification verification failure. NOTE—Failure of providing an authorized identification of the corresponding regulatory organization can cause the responding STA to reject the query and return such a Reason Result Code. |
| 6 | Continuation frame | This frame continues the fields from the previous CAQ frame. |
| 7–255 | | Reserved. |

The Channel Query Info field is used to indicate the type of Channel Query request and associated parameters. The format of the Channel Query Info field is shown in Figure 9-631.

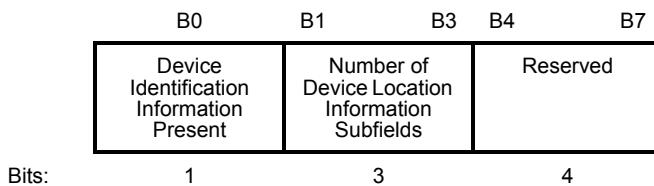

Figure 9-631—Channel Query Info field format

The Device Identification Information Present subfield value is set to 1 to indicate that the Device Identification Information field is present in the Channel Availability Query element; otherwise it is set to 0 to indicate that the Device Identification Information field is not provided.

The Number of Device Location Information Subfields subfield indicates the number of device location information subfields presented in the Channel Availability Query element. When no device location is present, the Number of Device Location Information Subfields subfield is set to 0.

The Device Class field is used to indicate the characteristics of STA requesting the channel availability query. The format of the Device Class field is specified in 9.4.4.2.1. The Device Class field is present only when the Reason Result Code field value is 1.

The Device Identification Information field is used to indicate the identification of the STA requesting the channel availability query. The format of the Device Identification Information field is specified in 9.4.4.2.2.

The Device Location Information field is used to provide the location of the STA requesting the channel availability query, which is provided in the format specified in 9.4.4.2.3.

The WSM Information field is defined in the White Space Map element (see 9.4.2.170). The WSM Information field is present only when the Reason Result Code field value is 2 or 3, as the successful result of the query.

9.4.6.3 Channel Schedule Management RLQP-element

The Channel Schedule Management element is used by an GDD enabling STA to query the RLSS or another GDD enabling STA for channel schedule information. The element is in the format shown in Figure 9-632.

| Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Channel Schedule Management Mode | Device Identification Information | Channel Schedule Descriptor |
|---------|--------|-----------------------|-----------------------|--------------------|----------------------------------|-----------------------------------|-----------------------------|
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | variable |

Figure 9-632—Channel Schedule Management RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the channel schedule management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The remaining fields are as defined in the Channel Schedule Management element (see 9.6.8.26).

9.4.6.4 Network Channel Control RLQP-element

The Network Channel Control element is used to request network channel control and respond to network channel requests using the GAS protocol. The element is in the format shown in Figure 9-633.

| | | | | | | | | |
|---------|--------|-----------------------|-----------------------|--------------------|--|-----------------------------------|---|---|
| Info ID | Length | Requester STA Address | Responder STA Address | Reason Result Code | Number of Network Channel Control Triplets | a Network Channel Control triplet | | |
| Octets: | 2 | 2 | 6 | 6 | 1 | 1 | 1 | 1 |

Figure 9-633—Network Channel Control RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the network channel control process.

The ResponderSTAAddress field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The length of the Reason Result Code field is 1 octet. The encoding of the Reason Result Code field is shown in Table 9-282.

Table 9-282—Reason Result Code field values

| Reason Result Code field value | Name | Description |
|--------------------------------|--------------------------------|--|
| 0 | REQUEST | Network channel request. |
| 1 | SUCCESS | Success. |
| 2 | REFUSED | Request declined. |
| 3 | TOO_MANY_SIMULTANEOUS_REQUESTS | Network channel request denied because the GDD enabling STA is unable to handle additional GDD dependent STAs. |
| 4 | Continuation frame | This frame continues the fields from the previous NCC frame. |
| 5–255 | | Reserved. |

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Transmit Power Constraint fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class field and Channel Number field are used together to specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of a Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In a response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field is coded as a signed integer in units of 0.5 dBm. The field is set to –128 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.4.6.5 Vendor Specific RLQP-element

The Vendor Specific RLQP-element is used to carry information not defined in this standard within a single defined format, so that reserved Info IDs are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information. The RLQP-element is in the format shown in Figure 9-634.

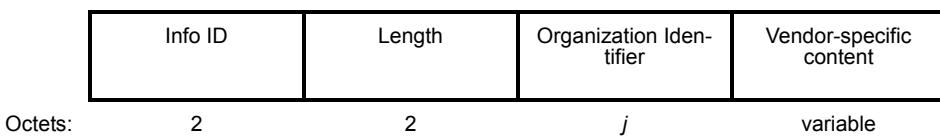

Figure 9-634—Vendor Specific RLQP-element format

The Info ID and Length fields are defined in 9.4.6.1.

The Organization Identifier field identifies (see 9.4.1.32) the entity that has defined the content of the particular Vendor Specific RLQP-element. See 9.4.1.32 for the definition of *j*.

9.5 Fields used in Management and Extension frame bodies and Control frames

9.5.1 Sector Sweep field

The format of the sector sweep (SSW) field is shown in Figure 9-635.

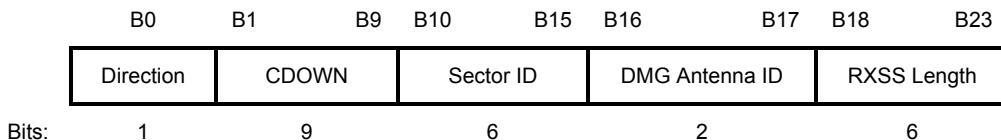

Figure 9-635—SSW field format

The Direction subfield is set to 0 to indicate that the frame is transmitted by the beamforming initiator and set to 1 to indicate that the frame is transmitted by the beamforming responder.

The CDOWN subfield is a down-counter indicating the number of remaining DMG Beacon frame transmissions to the end of the TXSS, or the number of remaining SSW frame transmissions to the end of the TXSS/RXSS. This subfield is set to 0 in the last frame DMG Beacon and SSW frame transmission. Possible values range from 0 to 511.

The Sector ID subfield is set to indicate the sector number through which the frame containing this SSW field is transmitted.

The DMG Antenna ID subfield indicates the DMG antenna the transmitter is currently using for this transmission.

The RXSS Length subfield is valid only when transmitted in a CBAP and is reserved otherwise. The RXSS Length subfield specifies the length of a receive sector sweep as required by the transmitting STA and is defined in units of an SSW frame. The length of the sector sweep is given by $(\text{RXSS Length} + 1) \times 2$.

9.5.2 Dynamic Allocation Info field

The format of the Dynamic Allocation Info field is shown in Figure 9-636.

The TID subfield identifies the TC or TS for the allocation request or grant.

NOTE—Unlike pseudo-static allocations, nonpseudo-static allocations are not labeled with an allocation ID, and are associated to a TID.

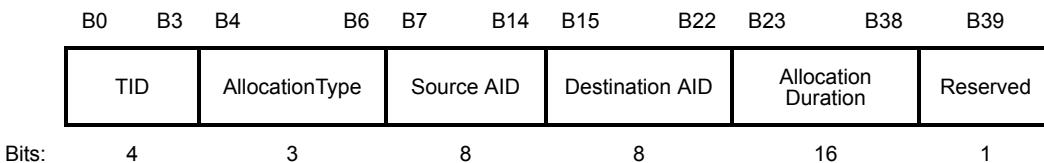

Figure 9-636—Dynamic Allocation Info field format

The AllocationType subfield is defined in 9.4.2.132.

The Source AID subfield identifies the STA that is the source of the allocation.

The Destination AID subfield identifies the STA that is the destination of the allocation.

When the Dynamic Allocation Info field is transmitted within an SPR frame, the Allocation Duration subfield contains the requested duration in microseconds. When the Dynamic Allocation Info subfield is transmitted within a Grant frame by an AP or PCP in an ATI or GP, the Allocation Duration subfield contains the granted duration of the SP or CBAP allocation in microseconds (see 10.36.3, 10.36.7, 10.36.8, and 10.36.9). Possible values range from 0 to 32 767 for an SP allocation and a CBAP allocation. A value of 0 in the Allocation Duration subfield transmitted within a Grant frame means that the STA can transmit one PPDU followed by any relevant acknowledgment plus one RTS/DMG CTS handshake.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame in a CBAP, the value of the Allocation Duration field indicates the purpose of the Grant frame transmission. Two purposes are possible:

- a) Beyond current TXOP: in this case, the Allocation Duration subfield values range from 0 to 32 767. The value of the Allocation Duration field plus the Duration field of the Grant frame indicates the time offset from the PHY-TXEND.indication primitive of the Grant frame when the STA transmitting the Grant frame will attempt to initiate access for communication with the STA indicated by the RA field of the Grant frame.
- b) Within current TXOP: in this case, the Allocation Duration subfield is set to 32 768.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to broadcast address by a source or destination STA of an SP, the Allocation Duration subfield values range from 0 to 32 767.

When the Dynamic Allocation Info subfield is transmitted within a Grant frame with RA set to unicast address by a source STA of an SP, the Allocation Duration subfield is set to 32 768.

9.5.3 Sector Sweep Feedback field

When the SSW Feedback field is transmitted as part of an ISS, the format of the field is as shown in Figure 9-637. Otherwise, the format of the SSW Feedback field is as shown in Figure 9-638.

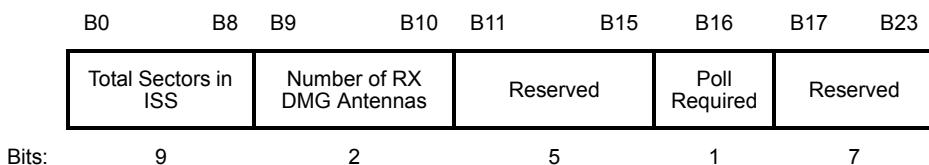

Figure 9-637—SSW Feedback field format when transmitted as part of an ISS

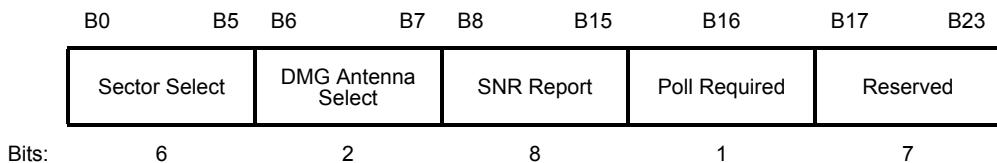

Figure 9-638—SSW Feedback field format when not transmitted as part of an ISS

The Total Sectors in ISS subfield indicates the total number of sectors that the initiator uses in the ISS, including any repetition performed as part of multi-antenna beamforming. Possible values range from 0 to 511, representing 1 to 512 sectors.

The Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the following RSS. The number of receive DMG antennas used is equal to the value of this subfield plus 1.

The Sector Select subfield contains the value of the Sector ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which packet was received with best quality is implementation dependent. Possible values of this subfield range from 0 to 63.

The DMG Antenna Select subfield indicates the value of the DMG Antenna ID subfield of the SSW field within the frame that was received with best quality in the immediately preceding sector sweep. The determination of which frame was received with best quality is implementation dependent.

The SNR Report subfield is set to the value of the SNR from the frame that was received with best quality during the immediately preceding sector sweep, and which is indicated in the Sector Select field. This subfield is encoded as 8-bit 2s complement value of $4 \times (\text{SNR}-19)$, where SNR is measured in dB. This covers from -13 dB to 50.75 dB in 0.25 dB steps.

The Poll Required subfield is set to 1 by a non-AP and non-PCP STA to indicate that it requires the AP or PCP to initiate communication with the non-AP and non-PCP. This subfield is set to 0 to indicate that the non-AP and non-PCP has no preference about whether the AP or PCP initiates the communication. This subfield is reserved when transmitted by an AP or PCP.

9.5.4 BRP Request field

The BRP Request field is defined in Figure 9-639.

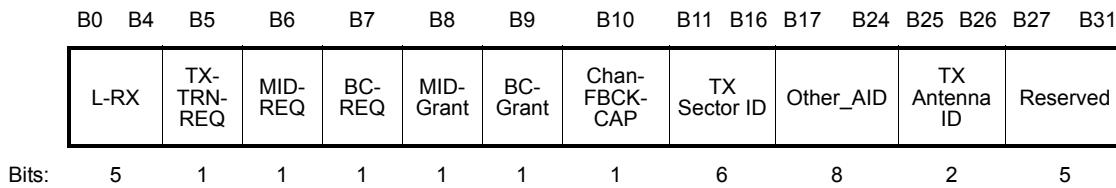

Figure 9-639—BRP Request field format

If the MID-REQ subfield is set to 0, the L-RX subfield indicates the compressed number of TRN-R subfields requested by the transmitting STA as part of beam refinement. To obtain the number of TRN-R subfields, the value of the L-RX subfield is multiplied by 4. Possible values range from 0 to 16, corresponding to 0 to 64 TRN-R fields. Other values are reserved. If the subfield is set to 0, the transmitting STA does not need receive training as part of beam refinement. If the MID-REQ subfield is set to 1, the

L-RX subfield indicates the compressed number of AWV settings that the STA uses during the MID phase. To obtain the number of AWVs that is used, the value of the L-RX subfield is multiplied by 4.

The TX-TRN-REQ subfield is set to 1 to indicate that the STA needs transmit training as part of beam refinement. Otherwise, it is set to 0.

A STA sets the MID-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I-MID subphase or R-MID subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I-MID subphase or R-MID subphase. In case an R-MID subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the MID-grant subfield in SSW-Ack or BRP frames to 1 to grant this request or otherwise sets it to 0.

A STA sets the BC-REQ subfield to 1 in SSW-Feedback or BRP frames to indicate a request for an I/R-BC subphase; otherwise, the STA sets the subfield to 0 to indicate it is not requesting an I/R-BC subphase. In case an R-BC subphase is requested, the STA can include information on the TX sector IDs to be used by the STA receiving this request. The STA receiving this request sets the BC-grant subfield in SSW-Ack or BRP frames to 1 to grant this request; otherwise, the STA sets it to 0 to reject the request.

The Chan-FBCK-CAP subfield is set to 1 to indicate the STA is capable to return channel measurement during beam refinement. The Chan-FBCK-CAP subfield is set to 0 to indicate the STA is able to return only BS-FBCK during beam refinement.

NOTE—Regardless of the value of the Chan-FBCK-CAP subfield, 10.38.6.4 requires a DMG STA to return the SNR values from the last TXSS if it receives a BRP frame with the TXSS-FBCK-REQ field and the SNR Requested subfield within the FBCK-REQ field both set to 1.

The TX sector ID subfield indicates the sector ID that is used when transmitting the packet. If the packet is transmitted using a pattern that is not a sector that has been used in the sector sweep, the value of this subfield is set to 0x63.

The Other_AID subfield is set to the AID of an additional STA referenced in the BRP procedure as described in 10.38.6.4.4 and 20.10.2.2.6. Otherwise, if the additional STA is not used, this subfield is set to 0.

The TX Antenna ID subfield indicates the DMG antenna ID that is used when transmitting the packet.

9.5.5 Beamforming Control field

The Beamforming Control field is formatted as shown in Figure 9-640 when both the IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1, and the Beamforming Control field is transmitted in either a Grant or Grant Ack frames. In all other cases, the Beamforming Control field is formatted as shown in Figure 9-641.

| | B0 | B1 | B2 | B3 | B9 | B10 | B11 | B12 | B15 |
|--|----------------------|-----------------|-----------------|-------------------------|---------------------------|----------|-----|-----|-----|
| | Beamforming Training | IsInitiatorTXSS | IsResponderTXSS | Total Number of Sectors | Number of RX DMG Antennas | Reserved | | | |

Bit: 1 1 1 7 2 4

Figure 9-640—BF Control field format when both IsInitiatorTXSS and IsResponderTXSS subfields are equal to 1 and the BF Control field is transmitted in Grant or Grant Ack frames

| B0 | B1 | B2 | B3 | B8 | B9 | B10 | B15 |
|----------------------|-----------------|-----------------|----|-------------|------------|----------|-----|
| Beamforming Training | IsInitiatorTXSS | IsResponderTXSS | | RXSS Length | RXSSTxRate | Reserved | |
| Bit: | 1 | 1 | 1 | 6 | 1 | 6 | |

Figure 9-641—BF Control field format in all other cases

The Beamforming Training subfield is set to 1 to indicate that the source DMG STA intends to initiate beamforming training with the destination DMG STA at the start of the allocation and is set to 0 otherwise. If the Beamforming Training subfield is set to 0, all other subfields of the Beamforming Control field are reserved.

The IsInitiatorTXSS subfield is set to 1 to indicate that the source DMG STA starts the beamforming training with an initiator TXSS. This subfield is set to 0 to indicate that the source DMG STA starts the BF training with an initiator RXSS.

The IsResponderTXSS subfield is set to 1 to indicate that the destination DMG STA starts the RSS with a responder TXSS. This subfield is set to 0 to indicate that the destination DMG STA is to initiate the RSS with a responder RXSS.

When the Beamforming Control field is transmitted within an Extended Schedule element, either the IsInitiatorTXSS subfield or the IsResponderTXSS subfield is set to 0, but not both.

The RXSS Length subfield is valid only if at least one of IsInitiatorTXSS subfield or IsResponderTXSS subfield is equal to 0 and is reserved otherwise. The value represented by the RXSS Length subfield specifies the total number of receive sectors combined over all receive DMG antennas of the STA, including any LBIFS as necessary for DMG antenna switching. The value represented by this subfield is in the range 2 to 128 and is given by $(RXSS\ Length+1) \times 2$.

The RXSSTxRate subfield is valid only if the RXSS Length subfield is valid and the value of the RXSS Length subfield is greater than 0. Otherwise, the RXSSTxRate subfield is reserved. The RXSSTxRate subfield is set to 0 to indicate that all frames transmitted as part of the RXSS use the DMG Control modulation class (10.7.7.1). The RXSSTxRate subfield is set to 1 to indicate that only the first frame transmitted as part of the RXSS use the DMG Control modulation class and the remaining frames use MCS 1 of the DMG SC modulation class. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant frame, the RXSSTxRate subfield refers to the RSS only. If both the IsInitiatorTXSS and IsResponderTXSS subfields are set to 0 and the BF Control field is sent within a Grant Ack frame, the RXSSTxRate subfield refers to the ISS only.

When the BF Control field is transmitted in a Grant frame, the Total Number of Sectors subfield indicates the total number of sectors the initiator uses during the ISS, including any LBIFS required for DMG antenna switching (see 10.38). When the BF Control field is transmitted in a Grant Ack frame, the Total Number of Sectors subfield indicates the total number of sectors the responder uses during the RSS. In both cases, the total number of sectors used is equal to the value of this field plus 1.

When the BF Control field is transmitted in a Grant frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the initiator uses during the RSS. When the BF Control field is transmitted in a Grant Ack frame, the Number of RX DMG Antennas subfield indicates the number of receive DMG antennas the responder uses during the ISS. In both cases, the number of receive DMG antennas used is equal to the value of this subfield plus 1.

When the BF Control field is transmitted in a Grant Ack frame in response to a Grant frame with the Beamforming Training field equal to 0, the following fields are reserved: IsInitiatorTXSS, IsResponderTXSS, Total Number of Sectors, and Number of RX DMG Antennas.

9.5.6 Beamformed Link Maintenance field

The Beamformed Link Maintenance field is shown in Figure 9-642 and provides a DMG STA with the value of dot11BeamLinkMaintenanceTime.

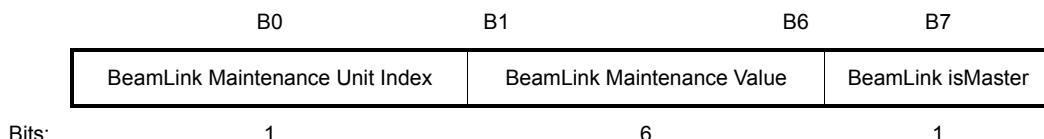

Figure 9-642—Beamformed Link Maintenance field format

The encoding of the BeamLink Maintenance Unit Index subfield is specified in Table 9-283.

Table 9-283—Encoding of BeamLink Maintenance Unit Index

| BeamLink Maintenance Unit Index | BeamLink Maintenance Unit (μs) |
|---------------------------------|---|
| 0 | 32 |
| 1 | 2000 |

If the content of the BeamLink Maintenance Value subfield is greater than 0, it is used to calculate dot11BeamLinkMaintenanceTime as follows:

$$\text{dot11BeamLinkMaintenanceTime} = \text{BLMU} \times \text{BLMV}$$

where

BLMU is the value of the BeamLink Maintenance Unit corresponding to the value of the BeamLink Maintenance Unit Index subfield (see Table 9-283)

BLMV is the value of the BeamLink Maintenance Value subfield

Otherwise, if the value of the BeamLink Maintenance Value subfield is 0, the dot11BeamLinkMaintenanceTime is left undefined. An undefined value of the dot11BeamLinkMaintenanceTime indicates that the STA does not participate in beamformed link maintenance.

The BeamLink isMaster subfield is set to 1 to indicate that the STA is the master of the data transfer and set to 0 if the STA is a slave of the data transfer. The STAs use the BeamLink isMaster subfield to negotiate the dot11BeamLinkMaintenanceTime as specified in Table 9-284.

NOTE—In Table 9-284, STA-A and STA-B refer to any of the STAs performing the Beamformed Link Maintenance negotiation procedure in no particular order.

Table 9-284—The Beamformed Link Maintenance negotiation

| BeamLink isMaster subfield (STA-A) | BeamLink isMaster subfield (STA-B) | dot11BeamLinkMaintenanceTime (STA-A) vs. dot11BeamLinkMaintenanceTime (STA-B) | Result |
|---|---|---|---|
| 0 | 0 | ≥ | dot11BeamLinkMaintenanceTime (STA-A) |
| 1 | 0 | >, <, = | dot11BeamLinkMaintenanceTime (STA-A) |
| 1 | 1 | = | dot11BeamLinkMaintenanceTime (STA-A) |
| 0 or 1 | 0 or 1 | If either dot11BeamLinkMaintenanceTime (STA-A) or dot11BeamLinkMaintenanceTime (STA-B) is undefined | Undefined |

9.6 Action frame format details

9.6.1 Introduction

Subclause 9.6 describes the Action field formats allowed in each of the action categories defined in Table 9-47 in 9.4.1.11.

9.6.2 Spectrum management Action frames

9.6.2.1 General

Five Action frame formats are defined for spectrum management. A Spectrum Management Action field, in the octet field immediately after the Category field, differentiates the five formats. The Spectrum Management Action field values associated with each frame format are defined in Table 9-285.

Table 9-285—Spectrum Management Action field values

| Spectrum Management Action field value | Description |
|---|-----------------------------|
| 0 | Measurement Request |
| 1 | Measurement Report |
| 2 | TPC Request |
| 3 | TPC Report |
| 4 | Channel Switch Announcement |
| 5–255 | Reserved |

9.6.2.2 Measurement Request frame format

The Measurement Request frame uses the Action frame body format and is transmitted to request another STA to measure one or more channels. The format of the Measurement Request Action field is shown in Figure 9-643.

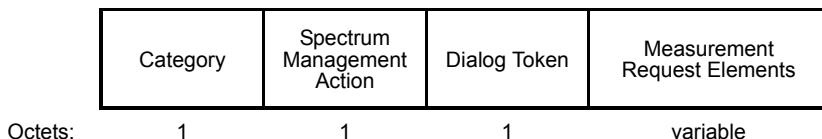

Figure 9-643—Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The Measurement Request Elements field contains one or more of the Measurement Request elements described in 9.4.2.21. The number and length of the Measurement Request elements in a Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.2.3 Measurement Report frame format

The Measurement Report frame uses the Action frame body format and is transmitted in response to a Measurement Request frame or transmitted autonomously providing measurement information. The format of the Measurement Report Action field is shown in Figure 9-644.

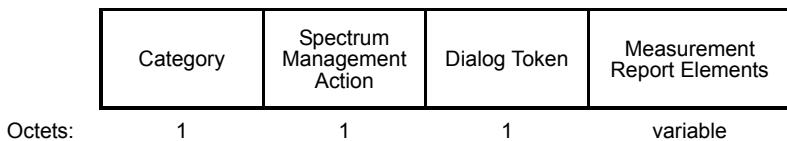

Figure 9-644—Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to the same value as the Dialog Token field of the corresponding Measurement Request frame. If the Measurement Report frame is not being transmitted in response to a Measurement Request frame, then the dialog token is set to 0.

The Measurement Report Elements field contains one or more of the Measurement Report elements described in 9.4.2.22. The number and length of the Measurement Report elements in a Measurement Report frame are limited by the maximum allowed MMPDU size.

9.6.2.4 TPC Request frame format

The TPC Request frame uses the Action frame body format and is transmitted requesting another STA for transmit power and link margin information. The format of the TPC Request Action field is shown in Figure 9-645.

| | | | |
|----------|----------------------------|--------------|---------------------|
| Category | Spectrum Management Action | Dialog Token | TPC Request element |
| Octets: | 1 | 1 | 1 |

Figure 9-645—TPC Request frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The TPC Request element is set as described in 9.4.2.16.

9.6.2.5 TPC Report frame format

The TPC Report frame uses the Action frame body format and is transmitted in response to a TPC Request frame. The format of the TPC Report Action field is shown in Figure 9-646.

| | | | |
|----------|----------------------------|--------------|--------------------|
| Category | Spectrum Management Action | Dialog Token | TPC Report element |
| Octets: | 1 | 1 | 4 |

Figure 9-646—TPC Report frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding TPC Request frame.

The TPC Report element is set as described 9.4.2.17.

9.6.2.6 Channel Switch Announcement frame format

The Channel Switch Announcement frame uses the Action frame body format and is transmitted by an AP, IBSS STA, or mesh STA to advertise a channel switch. The format of the Channel Switch Announcement Action field is shown in Figure 9-647.

| | | | | | | | | |
|----------|----------------------------|-------------------------------------|----------------------------------|--|---------------------------------------|-------------------------------------|----------|--------------|
| Category | Spectrum Management Action | Channel Switch Announcement element | Secondary Channel Offset element | Mesh Channel Switch Parameters element | Wide Bandwidth Channel Switch element | New Transmit Power Envelope element | Optional | Zero or more |
| Octets: | 1 | 1 | 5 | 0 or 3 | 0 or 8 | 0 or 5 | variable | |

Figure 9-647—Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Spectrum Management Action field is defined in 9.6.2.1.

The Channel Switch Announcement element is set as described 9.4.2.19.

The Secondary Channel Offset element is defined in 9.4.2.20. This element is present when switching to a 40 MHz or wider channel. It can be present when switching to a 20 MHz channel (in which case the Secondary Channel Offset field is set to SCN); see 11.40.4.

The Mesh Channel Switch Parameters element is defined in 9.4.2.103. This element is present when a mesh STA performs MBSS channel switching. Otherwise, the Mesh Channel Switch Parameters element is not present.

The Wide Bandwidth Channel Switch element is defined in 9.4.2.161. This element is present when switching to a channel width wider than 40 MHz.

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.162) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the local maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after channel switching (see 11.40.1).

9.6.3 QoS Action frame details

9.6.3.1 General

Several Action frame formats are defined for QoS purposes. These frames are identified by the single octet QoS Action field, which follows immediately after the Category field. The values of the QoS Action field are defined in Table 9-286.

Table 9-286—QoS Action field values

| QoS Action field value | Meaning |
|------------------------|-----------------------|
| 0 | ADTS Request |
| 1 | ADTS Response |
| 2 | DELTS |
| 3 | Schedule |
| 4 | QoS Map Configure |
| 5 | ADTS Reserve Request |
| 6 | ADTS Reserve Response |
| 7–255 | Reserved |

Two variants are defined for the ADTS frames: a Basic ADTS frame variant and a DMG ADTS frame variant. These variants use different TSPEC formats. The variant of the frame is indicated by the Element ID in the fourth field of the ADTS Request frame Action field format (Table 9-303) and sixth field of the

ADTS Response frame Action field format (Table 9-304). The Element ID is the first octet of each of these fields. The encoding of the ADTS frame variants is shown in Table 9-287 and Table 9-288.

Table 9-287—Encoding of the ADTS Request frame variant

| Element ID of fourth field of ADTS Request frame | ADTS Request frame variant |
|--|----------------------------|
| 13 (TSPEC) | Basic ADTS Request frame |
| 146 (DMG TSPEC) | DMG ADTS Request frame |

Table 9-288—Encoding of the ADTS Response frame variant

| Element ID of sixth field of ADTS Response frame | ADTS Response frame variant |
|--|-----------------------------|
| 13 (TSPEC) | Basic ADTS Response frame |
| 146 (DMG TSPEC) | DMG ADTS Response frame |

9.6.3.2 Basic and DMG ADTS Request frame format

9.6.3.2.1 Basic ADTS Request frame variant

The ADTS frames are used to carry TSPEC and optionally TCLAS elements to set up and maintain TSs using the procedures defined in 11.4.

The Action field of the ADTS Request frame contains the information shown in Table 9-289.

Table 9-289—Basic ADTS Request frame variant Action field format

| Order | Information | Notes |
|-------|--|-------------------------------|
| 1 | Category | |
| 2 | QoS Action | |
| 3 | Dialog token | |
| 4 | TSPEC | |
| 5 | TCLAS | Optional |
| 6 | TCLAS Processing | Optional |
| 7 | U-APSD Coexistence | Optional |
| 8 | Expedited Bandwidth Request element | Optional |
| 9 | Intra-Access Category Priority element | Optional |
| 10 | Higher Layer Stream ID element | Only in AP-initiated TS setup |
| 11 | Multi-band | Optional |
| 12 | U-PID | Optional |
| 13 | Multiple MAC Sublayers | Optional |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The values of the Dialog Token, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTs.request primitive that causes the frame to be sent. Some of the TSPEC parameters have the same values as the corresponding parameters in the invocation of the MLME-ADDTs.request primitive, while the values of the other fields (i.e., Surplus Bandwidth Allowance, Minimum Service Interval, Maximum Service Interval, and Minimum PHY Rate) are generated within the MAC.

The TSPEC element, defined in 9.4.2.30, and the optional TCLAS element, defined in 9.4.2.31, contain the QoS parameters that define the TS. The TS is identified by the TSID and Direction fields within the TSPEC element. The TCLAS element is optional at the discretion of the STA that sends the ADDTS Request frame, regardless of the setting of the access policy (EDCA, SPCA, or HCCA). There are zero or more TCLAS elements in the ADDTS frame. The TCLAS Processing element is present when there is more than one TCLAS element and is defined in 9.4.2.33. An Expedited Bandwidth Request element is optionally present, which is defined in 9.4.2.94.

The U-APSD Coexistence element, defined in 9.4.2.91, contains the coexistence parameters requested by the non-AP STA when using the U-APSD coexistence capability as described in 11.2.3.5.2. The U-APSD Coexistence element is optionally present.

An Intra-Access Category Priority element is optionally present, which is defined in 9.4.2.121 and described in 11.4.1.

The Higher Layer Stream ID element (9.4.2.125) provides the stream identifier from a higher layer protocol. The Higher Layer Stream ID element is present only in the AP-initiated TS setup (11.4.4.3).

When present in an ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Request frame applies and contains band-specific information.

When present in the ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC element contained in this frame.

When present in the ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.2.2 DMG ADDTS Request frame variant

The DMG ADDTS Request frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Request frame contains the information shown in Table 9-290.

Table 9-290—DMG ADDTS Request frame variant Action field format

| Order | Information | Notes |
|-------|--------------|-------|
| 1 | Category | |
| 2 | Action | |
| 3 | Dialog Token | |

Table 9-290—DMG ADDTS Request frame variant Action field format (continued)

| Order | Information | Notes |
|-------|------------------------|----------|
| 4 | DMG TSPEC | |
| 5 | TSPEC | Optional |
| 6 | TCLAS | Optional |
| 7 | TCLAS Processing | Optional |
| 8 | Multi-band | Optional |
| 9 | U-PID | Optional |
| 10 | Multiple MAC Sublayers | Optional |
| 11 | Higher Layer Stream ID | Optional |

The values of the Dialog Token, DMG TSPEC, TSPEC, TCLAS, and subsequent fields of this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTs.request primitive that causes the frame to be sent.

The DMG TSPEC element contains the parameters that define an allocation. The allocation uniquely identified by the Source AID, Allocation ID, and Destination AID subfields within the DMG TSPEC element.

The optional TSPEC element defines a TS that can use the allocation if the allocation is created successfully.

The TCLAS element is optional and can be present only when a TSPEC element is present; it is used to identify the destination non-AP and non-PCP DMG STA of the ADDTS Request frame. There can be one or more TCLAS elements in the DMG ADDTS Request frame. The TCLAS Processing element is present if there is more than one TCLAS element.

When present in a DMG ADDTS Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Request frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC element contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Request frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster.

9.6.3.3 Basic and DMG ADDTS Response frame format

9.6.3.3.1 Basic ADDTS Response frame variant

The ADDTS Response frame is transmitted in response to an ADDTS Request frame. The Action field of the ADDTS Response frame contains the information shown in Table 9-291.

Table 9-291—Basic ADDTS Response frame variant Action field format

| Order | Information | Notes |
|-------|-----------------------------|--|
| 1 | Category | |
| 2 | QoS Action | |
| 3 | Dialog Token | |
| 4 | Status Code | |
| 5 | TS Delay | |
| 6 | TSPEC | |
| 7 | TCLAS | Optional |
| 8 | TCLAS Processing | Optional |
| 9 | Schedule | Optionally present if the status code is equal to SUCCESS; otherwise not present |
| 10 | Expedited Bandwidth Request | Optional |
| 11 | Higher Layer Stream ID | Only in AP-initiated TS setup |
| 12 | Multi-band | Optional |
| 13 | U-PID | Optional |
| 14 | Multiple MAC Sublayers | Optional |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Status Code field is defined in 9.4.1.9.

The values the Dialog Token, TS Delay, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTs.response primitive that causes the frame to be sent. The TS Delay element is present in an ADDTS Response frame only if the status code is equal to REJECTED_FOR_DELAY_PERIOD.

The Schedule element, defined in 9.4.2.34, is present in an ADDTS Response frame only if the status code is equal to SUCCESS(i.e., when the TS is admitted).

The Higher Layer Stream ID element is present only in AP-initiated TS setup. The Higher Layer Stream ID element (9.4.2.125) contains the stream identifier provided by a higher layer protocol.

When present in an ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDTS Response frame applies and contains band-specific information.

When present in the ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TID/TSID specified within the TSPEC contained in this frame.

When present in the ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.34).

9.6.3.3.2 DMG ADDTS Response frame variant

The DMG ADDTS Response frame is used by DMG STAs in a PBSS and in an infrastructure BSS. The Action field of the DMG ADDTS Response frame contains the information shown in Table 9-292.

Table 9-292—DMG ADDTS Response frame variant Action field format

| Order | Information | Notes |
|-------|------------------------|----------|
| 1 | Category | |
| 2 | Action | |
| 3 | Dialog Token | |
| 4 | Status code | |
| 5 | TS Delay | |
| 6 | DMG TSPEC | |
| 7 | TSPEC | Optional |
| 8 | TCLAS | Optional |
| 9 | TCLAS Processing | Optional |
| 10 | Multi-band | Optional |
| 11 | U-PID | Optional |
| 12 | Multiple MAC Sublayers | Optional |
| 13 | Higher Layer Stream ID | Optional |

The values of the Dialog Token, TS Delay, DMG TSPEC, TSPEC, TCLAS, and subsequent fields in this frame are the same as the values of the corresponding parameters in the invocation of the MLME-ADDTs.response primitive that causes the frame to be sent. The TS Delay element is present in a DMG ADDTS Response frame only if the status code is set to REJECTED_FOR_DELAY_PERIOD (9.4.1.9).

When present in a DMG ADDTS Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the TS identified by the optional TSPEC element applies.

When present in the DMG ADDTS Response frame, the U-PID element indicates the upper layer protocol associated with the TS identified by the optional TSPEC contained in this frame. If a TSPEC element is not present in the frame, the U-PID element is not present in the frame.

When present in the DMG ADDTS Response frame, the Multiple MAC Sublayers element is used to establish an MMSL cluster (see 11.34).

9.6.3.4 DELTS frame format

The DELTS frame is used to delete a TS or an allocation using the procedures defined in 11.4.9.

The Action field of a DELTS frame contains the information shown in Table 9-293.

Table 9-293—DELTS frame Action field format

| Order | Information |
|-------|--------------------------------|
| 1 | Category |
| 2 | QoS Action |
| 3 | TS Info |
| 4 | Reason Code |
| 5 | DMG Allocation Info (optional) |
| 6 | Multi-band (optional) |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The TS Info field is defined in 9.4.2.30. Either the field identifies an existing TS created using the TSPEC element, or all its subfields are set to 0. The DMG Allocation Info field, defined in 9.4.2.134, is present when an existing DMG allocation is being deleted. When a DMG allocation is being deleted, the DMG Allocation Info field identifies an existing allocation created using the DMG TSPEC element. When a DMG allocation is not being deleted, all subfields in the DMG Allocation Info field are set to 0.

The Reason Code field is defined in 9.4.1.7.

A DELTS frame is used to delete a TS characterized by the TS Info field or to delete a DMG allocation identified by the DMG Allocation Info field in the frame. A DELTS frame can be sent from the HC or PCP to the source STA of that TS, or vice versa, to indicate an imperative request, to which no response is required from the recipient STA.

When present in an DELTS frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELTS frame applies.

9.6.3.5 Schedule frame format

The Schedule frame is transmitted by the HC to announce the schedule of delivery of data and polls. The Action field of the Schedule frame contains the information shown in Table 9-294.

Table 9-294—Schedule frame Action field format

| Order | Information |
|-------|-------------|
| 1 | Category |
| 2 | QoS Action |
| 3 | Schedule |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1.

The Schedule element is defined in 9.4.2.34.

9.6.3.6 QoS Map Configure frame format

The QoS Map Configure frame is used by an AP to provide the QoS Map information to a non-AP STA using the procedures defined in 11.25.9.

The Action field of the QoS Map Configure frame contains the information shown in Table 9-295.

Table 9-295—QoS Map Configure frame Action field format

| Order | Information |
|-------|--|
| 0 | Category |
| 1 | Action |
| 2 | QoS Map |
| 3 | Intra-Access Category Priority elements (optional) |

The Category field is defined in 9.4.1.11.

The Action field is defined in 9.6.3.1.

The QoS Map element is defined in 9.4.2.95.

Zero or more Intra-Access Category Priority elements are present, which are defined in 9.4.2.121.

9.6.3.7 ADDTS Reserve Request frame format

The ADDTS Reserve Request frame is transmitted by an AP to a non-AP STA in response to a higher layer protocol. See 11.4.4.3.

The Action field of the ADDTS Reserve Request frame contains the information shown in Table 9-296.

Table 9-296—ADDTS Reserve Request frame Action field format

| Order | Information |
|-------|------------------------|
| 1 | Category |
| 2 | QoS Action |
| 3 | TSPEC |
| 4 | Schedule |
| 5 | Higher Layer Stream ID |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1. ADDTS Reserve Request.

The TSPEC element contains the QoS parameters that define the TS. The QoS parameters in the TSPEC are equivalent to the QoS parameters of the higher level stream identified by the Higher Level Stream ID. The TS is identified by the TSID and Direction fields within the TSPEC element.

The Schedule element is defined in 9.4.2.34 and set to reflect schedule information corresponding to the TSPEC specification.

The Higher Layer Stream ID element (defined in 9.4.2.125) provides the stream identifier from a higher layer protocol.

9.6.3.8 ADDTS Reserve Response frame format

An ADDTS Reserve Response frame is used by a non-AP STA to indicate the completion of an AP-initiated TS setup procedure (11.4.4.3). The Action field of the ADDTS Reserve Response frame contains the information shown in Table 9-297.

Table 9-297—ADDTS Reserve Response frame Action field format

| Order | Information |
|-------|------------------------|
| 1 | Category |
| 2 | QoS Action |
| 3 | Higher Layer Stream ID |
| 4 | Status Code |

The Category field is defined in 9.4.1.11.

The QoS Action field is defined in 9.6.3.1. representing ADDTS Reserve Response.

The Higher Layer Stream ID is defined in 9.4.2.125.

The Status Code field is defined in 9.4.1.9.

9.6.4 DLS Action frame details

9.6.4.1 General

Several Action frame formats are defined for DLS management purposes. A DLS Action field, in the octet field immediately after the Category field, differentiates the formats. The DLS Action field values associated with each frame format are defined in Table 9-298.

Table 9-298—DLS Action field values

| DLS Action field value | Meaning |
|------------------------|--------------|
| 0 | DLS Request |
| 1 | DLS Response |
| 2 | DLS Teardown |
| 3–255 | Reserved |

9.6.4.2 DLS Request frame format

The DLS Request frame is used to set up a direct link with a peer MAC. The Action field of the DLS Request frame contains the information shown in Table 9-299, with some fields being optionally present as indicated in the “Notes” column of the table.

Table 9-299—DLS Request frame Action field format

| Order | Information | Notes |
|-------|---|--|
| 1 | Category | |
| 2 | DLS Action | |
| 3 | Destination MACAddress | |
| 4 | Source MACAddress | |
| 5 | Capability Information | |
| 6 | DLS Timeout Value | |
| 7 | Supported Rates and BSS Membership Selectors | |
| 8 | Extended Supported Rates and BSS Membership Selectors | |
| 9 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 10 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented is true. |
| 11 | VHT Capabilities | The VHT Capabilities element is present if the dot11VHTOptionImplemented is true. |

The Category field is defined in 9.4.1.11.

The DLS Action field is defined in 9.6.4.1.

The Destination MAC Address field value is the MAC address of the target destination.

The Source MAC Address field value is the MAC address of the initiating STA.

The Capability Information field value is the capability information of the originator of the request.

The DLS Timeout Value field is defined in 9.4.1.13.

The Supported Rates and BSS Membership Selectors and Extended Supported Rates and BSS Membership Selectors fields contain the supported rates information of the originator.

9.6.4.3 DLS Response frame format

The DLS Response frame is sent in response to a DLS Request frame. The Action field of a DLS Response frame contains the information shown in Table 9-300, with some fields being optionally present as indicated in the “Notes” column of the table.

Table 9-300—DLS Response frame Action field format

| Order | Information | Notes |
|--------------|---|--|
| 1 | Category | |
| 2 | DLS Action | |
| 3 | Status Code | |
| 4 | Destination MACAddress | |
| 5 | Source MACAddress | |
| 6 | Capability Information | |
| 7 | Supported Rates and BSS Membership Selectors | |
| 8 | Extended Supported Rates and BSS Membership Selectors | |
| 9 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 10 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented is true. |
| 11 | VHT Capabilities | The VHT Capabilities element is present if the dot11VHTOptionImplemented is true. |

The Category field is defined in 9.4.1.11.

The DLS Action field is defined in 9.6.4.1.

The Status Code field is defined in 9.4.1.9.

The Destination MAC Address field value and the Source MAC Address field value are copied from the corresponding fields in the DLS Request frame.

The Capability Information field is the capability information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).

The Supported Rates and BSS Membership Selectors and Extended Supported Rates and BSS Membership Selectors fields contain the supported rates information of the target destination. This information is included only if the DLS result code corresponds to SUCCESS (DLS status code 0).

9.6.4.4 DLS Teardown frame format

The DLS Teardown frame is sent to terminate a direct link with a peer MAC. The Action field of the DLS Teardown frame contains the information shown in Table 9-301.

Table 9-301—DLS Teardown frame Action field format

| Order | Information |
|-------|-------------------------|
| 1 | Category |
| 2 | DLS Action |
| 3 | Destination MAC Address |
| 4 | Source MAC Address |
| 5 | Reason Code |

The Category field is defined in 9.4.1.11.

The DLS Action field is defined in 9.6.4.1.

The Destination MAC Address field value is the MAC address of the target destination.

The Source MAC Address field value is the MAC address of the initiating STA.

The Reason Code field is defined in 9.4.1.7.

9.6.5 Block Ack Action frame details

9.6.5.1 General

ADDBA Request and ADDBA Response frames are used to set up or, if a STA is PBAC, to modify Block Ack operation for a specific TC, TS, or GCR group address. A Block Ack Action field, in the octet immediately after the Category field, differentiates the Block Ack Action frame formats. The Block Ack Action field values associated with each frame format within the Block Ack category are defined in Table 9-302.

Table 9-302—Block Ack Action field values

| Block Ack Action field values | Meaning |
|-------------------------------|----------------|
| 0 | ADDBA Request |
| 1 | ADDBA Response |
| 2 | DELBA |
| 3–255 | Reserved |

9.6.5.2 ADDBA Request frame format

An ADDBA Request frame is sent by an originator of block ack to another STA. The Action field of an ADDBA Request frame contains the information shown in Table 9-303.

Table 9-303—ADDBA Request frame Action field format

| Order | Information |
|-------|--------------------------------------|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | Dialog Token |
| 4 | Block Ack Parameter Set |
| 5 | Block Ack Timeout Value |
| 6 | Block Ack Starting Sequence Control |
| 7 | GCR Group Address element (optional) |
| 8 | Multi-band (optional) |
| 9 | TCLAS (optional) |
| 10 | ADDBA Extension (optional) |

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.5.1.

The Dialog Token field is set to a nonzero value chosen by the STA.

The Block Ack Parameter Set field is defined in 9.4.1.14.

The Block Ack Timeout Value field is defined in 9.4.1.15.

The Starting Sequence Number subfield of the Block Ack Starting Sequence Control field (see Figure 9-27) contains the sequence number of the first or next (in the case of a renegotiation of a block ack agreement) MSDU to be sent under this block ack agreement. The Fragment Number subfield is set to 0.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the ADDBA Request frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.139.

9.6.5.3 ADDBA Response frame format

The ADDBA Response frame is sent in response to an ADDBA Request frame. The Action field of an ADDBA Response frame contains the information shown in Table 9-304.

Table 9-304—ADDBA Response frame Action field format

| Order | Information |
|-------|--------------------------------------|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Block Ack Parameter Set |
| 6 | Block Ack Timeout Value |
| 7 | GCR Group Address element (optional) |
| 8 | Multi-band (optional) |
| 9 | TCLAS (optional) |
| 10 | ADDBA Extension (optional) |

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.5.1.

The Dialog Token field value is copied from the corresponding received ADDBA Request frame.

The Status Code field is defined in 9.4.1.9.

The Block Ack Parameter Set field is defined in 9.4.1.14.

The Block Ack Timeout Value field is defined in 9.4.1.15.

If the GCR Group Address element is present, the TID field within the Block Ack Parameter Set field is reserved.

The GCR Group Address element contains the group address for which a block ack agreement is requested.

When present in an ADDBA Response frame, the Multi-band element indicates the frequency band ID, operating class, and channel number to which the ADDBA Response frame applies and contains band-specific information.

The ADDBA Extension element is defined in 9.4.2.139.

9.6.5.4 DELBA frame format

The DELBA frame is sent by either the originator of the traffic or the recipient to terminate the block ack participation. The Action field of a DELBA frame format contains the information shown in Table 9-305.

Table 9-305—DELBA frame Action field format

| Order | Information |
|-------|-------------------------|
| 1 | Category |
| 2 | Block Ack Action |
| 3 | DELBA Parameter Set |
| 4 | Reason Code |
| 5 | DELBA GCR Group Address |
| 6 | Multi-band (optional) |
| 7 | TCLAS (optional) |

The Category field is defined in 9.4.1.11.

The Block Ack Action field is defined in 9.6.5.1.

The DELBA Parameter Set field is defined in 9.4.1.16.

The Reason Code field is defined in 9.4.1.7.

The DELBA GCR Group Address field is defined in 9.4.2.126 and contains the GCR group address whose block ack agreement is being terminated.

When present in an DELBA frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the DELBA frame applies.

9.6.6 Vendor-specific action details

The Vendor Specific frame is defined for vendor-specific signaling. The format of the Action field of the Vendor Specific frame is shown in Figure 9-648. An Organization Identifier, in the octet field immediately after the Category field, differentiates the vendors (see 9.4.1.32).

NOTE—If management frame protection is negotiated, then Vendor Specific Protected Action frames (see Table 9-47) are protected; otherwise they are unprotected.

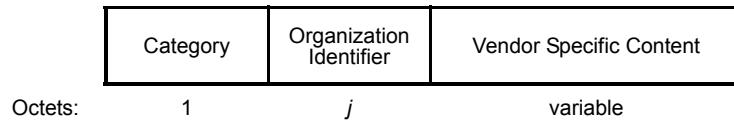

Figure 9-648—Vendor Specific frame Action field format

The Category field is defined in 9.4.1.11.

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.32. The order of the Organization Identifier field is described in 9.2.2.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific frame is limited by the maximum allowed MMPDU size.

9.6.7 Radio Measurement action details

9.6.7.1 General

Several Action frame formats are defined for radio measurement purposes. A Radio Measurement Action field, in the octet field immediately after the Category field, differentiates the formats. The Radio Measurement Action field values associated with each frame format are defined in Table 9-306.

Table 9-306—Radio Measurement Action field values

| Radio Measurement Action field value | Description |
|--------------------------------------|---------------------------|
| 0 | Radio Measurement Request |
| 1 | Radio Measurement Report |
| 2 | Link Measurement Request |
| 3 | Link Measurement Report |
| 4 | Neighbor Report Request |
| 5 | Neighbor Report Response |
| 6–255 | Reserved |

9.6.7.2 Radio Measurement Request frame format

The Radio Measurement Request frame uses the Action frame body format. It is transmitted to another STA to request that it makes one or more measurements on one or more channels. The format of the Action field in the Radio Measurement Request frame is shown in Figure 9-649.

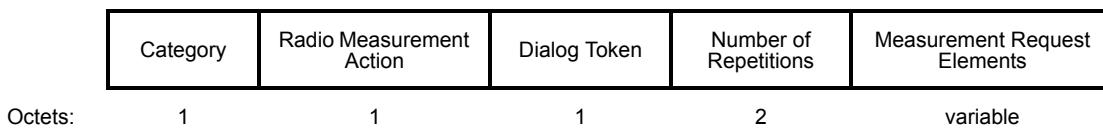

Figure 9-649—Radio Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the radio measurement request to identify the request/report transaction.

The Number of Repetitions field contains the requested number of repetitions for all of the Measurement Request elements in this frame. A value of 0 in the Number of Repetitions field indicates Measurement Request elements are executed once without repetition. A value of 65 535 in the Number of Repetitions field indicates Measurement Request elements are repeated until the measurement is canceled or superseded.

The Measurement Request Elements field contains zero or more of the Measurement Request elements described in 9.4.2.21. The number and length of the Measurement Request elements in a Measurement Request frame are limited by the maximum allowed MMPDU size.

9.6.7.3 Radio Measurement Report frame format

The Radio Measurement Report frame uses the Action frame body format. It is transmitted in response to a Radio Measurement Request frame or by a STA providing a triggered autonomous measurement report. The format of the Action field in the Radio Measurement Report frame is shown in Figure 9-650.

| Category | Radio Measurement Action | Dialog Token | Measurement Report Elements |
|----------|--------------------------|--------------|-----------------------------|
| Octets: | 1 | 1 | 1 variable |

Figure 9-650—Radio Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field is set to the value in the corresponding Radio Measurement Request frame. If the Radio Measurement Report frame is not being transmitted in response to a Radio Measurement Request frame then the dialog token is set to 0.

The Measurement Report Elements field contains one or more Measurement Report elements described in 9.4.2.22. The number and length of the Measurement Report elements in a single Radio Measurement Report frame are limited by the maximum allowed MMPDU size. Subclause 11.11.6 describes the required behavior for multiframe Radio Measurement Report frame responses.

9.6.7.4 Link Measurement Request frame format

The Link Measurement Request frame is transmitted by a STA to request another STA to respond with a Link Measurement Report frame to enable measurement of link path loss and estimation of link margin. In a non-DMG BSS, a Link Measurement Request frame is an Action frame and in a DMG BSS, a Link Measurement Request frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Request frame is shown in Figure 9-651.

| Category | Radio Measurement Action | Dialog Token | Transmit Power Used | Max Transmit Power |
|----------|--------------------------|--------------|---------------------|--------------------|
| Octets: | 1 | 1 | 1 | 1 |

Figure 9-651—Link Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

The Transmit Power Used field is set to the transmit power used to transmit the frame containing the Link Measurement Request, as described in 9.4.1.20.

The Max Transmit Power field provides the upper limit on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. This field is described in 9.4.1.19. The Max Transmit Power field is a 2s complement signed integer and is 1 octet in length,

providing an upper limit, in a dBm scale, on the transmit power as measured at the output of the antenna connector to be used by the transmitting STA on its operating channel. The maximum tolerance for the value reported in Max Transmit Power field is ± 5 dB. The value of the Max Transmit Power field is equal to the minimum of the maximum powers at which the STA is permitted to transmit in the operating channel by device capability, policy, and regulatory authority.

9.6.7.5 Link Measurement Report frame format

The Link Measurement Report frame is transmitted in response to a Link Measurement Request frame. In a non-DMG BSS, a Link Measurement Report frame is an Action frame and in a DMG BSS, a Link Measurement Report frame is an Action or an Action No Ack frame. The format of the Action field in the Link Measurement Report frame is shown in Figure 9-652.

| Category | Radio Measurement Action | Dialog Token | TPC Report element | Receive Antenna ID | Transmit Antenna ID | RCPI | RSNI | DMG Link Margin | DMG Link Adaptation Acknowledgment |
|----------|--------------------------|--------------|--------------------|--------------------|---------------------|------|------|-----------------|------------------------------------|
| Octets: | 1 | 1 | 1 | 4 | 1 | 1 | 1 | variable | variable |

Figure 9-652—Link Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding Link Measurement Request frame.

The TPC Report element is set as described in 9.4.2.17.

The Receive Antenna ID field contains the identifying number for the antenna(s) used to receive the corresponding Link Measurement Request frame. Antenna ID is defined in 9.4.2.40.

The Transmit Antenna ID field contains the identifying number for the antenna(s) used to transmit this Link Measurement Report frame. Antenna ID is defined in 9.4.2.40.

RCPI indicates the received channel power of the corresponding Link Measurement Request frame, which is a logarithmic function of the received signal power, as defined in 9.4.2.38.

RSNI indicates the received signal-to-noise indication for the corresponding Link Measurement Request frame, as described in 9.4.2.41.

The DMG Link Margin field is optionally present. When present, it contains a DMG Link Margin element (see 9.4.2.142).

The DMG Link Margin Adaptation Acknowledgment field is optionally present. When present, it contains a DMG Link Margin Adaptation Acknowledgment element (see 9.4.2.143).

9.6.7.6 Neighbor Report Request frame format

The Neighbor Report Request frame uses the Action frame body format and is transmitted requesting information in the neighbor report about neighboring APs. The format of the Action field in the Neighbor Report Request frame is shown in Figure 9-653.

| Category | Radio Measurement Action | Dialog Token | SSID (optional) | LCI Measurement Request (optional) | Location Civic Measurement Request (optional) |
|----------|--------------------------|--------------|-----------------|------------------------------------|---|
| Octets: | 1 | 1 | 1 | variable | variable |

Figure 9-653—Neighbor Report Request frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the measurement request to identify the request/report transaction.

The SSID field is optionally present. If present, it contains an SSID element. The presence of an SSID element in a Neighbor Report Request frame indicates a request for a neighbor list for the specified SSID in the SSID Element. The absence of an SSID element indicates neighbor report for the current ESS.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-82), which indicates a request for a Measurement Report subelement with Measurement Type field equal to LCI for each Neighbor Report element (see 11.11.10.2). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-94). The Request, Report and Duration Mandatory bits within the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.21.1).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-82). The element indicates a request for a Measurement Report subelement with Measurement Type field equal to Location Civic for each Neighbor Report element (see 11.11.10.2). The Enable bit in the Measurement Request Mode field within the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is equal to Location Subject Remote (see Table 9-94). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory bits in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.21.1).

9.6.7.7 Neighbor Report Response frame format

The Neighbor Report Response frame uses the Action frame body format and is transmitted in response to a Neighbor Report Request frame. The format of the Action field in the Neighbor Report Response frame is shown in Figure 9-654.

| Category | Radio Measurement Action | Dialog Token | Neighbor Report Elements |
|----------|--------------------------|--------------|--------------------------|
| Octets: | 1 | 1 | variable |

Figure 9-654—Neighbor Report Response frame Action field format

The Category field is defined in 9.4.1.11.

The Radio Measurement Action field is defined in 9.6.7.1.

The Dialog Token field set to the value in the corresponding Neighbor Report Request frame. If the Neighbor Report Response frame is not being transmitted in response to a Neighbor Report Request frame, then the dialog token is set to 0.

The Neighbor Report Elements field contains the Neighbor Report elements for validated APs described in 9.4.2.37. If the STA has no information in response to the Neighbor Report Request, the Neighbor Report elements are omitted. The number and length of the Neighbor Report Elements in a Neighbor Report frame is limited by the maximum allowed MMPDU size.

NOTE—Under some circumstances, a Neighbor Report element is included for the STA transmitting the frame. See 11.11.10.3.

9.6.8 Public Action details

9.6.8.1 Public Action frames

The Public Action frame is defined to allow the following:

- Inter-BSS and AP to unassociated-STA communications
- Intra-BSS communication
- GAS

A Public Action field, in the octet immediately after the Category field, differentiates the Public Action frame formats. The defined Public Action frames are listed in Table 9-307.

Table 9-307—Public Action field values

| Public Action field value | Description |
|---------------------------|--|
| 0 | 20/40 BSS Coexistence Management (see 9.6.8.2) |
| 1 | DSE enablement |
| 2 | DSE deenablement |
| 3 | DSE Registered Location Announcement |
| 4 | Extended Channel Switch Announcement |
| 5 | DSE measurement request |
| 6 | DSE measurement report |
| 7 | Measurement Pilot |
| 8 | DSE power constraint |
| 9 | Vendor Specific |
| 10 | GAS Initial Request (see 9.6.8.12) |
| 11 | GAS Initial Response (see 9.6.8.13) |
| 12 | GAS Comeback Request (see 9.6.8.14) |
| 13 | GAS Comeback Response (see 9.6.8.15) |
| 14 | TDLS Discovery Response |
| 15 | Location Track Notification |

Table 9-307—Public Action field values (continued)

| Public Action field value | Description |
|---------------------------|---------------------------------|
| 16 | QAB Request frame |
| 17 | QAB Response frame |
| 18 | QMF Policy |
| 19 | QMF Policy Change |
| 20 | QLoad Request |
| 21 | QLoad Report |
| 22 | HCCA TXOP Advertisement |
| 23 | HCCA TXOP Response |
| 24 | Public Key |
| 25 | Channel Availability Query |
| 26 | Channel Schedule Management |
| 27 | Contact Verification Signal |
| 28 | GDD Enablement Request |
| 29 | GDD Enablement Response |
| 30 | Network Channel Control |
| 31 | White Space Map Announcement |
| 32 | Fine Timing Measurement Request |
| 33 | Fine Timing Measurement |
| 25–255 | Reserved |

9.6.8.2 20/40 BSS Coexistence Management frame format

The 20/40 BSS Coexistence Management frame is a Public Action frame. The format of its Action field is defined in Table 9-308.

Table 9-308—20/40 BSS Coexistence Management frame Action field format

| Order | Information | Notes |
|-------|--|----------------------------|
| 1 | Category | |
| 2 | Public Action | |
| 3 | 20/40 BSS Coexistence (see 9.4.2.60) | |
| 4 | 20/40 BSS Intolerant Channel Report (see 9.4.2.58) | Appears zero or more times |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

9.6.8.3 Measurement Pilot frame format

The Measurement Pilot frame uses the Action frame format. The format of the Action field is shown in Figure 9-655.

| Category | Public Action | Condensed Capability Information | Condensed Country String | Operating Class | Channel | Measurement Pilot Interval | Optional Subelements |
|----------|---------------|----------------------------------|--------------------------|-----------------|---------|----------------------------|----------------------|
| Octets: | 1 | 1 | 1 | 2 | 1 | 1 | variable |

Figure 9-655—Measurement Pilot frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Condensed Capability Information field contains two subfields as shown in Figure 9-656.

| B0 | B1 | B2 | B7 |
|---------------------|-----------------|----------|----|
| Spectrum Management | Short Slot Time | Reserved | |
| Bits: | 1 | 1 | 6 |

Figure 9-656—Condensed Capability Information field

The Spectrum Management subfield is set to 1 if `dot11SpectrumManagementRequired` is true; otherwise, it is set to 0.

The Short Slot Time subfield is set to 1 if `dot11ShortSlotTimeOptionImplemented` and `dot11ShortSlotTimeOptionActivated` are true. Otherwise, the Short Slot Time subfield is set to 0.

The Condensed Country String field is set to the first two octets of the value contained in `dot11CountryString`.

If the Wide Bandwidth Channel Switch subelement is not included, the Operating Class field indicates the operating class value for the operating channel. The Country, Operating Class, and Channel Number fields together specify the channel frequency and spacing for the operating channel. Valid operating classes are listed in Annex E, excluding Operating Classes that encompass a primary channel but do not identify the location of the primary channel. The Channel Number field indicates the operating channel. Channel number is defined within an operating class as shown in Annex E.

If the Wide Bandwidth Channel Switch subelement is included, the fields in the Wide Bandwidth Channel Switch subelement indicate the operating channel, and the Operating Class and Channel Number together specify the primary channel and primary 40 MHz channel within the channel identified by the Wide Bandwidth Channel Switch subelement.

The Measurement Pilot Interval field is set to the value contained in `dot11RMMeasurementPilotPeriod`.

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-309.

Table 9-309—Optional subelement IDs for Measurement Pilot frame

| Subelement ID | Name | Extensible |
|---------------|-------------------------------|-------------|
| 0–70 | Reserved | |
| 71 | Multiple BSSID | Subelements |
| 72–162 | Reserved | |
| 163 | Wide Bandwidth Channel Switch | Yes |
| 164–255 | Reserved | |

The Wide Bandwidth Channel Switch subelement has the same format as the corresponding element (see 9.4.2.161) with the constraint that the New Channel Width field indicates an 80 MHz, 160 MHz, or 80+80 MHz BSS bandwidth.

The Multiple BSSID and Vendor Specific subelements have the same format as the Multiple BSSID and Vendor Specific elements (see 9.4.2.46 and 9.4.2.36, respectively). Multiple Vendor Specific subelements may be included in the list of optional subelements.

9.6.8.4 DSE Enablement frame format

The DSE Enablement frame is an Action frame. It is transmitted as part of enablement. The format of the DSE Enablement frame Action field is shown in Figure 9-657.

| Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code | Enablement Identifier |
|----------|---------------|-----------------------|-----------------------|--------------------|-----------------------|
| Octets: | 1 | 1 | 6 | 6 | 1 |

Figure 9-657—DSE Enablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the enablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the enablement responder. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Enablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-310.

The Enablement Identifier field is a 16-bit number assigned by an enabling STA to a dependent STA; otherwise, it is 0, set using the procedures defined in 11.12.

Table 9-310—Reason Result Code field values

| Reason Result Code field value | Name | Description |
|---------------------------------------|--------------------------------|--|
| 0 | | Reserved |
| 1 | | Reserved |
| 2 | | Enablement requested |
| 3 | SUCCESS | Success |
| 4 | REFUSED | Request declined |
| 5 | INVALID_PARAMETERS | Request not successful as one or more parameters have invalid values |
| 6 | TOO_MANY_SIMULTANEOUS_REQUESTS | Enablement denied because the enabling STA is unable to handle additional dependent STAs |
| 7–255 | | Reserved |

9.6.8.5 DSE Deenablement frame format

The DSE Deenablement frame is an Action frame. It is transmitted as part of deenablement. The format of the DSE Deenablement frame Action field is shown in Figure 9-658.

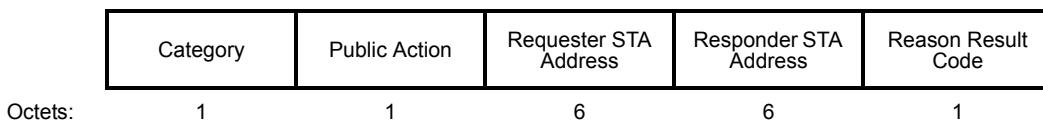

Figure 9-658—DSE Deenablement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The RequesterSTAAddress field is the MAC address of the requesting STA that initiates the deenablement process. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that becomes deenabled. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Deenablement frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-311.

Table 9-311—Reason Result Code field values

| Reason Result Code field value | Description |
|---------------------------------------|------------------------|
| 0 | Reserved |
| 1 | Reserved |
| 2 | Deenablement requested |
| 3–255 | Reserved |

9.6.8.6 DSE Registered Location Announcement frame format

The DSE Registered Location Announcement frame is transmitted by a dependent STA to advertise the registered location of its enabling STA. The format of the DSE Registered Location Announcement frame Action field is shown in Figure 9-659.

| Category | Public Action | DSE Registered Location Information |
|----------|---------------|-------------------------------------|
| Octets: | 1 | 1 |

Figure 9-659—DSE Registered Location Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The DSE Registered Location Information field is defined in 9.4.2.52.

9.6.8.7 Extended Channel Switch Announcement frame format

The Extended Channel Switch Announcement frame is transmitted by an AP, IBSS STA, or mesh STA to advertise a channel switch. The format of the Extended Channel Switch Announcement frame Action field is shown in Figure 9-660.

| Category | Public Action | Channel Switch Mode | New Operating Class | New Channel Number | Channel Switch Count | Mesh Channel Switch Parameters element | New Country element | Wide Bandwidth Channel Switch element | New Transmit Power Envelope element |
|----------|---------------|---------------------|---------------------|--------------------|----------------------|--|---------------------|---------------------------------------|-------------------------------------|
| Octets: | 1 | 1 | 1 | 1 | 1 | 0 or 8 | variable | variable | variable |

Figure 9-660—Extended Channel Switch Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Channel Switch Mode, New Operating Class, New Channel Number, and Channel Switch Count fields are as described in the Extended Channel Switch Announcement element (see 9.4.2.53).

Mesh Channel Switch Parameters element is defined in 9.4.2.103. This element is present when a mesh STA performs MBSS channel switching. The Mesh Channel Switch Parameters element is not included for channel switching other than for a MBSS channel switch.

The New Country element is present when an AP or mesh STA performs extended channel switching to a new Country, new Operating Class Table, or a changed set of operating classes relative to the contents of the Country element sent in the Beacon; otherwise, this element is not present. The format of the New Country element is defined to be the same as the format of the Country element (see 9.4.2.9), except that no Subband Triplet fields are present in the New Country element. The Country String field in the New Country element indicates the Country and Operating Class Table of the BSS after extended channel switching and Operating Triplet fields within the New Country element indicate the operating classes of the BSS after extended channel switching (see 11.40.1).

This Wide Bandwidth Channel Switch element is present when extended channel switching to a channel width wider than 40 MHz; otherwise, this element is not present. The Wide Bandwidth Channel Switch element is defined in 9.4.2.161. The Wide Bandwidth Channel Switch element indicates the BSS bandwidth after extended channel switching (see 11.40.1).

Each New Transmit Power Envelope element that is present is defined to have the same format as the Transmit Power Envelope element (see 9.4.2.162) and includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the BSS for the indicated bandwidths with an indicated unit interpretation after extended channel switching (see 11.40.1).

9.6.8.8 DSE Measurement Request frame format

The DSE Measurement Request frame is a Public Action frame requesting a DSE measurement report. It is transmitted using the procedures defined in 11.12. The format of the DSE Measurement Request frame Action field is shown in Figure 9-661.

| Category | Public Action | Requester STA Address | Responder STA Address | Operating Class | Channel Number | Measurement Start Time | Measurement Duration |
|----------|---------------|-----------------------|-----------------------|-----------------|----------------|------------------------|----------------------|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | 8 |

Figure 9-661—DSE Measurement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE measurement report. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Operating Class field indicates the channel set for which the measurement request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Start Time field is set to the timing synchronization function (TSF) at the time (± 1 TU) at which the requested DSE request measurement starts. A value of 0 indicates it starts immediately.

The Measurement Duration field is set to the duration of the requested measurement, expressed in number of time units (TUs).

9.6.8.9 DSE Measurement Report frame format

The DSE Measurement Report frame is a Public Action frame. It is transmitted using the procedures defined in 11.12. The format of the DSE Measurement Report frame Action field is shown in Figure 9-662.

| Category | Public Action | Requester STA Address | Responder STA Address | Length | Operating Class | Channel Number | Measurement Report Mode | Actual Measurement Start Time | Measurement Duration | Reported DSE LCI fields | |
|----------|---------------|-----------------------|-----------------------|--------|-----------------|----------------|-------------------------|-------------------------------|----------------------|-------------------------|---------------|
| Octets: | 1 | 1 | 6 | 6 | 2 | 1 | 1 | 1 | 8 | 2 | $n \times 26$ |

Figure 9-662—DSE Measurement Report frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The RequesterSTAAddress field is the MAC address of the STA that requested the DSE measurement report. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that operates based on the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 13.

The Operating Class field indicates the channel set for which the measurement report applies. The Operating Class and Channel Number fields together specify the channel frequency and spacing for which the measurement request applies. Valid values for the Operating Class field are shown in Annex E.

The Measurement Report Mode field is as defined in 9.4.2.22 (see Figure 9-192).

The Actual Measurement Start Time field is set to the measuring STA's TSF timer at the time (± 1 TU) at which the DSE measurement started.

The Measurement Duration field is set to the duration over which the requested measurement was measured, expressed in number of TUs.

The reported DSE LCI fields contain the DSE LCI received at the measuring STA. If the reported DSE LCI fields would cause the frame to exceed the maximum MAC management protocol data unit (MMPDU) size, then the reported DSE LCI fields are truncated so that the last reported DSE LCI field is complete. The DSE LCI field format is shown in Figure 9-663.

| | | | | | | | | | | | | | | | |
|----------------|----------------------|------------|-----------------------|-----------|---------------------------------|----------------------|----------------|------|------|------|------|------|------|------|------|
| B0 | B47 | B48 | B53 | B54 | B87 | B88 | B93 | B94 | B127 | B128 | B131 | B132 | B137 | B138 | B167 |
| SA MAC Address | Latitude Uncertainty | Latitude | Longitude Uncertainty | Longitude | Altitude Type | Altitude Uncertainty | Altitude | | | | | | | | |
| Bits: | 48 | 6 | 34 | 6 | 34 | 4 | 6 | | | | | | | | 30 |
| B168 | B170 | B171 | B172 | B173 | B174 | B175 | B176 | B191 | B192 | B199 | B200 | B207 | | | |
| Datum | RegLoc Agreement | RegLoc DSE | Dependent STA | Version | Dependent Enablement Identifier | Operating Class | Channel Number | | | | | | | | |
| Bits: | 3 | 1 | 1 | 1 | 2 | 16 | 8 | | | | | | | | 8 |

Figure 9-663—DSE LCI field format

The SA MAC Address field contains the SA MAC address from the Beacon or Public Action frame containing a DSE Registered Location element being reported.

The remaining fields are as defined in the DSE Registered Location Information field (see 9.4.2.52).

9.6.8.10 DSE Power Constraint frame format

The DSE Power Constraint frame is a Public Action frame requesting that a dependent STA constrain transmit power below the regulatory limit. It is transmitted by an enabling STA as part of enablement. The format of the DSE Power Constraint frame Action field is shown in Figure 9-664.

| Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code | Local Power Constraint |
|----------|---------------|-----------------------|-----------------------|--------------------|------------------------|
| Octets: | 1 | 1 | 6 | 6 | 1 |

Figure 9-664—DSE Power Constraint frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The RequesterSTAAddress field is the MAC address of the STA that requests the DSE power constraint. The length of the RequesterSTAAddress field is 6 octets.

The ResponderSTAAddress field is the MAC address of the responding STA that initiates the enablement. The length of the ResponderSTAAddress field is 6 octets.

The Reason Result Code field is used to indicate the reason that a DSE Power Constraint frame was generated. The length of the Reason Result Code field is 1 octet. The reason result codes that have been allocated are shown in Table 9-312.

Table 9-312—Reason Result Code field values

| Reason Result Code field value | Name | Description |
|--------------------------------|--------------------|--|
| 0 | | Reserved |
| 1 | | Reserved |
| 2 | | Power constraint requested |
| 3 | SUCCESS | Success |
| 4 | REFUSED | Refused — no reason specified |
| 5 | INVALID_PARAMETERS | Request not successful as one or more parameters have invalid values |
| 6–255 | | Reserved |

The Local Power Constraint field is coded as an unsigned integer in units of decibels relative to 1 mW. The local maximum transmit power for a channel is thus defined as the maximum transmit power level specified for the channel in the Country element minus the local power constraint specified for the channel in the DSE Power Constraint frame.

9.6.8.11 Vendor Specific Public Action frame format

The Vendor Specific Public Action frame is defined for vendor-specific signaling between unassociated STAs. The format of the Action field of the Vendor Specific Public Action frame is shown in Figure 9-665.

| Category | Public Action | Organization Identifier | Vendor Specific Content |
|----------|---------------|-------------------------|-------------------------|
| Octets: | 1 | 1 | variable |

Figure 9-665—Vendor Specific Public Action frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Organization Identifier field contains a organization identifier assigned by the IEEE and is specified in 9.4.1.32. The order of the Organization Identifier field is described in 9.2.2. The length of the Organization Identifier field is variable, as specified in 9.4.1.32.

The Vendor Specific Content field contains vendor-specific field(s). The length of the vendor specific content in a Vendor Specific frame is limited by the maximum allowed MMPDU size.

9.6.8.12 GAS Initial Request frame format

The GAS Initial Request frame is a Public Action frame. It is transmitted by a requesting STA to request information from another STA. The format of the GAS Initial Request Action field is shown in Table 9-313.

Table 9-313—GAS Initial Request Action field format

| Order | Information |
|-------|--------------------------------|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Advertisement Protocol element |
| 4 | Query Request Length |
| 5 | Query Request |
| 6 | Multi-band (optional) |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA.

The Advertisement Protocol element is defined in 9.4.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Request Length field is defined in Figure 9-666. The value of the Query Request Length field is set to the total number of octets in the Query Request field.

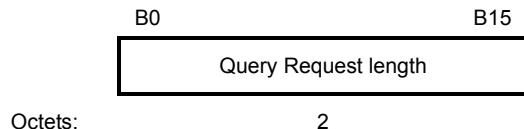

Figure 9-666—Query Request Length field

The Query Request field is defined in Figure 9-667. The Query Request field is a generic container whose value is a GAS Query that is formatted in accordance with the protocol identified in the Advertisement Protocol element.

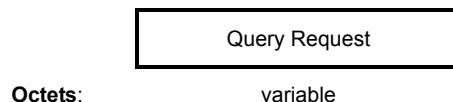

Figure 9-667—Query Request field

When present in a GAS Initial Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Request frame applies.

9.6.8.13 GAS Initial Response frame format

The GAS Initial Response frame is a Public Action frame. It is transmitted responding to a GAS Initial Request frame. The format of the GAS Initial Response Action field is shown in Table 9-314.

Table 9-314—GAS Initial Response Action field format

| Order | Information |
|-------|--------------------------------|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | GAS Comeback Delay |
| 5 | Advertisement Protocol element |
| 6 | Query Response Length |
| 7 | Query Response (optional) |
| 8 | Multi-band (optional) |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

The Status Code values are defined in Table 9-46.

The GAS Comeback Delay field specifies the delay time value in TUs. The GAS Comeback Delay field format is provided in Figure 9-668. The behavior is described in 11.25.3.2. The value 0 will be returned by the STA when a Query Response is provided in this frame.

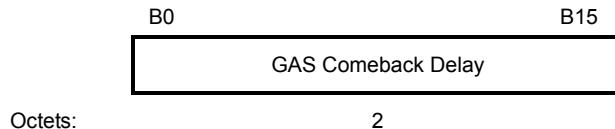

Figure 9-668—GAS Comeback Delay field

The Advertisement Protocol element is defined in 9.4.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 9-669. The value of the Query Response Length field is set to the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

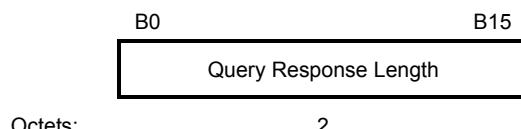

Figure 9-669—Query Response Length field

The Query Response field is defined in Figure 9-670. The Query Response field is a generic container whose value is the response to a GAS Query and is formatted in accordance with the protocol specified in the Advertisement Protocol element.

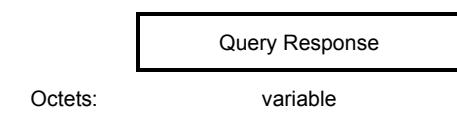

Figure 9-670—Query Response field

When present in a GAS Initial Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Initial Response frame applies.

9.6.8.14 GAS Comeback Request frame format

The GAS Comeback Request frame is a Public Action frame. It is transmitted by a requesting STA to a responding STA. The format of the GAS Comeback Request Action field is shown in Table 9-315.

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is copied from the corresponding GAS Initial Request frame.

When present in a GAS Comeback Request frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Request frame applies.

Table 9-315—GAS Comeback Request Action field format

| Order | Information |
|-------|-----------------------|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Multi-band (optional) |

9.6.8.15 GAS Comeback Response frame format

The GAS Comeback Response frame is a Public Action frame. It is transmitted by a responding STA to a requesting STA. The format of the GAS Comeback Response Action field is shown in Table 9-316.

Table 9-316—GAS Comeback Response Action field format

| Order | Information |
|-------|--------------------------------|
| 0 | Category |
| 1 | Public Action |
| 2 | Dialog Token |
| 3 | Status Code |
| 4 | GAS Query Response Fragment ID |
| 5 | GAS Comeback Delay |
| 6 | Advertisement Protocol element |
| 7 | Query Response Length |
| 8 | Query Response (optional) |
| 9 | Multi-band (optional) |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is copied from the Dialog Token field of the corresponding GAS Comeback Request frame. The same value of the Dialog Token field is present in all fragments of a multi-fragment query response.

The Status Code values are defined in Table 9-46. The same status code value will be present in all fragments of a multi-fragment query response.

The GAS Query Response Fragment ID is defined in 9.4.1.34. If the responding STA has not received a response to the query that it posted on behalf of a requesting STA, then the responding STA sets the GAS Query Response Fragment ID to 0. When there is more than one query response fragment, the responding STA sets the GAS Query Response Fragment ID to 0 for the initial fragment and increments it by 1 for each

subsequent fragment in a multi-fragment Query Response. The More GAS Fragments field is set to 0 whenever the final fragment of a query response is being transmitted. A GAS Query Response Fragment ID field having a nonzero Fragment ID and the More GAS Fragments field set to 1 indicates to the requesting STA that another GAS Comeback frame exchange should be performed to continue the retrieval of the query response.

The GAS Comeback Delay field format is provided in Figure 9-668. A nonzero GAS Comeback Delay value is returned by the responding STA in this frame to indicate that the GAS Query being carried out on behalf of the requesting STA is still in progress.

- A nonzero value indicates to the requesting STA that another GAS Comeback frame exchange should be performed after the expiration of the GAS Comeback Delay timer in order to retrieve the query response.
- This field is set to 0 for all GAS Comeback Response frames containing a query response or a fragment of a multi-fragment query response.

The Advertisement Protocol element is defined in 9.4.2.93. The Advertisement Protocol element includes exactly one Advertisement Protocol ID.

The Query Response Length field is defined in Figure 9-669. The value of the Query Response Length field is the total number of octets in the Query Response field. If the Query Response Length field is set to 0, then there is no Query Response included in this Action frame.

The Query Response field is defined in Figure 9-670. The value of the Query Response field is a generic container dependent on the advertisement protocol specified in the Advertisement Protocol element and the query itself. In a multi-fragment query response, the response to the query posted on behalf of a requesting STA is fragmented such that each fragment to be transmitted fits within the MMPDU size limitation.

When present in a GAS Comeback Response frame, the Multi-band element indicates the frequency band, operating class, and channel number to which the GAS Comeback Response frame applies.

9.6.8.16 TDLS Discovery Response frame format

The format of the TDLS Discovery Response Action field is shown in Table 9-317.

Table 9-317—TDLS Discovery Response Action field format

| Order | Information | Notes |
|-------|---|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | Public Action | The Public Action field is defined in 9.6.8.1. |
| 3 | Dialog Token | The dialog token is copied from the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12. |
| 4 | Capability | The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4. |
| 5 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates which are supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3. |
| 6 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present whenever there are more than eight supported rates, and it is optional otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.13. |

Table 9-317—TDLS Discovery Response Action field format (continued)

| Order | Information | Notes |
|-------|-------------------------------------|---|
| 7 | Supported Channels | The Supported Channels element is present if the TDLS channel switching capability field is equal to 1. The Supported Channels element is defined in 9.4.2.18. |
| 8 | RSNE | The RSNE is optionally present if security is required on the direct link. The RSNE is defined in 9.4.2.25. |
| 9 | Extended Capabilities | The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.27. |
| 10 | FTE | The FTE is optionally present if security is required on the direct link. The FTE is defined in 9.4.2.48. |
| 11 | Timeout Interval (TPK key lifetime) | The Timeout Interval element contains the TPK key lifetime. It is present if security is required on the direct link. The Timeout Interval element is defined in 9.4.2.49. |
| 12 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS channel switching capability field is equal to 1. The Supported Operating Classes element is defined in 9.4.2.54. |
| 13 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. The HT Capabilities element is defined in 9.4.2.56. |
| 14 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is present when dot112040BSSCoexistenceManagementSupport is true. The 20/40 BSS Coexistence element is defined in 9.4.2.60. |
| 15 | Link Identifier | The Link Identifier element is defined in 9.4.2.62. |
| 16 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 17 | VHT Capabilities | VHT Capabilities element (optional). The VHT Capabilities element is present if the dot11VHTOptionImplemented is true. The VHT Capabilities element is defined in 9.4.2.158. |

The TDLS Discovery Response frame is transmitted directly (i.e., not via the AP) to the TDLS peer STA that sent the corresponding TDLS Discovery Request frame. See 11.23.

9.6.8.17 Location Track Notification frame format

The Location Track Notification frame uses the Action frame body format and is transmitted to allow remote location determination to occur by another STA. The format of the Location Track Notification Action field is shown in Figure 9-671.

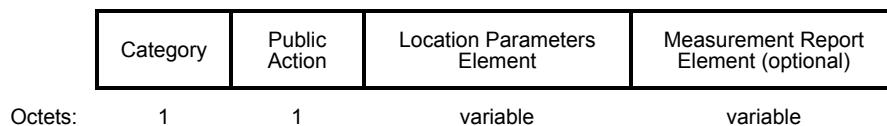

Figure 9-671—Location Track Notification Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Location Parameters Element field contains the Location Parameters subelements, described in Table 9-191. Table 9-318 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the frame.

Table 9-318—Location Parameters Element field for Location Track Notification frame

| Allowed subelements | Subelement ID | Notes |
|------------------------------|---------------|---|
| Location Indication Channels | 2 | The Location Indication Channels subelement is included in the Location Track Notification frame. |
| Radio Information | 4 | The Radio subelement is included in the Location Track Notification frame. |
| Motion | 5 | The Motion subelement is included in the Location Track Notification frame if dot11MotionDetectionActivated is true. |
| Time of Departure | 7 | The Time of Departure subelement is included in the Location Track Notification frame if dot11TODActivated is true. |
| Location Indication Options | 8 | The Location Indication Options subelement is included in the Location Track Notification frame if the successful Location Configuration Request frame that configured the STA included a Location Indication Options subelement. |

The Measurement Report Element field contains a Measurement Report element of type Beacon report as defined in 9.4.2.22.7. The Measurement Report Element field is included in the Location Track Notification frame if the Location Parameters Element field contains a Location Indication Options subelement. The Measurement Report element Measurement Token field is set to the same value of the dialog token in the Location Configuration Request frame that configured the STA.

9.6.8.18 QMF Policy frame format

The QMF Policy frame uses the Action frame format and is transmitted by a requesting STA to a receiving STA with the included QMF policy. It is either sent unsolicited by the requesting STA or in response to a QMF Policy Change frame from a receiving STA. The format of the Action field of the QMF Policy frame is shown in Figure 9-672.

Figure 9-672—QMF Policy frame Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is set to the value in the corresponding QMF Policy Change frame. If the QMF Policy frame is not being transmitted in response to a QMF Policy Change frame, then the Dialog Token field is set to 0.

The Status Code field is defined in Table 9.4.1.9.

The QMF Policy element is set as described in 9.4.2.120. It indicates the new access categories configured for Management frame(s). This field is included if the Status Code is SUCCESS and this frame is not being transmitted in response to a QMF Policy Change frame, and optionally included if the Status Code is REQUEST_DECLINED.

9.6.8.19 QMF Policy Change frame format

The QMF Policy Change frame uses the Action frame format and is transmitted by a requesting STA to request a change to the QMF policy it most recently received from the destination STA. The format of the Action field of the QMF Policy Change frame is shown in Figure 9-673.

| Category | Public Action | Dialog Token | QMF Policy element |
|----------|---------------|--------------|--------------------|
| Octets: | 1 | 1 | 1 3-257 |

Figure 9-673—QMF Policy Change Action field contents

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the QMF Policy Change frame to identify the transaction.

The QMF Policy element is set as described in 9.4.2.120. It indicates the access categories requested for Management frame(s), including any changes to the QMF policy it most recently received from the destination STA.

9.6.8.20 QLoad Request frame format

The QLoad Request frame is transmitted by an AP to request information from another AP. The Action field format of the QLoad Request frame is shown in Table 9-319.

Table 9-319—QLoad Request frame Action field format

| Order | Information |
|-------|----------------------|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | QLoad Report element |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.27.5.

The QLoad Report element is defined in 9.4.2.123 and contains the QLoad report corresponding to the AP sending the request.

9.6.8.21 QLoad Report frame format

The QLoad Report frame is transmitted by an AP responding to a QLoad Request frame. The Action field format of the QLoad Report frame is shown in Table 9-320.

Table 9-320—QLoad Report frame Action field format

| Order | Information |
|-------|----------------------|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | QLoad Report element |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.27.5. The Dialog Token field is set to 0 when an unsolicited QLoad Report frame is sent by the AP.

The QLoad Report element is defined in 9.4.2.123.

9.6.8.22 HCCA TXOP Advertisement frame

The HCCA TXOP Advertisement frame is transmitted by an AP to another AP to inform it of active and pending TXOP reservations. The Action field format of the HCCA TXOP Advertisement frame is shown in Figure 9-674.

| Category | Public Action | Dialog Token | Number of Reported TXOP Reservations | Number of Pending TXOP Reservations | Active TXOP Reservations | Pending TXOP Reservations |
|----------|---------------|--------------|--------------------------------------|-------------------------------------|--------------------------|---------------------------|
| Octets: | 1 | 1 | 1 | 1 | variable | variable |

Figure 9-674—HCCA TXOP Advertisement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is defined in 9.4.1.12 and is set by the AP to a nonzero value that is used for matching action responses with action requests. See 10.27.5.

The Number of Reported TXOP Reservations field is 1 octet in length and contains a positive integer that specifies the number of active TXOP reservations reported in this frame. A value of 0 indicates that no TXOP reservations are active.

The Number of Pending Reported TXOP Reservations field is 1 octet in length and contains a positive integer that specifies the number of pending TXOP reservations reported in this frame. A value of 0 indicates that no TXOP reservations are in the process of being activated.

The Active TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.44. This field indicates active HCCA TXOPs that the AP has scheduled. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The Pending TXOP Reservation field contains zero or more TXOP Reservation fields as defined in 9.4.1.44. This field indicates new HCCA TXOPs that the AP is scheduling. The Start Time subfield of the TXOP Reservation field is relative to the TSF of the sending AP.

The use of the HCCA TXOP Advertisement frame is described in 11.28.3.

9.6.8.23 HCCA TXOP Response frame

The HCCA TXOP Response frame is transmitted by an AP to another AP to respond to an HCCA TXOP Advertisement frame. The Action field format of the HCCA TXOP Response frame is shown in Figure 9-675.

| Category | Public Action | Dialog Token | Status Code | Schedule Conflict | Alternate Schedule | Avoidance Request |
|----------|---------------|--------------|-------------|-------------------|--------------------|-------------------|
| Octets: | 1 | 1 | 1 | 2 | 0 or 1 | 0 or 6 |

Figure 9-675—HCCA TXOP Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is set to the value of the Dialog Token field from the corresponding HCCA TXOP Advertisement frame.

The Status Code field is defined in 9.4.1.9 and is set to either the value SUCCESS or TS_SCHEDULE_CONFLICT.

The Schedule Conflict field is present only when the Status Code field is not SUCCESS. The Schedule Conflict field indicates the TXOP reservation from the HCCA TXOP Advertisement frame that conflicts with an existing or in-progress schedule. Its value is between 1 and the summation of the values from the Number of Reported TXOP Reservations and Number of Pending TXOP Reservations fields of the HCCA TXOP Advertisement frame. A value of 1 indicates the first TXOP reservation in the HCCA TXOP Advertisement frame, a value of 2 indicates the second TXOP reservation in the HCCA TXOP Advertisement frame, and so on. The value of zero is reserved.

The optional Alternate Schedule field contains a TXOP Reservation field, as defined in 9.4.1.44 and is present only when the Status Code field is not SUCCESS. When the Alternate Schedule field is present, it contains an alternate to the TXOP reservation given in the corresponding HCCA TXOP Advertisement frame. The Start Time subfield of the Alternate Schedule field is relative to the TSF of the destination AP.

The optional Avoidance Request field contains a TXOP Reservation field, as defined in 9.4.1.44 and is optionally present when the Status Code field is not SUCCESS. When the Avoidance Request field is present, it indicates a TXOP schedule that the AP sending the TXOP Response frame is requesting to be avoided by the AP that is the destination of the TXOP Response frame. The Start Time subfield of the Avoidance Request field is relative to the TSF of the destination AP.

The use of the HCCA TXOP Response frame is described in 11.28.3.

9.6.8.24 Public Key frame

The Public Key frame is transmitted by an AP to provide its public key to peer APs and to request the peer's public key. The format of the Public Key Action field is defined in Figure 9-676.

| Category | Public Action | Public Key Frame Usage | Group | Public Key (optional) |
|----------|---------------|------------------------|-------|-----------------------|
| Octets: | 1 | 1 | 1 | 2 variable |

Figure 9-676—Public Key Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Public Key Frame Usage field is set to a number to signify the usage mode of this frame. The Request Types are shown in Table 9-321.

Table 9-321—Public Key Frame Usage field values

| Public Key Frame Usage | Value |
|------------------------|-------|
| Request | 0 |
| Response | 1 |
| NAK | 2 |
| Refused | 3 |
| Reserved | 4–255 |

The Public Key Frame Usage field is set to “Request” to indicate that a public key is being requested from a peer AP.

The Public Key Frame Usage field is set to “Response” to indicate that this frame is in response to a Public Key frame.

The Public Key Frame Usage field is set to “NAK” to indicate rejection of a received Public Key frame.

The Group field is used to indicate which cryptographic group was used when generating the public key and is defined in 9.4.1.43), or the preferred group when the Public Key Frame Usage field is set to “NAK”.

When the Public Key Frame Usage field is set to “NAK” or “Refused”, the Public Key field is not included. In all other cases, the Public Key field contains the public key of the AP that is sending this Public Key frame encoded as an octet string according to 12.4.7.2.5.

The use of the Public Key frame is described in 12.11.

9.6.8.25 Channel Availability Query frame format

The Channel Availability Query frame is an Action frame. It is transmitted as part of channel query. The format of the Channel Availability Query frame Action field is shown in Figure 9-677.

| Category | Public Action | Requester STA Address | Responder STA Address | Reason Result Code | Length | Channel Query Info | Device Class | Device Identification Information | Device Location Information | WSM Information |
|----------|---------------|-----------------------|-----------------------|--------------------|--------|--------------------|--------------|-----------------------------------|-----------------------------|-----------------|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | variable | variable | variable | variable |

Figure 9-677—Channel Availability Query frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable.

The remaining fields are as defined in the Channel Availability Query element (see 9.4.6.2) and White Space Map element (see 9.4.2.170).

9.6.8.26 Channel Schedule Management frame format

The Channel Schedule Management frame is a Public Action frame. It is transmitted to exchange the channel schedule information as part of the channel schedule management procedure. The format of the Channel Schedule Management frame Action field is shown in Figure 9-678.

| Category | Public Action | Requester STA Address | Responder STA Address | Length | Reason Result Code | Channel Schedule Management Mode | Device Identification Information | Channel Schedule Descriptor |
|----------|---------------|-----------------------|-----------------------|--------|--------------------|----------------------------------|-----------------------------------|-----------------------------|
| Octets: | 1 | 1 | 6 | 6 | 1 | 1 | variable | variable |

Figure 9-678—Channel Schedule Management frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Requester STA Address field is the MAC address of the requesting STA that initiates the Channel Schedule Management process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested channel schedule management.

The Length field indicates the length of the remaining fields in octets, and the value is variable.

The Reason Result Code field indicates the reason for transmitting a query request for channel schedule information. It also indicates the result of a query as successful or not and the reason when the query is not successful. The value of this field is defined in Table 9-322.

Table 9-322—Reason Result Code field values

| Reason Result Code field values | Description |
|---------------------------------|--|
| 0 | Request for channel schedule information from a RLSS. |
| 1 | Request for channel schedule information from a GDD enabling STA. |
| 2 | Success, returning full channel schedule information on the requested channels. |
| 3 | Success, returning additional timeslots from the list of the last query on the requested channels. |
| 4 | Success, returning timeslots deleted from the list of last query on the requested channels. |
| 5 | Success, returning deleted and added timeslots from the list of last query on the requested channels. |
| 6 | Success, returning no channel schedule changes from last query. |
| 7 | Request declined by the GDD enabling STA for unspecified reason. |
| 8 | Request declined by the GDD enabling STA because of no capability for providing schedule information on WLAN channels. |
| 9 | Request declined by RLSS for unspecified reason. |
| 10 | Request declined by RLSS because of no capability for providing schedule information on WLAN channels. |
| 11 | Unknown reason. |
| 12 | Continuation frame. This frame continues the fields from the previous CSM frame. |
| 13–63 | Reserved. |

The Channel Schedule Management Mode field indicates if the schedule information of the channel availability is based on TV channels or WLAN channels. If the schedule information is based on WLAN channels, the optional Operating Class field is present in the Channel Schedule Descriptor field as defined in E.1. This field also indicates whether the optional Channel Availability Starting Time field is present in the Channel Schedule Descriptor field. The value of this field is defined in Table 9-323.

Table 9-323—Channel Schedule Management Mode field values

| Channel Schedule Management Mode value | Description |
|--|---|
| 0 | The channel schedule information is based on TV channels. The Reason Result Code field is set to either 0 or 1. |
| 1 | The channel schedule information is based on WLAN channels. The Reason Result Code field is set to either 0 or 1. |
| 2–3 | Reserved. |

The Device Identification Information field indicates the regulatory identification of the STA that is requesting the schedule information. The Device Identification Information field is present only when Reason Result Code is either 0 or 1. The value of the field is defined in 9.4.4.2.2.

The Channel Schedule Descriptor field indicates the channels for which the schedule information is requested, and the channel schedule information is provided in the response. The value of the field is defined in 9.4.4.2.4. The Channel Schedule Descriptor field is repeated, as determined by the Length field.

9.6.8.27 Contact Verification Signal frame format

The Contact Verification Signal frame is a Public Action frame that is transmitted by a GDD enabling STA to notify whether the available channel information from the GDB has been updated. The format of the Contact Verification Signal frame Action field is shown in Figure 9-679.

| | | | |
|---------|----------|---------------|--------|
| | Category | Public Action | Map ID |
| Octets: | 1 | 1 | 1 |

Figure 9-679—Contact Verification Signal frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Map ID field is set to a number that is equal to the Map ID of the recently received WSM. The WSM is defined in Table 9-269 in 9.4.4.2.5.

9.6.8.28 GDD Enablement Request frame format

The GDD Enablement Request frame is a Public Action frame. The format of the GDD Enablement Request frame action field is shown in Figure 9-680.

| | | | | | |
|---------|----------|---------------|--------------|--------------|-----------------------------------|
| | Category | Public Action | Dialog Token | Device Class | Device Identification Information |
| Octets: | 1 | 1 | 1 | 1 | variable |

Figure 9-680—GDD Enablement Request frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is a nonzero value chosen by the STA sending the GDD Enablement Request frame to identify the request/response transaction.

The Device Class field is used to indicate the characteristic of the STA requesting the GDD Enablement Request frame. The format of the Device Class field is specified in 9.4.4.2.1.

The Device Identification Information field is used to indicate the identification of the STA requesting the GDD Enablement Request frame. The format of the Device Identification Information field is specified in 9.4.4.2.2.

9.6.8.29 GDD Enablement Response frame format

The GDD Enablement Response frame is a Public Action frame. The format of the GDD Enablement Response frame action field is shown in Figure 9-681.

| | | | | |
|----------|---------------|--------------|-------------|-----------------|
| Category | Public Action | Dialog Token | Status Code | WSM Information |
| Octets: | 1 | 1 | 1 | 2 variable |

Figure 9-681—GDD Enablement Response frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is a nonzero value of the corresponding GDD Enablement Request frame. If a GDD Enablement Response frame is being transmitted other than in response to an GDD Enablement Request frame, then the Dialog Token field is 0.

The Status Code field contains the status code in response to a GDD Enablement Request frame as defined in Table 9-46.

The remaining field is as defined in the WSM element (see 9.4.2.170).

9.6.8.30 Network Channel Control frame format

The Network Channel Control frame is a Public Action frame. It is transmitted by a GDD dependent STA and a GDD enabling STA as part of the procedure that allows a GDD enabling STA to control the frequency usage of a GDD dependent STA's WLAN network channels. The format of the Network Channel Control frame is shown in Figure 9-682.

| | | | | | | | | | |
|----------|---------------|--------|-----------------------|-----------------------|--------------------|--|-----------------------------------|---|---|
| Category | Public Action | Length | Requester STA Address | Responder STA Address | Reason Result Code | Number of Network Channel Control Triplets | a Network Channel Control triplet | | |
| Octets: | 1 | 1 | 1 | 6 | 6 | 1 | 1 | 1 | 1 |

Figure 9-682—Network Channel Control frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Length field indicates the length of the remaining frame fields in octets, and the value is variable. The minimum value of the Length field is 14.

The Requester STA Address field is the MAC address of the requesting STA that initiates the network channel control process.

The Responder STA Address field is the MAC address of the STA that responds to the STA that requested network channel control.

The Reason Result Code field is used to indicate the reason that a Network Channel Control frame was generated. The length of the Reason Result Code field is 1 octet. The encoding of the Reason Result Code field is shown in Table 9-282.

The Number of Network Channel Control Triplets field indicates the number of triplets of Operating Class, Channel Number, and Maximum Transmit Power fields.

The Operating Class field indicates the channel set for which the network channel control request applies. The Operating Class and Channel Number fields together specify the channel frequency and channel bandwidth for which the network channel control applies. Values for the Operating Class field are shown in E.1.

In a request, the Channel Number field of the Network Channel Control frame indicates the channel that the requesting STA intends to operate on. In the response, the Channel Number field in the Network Channel Control frame indicates the channels that the responding STA permits the requesting STA to operate on. The Channel Number is defined within an Operating Class as shown in E.1.

The Maximum Transmit Power field gives the intended maximum transmit power in dBm for operation in the request frame and indicates the maximum allowable transmit power in dBm for operation in the response frame. The field contains EIRP per channel bandwidth and is coded as a signed integer in units of 0.5 dBm. The field is set to 0 when a requesting STA requests a responding STA to provide a network channel control response without specifying in the request the intended maximum transmit power.

9.6.8.31 White Space Map Announcement frame format

The White Space Map Announcement frame is a Public Action frame. The format of the White Space Map Announcement frame body is shown in Figure 9-683.

| | | | |
|----------|---------------|--------------------|-----------------|
| Category | Public Action | Reason Result Code | White Space Map |
| Octets: | 1 | 1 | 1 variable |

Figure 9-683—White Space Map Announcement frame Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

A Reason Result Code value of 1 indicates the Public Action frame is a continuation of the previous WSM Public Action frame, and any other value indicates this is not a continuation of the previous WSM Public Action frame.

The White Space Map field contains a White Space Map element (see 9.4.2.170).

9.6.8.32 Fine Timing Measurement Request frame format

The format of the Fine Timing Measurement Request Action field is shown in Figure 9-684.

| Category | Public Action | Trigger | LCI Measurement Request (optional) | Location Civic Measurement Request (optional) | Fine Timing Measurement Parameters (optional) |
|----------|---------------|---------|------------------------------------|---|---|
| Octets: | 1 | 1 | 1 | variable | variable |

Figure 9-684—Fine Timing Measurement Request Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Trigger field set to 1 indicates that the initiating STA requests that the responding STA start or continue sending Fine Timing Measurement frames (see 11.24.6). The Trigger field set to 0 indicates that the initiating STA requests that the responding STA stop sending Fine Timing Measurement frames. Trigger field values 2–255 are reserved.

The LCI Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to LCI (see Table 9-82), which indicates a request for a Measurement Report element with Measurement Type field equal to LCI (see 11.24.6.7). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-94). The Request, Report and Duration Mandatory bits in the Measurement Request Mode field in the Measurement Request element are reserved (see 9.4.2.21.1).

The Location Civic Measurement Request field is optionally present. If present, it contains a Measurement Request element with Measurement Type field equal to Location Civic (see Table 9-82), which indicates a request for a Measurement Report element with Measurement Type field equal to Location Civic (see 11.24.6.7). The Enable bit in the Measurement Request Mode field in the Measurement Request element is set to 0. The Location Subject field in the Measurement Request field of the Measurement Request element is set to Location Subject Remote (see Table 9-94). The Location Service Interval Units field in the Measurement Request field of the Measurement Request element is set to 0. The Request, Report and Duration Mandatory bits in the Measurement Request Mode field within the Measurement Request element are reserved (see 9.4.2.21.1).

The Fine Timing Measurement Parameters field is present in the initial Fine Timing Measurement Request frame (see 11.24.6.3) and its retransmissions and is not present in subsequent Fine Timing Measurement Request frames. If present, it contains a Fine Timing Measurement Parameters element as defined in 9.4.2.168.

9.6.8.33 Fine Timing Measurement frame format

The Fine Timing Measurement frame is used to support the FTM procedure described in 11.24.6. The format of the Fine Timing Measurement Action field is shown in Figure 9-685.

| | Category | Public Action | Dialog Token | Follow Up Dialog Token | TOD | TOA |
|---------|-----------|---------------|-----------------------|----------------------------------|---|--|
| Octets: | 1 | 1 | 1 | 1 | 6 | 6 |
| | TOD Error | TOA Error | LCI Report (optional) | Location Civic Report (optional) | Fine Timing Measurement Parameters (optional) | FTM Synchronization Information (optional) |
| Octets: | 2 | 2 | variable | variable | variable | variable |

Figure 9-685—Fine Timing Measurement Action field format

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The TOD Error field is structured as shown in Figure 9-686.

| B0 | B4 | B5 | B14 | B15 |
|------------------------|----------|--------------------|-----|-----|
| Max TOD Error Exponent | Reserved | TOD Not Continuous | | |
| Bits: | 5 | 10 | 1 | |

Figure 9-686—Format of the TOD Error field

The TOA Error field is structured as shown in 9-687.

| B0 | B4 | B5 | B15 |
|------------------------|----------|----|-----|
| Max TOA Error Exponent | Reserved | | |
| Bits: | 5 | 11 | |

Figure 9-687—Format of the TOA Error field

The Dialog Token field is a nonzero value chosen by the responding STA to identify the Fine Timing Measurement frame as the first of a pair, with the second or follow-up Fine Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate the end of the FTM session (see 11.24.6.6 and 11.24.6.4).

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the last transmitted Fine Timing Measurement frame to indicate that it is the follow up Fine Timing Measurement frame and that the TOD, TOA, Max TOD Error Exponent and Max TOA Error Exponent fields contain the values of the timestamps captured with the first Fine Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Fine Timing Measurement frame is not a follow up to a last transmitted Fine Timing Measurement frame. The value 0 in this field also indicates that TOD, TOA, TOD Error, and TOA Error fields are reserved. See 11.24.6.

The TOD and TOA fields are expressed in units of picoseconds.

The maximum errors in the TOD and TOA values are represented using the function defined in Equation (9-4).

$$E_{max} = \begin{cases} \text{unknown}, F = 0 \\ 2^{F-1}, & 1 \leq F \leq 30 \\ \geq 2^{30}, & F = 31 \end{cases} \quad (9-4)$$

where

F is the Max Error Exponent

E_{max} is the maximum TOD or TOA error, respectively, in units of picoseconds

The TOD field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the last transmitted Fine Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time, with respect to a time base, at which the start of the preamble of the Ack frame to the last transmitted Fine Timing Measurement frame arrived at the receive antenna connector.

NOTE—The values specified in the TOD and TOA fields are described in 6.3.70.

The Max TOD Error Exponent field contains an upper bound for the error exponent in the value specified in the TOD field.

NOTE—For instance, a value of 2 in the Max TOD Error Exponent field indicates that the value in the TOD field has a maximum error of ± 2 ps.

The TOD Not Continuous field indicates that the TOD value is with respect to a different underlying time base than the last transmitted TOA value. It is set to 1 when a discontinuity is present. Otherwise, it is set to 0.

The Max TOA Error Exponent field contains an upper bound for the error exponent in the value specified in the TOA field.

A value of 0 for the Max TOD Error Exponent or the Max TOA Error Exponent field indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. A value of 31 indicates that the upper bound on the error is greater than or equal to 1.073 741 824 ms.

The LCI Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to LCI (see Table 9-107), which either indicates the LCI of the transmitting STA and includes the Z and Usage Rules/Policy subelement or indicates an unknown LCI (see 11.24.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS which is co-located with the reporting BSS.

The Location Civic Report field is optionally present. If present, it contains a Measurement Report element with Measurement Type field equal to Location Civic (see Table 9-107), which either indicates the Civic address of the transmitting STA or an unknown Civic address (see 11.24.6.7). The Late, Incapable and Refused bits in the Measurement Report Mode field are set to 0. The Co-Located BSSID List subelement is present in the Measurement Report element with Measurement Type field equal to LCI, when there is at least one other BSS which is co-located with the reporting BSS. When the LCI Report field contains a Co-Located BSSID List subelement, the Co-Located BSSID List subelement is not present in the Location Civic Report field.

The Fine Timing Measurement Parameters field is present in the initial Fine Timing Measurement Frame and is not present in subsequent Fine Timing Measurement frames. If present, it contains a Fine Timing Measurement Parameters element as defined in 9.4.2.168.

The FTM Synchronization Information field is present in the initial Fine Timing Measurement frame and its retransmissions if any, and in the first Fine Timing Measurement frame within each burst and its retransmissions if any; otherwise it is not present. If present, it contains an FTM Synchronization Information element with a TSF Sync Info field containing the 4 least significant octets of the TSF at the responding STA corresponding to the time the responding STA received the last Fine Timing Measurement Request frame with the Trigger field equal to 1.

9.6.8.34 QAB Request frame format

The QAB Request frame is transmitted by an AP to another AP to schedule quiet periods that facilitate the detection of other system operating in the same band. The format of the QAB Request frame Action field is shown in Table 9-324.

Table 9-324—QAB Request frame Action field format

| Order | Information |
|-------|------------------------------|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | RequesterAP Address |
| 5 | ResponderAP Address |
| 6 | Quiet Period Request element |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field is set to a nonzero value chosen by the AP.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets. This field can be set to the broadcast address if the request is sent to multiple APs.

The Quiet Period Request element is defined in 9.4.2.150.

9.6.8.35 QAB Response frame format

A QAB Response frame is sent in response to a QAB Request frame. The format of a QAB Response frame Action field contains the information shown in Table 9-325.

Table 9-325—QAB Response frame Action field format

| Order | Information |
|-------|-------------------------------|
| 1 | Category |
| 2 | Public Action |
| 3 | Dialog Token |
| 4 | RequesterAP Address |
| 5 | ResponderAP Address |
| 6 | Quiet Period Response element |

The Category field is defined in 9.4.1.11.

The Public Action field is defined in 9.6.8.1.

The Dialog Token field value is copied from the corresponding received QAB Request frame.

The RequesterAP Address field is the MAC address of the AP that initiates the process. The length of this field is 6 octets.

The ResponderAP Address field is the MAC address of the responding AP. The length of this field is 6 octets.

The Quiet Period Response element is defined in 9.4.2.151.

9.6.9 FT Action frame details

9.6.9.1 General

Four Action frame formats are defined to support fast BSS transitions over the DS, which are initiated through the currently associated AP. The FT Action frames are sent over the air between the STA and the current AP. The Action frame is used as a transport mechanism for data that are destined for the target AP. An FT Action field, in the octet immediately after the Category field, differentiates the FT Action frame formats. The FT Action field values associated with each FT Action frame format are defined in Table 9-326.

Table 9-326—FT Action field values

| FT Action field value | Description |
|-----------------------|--------------------|
| 0 | Reserved |
| 1 | FT Request frames |
| 2 | FT Response frames |
| 3 | FT Confirm frames |
| 4 | FT Ack frames |
| 5–255 | Reserved |

9.6.9.2 FT Request frame

The FT Request frame is sent by the STA to its associated AP to initiate an over-the-DS fast BSS transition.

Figure 9-688 shows the format of the FT Request frame Action field.

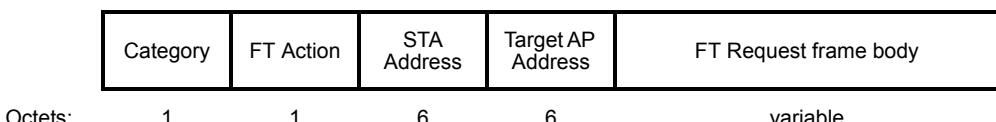

Figure 9-688—FT Request frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.9.1.

The STA Address field is set to the fast BSS transition originator's (FTO's) MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Request frame body contains the information shown in Table 9-327.

Table 9-327—FT Request frame body

| Order | Information | Notes |
|-------|---------------------|--|
| 1 | RSN | A RSNE is present if dot11RSNAActivated is true. |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |

The usage of these elements is defined in 13.8.2.

9.6.9.3 FT Response frame

The FT Response frame is transmitted by the currently associated AP as a response to the STA's FT Request frame. Figure 9-689 shows the format of the FT Response frame Action field.

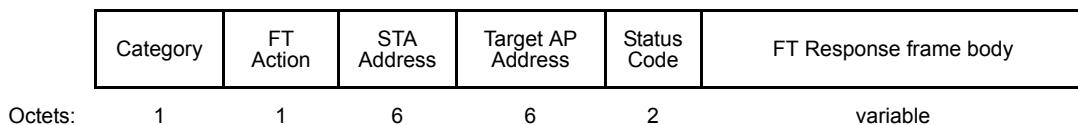

Figure 9-689—FT Response frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.9.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Response frame body contains the information shown in Table 9-328.

Table 9-328—FT Response frame body

| Order | Information | Notes |
|-------|---------------------|--|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true. |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |

The usage of these elements is defined in 13.8.3.

9.6.9.4 FT Confirm frame

The FT Confirm frame in an RSN is confirmation to the target AP of receipt of the ANonce and indicates the liveness of the PTKSA. The FT Confirm frame is optionally used by the FTO to request resources. Figure 9-690 shows the FT Confirm frame Action field format.

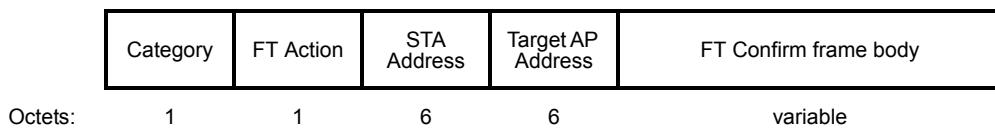

Figure 9-690—FT Confirm frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.9.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The FT Confirm frame body contains the information shown in Table 9-329.

Table 9-329—FT Confirm frame body

| Order | Information | Notes |
|-------|---------------------|--|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true. |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |
| 4 | RIC | The RIC Request field is present if resources are being requested. |

The usage of these elements is defined in 13.8.4.

9.6.9.5 FT Ack frame

The FT Ack frame is transmitted by the currently associated AP as a response to the STA's FT Confirm frame. Figure 9-691 shows the FT Ack frame Action field format.

| | | | | | |
|----------|-----------|-------------|-------------------|-------------|-------------------|
| Category | FT Action | STA Address | Target AP Address | Status Code | FT Ack frame body |
| Octets | 1 | 1 | 6 | 6 | 2 variable |

Figure 9-691—FT Ack frame Action field format

The Category field is defined in 9.4.1.11.

The FT Action field is defined in 9.6.9.1.

The STA Address field is set to the FTO's MAC address.

The Target AP Address field is set to the BSSID value of the target AP.

The Status Code field is a value from the options listed in 9.4.1.9.

If the Status Code field is SUCCESS, then the FT Ack frame body contains the information shown in Table 9-330.

Table 9-330—FT Ack frame body

| Order | Information | Notes |
|-------|--|--|
| 1 | RSN | The RSNE is present if dot11RSNAActivated is true. |
| 2 | Mobility Domain | The MDE is present. |
| 3 | Fast BSS Transition | An FTE is present if dot11RSNAActivated is true. |
| 4 | Timeout Interval (reassociation deadline) | A TIE containing the reassociation deadline interval is present if resources were requested in the FT Confirm frame and dot11RSNAActivated is false. |
| 5 | RIC | The RIC Response field is present if resources were requested in the FT Confirm frame. |

The usage of these elements is defined in 13.8.5.

9.6.10 SA Query Action frame details

9.6.10.1 General

Two Action frame formats are defined for the SA Query procedure. A SA Query Action field, in the octet field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-331.

NOTE—The SA query functionality defined in this standard is used to prevent the Association Lockout problem (defined in 11.3).

Table 9-331—SA Query Action field values

| SA Query Action field value | Description |
|-----------------------------|-------------------|
| 0 | SA Query Request |
| 1 | SA Query Response |

9.6.10.2 SA Query Request frame

The SA Query Request frame is used to request a SA Query Response from the receiving STA. The format of the Action field is shown in Figure 9-692.

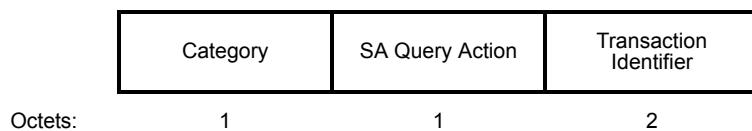

Figure 9-692—SA Query Request frame Action field format

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.10.1.

The Transaction Identifier field is a 16-bit non-negative counter value set by the STA sending the SA Query Request frame to identify any outstanding request/response transaction.

9.6.10.3 SA Query Response frame

The SA Query Response frame is used to respond to an SA Query Request frame from another STA. The format of the Action field is shown in Figure 9-693.

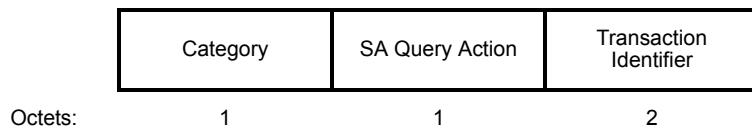

Figure 9-693—SA Query Response frame Action field format

The Category field is defined in 9.4.1.11.

The SA Query Action field is defined in 9.6.10.1.

The Transaction Identifier field is set to the same value as the Transaction Identifier field in the corresponding SA Query Request frame.

9.6.11 Protected Dual of Public Action frames

The Protected Dual of Public Action frame is defined to allow robust STA-STA communications of the same information that is conveyed in Action frames that are not robust (see 9.4.1.11). A Public Action field, in the octet immediately after the Category field, differentiates the Protected Dual of Public Action frame formats. The defined Protected Dual of Public Action frames are listed in Table 9-332.

The Protected Dual of Public Action frames have the same format as the corresponding nonprotected Public Action frame.

Table 9-332—Public Action field values defined for Protected Dual of Public Action frames

| Public Action field value | Description | Defined in |
|---------------------------|--|------------|
| 0 | Reserved | |

9.6.12 HT Action frame details

9.6.12.1 HT Action field

Several Action frame formats are defined to support HT features. An HT Action field, in the octet immediately after the Category field, differentiates the HT Action frame formats. The HT Action field values associated with each frame format within the HT category are defined in Table 9-333. The frame formats are defined in 9.6.12.2 to 9.6.12.9.

Table 9-333—HT Action field values

| HT Action field value | Meaning | Time priority |
|-----------------------|---------------------------|---------------|
| 0 | Notify Channel Width | No |
| 1 | SM Power Save | No |
| 2 | PSMP | Yes |
| 3 | Set PCO Phase | Yes |
| 4 | CSI | Yes |
| 5 | Noncompressed Beamforming | Yes |
| 6 | Compressed Beamforming | Yes |
| 7 | ASEL Indices Feedback | Yes |
| 8–255 | Reserved | — |

9.6.12.2 Notify Channel Width frame format

A STA sends the Notify Channel Width frame to another STA if it wants to change the channel width of frames that the other STA sends to it. See definition in 11.16.2.

The format of the Notify Channel Width frame Action field is defined in Table 9-334.

This frame can be sent by both non-AP STA and AP.

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

Table 9-334—Notify Channel Width frame Action field format

| Order | Information |
|-------|------------------------------|
| 1 | Category |
| 2 | HT Action |
| 3 | Channel Width (see 9.4.1.21) |

9.6.12.3 SM Power Save frame format

The SM Power Save frame is of category HT. The SM Power Save frame is used to manage SM power-saving state transitions as defined in 11.2.6.

The Action field of the SM Power Save frame is defined in Table 9-335.

Table 9-335—SM Power Save frame Action field format

| Order | Information |
|-------|---------------------------------|
| 1 | Category |
| 2 | HT Action |
| 3 | SM Power Control (see 9.4.1.23) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

9.6.12.4 PSMP frame format

PSMP is an Action frame of category HT.

The DA field of this frame is a group address. (See 10.29.2.8.)

The PSMP Parameter Set field and PSMP STA Info fields define zero or more PSMP-DTT and PSMP-UTT time allocations that follow immediately after the PSMP frame.

The Action field of this frame is defined in Table 9-336. The PSMP Parameter Set field is followed by zero or more PSMP STA Info fields.

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

The PSMP STA Info fields within a PSMP frame are ordered by STA_INFO Type as follows: group addressed (STA_INFO Type=1) and then individually addressed (STA_INFO Type=2).

Table 9-336—PSMP frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | HT Action |
| 3 | PSMP Parameter Set (see 9.4.1.25) |
| 4 | PSMP STA Info (see 9.4.1.26) Repeated N_STA times (N_STA is a subfield of the PSMP Parameter Set field) |

9.6.12.5 Set PCO Phase frame format

The PCO mechanism is obsolete. Consequently, this subclause might be removed in a later revision of this standard.

Set PCO Phase is an Action frame of category HT that announces the phase change between 20 MHz and 40 MHz. The format of its Action field is defined in Table 9-337. The operation of the PCO feature is defined in 11.17.

Table 9-337—Set PCO Phase frame Action field format

| Order | Information |
|-------|----------------------------------|
| 1 | Category |
| 2 | HT Action |
| 3 | PCO Phase Control (see 9.4.1.24) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

This frame is sent by a PCO active AP.

9.6.12.6 CSI frame format

The CSI frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-338.

Table 9-338—CSI frame Action field format

| Order | Information |
|-------|-----------------------------|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.27) |
| 4 | CSI Report (see 9.4.1.28) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

In a CSI frame, the fields of the MIMO Control field (see 9.4.1.27) are used as described in Table 9-51. The Codebook Information subfield is reserved in this frame.

9.6.12.7 Noncompressed Beamforming frame format

The Noncompressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-339.

Table 9-339—Noncompressed Beamforming frame Action field format

| Order | Information |
|-------|---|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.27) |
| 4 | Noncompressed Beamforming Report (see 9.4.1.29) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

In a Noncompressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.27) are used as described in Table 9-51. The Codebook Information subfield is reserved in this frame.

9.6.12.8 Compressed Beamforming frame format

The Compressed Beamforming frame is an Action or an Action No Ack frame of category HT. The format of its Action field is defined in Table 9-340.

Table 9-340—Compressed Beamforming frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | HT Action |
| 3 | MIMO Control (see 9.4.1.27) |
| 4 | Compressed Beamforming Report (see 9.4.1.30) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

In a Compressed Beamforming frame, the fields of the MIMO Control field (see 9.4.1.27) are used as described in Table 9-51. The Coefficient Size subfield is reserved in this frame.

9.6.12.9 Antenna Selection Indices Feedback frame format

The Antenna Selection Indices Feedback frame is an Action or Action No Ack frame of category HT. The format of its Action field is defined in Table 9-341.

Table 9-341—Antenna Selection Indices Feedback frame Action field format

| Order | Information |
|--------------|--|
| 1 | Category |
| 2 | HT Action |
| 3 | Antenna Selection Indices (see 9.4.1.31) |

The Category field is defined in 9.4.1.11.

The HT Action field is defined in 9.6.12.1.

9.6.13 TDLS Action field formats

9.6.13.1 General

Several Action field formats are defined to support TDLS. A TDLS Action field, in the octet immediately after the Category field, differentiates the TDLS Action field formats. The TDLS Action field values associated with each Action field format within the TDLS category are defined in Table 9-342.

Table 9-342—TDLS Action field values

| Action field value | Meaning |
|---------------------------|------------------------------|
| 0 | TDLS Setup Request |
| 1 | TDLS Setup Response |
| 2 | TDLS Setup Confirm |
| 3 | TDLS Teardown |
| 4 | TDLS Peer Traffic Indication |
| 5 | TDLS Channel Switch Request |
| 6 | TDLS Channel Switch Response |
| 7 | TDLS Peer PSM Request |
| 8 | TDLS Peer PSM Response |
| 9 | TDLS Peer Traffic Response |
| 10 | TDLS Discovery Request |
| 11–255 | Reserved |

References to one of the TDLS Action field values as a frame, e.g., “TDLS Setup Request frame,” denote a Data frame carrying a TDLS Action field and any vendor-specific elements tunneled as described in 11.23.1.

9.6.13.2 TDLS Setup Request Action field format

The Action field of a TDLS Setup Request Action field contains the information shown in Table 9-343.

Table 9-343—Information for TDLS Setup Request Action field

| Order | Information | Notes |
|-------|---|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The Dialog Token field contains a unique nonzero value for the conversation between the STAs involved in this request. The dialog token is specified in 9.4.1.12. |
| 4 | Capability | The Capability field indicates the capabilities of the STA. The Capability field is defined in 9.4.1.4. |
| 5 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3. |
| 6 | Country | The Country element is present when dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true. The Country element is defined in 9.4.2.9. |
| 7 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present whenever there are more than eight supported rates, and it is optionally present otherwise. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.13. |
| 8 | Supported Channels | The Supported Channels element is present if the TDLS channel switching capability field is equal to 1. The Supported Channels element is defined in 9.4.2.18. |
| 9 | RSNE | The RSNE is present if security is required on the direct link. The RSNE is defined in 9.4.2.25. |
| 10 | Extended Capabilities | The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. The Extended Capabilities element is defined in 9.4.2.27. |
| 11 | QoS Capability | The QoS Capability element is present when dot11QosOptionImplemented is true and not present otherwise. The QoS Capability element is defined in 9.4.2.35. |
| 12 | FTE | The FTE is present if security is required on the TDLS direct link. The FTE is defined in 9.4.2.48. |
| 13 | Timeout Interval (TPK key lifetime) | The Timeout Interval element contains the TPK key lifetime and is present if security is required on the direct link. The Timeout Interval element is defined in 9.4.2.49. |
| 14 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS channel switching capability field is equal to 1. The Supported Operating Classes element is defined in 9.4.2.54 (optional). |
| 15 | HT Capabilities | The HT Capabilities element is defined in 9.4.2.56. The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |

Table 9-343—Information for TDLS Setup Request Action field (continued)

| Order | Information | Notes |
|-------|-----------------------|---|
| 16 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is defined in 9.4.2.60. The 20/40 BSS Coexistence element is optionally present. |
| 17 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. |
| 18 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |
| 19 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented is true. |
| 20 | VHT Capabilities | The VHT Capabilities element is present if the dot11VHTOptionImplemented is true. |

The TDLS Setup Request Action field is encapsulated in a Data frame and transmitted to the recipient STA through the AP to request the setup of a TDLS direct link. See 11.23.

9.6.13.3 TDLS Setup Response Action field format

The Action field of a TDLS Setup Response Action field contains the information shown in Table 9-344.

Table 9-344—Information for TDLS Setup Response Action field

| Order | Information | Notes |
|-------|---|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Status Code | The Status Code is defined in 9.4.1.9. |
| 4 | Dialog Token | The dialog token is copied from the corresponding TDLS Setup Request. The dialog token is specified in 9.4.1.12. |
| 5 | Capability | The Capability field indicates the capabilities of the STA and is present when the Status Code is SUCCESS and is not present otherwise. The Capability field is defined in 9.4.1.4. |
| 6 | Supported Rates and BSS Membership Selectors | The Supported Rates and BSS Membership Selectors element indicates the rates that are supported by the STA and is present when the Status Code is SUCCESS and is not present otherwise. The Supported Rates and BSS Membership Selectors element is defined in 9.4.2.3. |
| 7 | Country | The Country element is present when Status Code is SUCCESS and either dot11MultiDomainCapabilityActivated is true or dot11SpectrumManagementRequired is true and is not present otherwise. The Country element is defined in 9.4.2.9 |
| 8 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present when there are more than 8 supported rates and Status Code is SUCCESS. It is optionally present when there are less than 8 supported rates and Status Code is SUCCESS. Otherwise it is not present. The Extended Supported Rates and BSS Membership Selectors element is defined in 9.4.2.13. |

Table 9-344—Information for TDLS Setup Response Action field (continued)

| Order | Information | Notes |
|--------------|-------------------------------------|---|
| 9 | Supported Channels | The Supported Channels element is defined in 9.4.2.18. It is present if the TDLS channel switching capability bit is equal to 1 and the Status Code is SUCCESS, and not present otherwise. |
| 10 | RSNE | The RSNE is present if security is required on the TDLS direct link and the Status Code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.25. |
| 11 | Extended Capabilities | The Extended Capabilities element is present if any of the fields in this element are nonzero and the Status Code is SUCCESS, and not present otherwise. The Extended Capabilities element is defined in 9.4.2.27. |
| 12 | QoS Capability | The QoS Capability element is present when dot11QosOptionImplemented is true and the Status Code is SUCCESS and not present otherwise. The QoS Capability element is defined in 9.4.2.35. |
| 13 | FTE | The FTE is present if security is required on the TDLS direct link and the Status Code is SUCCESS, and not present otherwise. The FTE is defined in 9.4.2.48. |
| 14 | Timeout Interval (TPK key lifetime) | The Timeout Interval element, containing the TPK key lifetime, is present if security is required on the direct link and the Status Code is SUCCESS, and not present otherwise. The Timeout Interval element is defined in 9.4.2.49. |
| 15 | Supported Operating Classes | The Supported Operating Classes element is present if the TDLS channel switching capability bit is equal to 1 and the Status Code is SUCCESS and not present otherwise. The Supported Operating Classes element is defined in 9.4.2.54. |
| 16 | HT Capabilities | The HT Capabilities element is present if dot11HighThroughputOptionImplemented is true and the Status Code is SUCCESS and is not present otherwise. The HT Capabilities element is defined in 9.4.2.56. |
| 17 | 20/40 BSS Coexistence | The 20/40 BSS Coexistence element is optionally present if the Status Code is SUCCESS and not present otherwise. The 20/40 BSS Coexistence element is defined in 9.4.2.60. |
| 18 | Link Identifier | The Link Identifier element is present if the Status Code is SUCCESS and not present otherwise. The Link Identifier is specified in 9.4.2.62. |
| 19 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true and the Status Code is SUCCESS and not present otherwise. |
| 20 | AID | The AID element containing the AID of the STA sending the frame is present if dot11VHTOptionImplemented is true and the Status Code is SUCCESS and not present otherwise. |
| 21 | VHT Capabilities | The VHT Capabilities element is present if the dot11VHTOptionImplemented is true and the Status Code is SUCCESS and not present otherwise. |
| 22 | Operating Mode Notification | The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1. |

The TDLS Setup Response Action field is encapsulated in a Data frame and transmitted to the TDLS initiator STA through the AP in response to a received TDLS Setup Request Action field. See 11.23.

9.6.13.4 TDLS Setup Confirm Action field format

The Action field of a TDLS Setup Confirm Action field contains the information shown in Table 9-345.

Table 9-345—Information for TDLS Setup Confirm Action field

| Order | Information | Notes |
|-------|-------------------------------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Status Code | The Status Code is defined in 9.4.1.9. |
| 4 | Dialog Token | The dialog token is copied from the corresponding TDLS Setup Response. The dialog token is specified in 9.4.1.12. |
| 5 | RSNE | The RSNE is present if security is required on the TDLS direct link and the Status Code is SUCCESS, and not present otherwise. The RSNE is defined in 9.4.2.25. |
| 6 | EDCA Parameter Set | The EDCA parameter set is present if QoS is supported on the direct link. The EDCA Parameter Set element is specified in 9.4.2.29. It is present for Status Code SUCCESS. |
| 7 | FTE | The FTE is defined in 9.4.2.48. The FTE is present if security is required on the TDLS direct link and the Status Code is SUCCESS, and not present otherwise. |
| 8 | Timeout Interval (TPK Key Lifetime) | The Timeout Interval element is defined in 9.4.2.49. The Timeout Interval, containing the TPK Key Lifetime, is present if security is required on the direct link and the Status Code is SUCCESS, and not present otherwise. |
| 9 | HT Operation | The HT Operation element is present if dot11HighThroughputOptionImplemented is true, the TDLS Setup Response frame contained an HT Capabilities element, the Status Code is SUCCESS. The HT Operation element is defined in 9.4.2.57. |
| 10 | Link Identifier | The Link Identifier is specified in 9.4.2.62. It is present if the Status Code is SUCCESS. |
| 11 | VHT Operation | VHT Operation element (optional). The VHT Operation element is present if the dot11VHTOptionImplemented is true, the TDLS Setup Response frame contained a VHT Capabilities element, the status code is SUCCESS, and the TDLS direct link is not established in the 2.4 GHz band. The VHT Operation element is defined in 9.4.2.159. |
| 12 | Operating Mode Notification | The Operating Mode Notification element is optionally present if the TDLS Setup Request frame contained an Extended Capabilities element with the Operating Mode Notification field is equal to 1. |

The TDLS Setup Confirm Action field is encapsulated in a Data frame and transmitted to the TDLS responder STA through the AP in response to a received TDLS Setup Response Action field. See 11.23.

9.6.13.5 TDLS Teardown Action field format

The Action field of a TDLS Teardown Action field contains the information shown in Table 9-346.

Table 9-346—Information for TDLS Teardown Action field

| Order | Information | Notes |
|-------|-----------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Reason Code | The Reason Code is defined in 9.4.1.7. |
| 4 | FTE | The FTE is present if a TPK handshake was successful for this session (optional). The FTE is defined in 9.4.2.48. |
| 5 | Link Identifier | The Link Identifier is specified in 9.4.2.62. |

The TDLS Teardown Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly or through the AP to tear down a TDLS direct link. See 11.23.

9.6.13.6 TDLS Peer Traffic Indication Action field format

The Action field of a TDLS Peer Traffic Indication Action field contains the information shown in Table 9-347.

Table 9-347—Information for TDLS Peer Traffic Indication Action field

| Order | Information | Notes |
|-------|-------------------|---|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The dialog token is specified in 9.4.1.12. |
| 4 | Link Identifier | The Link Identifier is specified in 9.4.2.62. |
| 5 | PTI Control | The PTI Control element is optionally present. It is defined in 9.4.2.65. |
| 6 | TPU Buffer Status | The TPU Buffer Status element is defined in 9.4.2.66. |

The TDLS Peer Traffic Indication Action field indicates the state of the power save buffer at the STA supporting TPU that is buffering data for a TDLS peer STA in power save mode.

The TPU Buffer Status element indicates the status of the AC buffers at the TPU buffer STA.

The PTI Control element is optionally included in the TDLS Peer Traffic Indication Action field (see 11.2.3.15) to identify the latest MPDU transmitted to the TPU sleep STA that is the destination of the TDLS Peer Traffic Indication Action field.

The TDLS Peer Traffic Indication Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA through the AP. See 11.2.3.15.

9.6.13.7 TDLS Channel Switch Request Action field format

The Action field of the TDLS Channel Switch Request Action field contains the information shown in Table 9-348.

Table 9-348—Information for TDLS Channel Switch Request Action field

| Order | Information | Notes |
|-------|-------------------------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Target Channel | 1 octet field that specifies the channel number of the target channel. See 9.4.1.36. |
| 4 | Operating Class | 1 octet field that specifies the operating class for the target channel. The Operating Channel field is defined in 9.4.1.37. |
| 5 | Secondary Channel Offset | The secondary channel offset is present if a switch to a 40 MHz direct link is indicated and is absent otherwise. See 9.4.2.20. |
| 6 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. |
| 7 | Channel Switch Timing | The Channel Switch Timing element is specified in 9.4.2.64. |
| 8 | Wide Bandwidth Channel Switch | Wide Bandwidth Channel Switch element (optional). The Wide Bandwidth Channel Switch element is included when a switch to an 80 MHz, 160 MHz, or 80+80 MHz direct link is indicated. See 9.4.2.161. |
| 9 | Country | Country element (optional). The Country element is included to change operating classes when a switch to a direct link is indicated. The Country element indicates the same country as the BSS and includes zero Subband Triplet fields. |
| 10 | Transmit Power Envelope | Transmit Power Envelope element (zero or more). Each Transmit Power Envelope element that is present includes a distinct value of the Local Maximum Transmit Power Unit Interpretation subfield. If present, the New Transmit Power Envelope element indicates the maximum transmit powers for the direct link for the indicated bandwidths with an indicated unit interpretation after a switch to a direct link (see 11.23.6.5.1). |

The TDLS Channel Switch Request Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA to request for the TDLS direct link to be switched to another channel. See 11.23.

9.6.13.8 TDLS Channel Switch Response Action field format

The Action field of the TDLS Channel Switch Response Action field contains the information shown in Table 9-349.

The TDLS Channel Switch Response Action field is encapsulated in a Data frame and transmitted directly to the TDLS peer STA in response to a received TDLS Channel Switch Request Action field. See 11.23.

Table 9-349—Information for TDLS Channel Switch Response Action field

| Order | Information | Notes |
|-------|-----------------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Status Code | The Status Code is defined in 9.4.1.9. |
| 5 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. It is present if the Status Code is SUCCESS. |
| 6 | Channel Switch Timing | The Channel Switch Timing element is specified in 9.4.2.64. |

9.6.13.9 TDLS Peer PSM Request Action field format

The TDLS Peer PSM Request Action field contains the information shown in Table 9-350.

Table 9-350—Information for TDLS Peer PSM Request Action field

| Order | Information | Notes |
|-------|-----------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The Dialog Token field contains a value that is unique among TDLS Peer PSM Request Action fields for which a corresponding TDLS Peer PSM Response Action field has not been received. The dialog token is specified in 9.4.1.12. |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. |
| 5 | Wakeup Schedule | The Wakeup Schedule element is specified in 9.4.2.63. |

The TDLS Peer PSM Request Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA, directly or through the AP, to set up or change a periodic wakeup schedule on the TDLS direct link. See 11.2.3.14.

9.6.13.10 TDLS Peer PSM Response Action field format

The TDLS Peer PSM Response Action field contains the information shown in Table 9-351.

Table 9-351—Information for TDLS Peer PSM Response Action field

| Order | Information | Notes |
|-------|--------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The dialog token is set to the value contained in the corresponding TDLS Peer PSM Request Action field. The dialog token is specified in 9.4.1.12. |
| 4 | Status Code | The Status Code is specified in 9.4.1.9. |

Table 9-351—Information for TDLS Peer PSM Response Action field (continued)

| Order | Information | Notes |
|-------|-----------------|--|
| 5 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. It is present if the Status Code is SUCCESS. |
| 6 | Wakeup Schedule | The Wakeup Schedule element is present if the status code is set to TDLS_REJECTED_ALTERNATIVE_PROVIDED and is not present otherwise. The Wakeup Schedule is specified in 9.4.2.63. |

The TDLS Peer PSM Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly in response to a TDLS Peer PSM Request Action field. See 11.2.3.14.

9.6.13.11 TDLS Peer Traffic Response Action field format

The Action field of a TDLS Peer Traffic Response Action field contains the information shown in Table 9-352.

Table 9-352—Information for TDLS Peer Traffic Response Action field

| Order | Information | Notes |
|-------|-----------------|---|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The dialog token is specified in 9.4.1.12. |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. |

The TDLS Peer Traffic Response Action field indicates the receipt of the corresponding TDLS Peer Traffic Indication Action field.

The Dialog Token field is set to the nonzero value of the corresponding TDLS Peer Traffic Indication Action field.

The Link Identifier field is set to identify the TDLS direct link in relation to which the TDLS Peer Traffic Response Action field is transmitted.

The TDLS Peer Traffic Response Action field is encapsulated in a Data frame and transmitted to the TDLS peer STA directly. See 11.2.3.15.

9.6.13.12 TDLS Discovery Request Action field format

The TDLS Discovery Request Action field contains the information shown in Table 9-353.

The TDLS Discovery Request Action field is encapsulated in a Data frame and transmitted to a TDLS peer STA through the AP, to request TDLS capable STAs in the same BSS to respond with a TDLS Discovery Response frame. See 11.23.

Table 9-353—Information for TDLS Discovery Request Action field

| Order | Information | Notes |
|-------|-----------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | TDLS Action | The TDLS Action field is defined in 9.6.13.1. |
| 3 | Dialog Token | The Dialog Token field can be used to match TDLS Discovery Response frames to the corresponding TDLS Discovery Request frame. The dialog token is specified in 9.4.1.12. |
| 4 | Link Identifier | The Link Identifier element is specified in 9.4.2.62. |
| 5 | Multi-band | The Multi-band element is optionally present if dot11MultibandImplemented is true. |

9.6.14 WNM Action details

9.6.14.1 WNM Action fields

Several Action frame formats are defined for wireless network management (WNM) purposes. A WNM Action field, in the octet field immediately after the Category field, differentiates the formats. The WNM Action field values associated with each frame format are defined in Table 9-354.

Table 9-354—WNM Action field values

| WNM Action field value | Description |
|------------------------|------------------------------------|
| 0 | Event Request |
| 1 | Event Report |
| 2 | Diagnostic Request |
| 3 | Diagnostic Report |
| 4 | Location Configuration Request |
| 5 | Location Configuration Response |
| 6 | BSS Transition Management Query |
| 7 | BSS Transition Management Request |
| 8 | BSS Transition Management Response |
| 9 | FMS Request |
| 10 | FMS Response |
| 11 | Collocated Interference Request |
| 12 | Collocated Interference Report |
| 13 | TFS Request |
| 14 | TFS Response |
| 15 | TFS Notify |
| 16 | WNM Sleep Mode Request |
| 17 | WNM Sleep Mode Response |
| 18 | TIM Broadcast Request |

Table 9-354—WNM Action field values (continued)

| WNM Action field value | Description |
|------------------------|-------------------------------|
| 19 | TIM Broadcast Response |
| 20 | QoS Traffic Capability Update |
| 21 | Channel Usage Request |
| 22 | Channel Usage Response |
| 23 | DMS Request |
| 24 | DMS Response |
| 25 | Timing Measurement Request |
| 26 | WNM Notification Request |
| 27 | WNM Notification Response |
| 28 | WNM-Notify Response |
| 29–255 | Reserved |

9.6.14.2 Event Request frame format

The Event Request frame uses the Action frame body format and is transmitted to request another STA to report one or more events. The format of the Event Request Action field is shown in Figure 9-694.

Figure 9-694—Event Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the event request to identify the request/report transaction.

The Event Request Elements field contains one or more of the Event Request elements described in 9.4.2.67.

The Destination URI element field contains zero or one Destination URI element described in 9.4.2.90.

9.6.14.3 Event Report frame format

The Event Report frame uses the Action frame body format and is transmitted in response to an Event Request frame, or autonomously. The format of the Event Report Action field is shown in Figure 9-695.

| Category | WNM Action | Dialog Token | Event Report Elements |
|----------|------------|--------------|-----------------------|
| Octets: | 1 | 1 | 1 variable |

Figure 9-695—Event Report Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value of the corresponding Event Request frame. If the Event Report frame is being transmitted other than in response to an Event Request frame, then the dialog token is 0.

The Event Report Elements field contains one or more of the Event Report elements described in 9.4.2.68.

9.6.14.4 Diagnostic Request frame format

The Diagnostic Request frame uses the Action frame body format and is transmitted requesting the receiving STA to execute a diagnostic test. The format of the Diagnostic Request Action field is shown in Figure 9-696.

| Category | WNM Action | Dialog Token | Diagnostic Request Elements | Destination URI Element (optional) |
|----------|------------|--------------|-----------------------------|------------------------------------|
| Octets: | 1 | 1 | 1 variable | variable |

Figure 9-696—Diagnostic Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the Diagnostic Request frame to identify the request/report transaction.

The Diagnostic Request Elements field contains one or more of the Diagnostic Request elements described in 9.4.2.69. The number and length of the Diagnostic Request elements in a Diagnostic Request frame is limited by the maximum MMPDU size (see 9.3.3.2).

The Destination URI element field contains zero or one Destination URI element described in 9.4.2.90.

9.6.14.5 Diagnostic Report frame format

The Diagnostic Report frame uses the Action frame body format transmitted by a STA in response to a Diagnostic Request frame. The format of the Diagnostic Report Action field is shown in Figure 9-697.

| Category | WNM Action | Dialog Token | Diagnostic Report Elements |
|----------|------------|--------------|----------------------------|
| Octets: | 1 | 1 | 1 variable |

Figure 9-697—Diagnostic Report Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value in any corresponding Diagnostic Request frame.

The Diagnostic Report Elements field contains one or more of the Diagnostic Report elements described in 9.4.2.70. The number and length of the Diagnostic Report elements in a Diagnostic Report frame is limited by the maximum MMPDU size (see 9.3.3.2).

9.6.14.6 Location Configuration Request frame format

The Location Configuration Request frame uses the Action frame body format and is transmitted to configure another STA to send a Location Track Notification frame on a set of channels periodically for the purposes of determining location of the STA. The format of the Location Configuration Request Action field is shown in Figure 9-698.

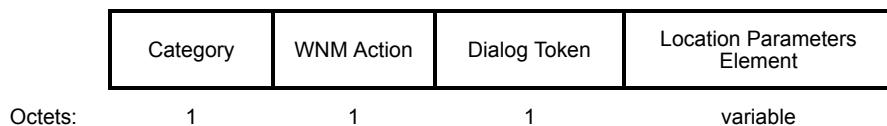

Figure 9-698—Location Configuration Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value that is unique among the Location Configuration Request frames sent to each destination MAC address for which a corresponding Location Configuration Response frame has not been received.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.71. Table 9-355 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Request frame.

Table 9-355—Location Parameters Element field for Location Configuration Request frame

| Allowed subelements | Subelement ID | Notes |
|---|---------------|---|
| Location Indication Parameters | 1 | The Location Indication Parameters subelement is included in the Location Configuration Request frame. |
| Location Indication Channels | 2 | The Location Indication Channels subelement is included in the Location Configuration Request frame. |
| Location Indication Broadcast Data Rate | 6 | The Location Indication Broadcast Data Rate subelement is included in the Location Configuration Request frame. |
| Location Indication Options | 8 | The Location Indication Options subelement is optionally included in the Location Configuration Request frame. |
| Vendor Specific Information | 221 | Zero or more Vendor Specific subelements are included in the Location Configuration Request frame. |

9.6.14.7 Location Configuration Response frame format

The Location Configuration Response frame uses the Action frame body format and is transmitted in response to the receipt of a Location Configuration Request frame. The format of the Location Configuration Response Action field is shown in Figure 9-699.

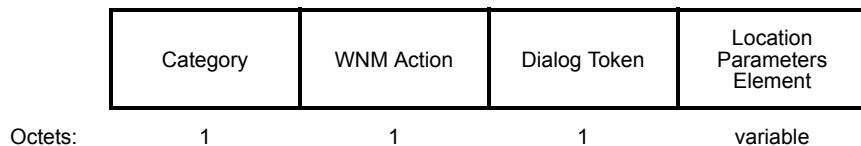

Figure 9-699—Location Configuration Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the Location Configuration Request frame to identify the request/response transaction.

The Location Parameters Element field contains the location parameters subelements, described in 9.4.2.71. Table 9-356 defines the allowed Location Parameters subelements for a Location Parameters element that is included in the Location Configuration Response frame.

Table 9-356—Location Parameters Element field for Location Configuration Response frame

| Allowed subelements | Subelement ID | Notes |
|---|---------------|--|
| Location Indication Parameters | 1 | The Location Indication Parameters subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Channels | 2 | The Location Indication Channels subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Broadcast Data Rate | 6 | The Location Indication Broadcast Data Rate subelement is optionally included in the Location Configuration Response frame. |
| Location Indication Options | 8 | The Location Indication Options subelement is optionally included in the Location Configuration Response frame. |
| Location Status | 3 | The Location Status subelement is included in the Location Configuration Response frame. If all configuration of the subelements contained in a Location Configuration Request frame was successful, then a single Location Status subelement is included in the Location Configuration Response frame. For each subelement contained in the Location Configuration Request frame that is not successful a Location Status subelement is included in the Location Configuration Response frame that indicates the subelement ID and the unsuccessful status code for that subelement ID. |
| Vendor Specific Information | 221 | Zero or more Vendor Specific subelements are included in the Location Configuration Response frame. |

9.6.14.8 BSS Transition Management Query frame format

The BSS Transition Management Query frame uses the Action frame body format and is transmitted to request or provide information on BSS transition candidate APs. The format of the BSS Transition Management Query Action field is shown in Figure 9-700.

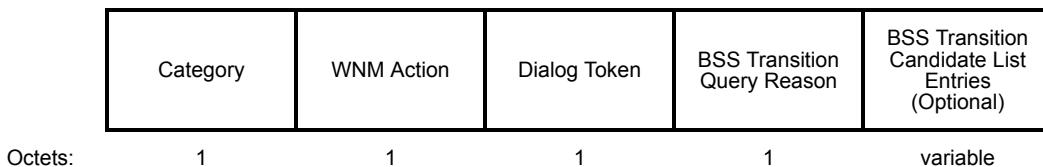

Figure 9-700—BSS Transition Management Query Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the BSS Transition Management Query frame to identify the query/request/response transaction.

The BSS Transition Query Reason field contains the reason code for a BSS transition management query as defined in Table 9-176.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements, as described in 9.4.2.37. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.24.7.2. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Query frame is limited by the maximum MMPDU size (see 9.3.3.2).

9.6.14.9 BSS Transition Management Request frame format

The BSS Transition Management Request frame uses the Action frame body format and is transmitted by an AP STA in response to a BSS Transition Management Query frame, or autonomously. The format of the BSS Transition Management Request Action field is shown in Figure 9-701.

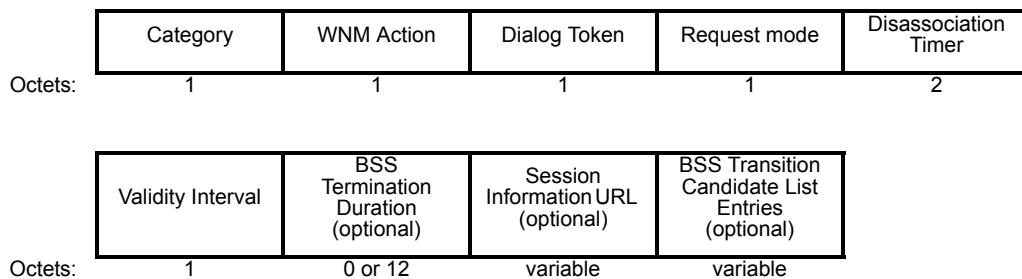

Figure 9-701—BSS Transition Management Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the BSS Transition Management Query frame if the BSS Transition Management Request frame is being transmitted in response to a BSS Transition

Management Query frame. If the BSS Transition Management Request frame is being transmitted other than in response to a BSS Transition Management Query frame, then the Dialog Token field is a nonzero value chosen by the AP STA sending the BSS Transition Management Request frame to identify the request/response transaction.

The Request mode field is defined in Figure 9-702.

| | | | | | | |
|-----------------------------------|----------|-------------------------|--------------------------|-----------------------------|----------|-----|
| Preferred Candidate List Included | Abridged | Disassociation Imminent | BSS Termination Included | ESS Disassociation Imminent | Reserved | |
| Bit: | 0 | 1 | 2 | 3 | 4 | 5-7 |

Figure 9-702—Request Mode field

- The Preferred Candidate List Included (bit 0) field indicates whether the BSS transition candidate list included in this frame is a preferred candidate list or a list of known BSS transition candidates. The Preferred Candidate List Included bit set to 0 indicates that the receiving STA can ignore the BSS Transition Candidate List Entries field (see 11.24.7.3). The Preferred Candidate List Included bit set to 1 indicates that the sender expects the receiving STA to process this frame.
- The Abridged (bit 1) field indicates to the recipient of the frame the intended treatment of all BSSIDs not listed in the BSS Transition Candidate List Entries field. The AP sets the Abridged bit in the Request Mode field to 1 when a preference value of 0 is assigned to all BSSIDs that do NOT appear in the BSS Transition Candidate List. The AP sets the Abridged bit in the Request Mode field to 0 when the AP has no recommendation for or against any BSSID not present in the BSS Transition Candidate List Entries field.
- The Disassociation Imminent (bit 2) field indicates whether the STA will be disassociated from the current AP. The value 1 in the Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the current AP, while the value 0 indicates that disassociation from the AP is not imminent.
- The BSS Termination Included (bit 3) field indicates that the BSS Termination Duration field is included, the BSS is shutting down and the STA will be disassociated. The AP sets the BSS Termination Included bit in the Request mode field to 1 to indicate that the BSS is shutting down. The BSS Termination Included bit is 0 if no BSS Termination Duration information is included in the BSS Transition Management Request frame.
- The ESS Disassociation Imminent (bit 4) field indicates that the Session Information URL field is included, and that the STA will be disassociated from the ESS. The value 1 in the ESS Disassociation Imminent bit in the Request Mode field indicates that the STA is to be disassociated from the ESS, while the value 0 indicates that disassociation from the ESS is not imminent. When the ESS Disassociation Imminent bit value is 1, a Session Information URL field is included in the BSS Transition Management Request frame.

The Disassociation Timer indicates the time after which the AP issues a Disassociation frame to this STA. The Disassociation Timer field contains the number of beacon transmission times (TBTTs) until the AP sends a Disassociation frame to this STA. A value of 0 indicates that the AP has not determined when it will send a Disassociation frame to this STA. If the Disassociation Imminent field is 0, the Disassociation Timer field is reserved. The format of the Disassociation Timer field is shown in Figure 9-703.

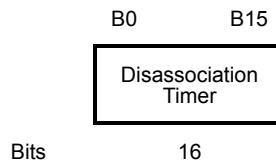

Figure 9-703—Disassociation Timer field format

The Validity Interval field is the number of beacon transmission times (TBTTs) until the BSS transition candidate list is no longer valid. A value of 0 is reserved.

The BSS Termination Duration field contains the BSS Termination Duration subelement (see 9.4.2.37) for the current BSS and is present only when the BSS Termination Included field is 1 in the Request mode field.

The format of the optional Session Information URL field is shown in Figure 9-704. This field is present when the ESS Disassociation Imminent field is 1.

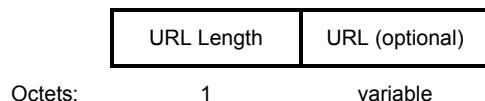

Figure 9-704—Session Information URL field format

The URL Length field is the value of the length of the URL field. The URL Length field is 0 when the URL field is not present.

The URL field is a variable-length field formatted in accordance with IETF RFC 3986.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.37. If the STA has no information in response to the BSS Transition Management Query frame or in an unsolicited BSS Transition Management Request frame, the Neighbor Report elements are omitted and the Preferred Candidate List Included bit is 0. The length of the BSS Transition Candidate List Entries in a BSS Transition Management Request frame is limited by the maximum MMPDU size (see 9.3.3.2).

9.6.14.10 BSS Transition Management Response frame format

The BSS Transition Management Response frame uses the Action frame body format and is optionally transmitted by a STA in response to a BSS Transition Management Request frame. The format of the BSS Transition Management Response Action field is shown in Figure 9-705.

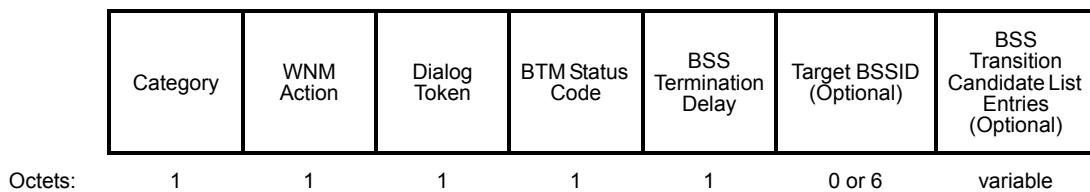

Figure 9-705—BSS Transition Management Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the value in the corresponding BSS Transition Management Request frame. The BSS Transition Management Response frame is transmitted in response to a BSS Transition Management Request frame.

The BTM Status Code field contains the status code in response to a BSS Transition Management Request frame as defined in Table 9-357. If the STA will transition to another BSS, then the status code is 0 (i.e., Accept). If the STA intends to retain the association with the current BSS, the status code is one of the “Reject” status codes.

Table 9-357—BTM status code definitions

| Status code | Status code description |
|-------------|---|
| 0 | Accept |
| 1 | Reject—Unspecified reject reason. |
| 2 | Reject—Insufficient Beacon or Probe Response frames received from all candidates. |
| 3 | Reject—Insufficient available capacity from all candidates. |
| 4 | Reject—BSS termination undesired. |
| 5 | Reject—BSS termination delay requested. |
| 6 | Reject—STA BSS Transition Candidate List provided. |
| 7 | Reject—No suitable BSS transition candidates. |
| 8 | Reject—Leaving ESS. |
| 9–255 | Reserved |

The BSS Termination Delay field is the number of minutes that the responding STA requests the BSS to delay termination. This field is reserved if the Status code field value is not set to 5.

The Target BSSID field is the BSSID of the BSS that the non-AP STA transitions to. This field is present if the Status code subfield contains 0, and not present otherwise.

The BSS Transition Candidate List Entries field contains zero or more Neighbor Report elements described in 9.4.2.37. The Neighbor Report elements are collected by the STA as part of its scanning procedures and provided to the AP as described in 11.24.7.4. The length of the BSS Transition Candidate List Entries field in a BSS Transition Management Response frame is limited by the maximum MMPDU size (see 9.3.3.2).

9.6.14.11 FMS Request frame format

The FMS Request frame is sent by a non-AP STA to the AP to request the specified FMS and to propose delivery intervals for a set of group addressed streams. The FMS Request frame is also sent by a non-AP STA to request a modification to a previous FMS Request. The format of the Action field is shown in Figure 9-706.

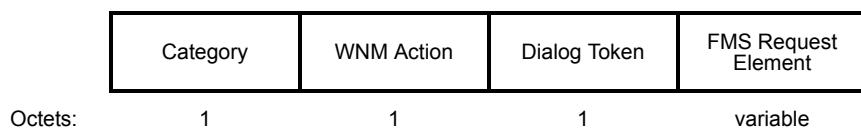

Figure 9-706—FMS Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value that is unique among the FMS Request frame sent to each destination MAC address for which a corresponding FMS Report frame has not been received.

The FMS Request Element field indicates the group addressed traffic streams that are requested by the non-AP STA. The FMS Request Element field contains one FMS Request element described in 9.4.2.76.

9.6.14.12 FMS Response frame format

The FMS Response frame is sent by an AP in response to an FMS Request frame, or sent by the AP to the STA to instruct the non-AP STA to change the delivery interval or data rate. The format of the Action field is shown in Figure 9-707.

| | | | |
|----------|------------|--------------|----------------------|
| Category | WNM Action | Dialog Token | FMS Response Element |
| Octets: | 1 | 1 | 1 variable |

Figure 9-707—FMS Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the FMS Request frame to identify the request/response transaction. If an FMS Response frame is being transmitted other than in response to an FMS Request frame, then the Dialog Token field is 0.

The FMS Response Element indicates the group addressed traffic streams that the AP supports and the corresponding delivery intervals. The FMS Response Element field contains one FMS Response elements, described in 9.4.2.77.

9.6.14.13 Collocated Interference Request frame format

The Collocated Interference Request frame uses the Action frame body format and is transmitted to request collocated interference reports, sent using Collocated Interference Report frames. The format of the Collocated Interference Request Action field is shown in Figure 9-708.

| | | | |
|----------|------------|--------------|--------------|
| Category | WNM Action | Dialog Token | Request Info |
| Octets: | 1 | 1 | 1 |

Figure 9-708—Collocated Interference Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is any nonzero value to identify the request/response transaction.

The Request Info field is shown in Figure 9-709.

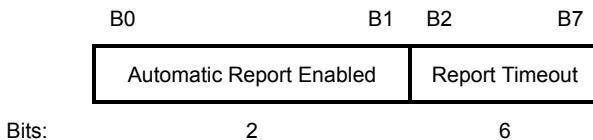

Figure 9-709—Request Info field format

The Automatic Report Enabled subfield contains an unsigned integer value.

The Automatic Report Enabled subfield set to 0 indicates that the requesting STA cancels the previous requests so that the receiving STA stops sending collocated interference reports.

The Automatic Report Enabled subfield set to 1 indicates that the requesting STA requests the receiving STA to send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

The Automatic Report Enabled subfield set to 2 indicates that the requesting STA requests the receiving STA to send a collocated interference report periodically using the period included in the Report Period field in the Collocated Interference Report element; see 9.4.2.85.

The Automatic Report Enabled subfield set to 3 indicates that the requesting STA requests the receiving STA to send collocated interference reports periodically using the period included in the Report Period field in the Collocated Interference Report element; see 9.4.2.85, or send a collocated interference report when the STA knows of a change in the collocated interference, subject to meeting the Report Timeout requirement.

The Report Timeout field contains a value in units of 200 TUs and indicates the minimum duration between two consecutive Collocated Interference Report frames from the reporting STA. When the Automatic Report Enabled subfield is 0, the Report Timeout field is reserved.

9.6.14.14 Collocated Interference Report frame format

The Collocated Interference Report frame uses the Action frame body format and is transmitted in response to Collocated Interference Request frame. The format of the Collocated Interference Report Action field is shown in Figure 9-710.

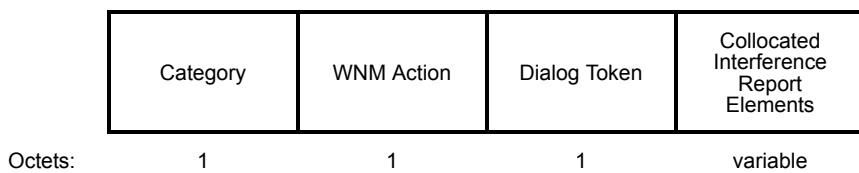

Figure 9-710—Collocated Interference Report Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the corresponding Collocated Interference Request frame to identify the request/response transaction.

The Collocated Interference Report Elements field contains one or more Collocated Interference Report elements to indicate the characteristics of the reported collocated interferences, as defined in 9.4.2.85.

9.6.14.15 TFS Request frame format

The TFS Request frame is sent by a non-AP STA to the AP to request the specified traffic filtering. The format of TFS Request frame is defined in Figure 9-711.

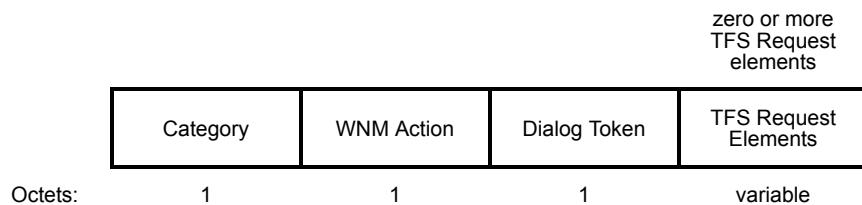

Figure 9-711—TFS Request frame format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a value chosen by the STA sending the TFS Request frame to identify the request/response transaction.

The TFS Request Elements field contains one or more TFS Request elements to specify one or more traffic filter sets that are requested by the non-AP STA, as defined in 9.4.2.80, or zero TFS Request elements to cancel all of the existing traffic filter sets (see 11.24.12.2).

9.6.14.16 TFS Response frame format

The TFS Response frame is sent by an AP in response to a TFS Request frame. The format of the TFS Response Action field is defined in Figure 9-712.

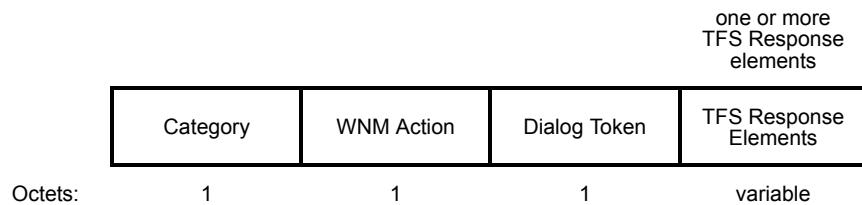

Figure 9-712—TFS Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the value in the corresponding TFS Request frame.

The TFS Response Elements field contains one or more TFS Response elements to indicate the status of the filtering parameters that the AP is requested to support, as defined in 9.4.2.81. The number of TFS Response elements in a TFS Response frame is the same as the number of the TFS Request elements in the TFS Request frame with the same dialog token, where the TFS Response elements appear in the same order as the corresponding TFS Request elements in the TFS Request frame with the same dialog token.

9.6.14.17 TFS Notify frame format

The TFS Notify frame is sent by an AP to a STA when a frame matching a traffic filter is encountered. The format of the TFS Notify Action field is defined in Figure 9-713.

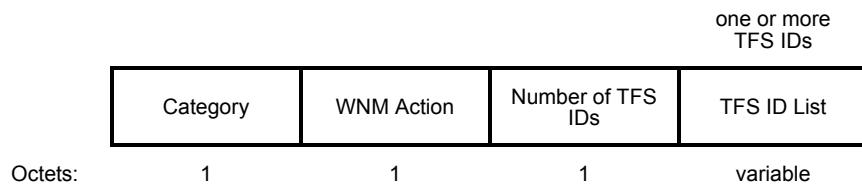

Figure 9-713—TFS Notify Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID field indicates the traffic filter set containing the matched TCLAS element.

9.6.14.18 TFS Notify Response frame format

A TFS Notify Response frame is transmitted by a non-AP STA to an AP to request the AP to resume generation of the TFS Notify frame when a frame matches any traffic filter set identified by the TFS ID(s) included in the TFS Notify Response frame. The format of the TFS Notify Response Action field is shown in Figure 9-714.

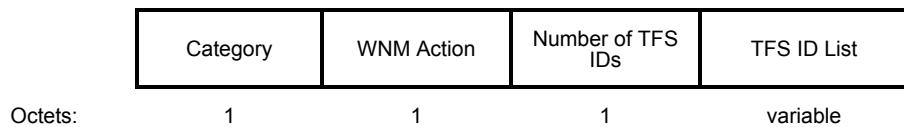

Figure 9-714—TFS Notify Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Number of TFS IDs field indicates the number of 1-octet TFS IDs present in the TFS ID List field.

The TFS ID List field indicates the identifiers of the traffic filter sets.

9.6.14.19 WNM Sleep Mode Request frame format

The WNM Sleep Mode Request frame is sent by a non-AP STA to the AP to enter the WNM sleep mode. The format of the WNM Sleep Mode Request frame is defined in Figure 9-715.

Figure 9-715—WNM Sleep Mode Request frame format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the WNM Sleep Mode Request frame to identify the request/response transaction.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element that is requested by a non-AP STA, as described in 9.4.2.82.

The TFS Request Elements field contains one or more TFS Request elements to specify the traffic filters that are requested by a non-AP STA, as defined in 9.4.2.80.

9.6.14.20 WNM Sleep Mode Response frame format

The WNM Sleep Mode Response frame is sent by an AP in response to a WNM Sleep Mode Request frame or is sent without solicitation by an AP to a non-AP STA upon the AP's deletion of all traffic filter sets established according to the traffic filtering agreement between the AP and the non-AP STA. The format of the WNM Sleep Mode Response Action field is defined in Figure 9-716.

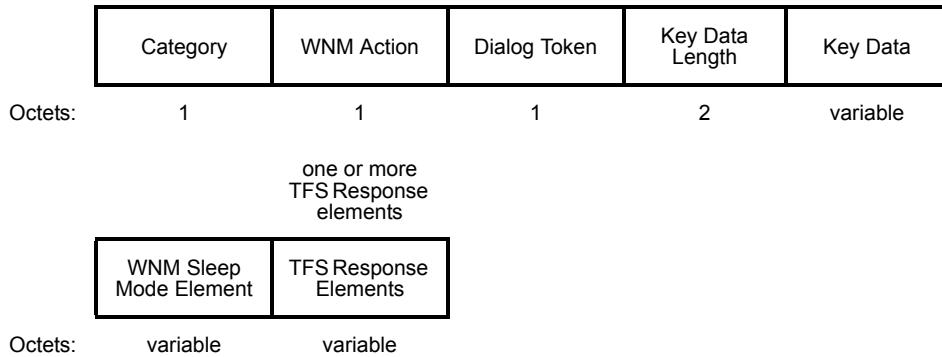

Figure 9-716—WNM Sleep Mode Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

When the WNM Sleep Mode Response frame is transmitted as a response to a WNM Sleep Mode Request frame, the Dialog Token field is the value in the corresponding WNM Sleep Mode Request frame. When the WNM Sleep Mode Response frame is transmitted as an unsolicited response, the Dialog Token field is set to 0.

The Key Data Length field is the length of the Key Data field. If the management frame protection is not used, this field is 0.

The Key Data field contains zero or more subelements that provide the current GTK and IGTK to the STA. The format of these subelements is given in Figure 9-717 and Figure 9-718. The subelement IDs for these subelements are defined in Table 9-358. Each subelement starts with the ID and Length fields. The Length field in the subelement is the length of the contents of the subelement. When management frame protection is not used, the Key Data field is not present.

Table 9-358—Optional subelement IDs for WNM Sleep Mode parameters

| Value | Contents of subelement |
|-------|------------------------|
| 0 | GTK |
| 1 | IGTK |
| 2–255 | Reserved |

The GTK subelement contains the Group Key as shown in Figure 9-717.

| Subelement ID | Length | Key Info | Key Length | RSC | Key |
|---------------|--------|----------|------------|-----|-----|
| Octets: | 1 | 1 | 2 | 1 | 8 |

Figure 9-717—WNM Sleep Mode GTK subelement format

The Subelement ID field is set to 0.

The Length field is defined in 9.4.3.

The Key Info field is defined in Figure 9-319.

The Key Length field is the length of the Key field in octets.

The RSC field contains the receive sequence counter (RSC) for the GTK being installed. The RSC field gives the current message number for the GTK to allow a STA to identify replayed MPDUs. If the RSC field value is less than 8 octets in length, the remaining octets are set to 0. The least significant octet of the TSC or PN is in the first octet of the RSC field.

NOTE—The RSC field value for TKIP is the Transmit Sequence Counter (TSC) and is stored in the first 6 octets; for CCMP it is the Packet Number (PN) and is stored in the first 6 octets; see Table 12-5.

The Key field is the GTK being distributed.

The IGTK subelement contains the Integrity GTK as shown in Figure 9-718.

| Subelement ID | Length | Key ID | PN | Key |
|---------------|--------|--------|----|-----|
| Octets: | 1 | 1 | 2 | 6 |

Figure 9-718—WNM Sleep Mode IGTK subelement format

The Subelement ID field is set to 1.

The Length field is defined in 9.4.3.

The Key ID field indicates the value of the BIP key identifier.

The PN field indicates the receive sequence counter for the IGTK being installed. The PN field gives the current message number for the IGTK, to allow a STA to identify replayed MPDUs.

The Key field is the IGTK being distributed.

NOTE 1—There might be multiple GTK and multiple IGTK subelements if a group rekeying is in process when the non-AP STA wakes up from WNM sleep mode.

NOTE 2—Management frame protection is used to provide confidentiality, replay, and integrity protection for GTK/IGTK update in WNM Sleep Mode Response frames.

The WNM Sleep Mode Element field contains a WNM Sleep Mode element, as described in 9.4.2.82.

The TFS Response Elements field contains one or more TFS Response elements to specify the traffic filters, as defined in 9.4.2.81.

9.6.14.21 TIM Broadcast Request frame format

The format of the TIM Broadcast Request Action field is shown in Figure 9-719.

| | | | | |
|---------|----------|------------|--------------|-------------------------------|
| | Category | WNM Action | Dialog Token | TIM Broadcast Request Element |
| Octets: | 1 | 1 | 1 | 3 |

Figure 9-719—TIM Broadcast Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the STA sending the TIM Broadcast Request frame to identify the request/response transaction.

The TIM Broadcast Request Element field contains a TIM Broadcast Request Element as specified in 9.4.2.83.

9.6.14.22 TIM Broadcast Response frame format

The format of the TIM Broadcast Response Action field is shown in Figure 9-720.

| | | | | |
|---------|----------|------------|--------------|--------------------------------|
| | Category | WNM Action | Dialog Token | TIM Broadcast Response Element |
| Octets: | 1 | 1 | 1 | 3 or 12 |

Figure 9-720—TIM Broadcast Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value of the corresponding TIM Broadcast Request frame. If the TIM Broadcast Response frame is being transmitted other than in response to a TIM Broadcast Request frame, then the dialog token is 0.

The TIM Broadcast Response Element field contains a TIM Broadcast Response Element as specified in 9.4.2.84.

9.6.14.23 QoS Traffic Capability Update frame format

The QoS Traffic Capability Update frame is sent by a non-AP STA to the AP to update QoS Traffic Capability information. The format of the Action field is shown in Figure 9-721.

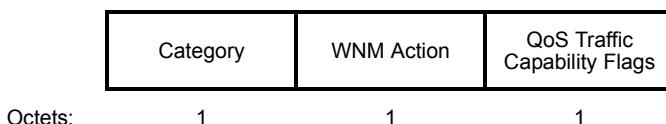

Figure 9-721—QoS Traffic Capability Update Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The QoS Traffic Capability Flags field is defined in Table 9-359. The QoS Traffic Capability Flags field comprises 1 octet, with the bits 4–6 serving as QoS Traffic Capability Flags. Each of the bits 4–6 serves as a flag for one of the three user priorities, UP 4–6. The field is 1 to indicate the expectation of generating traffic belonging to the corresponding user priority (UP). The field is 0 to indicate that such expectation does not exist. The use of the QoS Traffic Capability Update frame is described in 11.24.10.

Table 9-359—QoS Traffic Capability Flags definition

| Bit | Description |
|-----|--------------|
| 0–3 | Reserved |
| 4 | UP 4 Traffic |
| 5 | UP 5 Traffic |
| 6 | UP 6 Traffic |
| 7 | Reserved |

9.6.14.24 Channel Usage Request frame format

The Channel Usage Request frame is sent by a non-AP STA to the AP to request the specified Channel Usage information. The format of the Channel Usage Request Action field is defined in Figure 9-722.

| Category | WNM Action | Dialog Token | Channel Usage Elements | Supported Operating Classes Element |
|----------|------------|--------------|------------------------|-------------------------------------|
| Octets: | 1 | 1 | 1 | variable |

Figure 9-722—Channel Usage Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the Channel Usage Request frame to identify the request/response transaction.

The Channel Usage Element field includes one or more Channel Usage elements described in 9.4.2.86 to identify the request Usage Mode.

The Supported Operating Classes Element field includes a Supported Operating Classes element to indicate the supported operating classes for the requested network type, consistent with the Country element advertised by the AP. The Supported Operating Classes is described in 9.4.2.54.

9.6.14.25 Channel Usage Response frame format

The Channel Usage Response frame is sent by an AP STA in response to a Channel Usage Request frame, or autonomously. The format of the Channel Usage Response Action field is shown in Figure 9-723.

| Category | WNM Action | Dialog Token | Channel Usage Elements | Country String | Power Constraint Element (optional) | EDCA Parameter Set Element (optional) | Transmit Power Envelope element (optional) |
|----------|------------|--------------|------------------------|----------------|-------------------------------------|---------------------------------------|--|
| Octets: | 1 | 1 | variable | 3 | 0 or 3 | 0 or 20 | variable |

Figure 9-723—Channel Usage Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the Channel Usage Request frame if the Channel Usage Response frame is being transmitted in response to a Channel Usage Request frame. The Dialog Token field is 0 if the Channel Usage Response frame is being transmitted other than in response to a Channel Usage Request frame.

The Channel Usage Element field includes zero or more Channel Usage elements described in 9.4.2.86.

The Country String field is the value contained in the dot11CountryString attribute.

The Power Constraint Element field includes zero or one Power Constraint elements described in 9.4.2.14. The use of the Power Constraint element included in the Power Constraint Element field is described in 11.24.15.

The EDCA Parameter Set Element field includes zero or one EDCA Parameter Set elements described in 9.4.2.29. The use of the EDCA Parameter Set element included in the EDCA Parameter Set Element field is described in 11.24.15.

The Transmit Power Envelope element field is defined in 9.4.2.162.

9.6.14.26 DMS Request frame format

The DMS Request frame is sent by a non-AP STA to the AP to define information about a DMS request to the AP. The format of the DMS Request Action field is defined in Figure 9-724.

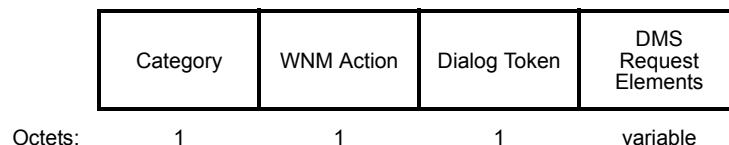

Figure 9-724—DMS Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is a nonzero value chosen by the non-AP STA sending the DMS Request frame to identify the request/response transaction.

The DMS Request Elements field contains one or more DMS Request elements as specified in 9.4.2.88.

9.6.14.27 DMS Response frame format

The DMS Response frame is sent by an AP or a mesh STA in response to a DMS Request frame, or autonomously to terminate a requested DMS stream, or to advertise the current parameters for one or more GCR streams. The format of the DMS Response Action field is shown in Figure 9-725.

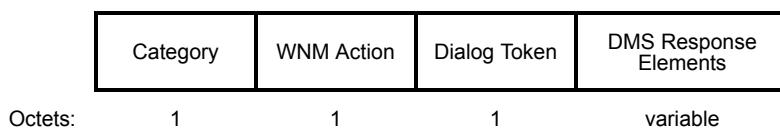

Figure 9-725—DMS Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is the nonzero value received in the DMS Request frame if the DMS Response frame is being transmitted in response to a DMS Request frame. The Dialog Token field is 0 if the DMS Response frame is being transmitted autonomously, and not in response to a DMS Request frame.

The DMS Response Elements field contains one or more DMS Response elements as specified in 9.4.2.89.

9.6.14.28 Timing Measurement Request frame format

The format of the Timing Measurement Request Action field is shown in Figure 9-726.

| Category | WNM Action | Trigger |
|----------|------------|---------|
| Octets: | 1 | 1 |

Figure 9-726—Timing Measurement Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Trigger field set to the value 1 indicates that the sending STA requests a timing measurement procedure at the receiving STA as defined in 11.24.5. The Trigger field set to the value 0 indicates that the sending STA requests that the receiving STA stop sending Timing Measurement frames. Trigger field values 2–255 are reserved.

9.6.14.29 WNM Notification Request frame format

The format of the WNM Notification Request Action field is shown in Figure 9-727.

| Category | WNM Action | Dialog Token | Type | Optional Subelements |
|----------|------------|--------------|------|----------------------|
| Octets: | 1 | 1 | 1 | 1 variable |

Figure 9-727—WNM Notification Request Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the WNM notification request to identify the request/response transaction.

The Type field indicates the type of WNM notification, as defined in Table 9-360.

Table 9-360—WNM notification type

| Value | Description |
|---------|------------------------------|
| 0 | Firmware Update Notification |
| 1–220 | Reserved |
| 221 | Vendor Specific |
| 222–255 | Reserved |

The Optional Subelements field contains zero or more subelements. The subelement format and ordering of subelements are defined in 9.4.3.

The Subelement ID field values for the defined subelements are shown in Table 9-361.

Table 9-361—Optional subelement IDs for WNM Notification Request

| Subelement ID | Name | Extensible |
|---------------|--------------------------|------------|
| 0 | AP Descriptor | |
| 1 | Firmware Version—Current | |
| 2 | Firmware Version—New | |
| 3–255 | Reserved | |

When the Type field is 0, the AP Descriptor, Firmware Version—Current, and Firmware Version—New optional subelements are included in the WNM Notification Request frame. The AP descriptor field format is as defined in Figure 9-374. The Firmware Version—Current subelement contains the current firmware version, in the Firmware Version subelement format defined in Figure 9-380. The Firmware Version—New subelement contains the new firmware version, in the Firmware Version subelement format defined in Figure 9-380.

9.6.14.30 WNM Notification Response frame format

The format of the WNM Notification Response Action field is shown in Figure 9-728.

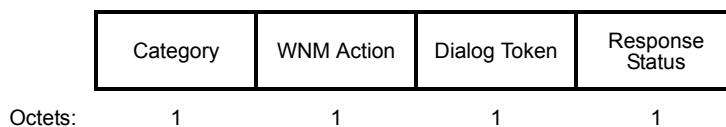

Figure 9-728—WNM Notification Response Action field format

The Category field is defined in 9.4.1.11.

The WNM Action field is defined in 9.6.14.1.

The Dialog Token field is set to the nonzero value of the corresponding WNM Notification Request frame.

The Response Status field indicates the Response Status value, as defined in Table 9-362.

Table 9-362—WNM Notification Response Status

| Value | Description |
|-------|---------------------------|
| 0 | Notification Acknowledged |
| 1–255 | Reserved |

9.6.15 Unprotected WNM Action details

9.6.15.1 Unprotected WNM Action fields

Unprotected WNM Action frames are not encapsulated using mechanisms defined for robust Management frames. An Unprotected WNM Action field, in the octet field immediately after the Category field, differentiates the formats. The Unprotected WNM Action field values associated with each frame format is defined in Table 9-363.

Table 9-363—Unprotected WNM Action field values

| Action field value | Description |
|--------------------|--------------------|
| 0 | TIM |
| 1 | Timing Measurement |
| 2–255 | Reserved |

9.6.15.2 TIM frame format

The format of the TIM Action field is shown in Figure 9-729.

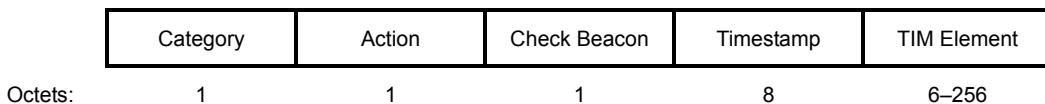

Figure 9-729—TIM Action field format

The Category field is defined in 9.4.1.11.

The Unprotected WNM Action field is defined in 9.6.15.1.

The Check Beacon field is defined as an unsigned integer initialized to 0, that increments when a critical update to the Beacon frame has occurred; see 11.2.3.17.

The Timestamp field is defined in 9.4.1.10. The field contains a valid TSF timestamp when the TIM Broadcast Response frame contained a Status field set to “Accept, valid timestamp present in TIM frames” or “Overridden, valid timestamp present in TIM frames.” The field is reserved otherwise.

The TIM Element field contains a TIM element as specified in 9.4.2.6. The bit corresponding to buffered group addressed frames is reserved for all BSSIDs.

9.6.15.3 Timing Measurement frame format

The Timing Measurement frame is used to support the timing measurement procedure described in 11.24.5. The format of the Timing Measurement Action field is shown in Figure 9-730.

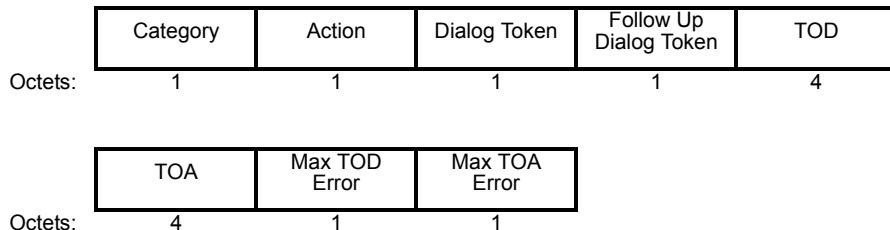

Figure 9-730—Timing Measurement Action field format

The Category field is defined in 9.4.1.11.

The Unprotected WNM Action field is defined in 9.6.15.1.

The Dialog Token field is a nonzero value chosen by the sending STA to identify the Timing Measurement frame as the first of a pair, with the second or follow-up Timing Measurement frame to be sent later. The Dialog Token field is set to 0 to indicate that the Timing Measurement frame will not be followed by a subsequent follow-up Timing Measurement frame.

The Follow Up Dialog Token field is the nonzero value of the Dialog Token field of the previously transmitted Timing Measurement frame to indicate that it is the follow up Timing Measurement frame and that the TOD, TOA, Max TOD Error and Max TOA Error fields contain the values of the timestamps captured with the first Timing Measurement frame of the pair. The Follow Up Dialog Token field is 0 to indicate that the Timing Measurement frame is not a follow up to a previously transmitted Timing Measurement frame. The value 0 in this field also indicates that the TOD, TOA, Max TOD Error, and Max TOA Error fields are reserved. See 11.24.5.

The TOD, TOA, Max TOD Error, and Max TOA Error fields are expressed in units of 10 ns.

The TOD field contains a timestamp that represents the time at which the start of the preamble of the previously transmitted Timing Measurement frame appeared at the transmit antenna connector.

The TOA field contains a timestamp that represents the time at which the start of the preamble of the Ack frame to the previously transmitted Timing Measurement frame arrived at the receive antenna connector.

NOTE—The values specified in the TOD and TOA fields are described in 6.3.57.

The Max TOD Error field contains an upper bound for the error in the value specified in the TOD field. For instance, a value of 2 in the Max TOD Error field indicates that the value in the TOD field has a maximum error of ± 20 ns.

The Max TOA Error field contains an upper bound for the error in the value specified in the TOA field. For instance, a value of 2 in the Max TOA Error field indicates that the value in the TOA field has a maximum error of ± 20 ns.

A value of 0 for the Max TOD Error or the Max TOA Error field indicates that the upper bound on the error in the corresponding TOD or TOA value is unknown. A value of 255 indicates that the upper bound on the error is greater than or equal to 2.55 μ s.

9.6.16 Self-protected Action frame details

9.6.16.1 Self-protected Action fields

The Self-protected Action frame is defined to allow robust STA-STA communications of the Action frames that are not robust (see 9.4.1.11). The protocols that use these Action frames are responsible for deciding whether to protect these frames and supporting protection mechanisms for these frames as needed.

Self-protected Action frames have a different nature than Public Action frames and robust Action frames. Robust Action frames assume the existence of a completely established security association. Self-protected Action frames typically exist to manage the creation and deletion of security associations, regardless of whether they are completely established.

Public Action frames are defined as public for all STAs, including those that are not in the BSS and MBSS. Self-protected Action frames, however, are used for relationship creation and maintenance between two specific STAs. Their public nature is incidental.

A Self-protected Action field, in the octet field immediately after the Category field, differentiates the formats. The defined Self-protected Action frames are listed in Table 9-364.

Table 9-364—Self-protected Action field values

| Self-protected Action field value | Description |
|-----------------------------------|----------------------------|
| 0 | Reserved |
| 1 | Mesh Peering Open |
| 2 | Mesh Peering Confirm |
| 3 | Mesh Peering Close |
| 4 | Mesh Group Key Inform |
| 5 | Mesh Group Key Acknowledge |
| 6–255 | Reserved |

The Mesh Peering Open frame, the Mesh Peering Confirm frame, and the Mesh Peering Close frame are referred to as *mesh peering Management frames*.

9.6.16.2 Mesh Peering Open frame format

9.6.16.2.1 Mesh Peering Open frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Open frames.

When the Mesh Peering Open frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.16.2.2 Mesh Peering Open frame details

The Mesh Peering Open frame is used to open a mesh peering using the procedures defined in 14.3.6 and in 14.5.5. The format of the Mesh Peering Open frame Action field is shown in Table 9-365.

Table 9-365—Mesh Peering Open frame Action field format

| Order | Information | Notes |
|-------|---|--|
| 1 | Category | |
| 2 | Self-protected Action | |
| 3 | Capability | |
| 4 | Supported Rates and BSS Membership Selectors | |
| 5 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. |
| 6 | Power Capability | The Power Capability element is present if dot11SpectrumManagementRequired is true. |
| 7 | Supported Channels | The Supported Channels element is present if dot11SpectrumManagementRequired is true and dot11ExtendedChannelSwitchActivated is false. |

Table 9-365—Mesh Peering Open frame Action field format (continued)

| Order | Information | Notes |
|-------|-------------------------------|--|
| 8 | RSN | The RSNE is present if dot11MeshSecurityActivated, dot11ProtectedQLoadReportActivated, or dot11ProtectedTXOPNegotiationActivated is true; otherwise not present. |
| 9 | Mesh ID | |
| 10 | Mesh Configuration | |
| 11 | Mesh Peering Management | The Mesh Peering Management element is set as described in 9.4.2.98. |
| 12 | ERP Information | The ERP element is present if ERP mesh STA detects NonERP STAs in its vicinity and is optionally present otherwise. |
| 13 | Supported Operating Classes | The Supported Operating Classes element is present if dot11ExtendedChannelSwitchActivated is true. |
| 14 | HT Capabilities | The HT Capabilities element is present when dot11HighThroughputOptionImplemented is true. |
| 15 | HT Operation | The HT Operation element is included when dot11HighThroughputOptionImplemented is true. |
| 16 | 20/40 BSS Coexistence element | The 20/40 BSS Coexistence element is optionally present when the dot112040BSSCoexistenceManagementSupport is true. |
| 17 | Extended Capabilities element | The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. |
| 18 | Interworking | The Interworking element is present if dot11InterworkingServiceActivated is true. |
| 19 | VHT Capabilities | The VHT Capabilities element is present when dot11VHTOptionImplemented is true. |
| 20 | VHT Operation | The VHT Operation element is present when dot11VHTOptionImplemented is true. |
| 21 | Operating Mode Notification | The Operating Mode Notification element is optionally present if dot11OperatingModeNotificationImplemented is true. |

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.16.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Open frame body is encrypted and authenticated (see 14.5).

9.6.16.3 Mesh Peering Confirm frame format

9.6.16.3.1 Mesh Peering Confirm frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Confirm frames.

When the Mesh Peering Confirm frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.16.3.2 Mesh Peering Confirm frame details

The Mesh Peering Confirm frame is used to confirm a mesh peering using the procedures defined in 14.3.7 and 14.5.5. The format of the Mesh Peering Confirm frame Action field is shown in Table 9-366.

Table 9-366—Mesh Peering Confirm frame Action field format

| Order | Information | Notes |
|-------|---|---|
| 1 | Category | |
| 2 | Self-protected Action | |
| 3 | Capability | |
| 4 | AID | |
| 5 | Supported Rates and BSS Membership Selectors | |
| 6 | Extended Supported Rates and BSS Membership Selectors | The Extended Supported Rates and BSS Membership Selectors element is present if there are more than eight supported rates and is optionally present otherwise. |
| 7 | RSN | The RSNE is present only when <code>dot11MeshSecurityActivated</code> , <code>dot11ProtectedQLoadReportActivated</code> , or <code>dot11ProtectedTXOPNegotiationActivated</code> is true. |
| 8 | Mesh ID | |
| 9 | Mesh Configuration | The Mesh Configuration element is present when <code>dot11MeshActivated</code> is true. |
| 10 | Mesh Peering Management | The Mesh Peering Management element is set as described in 9.4.2.102. |
| 11 | HT Capabilities | The HT Capabilities element is present when <code>dot11HighThroughputOptionImplemented</code> is true. |
| 12 | HT Operation | The HT Operation element is included when <code>dot11HighThroughputOptionImplemented</code> is true. |
| 13 | 20/40 BSS Coexistence element | The 20/40 BSS Coexistence element is optionally present when the <code>dot112040BSSCoexistenceManagementSupport</code> is true. |
| 14 | Extended Capabilities element | The Extended Capabilities element is optionally present if any of the fields in this element are nonzero. |
| 15 | VHT Capabilities | The VHT Capabilities element is present when <code>dot11VHTOptionImplemented</code> is true. |
| 16 | VHT Operation | The VHT Operation element is present when <code>dot11VHTOptionImplemented</code> is true. |
| 17 | Operating Mode Notification | The Operating Mode Notification element is optionally present if <code>dot11OperatingModeNotificationImplemented</code> is true. |

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.16.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Confirm frame body is encrypted and authenticated (see 14.5).

9.6.16.4 Mesh Peering Close frame format

9.6.16.4.1 Mesh Peering Close frame self protection

Protection of this frame is provided when authenticated mesh peering exchange (AMPE) is enabled. AMPE provides integrity protection of Mesh Peering Close frames.

When the Mesh Peering Close frame is used by the mesh peering management (MPM) protocol, integrity protection on the frame is not enabled.

9.6.16.4.2 Mesh Peering Close frame details

The Mesh Peering Close frame is used to close a mesh peering using the procedures defined in 14.3.8 and in 14.5.5. The format of the Mesh Peering Close frame Action field is shown in Table 9-367.

Table 9-367—Mesh Peering Close frame Action field format

| Order | Information | Notes |
|-------|-------------------------|-------|
| 1 | Category | |
| 2 | Self-protected Action | |
| 3 | Mesh ID | |
| 4 | Mesh Peering Management | |

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.16.1.

The MIC element appears prior to the Authenticated Mesh Peering Exchange element in the Mesh Peering Open frame. The information following the MIC element through to the end of the Mesh Peering Close frame body is encrypted and authenticated (see 14.5).

9.6.16.5 Mesh Group Key Inform frame format

9.6.16.5.1 Mesh Group Key Inform frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.6) that uses Mesh Group Key Inform frames.

9.6.16.5.2 Mesh Group Key Inform frame details

The Mesh Group Key Inform frame is used to update a mesh GTK (MGTK) with a peer. The format of the Mesh Group Key Inform frame Action field is shown in Table 9-368.

Table 9-368—Mesh Group Key Inform frame Action field format

| Order | Information | Notes |
|-------|-------------------------------------|-------|
| 1 | Category | |
| 2 | Self-protected Action | |
| 3 | MIC element | |
| 4 | Authenticated Mesh Peering Exchange | |

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.16.1.

The MIC element is set as defined in 9.4.2.119.

The Authenticated Mesh Peering Exchange element is set according to 14.6. The information following the MIC element through to the end of the Mesh Group Key Inform frame body is encrypted and authenticated (see 14.6.2).

9.6.16.6 Mesh Group Key Acknowledge frame format

9.6.16.6.1 Mesh Group Key Acknowledge frame self protection

The protection of the frames is provided by the mesh group key handshake protocol (see 14.6) that uses Mesh Group Key Acknowledge frames.

9.6.16.6.2 Mesh Group Key Acknowledge frame details

The Mesh Group Key Acknowledge frame is used to acknowledge receipt and processing of a Mesh Group Key Inform frame. The format of the Mesh Group Key Acknowledge frame Action field is shown in Table 9-369.

Table 9-369—Mesh Group Key Acknowledge frame Action field format

| Order | Information | Notes |
|-------|-------------------------------------|-------|
| 1 | Category | |
| 2 | Self-protected Action | |
| 3 | MIC element | |
| 4 | Authenticated Mesh Peering Exchange | |

The Category field is defined in 9.4.1.11.

The Self-protected Action field is defined in 9.6.16.1.

The MIC element is set as defined in 9.4.2.119.

The Authenticated Mesh Peering Exchange element is set according to 14.6. The information following the MIC element through to the end of the Mesh Group Key Acknowledge frame body is encrypted and authenticated (see 14.6.2).

9.6.17 Mesh Action frame details

9.6.17.1 Mesh Action fields

Several Mesh Action frame formats are defined for mesh BSS operation. A Mesh Action field, in the octet field immediately after the Category field, differentiates the formats. The Mesh Action field values associated with each frame format are defined in Table 9-370.

Table 9-370—Mesh Action field values

| Mesh Action field value | Description |
|-------------------------|---------------------------------|
| 0 | Mesh Link Metric Report |
| 1 | HWMP Mesh Path Selection |
| 2 | Gate Announcement |
| 3 | Congestion Control Notification |
| 4 | MCCA Setup Request |
| 5 | MCCA Setup Reply |
| 6 | MCCA Advertisement Request |
| 7 | MCCA Advertisement |
| 8 | MCCA Teardown |
| 9 | TBTT Adjustment Request |
| 10 | TBTT Adjustment Response |
| 11–255 | Reserved |

9.6.17.2 Mesh Link Metric Report frame format

The Mesh Link Metric Report frame is transmitted by a mesh STA to a neighbor peer mesh STA to report metric information on the link between the two mesh STAs. It is also transmitted by a mesh STA to a neighbor peer mesh STA to request metric information on the link between the two mesh STAs from the recipient. This frame is transmitted using an individually addressed frame. The format of the Mesh Link Metric Report frame Action field is shown in Table 9-371.

Table 9-371—Mesh Link Metric Report frame Action field format

| Order | Information | Notes |
|-------|---------------------------------|-------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Mesh Link Metric Report element | |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The Mesh Link Metric Report element is set as described in 9.4.2.100.

9.6.17.3 HWMP Mesh Path Selection frame format

The HWMP Mesh Path Selection frame is transmitted by a mesh STA to establish, update or delete paths to other mesh STAs using the HWMP defined in 14.10. This frame is transmitted in an individually or group addressed frame depending on the contained elements and as defined in 14.10.7. The format of the HWMP Mesh Path Selection frame Action field is shown in Table 9-372.

The HWMP Mesh Path Selection frame contains one or more of the elements indicated in Table 9-372.

Table 9-372—HWMP Mesh Path Selection frame Action field format

| Order | Information | Notes |
|-------|--------------|--------------------------------------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | PREQ element | A PREQ element is optionally present |
| 4 | PREP element | A PREP element is optionally present |
| 5 | PERR element | A PERR element is optionally present |
| 6 | RANN element | A RANN element is optionally present |

Usage of the HWMP Mesh Path Selection frame is described in 14.10.7.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The PREQ element is set as described in 9.4.2.113. It is present in a HWMP Mesh Path Selection frame as described in 14.10.9.

The PREP element is set as described in 9.4.2.114.

The PERR element is set as described in 9.4.2.115.

The RANN element is set as described in 9.4.2.112.

9.6.17.4 Gate Announcement frame format

The Gate Announcement frame is transmitted by a mesh gate to announce its presence in the MBSS. This frame is transmitted using group addresses. The format of the Gate Announcement frame Action field is shown in Table 9-373.

Table 9-373—Gate Announcement frame Action field format

| Order | Information | Notes |
|-------|--------------|-------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | GANN element | |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The GANN element is set as described in 9.4.2.111.

9.6.17.5 Congestion Control Notification frame format

A mesh STA uses the Congestion Control Notification frame to indicate its congestion status to its neighbor peer mesh STA(s). This frame is transmitted using individual addresses or group addresses. The format of the Congestion Control Notification frame Action field is shown in Table 9-374.

Table 9-374—Congestion Control Notification frame Action field format

| Order | Information | Notes |
|-------|---------------------------------|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Congestion Notification element | One or more Congestion Notification elements (9.4.2.101) are present. Repeated N times (N is the number of Congestion Notification elements contained in the frame). |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The Congestion Notification element is set as described in 9.4.2.101.

9.6.17.6 MCCA Setup Request frame format

The MCCA Setup Request frame is used to set up an MCCAOP reservation. A mesh STA (whose dot11MCCAActivated is true) transmits the MCCA Setup Request frame to one or more neighbor mesh STAs (whose dot11MCCAActivated values also are true). This frame is transmitted using individual addresses or group addresses. The format of the MCCA Setup Request frame Action field is shown in Table 9-375.

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The MCCAOP Setup Request element is described in 9.4.2.106.

Table 9-375—MCCA Setup Request frame Action field format

| Order | Information | Notes |
|-------|------------------------------|-------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Setup Request element | |

9.6.17.7 MCCA Setup Reply frame format

The MCCA Setup Reply frame is used to reply to an MCCA Setup Request frame. It is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true. This frame is transmitted using individual addresses. The format of the MCCA Setup Reply frame Action field is shown in Table 9-376.

Table 9-376—MCCA Setup Reply frame Action field format

| Order | Information | Notes |
|-------|----------------------------|-------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Setup Reply element | |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The MCCAOP Setup Reply element is described in 9.4.2.107.

9.6.17.8 MCCA Advertisement Request frame format

The MCCA Advertisement Request frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to a neighbor peer mesh STA with dot11MCCAActivated equal to true in order to request MCCAOP advertisements from the neighbor peer mesh STA. This frame is transmitted using individual addresses. The format of the MCCA Advertisement Request frame Action field is shown in Table 9-377.

Table 9-377—MCCA Advertisement Request frame Action field format

| Order | Information | Notes |
|-------|---------------------------------------|---|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Advertisement Overview element | An MCCAOP Advertisement Overview element is optionally present. |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The MCCAOP Advertisement Overview element is described in 9.4.2.108.

9.6.17.9 MCCA Advertisement frame format

The MCCA Advertisement frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Advertisement frame Action field is shown in Table 9-378.

Table 9-378—MCCA Advertisement frame Action field format

| Order | Information | Notes |
|-------|---------------------------------------|--|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Advertisement Overview element | An MCCAOP Advertisement Overview element is optionally present. |
| 4 | MCCAOP Advertisement elements | If an MCCAOP Advertisement Overview element is present, zero or more MCCAOP Advertisement elements are present. If an MCCAOP Advertisement Overview element is not present, one or more MCCAOP Advertisement elements are present. |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The MCCAOP Advertisement Overview element is described in 9.4.2.108.

The MCCAOP Advertisement element is described in 9.4.2.109.

9.6.17.10 MCCA Teardown frame format

The MCCA Teardown frame is transmitted by a mesh STA with dot11MCCAActivated equal to true to one or more neighbor peer mesh STAs with dot11MCCAActivated equal to true. This frame is transmitted using group addresses or individual addresses. The format of the MCCA Teardown frame Action field is shown in Table 9-379.

Table 9-379—MCCA Teardown frame Action field format

| Order | Information | Notes |
|-------|-------------------------|-------|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | MCCAOP Teardown element | |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The MCCAOP Teardown element is described in 9.4.2.110.

9.6.17.11 TBTT Adjustment Request frame format

The TBTT Adjustment Request frame is used to request a particular neighbor peer mesh STA to adjust its TBTT. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Request frame Action field is shown in Table 9-380.

Table 9-380—TBTT Adjustment Request frame Action field format

| Order | Information | Notes |
|-------|-----------------------|--|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Beacon Timing element | Repeated N_Info times (N_Info is a number of beacon timing information tuples as described in 14.13.4.2.5). |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The Beacon Timing element is set as described in 9.4.2.105. When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.17.12 TBTT Adjustment Response frame format

The TBTT Adjustment Response frame is used to respond to a TBTT adjustment request. This frame is transmitted using individual addresses. The format of the TBTT Adjustment Response frame Action field is shown in Table 9-381.

Table 9-381—TBTT Adjustment Response frame Action field format

| Order | Information | Notes |
|-------|----------------------------------|--|
| 1 | Category | |
| 2 | Mesh Action | |
| 3 | Status Code | |
| 4 | Beacon Timing element (optional) | Repeated N_Info times (N_Info is a number of beacon timing information tuples as described in 14.13.4.2.5). |

The Category field is defined in 9.4.1.11.

The Mesh Action field is defined in 9.6.17.1.

The Status Code field is set as described in 14.13.4.4.2.

The Beacon Timing element is set as defined in 9.4.2.105. It is present only if the Status Code is set to CANNOT_FIND_ALTERNATIVE_TBTT (i.e., when the request is not successful due to the neighbor constraint). When not all beacon timing information is included in a Beacon Timing element due to the maximum element size limit, multiple Beacon Timing elements are present. The elements are present in the order of Beacon Timing Element Number field value in the Report Control field of the Beacon Timing element.

9.6.18 Multihop Action frame details

9.6.18.1 Multihop Action fields

Several Multihop Action frame formats are defined for mesh BSS operation. A Multihop Action field, in the octet field immediately after the Category field, differentiates the formats. The Multihop Action field values associated with each frame format are defined in Table 9-382. The Mesh Control field is present immediately after the Multihop Action field in all Multihop Action frames.

Table 9-382—Multihop Action field values

| Multihop Action field value | Description |
|-----------------------------|---------------------------|
| 0 | Proxy Update |
| 1 | Proxy Update Confirmation |
| 2–255 | Reserved |

9.6.18.2 Proxy Update frame format

The Proxy Update frame is used to inform the recipient about new, updated, or deleted proxy information. This frame is transmitted using individual addresses. The format of the Proxy Update frame Action field is shown in Table 9-383.

Table 9-383—Proxy Update frame Action field format

| Order | Information | Notes |
|-------|-----------------|---|
| 1 | Category | |
| 2 | Multihop Action | |
| 3 | Mesh Control | |
| 4 | PXU element | Repeated N times (N is the number of PXU elements contained in the frame). |

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.18.1.

The Mesh Control field is set as defined in 9.2.4.7.3.

The PXU element is described in 9.4.2.116. The Proxy Update frame allows the inclusion of multiple PXU elements.

9.6.18.3 Proxy Update Confirmation frame format

The Proxy Update Confirmation frame is transmitted by a mesh STA in response to a Proxy Update frame. This frame is used to inform that the corresponding PXU element has been properly received and is transmitted using individual addresses. The format of the Proxy Update Confirmation frame Action field is shown in Table 9-384.

Table 9-384—Proxy Update Confirmation frame Action field format

| Order | Information | Notes |
|-------|-----------------|--|
| 1 | Category | |
| 2 | Multihop Action | |
| 3 | Mesh Control | |
| 4 | PXUC element | Repeated N times (N is the number of PXUC elements contained in the frame). |

The Category field is defined in 9.4.1.11.

The Multihop Action field is defined in 9.6.18.1.

The Mesh Control field is set as defined in 9.2.4.7.3.

The PXUC element is described in 9.4.2.117. The Proxy Update Confirmation frame allows the inclusion of one or more PXUC elements.

9.6.19 Robust AV Streaming Action frame details

9.6.19.1 General

Several Action frame formats are defined to support robust AV streaming. The Robust Action field values associated with each frame format within the robust AV streaming category are defined in Table 9-385. The frame formats are defined in 9.6.19.2 to 9.6.19.5.

Table 9-385—Robust AV streaming Robust Action field values

| Robust Action field value | Meaning |
|---------------------------|---------------------------|
| 0 | SCS Request |
| 1 | SCS Response |
| 2 | Group Membership Request |
| 3 | Group Membership Response |
| 4–255 | Reserved |

9.6.19.2 SCS Request frame format

SCS Request frames are used to request the creation, modification, or deletion of a stream classification using the procedures defined in 11.27.2.

The Action field of the SCS Request frame contains the information shown in Figure 9-731.

| Category | Robust Action | Dialog Token | SCS Descriptor List |
|----------|---------------|--------------|---------------------|
| Octets: | 1 | 1 | variable |

Figure 9-731—SCS Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.27.5.

The SCS Descriptor List field contains one or more SCS Descriptor elements, as defined in 9.4.2.122.

9.6.19.3 SCS Response frame format

The SCS Response frame is sent in response to an SCS Request frame using the procedures defined in 11.27.2. The Action field of an SCS Response frame contains the information shown in Figure 9-732.

| Category | Robust Action | Dialog Token | SCS Status List |
|----------|---------------|--------------|-----------------|
| Octets: | 1 | 1 | variable |

Figure 9-732—SCS Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.19.1.

The Dialog Token field is set to the nonzero value of the corresponding SCS Request frame. If the SCS Report frame is being transmitted for a reason other than in response to an SCS Request frame, then the Dialog Token field is set to 0.

The SCS Status List field contains one or more SCS Status duples. The format of the SCS Status duple is defined in Figure 9-733.

| SCSID | Status |
|---------|--------|
| Octets: | 1 |

Figure 9-733—SCS Status duple format

The SCSID field is set to the value of the SCSID field in the SCS Descriptor element received in the SCS Request frame.

The Status field indicates the status of the requested SCSID, as indicated in Table 9-46.

9.6.19.4 Group Membership Request frame format

The Group Membership Request frame is sent to a STA to request the contents of its dot11GroupAddressesTable. The Action field of a Group Membership Request frame contains the information shown in Figure 9-734.

| Category | Robust Action | Dialog Token |
|----------|---------------|--------------|
| Octets: | 1 | 1 |

Figure 9-734—Group Membership Request frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.19.1.

The Dialog Token field is defined in 9.4.1.12 and set by the requesting STA to a nonzero value that is used for matching action responses with action requests. See 10.27.5.

Usage of the Group Membership Request frame is described in 11.24.16.3.2.

9.6.19.5 Group Membership Response frame format

The Group Membership Response frame is sent in response to a Group Membership Request frame or upon a change in the dot11GroupAddressesTable object, using the procedures defined in 11.24.16.3.2. The Action field of a Group Membership Response frame contains the information shown in Figure 9-735.

| Category | Robust Action | Dialog Token | Address Count | Group Address List |
|----------|---------------|--------------|---------------|--------------------|
| Octets: | 1 | 1 | 1 | variable |

Figure 9-735—Group Membership Response frame Action field format

The Category field is defined in 9.4.1.11.

The Robust Action field is defined in 9.6.19.1.

The Dialog Token field is set to the nonzero value of the corresponding Group Membership Request frame. If the Group Membership Report frame is being transmitted for a reason other than in response to a Group Membership Request frame, the Dialog Token field is set to 0.

The Address Count field specifies the number of MAC addresses that are in the Group Address List field.

The Group Address List field contains zero or more MAC addresses to indicate the set of group addressed MAC addresses for which the STA receives frames. Each MAC address is 6 octets in length, as described in 9.2.4.3.2.

9.6.20 DMG Action frame details

9.6.20.1 DMG Action field

Several Action frame formats are defined to support DMG features. A DMG Action field, in the octet immediately after the Category field, differentiates the DMG Action frame formats. The DMG Action field values associated with each frame format within the DMG category are defined in Table 9-386.

Table 9-386—DMG Action field values

| DMG Action field value | Meaning |
|------------------------|---|
| 0 | Power Save Configuration Request |
| 1 | Power Save Configuration Response |
| 2 | Information Request |
| 3 | Information Response |
| 4 | Handover Request |
| 5 | Handover Response |
| 6 | DTP Request |
| 7 | DTP Response |
| 8 | Relay Search Request |
| 9 | Relay Search Response |
| 10 | Multi-Relay Channel Measurement Request |
| 11 | Multi-Relay Channel Measurement Report |
| 12 | RLS Request |
| 13 | RLS Response |
| 14 | RLS Announcement |
| 15 | RLS Teardown |
| 16 | Relay Ack Request |
| 17 | Relay Ack Response |
| 18 | TPA Request |
| 19 | TPA Response |
| 20 | TPA Report |
| 21 | ROC Request |
| 22 | ROC Response |

9.6.20.2 Power Save Configuration Request frame format

The format of the Power Save Configuration Request (PSC-REQ) frame Action field is shown in Table 9-387.

Table 9-387—Power Save Configuration Request frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | DMG Power Management |
| 5 | DMG Wakeup Schedule element (optional) |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The length of the DMG Power Management (DPM) field is one octet. Setting the DPM field to 0 indicates a transition from power save mode to active mode. Setting the DPM field to 1 indicates a transition from active mode to power save mode. All other values are reserved.

The DMG Wakeup Schedule element is defined in 9.4.2.131 (11.2.7.2).

9.6.20.3 Power Save Configuration Response frame format

The format of the Power Save Configuration Response (PSC-RSP) frame Action field is shown in Table 9-388.

Table 9-388—Power Save Configuration Response frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | DMG Wakeup Schedule element (optional) |
| 6 | Antenna Sector ID Pattern element (optional) |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding PSC-REQ frame.

The Status Code field is defined in 9.4.1.9.

The DMG Wakeup Schedule element is defined in 9.4.2.131.

The Antenna Sector ID Pattern element is defined in 9.4.2.157.

9.6.20.4 Information Request frame format

The Information Request frame is an Action frame of category DMG. The format of an Information Request frame Action field is shown in Table 9-389.

Table 9-389—Information Request frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | DMG Action |
| 3 | Subject Address |
| 4 | Request element |
| 5 | Zero or more DMG Capabilities elements |
| 6 | Zero or more provided elements |
| 7 | Zero or more Extended Request elements |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Subject Address field contains the MAC address of the STA whose information is being requested. If this frame is sent to the PCP and the value of the Subject Address field is the broadcast address, then the STA is requesting information regarding all associated STAs.

The Request element field is described in 9.4.2.10.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The format of this element is defined in 9.4.2.128.

Each provided element is an element as specified in 9.4.2, that the transmitter of this frame is providing to the destination of the frame.

The Extended Request element is described in 9.4.2.11.

9.6.20.5 Information Response frame format

The Information Response frame is an Action frame of category DMG. The format of an Information Response frame Action field is shown in Table 9-390.

This frame is individually addressed to a STA in response to an Information Request frame or it is sent unsolicited and individually addressed to a STA or broadcast to all STAs in the PBSS/infrastructure BSS. If this frame is sent as a broadcast, then this frame is an Action No Ack frame.

Table 9-390—Information Response frame Action field format

| Order | Information |
|-------|---------------------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Subject Address |
| 4 | One or more DMG Capabilities elements |
| 5 | Zero or more requested elements |
| 6 | Zero or more provided elements |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Subject Address field contains the MAC address of the STA whose information is being provided. If this field is set to the broadcast address, then the STA is providing information regarding all associated STAs.

The DMG Capabilities element carries information about the transmitter STA and other STAs known to the transmitter STA. The DMG Capabilities element is described in 9.4.2.128.

The requested elements are those returned in response to an Information Request frame, as described in 11.30.1.

The provided elements are elements, as described in 9.4.2, that the transmitter of this frame provides to the destination of the frame, either in addition to the requested elements, or in an unsolicited Information Response frame.

9.6.20.6 Handover Request frame format

The Handover Request frame is an Action frame of category DMG. The format of the Handover Request frame Action field is shown in Table 9-391.

Table 9-391—Handover Request frame Action field format

| Order | Information |
|-------|-----------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Handover Reason |
| 4 | Handover Remaining BI |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Handover Reason field is 1 octet in length and indicates the reason that the current PCP intends to do the PCP handover. The Handover Reason field is set to 0 to indicate the PCP is leaving the PBSS, it is set to 1 to indicate low power in the PCP, is set to 2 to indicate that a more qualified PCP handover capable STA is available, and is set to 3 to indicate that the PCP handover capable STA wishes to become a PCP. The other values are reserved.

The Handover Remaining BI field is 1 octet in length and indicates the number of beacon intervals, excluding the beacon interval in which this frame is transmitted, remaining until the handover takes effect.

9.6.20.7 Handover Response frame format

The Handover Response frame is an Action frame of category DMG. The format of the Handover Response frame Action field is shown in Table 9-392.

Table 9-392—Handover Response frame Action field format

| Order | Information |
|-------|------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Handover Result |
| 4 | Handover Reject Reason |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Handover Result field is 1 octet in length and indicates whether the STA accepted the handover request. A value of 0 indicates that the STA accepts the handover request. A value of 1 indicates that the STA does not accept the handover request.

If the Handover Result field is set to 0, the Handover Reject Reason field is reserved and set to 0. If the Handover Result field is set to 1, the Handover Reject Reason field indicates the reason the STA rejected the handover request and can be one of the following: 0 for low power, 1 for handover in progress with another STA, 2 for invalid value for Handover Remaining BI field, and 3 for unspecified reason. The length of Handover Reject Reason field is 1 octet.

9.6.20.8 DTP Request frame format

The DTP Request frame is transmitted to request DTP information. The format of the DTP Request frame Action field is shown in Figure 9-736.

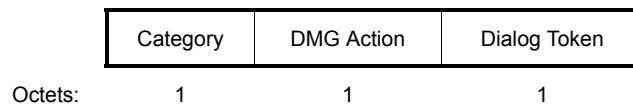

Figure 9-736—DTP Request frame Action field format

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the request to identify the transaction.

9.6.20.9 DTP Report frame format

The DTP Report frame is transmitted in response to a DTP Request frame. A DTP Report frame can also be sent unsolicited. The format of the DTP Report frame Action field is shown in Figure 9-737.

| Category | DMG Action | Dialog Token | DTP Report |
|----------|------------|--------------|------------|
| Octets: | 1 | 1 | 34 |

Figure 9-737—DTP Report frame Action field format

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value of the Dialog Token field in the corresponding DTP Request frame. If the DTP Report frame is not being transmitted in response to a DTP Request frame, the Dialog Token field is set to 0.

The DTP Report element is defined in 9.4.2.146.

9.6.20.10 Relay Search Request frame format

The Relay Search Request frame is transmitted by a non-AP and non-PCP STA to the AP or PCP to request a list of RDSS in the BSS. The format of the Relay Search Request frame Action field is shown in Table 9-393.

Table 9-393—Relay Search Request frame Action field format

| Order | Information |
|-------|----------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination REDS AID |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the Relay Search Request frame to identify the request/response transaction.

The Destination REDS AID field is set to the AID of the target destination REDS. The structure of the field is defined in 9.4.1.8.

9.6.20.11 Relay Search Response frame format

The Relay Search Response frame is sent by an AP or PCP in response to a Relay Search Request frame. The format of a Relay Search Response frame Action field is shown in Table 9-394.

Table 9-394—Relay Search Response frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Number of Relay Capable STAs |
| 6 | Zero or more Relay Capable STA Info fields |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value in the corresponding Relay Search Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

The Number of Relay Capable STAs field is one octet in length and indicates the number of STAs in the BSS that are relay capable. The value of this field is zero if the Status Code does not indicate success.

The Relay Capable STA Info field is defined in 9.4.1.45. This information is included only if the status code indicates successful. The number of Relay Capable STA Info fields that appear in the frame is indicated by the value of the Number of Relay Capable STAs field.

9.6.20.12 Multi-relay Channel Measurement Request frame format

The Multi-Relay Channel Measurement Request frame is transmitted by a STA initiating relay operation to the recipient STA in order to obtain Channel Measurements between the recipient STA and the other STA participating in the relay operation. The format of the Multi-Relay Channel Measurement Request frame Action field is shown in Table 9-395.

Table 9-395—Multi-relay Channel Measurement Request frame Action field format

| Order | Information |
|-------|--------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the Multi-Relay Channel Measurement Request frame to identify the request/report transaction.

9.6.20.13 Multi-relay Channel Measurement Report frame format

The Multi-Relay Channel Measurement Report frame is sent in response to a Multi-Relay Channel Measurement Request. The format of the Multi-Relay Channel Measurement Report frame Action field is shown in Table 9-396.

Table 9-396—Multi-relay Channel Measurement Report frame Action field format

| Order | Information |
|-------|---|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Number of Channel Measurement Info |
| 5 | One or more Channel Measurement Info fields |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value in any corresponding Multi-Relay Channel Measurement Request frame. If the Multi-Relay Channel Measurement Report frame is not being transmitted in response to a Multi-Relay Channel Measurement Request frame, then the dialog token is set to 0.

The Number of Channel Measurement Info field is one octet in length and indicates the number of Channel Measurements Info fields included in the frame.

The format of the Channel Measurement Info field is defined in Figure 9-738. The number of Channel Measurement Info fields included in the frame is indicated by the value of the Number of Channel Measurement Info field. Multiple Channel Measurement Info fields can be included if the reporting STA measures the channel for multiple RDSs.

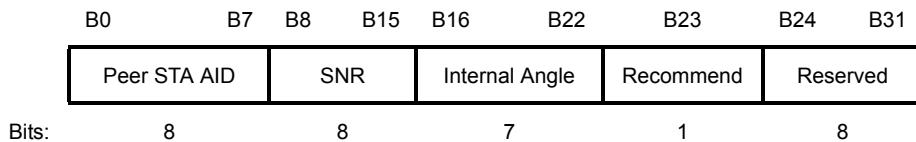

Figure 9-738—Channel Measurement Info field format

The Peer STA AID subfield contains the AID of the STA toward which the reporting STA measures link.

The SNR subfield indicates the SNR measured in the link toward the STA corresponding to Peer STA AID. This subfield is encoded as 8-bit 2's complement value of $4x(\text{SNR}-19)$, where SNR is measured in dB. This covers from -13 dB to 50.75 dB in 0.25 dB steps.

The Internal Angle subfield indicates the angle between directions toward the other STAs involved in the relay operation. This covers from 0° to 180° in 2° steps. This subfield uses the degree of the direction from the sector that the feedbacks indicates has highest quality during TXSS if SLS phase of BF is performed and RXSS is not included.

The Recommend subfield indicates whether the responding STA recommends relay operation based on the channel measurement with the Peer STA. This subfield is set to 1 when the relay operation is recommended and otherwise is set to 0.

9.6.20.14 RLS Request frame format

The RLS Request frame is used to set up a relay link. The format of the RLS Request frame Action field is shown in Table 9-397.

Table 9-397—RLS Request frame Action field format

| Order | Information |
|-------|------------------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination AID |
| 5 | Relay AID |
| 6 | Source AID |
| 7 | Destination Capability Information |
| 8 | Relay Capability Information |
| 9 | Source Capability Information |
| 10 | Relay Transfer Parameter Set |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the RLS Request frame to identify the request/response transaction.

The Destination AID field value is the AID of the target destination.

The Relay AID field value is the AID of the selected RDS.

The Source AID field value is the AID of the initiating STA.

The Destination Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the target destination REDS as defined in 9.4.2.148.

The Relay Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the selected RDS as defined in 9.4.2.148.

The Source Capability Information field indicates the Relay Capability Information field within the Relay Capabilities element of the originator of the request as defined in 9.4.2.148.

The Relay Transfer Parameter Set element is defined in 9.4.2.149.

9.6.20.15 RLS Response frame format

The RLS Response frame is sent in response to an RLS Request frame. The format of an RLS Response frame Action field is shown in Table 9-398.

Table 9-398—RLS Response frame Action field format

| Order | Information |
|-------|------------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Destination Status Code |
| 5 | Relay Status Code (optional) |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value in any corresponding RLS Request frame.

The Destination Status Code field is included when the destination REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

The Relay Status Code field is included when the relay REDS transmits an RLS Response frame as a result of RLS Request. It is defined in 9.4.1.9.

9.6.20.16 RLS Announcement frame format

The RLS Announcement frame is sent to announce the successful RLS. The format of an RLS Announcement frame Action field is shown in Table 9-399.

Table 9-399—RLS Announcement frame Action field format

| Order | Information |
|-------|-----------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Status Code |
| 4 | Destination AID |
| 5 | Relay AID |
| 6 | Source AID |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Status Code field is defined in 9.4.1.9.

The Destination AID field value is the AID of the target destination.

The Relay AID field value is the AID of the RDS.

The Source AID field value is the AID of the initiating STA.

9.6.20.17 RLS Teardown frame format

The RLS Teardown frame is sent to terminate a relay operation. The format of the RLS Teardown frame Action field is shown in Table 9-400.

Table 9-400—RLS Teardown frame Action field format

| Order | Information |
|-------|-----------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Destination AID |
| 4 | Relay AID |
| 5 | Source AID |
| 6 | Reason Code |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Destination AID field value is the AID of the destination REDS.

The Relay AID field value is the AID of the RDS.

The Source AID field value is the AID of the source REDS.

The Reason Code field is defined in 9.4.1.7.

9.6.20.18 Relay Ack Request frame format

The Relay Ack Request frame is sent by a source REDS to an RDS participating in a relay operation in order to determine whether all frames forwarded through the RDS were received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Request frame Action field is shown in Table 9-401.

Table 9-401—Relay Ack Request frame Action field format

| Order | Information |
|-------|------------------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | BAR Control |
| 4 | BlockAck Starting Sequence Control |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The BAR Control field and BlockAck Starting Sequence Control fields are defined in 9.3.1.8.

9.6.20.19 Relay Ack Response frame format

The Relay Ack Response frame is sent by an RDS to a source REDS participating in a relay operation in order to report which frames have been received by the destination REDS also participating in the relay operation. This frame is used only when the RDS is operated in HD-DF mode and relay operation is link switching. The format of the Relay Ack Response frame Action field is shown in Table 9-402.

Table 9-402—Relay Ack Response frame Action field format

| Order | Information |
|-------|------------------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | BA Control |
| 4 | BlockAck Starting Sequence Control |
| 5 | BlockAck Bitmap |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The BA Control field is defined in 9.3.1.9.

The BlockAck Starting Sequence Control field is defined in 9.3.1.9 and is set to the corresponding value within the immediately previously received Relay Ack Request frame.

The BlockAck Bitmap field is defined in 9.3.1.9.

9.6.20.20 TPA Request frame format

The TPA Request frame is sent by a destination REDS participating in operation based on link cooperation to both the RDS and source REDS that belong to the same group as the destination REDS in order for them to send back their own TPA Response frames at the separately predefined times. Also, a source REDS sends a TPA Request frame to the RDS that is selected by the source REDS in order for the RDS to feedback its own TPA Response frame at the pre-defined time.

The format of the TPA Request frame Action field is shown in Table 9-403.

Table 9-403—TPA Request frame Action field format

| Order | Information |
|-------|---------------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Timing Offset |
| 5 | Sampling Frequency Offset |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the TPA Request frame to identify the request/response transaction.

The Timing Offset field is 2 octets in length and indicates the amount of time, in nanoseconds, that the STA identified in the RA of the frame is required to change the timing offset of its transmissions so that they arrive at the expected time at the transmitting STA.

The Sampling Frequency Offset field is 2 octets in length and indicates the amount by which to change the sampling frequency offset of the burst transmission so that bursts arrive at the destination DMG STA with no sampling frequency offset. The unit is 0.01 ppm.

9.6.20.21 TPA Response frame format

The TPA Response frame is sent by an RDS or a source REDS participating in relay operation in response to a TPA Request frame from a destination REDS or a source REDS. The RDS or the source REDS that

receives a TPA Request frame responds to the destination REDS or the source REDS, as appropriate, with a TPA Response frame at a predetermined time from the end of the TPA Request frame (see 11.36). The format of the TPA Response frame Action field is shown in Table 9-404.

Table 9-404—TPA Response frame Action field format

| Order | Information |
|-------|--------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value of the Dialog Token field of the TPA Request frame that generated this response.

9.6.20.22 TPA Report frame format

The TPA Report frame is sent to announce whether a TPA procedure is successful. The format of the TPA Report frame Action field is shown in Table 9-405.

Table 9-405—TPA Report frame Action field format

| Order | Information |
|-------|-------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Status code |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Status Code field indicates the result of the current TPA procedure and is defined in 9.4.1.9.

9.6.20.23 ROC Request frame format

The ROC Request frame is sent by the source REDS participating in a relay operation in order to request a change in the current relay operation type. The format of the ROC Request frame Action field is shown in Table 9-406.

Table 9-406—ROC Request frame Action field format

| Order | Information |
|-------|----------------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Relay Operation Type |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the ROC Request frame to identify the request/response transaction.

The format of the Relay Operation Type field is defined in Figure 9-739.

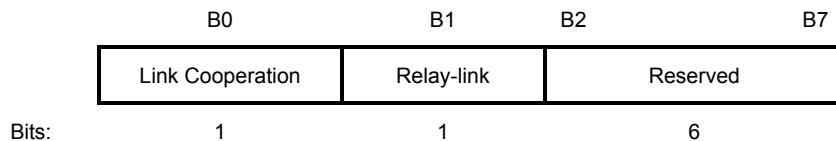

Figure 9-739—Relay Operation Type field format

The Link Cooperation subfield is set to 0 to request the operation to be changed to link switching and is set to 1 to request the operation to be changed to link cooperation.

The Relay-link subfield is set to 0 to indicate that the link switching operation starts at the direct link between the source REDS and destination REDS and set to 1 to indicate that the link switching operation starts with the RDS. If the Link Cooperation subfield is set to 1, the Relay-link subfield is reserved.

9.6.20.24 ROC Response frame format

The ROC Response frame is sent by the RDS or the destination DMG STA participating in a relay operation in response to a ROC Request frame from the source DMG STA. The format of the ROC Response frame Action field is shown in Table 9-407.

Table 9-407—ROC Response frame Action field format

| Order | Information |
|-------|--------------|
| 1 | Category |
| 2 | DMG Action |
| 3 | Dialog Token |
| 4 | Status Code |

The Category field is defined in 9.4.1.11.

The DMG Action field is defined in 9.6.20.1.

The Dialog Token field is set to the value received in the corresponding ROC Request frame that generated this response.

The Status Code field is defined in 9.4.1.9.

9.6.21 FST Action frame details

9.6.21.1 FST Action field

The FST Action field values are defined in Table 9-408.

Table 9-408—FST Action field values

| FST Action field value | Meaning |
|------------------------|---------------------------|
| 0 | FST Setup Request |
| 1 | FST Setup Response |
| 2 | FST Teardown |
| 3 | FST Ack Request |
| 4 | FST Ack Response |
| 5 | On-channel Tunnel Request |

9.6.21.2 FST Setup Request frame format

The FST Setup Request frame is an Action frame of category FST. The FST Setup Request frame allows an initiating STA to announce to a peer STA whether the initiating STA intends to enable FST for the session between the initiating STA and the peer STA (11.33). The format of the FST Setup Request frame Action field is shown in Table 9-409.

Table 9-409—FST Setup Request frame Action field format

| Order | Information |
|-------|--------------------------------|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | LLT |
| 5 | Session Transition |
| 6 | Multi-band (optional) |
| 7 | DMG Wakeup Schedule (optional) |

Table 9-409—FST Setup Request frame Action field format (continued)

| Order | Information |
|-------|---|
| 8 | Awake Window (optional) |
| 9 | Switching Stream (optional) |
| 10 | Zero or more additional elements are present, as defined in 11.33.1. Each of these elements is not present more than once in the frame. |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The Dialog Token field is set to a nonzero value chosen by the STA.

The Link loss timeout (LLT) field is 32 bits and indicates the compressed maximum duration counted from the last time an MPDU was received by the initiating STA from the peer STA until the initiating STA decides to initiate FST. The use of this field is described in 11.33.

The Session Transition field contains the Session Transition element as defined in 9.4.2.145.

The Multi-band field contains the Multi-Band element as defined in 9.4.2.138. The regulatory information contained in the Multi-band element is applicable to all of the fields and elements contained in the frame.

The DMG Wakeup Schedule element is defined in 9.4.2.131.

The Awake Window element is defined in 9.4.2.137.

The Switching Stream element is defined in 9.4.2.144.

9.6.21.3 FST Setup Response frame format

The FST Setup Response frame is an Action frame of category FST. This frame is transmitted in response to the reception of an FST Setup Request frame. The format of the frame Action field is shown in Table 9-410.

Table 9-410—FST Setup Response frame Action field format

| Order | Information |
|-------|--------------------------------|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | Status Code |
| 5 | Session Transition |
| 6 | Multi-band (optional) |
| 7 | DMG Wakeup Schedule (optional) |

Table 9-410—FST Setup Response frame Action field format (continued)

| Order | Information |
|-------|---|
| 8 | Awake Window (optional) |
| 9 | Switching Stream (optional) |
| 10 | Timeout Interval (optional) |
| 11 | Zero or more additional elements are present, as defined in 11.33.1. Each of these elements is not present more than once in the frame. |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The Dialog Token field value is copied from the corresponding received FST Setup Request frame.

The Status Code field is defined in 9.4.1.9.

The Session Transition field contains the Session Transition element as defined in 9.4.2.145.

The Multi-band element is defined in 9.4.2.138.

The DMG Wakeup Schedule element is defined in 9.4.2.131.

The Awake Window element is defined in 9.4.2.137

The Switching Stream element is defined in 9.4.2.144.

The Timeout Interval element is defined in 9.4.2.49.

9.6.21.4 FST Teardown frame format

The FST Teardown frame is an Action frame of category FST. This frame is transmitted to delete an established FST session between STAs. The format of the frame Action field is shown in Table 9-411.

Table 9-411—FST Teardown frame Action field format

| Order | Information |
|-------|-------------|
| 1 | Category |
| 2 | FST Action |
| 3 | FSTS ID |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified 9.4.2.145.

9.6.21.5 FST Ack Request frame format

The FST Ack Request frame is an Action frame of category FST. This frame is transmitted in the frequency band an FST session is transferred to and confirms the FST. The format of the frame Action field is shown in Table 9-412.

Table 9-412—FST Ack Request frame Action field format

| Order | Information |
|-------|--------------|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | FSTS ID |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The Dialog Token field is set to a nonzero value chosen by the STA sending the FST Ack request to identify the request/report transaction.

The FSTS ID field contains the identification of the FST session established between the STAs identified by the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.145.

9.6.21.6 FST Ack Response frame format

The FST Ack Response frame is an Action frame of category FST. This frame is transmitted in response to the reception of an FST Ack Request frame. The format of the frame Action field is shown in Table 9-413.

Table 9-413—FST Ack Response frame Action field format

| Order | Information |
|-------|--------------|
| 1 | Category |
| 2 | FST Action |
| 3 | Dialog Token |
| 4 | FSTS ID |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The Dialog Token field is set to the value in any corresponding FST Ack Request frame. If the FST Ack Response frame is not being transmitted in response to an FST Ack Request frame, then the dialog token is set to 0.

The FSTS ID field contains the identification of the FST session established between the STAs identified in the TA and RA fields of this frame. The format of the FSTS ID field is as specified in 9.4.2.145.

9.6.21.7 On-channel Tunnel Request frame format

The On-channel Tunnel Request frame is an Action frame of category FST. The On-channel Tunnel Request frame allows a STA of a multi-band device to encapsulate an MMPDU for transmission to an MLME of a peer STA within the same multi-band device (11.33), which can be used to perform multi-band association and multi-band authentication.

The format of the On-channel Tunnel Request frame Action field is shown in Table 9-414.

Table 9-414—On-channel Tunnel Request frame Action field format

| Order | Information |
|-------|-------------|
| 1 | Category |
| 2 | FST Action |
| 3 | OCT MMPDU |
| 4 | Multi-band |

The Category field is defined in 9.4.1.11.

The FST Action field is defined in 9.6.21.1.

The OCT MMPDU field is defined in Figure 9-740.

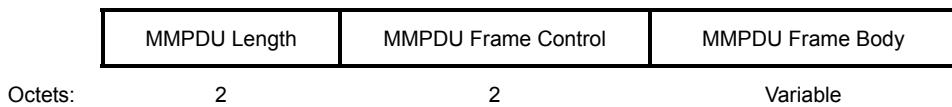

Figure 9-740—Definition of the OCT MMPDU field

The MMPDU Length subfield contains the length in octets of the MMPDU Frame Body subfield.

The MMPDU Frame Control subfield carries the content of the Frame Control field of an MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted over the air.

The MMPDU Frame Body subfield carries the content of the Frame Body field of an MMPDU that would be constructed if the MMPDU for the corresponding management frame type were transmitted over the air (i.e., all of the octets after the MAC header and up to, but not including, the FCS).

The Multi-band field contains the Multi-band element (see 9.4.2.138) of the peer MLME to which the OCT MMPDU is destined to. The channel, frequency band and MAC address contained in this element are used to deliver the OCT MMPDU to the correct MLME within the peer STA.

9.6.22 Unprotected DMG Action frame details

9.6.22.1 Unprotected DMG Action field

Unprotected DMG Action frames are not encapsulated using mechanisms defined for robust Management frames. An Action field, in the octet field immediately after the Category field, differentiates the formats. The Action field values associated with each frame format are defined in Table 9-415.

Table 9-415—Unprotected DMG Action field values

| Unprotected DMG Action field value | Meaning |
|------------------------------------|----------|
| 0 | Announce |
| 1 | BRP |

9.6.22.2 Announce frame format

The Announce frame is an Action or an Action No Ack frame of category Unprotected DMG. The format of an Announce frame Action field is shown in Table 9-416.

Announce frames can be transmitted during the ATI of a beacon interval and can perform functions including of a DMG Beacon frame, but since this frame does not have to be transmitted as a sector sweep to a STA, it can provide much more spectrally efficient access than using a DMG Beacon frame.

Table 9-416—Announce frame Action field format

| Order | Information | Notes |
|-------|------------------------|--|
| 1 | Category | The Category field is defined in 9.4.1.11. |
| 2 | Unprotected DMG Action | The Unprotected DMG Action field is defined in 9.6.22.1. |
| 3 | Timestamp | The Timestamp field is defined in 9.4.1.10. |
| 4 | Beacon Interval | The Beacon Interval field is defined in 9.4.1.3 and specifies the duration of the beacon interval of the BSS. |
| 5 | SSID | The SSID element is defined in 8.4.2.2. The SSID element is optionally present. If present, the SSID element specifies the SSID of the BSS. |
| 6 | Extended Schedule | The Extended Schedule element is defined in 9.4.2.132. The Extended Schedule element is optionally present. If present, the Extended Schedule element specifies the schedule of the BSS. |
| 7 | DMG Capabilities | The DMG Capabilities element is defined in 9.4.2.128. The DMG Capabilities element is optionally present. If present, the DMG Capabilities element specifies capabilities of the transmitting STA. |
| 8 | RSN | The RSNE is defined in 9.4.2.25. The RSNE is optionally present. If present, the RSNE indicates that security is required in the BSS. |

Table 9-416—Announce frame Action field format (continued)

| Order | Information | Notes |
|-------|--------------------------|--|
| 9 | Multiple BSSID | The Multiple BSSID element is defined in 9.4.2.46. The Multiple BSSID element is optionally present. If present, the Multiple BSSID element signals all the BSSIDs in use by the BSS. |
| 10 | DMG Operation | The DMG Operation element is defined in 9.4.2.129. The DMG Operation element is optionally present. If present, the DMG Operation element specifies the operational parameters of the BSS. |
| 11 | Next DMG ATI | The Next DMG ATI element is defined in 9.4.2.135. The Next DMG ATI element is optionally present. If present, the Next DMG ATI element specifies the start time of the next ATI at a subsequent beacon interval. |
| 12 | Multi-band | The Multi-band element is defined in 9.4.2.138. The Multi-band element is optionally present. |
| 13 | Awake Window | The Awake Window element is defined in 9.4.2.137. The Awake Window element is optionally present. |
| 14 | DMG BSS Parameter Change | The DMG BSS Parameter Change element is defined in 9.4.2.127. The DMG BSS Parameter Change element is optionally present. |
| 15 | BeamLink Maintenance | The BeamLink Maintenance element is defined in 9.4.2.152. The BeamLink Maintenance element is optionally present. |
| 16 | Multiple MAC Sublayers | The Multiple MAC Sublayers element is defined in 9.4.2.153. The Multiple MAC Sublayers element is optionally present. |
| 17 | ECAPC Policy | The ECAPC Policy element is defined in 9.4.2.155. The ECAPC Policy element is optionally present. |
| 18 | Cluster Report | The Cluster Report element is defined in 9.4.2.147. The Cluster Report element is optionally present. |
| 19 | Next PCP List | The Next PCP List element is defined in 9.4.2.140. The Next PCP List element is optionally present. |
| 20 | PCP Handover | The PCP Handover element is defined in 9.4.2.141. The PCP Handover element is optionally present. |
| 21 | STA Availability | The STA Availability element is defined in 9.4.2.133. The STA Availability element is optionally present. |
| 22 | UPSIM | The UPSIM element is defined in 9.4.2.167. The UPSIM element is optionally present. |

9.6.22.3 BRP frame format

The BRP frame is an Action No Ack frame. The format of a BRP frame Action field is shown in Table 9-417.

Table 9-417—BRP frame Action field format

| Order | Information |
|-------|------------------------|
| 1 | Category |
| 2 | Unprotected DMG Action |

Table 9-417—BRP frame Action field format (continued)

| Order | Information |
|-------|--|
| 3 | Dialog Token |
| 4 | BRP Request field |
| 5 | DMG Beam Refinement element |
| 6 | Zero or more Channel Measurement Feedback elements |

The Category field is defined in 9.4.1.11.

The Unprotected DMG Action field is defined in 9.6.22.1.

The Dialog Token field is set to a value chosen by the STA sending the frame to uniquely identify the transaction.

The BRP Request field is defined in 9.5.4.

The DMG Beam Refinement element is defined in 9.4.2.130.

The Channel Measurement Feedback element is defined in 9.4.2.136.

The BRP frame contains more than one Channel Measurement Feedback element if the measurement information exceeds 255 octets. The content of each Channel Measurement Feedback element that follows the first one in a single BRP frame is a continuation of the content in the previous element. The Channel Measurement, Tap Delay, and Sector ID Order subfields can be split between several elements. Each Channel Measurement Feedback element that is not the last Channel Measurement Feedback element in the frame is 257 octets long. Channel measurement information for a single channel measurement is always contained within a single BRP frame.

NOTE—The length of a BRP frame can limit the choice of channel measurement parameters such as the number of measurements and the number of taps.

9.6.23 VHT Action frame details

9.6.23.1 VHT Action field

Several Action frame formats are defined to support VHT functionality. A VHT Action field, in the octet immediately after the Category field, differentiates the VHT Action frame formats. The VHT Action field values associated with each frame format within the VHT category are defined in Table 9-418.

Table 9-418—VHT Action field values

| Value | Meaning | Time priority |
|-------|-----------------------------|---------------|
| 0 | VHT Compressed Beamforming | Yes |
| 1 | Group ID Management | No |
| 2 | Operating Mode Notification | No |
| 3–255 | Reserved | |

9.6.23.2 VHT Compressed Beamforming frame format

The VHT Compressed Beamforming frame is an Action No Ack frame of category VHT. The Action field of a VHT Compressed Beamforming frame contains the information shown in Table 9-419.

Table 9-419—VHT Compressed Beamforming frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | VHT Action |
| 3 | VHT MIMO Control (see 9.4.1.48) |
| 4 | VHT Compressed Beamforming Report (see 9.4.1.49) |
| 5 | MU Exclusive Beamforming Report (see 9.4.1.51) |

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.23.1.

The VHT MIMO Control field is always present in the frame. The presence and contents of the VHT Compressed Beamforming Report field and the MU Exclusive Beamforming Report field are dependent on the values of the Feedback Type, Remaining Feedback Segments, and First Feedback Segment subfields of the VHT MIMO Control field (see 9.4.1.48, 9.4.1.49, 9.4.1.51, and 10.34.5).

No vendor-specific elements are present in a VHT Compressed Beamforming frame.

9.6.23.3 Group ID Management frame format

The Group ID Management frame is an Action frame of category VHT. It is transmitted by the AP to assign or change the user position of a STA for one or more group IDs. The Action field of a Group ID Management frame contains the information shown in Table 9-420.

Table 9-420—Group ID Management frame Action field format

| Order | Information |
|-------|--|
| 1 | Category |
| 2 | VHT Action |
| 3 | Membership Status Array (see 9.4.1.54) |
| 4 | User Position Array (see 9.4.1.55) |

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.23.1.

9.6.23.4 Operating Mode Notification frame format

The Operating Mode Notification frame is an Action frame of category VHT. It is used to notify STAs that the transmitting STA is changing one or more of its operating channel width, the maximum number of spatial streams it can receive, and its LDPC receive preference.

The Action field of the Operating Mode Notification frame contains the information shown in Table 9-421.

Table 9-421—Operating Mode Notification frame Action field format

| Order | Information |
|-------|-------------------------------|
| 1 | Category |
| 2 | VHT Action |
| 3 | Operating Mode (see 9.4.1.53) |

The Category field is defined in 9.4.1.11.

The VHT Action field is defined in 9.6.23.1.

9.7 Aggregate MPDU (A-MPDU)

9.7.1 A-MPDU format

An A-MPDU consists of a sequence of one or more A-MPDU subframes and a variable amount of EOF padding as shown in Figure 9-741.

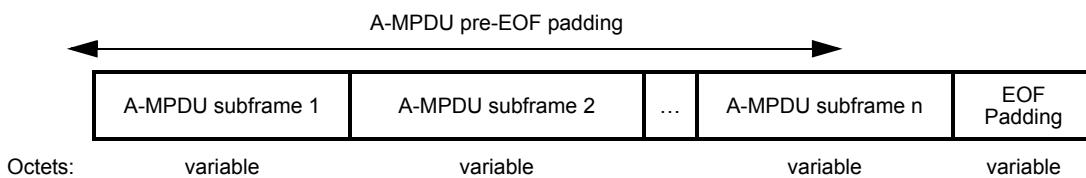

Figure 9-741—A-MPDU format

The structure of the A-MPDU subframe is shown in Figure 9-743. Each A-MPDU subframe consists of an MPDU delimiter optionally followed by an MPDU. Each nonfinal A-MPDU subframe in an A-MPDU has padding octets appended to make the subframe a multiple of 4 octets in length. The content of these octets is unspecified.

In an HT PPDU, the final A-MPDU subframe is not padded.

The EOF Padding field is shown in Figure 9-742. This is present only in a VHT PPDU.

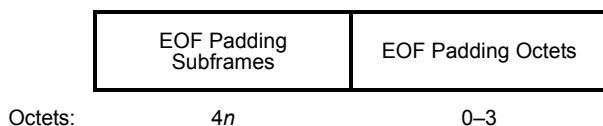

Figure 9-742—EOF Padding field format

The EOF Padding Subframes subfield contains zero or more EOF padding subframes. An EOF padding subframe is an A-MPDU subframe with 0 in the MPDU Length field and 1 in the EOF field.

In a VHT PPDU, the following padding is present, as determined by the rules in 10.13.6:

- 0–3 octets in the Padding subfield of the final A-MPDU subframe (see Figure 9-743) before any EOF padding subframes. The content of these octets is unspecified.
- Zero or more EOF padding subframes in the EOF Padding Subframes subfield.
- 0–3 octets in the EOF Padding Octets subfield. The content of these octets is unspecified.

An A-MPDU pre-EOF padding refers to the contents of the A-MPDU up to, but not including, the EOF Padding field.

NOTE—A-MPDU pre-EOF padding includes any A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF field inserted in order to meet the minimum MPDU start spacing requirement.

The maximum length of an A-MPDU in an HT PPDU is 65 535 octets. The maximum length of an A-MPDU in a DMG PPDU is 262 143 octets. The maximum length of an A-MPDU pre-EOF padding in a VHT PPDU is 1 048 575 octets. The length of an A-MPDU addressed to a particular STA can be further constrained as described in 10.13.2.

Figure 9-743—A-MPDU subframe format

The MPDU delimiter is 4 octets in length. The structure of the MPDU delimiter when transmitted by a non-DMG STA is defined in Figure 9-744. The structure of the MPDU Delimiter field when transmitted by a DMG STA is shown in Figure 9-745.

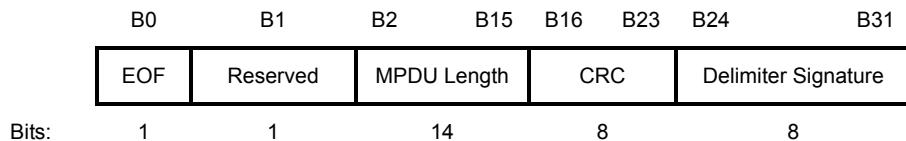

Figure 9-744—MPDU delimiter (non-DMG)

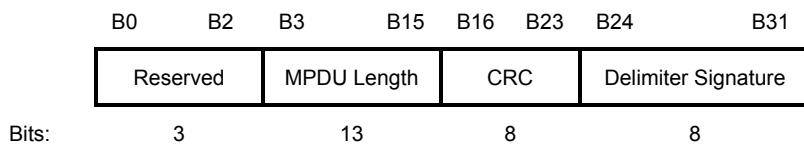

Figure 9-745—MPDU delimiter (DMG)

The fields of the MPDU delimiter when transmitted by a non-DMG STA are defined in Table 9-422. The fields of the MPDU delimiter when transmitted by a DMG STA are defined in Table 9-423.

Table 9-422—MPDU delimiter fields (non-DMG)

| Field | Size (bits) | Description |
|--|-------------|--|
| EOF | 1 | End of frame indication. Set to 1 in an A-MPDU subframe that has 0 in the MPDU Length field and that is used to pad the A-MPDU in a VHT PPDU as described in 10.13.6. Set to 1 in the MPDU delimiter of a VHT single MPDU as described in 10.13.7. Set to 0 otherwise. |
| Reserved | 1 | |
| MPDU Length | 14 | Length of the MPDU in octets. Set to 0 if no MPDU is present. An A-MPDU subframe with 0 in the MPDU Length field is used as defined in 10.13.3 to meet the minimum MPDU start spacing requirement and also to pad the A-MPDU to fill the available octets in a VHT PPDU as defined in 10.13.6. |
| CRC | 8 | 8-bit CRC of the preceding 16 bits. |
| Delimiter Signature | 8 | Pattern that can be used to detect an MPDU delimiter when scanning for an MPDU delimiter. The unique pattern is 0x4E (see NOTE below). |
| NOTE—The ASCII value of the character ‘N’ was chosen as the unique pattern for the value in the Delimiter Signature field. | | |

Table 9-423—MPDU delimiter fields (DMG)

| MPDU Delimiter field | Size (bits) | Description |
|----------------------|-------------|---|
| Reserved | 3 | |
| MPDU Length | 13 | Length of MPDU in octets |
| CRC | 8 | 8-bit CRC on preceding 16 bits |
| Delimiter Signature | 8 | Pattern that can be used to detect an MPDU delimiter when scanning for a delimiter. The unique pattern is 0x4E. |

The format of the MPDU Length field when transmitted by a non-DMG STA is shown in Figure 9-746. The MPDU Length Low subfield contains the 12 low order bits of the MPDU length. In a VHT PPDU, the MPDU Length High subfield contains the two high order bits of the MPDU length. In an HT PPDU, the MPDU Length High subfield is reserved.

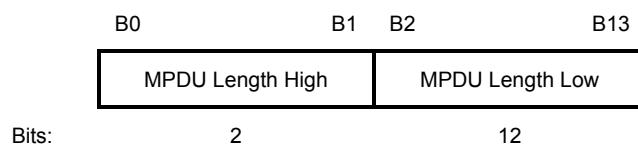

Figure 9-746—MPDU Length field (non-DMG)

The MPDU length value is derived from the MPDU Length field subfields as follows:

$$L_{MPDU} = \begin{cases} L_{low} + L_{high} \times 4096, & \text{VHT PPDU} \\ L_{low}, & \text{HT PPDU} \\ L, & \text{DMG PPDU} \end{cases} \quad (9-5)$$

where

- L_{low} is the value of the MPDU Length Low subfield
- L_{high} is the value of the MPDU Length High subfield
- L is the value of the MPDU Length field

NOTE—The format of the MPDU Length field maintains a common encoding structure for both VHT and HT PPDUs. For HT PPDUs, only the MPDU Length Low subfield is used, while for VHT PPDUs, both subfields are used.

The purpose of the MPDU delimiter is to locate the MPDUs within the A-MPDU so that the structure of the A-MPDU can usually be recovered when one or more MPDU delimiters are received with errors. See O.2 for a description of a deaggregation algorithm.

9.7.2 MPDU delimiter CRC field

The MPDU delimiter CRC field is an 8-bit CRC value. It is used as a frame check sequence (FCS) to protect the Reserved and MPDU Length fields. The CRC field is the 1s complement of the remainder generated by the modulo 2 division of the protected bits by the polynomial $x^8 + x^2 + x^1 + 1$, where the shift-register state is preset to all 1s.

NOTE—The order of transmission of bits within the CRC field is defined in 9.2.2.

Figure 9-747 illustrates the CRC calculation for the MPDU delimiter.

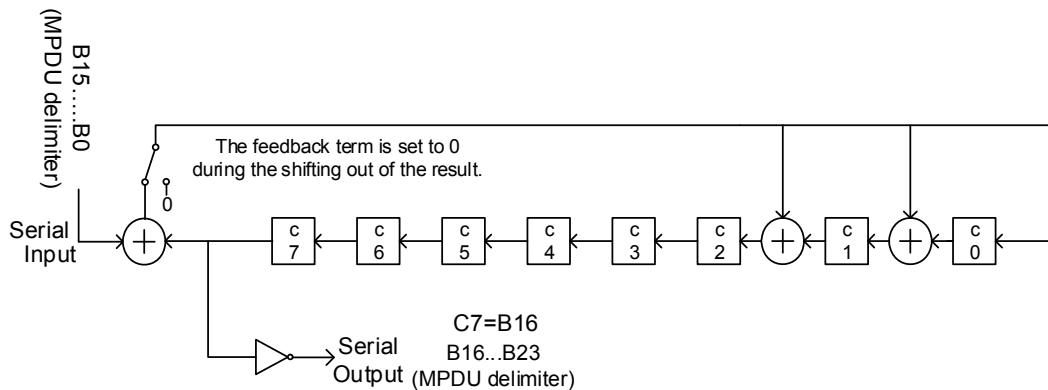

Figure 9-747—MPDU delimiter CRC calculation

9.7.3 A-MPDU contents

In a non-DMG PPDU, an A-MPDU is a sequence of A-MPDU subframes carried in a single PPDU with one of the following combinations of RXVECTOR or TXVECTOR parameter values:

- The FORMAT parameter set to VHT
- The FORMAT parameter set to HT_MF or HT_GF and the AGGREGATION parameter set to 1

In a DMG PPDU, an A-MPDU is a sequence of MPDUs carried in a single PPDU with the TXVECTOR/RXVECTOR AGGREGATION parameter set to 1.

All of the MPDUs within an A-MPDU are addressed to the same RA. All QoS Data frames within an A-MPDU that have a TID for which an HT-immediate block ack agreement exists have the same value for the Ack Policy subfield of the QoS Control field.

All protected MPDUs within an A-MPDU have the same Key ID.

The Duration/ID fields in the MAC headers of all MPDUs in an A-MPDU carry the same value. The Duration/ID fields in the MAC headers of MPDUs in A-MPDUs carried in the same VHT MU PPDU all carry the same value.

NOTE—The reference point for the Duration/ID field is the end of the PPDU carrying the MPDU. Setting the Duration/ID field to the same value in the case of A-MPDU aggregation means that each MPDU consistently specifies the same NAV setting.

An A-MPDU is transmitted in one of the contexts specified in Table 9-424 as defined by the description in the “Definition of context” column, independently of whether the A-MPDU is contained in a VHT MU PPDU or an SU PPDU. Ordering of MPDUs within an A-MPDU is not constrained, except where noted in these tables. See 10.13.1.

Table 9-424—A-MPDU contexts

| Name of Context | Definition of Context | Table defining permitted contents |
|---|---|-----------------------------------|
| Data Enabled Immediate Response | The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder or an RD responder including potential immediate responses. | Table 9-425 |
| Data Enabled No Immediate Response | The A-MPDU is transmitted outside a PSMP sequence by a TXOP holder that does not include or solicit an immediate response. See NOTE. | Table 9-426 |
| PSMP | The A-MPDU is transmitted within a PSMP sequence. | Table 9-427 |
| Control Response | The A-MPDU is transmitted by a STA that is neither a TXOP holder nor an RD responder that also needs to transmit one of the following immediate response frames: Ack BlockAck frame with a TID for which an HT-immediate block ack agreement exists | Table 9-428 |
| VHT single MPDU context | The A-MPDU is transmitted within a VHT PPDU and contains a VHT single MPDU. | Table 9-429 |
| NOTE —This context includes cases when no response is generated or when a response is generated later by the operation of the delayed block ack rules. | | |

A VHT MU PPDU does not carry more than one A-MPDU that contains one or more MPDUs soliciting an immediate response.

NOTE 1—The TIDs present in a data enabled A-MPDU context are also constrained by the channel access rules (for a TXOP holder; see 10.22.2 and 10.22.3) and the RD response rules (for an RD responder, see 10.28.4). This is not shown in these tables.

NOTE 2—If a STA supports A-MSDUs of 7935 octets (indicated by the Maximum A-MSDU Length field in the HT Capabilities element), A-MSDUs transmitted by that TA within an A-MPDU carried in a PPDU with FORMAT HT_MF or HT_GF or within an MPDU carried in a non-HT PPDU are constrained so that the length of the QoS Data frame carrying the A-MSDU is no more than 4095 octets. The 4095-octet MPDU length limit does not apply to A-MPDUs carried in VHT or DMG PPDUs. The use of A-MSDU within A-MPDU might be further constrained as described in 9.4.1.14 through the operation of the A-MSDU Supported field.

Table 9-425—A-MPDU contents in the data enabled immediate response context

| MPDU Description | Conditions |
|--|---|
| Ack | If the preceding PPDU contains an MPDU that requires an Ack frame response, a single Ack frame at the start of the A-MPDU. |
| HT-immediate BlockAck | In a non-DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, at most one BlockAck frame for this TID, in which case it occurs at the start of the A-MPDU. In a DMG STA: if the preceding PPDU contains an implicit or explicit block ack request for a TID for which an HT-immediate block ack agreement exists, one or more copies of the same BlockAck for this TID. |
| Delayed BlockAcks | BlockAck frames with the BA Ack Policy subfield equal to No Acknowledgment with a TID for which an HT-delayed block ack agreement exists. |
| Delayed block ack data | QoS Data frames with a TID that corresponds to a Delayed or HT-delayed block ack agreement. These have the Ack Policy field equal to Block Ack. |
| Action No Ack | Action No Ack frames. |
| Delayed BlockAckReqs | BlockAckReq frames with a TID that corresponds to an HT-delayed block ack agreement in which the BA Ack Policy subfield is equal to No Acknowledgment. |
| Data frames sent under an HT-immediate block ack agreement | QoS Data frames with the same TID, which corresponds to an HT-immediate block ack agreement. See NOTE. |
| QoS Null MPDUs with Ack Policy set to No Ack | In a DMG BSS, QoS Null MPDUs with Ack Policy set to No Ack. |
| Immediate BlockAckReq | At most one BlockAckReq frame with a TID that corresponds to an HT-immediate block ack agreement. This is the last MPDU in the A-MPDU. It is not present if any QoS Data frames for that TID are present. |
| NOTE—These MPDUs all have the Ack Policy field equal to the same value, which is either Implicit Block Ack Request or Block Ack. | |

Table 9-426—A-MPDU contents in the data enabled no immediate response context

| MPDU Description | Conditions |
|------------------------------------|--|
| Delayed BlockAcks | BlockAck frames for a TID for which an HT-delayed block ack agreement exists with the BA Ack Policy subfield equal to No Acknowledgment. |
| Delayed Block Ack data | QoS Data frames with a TID that corresponds to a Delayed or HT-delayed block ack agreement. These have the Ack Policy field equal to Block Ack. |
| Data without a block ack agreement | QoS Data frames with a TID that does not correspond to a block ack agreement. These have the Ack Policy field equal to No Ack and the A-MSDU Present subfield equal to 0. |
| Action No Ack | Action No Ack frames. |
| Delayed BlockAckReqs | BlockAckReq frames with the BA Ack Policy subfield equal to No Acknowledgment and with a TID that corresponds to an HT-delayed block ack agreement. |

Table 9-427—A-MPDU contents in the PSMP context

| MPDU Description | Conditions | |
|------------------------------------|---|--|
| Acknowledgment for PSMP data | At most one Multi-TID BlockAck frame. Acknowledgment in response to data received with the Ack Policy field equal to PSMP Ack and/or a Multi-TID BlockAckReq frame in the previous PSMP-UTT or PSMP-DTT. | |
| Delayed BlockAcks | BlockAck frames with the BA Ack Policy subfield equal to No Acknowledgment and with a TID for which an HT-delayed block ack agreement exists. | |
| HT-immediate Data | QoS Data frames in which the Ack Policy field is equal to PSMP Ack or Block Ack and with a TID that corresponds to an HT-immediate block ack agreement. | An A-MPDU containing MPDUs with a block ack agreement does not also contain MPDUs without a block ack agreement. |
| Delayed Block Ack data | QoS Data frames with a TID that corresponds to a Delayed or HT-delayed block ack agreement. These have the Ack Policy field equal to Block Ack. | |
| Data without a block ack agreement | QoS Data frames with a TID that does not correspond to a block ack agreement. These have the Ack Policy field equal to No Ack and the A-MSDU Present subfield is equal to 0. | |
| Action No Ack | Action No Ack frames. | |
| Delayed BlockAckReqs | BlockAckReq frames with the BA Ack Policy subfield equal to No Acknowledgment and with a TID that corresponds to an HT-delayed Block Ack. | |
| Multi-TID BlockAckReq | At most one Multi-TID BlockAckReq frame with the BA Ack Policy subfield equal to No Acknowledgment. | |

Table 9-428—A-MPDU contents MPDUs in the control response context

| MPDU | Conditions | |
|---------------|--|---|
| Ack | Ack frame transmitted in response to an MPDU that requires an Ack frame. | One of these is present at the start of the A-MPDU. |
| BlockAck | BlockAck frame with a TID that corresponds to an HT-immediate block ack agreement. | |
| Action No Ack | +HTC Action No Ack frames carrying a Management Action Body containing an explicit feedback response or BRP frame. | |

10. MAC sublayer functional description

10.1 Introduction

The MAC functional description is presented in this clause. The architecture of the MAC sublayer, including the distributed coordination function (DCF), the point coordination function (PCF), the hybrid coordination function (HCF), the mesh coordination function (MCF), and their coexistence in an IEEE 802.11 LAN are introduced in 10.2. These functions are expanded on in 10.3, 10.4, 10.22, and 10.23. Fragmentation and defragmentation are defined in 10.5 and 10.6. Multirate support is addressed in 10.7. A number of additional restrictions to limit the cases in which MSDUs are reordered or discarded are described in 10.8. Operation across regulatory domains is defined in 10.21. The block ack mechanism is described in 10.24. The No Ack mechanism is described in 10.25. The protection mechanism is described in 10.26. Rules for processing MAC frames are described in 10.27.

The PCF mechanism is obsolete. Consequently, the PCF mechanism might be removed in a later revision of the standard.

10.2 MAC architecture

10.2.1 General

The MAC architecture is shown in Figure 10-1 and Figure 10-2.

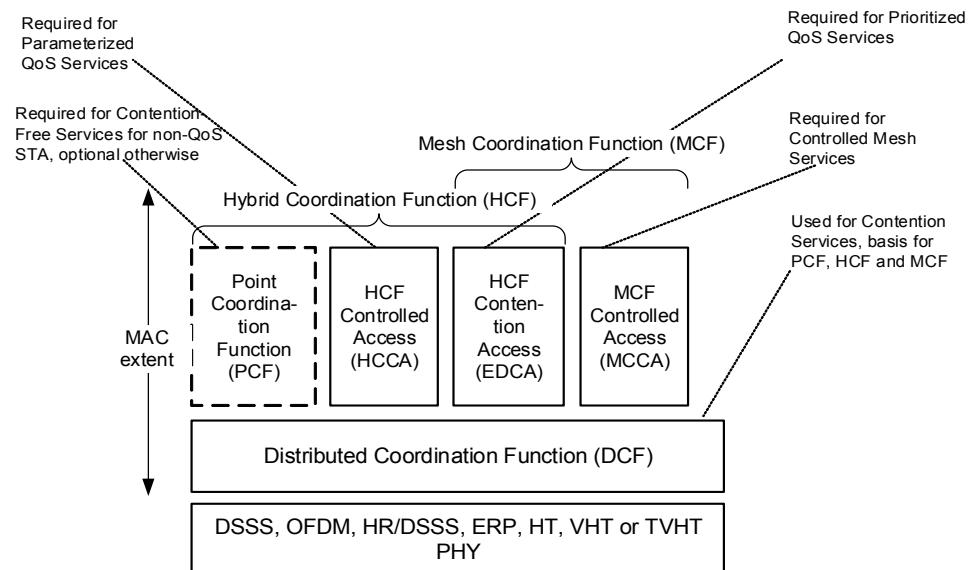

Figure 10-1—Non-DMG STA MAC architecture

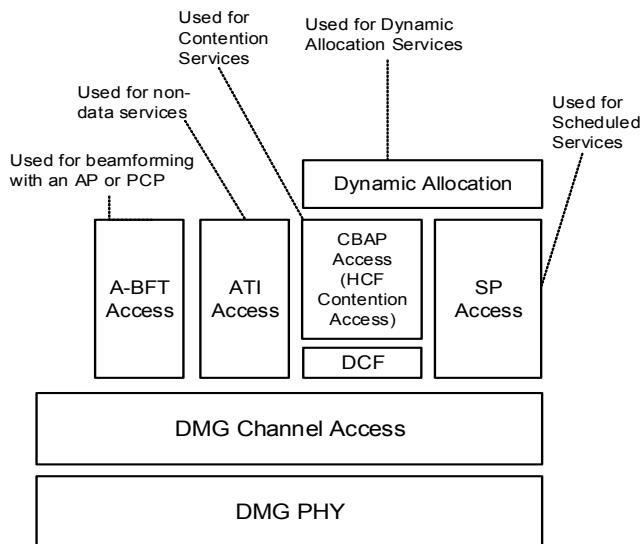

Figure 10-2—DMG STA MAC architecture

In a non-DMG STA:

- The MAC provides the PCF, HCF and MCF service using the services of the DCF.
- The PCF is optionally present in nonmesh STAs and absent otherwise.
- The HCF is present in QoS STAs and absent otherwise.
- The MCF is present in mesh STAs and absent otherwise.

In a DMG STA:

- The MAC provides services using the DMG channel access mechanisms.
- Specific rules apply for access during scheduled periods, which include the association beamforming training (A-BFT) period, announcement transmission interval (ATI), contention based access period (CBAP), and service period (SP).
- The DCF is used during contention based access periods.
- Dynamic allocation (10.36.7) is built on service period and contention based access period.

10.2.2 DCF

The fundamental access method of the MAC used by non-DMG STAs is a DCF known as *carrier sense multiple access with collision avoidance* (CSMA/CA). The DCF shall be implemented in all STAs.

For a STA to transmit, it shall sense the medium to determine if another STA is transmitting. If the medium is not determined to be busy (see 10.3.2.1), the transmission may proceed. The CSMA/CA distributed algorithm mandates that a gap of a minimum specified duration exists between frame exchange sequences. A transmitting STA shall verify that the medium is idle for this required duration before attempting to transmit. If the medium is determined to be busy, a non-DMG STA shall defer until the end of the current transmission, and a DMG STA may defer until the end of the current transmission. After deferral, or prior to attempting to transmit again immediately after a successful transmission, the STA shall select a random backoff interval and shall decrement the backoff interval counter while the medium is idle. A refinement of the method may be used under various circumstances to further minimize collisions—here the transmitting and receiving STA exchange short Control frames (RTS and CTS frames for non-DMG STAs, and RTS and DMG CTS frames for DMG STAs) after determining that the medium is idle and after any deferrals or backoffs, prior to data transmission. The details of CSMA/CA, deferrals, and backoffs are described in 10.3. RTS/CTS and RTS/DMG CTS exchanges are also presented in 10.3.

10.2.3 PCF

The PCF mechanism is obsolete. Consequently, this subclause might be removed in a later revision of the standard.

The IEEE 802.11 MAC may also incorporate an optional access method called a *PCF*, which is usable only in infrastructure network configurations. This access method uses a PC, which shall operate at the AP of the BSS, to determine which STA currently has the right to transmit. The operation is essentially that of polling, with the PC performing the role of the polling master. The operation of the PCF might require additional coordination, not specified in this standard, to permit efficient operation when multiple point-coordinated BSSs are operating on the same channel, in overlapping physical space.

The PCF uses a virtual carrier sense (CS) mechanism aided by an access priority mechanism. The PCF shall distribute information within Beacon frames to gain control of the medium by setting the NAV in STAs. In addition, all frame transmissions under the PCF may use an interframe space (IFS) that is smaller than the IFS for frames transmitted via the DCF. The use of a smaller IFS implies that point-coordinated traffic has priority access to the medium over STAs in overlapping BSSs operating under the DCF access method.

The access priority provided by a PCF may be utilized to create a CF access method. The PC controls the frame transmissions of the STAs so as to eliminate contention for a limited period of time.

10.2.4 Hybrid coordination function (HCF)

10.2.4.1 General

The QoS facility includes an additional coordination function called *HCF* that is usable only in QoS network configurations. The HCF shall be implemented in all QoS STAs except mesh STAs. Instead, mesh STAs implement the MCF. The HCF combines functions from the DCF and PCF with some enhanced, QoS-specific mechanisms and frame subtypes to allow a uniform set of frame exchange sequences to be used for QoS data transfers during both the CP and CFP. The HCF uses both a contention based channel access method, called the *enhanced distributed channel access (EDCA)* mechanism for contention based transfer and a controlled channel access, referred to as the *HCF controlled channel access (HCCA)* mechanism, for contention free transfer.

A STA may obtain a TXOP using one or both of the channel access mechanisms specified in 10.22. If a TXOP is obtained using the contention based channel access, it is defined as *EDCA TXOP*. If a TXOP is obtained using the controlled channel access, it is defined as *HCCA TXOP*. If an HCCA TXOP is obtained due to a QoS (+)CF-Poll frame from the HC, the TXOP is defined as a *polled TXOP*.

Time priority Management frames are transmitted outside of the normal MAC queuing process as per individually described transmission rules. Frames listed in Table 9-333 and Table 9-418 with a value of “Yes” in the “Time priority” column are time priority Management frames. No other frames are time priority Management frames.

10.2.4.2 HCF contention based channel access (EDCA)

The EDCA mechanism provides differentiated, distributed access to the WM for STAs using eight different UPs. The EDCA mechanism defines four access categories (ACs) that provide support for the delivery of traffic with UPs at the STAs. Six transmit queues are defined when `dot11AlternateEDCAActivated` is true, and four transmit queues otherwise. The transmit queue and AC are derived from the UPs as shown in Table 10-1.

NOTE—A DMG STA that implements a single AC (see 10.22.2.1) has all of its UP values in Table 10-1 mapped to AC_BE.

Table 10-1—UP-to-AC mappings

| Priority | UP (Same as IEEE 802.1D user priority) | IEEE 802.1D designation | AC | Transmit queue (dot11Alternate- EDCAActivated false or not present) | Transmit queue (dot11Alternate EDCAActivated true) | Designation (informative) |
|----------------------------|---|-------------------------------|-------|---|---|------------------------------|
| Lowest ↓ Highest | 1 | BK | AC_BK | BK | BK | Background |
| | 2 | — | AC_BK | BK | BK | Background |
| | 0 | BE | AC_BE | BE | BE | Best Effort |
| | 3 | EE | AC_BE | BE | BE | Best Effort |
| | 4 | CL | AC_VI | VI | A_VI | Video (alternate) |
| | 5 | VI | AC_VI | VI | VI | Video (primary) |
| | 6 | VO | AC_VO | VO | VO | Voice (primary) |
| | 7 | NC | AC_VO | VO | A_VO | Voice (alternate) |

For each AC an enhanced variant of the DCF, called an *enhanced distributed channel access function (EDCAF)*, contends for TXOPs using a set of EDCA parameters. When communicating Data frames outside the context of a BSS (dot11OCBActivated is true), the EDCA parameters are the corresponding default values or are as set by the SME in dot11EDCATable (except for TXOP limits, which shall be set to 0 for each AC). When communicating within a BSS, the EDCA parameters used are from the EDCA Parameter Set element or from the default values for the parameters when no EDCA Parameter Set element is received from the AP of the BSS with which the STA is associated or when the STA is a mesh STA. The parameters used by the EDCAF to control its operation are defined by dot11QAPEDCATable at the AP and by dot11EDCATable at the non-AP STA.

The following rules apply for HCF contention based channel access:

- a) The minimum specified idle duration time is not the constant value (DIFS) defined for DCF, but is a distinct value. This value is specified in table dot11QAPEDCATableAIFSN for an AP and in table dot11EDCATableAIFSN for a non-AP STA; see 10.22.2. The minimum idle duration time is assigned either by a management entity or by an AP.
- b) The contention window limits aCWmin and aCWmax, from which the random backoff is computed, are not fixed per PHY, as with DCF, but are variable (contained in tables dot11QAPEDCATableCWmin and dot11QAPEDCATableCWmax for an AP and in tables dot11EDCATableCWmin and dot11EDCATableCWmax for a non-AP STA) and assigned by a management entity or by an AP.
- c) Collisions between contending EDCAFs in a STA are resolved within the STA, so that the Data frames from the higher priority AC receive the TXOP and the Data frames from the lower priority colliding AC(s) behave as if there were an external collision on the WM except that the Retry subfield in the MAC headers of MPDUs at the head of the lower priority ACs is not affected.
- d) During an EDCA TXOP won by an EDCAF a STA may initiate multiple frame exchange sequences to transmit MMPDUs and/or MSDUs within the same AC. The duration of this EDCA TXOP is bounded, for an AC, by the value dot11QAPEDCATableTXOPLimit for an AP and by dot11EDCATableTXOPLimit for a non-AP STA. A value of 0 for this duration means that the EDCA TXOP is limited as defined by the rule for TXOP limit of 0 found in 10.22.2.8.

The QoS AP shall announce the EDCA parameters in selected Beacon frames and in all Probe Response and (Re)Association Response frames by the inclusion of the EDCA Parameter Set element using the information

from the MIB entries in dot11ECDATable. If no such element is received, a STA shall use the default values for the parameters. The fields following the QoS Info field in the EDCA Parameter Set element shall be included in all Beacon frames occurring within two (optionally more) delivery traffic indication map (DTIM) periods following a change in AC parameters, which provides all STAs an opportunity to receive the updated EDCA parameters. If any associated STAs are in WNM sleep mode or using FMS, these fields should be included by the AP for as many DTIM periods as needed to exceed the longest interval any STA is expected to not receive Beacon frames. A QoS STA shall update its MIB attributes that correspond to fields in an EDCA Parameter Set element within an interval of time equal to one beacon interval after receiving an updated EDCA parameter set. QoS STAs update the MIB attributes and store the EDCA Parameter Set update count value in the QoS Info field. An AP may change the EDCA access parameters by changing the EDCA Parameter Set element in the Beacon frame, Probe Response frame, and (Re)Association Response frame. However, the AP should change them only rarely. A QoS STA shall use the EDCA Parameter Set Update Count Value subfield in the QoS Capability element of all Beacon frames to determine whether the STA is using the current EDCA Parameter Values. If the EDCA Parameter Set update count value in the QoS Capability element is different from the value that has been stored, the QoS STA shall query the updated EDCA parameter values by sending a Probe Request frame to the AP.

In the Beacon frame the EDCA Parameter Set Update Count subfield is initially set by the AP to 0 and is incremented every time any of the AC parameters changes.

An AP or PCP may use a different set of EDCA parameter values than it advertises to the STAs in its BSS.

A QoS STA that transmits a Management frame determines access category used for medium access in transmission of the Management frame as follows:

- If dot11QMFActivated is false or not present
 - If the Management frame is individually addressed to a non-QoS STA, category AC_BE should be selected

NOTE—Category AC_BE might not be selected when no prior Data frames have been transmitted to the non-QoS STA
 - If category AC_BE was not selected by the previous step, category AC_VO shall be selected

NOTE—Selection of AC_VO above is independent of whether the STA is associated with a BSS, or whether there is a QoS facility in the BSS.
- If dot11QMFActivated is true the STA determines the access category as described in 11.26.

BlockAckReq and BlockAck frames shall be sent using the same access category for medium access as the corresponding QoS Data frames.

PS-Poll frames shall be sent using the access category AC_BE for medium access (to reduce the likelihood of collision following a Beacon frame).

When the first frame in a frame exchange sequence intended to carry a QoS Data, QoS Null or Management frame is an RTS or CTS frame, the RTS or CTS frame shall be transmitted using the access category of the corresponding QoS Data or QoS Null frame or the access category used for medium access of the Management frame.

Control Wrapper frames shall be sent using the access category that would apply to the carried Control frame.

A beamformer may send a VHT NDP Announcement frame or Beamforming Report Poll frame using any access category and without being restricted by admission control procedures.

PS-Poll frames and Management frames are exempted from any and all restrictions on transmissions arising from admission control procedures.

The operation rules of HCF contention based channel access are defined in 10.22.2.

The alternate video (A_VI) and alternate voice (A_VO) transmit queues share the same EDCAF as VI and VO transmit queues, respectively, as shown in Figure 10-25. When dot11AlternateEDCAActivated is true, a scheduling function above the VO EDCAF selects from the primary or alternate transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VO EDCAF (as shown in Figure 10-25) so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. When dot11AlternateEDCAActivated is true, a scheduling function above the VI EDCAF selects from the primary or alternate transmit queue an MSDU, an A-MSDU, an MMPDU, or set of MSDUs to be the next to be passed to the VI EDCAF so that the MSDU(s), A-MSDU(s), or MMPDU(s) from the queue with the higher UP are selected with a higher probability than from the queue with the lower UP. The default algorithm to select an MSDU, A-MSDU, or MMPDU from either the A_VI or VI queue and to select an MSDU, A-MSDU, or MMPDU from either the A_VO or VO queue is as follows:

- a) For each EDCAF, an MSDU, A-MSDU, or MMPDU is selected for transmission using the transmission selection procedures defined in 8.6.8 of IEEE Std 802.1Q-2011 using two queues, the primary and alternate.
- b) For a given AC, the order in which frames are selected for transmission shall maintain the requirements specified in 10.8 of this standard.

Alternative prioritization algorithms that meet the requirements of 10.8 may be used.

All MSDUs, A-MSDUs, and MMPDUs passed to the VO EDCAF are transmitted according to AC_VO EDCAF parameters and rules. All MSDUs, A-MSDUs, and MMPDUs passed to the VI EDCAF are transmitted according to AC_VI EDCAF parameters and rules.

10.2.4.3 HCF controlled channel access (HCCA)

The HCCA mechanism uses a QoS-aware centralized coordinator, called a *hybrid coordinator (HC)*, and operates under rules that are different from the PC of the PCF. The HC is collocated with the AP of the BSS and uses the HC's higher priority of access to the WM to initiate frame exchange sequences and to allocate TXOPs to itself and other STAs in order to provide limited-duration CAPs for contention free transfer of QoS data.

The HC traffic delivery and TXOP allocation may be scheduled during the CP and any locally generated CFP (generated optionally by the HC) to meet the QoS requirements of a particular TC or TS. TXOP allocations and contention free transfers of QoS traffic might be based on the HC's BSS-wide knowledge of the amounts of pending traffic belonging to different TS and/or TCs and are subject to BSS-specific QoS policies.

An AP may transmit a CF-Poll to a non-QoS STA, thereby providing non-QoS contention free transfers during the CFP. This provisioning of contention free transfers during the CFP to non-QoS STAs, however, is not recommended. Implementers are cautioned that QoS STAs are not required to interpret data subtypes that include QoS +CF-Ack in frames not addressed to themselves unless they set the Q-Ack subfield in the QoS Capability element to 1. QoS STAs are also not required to interpret data subtypes that are non-QoS (+)CF-Poll frames (i.e., Data frames with bits 7, 5, and 4 in the Frame Control field equal to 0, 1, and 0, respectively); therefore, QoS STAs cannot be treated as CF-Pollable STAs. This requires an AP that provides non-QoS CF-polling to adhere to frame exchange sequence restrictions considerably more complex than, and less efficient than, those specified for either PCF or HCF. In addition, the achievable service quality is likely to be degraded when non-QoS STAs are associated and being polled.

The HCF protects the transmissions during each CAP using the virtual CS mechanism.

A STA may initiate multiple frame exchange sequences during a polled TXOP of sufficient duration to perform more than one such sequence. The use of virtual CS by the HC provides improved protection of the CFP, in addition to the protection provided by having all STAs in the BSA setting their NAVs to dot11CFPMaxDuration at the target beacon transmission time (TBTT) of DTIM Beacon frames.

The operation rules of the HCCA are defined in 10.22.3.

10.2.5 Mesh coordination function (MCF)

The mesh facility includes an additional coordination function called *MCF* that is usable only in an MBSS. A mesh STA shall implement the MCF only. MCF has both a contention based channel access and contention free channel access mechanism. The contention based mechanism is EDCA and the contention free mechanism is called the *MCF controlled channel access (MCCA)*. MCF uses the default values for the PTKSA, GTKSA and STKSA Replay Counters. The operation rules of the EDCA are defined in 10.22.2. The operation rules of the MCCA are defined in 10.23.3.

10.2.6 Combined use of DCF, PCF, and HCF

The DCF and a centralized coordination function (either PCF or HCF) are defined so they may operate within the same BSS. When a PC is operating in a BSS, the PCF and DCF access methods alternate, with a CFP followed by a CP. This is described in greater detail in 10.4. When an HC is operating in a BSS, it may generate an alternation of CFP and CP in the same way as a PC, using the DCF access method only during the CP. The HCF access methods (controlled and contention based) operate sequentially when the channel is in CP. Sequential operation allows the polled and contention based access methods to alternate, within intervals as short as the time to transmit a frame exchange sequence, under rules defined in 10.22.

10.2.7 Fragmentation/defragmentation overview

The process of partitioning an MSDU or an MMPDU into smaller MAC level frames, MPDUs, is called *fragmentation*. Fragmentation creates MPDUs smaller than the original MSDU or MMPDU length to increase reliability, by increasing the probability of successful transmission (as defined in 10.2.2) of the MSDU or MMPDU when channel characteristics limit reception reliability for longer frames. A STA may use fragmentation to use the medium efficiently in consideration of the duration available in granted TXOPs, as long as the rules in 10.5 are followed. Fragmentation is accomplished at each immediate transmitter. The process of recombining MPDUs into a single MSDU or MMPDU is defined as *defragmentation*. Defragmentation is accomplished at each immediate recipient.

An MSDU transmitted under HT-immediate or HT-delayed block ack agreement shall not be fragmented even if its length exceeds dot11FragmentationThreshold. An MSDU or MMPDU transmitted within an A-MPDU that does not contain a VHT single MPDU (see 10.13.8) shall not be fragmented even if its length exceeds dot11FragmentationThreshold. MSDUs or MMPDUs carried in a group addressed MPDU shall not be fragmented even if their length exceeds dot11FragmentationThreshold.

NOTE 1—A fragmented MSDU or MMPDU transmitted by an HT STA to another HT STA can be acknowledged only using immediate acknowledgment (i.e., transmission of an Ack frame after a SIFS).

NOTE 2—As specified in 10.12, A-MSDUs are never fragmented.

Except as described below, when an individually addressed MSDU is received from the LLC or an individually addressed MMPDU is received from the MLME that would result in an MPDU of length greater than dot11FragmentationThreshold, the MSDU or MMPDU shall be fragmented. An exception applies when an MSDU is transmitted using an HT-immediate or HT-delayed block ack agreement or when the MSDU or MMPDU is carried in an A-MPDU that does not contain a VHT single MPDU, in which case the MSDU or MMPDU is transmitted without fragmentation. Each fragment is a frame no longer than dot11FragmentationThreshold, if security encapsulation is not invoked for the MPDU. If security

encapsulation is active for the MPDU, then the fragments shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold. It is possible that any fragment may be a frame smaller than dot11FragmentationThreshold. An illustration of fragmentation is shown in Figure 10-3.

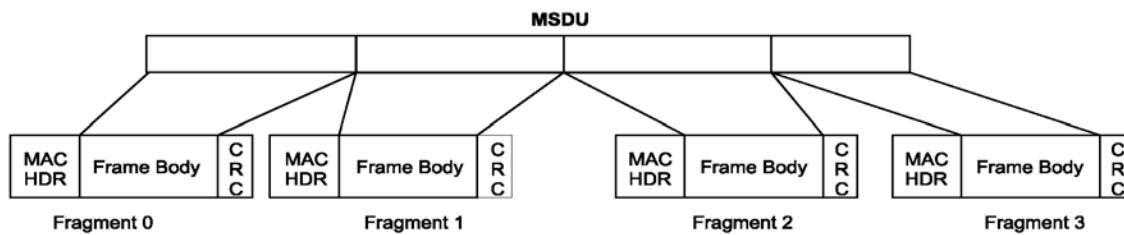

Figure 10-3—Fragmentation

The MPDUs resulting from the fragmentation of an MSDU or MMPDU are sent as independent transmissions, each of which is separately acknowledged. This permits transmission retries to occur per fragment, rather than per MSDU or MMPDU. The fragments of a single MSDU or MMPDU are either

- Sent during a CP as individual frames using the DCF, or
- Sent during a CFP as individual frames obeying the rules of the PC medium access procedure, or
- Sent as a burst in an EDCA or HCCA TXOP, subject to TXOP limits and medium occupancy limits for the attached PHY.

A QoS Data frame with a TID matching an existing block ack agreement may be transmitted outside an A-MPDU with its Ack Policy subfield set to Normal Ack.

Transmission of fragmented MPDUs by a DMG STA outside of an A-MPDU depends on setting of the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake. The MSDU shall not be fragmented if the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame transmitted during the block ack agreement handshake is 1. If the No-Fragmentation field in the ADDBA Extension element within the ADDBA Response frame is 0, the originator may send fragmented nonaggregated MSDU with Normal Ack policy under block ack agreement.

10.2.8 MAC data service

The MAC data service provides the transport of MSDUs between MAC peer entities as characterized in 5.1.1.

The transmission process is started by the MAC's receipt of an MA-UNITDATA.request primitive containing an MSDU and the associated parameters. This might cause one or more Data frames containing the MSDU to be transmitted following A-MSDU aggregation, fragmentation, and security encapsulation, as appropriate.

The MAC generates the MA-UNITDATA.indication primitive in response to one or more received Data frames containing an MSDU following validation, address filtering, decryption, decapsulation, defragmentation, and A-MSDU deaggregation, as appropriate.

When dot11SSPNInterfaceActivated is true, an AP shall distribute the group addressed message into the BSS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true. When dot11SSPNInterfaceActivated is false, the group addressed message shall be distributed into the BSS. Unless the MPDU is delivered via DMS, the STA originating the message receives the message as a group addressed message (prior to any filtering). Therefore, a STA shall filter out group addressed messages that contain their address as the source address. When dot11SSPNInterfaceActivated is false, group addressed MSDUs shall be propagated throughout the ESS.

When dot11SSPNInterfaceActivated is true, group addressed MSDUs shall be propagated throughout the ESS only if dot11NonAPStationAuthSourceMulticast in the dot11InterworkingEntry identified by the source MAC address in the received message is true.

The MAC performs address filtering on the Address 1 field of each MPDU contained in a PPDU and on the DA of each MSDU within an A-MSDU. When the Address 1 field or DA field contains a group address, address filtering is performed by comparing the value in the Address 1 field or DA field to all values in the dot11GroupAddressesTable, and the STA also validates the BSSID to verify either that the group addressed frame originated from a STA in the BSS of which the receiving STA is a member, or that it contains the wildcard BSSID value, indicating a Data frame sent outside the context of a BSS (dot11OCBActivated is true in the transmitting STA).

A mesh STA also uses the address matching rules described in 10.35.3, when it receives an individually addressed frame. When a mesh STA receives a frame with the Address 1 field equal to a group address, the mesh STA also checks the TA to determine whether the group addressed frame originated from one of its peer mesh STAs; if there is no match, the STA shall discard the frame. A mesh STA also uses the address matching rules described in 10.35.4.

If the Address 1 field of an MPDU carrying an A-MSDU does not match any address at a receiving STA, then the entire A-MSDU is discarded.

In a QoS STA, the TID parameter of the MA-UNITDATA.request primitive results in a TID being specified for the transmitted MSDU. This TID associates the MSDU with the AC or TS queue for the indicated traffic.

10.3 DCF

10.3.1 General

The basic medium access protocol is a DCF that allows for automatic medium sharing between compatible PHYs through the use of CSMA/CA and a random backoff time following a busy medium condition. In addition, all individually addressed traffic uses immediate positive acknowledgment (Ack frame), in which retransmission is scheduled by the sender if no Ack frame is received.

The CSMA/CA protocol is designed to reduce the collision probability between multiple STAs accessing a medium, at the point where collisions would most likely occur. Just after the medium becomes idle following a busy medium (as indicated by the CS function) is when the highest probability of a collision exists. This is because multiple STAs could have been waiting for the medium to become available again. This is the situation that necessitates a random backoff procedure to resolve medium contention conflicts.

The DCF is modified for use by DMG STAs to allow sharing of the medium between compatible DMG PHYs (see 10.3.4). A DMG STA has no direct knowledge of when it might interfere (collide with the transmission of) another STA.

The CS function of a DMG STA might not indicate the medium busy condition due to the predominant nature of directional transmissions and receptions. The transmission of a STA might interfere (collide) with the transmission of another STA even though the CS function at the first STA does not indicate medium busy. The interference (collision) is identified when the expected response frame is not received. SPSH is achieved by the proper combination of the STA antenna configuration during the media access and data transfer phases.

CS shall be performed both through physical and virtual mechanisms.

The virtual CS mechanism is achieved by distributing reservation information announcing the impending use of the medium. The exchange of RTS and CTS frames prior to the actual Data frame is one means of distribution of this medium reservation information. The RTS and CTS frames contain a Duration field that defines the period of time that the medium is to be reserved to transmit the actual Data frame and the returning Ack frame. A STA receiving either the RTS frame (sent by the originating STA) or the CTS frame (sent by the destination STA) shall process the medium reservation. Thus, a STA might be unable to receive from the originating STA and yet still know about the impending use of the medium to transmit a Data frame.

Another means of distributing the medium reservation information is the Duration/ID field in individually addressed frames. This field gives the time that the medium is reserved, either to the end of the immediately following Ack frame, or in the case of a fragment sequence, to the end of the Ack frame following the next fragment.

The RTS/CTS exchange also performs both a type of fast collision inference and a transmission path check. If the return CTS frame is not detected by the STA originating the RTS, the originating STA may repeat the process (after observing the other medium-use rules) more quickly than if the long Data frame had been transmitted and a return Ack frame had not been detected. An RTS/CTS exchange by VHT STAs also performs fast collision inference on the secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel and helps the VHT STA transmitting the RTS to determine the available bandwidth at the responder.

Another advantage of the RTS/CTS mechanism occurs where multiple BSSs utilizing the same channel overlap. The medium reservation mechanism works across the BSS boundaries. The RTS/CTS mechanism might also improve operation in a typical situation in which all STAs are able to receive from the AP, but might not be able to receive from all other STAs in the BSA.

Except for MPDUs transmitted via the GCR service, the RTS/CTS mechanism cannot be used for MPDUs with a group addressed immediate destination because there are multiple recipients for the RTS frame, and thus potentially multiple concurrent senders of the CTS frame in response. For MPDUs transmitted via the GCR service, an RTS frame may be used if it is directed to a STA within the GCR group (see 10.22.2.11.2 and 10.24.10). The RTS/CTS mechanism is not used for every Data frame transmission. Because the additional RTS and CTS frames add overhead inefficiency, the mechanism is not always justified, especially for short Data frames.

The use of the RTS/CTS mechanism is under control of dot11RTSThreshold. This attribute may be set on a per-STA basis. This mechanism allows STAs to be configured to initiate RTS/CTS either always, never, or only on frames longer than a specified length.

NOTE—A STA configured not to initiate the RTS/CTS mechanism updates its virtual CS mechanism with the duration information contained in a received RTS or CTS frame, and responds to an RTS frame addressed to it with a CTS frame if permitted by medium access rules.

All non-DMG STAs that are members of a BSS are able to receive and transmit at all of the data rates in the BSSBasicRateSet parameter of the MLME-START.request primitive or BSSBasicRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.3.4.2.4 and 6.3.11.2.4.

NOTE—A STA's operational rate set does not necessarily contain all the mandatory rates. However a STA has to be capable of receiving using a mandatory rate (as required by the rules in 10.7) even if it is not present in this set.

All HT STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.3.4.2.4 and 6.3.11.2.4.

All VHT STAs that are members of a BSS are able to receive and transmit using all of the <VHT-MCS, NSS> tuples in the basic VHT-MCS and NSS set (see 11.40.7) except as constrained by the rules of 10.7.12.

All DMG STAs that are members of a BSS are able to receive and transmit using all of the MCSs in the OperationalRateSet parameter of the MLME-START.request primitive or OperationalRateSet parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive; see 6.3.4.2.4 and 6.3.11.2.4.

To support the proper operation of the RTS/CTS by non-DMG STAs, RTS/DMG CTS by DMG STAs, and the virtual CS mechanism, a non-DMG STA shall be able to interpret Control frames with the Subtype subfield equal to RTS or CTS, and a DMG STA shall be able to interpret Control frames with the Subtype subfield equal to RTS or DMG CTS.

A Data frame sent under the DCF shall have the Type subfield set to Data and the Subtype subfield set to Data or Null. A STA receiving a frame with the Type subfield equal to Data shall not indicate the frame to the LLC when the Subtype subfield is equal to Null, but shall indicate the frame to the LLC when the Subtype subfield is equal to Data, even if the frame body contains zero octets.

While in the awake state and operating under DCF but not transmitting, a DMG STA can configure its receive antenna to a quasi-omni pattern in order to receive frames transmitted by any STA that is covered by this antenna pattern.

10.3.2 Procedures common to the DCF and EDCAF

10.3.2.1 CS mechanism

Physical and virtual CS functions are used to determine the state of the medium. When either function indicates a busy medium, the medium shall be considered busy; otherwise, it shall be considered idle.

A physical CS mechanism shall be provided by the PHY. See Clause 8 for how this information is conveyed to the MAC. The details of physical CS are provided in the individual PHY specifications.

A virtual CS mechanism shall be provided by the MAC. This mechanism is referred to as the *NAV*. The NAV maintains a prediction of future traffic on the medium based on duration information that is announced in RTS/CTS frames by non-DMG STAs and RTS/DMG CTS frames by DMG STAs prior to the actual exchange of data. The duration information is also available in the MAC headers of all frames sent during the CP other than PS-Poll frames, and during the BTI, the A-BFT, the ATI, the CBAP, and the SP. The mechanism for setting the NAV using RTS/CTS or RTS/DMG CTS in the DCF is described in 10.3.2.4, use of the NAV in PCF is described in 10.4.3.3, and use of the NAV in HCF is described in 10.22.2.2 and 10.22.3.4. Additional details regarding NAV use appear in 10.3.2.5, 10.3.2.12, 10.36.10, and 10.26.

The CS mechanism combines the NAV state and the STA's transmitter status with physical CS to determine the busy/idle state of the medium. The NAV may be thought of as a counter, which counts down to 0 at a uniform rate. When the counter is 0, the virtual CS indication is that the medium is idle; when the counter is nonzero, the indication is busy. If a DMG STA supports multiple NAVs as defined in 10.36.10 and all counters are 0, the virtual CS indication is that the medium is idle; when at least one of the counters is nonzero, the indication is busy. The medium shall be determined to be busy when the STA is transmitting.

At $aRxTxTurnaroundTime + aAirPropagationTime + aRxPHYDelay + 10\% \times (aSlotTime - aAirPropagationTime)$ after each MAC slot boundary as defined in 10.3.7 and 10.22.2.4, the MAC shall issue a PHY-CCARESET.request primitive to the PHY, where $aAirPropagationTime$ determined as described in 10.21.5.

10.3.2.2 MAC-level acknowledgments

The reception of some frames, as described in 10.3.2.9 and 10.4.4.5, requires the receiving STA to respond with an acknowledgment if the FCS of the received frame is correct. This technique is known as positive acknowledgment.

Lack of reception of an expected frame containing an acknowledgment indicates to the STA initiating the frame exchange that an error has occurred. Note, however, that the destination STA may have received the frame correctly, and that the error may have occurred in the transfer or reception of the frame containing an acknowledgment. When a frame containing an acknowledgment is lost, the MAC that initiated the frame exchange does not receive a protocol indication of whether the initial frame was correctly received.

A correctly received frame is one for which the PHY-RXEND.indication primitive does not indicate an error and the FCS indicates the frame is error free.

10.3.2.3 IFS

10.3.2.3.1 General

The time interval between frames is called the *IFS*. A STA shall determine that the medium is idle through the use of the CS function for the interval specified. Ten different IFSs are defined to provide priority levels for access to the wireless medium. Figure 10-4 shows some of these relationships. All timings are referenced from occurrence of the PHY interface primitives PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication.

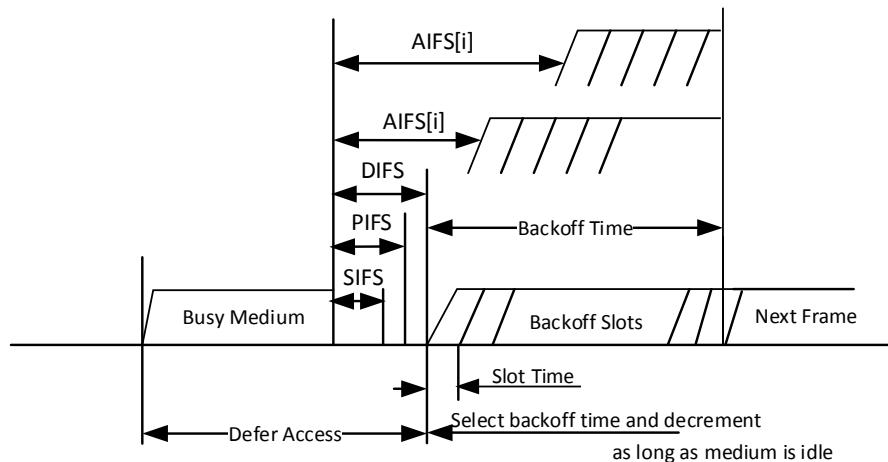

Figure 10-4—Some IFS relationships

The IFSs are as follows:

- RIFS reduced interframe space
- SIFS short interframe space
- PIFS PCF interframe space
- DIFS DCF interframe space
- AIFS arbitration interframe space (used by the QoS facility)
- EIFS extended interframe space
- SBIFS short beamforming interframe space
- BRPIFS beam refinement protocol interframe space
- MBIFS medium beamforming interframe space
- LBIFS long beamforming interframe space

The different IFSs shall be independent of the STA bit rate. The IFS timings are defined as time gaps on the medium, and the IFS timings except AIFS are fixed for each PHY (even in multirate-capable PHYs). The IFSs are determined from attributes specified by the PHY.

10.3.2.3.2 RIFS

The use of RIFS for a non-DMG STA is obsolete, and support for such use might be subject to removal in a future revision of the standard. A VHT STA shall not transmit frames separated by a RIFS.

RIFS is a means of reducing overhead and thereby increasing network efficiency.

RIFS may be used in place of SIFS to separate multiple transmissions from a single transmitter, when no SIFS-separated response transmission is expected and either of the following is true:

- The transmitter is not a DMG STA.
- The transmitter is a DMG STA, and each transmission occurs with the same transmit antenna configuration.

RIFS shall not be used between frames with different RA values. The duration of RIFS is defined by the aRIFS PHY characteristic (see Table 19-25 and Table 20-32). The RIFS is the time from the end of the last symbol of the previous frame to the beginning of the first symbol of the preamble of the subsequent frame as seen on the WM. A STA shall not allow the space between frames that are defined to be separated by a RIFS, as measured on the medium, to vary from the nominal RIFS (aRIFSTime) by more than $\pm 10\%$ of aRIFSTime. Two frames separated by a RIFS shall both be HT PPDUs or shall both be DMG PPDUs.

An HT STA shall not transmit PPDUs separated by a RIFS unless the beacon or probe response most recently received from the BSS's AP contains an HT Operation element with RIFS Mode field equal to 1.

There are additional restrictions regarding when RIFS may be employed as defined in 10.28 and 10.29. See also 10.26.3.3.

10.3.2.3.3 SIFS

The SIFS is the time from the end of the last symbol, or signal extension if present, of the previous frame to the beginning of the first symbol of the preamble of the subsequent frame as seen on the WM.

The SIFS shall be used prior to transmission of an Ack frame, a CTS frame, a PPDU containing a BlockAck frame that is an immediate response to either a BlockAckReq frame or an A-MPDU, a DMG CTS frame, a DMG DTS frame, a Grant Ack frame, a response frame transmitted in the ATI, the second or subsequent MPDU of a fragment burst, and by a STA responding to any polling by the PCF. The SIFS may also be within a TXOP or by a PC for any types of frames during the CFP (see 10.4).

An IEEE 802.11 implementation of a non-DMG STA shall not allow the space between frames that are defined to be separated by a SIFS, as measured on the medium, to vary from the nominal SIFS by more than $\pm 10\% \times (\text{aSlotTime} - \text{aAirPropagationTime})$ for the PHY in use. An implementation of a DMG STA shall not allow the space between frames that are defined to be separated by a SIFS, as measured on the medium, to vary from the nominal SIFS by more than -0% or $+10\% \times (\text{aSlotTime} - \text{aAirPropagationTime})$.

SIFS is the shortest of the IFSs between transmissions from different STAs. SIFS shall be used when STAs have seized the medium and need to keep it for the duration of the frame exchange sequence to be performed. Using the smallest gap between transmissions within the frame exchange sequence prevents other STAs, which are required to wait for the medium to be idle for a longer gap, from attempting to use the medium, thus giving priority to completion of the frame exchange sequence in progress.

When transmitting a response frame immediately following a SIFS, a DMG STA shall set the TXVECTOR parameter LAST_RSSI of the response frame to the power that was measured on the received packet, as reported in the RCPI field of the frame that elicited the response frame. The encoding of the value is as follows:

- Power values less than or equal to -68 dBm are represented as the value of 1.

- Power values between -68 dBm and -42 dBm are represented as $\left\lfloor \frac{p - (-71) + 0.5}{2} \right\rfloor$, where p is the power in dBm.
- Power values greater than or equal to -42 dBm are represented as the value 15.
- For all other cases, the STA shall set the TXVECTOR parameter LAST_RSSI of the transmitted frame to 0.

A DMG STA that transmits a PPDU containing at least one individually addressed MPDU shall set the TXVECTOR parameter Turnaround to 1 if the STA is required to listen for an incoming PPDU immediately following the transmission of the PPDU; otherwise, the STA shall set the TXVECTOR parameter Turnaround to 0. The STA shall set the TXVECTOR parameter Turnaround to 0 when it transmits an RTS frame.

10.3.2.3.4 PIFS

The PIFS is used to gain priority access to the medium.

The PIFS may be used as described in the following list and shall not be used otherwise:

- A STA operating under the PCF, as described in 10.4
- A STA transmitting a Channel Switch Announcement frame, as described in 11.9 or transmitting an Extended Channel Switch Announcement frame, as described in 11.10
- A STA transmitting a TIM frame, as described in 11.2.3.17
- An HC starting a CFP or a TXOP, as described in 10.22.3.2.3
- An HC or a non-AP QoS STA that is a polled TXOP holder recovering from the absence of an expected reception in a CAP, as described in 10.22.3.2.4
- An HT STA using dual CTS protection before transmission of the CTS2, as described in 10.3.2.8
- A TXOP holder continuing to transmit after a transmission failure, as described in 10.22.2.7
- A TXOP holder transmitting an RTS with a bandwidth signaling TA within a multiple frame transmission sequence, as specified in 10.22.2.7
- An RD initiator continuing to transmit using error recovery, as described in 10.28.3
- An HT AP during a PSMP sequence transmitting a PSMP recovery frame, as described in 10.29.2.3
- An HT STA performing clear channel assessment (CCA) in the secondary channel before transmitting a 40 MHz mask PPDU using EDCA channel access, as described in 11.16.9
- An AP continuing to transmit in a GCR block ack TXOP after the failure to receive a BlockAck frame, as described in 10.24.10
- A VHT STA performing CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before transmitting a 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz mask PPDU using EDCA channel access, as described in 10.22.3
- An AP or PCP continuing to transmit in the ATI after a transmission failure during the ATI (10.36.3)
- A source DMG STA of an SP continuing to transmit after a transmission failure, as described in 10.36.6.2
- A DMG STA performing EDCA access during an allocated CBAP, as described in 10.36.5
- A TVHT STA performing CCA in the secondary TVHT_W and TVHT_2W channels before transmitting a TVHT_2W or TVHT_W+W mask PPDU and TVHT_4W or TVHT_2W+2W mask PPDU, respectively, using EDCA channel access, as defined in 10.22.3

With the exception of performing CCA in the secondary channel (where the timing is defined in 11.16.9), a STA using PIFS starts its transmission after its CS mechanism (see 10.3.2.1) determines that the medium is idle at the TxPIFS slot boundary, as defined in 10.3.7 and 10.22.2.4.

10.3.2.3.5 DIFS

The DIFS shall be used by STAs operating under the DCF to transmit Data frames (MPDUs) and Management frames (MMPDUs). A STA using the DCF may transmit if both:

- After it has correctly received a frame, its CS mechanism (see 10.3.2.1) determines that the medium is idle at the TxDIFS slot boundary as defined in 10.3.7
- The STA's backoff timer has expired.

10.3.2.3.6 AIFS

The AIFS shall be used by QoS STAs that access the medium using the EDCAF to transmit: all Data frames (MPDUs) except during the ATI or an SP, all Management frames (MMPDUs) except during the ATI or an SP, all Extension frames except for the DMG Beacon frame, and the following Control frames:

- PS-Poll
- SSW (if first transmission by an initiator in a CBAP)
- Poll (if first transmission and when in a CBAP)
- Grant (if first transmission and when in a CBAP and not transmitted in response to a SPR frame)
- SPR (when in a CBAP and not transmitted as a response to a Poll)
- RTS
- CTS (when not transmitted as a response to an RTS frame)
- DMG CTS (when not transmitted as a response to an RTS frame)
- BlockAckReq
- BlockAck (when not transmitted as a response to a BlockAckReq frame)

A STA using the EDCAF shall obtain a TXOP for an AC if the STA's CS mechanism (see 10.3.2.1) determines that the medium is idle at the AIFS[AC] slot boundary (see 10.22.2.4), after a correctly received frame, and the backoff timer for that AC has expired.

A non-AP and non-PCP QoS STA computes the time periods for each AIFS[AC] from dot11EDCATableAIFSN. In an infrastructure BSS, QoS STAs update their dot11EDCATableAIFSN values using information in the most recent EDCA Parameter Set element of Beacon frames received from the AP of the BSS (see 9.4.2.29) if the STA is a non-DMG STA or the most recent EDCA Parameter Set element of DMG Beacon and Announce frames received from the AP or PCP of the BSS if the STA is a DMG STA. A QoS AP or PCP computes the time periods for each AIFS[AC] from dot11QAPEDCATableAIFSN.

10.3.2.3.7 EIFS

A DCF shall use EIFS before transmission, when it determines that the medium is idle following reception of a frame for which the PHY-RXEND.indication primitive contained an error or a frame for which the FCS value was not correct. Similarly, a STA's EDCA mechanism under HCF shall use the EIFS–DIFS+AIFS[AC] interval. The duration of an EIFS is defined in 10.3.7. The EIFS or EIFS–DIFS+AIFS[AC] interval shall begin following indication by the PHY that the medium is idle after detection of the erroneous frame, without regard to the virtual CS mechanism. The STA shall not begin a transmission until the expiration of the later of the NAV and EIFS or EIFS–DIFS+AIFS[AC]. The EIFS and EIFS–DIFS+AIFS[AC] are defined to provide enough time for another STA to acknowledge what was, to this STA, an incorrectly received frame before this STA commences transmission. Reception of an error-free frame during the EIFS or EIFS–DIFS+AIFS[AC] resynchronizes the STA to the actual busy/idle state of the medium, so the EIFS or EIFS–DIFS+AIFS[AC] is terminated and medium access (using DIFS or AIFS as appropriate and, if necessary, backoff) continues following reception of that frame. At the expiration or termination of the EIFS or EIFS–DIFS+AIFS[AC], the STA reverts to the NAV and physical CS to control access to the medium.

EIFS shall not be invoked if the NAV is updated by the frame that would have caused an EIFS. EIFS shall not be invoked for an A-MPDU if one or more of its frames are received correctly.

10.3.2.3.8 SBIFS

The SBIFS shall be used to separate multiple transmissions from a single transmitter during a receive sector sweep or when each transmission occurs with a different transmit antenna configuration and no SIFS-separated response transmission is expected. The duration of SBIFS is determined by the aSBIFSTime PHY characteristic. The SBIFS is the time from the end of the last symbol of the previous frame to the beginning of the first symbol of the preamble of the subsequent frame as seen on the WM. A STA shall not allow the space between frames that are defined to be separated by a SBIFS, as measured on the medium, to be less than aSBIFSTime or to be more than aSBIFSTime + aSBIFSAccuracy. Two frames separated by a SBIFS shall both be DMG PPDUUs.

10.3.2.3.9 BRPIFS

The BRPIFS shall be used by STAs between transmissions of BRP frames. The BRPIFS is the maximum time from the end of the last symbol of the previous PPDU, or training field if present in the PPDU, to the beginning of the first symbol of the preamble of the subsequent PPDU as seen on the WM. The corresponding minimum time is SIFS. BRPIFS is defined to be equal to aBRPIFS+10%.

10.3.2.3.10 MBIFS

The MBIFS shall be used between the BTI and the A-BFT and between the ISS, RSS, SSW-Feedback, and SSW-Ack. MBIFS is equal to $3 \times$ aSIFSTime. An implementation of a DMG STA shall not allow the space between frames that are defined to be separated by an MBIFS, as measured on the medium, to vary from the nominal MBIFS by more than -0% or $+10\% \times (aSlotTime - aAirPropagationTime)$.

10.3.2.3.11 LBIFS

The LBIFS shall be used between transmissions employing different DMG antennas and when the recipient STA is expected to switch DMG antennas. LBIFS is equal to TXTIME(SSW) + $2 \times$ SBIFS. An implementation of a DMG STA shall not allow the space between frames that are defined to be separated by an LBIFS, as measured on the medium, to vary from the nominal LBIFS by more than -0% or $+10\% \times (aSlotTime - aAirPropagationTime)$.

10.3.2.4 Setting and resetting the NAV

This subclause describes the setting and resetting of the NAV for non-DMG STAs and DMG STAs that support a single NAV. DMG STAs that support multiple NAVs shall update their NAVs according to the procedures described in 10.36.10.

A STA that receives at least one valid frame in a PSDU can update its NAV with the information from any valid Duration field in the PSDU. When the received frame's RA is equal to the STA's own MAC address, the STA shall not update its NAV. Further, when the received frame is a DMG CTS frame and its TA is equal to the STA's own MAC address, the STA shall not update its NAV. For all other received frames the STA shall update its NAV when the received Duration is greater than the STA's current NAV value. Upon receipt of a PS-Poll frame, a STA shall update its NAV settings as appropriate under the data rate selection rules using a duration value equal to the time, in microseconds, required to transmit one Ack frame plus one SIFS, but only when the new NAV value is greater than the current NAV value. If the calculated duration includes a fractional microsecond, that value is rounded up to the next higher integer. Various additional conditions may set or reset the NAV, as described in 10.4.3.3. When the NAV is reset, a PHY-CCARESET.request primitive shall be issued. This NAV update operation is performed when the PHY-RXEND.indication primitive is received.

Figure 10-5 indicates the NAV for STAs that might receive the RTS frame, while other STAs might receive only the CTS frame, resulting in the lower NAV bar as shown (with the exception of the STA to which the RTS frame was addressed).

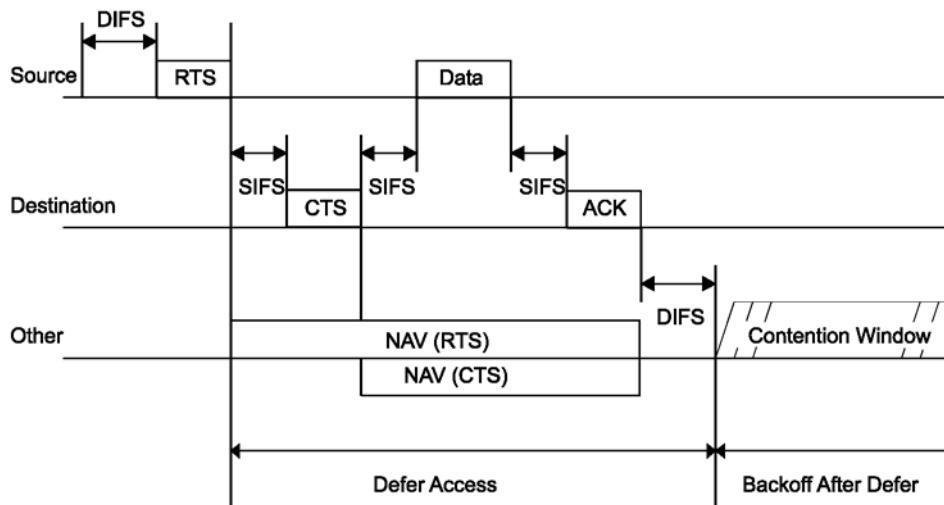

Figure 10-5—RTS/CTS/data/Ack and NAV setting

A STA that used information from an RTS frame as the most recent basis to update its NAV setting is permitted to reset its NAV if no PHY-RXSTART.indication primitive is received from the PHY during a NAVTimeout period starting when the MAC receives a PHY-RXEND.indication primitive corresponding to the detection of the RTS frame.

In non-DMG BSS, NAVTimeout period is equal to $(2 \times aSIFSTime) + (CTS_Time) + aRxPHYStartDelay + (2 \times aSlotTime)$. The “CTS_Time” shall be calculated using the length of the CTS frame and the data rate at which the RTS frame used for the most recent NAV update was received.

In DMG BSS, NAVTimeout period is equal to $(2 \times aSIFSTime) + T_{DMG-CTS} + StartDelayCompensation + (2 \times aSlotTime)$, where $T_{DMG-CTS}$ is the duration of a DMG CTS frame calculated using the TXVECTOR TRN-LEN parameter equal to the RXVECTOR TRN-LEN parameter of the received RTS frame and StartDelayCompensation is equal to aSlotTime.

NOTE—This value of StartDelayCompensation is a compromise over the possible values of aRxPHYStartDelay, which are dependent on both the implementation and the DMG PHY mode.

A STA supporting L-SIG TXOP that used the information from a frame with different L-SIG duration and MAC duration endpoints (characteristics of an L-SIG TXOP initiating frame; see 10.26.5.4 for details) as the most recent basis to update its NAV setting may reset its NAV if no PHY-RXSTART.indication primitive is received from the PHY during a period with a duration of $aSIFSTime + aRxPHYStartDelay + (2 \times aSlotTime)$ starting at the expiration of the L-SIG duration. For details of L-SIG duration, see 10.26.5.

10.3.2.5 RTS/CTS with fragmentation

The following is a description of using RTS/CTS for a fragmented MSDU or MMPDU. The RTS/CTS frames define the duration of the following frame and acknowledgment. The Duration/ID field in the Data and Ack frames specifies the total duration of the next fragment and acknowledgment. This is illustrated in Figure 10-6.

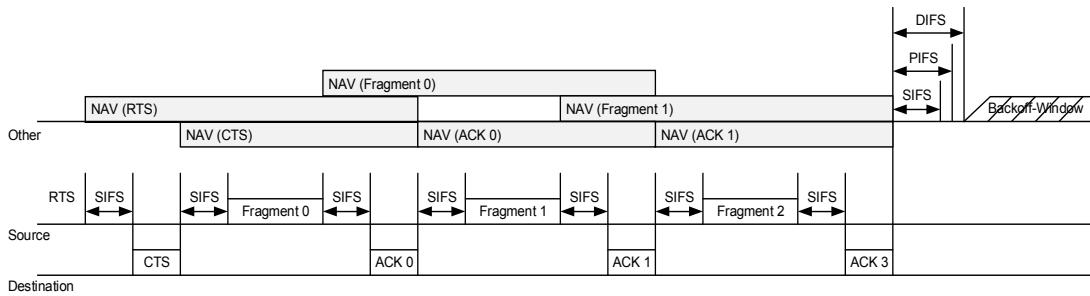

Figure 10-6—RTS/CTS with fragmented MSDU

Each frame contains information that defines the duration of the next transmission. The duration information from RTS frames shall be used to update the NAV to indicate busy until the end of Ack frame 0. The duration information from the CTS frame shall also be used to update the NAV to indicate busy until the end of Ack frame 0. Both Fragment 0 and Ack frame 0 shall contain duration information to update the NAV to indicate busy until the end of Ack frame 1. This shall be done by using the Duration/ID field in the Data and Ack frames. This shall continue until the last fragment, which shall have a duration of one Ack time plus one SIFS, and its Ack frame, which shall have its Duration/ID field set to 0. Each fragment and Ack frame acts as a virtual RTS frame and CTS frame; therefore no further RTS/CTS frames need to be generated after the RTS/CTS that began the frame exchange sequence even though the PSDUs carrying subsequent fragments may be larger than dot11RTSThreshold.

In the case where an acknowledgment is sent but not received by the source STA, STAs that heard the fragment, or Ack frame, mark the channel busy for the next frame exchange due to the NAV having been updated from these frames. This is the worst-case situation, and it is shown in Figure 10-7. If an acknowledgment is not sent by the destination STA, STAs that can only hear the destination STA do not update their NAV and may attempt to access the channel when their NAV updated from the previously received frame reaches 0. All STAs that hear the source are free to access the channel after their NAV updated from the transmitted fragment has expired.

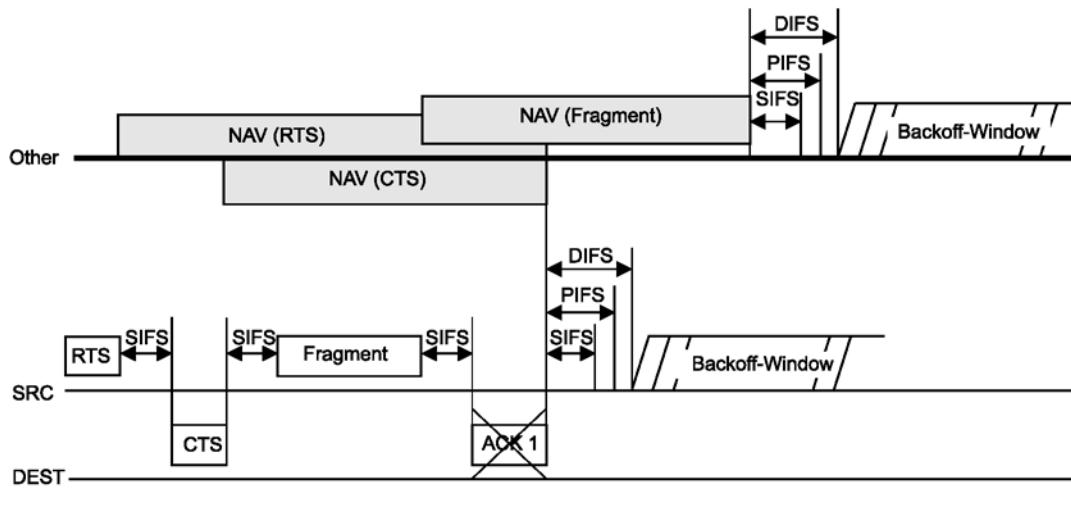

Figure 10-7—RTS/CTS with transmitter priority and missed acknowledgment

10.3.2.6 VHT RTS procedure

A VHT STA transmitting an RTS frame carried in non-HT or non-HT duplicate format and addressed to a VHT STA shall set the TA field to a bandwidth signaling TA and shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value. If the STA sending the RTS frame is capable of dynamic bandwidth operation (see 10.3.2.7), the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Dynamic. Otherwise, the STA shall set the TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT to Static.

A VHT STA that initiates a TXOP by transmitting an RTS frame with the TA field set to a bandwidth signaling TA shall not send an RTS frame to a non-VHT STA for the duration of the TXOP.

NOTE—A non-VHT STA considers the bandwidth signaling TA as the address of the TXOP holder. If an RTS frame is sent to a non-VHT STA during a TXOP that is initiated by an RTS frame with a bandwidth signaling TA, the non-VHT STA does not recognize the RTS sender as the TXOP holder.

10.3.2.7 CTS and DMG CTS procedure

A STA that receives an RTS frame addressed to it considers the NAV in determining whether to respond with CTS, unless the NAV was set by a frame originating from the STA sending the RTS frame (see 10.22.2.2). In this subclause, “NAV indicates idle” means that the NAV count is 0 or that the NAV count is nonzero but the nonbandwidth signaling TA obtained from the TA field of the RTS frame matches the saved TXOP holder address.

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Static behaves as follows:

- If the NAV indicates idle and CCA has been idle for all secondary channels (secondary 20 MHz channel, secondary 40 MHz channel, and secondary 80 MHz channel) in the channel width indicated by the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for a PIFS prior to the start of the RTS frame, then the STA shall respond with a CTS frame carried in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame’s TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to the same value as the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.
- Otherwise, the STA shall not respond with a CTS frame.

A VHT STA that is addressed by an RTS frame in a non-HT or non-HT duplicate PPDU that has a bandwidth signaling TA and that has the RXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT equal to Dynamic behaves as follows:

- If the NAV indicates idle, then the STA shall respond with a CTS frame in a non-HT or non-HT duplicate PPDU after a SIFS. The CTS frame’s TXVECTOR parameters CH_BANDWIDTH and CH_BANDWIDTH_IN_NON_HT shall be set to any channel width for which CCA on all secondary channels has been idle for a PIFS prior to the start of the RTS frame and that is less than or equal to the channel width indicated in the RTS frame’s RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT.
- Otherwise, the STA shall not respond with a CTS frame.

A non-VHT STA that is addressed by an RTS frame or a VHT STA that is addressed by an RTS frame carried in a non-HT or non-HT duplicate PPDU that has a nonbandwidth signaling TA or a VHT STA that is addressed by an RTS frame in a format other than non-HT or non-HT duplicate behaves as follows:

- If the NAV indicates idle, the STA shall respond with a CTS frame after a SIFS.
- Otherwise, the STA shall not respond with a CTS frame.

The RA field of the CTS frame shall be set to the nonbandwidth signaling TA obtained from the TA field of the RTS frame to which this CTS frame is a response. The Duration field in the CTS frame shall be the duration field from the received RTS frame, adjusted by subtraction of aSIFSTime and the number of microseconds required to transmit the CTS frame at a data rate determined by the rules in 10.7.

After transmitting an RTS frame, the STA shall wait for a CTSTimeout interval with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay. This interval begins when the MAC receives a PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the CTSTimeout interval, the STA shall conclude that the transmission of the RTS frame has failed, and this STA shall invoke its backoff procedure upon expiration of the CTSTimeout interval. If a PHY-RXSTART.indication primitive does occur during the CTSTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the RTS frame transmission was successful. The recognition of a valid CTS frame sent by the recipient of the RTS frame, corresponding to this PHY-RXEND.indication primitive, shall be interpreted as successful response, permitting the frame exchange sequence to continue (see Annex G). The recognition of anything else, including any other valid frame, shall be interpreted as failure of the RTS frame transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame.

A DMG STA follows the procedure defined in this subclause, except that it uses a DMG CTS frame instead of a CTS frame. A non-DMG STA does not transmit DMG CTS frames.

10.3.2.8 Dual CTS protection

10.3.2.8.1 Dual CTS protection procedure

The use of the dual CTS mechanism is deprecated.

A VHT STA shall not transmit VHT PPDUs in a TXOP protected by dual CTS protection.

A VHT AP shall not transmit an HT Operation element with the Dual CTS Protection field set to 1.

If the Dual CTS Protection field of the HT Operation element has value 1 in the Beacon frames transmitted by its AP, a non-AP HT STA shall start every TXOP with an RTS frame addressed to the AP. The RTS frame shall be an STBC frame if the STBC transmit and receive capabilities of the non-AP HT STA allow it to receive and transmit STBC frames using a single spatial stream; otherwise, the RTS frame shall be a non-STBC frame. The AP shall respond with a dual CTS (CTS1 followed by CTS2) separated by PIFS or SIFS. Table 10-2 describes the sequence of CTS frame transmissions and the required timing.

Table 10-2—Dual CTS rules

| Type of RTS | CTS description | Timing |
|-------------------------|---|--|
| RTS (non-STBC frame) | CTS1: Same rate or MCS as the RTS frame (non-STBC frame) CTS2: Basic STBC MCS (STBC frame) | PIFS shall be used as the interval between CTS1 and CTS2. If the CS mechanism (see 10.3.2.1) indicates that the medium is busy at the TxPIFS slot boundary (see Figure 10-26) following CTS1, CTS2 shall not be transmitted as part of this frame exchange. |
| RTS (STBC frame) | CTS1: Basic STBC MCS (STBC frame) CTS2: Lowest basic rate (non-STBC frame) | SIFS shall be used as the interval between CTS1 and CTS2. The STA resumes transmission after a SIFS+CTS2+SIFS after receiving CTS1, instead of after SIFS. |

The dual CTS response applies only to the AP; a non-AP STA shall respond to an RTS frame with a single CTS frame.

If dual CTS Protection is enabled, the AP shall begin each EDCA TXOP with a CTS frame. This CTS frame uses STBC when the immediately following frame uses non-STBC and vice versa. The RA of this CTS frame shall be identical to the RA of the immediately following frame. The AP may continue a PIFS after the CTS frame, only if the CS mechanism (see 10.3.2.1) indicates that the medium is IDLE at the TxPIFS slot boundary (see Figure 10-26) following the transmission of the CTS frame.

To avoid the resetting of NAV by STAs that have set their NAV due to the reception of a non-STBC RTS frame that is part of a dual CTS exchange, but then do not hear the CTS2, a non-AP HT STA may create a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 at the receiving STAs by initiating the TXOP with a non-STBC CTS addressed to the AP (known as *CTS-to-AP*).

NOTE—Sending a CTS-to-AP allows NAV protection to be established without causing the AP to update its NAV, as opposed to, for example, the sending of a CTS-to-self frame, which would potentially have caused the AP NAV to become set and then prevented it from responding to the subsequent RTS frame. The AP does not set a NAV in the CTS-to-AP case and is able to respond to the following RTS frame. The NAV at receiving STAs is not updated by the RTS frame because its duration does not exceed the duration of the preceding CTS frame, and subsequently, the NAV cannot be reset during CTS2.

An STBC CTS addressed to the AP may be transmitted prior to an STBC RTS frame to set a NAV that is not resettable according to the RTS NAV reset rule defined in 10.3.2.4 at receiving STAs.

NOTE—When an HT STA sends an RTS frame to the AP that is a non-STBC frame, the AP returns a CTS frame that is a non-STBC frame to the STA and then immediately transmits a CTS frame that is an STBC frame. The original non-AP STA is now free to transmit. But a non-HT STA that has set its NAV based on the original RTS frame might reset its NAV and then decrement its backoff counter, given that a SIFS + the duration of CTS2 is longer than a DIFS (i.e., the STA does not detect PHY-RXSTART.indication primitive within the period specified in 10.3.2.4). Thus, without sending a CTS-to-AP, the NAV reservation might not always work.

If dual CTS protection is enabled and a STA obtains a TXOP and does not have any frames to transmit before the expiration of the TXOP duration, the STA may indicate truncation of the TXOP provided that the remaining duration of the TXOP after the transmission of the last frame can accommodate the CF-End frame, a CF-End frame that is an STBC frame duration at the basic STBC MCS, a CF-End frame that is a non-STBC frame at the lowest basic rate, and three SIFSS. The STA indicates truncation of the TXOP by transmitting a CF-End frame with TXVECTOR parameter restrictions as specified in 10.7.6.3.

On receiving a CF-End frame from a STA with a matching BSSID, an AP whose last transmitted HT Operation element contained the Dual CTS Protection field equal to 1 shall respond with dual CF-End frames, one CF-End frame that is an STBC frame at the basic STBC MCS and one CF-End frame that is a non-STBC frame at the lowest basic rate, after a SIFS. Dual CF-End frames eliminate unfairness toward STAs that are not of the same mode as the one that owns the TXOP being truncated.

If the TXOP is owned by the AP and dual CTS protection is enabled in the system, the AP may send dual CF-End frames if it runs out of frames to transmit, provided that the remaining TXOP duration after the transmission of the last frame can accommodate a STBC CF-End frame duration at the lowest STBC basic rate, a CF-End frame that is a non-STBC frame at the lowest basic rate, and two SIFSS.

The spacing between the dual CF-End frames sent by the AP shall be SIFS. The first CF-End frame shall use the same encoding (STBC frame versus non-STBC frame) used for transmissions in the TXOP being truncated, and the second CF-End frame shall use the other encoding.

An STBC-capable STA shall choose between control frame operation using either STBC frames or non-STBC frames. In the non-STBC frame case, it discards Control frames that are STBC frames it receives. In the STBC frame case, it discards Control frames that are non-STBC frames received from its own BSS. This choice is a matter of policy local at the STA.

10.3.2.8.2 Dual CTS protection examples

Figure 10-8 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is an STBC non-AP STA.

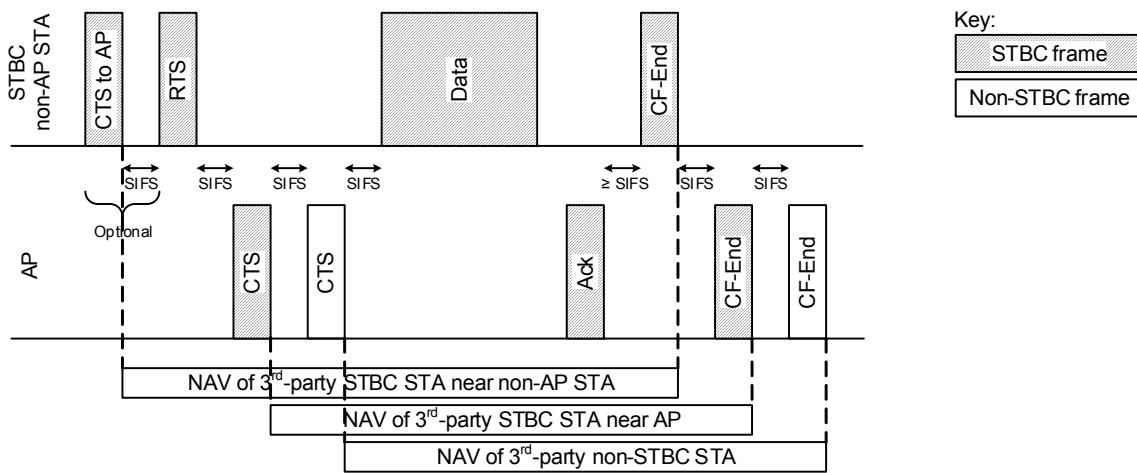

Figure 10-8—Example of dual CTS mechanism (STBC initiator)

Figure 10-9 shows an example of the operation of the dual CTS protection mechanism. In this example, the initiating STA is a non-STBC non-AP HT STA.

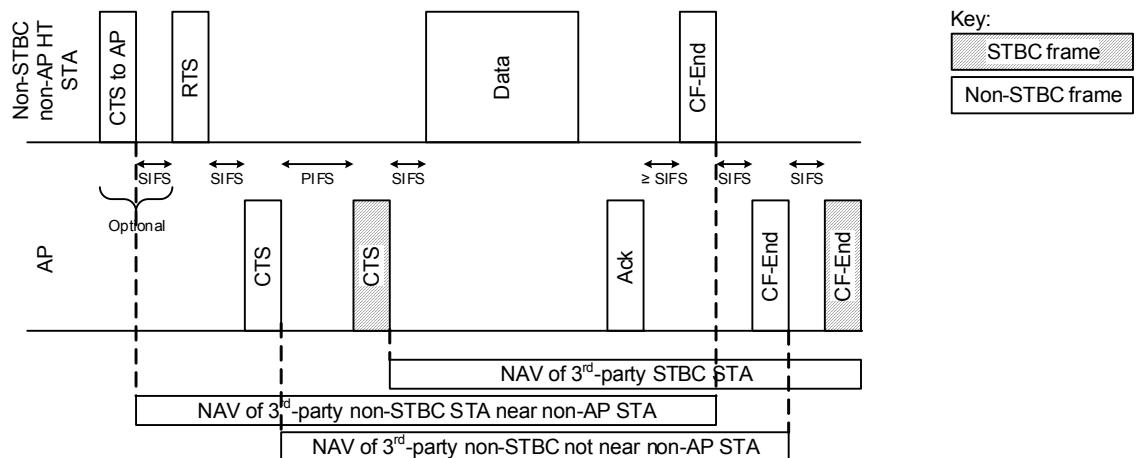

Figure 10-9—Example of dual CTS mechanism (non-STBC initiator)

10.3.2.9 Acknowledgment procedure

The cases when an Ack or BlockAck frame can be generated are shown in the frame exchange sequences listed in Annex G.

A STA shall not transmit an Ack frame in response to a Management frame of subtype Action No Ack. A non-AP STA shall not transmit an Ack or BlockAck frame in response to a group addressed frame.

NOTE—Group addressed MSDUs are sent to an AP in individually addressed frames.

Otherwise, upon reception of a frame that requires acknowledgment and, for an AP, with the To DS subfield equal to 1, a STA shall transmit an Ack or BlockAck frame after a SIFS, without regard to the busy/idle state of the medium. (See Figure 10-10.)

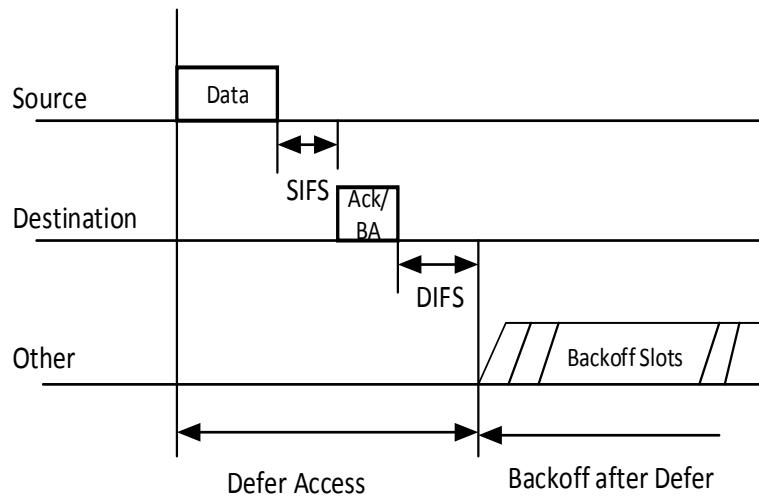

Figure 10-10—Individually addressed data/Ack/BA frame

After transmitting an MPDU that requires an Ack or BlockAck frame as a response (see Annex G), the STA shall wait for an AckTimeout interval, with a value of aSIFSTime + aSlotTime + aRxPHYStartDelay, starting at the PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the AckTimeout interval, the STA concludes that the transmission of the MPDU has failed, and this STA shall invoke its backoff procedure upon expiration of the AckTimeout interval.

If a PHY-RXSTART.indication primitive does occur during the AckTimeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to determine whether the MPDU transmission was successful. If the STA recognizes a valid Ack frame addressed to the STA and corresponding to this PHY-RXEND.indication primitive, this recognition shall be interpreted as successful acknowledgment.

If the STA does not recognize a valid Ack frame addressed to the STA, this condition shall be interpreted as failure of its MPDU transmission. In this instance, the STA shall invoke its backoff procedure at the PHY-RXEND.indication primitive and may process the received frame. If the STA has transmitted a PS-Poll frame, then the STA's receipt and recognition of a valid Data or Management frame transmitted by the recipient of the PS-Poll frame shall also be accepted as successful acknowledgment of the PS-Poll frame.

NOTE 1—The backoff procedure in the specific case of reception of a corrupted Ack or BlockAck frame results in EIFS rather than DIFS or AIFS being used after the AckTimeout interval and subsequent reception of the corrupted Ack or BlockAck frame (see 10.3.4.3 and 10.22.2.4 respectively).

NOTE 2—The receiver STA performs the acknowledgment procedure on all received frames requiring acknowledgment, even if an MSDU or A-MSDU is carried partly or wholly within the frame and is subsequently discarded due to drop eligibility (see DEI subfield in 9.2.4.6.2).

NOTE 3—The rules that specify the contents of BlockAck frames are defined in 10.24.

10.3.2.10 MU acknowledgment procedure

The acknowledgment procedure performed by a STA that receives MPDUs that were transmitted within a VHT MU PPDU is the same as the acknowledgment procedure for MPDUs that were not transmitted within a VHT MU PPDU.

NOTE—All MPDUs transmitted within a VHT MU PPDU are contained within A-MPDUs, and the rules specified in 9.7.3 prevent an immediate response to more than one of the A-MPDUs.

Responses to A-MPDUs within a VHT MU PPDU that are not immediate responses to the VHT MU PPDU are transmitted in response to explicit BlockAckReq frames by the AP. Examples of VHT MU PPDU frame exchange sequences are shown in Figure 10-11 and Figure 10-12.

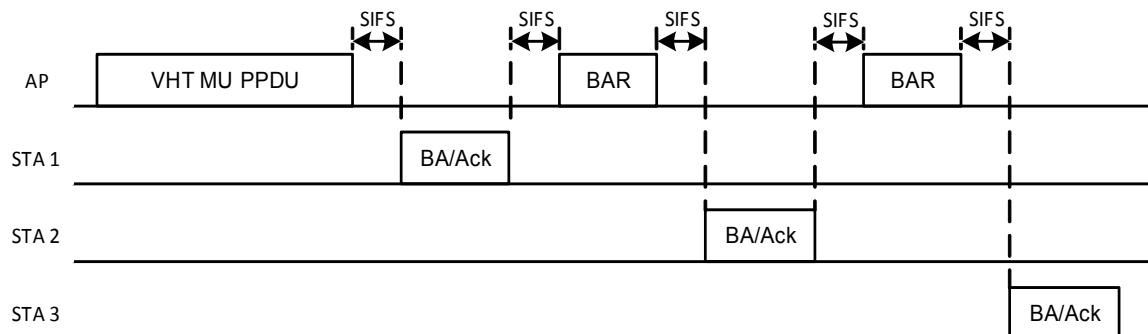

Figure 10-11—Example of TXOP containing VHT MU PPDU transmission with immediate acknowledgment to VHT MU PPDU

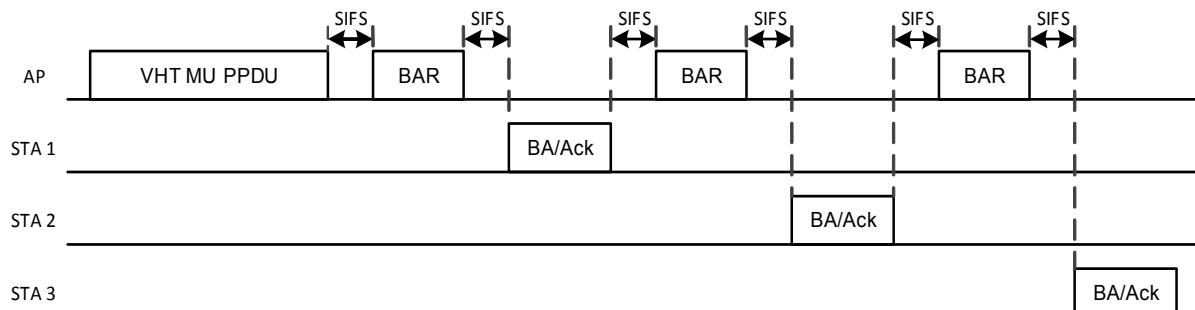

Figure 10-12—Example of TXOP containing VHT MU PPDU transmission with no immediate acknowledgment to VHT MU PPDU

Recovery within the TXOP that contains a VHT MU PPDU can be performed according to the rules of 10.22.2.7. BlockAckRequest frames related to A-MPDUs within a VHT MU PPDU can be transmitted in a TXOP separate from the one that contained the VHT MU PPDU.

NOTE 1—A BlockAck frame or an Ack frame is sent in immediate response to the BlockAckReq frame for HT-immediate or HT-delayed Block Ack, respectively. An Ack frame might be sent in immediate response to a VHT single MPDU in the VHT MU PPDU.

NOTE 2—A BlockAckRequest frame would typically not be sent to a STA in the case where the A-MPDU to the STA contained no MPDUs requiring acknowledgment. It could be sent if MPDUs in a previous A-MPDU remain unacknowledged.

10.3.2.11 Duplicate detection and recovery

10.3.2.11.1 General

Because MAC-level acknowledgments and retransmissions are incorporated into the protocol, there is the possibility that a frame may be received more than once. The procedures defined in this subclause attempt to filter out these duplicates. Additional duplicate filtering is performed during Receive Buffer Operation for frames that are part of a block ack agreement as described in 10.24.4 and 10.24.7.

Duplicate frame filtering is facilitated through the inclusion of a Sequence Control field (consisting of a sequence number and fragment number) within Data, Management, and Extension frames, a TID subfield in the QoS Control field within QoS Data frames, and an ACI subfield in the Sequence Number field within QMFs.

NOTE—In 10.3.2.11, Data frames with a value of 1 in the QoS subfield of the Subtype subfield are collectively referred to as *QoS Data frames*.

10.3.2.11.2 Transmitter requirements

A STA maintains one or more sequence number spaces that are used when transmitting a frame to determine the sequence number for the frame. When multiple sequence number spaces are supported, the appropriate sequence number space is determined by information from the MAC control fields of the frame to be transmitted. Except as noted below, each sequence number space is represented by a modulo 4096 counter, starting at 0 and incrementing by 1, for each MSDU or MMPDU transmitted using that sequence number space.

NOTE—Group addressed retransmissions of BUs use the same sequence number as the initial group addressed transmission of the BU. Unicast retransmissions of a group addressed BU delivered via DMS use the same sequence number as the initial unicast transmission of the BU. When a BU is delivered both using group addressing and unicast (e.g., when DMS is active but there are other associated STAs not using DMS), the sequence number might differ between the group addressed and unicast transmissions of the same BU.

MPDUs that are part of the same MSDU or A-MSDU shall have the same sequence number. Different MSDUs or A-MSDUs have (with a high probability) a different sequence number.

A transmitting STA shall support the applicable sequence number spaces defined in Table 10-3. Applicability is defined by the “applies to” column. The “Status” column indicates the level of support that is required if “Applies to” matches the transmission. The “Multiplicity” column indicates whether the sequence number space contains a single counter, or multiple counters and in the latter case identifies any indexes. The “Transmitter requirements” column identifies requirements for the operation of this sequence number space. The referenced requirements are defined at the end of the table.

Table 10-3—Transmitter sequence number spaces

| Sequence number space identifier | Sequence number space | Applies to | Status | Multiplicity | Transmitter requirements |
|----------------------------------|---------------------------------|--|-----------|-----------------------------|--------------------------|
| SNS1 | Baseline | A STA transmitting a frame that is not covered by any of the other sequence number spaces. | Mandatory | Single Instance | TR1 |
| SNS2 | Individually addressed QoS Data | A STA transmitting an individually addressed QoS Data frame, excluding SNS5 | Mandatory | Indexed by <Address 1, TID> | |

Table 10-3—Transmitter sequence number spaces (continued)

| Sequence number space identifier | Sequence number space | Applies to | Status | Multiplicity | Transmitter requirements |
|--|--------------------------|---|-----------|-----------------------------|--------------------------|
| SNS3 | Time Priority Management | A QoS STA transmitting a Time Priority Management frame | Optional | Indexed by <Address 1, TID> | |
| SNS4 | QMF | A QMF STA transmitting a QMF | Mandatory | Indexed by <Address 1, AC> | TR2 |
| SNS5 | QoS (+)Null | A STA transmitting a QoS (+)Null frame | Mandatory | None | TR3 |
| TR1: A transmitting STA should cache the last used sequence number per RA for frames that are assigned sequence numbers from this sequence number space. The STA should check that the successively assigned sequence numbers for frames transmitted to a single RA do not have the same value as is found in the cache for that RA. If the check fails the STA should increment the counter by 2, rather than 1. TR2: The STA shall assign the sequence number from one modulo 1024 counter per <Address 1, AC> tuple starting at 0 and incrementing by 1 for each MMPDU carried in one or more QMFs with Address 1 and ACI fields matching the <Address 1, AC> tuple values corresponding to that counter. TR3: Sequence numbers for transmitted QoS (+)Null frames may be set to any value. | | | | | |

10.3.2.11.3 Receiver requirements

A STA maintains one or more duplicate detection caches. Table 10-4 defines the conditions under which a duplication detection cache is supported and the rules followed by the receiver for the cache. When a Data, Management or Extension frame is received, a record of that frame is inserted in an appropriate cache. That record is identified by a sequence number and possibly other information from the MAC control fields of the frame. When a Data, Management or Extension frame is received in which the Retry subfield of the Frame Control field is equal to 1, the appropriate cache, if any, is searched for a matching frame. In DMG, when a group addressed frame is received the appropriate cache is searched for a matching frame. If the search is successful, the frame is considered to be a duplicate. Duplicate frames are discarded.

NOTE—The receiver STA performs the Ack and (for an AP) PS procedures on all received frames requiring acknowledgment, even if the frame is discarded due to duplicate filtering.

There is a small possibility that a frame may be improperly rejected due to such a match; however, this occurrence is rare and simply results in a lost frame (similar to an FCS error in other LAN protocols).

A receiving STA shall implement the applicable receiver requirements defined in Table 10-4 with “Status” indicated as “Mandatory”. A receiving STA should implement the applicable receiver requirements defined in Table 10-4 with “Status” indicated as “Recommended”. A receiving STA may implement the applicable receiver requirements defined in Table 10-4 with “Status” indicated as “Optional”. Applicability is defined by the “applies to” column. The “Status” column indicates the level of support that is required if “Applies to” matches the received frame. The “Multiplicity / Cache size” column indicates the indexes that identify a cache entry and the number of entries that shall be supported. The “Receiver requirements” column identifies requirements for the operation of this cache. The referenced requirements are defined at the end of the table. The requirements relate to caching information that identifies a cache entry and discarding duplicate MPDUs.

Table 10-4—Receiver caches

| Receiver cache identifier | Cache name | Applies to | Status | Multiplicity / Cache size | Receiver requirements |
|----------------------------------|------------------------------|--|--|---|------------------------------|
| RC1 | Not QoS Data | A STA receiving frames (individually or group addressed) that are not QoS Data, excluding if supported: RC4 RC5 RC6 RC7 RC8 RC10 | Mandatory | Indexed by: <Address 2, sequence number, fragment number> At least the most recent cache entry per <Address 2>. | RR1 RR2 RR5 |
| RC2 | QoS Data | A STA receiving an (individually or group addressed) QoS Data frame, excluding RC3, and if supported: RC7, RC8, RC9, and RC10 | Mandatory | Indexed by: <Address 2, TID, sequence number, fragment number> At least the most recent cache entry per <Address 2, TID> pair in this cache. | RR1 RR5 |
| RC3 | QoS (+)Null | A QoS STA receiving a QoS (+)Null frame | Mandatory | None | RR4 |
| RC4 | Non-time priority Management | A STA receiving an individually addressed non-time priority Management frame, excluding RC6 if RC6 is supported | Recommended | Indexed by: <Address 2, sequence number, fragment number> At least the most recent cache entry per <Address 2> value. | RR1 RR2 RR5 |
| RC5 | Time priority Management | A STA receiving an individually addressed time priority Management frame | Supported if RC4 is supported; otherwise not supported | Indexed by: <Address 2, sequence number, fragment number> At least the most recent cache entry per <Address 2> value. | RR5 |
| RC6 | QMFs | A STA receiving an individually addressed QMF | Mandatory | Indexed by: <Address 2, AC, sequence number, fragment number> The most recent cache entry per <Address 2, AC, sequence-number, fragment-number>. | RR2 RR3 RR5 |

Table 10-4—Receiver caches (continued)

| Receiver cache identifier | Cache name | Applies to | Status | Multiplicity / Cache size | Receiver requirements |
|---|---------------------|---|-------------|--|-----------------------|
| RC7 | Nonmesh GCR | A nonmesh STA receiving a group addressed frame subject to a GCR agreement. | Mandatory | Indexed by: <DA, sequence number> One cache entry per <DA, sequence-number> tuple for each group address subject to a GCR agreement. | RR5 |
| RC8 | Mesh GCR | A mesh STA receiving a group addressed frame subject to a GCR agreement. | Mandatory | Indexed by: <DA, Address 2, sequence number>. One cache entry per <DA, Address 2, sequence-number> tuple for each group address subject to a GCR agreement. | RR5 |
| RC9 | QoS Data under BA | A non-DMG QoS STA receiving a QoS Data frame sent under a BA agreement | Recommended | None | RR4 |
| RC10 | DMG Group Addressed | A DMG STA receiving a group addressed frame. | Mandatory | Indexed by: <Address 1, Address 2, sequence number, fragment number> The most recent cache entry per <Address 1, Address 2, sequence-number>. | RR6 |
| RR1: A receiving non-DMG STA with dot11QMFActivated false or not present and with dot11RobustAVStreamingImplemented false or not present should omit tuples obtained from group addressed frames from this cache. RR2: A receiving STA should omit tuples obtained from ATIM frames from this cache. RR3: A receiving QMF STA that is a non-DMG STA with dot11RobustAVStreamingImplemented false or not present shall omit from the cache all tuples obtained from group addressed Data frames. RR4: For the purposes of duplicate detection using receiver caches, QoS (+)Null frames and, in a non-DMG BSS, QoS Data frames under a BA agreement, shall be ignored. RR5: The STA shall discard the frame if the Retry subfield of the Frame Control field is 1 and it matches an entry in the cache. RR6: The STA shall discard the frame if it matches an entry in the cache. | | | | | |

10.3.2.12 NAV distribution

When a node needs to distribute NAV information, for instance, to reserve the medium for a transmission of a nonbasic rate frame (that might not be heard by other nodes in the BSS), the node may first transmit a CTS frame with the RA field equal to its own MAC address (CTS-to-self) if the node is a non-DMG STA, or it may

transmit a DMG CTS frame with the RA field equal to its own MAC address and the TA field equal to the MAC address of the peer STA for which the forthcoming transmission of the node is intended (DMG CTS-to-self) if the node is a DMG STA. A duration value in the frame protects the pending transmission, plus possibly an Ack frame.

The CTS-to-self and DMG CTS-to-self NAV distribution mechanisms are lower in network overhead cost than are the RTS/CTS and RTS/DMG CTS NAV distribution mechanisms, respectively, but CTS-to-self and DMG CTS-to-self are less robust against hidden nodes and collisions than RTS/CTS and RTS/DMG CTS-to-self, respectively. STAs employing a NAV distribution mechanism should choose a mechanism that is appropriate for the given network conditions. If errors occur when employing the CTS-to-self or DMG CTS-to-self mechanism, STAs should switch to a more robust mechanism.

10.3.2.13 Operation of aSlotTime

A STA in which dot11ShortSlotTimeOptionImplemented is true shall set the MAC variable aSlotTime to the short slot value upon transmission or reception of Beacon, Probe Response, Association Response, and Reassociation Response frames from the BSS that the STA has joined or started and that have the short slot subfield equal to 1. The STA shall set the MAC variable aSlotTime to the long slot value upon transmission or reception of Beacon, Probe Response, Association Response, and Reassociation Response frames from the BSS that the STA has joined or started and that have the short slot subfield equal to 0.

A STA in which dot11ShortSlotTimeOptionImplemented is false shall set the MAC variable aSlotTime to the long slot value at all times. A STA in which dot11ShortSlotTimeOptionImplemented is not present, or when the PHY supports only a single slot time value shall set the MAC variable aSlotTime to the slot value appropriate for the attached PHY.

10.3.3 Random backoff time

A STA desiring to initiate transfer of Data frames and/or Management frames using the DCF shall invoke the CS mechanism (see 10.3.2.1) to determine the busy/idle state of the medium. If the medium is busy, the STA shall defer until the medium is determined to be idle without interruption for a period of time equal to DIFS when the last frame detected on the medium was received correctly, or after the medium is determined to be idle without interruption for a period of time equal to EIFS when the last frame detected on the medium was not received correctly. After this DIFS or EIFS medium idle time, the STA shall then generate a random backoff period (defined by Equation (10-1)) for an additional deferral time before transmitting, unless the backoff timer already contains a nonzero value, in which case the selection of a random number is not needed and not performed. This process minimizes collisions during contention between multiple STAs that have been deferring to the same event.

$$\text{Backoff Time} = \text{Random}() \times \text{aSlotTime} \quad (10-1)$$

where

$\text{Random}()$ = Pseudorandom integer drawn from a uniform distribution over the interval $[0, \text{CW}]$, where CW is an integer within the range of values of the PHY characteristics aCWmin and aCWmax, $\text{aCWmin} \leq \text{CW} \leq \text{aCWmax}$. It is important that designers recognize the need for statistical independence among the random number streams among STAs.

The contention window (CW) parameter shall take an initial value of aCWmin. Every STA shall maintain a STA short retry count (SSRC) as well as a STA long retry count (SLRC), both of which shall take an initial value of 0. The SSRC shall be incremented when any short retry count (SRC) associated with any MPDU with the Type subfield equal to Data is incremented. The SLRC shall be incremented when any long retry count (LRC) associated with any MPDU with the Type subfield equal to Data is incremented. The CW shall take the next value in the series every time an unsuccessful attempt to transmit an MPDU causes either STA retry

counter to increment, until the CW reaches the value of aCWmax. A retry is defined as the entire sequence of frames sent, separated by SIFSs, in an attempt to deliver an MPDU, as described in Annex G. Once it reaches aCWmax, the CW shall remain at the value of aCWmax until the CW is reset. This improves the stability of the access protocol under high-load conditions. See Figure 10-13.

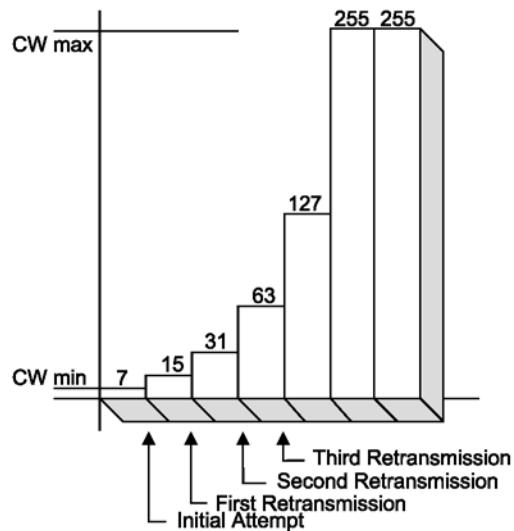

Figure 10-13—Example of exponential increase of CW

The CW shall be reset to aCWmin after every successful attempt to transmit a frame containing all or part of an MSDU or MMPDU, when SLRC reaches dot11LongRetryLimit, or when SSRC reaches dot11ShortRetryLimit.

The SSRC shall be reset to 0 when a CTS frame is received in response to an RTS frame, when a BlockAck frame is received in response to a BlockAckReq frame, when an Ack frame is received in response to the transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length less than or equal to dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

The SLRC shall be reset to 0 when an Ack frame is received in response to transmission of a frame containing all or part of an MSDU or MMPDU that is contained in a PSDU of length greater than dot11RTSThreshold, or when a frame with a group address in the Address 1 field is transmitted.

The set of CW values shall be sequentially ascending integer powers of 2, minus 1, beginning with a PHY-specific aCWmin value, and continuing up to a PHY-specific aCWmax value.

10.3.4 DCF access procedure

10.3.4.1 Introduction

The CSMA/CA access method is the foundation of the DCF. The operational rules vary slightly between the DCF and the PCF.

10.3.4.2 Basic access

Basic access refers to the core mechanism a STA uses to determine whether it may transmit using the DCF.

A STA may transmit an MPDU when it is operating under the DCF access method, either in the absence of a PC, or in the CP of the PCF access method, when the STA determines that the medium is idle when a frame is queued for transmission, and remains idle for a period of a DIFS, or an EIFS (10.3.2.3.7) from the end of the immediately preceding medium-busy event, whichever is the greater, and the backoff timer is zero. Otherwise the random backoff procedure described in 10.3.4.3 shall be followed.

A DMG STA operating under the DCF access method should transmit frames with its transmit antenna pattern directed toward the intended receiver.

A DMG STA operating under the DCF access method that does not operate in a TXOP exchange may configure its receiving antenna array to a quasi-omni antenna pattern to be ready to receive frames from any DMG STA.

NOTE—The steady state of the antenna configuration might depend on the actual applications in which a DMG STA is involved. For example, a DMG STA that expects transactions with several STAs during a CBAP configures the receiving antenna to a quasi-omni pattern to be ready to receive transmission from any of the STAs. A DMG STA that expects transactions with a single STA (e.g., AP or PCP) might keep its receiving antenna directed to the peer STA.

A DMG STA operating under the DCF access method that is participating in a TXOP exchange should configure its receiving antenna array to be directed toward the other transmitter involved in the TXOP.

The basic access mechanism is illustrated in Figure 10-14.

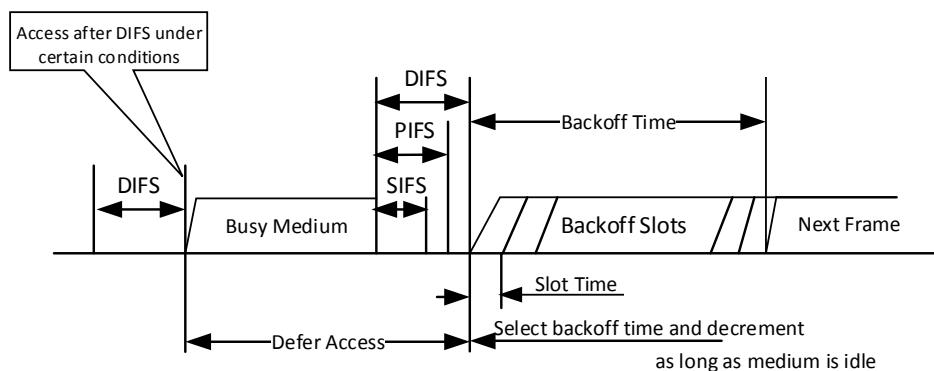

Figure 10-14—Basic access method

10.3.4.3 Backoff procedure for DCF

This subclause describes backoff procedure that is to be invoked when DCF is used. For the backoff procedure when EDCA is used, see 10.22.2.2.

A STA shall invoke the backoff procedure to transfer a frame when finding the medium busy as indicated by either the physical or virtual CS mechanism (see Figure 10-15). A transmitting STA shall invoke the backoff procedure when the STA infers a failed transmission as defined in 10.3.2.7 or 10.3.2.9.

To begin the backoff procedure, the STA shall set its backoff timer to a random backoff time using the equation in 10.3.3. All backoff slots occur following a DIFS during which the medium is determined to be idle for the duration of the DIFS, or following an EIFS during which the medium is determined to be idle for the duration of the EIFS, as appropriate (see 10.3.2.3) except that no backoff slots for DCF occur during the BTI, the A-BFT, the ATI, and non-CBAP portions of the DTI.

A STA performing the backoff procedure shall use the CS mechanism (see 10.3.2.1) to determine whether there is activity during each backoff slot. If no medium activity is indicated for the duration of a particular backoff slot, then the backoff procedure shall decrement its backoff timer by aSlotTime.

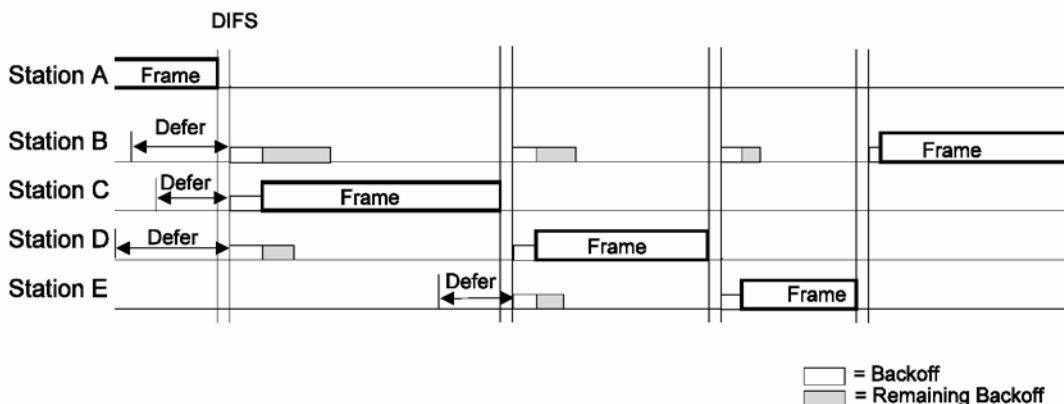

Figure 10-15—Backoff procedure

If the medium is determined to be busy at any time during a backoff slot, then the backoff procedure is suspended; that is, the backoff timer shall not decrement for that slot. The medium shall be determined to be idle for the duration of a DIFS or EIFS, as appropriate (see 10.3.2.3), before the backoff procedure is allowed to resume. Transmission shall commence when the backoff timer reaches 0.

A backoff procedure shall be performed immediately after the end of every transmission with the More Fragments bit equal to 0 of an MPDU with the Type subfield equal to Data, Management, or Control with subtype PS-Poll, even if no additional transmissions are currently queued. In the case of successful acknowledged transmissions, this backoff procedure shall begin at the end of the received Ack frame. In the case of unsuccessful transmissions requiring acknowledgment, this backoff procedure shall begin at the end of the AckTimeout interval (as defined in 10.3.2.9). An unsuccessful transmission is one where an Ack frame is not received from the STA addressed by the RA field of the transmitted frame and the value of the RA field is an individual address. If the transmission is successful, the CW value reverts to aCWmin before the random backoff interval is chosen, and the SSRC and/or SLRC are updated as described in 10.3.3. The result of this procedure is that transmitted frames from a STA are always separated by at least one backoff interval.

The effect of this procedure is that when multiple STAs are deferring and go into random backoff, then the STA selecting the smallest backoff time using the random function wins the contention (assuming all of the contending STAs detect the same instances of WM activity at their respective receivers, a situation that is not always true, due to hidden node effects and interference events). The number of DMG STAs that are able to detect each WM transmission is reduced even further due to SPSH.

In an IBSS the backoff timer for a pending non-Beacon or non-ATIM transmission shall not decrement in the period from the TBTT until the expiration of the ATIM window, and the backoff timer for a pending ATIM frame shall decrement only within the ATIM window. (See Clause 11.) Within an IBSS a separate backoff interval shall be generated to precede the transmission of a Beacon frame, as described in 11.1.3.5.

At the start of an awake window, a DMG STA shall suspend decrementing its backoff timer(s) for any transmission of non-ATIM frames for the duration of the awake window as indicated in the most recently received Awake Window element. At the end of the awake window, the DMG STA shall resume the backoff timer(s) for non-ATIM frames. A DMG STA shall not decrement the backoff timer for a pending ATIM frame outside the awake window.

Figure 10-17 describes the backoff procedure for DMG STAs for the example topology shown in Figure 10-16.

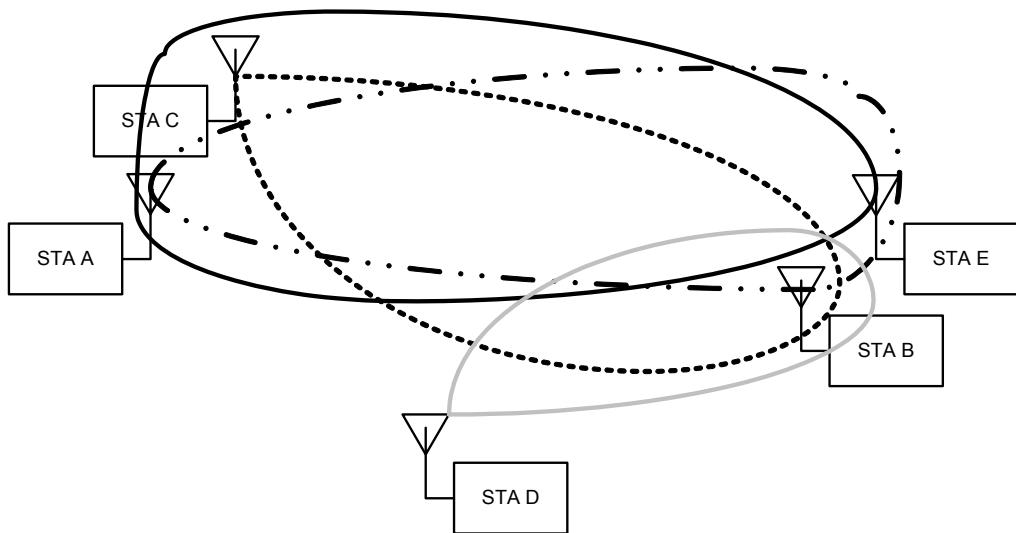

Figure 10-16—Example topology of NAV setting in DMG STAs

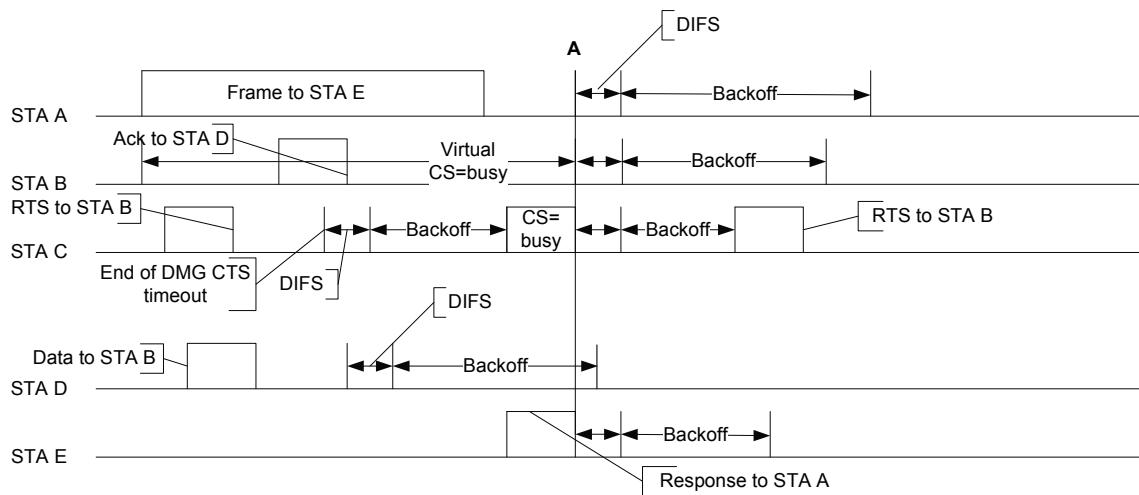

Figure 10-17—Backoff procedure for DMG STAs

At the time that STA A starts transmitting a frame to STA E and STA E starts receiving the frame, the antennas of both stations are directed to the peer, i.e., the transmitting antennas of STA A are directed to STA E and the receiving antennas of STA E are directed to STA A. At this point, STA B, STA C, and STA D are not involved in any frame exchange; therefore, they are in receiving state and happen to have the configuration of their receiving antenna arrays set to a quasi-omni antenna pattern to be ready to receive frames from any STA.

STA B receives the frame transmitted by STA A (to STA E), and CS (physical and virtual) in STA B indicates a busy medium during the exchange between STA A and STA E.

STA D is not able to receive the frame transmitted by STA A or the response transmitted by STA E; hence CS in STA D indicates IDLE for the duration of the exchange between STA A and STA E.

The physical CS function of STA C indicates a medium busy condition when it receives the response sent by STA E, but indicates an idle medium condition during the transmission from STA A.

STA A and STA E (which are directly involved in the frame exchange), STA B (which received the frame sent by STA A), and STA C (which received the response sent by STA E) are synchronized at point A, where the transaction between STA A and STA E completes.

Since STA D cannot hear the directional transmissions from either STA A or STA C, its physical CS indicates an idle medium condition for the duration of the frame exchange, enabling a frame exchange with STA B at the same time as the frame exchange between STA A and STA E. This is an example of SPSH.

Because STA C is unaware of the transmission of the frame from STA A to STA E, STA C transmits an RTS to STA B. But STA C does not receive a DMG CTS from STA B since the CS at STA B is busy when STA B receives the RTS from the STA C. This causes STA C to retry the RTS transmission following the expiration of a backoff count, which occurs after the completion of the exchange between STA A and STA E.

10.3.4.4 Recovery procedures and retransmit limits

Under DCF, error recovery is always the responsibility of the STA that initiates a frame exchange sequence (described in Annex G). Many circumstances may cause an error to occur that requires recovery. For example, the CTS frame might not be returned after an RTS frame is transmitted. This may happen due to a collision with another transmission, due to interference in the channel during the RTS or CTS frame, or because the STA receiving the RTS frame has an active virtual CS condition (indicating a busy medium time period).

Error recovery shall be attempted by retrying transmissions for frame exchange sequences that the initiating STA infers have failed. Retries shall continue, for each failing frame exchange sequence, until the transmission is successful, or until the relevant retry limit is reached, whichever occurs first. A STA shall maintain a SRC and an LRC for each MSDU or MMPDU awaiting transmission. These counts are incremented and reset independently of each other.

After an RTS frame is transmitted, the STA shall perform the CTS procedure, as defined in 10.3.2.7. If the RTS frame transmission fails, the SRC for the MSDU or MMPDU and the SSRC are incremented. This process shall continue until the number of attempts to transmit that MSDU or MMPDU reaches dot11ShortRetryLimit.

After transmitting a frame that requires acknowledgment, the STA shall perform the acknowledgment procedure, as defined in 10.3.2.9. The SRC for an MPDU with the Type subfield equal to Data or Management and of length less than or equal to dot11RTSThreshold and the SSRC shall be incremented every time transmission that MPDU fails. This SRC and the SSRC shall be reset when transmission of that MPDU succeeds. The LRC for an MPDU with the Type subfield equal to Data or Management and of length greater than dot11RTSThreshold and the SLRC shall be incremented every time transmission of that MPDU fails. This LRC and the SLRC shall be reset when transmission of that MPDU succeeds. All retransmission attempts for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

Retries for failed transmission attempts shall continue until the SRC for the MPDU with the Type subfield equal to Data or Management is equal to dot11ShortRetryLimit or until the LRC for the MPDU with the Type subfield equal to Data or Management is equal to dot11LongRetryLimit. When either of these limits is reached, retry attempts shall cease, and the MPDU with the Type subfield Data (and any MSDU of which it is a part) or Management shall be discarded. A DMG STA, in addition to using random access within a CBAP, may transmit retries in available scheduled SPs.

A STA in PS mode, in an infrastructure BSS, initiates a frame exchange sequence by transmitting a PS-Poll frame to request data from an AP. If no Ack, Data, or Management frame is received from the AP in response

to a PS-Poll frame, then the STA shall retry the sequence, by transmitting another PS-Poll frame. If the AP sends a Data or Management frame in response to a PS-Poll frame, but fails to receive the Ack frame acknowledging this Data or Management frame, the next PS-Poll frame from the same STA may cause a retransmission of the last MSDU²⁸. If the AP responds to a PS-Poll frame by transmitting an Ack frame, then responsibility for the Data or Management frame delivery error recovery shifts to the AP because the data are transferred in a subsequent frame exchange sequence, which is initiated by the AP. The AP shall attempt to deliver one buffered BU to the STA that transmitted the PS-Poll frame, using any frame exchange sequence valid for an individually addressed BU. If the PS STA that transmitted the PS-Poll frame returns to doze state after transmitting the Ack frame in response to successful receipt of this BU, but the AP fails to receive this Ack frame, then the AP retries transmission of this BU until the relevant retry limit is reached. See 11.2.3.8 for details on filtering of extra PS-Poll frames.

An AP that fails to receive an acknowledgment after the AP transmits a frame with the More Data subfield set to 0 to a non-AP VHT STA that is in TXOP power save mode retransmits the frame within the current TXOP under certain conditions as described in 11.2.3.19.

10.3.4.5 Control of the channel

The SIFS is used to provide an efficient MSDU delivery mechanism. Once the STA has contended for the channel, that STA shall continue to send fragments until either all fragments of a single MSDU or MMPDU have been sent or an acknowledgment is not received. Should the sending of the fragments be interrupted due to one of these reasons, when the next opportunity for transmission occurs the STA shall resume transmission. The algorithm by which the STA decides which of the outstanding MSDUs shall next be attempted after an unsuccessful transmission (as defined in 10.3.4.3) attempt is beyond the scope of this standard, but any such algorithm shall comply with the restrictions listed in 10.8.

Figure 10-18 illustrates the transmission of a multiple-fragment MSDU using the SIFS.

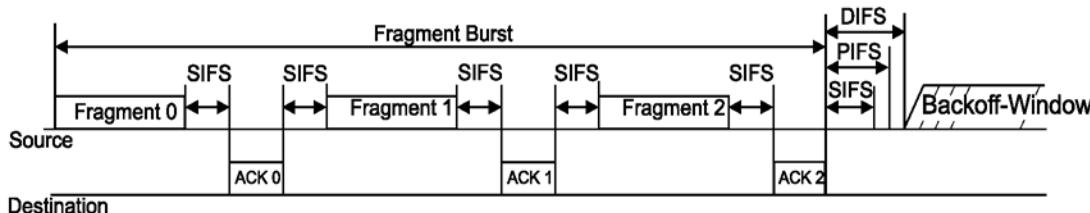

Figure 10-18—Transmission of a multiple-fragment MSDU using SIFS

When the source STA transmits a fragment, it shall release the channel, then immediately monitor the channel for an acknowledgment as described in 10.3.2.9.

When the destination STA has finished sending the acknowledgment, the SIFS following the acknowledgment shall be reserved for the source STA to continue (if necessary) with another fragment. The STA sending the acknowledgment shall not transmit on the channel immediately following the acknowledgment.

The process of sending multiple fragments after contending for the channel is defined as a fragment burst.

If the source STA does not receive an acknowledgment frame, it shall attempt to retransmit the failed MPDU or another eligible MPDU, as defined in 10.8, after performing the backoff procedure and the contention process.

²⁸This duplicate MSDU is filtered at the receiving STA using the duplicate frame filtering mechanism.

After a STA contends for the channel to retransmit a fragment of an MSDU, it shall start with the last fragment that was not acknowledged. The destination STA shall receive the fragments in order (because the source sends them in order and they are individually acknowledged). It is possible, however, that the destination STA may receive duplicate fragments. It shall be the responsibility of the receiving STA to detect and discard duplicate fragments.

A STA shall transmit after the SIFS only under the following conditions during a fragment burst:

- The STA has just received a fragment that requires acknowledgment.
- The source STA has received an acknowledgment for a previous fragment and has more fragment(s) for the same MSDU to transmit.

The following rules shall also apply:

- When a STA has transmitted a frame other than an initial or intermediate fragment, that STA shall not transmit on the channel following the acknowledgment for that frame, without performing the backoff procedure.
- When an MSDU has been successfully delivered or all retransmission attempts have been exhausted, and the STA has a subsequent MSDU to transmit, then that STA shall perform a backoff procedure.

10.3.5 Individually addressed MPDU transfer procedure

A STA using the DCF shall use an RTS/CTS exchange for individually addressed frames when the length of the PSDU is greater than the length threshold indicated by dot11RTSThreshold. A STA may also use an RTS/CTS exchange for individually addressed frames when it is necessary to distribute the NAV or when it is necessary to establish protection (see 10.26). Otherwise a STA using the DCF shall not use the RTS/CTS exchange.

If dot11RTSThreshold is 0, all MPDUs shall be delivered with the use of RTS/CTS. If dot11RTSThreshold is larger than the maximum PSDU length, all PSDUs shall be delivered without RTS/CTS exchanges.

When an RTS/CTS exchange is used, the PPDU containing the PSDU shall be transmitted starting one SIFS after the end of the CTS frame.

NOTE—No regard is given to the busy or idle status of the medium when transmitting this PSDU.

When an RTS/CTS exchange is not used, the PSDU shall be transmitted following the success of the basic access procedure. With or without the use of the RTS/CTS exchange procedure, the STA that is the destination of a Data frame shall follow the acknowledgment procedure.

10.3.6 Group addressed MPDU transfer procedure

When a STA transmits group addressed MPDUs in which the To DS subfield is 0, the STA shall use the basic access procedure, unless these MPDUs are delivered using PCF or using the group addressed transmission service (GATS). When GATS is not used to deliver group addressed MPDUs, the STA shall not use an RTS/CTS or RTS/DMG CTS exchange, regardless of the length of the frame. In addition, no recipient of the frame shall transmit an Ack frame. A STA that transmits a group addressed MPDU in which the To DS subfield is 1 shall, in addition to complying with the basic access procedure of CSMA/CA, obey the rules for RTS/CTS exchange and the acknowledgment procedure because the MPDU is directed to the AP. For DMG STAs, the MPDU transmission shall also comply with the access procedures defined in 10.36.

There is no MAC-level recovery on group addressed frames, except for the following:

- Frames in which the To DS subfield is 1
- Group addressed frames transmitted via the GATS

As a result, the reliability of this traffic is reduced, relative to the reliability of individually addressed traffic, due to the increased probability of lost frames from interference, collisions, or time-varying channel properties.

A DMG STA may transmit a copy of the same group addressed MPDU using different antenna configurations. This might be needed to provide a quasi-omni coverage or to enable transmission by an MCS that is higher than MCS 0. If multiple copies of a group addressed MPDU with a To DS subfield equal to 0 are transmitted, the STA shall not transmit a different frame before the completion of the transmission of all copies of the group addressed MPDU.

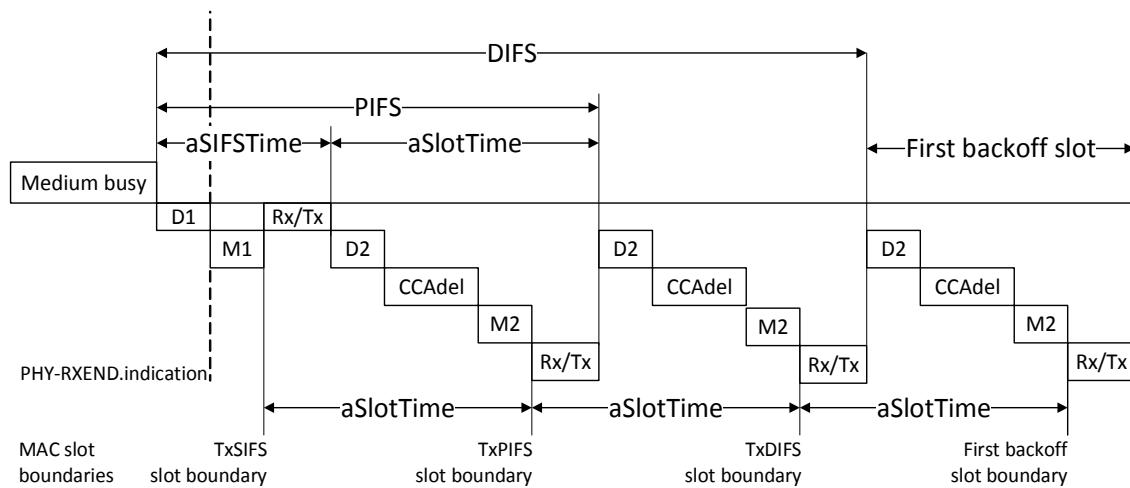

NOTE—The following paragraph addresses the Dual CTS protection mechanism. The use of the Dual CTS protection mechanism is deprecated.

An STBC-capable STA shall discard either all received group addressed Data frames that are STBC frames or all received group addressed Data frames that are non-STBC frames. How it makes this decision is outside the scope of this standard.

A STA shall discard an MPDU with a group address in the Address 1 field if the value in the Address 1 field does not match any value in the dot11GroupAddressesTable and does not match the Broadcast address value.

10.3.7 DCF timing relations

The IFSs are periods of time on the medium. The attributes of the IFSs are determined by the specific PHY (see Figure 10-19). The IFSs apply to transmission under EDCA, too (see Figure 10-25).

D1 = aRxPHYDelay (referenced from the end of the last symbol of a PPDU on the medium)

D2 = D1 + aAirPropagationTime

Rx/Tx = aRxTxTurnaroundTime (begins with a PHY-TXSTART.request)

M1 = M2 = aMACProcessingDelay

CCAdel = aCCATime – D1

Figure 10-19—DCF timing relationships

All medium timings that are referenced from the end of the transmission are referenced from the end of the last symbol, or signal extension if present, of the PPDU. The beginning of transmission refers to the first symbol of the preamble of the next PPDU. All MAC timings are referenced from the PHY-TXEND.confirm, PHY-TXSTART.confirm, PHY-RXSTART.indication, and PHY-RXEND.indication primitives.

aSIFSTime and aSlotTime are determined per PHY, aSIFSTime is fixed, and aSlotTime can change dynamically as aAirPropagationTime changes (see 10.21.5).

The STA may employ any non-negative value for each of the parameters:

- aRxPHYDelay
- aMACProcessingDelay
- aTxPHYDelay
- aTxRampOnTime
- aCCATime
- aRxTxSwitchTime

provided that the constraints in Equation (10-2), Equation (10-3), and Equation (10-4) are met, and provided that the CCA sensitivity specification for the attached PHY is met (see 15.4.6.5, 16.3.8.5, 17.3.10.6, 18.4.6 and 19.3.19.5, 20.4.4.2.2, 20.6.4.2.2, 21.3.18.5, and 22.3.18.6).

$$\begin{aligned} \text{aSIFSTime} = & \text{aRxPHYDelay} + \text{aMACProcessingDelay} + \\ & \text{aRxTxTurnaroundTime} \end{aligned} \quad (10-2)$$

$$\begin{aligned} \text{aSlotTime} = & \text{aCCATime} + \text{aMACProcessingDelay} + \text{aRxTxTurnaroundTime} + \\ & \text{aAirPropagationTime} \end{aligned} \quad (10-3)$$

$$\text{aRxTxTurnaroundTime} = \text{aTxPHYDelay} + \text{aRxTxSwitchTime} + \text{aTxRampOnTime} \quad (10-4)$$

where

aAirPropagationTime is determined as described in 10.21.5

aSlotTime, aSIFSTime and aRxTxTurnaroundTime are the values indicated in the PLME-CHARACTERISTICS.confirm primitive

the other attribute values are the values implemented

The PIFS and DIFS are derived by the Equation (10-5) and Equation (10-6), as illustrated in Figure 10-19.

$$\text{PIFS} = \text{aSIFSTime} + \text{aSlotTime} \quad (10-5)$$

$$\text{DIFS} = \text{aSIFSTime} + 2 \times \text{aSlotTime} \quad (10-6)$$

When dot11DynamicEIFSActivated is false or not defined, the EIFS is derived from the SIFS and the DIFS and the length of time it takes to transmit an Ack frame at the lowest PHY mandatory rate by Equation (10-7).

$$\text{EIFS} = \text{aSIFSTime} + \text{AckTxTime} + \text{DIFS} \quad (10-7)$$

where

AckTxTime is the time expressed in microseconds required to transmit an Ack frame, including preamble, PHY header and any additional PHY dependent information, at the lowest PHY mandatory rate.

When dot11DynamicEIFSActivated is true, EIFS is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS.

When dot11DynamicEIFSActivated is true, if the PPDU that causes the EIFS does not contain a single MPDU with a length equal to 14 or 32 octets, and the modulation of the PPDU that causes the EIFS is included in Table 10-5, then EIFS is determined as shown in Equation (10-8).

$$\text{EIFS} = \text{aSIFSTime} + \text{EstimatedAckTxTime} + \text{DIFS} \quad (10-8)$$

where

EstimatedAckTxTime is based on an estimated duration of the PPDU that is the possible response to the PPDU that causes the EIFS, as specified in Table 10-5.

Table 10-5—Determination of the EstimatedAckTxTime based on properties of the PPDU causing the EIFS

| Modulation of PPDU causing EIFS | Rate/MCS of PPDU causing EIFS | Other properties of PPDU causing EIFS | Presumed response | Presumed response rate | EstimatedAck TxTime (μs) |
|---------------------------------|-------------------------------|---------------------------------------|-------------------|------------------------|--------------------------|
| (HR)-DSSS | 1 Mb/s | | Ack | 1 Mb/s | 304 |
| (HR)-DSSS | ≥ 2 Mb/s (long preamble) | | Ack | 2 Mb/s | 248 |
| (HR)-DSSS | ≥ 2 Mb/s (short preamble) | | Ack | 2 Mb/s | 152 |
| (ERP)-OFDM | BPSK | | Ack | 6 Mb/s | 44 |
| (ERP)-OFDM | QPSK | | Ack | 12 Mb/s | 32 |
| (ERP)-OFDM | ≥16-QAM | | Ack | 24 Mb/s | 28 |
| HT | BPSK | Aggregation = 0 | Ack | 6 Mb/s | 44 |
| HT | QPSK | Aggregation = 0 | Ack | 12 Mb/s | 32 |
| HT | ≥16-QAM | Aggregation = 0 | Ack | 24 Mb/s | 28 |
| HT | BPSK | Aggregation = 1 | BlockAck | 6 Mb/s | 68 |
| HT | QPSK | Aggregation = 1 | BlockAck | 12 Mb/s | 44 |
| HT | ≥16-QAM | Aggregation = 1 | BlockAck | 24 Mb/s | 32 |
| VHT | BPSK | | BlockAck | | 68 |
| VHT | QPSK | | BlockAck | | 44 |
| VHT | ≥16-QAM | | BlockAck | | 32 |

When `dot11DynamicEIFSActivated` is true and the PPDU that causes the EIFS contains a single MPDU with a length equal to 14 or 32 octets, EIFS is equal to DIFS. This reflects the fact that a 14 or 32 octet MPDU is very likely an Ack or a BlockAck frame, which does not cause a response PPDU to be transmitted.

When `dot11DynamicEIFSActivated` is true and the modulation of the PPDU that causes the EIFS does not occur in Table 10-5, then EIFS is determined as shown in Equation (10-7).

Figure 10-19 illustrates the relation between the SIFS, PIFS, and DIFS as they are measured on the medium and the different MAC slot boundaries TxSIFS, TxPIFS, and TxDIFS. These slot boundaries define when the transmitter shall be turned on by the MAC to meet the different IFS timings on the medium, after subsequent detection of the CCA result of the previous slot time.

Equation (10-9), Equation (10-10) and Equation (10-11) define the MAC slot boundaries using attributes provided by the PHY, which are such that they compensate for implementation timing variations. The starting reference of these slot boundaries is again the end of the last symbol of the previous PPDU.

$$\text{TxSIFS} = \text{SIFS} - a_{\text{RxTxTurnaroundTime}} \quad (10-9)$$

$$\text{TxPIFS} = \text{TxSIFS} + a_{\text{SlotTime}} \quad (10-10)$$

$$\text{TxDIFS} = \text{TxSIFS} + 2 \times a_{\text{SlotTime}} \quad (10-11)$$

NOTE—The tolerance for SIFS is defined in 10.3.2.3.3.

10.3.8 Signal extension

Transmissions of frames with TXVECTOR parameter FORMAT of type NON_HT with NON_HT_MODULATION values of ERP-OFDM and NON_HT_DUP_OFDM and transmissions of frames with TXVECTOR parameter FORMAT with values of HT_MF and HT_GF include a period of no transmission of duration aSignalExtension, except for RIFS transmissions. The purpose of this signal extension is to enable the NAV value of Clause 16 STAs to be set correctly.

When an HT STA transmits a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to NON_HT with the NON_HT_MODULATION parameter equal to one of ERP-OFDM and NON_HT_DUP_OFDM or a PPDU using a RIFS and with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, it shall set the TXVECTOR parameter NO_SIG_EXTN to true. Otherwise, it shall set the TXVECTOR parameter NO_SIG_EXTN to false.

10.3.9 Determination of PLME aCWmin characteristics

In the case of the Clause 18 ERP, the aCWmin value is dependent on the requester's characteristic rate set. The characteristic rate set is equal to the IBSS's basic rate set when the STA is operating as a member of an IBSS. It is equal to the AP's operational rate set when the STA is associated with an AP. At all other times, it is equal to the STA's mandatory rate set. The MAC variable aCWmin is set to aCWmin(0) if the characteristic rate set includes only rates in the set 1, 2, 5.5, 11; otherwise, aCWmin is set to aCWmin(1). If the returned value for aCWmin is a scalar, then the MAC always sets the variable aCWmin to the returned scalar value of aCWmin.

10.4 PCF

10.4.1 General

The PCF mechanism is obsolete. Consequently, this subclause might be removed in a later revision of the standard.

The PCF provides CF frame transfer. It is an option for an AP to be able to become the PC. A non-AP STA shall not become a PC. All STAs inherently obey the medium access rules of the PCF, because these rules are based on the DCF, and all STAs set their NAV at the beginning of each CFP. The operating characteristics of the PCF are such that all STAs are able to operate in the presence of a BSS in which a PC is operating, and, if associated with a point-coordinated BSS, are able to receive frames sent under PCF control. It is also an option for a STA to be able to respond to a CF-Poll received from a PC. A STA that is able to respond to CF-Polls is referred to as being *CF-Pollable* and may request to be polled by an active PC. CF-Pollable STAs and the PC do not use RTS/CTS in the CFP. When polled by the PC, a CF-Pollable STA may transmit only one MPDU, which might be sent to the PC but may have any destination, and may “piggyback” the acknowledgment of a frame received from the PC using particular data frame subtypes for this transmission. If the Data frame is not in turn acknowledged, the CF-Pollable STA shall not retransmit the frame unless it is polled again by the PC, or it decides to retransmit during the CP. If the addressed recipient of a CF transmission is not CF-Pollable, that

STA acknowledges the transmission using the DCF acknowledgment rules, and the PC retains control of the medium. A PC may use CF frame transfer solely for delivery of frames to STAs, and never to poll CF-Pollable STAs.

A PC may perform a backoff on retransmission of an unacknowledged frame during the CFP. A PC that is maintaining a polling list may retry the unacknowledged frame the next time the particular AID is at the top of the polling list.

A PC may retransmit an unacknowledged frame during the CFP after a PIFS.

When more than one point-coordinated BSS is operating on the same PHY channel in overlapping space, the potential exists for collisions between PCF transfer activities by the independent PCs. The rules under which multiple, overlapping point-coordinated BSSs may coexist are presented in 10.4.4.3. As shown in Figure 10-1 (in 10.2), the PCF is built on top of the CSMA/CA-based DCF, by utilizing the access priority provisions provided by this scheme. An active PC shall be located at an AP, which restricts PCF operation to infrastructure networks. PCF is activated at a PC-capable AP by setting the CFPMaxDuration parameter in the CF Parameter Set of the MLME-START.request primitive to a nonzero value.

Data frames sent by, or in response to polling by, the PC during the CFP shall use the appropriate data subtypes based upon the following usage rules:

- Data +CF-Poll, Data +CF-Ack +CF-Poll, CF-Poll, and CF-Ack +CF-Poll shall be sent only by a PC.
- Data, Data +CF-Ack, Null Function, and CF-Ack may be sent by a PC or by any CF-Pollable STA.

A STA receiving Data frames shall consider the frame body as the basis of a possible indication to LLC only if the frame is of subtype Data, Data +CF-Ack, Data +CF-Poll, or Data +CF-Ack +CF-Poll. A CF-Pollable STA shall interpret all subtype bits of received Data type frames that contain the BSSID of the current BSS for CF purposes, but shall not inspect the frame body unless the frame is of subtype Data, Data +CF-Ack, Data +CF-Poll, or Data +CF-Ack +CF-Poll.

10.4.2 CFP structure and timing

The PCF controls frame transfers during a CFP. The CFP shall alternate with a CP, when the DCF controls frame transfers, as shown in Figure 10-20. Each CFP shall begin with a Beacon frame that contains a DTIM element (referred to as *DTIM Beacon frame*). The CFPs shall occur at a defined repetition rate, which shall be synchronized with the beacon interval as specified in the following paragraphs.

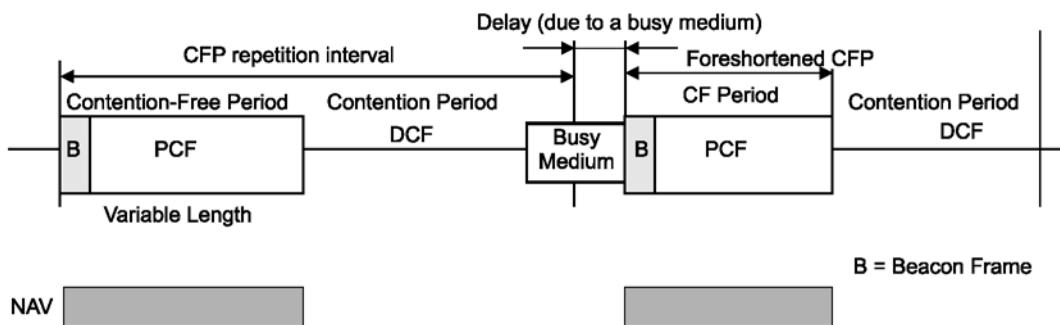

Figure 10-20—CFP/CP alternation

The PC generates CFPs at the CFP repetition interval (CFPPeriod), which is defined as a number of DTIM intervals. The PC shall determine the CFPPeriod (depicted as a repetition interval in the illustrations in Figure 10-20 and Figure 10-21) to use from dot11CFPPeriod. This value, in units of DTIM intervals, shall be communicated to other STAs in the BSS in the CFPPeriod field of the CF Parameter Set element of Beacon

frames. The CF Parameter Set element shall be present only in Beacon and Probe Response frames transmitted by STAs containing an active PC.

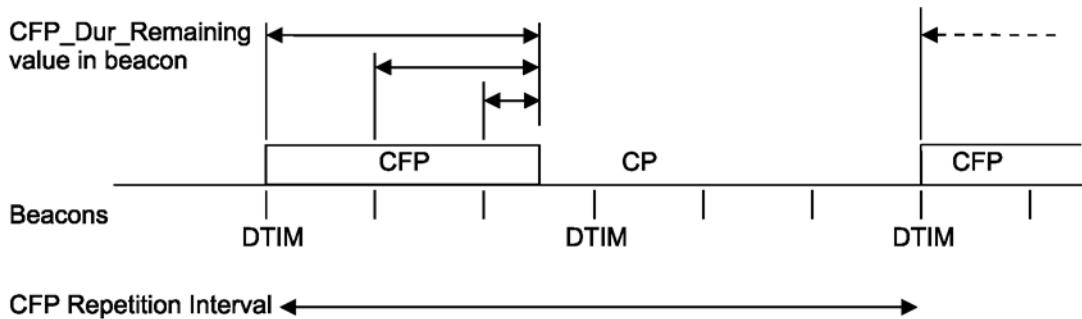

Figure 10-21—Beacon frames and CFPs

The length of the CFP is controlled by the PC, with maximum duration specified by `dot11CFPMaxDuration`. Neither the maximum duration nor the actual duration (signaled by transmission of a Control frame of subtype CF-End or CF-End +CF-Ack by the PC) is constrained to be a multiple of the beacon interval. If the CFP duration is greater than the beacon interval, the PC shall transmit Beacon frames at the appropriate times during the CFP (subject to delay due to traffic at the nominal times, as with all Beacon frames). The CF Parameter Set element in all Beacon frames at the start of, or within, a CFP shall contain a nonzero value in the `CFPDurRemaining` field. This value, in units of TU, shall specify the maximum time from the most recent TBTT to the end of this CFP. The value of the `CFPDurRemaining` field shall be 0 in Beacon frames sent during the CP. An example of these relationships is illustrated in Figure 10-21, which shows a case where the `CFPPeriod` is two DTIM intervals, the DTIM interval is three beacon intervals, and the `aCFPMaxDuration` value is approximately 2.5 beacon intervals.

The PC may terminate any CFP at or before the limit given by `dot11CFPMaxDuration`, based on available traffic and size of the polling list. Because the transmission of any Beacon frame may be delayed due to a medium busy condition at the TBTT, a CFP may be shortened by the amount of the delay. In the case of a busy medium due to DCF traffic, the Beacon frame shall be delayed for the time required to complete the current DCF frame exchange. When the Beacon frame transmission is delayed, the `CFPDurRemaining` value in the Beacon frame at the beginning of the CFP shall specify a time that causes the CFP to end no later than TBTT plus the value of `aCFPMaxDuration`. This is illustrated in Figure 10-22.

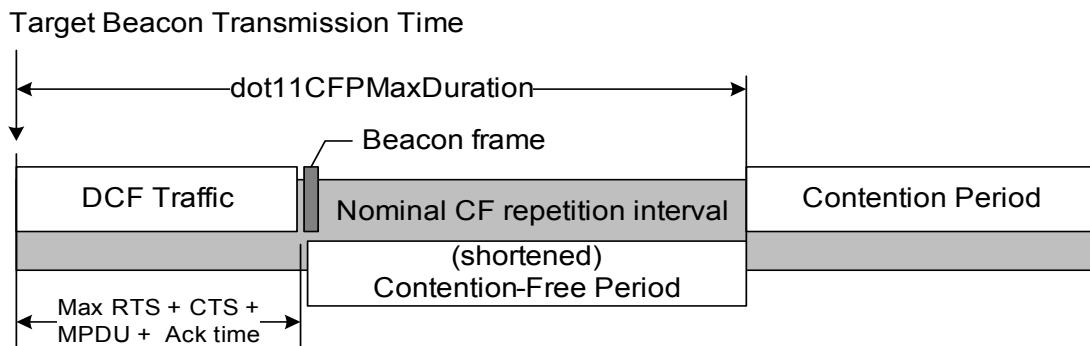

Figure 10-22—Example of delayed beacon and shortened CFP

10.4.3 PCF access procedure

10.4.3.1 General

The CF transfer protocol is based on a polling scheme controlled by a PC operating at the AP of the BSS. The PC gains control of the medium at the beginning of the CFP and attempts to maintain control for the entire CFP by waiting a shorter time between transmissions than the STAs using the DCF access procedure. All STAs that receive Beacon frames containing a CF Parameter Set element, including STAs not associated with the BSS, set their NAVs to the CFPMaxDuration value at the nominal start time of each CFP. This prevents most contention by preventing nonpolled transmissions by STAs regardless of whether they are CF-Pollable. Acknowledgment of frames sent during the CFP may be accomplished using Data +CF-Ack, CF-Ack, Data +CF-Ack +CF-Poll (only on frames transmitted by the PC), or CF-Ack +CF-Poll (only on frames transmitted by the PC) frames when a Data (or Null) frame immediately follows the frame being acknowledged, thereby avoiding the overhead of separate Ack frames. Non-CF-Pollable or unpolled CF-Pollable STAs acknowledge frames during the CFP using the DCF acknowledgment procedure.

10.4.3.2 Fundamental access

At the nominal beginning of each CFP, the PC shall sense the medium. When the medium is determined to be idle for one PIFS, the PC shall transmit a Beacon frame containing the CF Parameter Set element and a DTIM element.

After the initial Beacon frame, the PC shall wait for one SIFS, and then transmit one of the following: a Data frame, a CF-Poll frame, a Data +CF-Poll frame, a Management frame, or a CF-End frame. If the CFP is null, i.e., no traffic is buffered and no polls exist to send at the PC, a CF-End frame shall be transmitted immediately after the initial Beacon frame. If there are non-GCR-SP buffered group addressed MSDUs/MMPDUs, the PC shall transmit these prior to any individually addressed MSDUs/MMPDUs.

STAs receiving individually addressed, error-free frames from the PC are expected to respond after a SIFS, in accordance with the transfer procedures defined in 10.4.4. If the recipient STA is not CF-Pollable, the response to receipt of an error-free Data frame shall be an Ack frame.

10.4.3.3 NAV operation during the CFP

The mechanism for handling the NAV during the CFP is designed to facilitate the operation of overlapping CFP coordinated infrastructure BSSs. The mechanism by which infrastructure BSSs coordinate their CFPs is beyond the scope of this standard.

Each STA, except the STA with the PC, shall preset its NAV to the CFPMaxDuration value (obtained from the CF Parameter Set element in Beacon frames from this PC) at each TBTT (see Clause 11) at which a CFP is scheduled to start (based on the CFPCount field in the CF Parameter Set element of the Beacon frames from this PC). Each non-PC STA shall update its NAV using the CFPDurRemaining value in the CF Parameter Set element of any error-free Beacon frame that the STA receives. This includes CFPDurRemaining values in CF Parameter Set elements from Beacon frames received from other (overlapping) BSSs.

These actions prevent STAs from taking control of the medium during the CFP, which is especially important when the CFP spans multiple medium-occupancy intervals. This setting of the NAV also reduces the risk of hidden STAs determining the medium to be idle for a DIFS during the CFP and possibly corrupting a transmission in progress.

A STA joining a BSS operating with a PC shall use the information in the CFPDurRemaining element of the CF parameter set of any received Beacon or Probe Response frames to update its NAV prior to initiating any transmissions.

The PC shall transmit a CF-End or CF-End +CF-Ack frame at the end of each CFP. A STA that receives either of these frames, from any BSS, shall reset its NAV.

10.4.4 PCF transfer procedure

10.4.4.1 General

Frame transfers under the PCF may consist of frames alternately sent from the AP/PC and sent to the AP/PC. During the CFP, the ordering of these transmissions, and the STA allowed to transmit frames to the PC at any given point in time, shall be controlled by the PC. Figure 10-23 depicts frame transfer during a typical CFP. The rules under which this frame transfer takes place are detailed in 10.4.4.2 to 10.4.4.5.

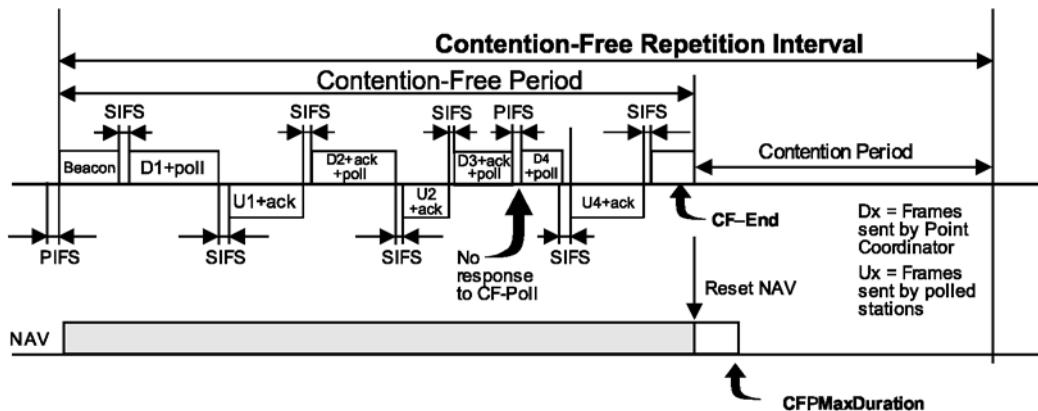

Figure 10-23—Example of PCF frame transfer

MaxMPDUTime is the time to transmit the maximum-sized MAC frame, expanded by security mechanisms, plus the time to transmit the PHY preamble, header, trailer, and expansion bits, if any.

10.4.4.2 PCF transfers when the PC STA is transmitter or recipient

The PC shall transmit frames between the Beacon frame that starts the CFP and the CF-End frame using the SIFS except when a transmission by another STA is expected by the PC and a SIFS elapses without the receipt of the expected transmission. In such cases the PC may send its next pending transmission as soon as one PIFS after the end of its last transmission. This permits the PC to retain control of the medium in the presence of an overlapping BSS. The PC may transmit any of the following frame types to CF-Pollable STAs:

- Data, used to send data from the PC when the addressed recipient is not being polled and there is no previous frame to acknowledge;
- Data +CF-Ack, used to send data from the PC when the addressed recipient is not being polled or is not CF-Pollable or the DA is a group address and the PC needs to acknowledge the receipt of a frame received from a CF-Pollable STA a SIFS before starting this transmission;
- Data +CF-Poll, used to send data from the PC when the addressed recipient is the next STA to be permitted to transmit during this CFP and there is no previous frame to acknowledge;
- Data +CF-Ack +CF-Poll, used to send data from the PC when the addressed recipient is the next STA to be permitted to transmit during this CFP and the PC needs to acknowledge the receipt of a frame received from a CF-Pollable STA a SIFS before starting this transmission;
- CF-Poll, used when the PC is not sending data to the addressed recipient but the addressed recipient is the next STA to be permitted to transmit during this CFP and there is no previous frame to acknowledge;

- CF-Ack +CF-Poll, used when the PC is not sending data to the addressed recipient but the addressed recipient is the next STA to be permitted to transmit during this CFP and the PC needs to acknowledge the receipt of a frame from a CF-Pollable STA a SIFS before starting this transmission;
- CF-Ack, used when the PC is not sending data to, or polling, the addressed recipient, but the PC needs to acknowledge receipt of a frame from a CF-Pollable STA a SIFS before starting this transmission (useful when the next transmission by the PC is a Management frame, such as a Beacon frame); or
- Any Management frame that is appropriate for the AP to send under the rules for that frame type.

The PC may transmit Data or Management frames to a non-CF-Pollable, non-PS STA during the CFP. This STA shall acknowledge receipt with Ack frames after a SIFS, as with the DCF. The PC may also transmit group addressed frames during the CFP. Because the Beacon frame that initiates the CFP contains a DTIM element, if there are associated STAs using PS mode, the buffered group addressed frames that are not delivered via the GCR-SP delivery method shall be sent immediately after any Beacon frame that contains a TIM element whose DTIM Count field is 0.

A CF-Pollable STA that receives an individually addressed Data frame of any subtype that includes CF-Poll may transmit one Data frame a SIFS after receiving the CF-Poll.

NOTE—A CF-Pollable STA ignores and does not reset its NAV when performing transmissions in response to a CF-Poll.

Non-CF-Pollable STAs that receive an individually addressed frame during the CFP shall transmit an Ack frame, but shall not reset their NAV.

For frames that require MAC-level acknowledgment, CF-Pollable STAs that received a CF-Poll (of any type) may perform this acknowledgment using the Data +CF-Ack subtype in the response to the CF-Poll. For example, the U1 frame in Figure 10-23 contains the acknowledgment to the preceding D1 frame. The D2 frame contains the acknowledgment to the preceding U1 frame. The PC may use the CF-Ack subtypes to acknowledge a received frame even if the Data frame sent with the CF-Ack subtype is addressed to a different STA than the one being acknowledged. CF-Pollable STAs that are expecting an acknowledgment shall interpret the subtype of the frame (if any) sent by the PC a SIFS after that STA's transmission to the PC. If a frame that requires MAC-level acknowledgment is received by a non-CF-Pollable STA, that STA shall not interpret the CF-Poll indication (if any), and shall acknowledge the frame by sending an Ack frame after a SIFS.

The lengths of the frames may be variable, only bounded by the frame and/or fragment length limitations that apply for the BSS. If a CF-Pollable STA does not respond to a CF-Poll (of any type) within the SIFS following a transmission from the PC, or a non-CF-Pollable STA does not return the Ack frame within a SIFS following a transmission from the PC that requires acknowledgment, then the PC shall resume control and may transmit its next frame after a PIFS from the end of the PC's last transmission.

A CF-Pollable STA shall respond to a frame with any data subtype that includes CF-Poll directed to its MAC address and received without error. If the STA has no frame to send when polled, the response shall be a Null frame. If the STA has no frame to send when polled, but an acknowledgment is required for the frame that conveyed the CF-Poll, the response shall be a CF-Ack (no data) frame. The null response is required to permit a “no-traffic” situation to be distinguished from a collision between overlapping PCs.

The CFP shall end when the CFPDurRemaining time has elapsed since the Beacon frame originating the CFP or when the PC has no further frames to transmit nor STAs to poll. In either case, the end of the CFP shall be signaled by the transmission of a CF-End frame by the PC. If there is a received frame that requires acknowledgment at the time the CF-End frame is to be transmitted, the PC shall transmit a CF-End +CF-Ack frame instead. A STA receiving a CF-End frame or CF-End +CF-Ack frame shall reset its NAV.

10.4.4.3 Operation with overlapping point-coordinated BSSs

Because the PCF operates without the CSMA/CA CW randomization and backoff of the DCF, there is a risk of repeated collisions if multiple, overlapping, point-coordinated BSSs are operating on the same PHY channel, and their CFP Rates and beacon intervals are approximately equal. To minimize the risk of significant frame loss due to CF collisions, the PC shall use a DIFS plus a random backoff delay (with CW in the range 1 to aCWmin) to start a CFP when the initial Beacon frame is delayed because of deferral due to a busy medium. The PC may use this backoff during the CFP prior to retransmitting an unacknowledged, individually addressed Data or Management frame.

To further reduce the susceptibility to inter-PC collisions, the PC shall require that the medium be determined as being idle for a DIFS plus a random (over a range of 1 to aCWmin) number of slot times once every dot11MediumOccupancyLimit TU during the CFP. This results in loss of control of the medium to overlapping BSS or hidden STA traffic, because the STAs in this BSS are prevented from transmitting by their NAV setting to CFPMaxDuration or CFPDurRemaining. dot11MediumOccupancyLimit may be set equal to CFPMaxDuration, which provides no protection against PCF collisions. The dot11MediumOccupancyLimit is also useful for compliance in regulatory domains that impose limits on continuous transmission time by a single STA as part of a spectrum etiquette.

10.4.4.4 CFPMaxDuration limit

The value of CFPMaxDuration shall be limited to allow coexistence between contention and CF traffic.

The minimum value for CFPMaxDuration is two times MaxMPDUTime plus the time required to send the initial Beacon frame and the CF-End frame of the CFP. This may allow sufficient time for the AP to send one Data frame to a STA, while polling that STA, and for the polled STA to respond with one Data frame.

The maximum value for CFPMaxDuration is the duration of (BeaconPeriod × DTIMPeriod × CFPPeriod) minus [MaxMPDUTime plus (2 × aSIFSTime) plus (2 × aSlotTime) plus (8 × AckSize)], expressed in microseconds. MaxMPDUTime is the time to transmit the maximum-sized MAC frame, expanded by security mechanisms, plus the time to transmit the PHY preamble, header, trailer, and expansion bits, if any. This allows sufficient time to send at least one Data frame during the CP.

10.4.4.5 CF usage rules

A PC may send group addressed frames, and individually addressed Data or Management frames to any active STA, as well as to CF-Pollable PS STAs. During the CFP, a CF-Pollable STA shall acknowledge after a SIFS, the receipt of each Data +CF-Poll frame or Data +CF-Ack +CF-Poll frame using Data +CF-Ack or CF-Ack (no data) frames, the receipt of each CF-Poll (no data) using Data or Null (no data), and the receipt of all other Data and Management frames using Ack frames. A non-CF-Pollable STA shall acknowledge receipt of Data and Management frames using Ack frames sent after a SIFS. This non-CF-Pollable operation is the same as that already employed by such STAs for DCF operation.

When polled by the PCF (Data +CF-Poll, Data +CF-Ack +CF-Poll, CF-Poll, or CF-Ack +CF-Poll) a CF-Pollable STA may send one Data frame to any destination. Such a frame directed to or through the PC STA shall be acknowledged by the PC, using the CF-Ack indication (Data +CF-Ack, Data +CF-Ack +CF-Poll, CF-Ack, CF-Ack +CF-Poll, or CF-End +CF-Ack) sent after a SIFS. Such a frame directed to a non-CF-Pollable STA shall be acknowledged using an Ack frame sent after a SIFS. A polled CF-Pollable STA with neither a Data frame nor an acknowledgment to send shall respond by transmitting a Null frame after a SIFS. A polled CF-Pollable STA with insufficient time before the end of the CFP or current medium occupancy limit to send its queued MPDU and receive an acknowledgment shall respond by transmitting a Null frame, or a CF-Ack frame if polled using Data +CF-Poll or Data +CF-Ack +CF-Poll, after a SIFS. The CF-Pollable STA may set the More Data bit to 1 in its response to permit the PC to distinguish between an empty STA queue and a response due to insufficient time to transfer an MPDU.

The PC shall not issue frames with a subtype that includes CF-Polls if insufficient time remains in the current CFP to permit the polled STA to transmit a Data frame containing a minimum length MPDU.

10.4.5 CF polling list

10.4.5.1 General

If the PC supports use of the CFP for inbound frame transfer as well as for frame delivery, the PC shall maintain a “polling list” for use in selecting STAs that are eligible to receive CF-Polls during CFPs. The polling list functional characteristics are defined below. If the PC supports the use of the CFP solely for frame delivery, the PC does not require a polling list, and shall never generate Data frames with a subtype that includes CF-Poll. The form of CF support provided by the PC is identified in the Capability Information field of Beacon, Association Response, Reassociation Response, and Probe Response frames, which are sent from APs. Any such frames sent by STAs, as in noninfrastructure networks, shall have these bits set to 0.

The polling list is used to force the polling of CF-Pollable STAs, regardless of whether the PC has pending traffic to transmit to those STAs. The polling list may be used to control the use of Data +CF-Poll and Data +CF-Ack +CF-Poll types for transmission of Data frames being sent to CF-Pollable STAs by the PC. The polling list is a *logical* construct, which is not exposed outside of the PC. A minimum set of polling list maintenance techniques are required to in order to provide interoperability of arbitrary CF-Pollable STAs in BSSs controlled by arbitrary APs with active PCs. An AP may also implement additional polling list maintenance techniques that are outside the scope of this standard.

10.4.5.2 Polling list processing

The PC shall send a CF-Poll to at least one STA during each CFP when there are entries in the polling list. During each CFP, the PC shall issue polls to a subset of the STAs on the polling list in order by ascending AID value.

While time remains in the CFP, all CF frames have been delivered, and all STAs on the polling list have been polled, the PC may generate one or more CF-Polls to any STAs on the polling list. While time remains in the CFP, all CF frames have been delivered, and all STAs on the polling list have been polled, the PC may send Data or Management frames to any STAs.

In order to gain maximum efficiency from the CFP, and the ability to piggyback acknowledgments on successor Data frames in the opposite direction, the PC should generally use Data +CF-Poll and Data +CF-Ack +CF-Poll types for each Data frame transmitted while sufficient time for the potential response to the CF-Poll remains in the CFP.

10.4.5.3 Polling list update procedure

A STA indicates its CF-Pollability using the CF-Pollable subfield of the Capability Information field of Association Request and Reassociation Request frames.

NOTE—A STA might perform a reassociation in order to change the PC’s record of its CF-Pollability.

During association, a CF-Pollable STA may request to be placed on the polling list, or to never be polled, by appropriate use of bits in the Capability Information field of the Associate Request or Reassociate Request frame, as shown in Table 9-44 (see 9.4.1.4).

CF-Pollable STAs that are not on the polling list, but did not request never to be polled during their most recent association, may be dynamically placed on the polling list by the PC to handle bursts of frame transfer activity by that STA.

10.5 Fragmentation

The MAC may fragment and reassemble MSDUs or MMPDUs that are carried in individually addressed MPDUs. The fragmentation and defragmentation mechanisms allow for fragment retransmission.

The length of each fragment shall be an equal number of octets for all fragments except the last, which may be smaller. The length of each fragment shall be an even number of octets, except for the last fragment of an MSDU or MMPDU, which may be either an even or an odd number of octets. The length of a fragment shall never be larger than dot11FragmentationThreshold unless security encapsulation is invoked for the MPDU. If security encapsulation is active for the MPDU, then the MPDU shall be expanded by the encapsulation overhead and this may result in a fragment larger than dot11FragmentationThreshold.

A fragment is an MPDU, the Frame Body field of which carries all or a portion of an MSDU or MMPDU. When data are to be transmitted, the number of octets in the fragment (before processing by the security mechanism) shall be limited by dot11FragmentationThreshold and the number of octets in the MPDU that have yet to be assigned to a fragment at the instant the fragment is constructed for the first time. Once a fragment is transmitted for the first time, its frame body content and length shall be fixed until it is successfully delivered to the immediate receiving STA.

A STA shall be capable of receiving fragments, containing all or part of an MSDU, of arbitrary length that is less than or equal to the maximum MSDU size as defined in 9.2.3, plus any security encapsulation overhead, plus MAC header and FCS.

A STA shall be capable of receiving fragments, containing all or part of an MMPDU, of arbitrary length that is less than or equal to the minimum of

- The maximum MMPDU size as defined in 9.3.3.2, plus any security encapsulation overhead, plus MAC header and FCS
- Any maximum MPDU length advertised by the STA

If a fragment requires retransmission, its frame body content and length shall remain fixed for the lifetime of the MSDU or MMPDU at that STA. Each fragment shall contain a Sequence Control field, which comprises a sequence number and fragment number. When a STA is transmitting an MSDU or MMPDU, the sequence number shall remain the same for all fragments of that MSDU or MMPDU. The fragments shall be sent in order of lowest fragment number to highest fragment number, where the fragment number value starts at 0, and increases by 1 for each successive fragment. The Frame Control field also contains a bit, the More Fragments bit, that is equal to 0 to indicate the last (or only) fragment of the MSDU or MMPDU.

The source STA shall maintain a transmit MSDU timer for each MSDU being transmitted. The attribute dot11MaxTransmitMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU. The timer starts on the initial attempt to transmit the first fragment of the MSDU. If the timer exceeds dot11MaxTransmitMSDULifetime, then all remaining fragments are discarded by the source STA and no attempt is made to complete transmission of the MSDU.

NOTE—A STA might interleave fragments of MSDUs with different TIDs sent to the same receiver, subject to any constraint caused by the number of replay counters.

10.6 Defragmentation

Each fragment contains information to allow the complete MSDU or MMPDU to be reassembled from its constituent fragments. The header of each fragment contains the following information that is used by the destination STA to reassemble the MSDU or MMPDU:

- Frame type
- Address of the sender, obtained from the Address 2 field

- Destination address
- *Sequence Control field*: This field allows the destination STA to check that all incoming fragments belong to the same MSDU or MMPDU, and the sequence in which the fragments should be reassembled. The sequence number within the Sequence Control field remains the same for all fragments of an MSDU or MMPDU, while the fragment number within the Sequence Control field increments for each fragment.
- Traffic identifier, for frames with a QoS Control field.
- *More Fragments indicator*: Indicates to the destination STA that this is not the last fragment of the MSDU or MMPDU. Only the last or sole fragment of the MSDU or MMPDU shall have this bit set to 0. All other fragments of the MSDU or MMPDU shall have this bit set to 1.

The destination STA shall reconstruct the MSDU or MMPDU by combining the fragments in order of fragment number subfield of the Sequence Control field. If security encapsulation has been applied to the fragment, it shall be deencapsulated and decrypted before the fragment is used for defragmentation of the MSDU or MMPDU. If the fragment with the More Fragments bit equal to 0 has not yet been received, then the destination STA knows that the MSDU or MMPDU is not yet complete. As soon as the STA receives the fragment with the More Fragments bit equal to 0, the STA knows that no more fragments may be received for the MSDU or MMPDU.

A STA shall support the concurrent reception of fragments of at least three MSDUs or MMPDUs. A STA should support the concurrent reception of fragments of at least one MSDU per access category. An AP should support the concurrent reception of at least one MSDU per access category per associated STA. Note that a STA receiving more than three fragmented MSDUs or MMPDUs concurrently might experience a significant increase in the number of frames discarded.

NOTE—The three MSDUs or MMPDUs might be from different peers (e.g., in an IBSS or MBSS).

The destination STA shall maintain a Receive Timer for each MSDU or MMPDU being received, for a minimum of three MSDUs or MMPDUs. The STA may implement additional timers to be able to receive additional concurrent MSDUs or MMPDUs. The receiving STA shall discard all fragments that are part of an MSDU or MMPDU for which a timer is not maintained. There is also dot11MaxReceiveLifetime, that specifies the maximum amount of time allowed to receive an MSDU. The receive MSDU or MMPDU timer starts on the reception of the first fragment of the MSDU or MMPDU. If the receive MSDU timer exceeds dot11MaxReceiveLifetime, then all received fragments of this MSDU or MMPDU are discarded by the destination STA. If additional fragments of an individually addressed MSDU or MMPDU are received after its dot11MaxReceiveLifetime is exceeded, those fragments shall be acknowledged and discarded.

To properly reassemble MPDUs into an MSDU or MMPDU, a destination STA shall discard any duplicated fragments received. A STA shall discard duplicate fragments as described in 10.3.2.11. However, an acknowledgment shall be sent in response to a duplicate fragment of an individually addressed MSDU or MMPDU.

10.7 Multirate support

10.7.1 Overview

Some PHYs have multiple data transfer rate capabilities that allow implementations to perform dynamic rate switching with the objective of improving performance. The algorithm for performing rate switching is beyond the scope of this standard, but in order to provide coexistence and interoperability on multirate-capable PHYs, this standard defines a set of rules to be followed by all STAs.

Only the data transfer rates of the mandatory rate set of the attached PHY are guaranteed to be supported when a STA for which dot11OCBActivated is true transmits a Management or Data frame. A higher layer protocol entity within a STA in which dot11OCBActivated is true might negotiate a rate outside the mandatory rate set.

A STA that transmits a frame shall select a rate defined by the rules for determining the rates of transmission of protection frames in 10.26 when the following conditions apply:

- The STA's protection mechanism for non-ERP receivers is enabled.
- The frame is a protection mechanism frame.
- The frame initiates an exchange.

Otherwise, a non-DMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.7.5 and 10.7.6. A DMG STA shall transmit the frame using a rate that is in accordance with rules defined in 10.7.7.

For specific PHYs, the value of the Duration/ID field is determined using the PLME-TXTIME.request primitive and the PLME-TXTIME.confirm primitive. These specific PHYs are defined in:

- Clause 16 for HR/DSSS
- Clause 17 for OFDM
- Clause 18 for ERP
- Clause 19 for HT
- Clause 20 for DMG
- Clause 21 for VHT
- Clause 22 for TVHT

The two PLME-TXTIME primitives are defined in the respective PHY specifications:

- 16.3.4 for HR TXTIME calculation
- 17.4.3 for OFDM TXTIME calculation
- 18.5.3.2 for ERP-OFDM TXTIME calculation
- 19.4.3 for HT TXTIME calculation
- 20.12.3 for DMG PLME TXTIME calculation
- 21.4.3 for VHT PLME TXTIME calculation
- 22.4.3 for TVHT PLME TXTIME calculation

The Duration/ID field in a frame transmitted by a QoS STA may cover multiple frames and might involve using the PLME-TXTIME.request primitive several times.

10.7.2 Basic HT-MCS Set field

An AP that transmits a frame containing an HT Operation element with either the Dual Beacon field or the Dual CTS Protection field equal to 1 shall include at least one MCS that has only one spatial stream in the Basic HT-MCS Set field of the HT Operation element of that frame.

10.7.3 Basic STBC MCS

The basic STBC MCS has the value null when any of the following conditions is true:

- The Dual Beacon field in the HT Operation element is equal to 0, and the Dual CTS Protection field in the HT Operation element is equal to 0.
- No HT Operation element is present in the Association Response frame received from the current AP.

- The Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty or does not exist.
- The lowest MCS of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive has NSS value greater than 1 (the mapping of MCS to NSS is PHY dependent, for the HT PHY see 19.5).

If none of the above conditions is true, then the basic STBC MCS is the lowest MCS index of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

When an MCS from the basic STBC MCS is required in 10.7.5 and 10.7.6 but the basic STBC MCS has the value null, the STA shall select a mandatory MCS of the attached PHY.

10.7.4 Basic rate set, basic HT-MCS set, and basic VHT-MCS and NSS set for mesh STA

A mesh STA shall not establish a mesh peering with a mesh STA using a different BSSBasicRateSet (see 14.2.7 and 14.2.8).

The SME of a Mesh STA should use the mandatory PHY rates as the default BSSBasicRateSet in the MLME-START.request primitive to reduce the risk that a candidate peer mesh STA utilizes a different BSSBasicRateSet. If the mesh STA is also an HT STA, it should adopt the mandatory HT MCSs as the default basic HT-MCS set. If the mesh STA is also a VHT STA, it should adopt <VHT-MCS, NSS> tuples formed from the mandatory VHT-MCSs and NSS = 1 as the default basic VHT-MCS and NSS set (see 11.40.7).

10.7.5 Rate selection for Data and Management frames

10.7.5.1 Rate selection for non-STBC Beacon and non-STBC PSMP frames

If the BSSBasicRateSet parameter is not empty, a non-STBC PSMP frame or a non-STBC Beacon frame shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter.

If the BSSBasicRateSet parameter is empty, the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

10.7.5.2 Rate selection for STBC group addressed Data and Management frames

When a STA has dot11TxSTBCOptionActivated true, it shall use the basic STBC MCS when it transmits an STBC Beacon frame or when it transmits a group addressed Data or Management frame that is an STBC frame.

10.7.5.3 Rate selection for other group addressed Data and Management frames

This subclause describes the rate selection rules for group addressed Data and Management frames, excluding the following:

- Non-STBC Beacon and non-STBC PSMP frames
- STBC group addressed Data and Management frames
- Data frames located in an FMS stream (see 11.24.8)
- Group addressed frames transmitted to the GCR concealment address (see 11.24.16.3.5)

If the BSSBasicRateSet parameter is not empty, a Data or Management frame (excluding the frames listed above) with a group address in the Address 1 field shall be transmitted in a non-HT PPDU using one of the rates included in the BSSBasicRateSet parameter or the rate chosen by the AP, described in 11.24.8, if the Data frames are part of an FMS stream.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is not empty, the frame shall be transmitted in an HT PPDU using one of the MCSs included in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

If the BSSBasicRateSet parameter is empty and the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty and the basic VHT-MCS and NSS set is not empty, the frame shall be transmitted in a VHT PPDU using one of the <VHT-MCS, NSS> tuples included in the basic VHT-MCS and NSS set.

If the BSSBasicRateSet parameter, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set are empty (e.g., a scanning STA that is not yet associated with a BSS), the frame shall be transmitted in a non-HT PPDU using one of the mandatory PHY rates.

10.7.5.4 Rate selection for polling frames

A Data frame of a subtype that includes CF-Poll that does not also include CF-Ack and that is sent in the CP shall be transmitted at a rate selected as follows:

- If an initial exchange has already established protection and the Duration/ID field in the frame establishing protection covers the entire TXOP, the rate or MCS is selected according to the rules in 10.7.5.7.
- Otherwise, the Data frame shall be transmitted at a rate or MCS as defined in 10.7.5.3, treating the frame as though it has a group address in the Address 1 field, solely for the purpose of determining the appropriate rate or MCS.

10.7.5.5 Rate selection for +CF-Ack frames

For a frame of type (QoS) Data +CF-Ack, (QoS) Data +CF-Poll+CFAck, or (QoS) CF-Poll +CF-Ack, the rate or MCS and TXVECTOR parameter CH_BANDWIDTH used to transmit the frame shall be chosen from among those supported by both the addressed recipient STA and the STA to which the Ack frame is intended.

10.7.5.6 Rate selection for Data frames sent within an FMS stream

Data frames sent within an FMS stream are sent at a rate negotiated during the establishment of the FMS stream. See 11.24.8.

10.7.5.7 Rate selection for other individually addressed Data and Management frames

A Data or Management frame not identified in 10.7.5.1 through 10.7.5.6 shall be sent using any data rate, MCS, or <VHT-MCS, NSS> tuple subject to the following constraints:

- A STA shall not transmit a frame using a rate or MCS that is not supported by the receiver STA or STAs, as reported in any Supported Rates and BSS Membership Selectors element, Extended

Supported Rates and BSS Membership Selectors element, or Supported MCS Set field in Management frames transmitted by the receiver STA.

- A STA shall not transmit a frame using a <VHT-MCS, NSS> tuple that is not supported by the receiver STA, as reported in any Supported VHT-MCS and NSS Set field in Management frames transmitted by the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
 - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
 - A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).
- A STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not supported by the receiver STA, as reported in any HT Capabilities element or VHT Capabilities element received from the intended receiver.
- An HT STA that is a member of a BSS and that is not a VHT STA shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received HT Operation element, with the exception transmissions on an off-channel TDLS direct link, which follow the rules described in 11.23.6.2 and 11.23.6.3.
- A VHT STA that is a member of a BSS shall not transmit a frame using a value for the CH_BANDWIDTH parameter of the TXVECTOR that is not permitted for use in the BSS, as reported in the most recently received VHT Operation element with the following exceptions:
 - Transmissions on an off-channel TDLS direct link follow the rules described in 11.23.6.2 and 11.23.6.3.
 - Transmissions by a VHT STA on a TDLS link follow the rules described in 11.23.1 and 11.23.6.5.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
 - A STA shall not transmit a frame using a value for the TXVECTOR parameter CH_BANDWIDTH that is not supported by the receiver STA as reported in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.

When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate in the BSSBasicRateSet parameter, or an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, or a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set, or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet, the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive, and the basic VHT-MCS and NSS set are empty.

The rules in this subclause also apply to A-MPDUs that aggregate MPDUs with the Type subfield equal to Data or Management with any other types of MPDU.

10.7.6 Rate selection for Control frames

10.7.6.1 General rules for rate selection for Control frames

Control frames carried in an A-MPDU that does not contain a VHT single MPDU shall be sent at a rate selected from the rules defined in 10.7.5.7.

NOTE—The rules defined in 10.7.6.2 through 10.7.6.5 apply only to Control frames not carried in an A-MPDU that does not contain a VHT single MPDU.

The following rules determine whether a Control frame is carried in a non-HT, HT or VHT PPDU:

- a) A Control frame shall be carried in an HT PPDU when the Control frame contains an L-SIG duration value (see 10.26.5).
- b) A control response frame shall be carried in an HT PPDU when the Control frame is a response to a frame that meets any of the following conditions:
 - 1) The frame eliciting the response included an HT variant HT Control field with the TRQ field equal to 1 and the HT NDP Announcement subfield equal to 0, and this responder set the Implicit Transmit Beamforming Receiving Capable field to 1 in its last transmitted HT Capabilities element; or
 - 2) The frame eliciting the response was an RTS frame carried in an HT PPDU; or
 - 3) The frame eliciting the response was an STBC frame, and the Dual CTS Protection field was equal to 1 in the last HT Operation element received from its AP or transmitted by the STA (see 10.3.2.8).
- c) A Control frame may be carried in an HT PPDU when the Control frame meets any of the following conditions:
 - 1) The Control frame contains an HT variant HT Control field with the MRQ subfield equal to 1, or
 - 2) The Control frame contains an HT variant HT Control field with the TRQ field equal to 1.
- d) A Control frame may be carried in a VHT PPDU when the Control frame contains an HT Control field.
- e) A Control frame shall be carried in an HT PPDU or a VHT PPDU when the Control frame is sent using an STBC frame.
- f) A control response frame shall be carried in a VHT PPDU if the eliciting frame was an RTS frame carried in a VHT PPDU that contains an HT Control field with MRQ subfield equal to 1.

Otherwise, the Control frame shall be carried in a non-HT PPDU. The requirements specified in 10.30, 10.31.2, and 10.32 further constrain the choice of non-HT, HT, or VHT PPDU.

If an Operating Mode field has been received from the intended receiver STA, the following constraints also apply:

- If at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the receiver STA:
 - A STA shall not transmit a frame with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 0 from the receiver STA.
- If at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA:
 - A STA shall not transmit an SU PPDU frame using a beamforming steering matrix with the number of spatial streams greater than that indicated in the Rx NSS subfield in the most recently received Operating Mode field with the Rx NSS Type subfield equal to 1 from the receiver STA if the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s).

Selection of channel width is defined in 10.7.6.6.

A control response frame is a Control frame that is transmitted as a response to the reception of a frame a SIFS after the PPDU containing the frame that elicited the response, e.g., a CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of a Control frame is not a control response transmission, such as when a CTS frame is used to initiate a TXOP.

10.7.6.2 Rate selection for Control frames that initiate a TXOP

This subclause describes the rate selection rules for Control frames that initiate a TXOP and that are either a VHT single MPDU or not carried in an A-MPDU.

If a Control frame other than a Basic BlockAckReq or Basic BlockAck frame is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using one of the rates in the BSSBasicRateSet parameter or a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

If a Basic BlockAckReq or Basic BlockAck frame is carried in a non-HT PPDU, the transmitting STA shall transmit the frame using a rate supported by the receiver STA, if known (as reported in the Supported Rates and BSS Membership Selectors element and/or Extended Supported Rates and BSS Membership Selectors element in frames transmitted by that STA). If the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or using a rate from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

NOTE—Because of their utility in resolving contention and in establishing a NAV, most control subtype frames that initiate a frame exchange are subject to explicit limitations regarding the choice of transmission rate with the intent of ensuring maximum possible coverage and receivability of the frame. But the Basic BlockAckReq and Basic BlockAck frames are subject to fewer restrictions because their use at times mimics a typical data-Ack exchange, where no BSSBasicRateSet rate restriction exists on the Data frame. In addition, the Basic BlockAck frame is significantly larger than the other Control frames.

When L-SIG TXOP protection is not used for an HT PPDU, an HT STA shall select an MCS from the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive when protection is required (as defined in 10.26) and shall select an MCS from the SupportedMCSSet parameter of the intended receiver when protection is not required.

When L-SIG TXOP protection is used, an HT STA shall select an MCS from the SupportedMCSSet parameter of the intended receiver.

When transmitting a VHT PPDU, a STA shall select a <VHT-MCS, NSS> tuple from the basic VHT-MCS and NSS set when protection is required (as defined in 10.26) and shall select a <VHT-MCS, NSS> tuple from the operational VHT-MCS and NSS set parameter of the intended receiver when protection is not required.

10.7.6.3 Rate selection for CF-End frames

If not operating during the 40 MHz phase of PCO, a STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using a rate in BSSBasicRateSet or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

If operating during the 40 MHz phase of PCO, a STA that transmits a CF-End frame that is not at the end of a TXOP that was obtained through the use of the dual CTS mechanism shall transmit the frame using an MCS from the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by a non-AP STA through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

- For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS frame transmitted in the TXOP.
- For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS frame that follows the first RTS frame transmitted in the TXOP.
- For the third CF-End frame transmitted in the TXOP, the matching Control frame is the second CTS frame that follows the first RTS frame transmitted in the TXOP.

A STA that transmits a CF-End frame at the end of a TXOP that was obtained by an AP through the use of the dual CTS mechanism shall transmit the CF-End frame with the same value for the TXVECTOR parameter STBC, TXVECTOR parameter MCS (if present), and TXVECTOR parameter RATE as was used for the transmission of the matching Control frame at the beginning of the TXOP. The matching Control frame is defined as follows:

- For the first CF-End frame transmitted in the TXOP, the matching Control frame is the first CTS-to-self frame transmitted in the TXOP.
- For the second CF-End frame transmitted in the TXOP, the matching Control frame is the first RTS transmitted in the TXOP.

10.7.6.4 Rate selection for Control frames that are not control response frames

This subclause describes the rate selection rules for Control frames that are not control response frames, are not the frame that initiates a TXOP, are not the frame that terminates a TXOP, and are either a VHT single MPDU or not carried in an A-MPDU.

A frame other than a BlockAckReq or BlockAck that is carried in a non-HT PPDU shall be transmitted by the STA using a rate no higher than the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate or non-HT reference rate (see 10.7.10) of the previously transmitted frame that was directed to the same receiving STA. If no rate in the BSSBasicRateSet parameter meets these conditions, the Control frame shall be transmitted at a rate no higher than the highest mandatory rate of the attached PHY that is less than or equal to the rate or non-HT reference rate (see 10.7.10) of the previously transmitted frame that was directed to the same receiving STA.

A BlockAckReq or BlockAck frame that is carried in a non-HT PPDU shall be transmitted by the STA using a rate supported by the receiver STA, as reported in the Supported Rates and BSS Membership Selectors element and/or Extended Supported Rates and BSS Membership Selectors element in frames transmitted by that STA. When the operational rate set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a rate from the BSSBasicRateSet parameter or from the mandatory rate set of the attached PHY if the BSSBasicRateSet is empty.

A frame that is carried in an HT PPDU shall be transmitted by the STA using an MCS supported by the receiver STA, as reported in the Supported MCS Set field in the HT Capabilities element received from that STA. When the supported MCS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using an MCS in the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive.

A frame that is carried in a VHT PPDU shall be transmitted by the STA using a <VHT-MCS, NSS> tuple supported by the receiver STA. A <VHT-MCS, NSS> tuple is supported if reported as such in the Supported

VHT-MCS and NSS Set field in the VHT Capabilities element received from that STA. When the Supported VHT-MCS and NSS set of the receiving STA or STAs is not known, the transmitting STA shall transmit using a <VHT-MCS, NSS> tuple in the basic VHT-MCS and NSS set.

10.7.6.5 Rate selection for control response frames

10.7.6.5.1 Introduction

Subclauses 10.7.6.5.2 through 10.7.6.5.5 describe the rate selection rules for control response frames that are either a VHT single MPDU or not carried in an A-MPDU.

10.7.6.5.2 Selection of a rate or MCS

To allow the transmitting STA to calculate the contents of the Duration/ID field, a STA responding to a received frame transmits its control response frame at a primary rate, or at an alternate rate, or at an MCS, as specified by the following rules:

- If a CTS or Ack frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. The STA may select an alternate rate according to the rules in 10.7.6.5.4. The STA shall transmit the non-HT PPDU CTS or Ack frame at either the primary rate or the alternate rate, if one exists.
- If a BlockAck frame is sent as an immediate response to either an implicit BlockAck request or to a BlockAckReq frame that was carried in an HT or VHT PPDU and the BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. The STA may select an alternate rate according to the rules in 10.7.6.5.4. The STA shall transmit the non-HT PPDU BlockAck frame at either the primary rate or the alternate rate, if one exists.
- If a Basic BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Basic BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the same rate and modulation class as the BlockAckReq frame, and the STA shall transmit the Basic BlockAck frame at the primary rate.
- If a Compressed BlockAck frame is sent as an immediate response to a BlockAckReq frame that was carried in a non-HT PPDU and the Compressed BlockAck frame is carried in a non-HT PPDU, the primary rate is defined to be the highest rate in the BSSBasicRateSet parameter that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. If no rate in the BSSBasicRateSet parameter meets these conditions, the primary rate is defined to be the highest mandatory rate of the attached PHY that is less than or equal to the rate (or non-HT reference rate; see 10.7.10) of the previous frame. The STA may select an alternate rate according to the rules in 10.7.6.5.4. The STA shall transmit the non-HT PPDU Compressed BlockAck frame at either the primary rate or the alternate rate, if one exists.
- If the control response frame is carried in an HT or VHT PPDU, then it is transmitted using an MCS or <VHT-MCS, NSS> tuple as determined by the procedure defined in 10.7.6.5.3.

The modulation class of the control response frame shall be selected according to the following rules:

- If the received frame is of a modulation class other than HT or VHT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted using the same

modulation class as the received frame. In addition, the control response frame shall be sent using the same value for the TXVECTOR parameter PREAMBLE_TYPE as the received frame.

- If the received frame is of the modulation class HT or VHT and the control response frame is carried in a non-HT PPDU, the control response frame shall be transmitted using one of the ERP-OFDM or OFDM modulation classes.
- If the control response frame is carried in an HT PPDU, the modulation class shall be HT.
- If the control response frame is carried in a VHT PPDU, the modulation class shall be VHT.

The selection of the value for the channel width (CH_BANDWIDTH parameter of the TXVECTOR) of the response transmission is defined in 10.7.6.6.

10.7.6.5.3 Control response frame MCS computation

If a control response frame is to be transmitted within an HT or VHT PPDU, the channel width (CH_BANDWIDTH parameter of the TXVECTOR) shall be selected first according to 10.7.6.6, and then the MCS or <VHT-MCS, NSS> tuple shall be selected from a set of MCSs and <VHT-MCS, NSS> tuples called the *CandidateMCSSet* as described in this subclause.

If the frame eliciting the response was transmitted by an HT STA that is not a VHT STA, the Rx Supported MCS Set is determined from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

- If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.
- If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in megabits per second) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

If the frame eliciting the response was transmitted by a VHT STA, the Rx Supported MCS Set is determined for VHT PPDUs as described in 10.7.12 and for HT PPDUs from the Supported MCS Set field in the HT Capabilities element received from the STA as follows:

- If a bit in the Rx MCS Bitmask subfield is equal to 0, the corresponding MCS is not supported.
- If a bit in the Rx MCS Bitmask subfield is equal to 1 and the integer part of the data rate (expressed in megabits per second) of the corresponding MCS is less than or equal to the rate represented by the Rx Highest Supported Data Rate subfield, then the MCS is supported by the STA on receive. If the Rx Highest Supported Data Rate subfield is equal to 0 and a bit in the Rx MCS Bitmask is equal to 1, then the corresponding MCS is supported by the STA on receive.

The CandidateMCSSet is determined using the following rules:

- If the frame eliciting the response was an STBC frame and the Dual CTS Protection bit is equal to 1, the CandidateMCSSet shall contain only the basic STBC MCS.
- If the frame eliciting the response had an L-SIG duration value (see 10.26.5) and initiates a TXOP, the CandidateMCSSet is the MCS Set consisting of the intersection of the Rx Supported MCS Set of the STA that sent the frame that is eliciting the response and the set of MCSs that the responding STA is capable of transmitting.
- If none of the above conditions is true, the CandidateMCSSet is the union of the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive and the basic VHT-MCS and NSS set. If the frame eliciting the response was an RTS frame carried in a VHT PPDU, then the CandidateMCSSet may additionally include the <VHT-MCS, NSS> tuple with the same MCS and number of spatial streams as the VHT PPDU. If the

combined Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive is empty, the CandidateMCSSet shall consist of

- The set of mandatory HT PHY MCSs if the STA eliciting the response is an HT STA that is not a VHT STA
- The set of mandatory HT MCSs plus the set of <VHT MCS, NSS> tuples corresponding to the mandatory VHT PHY MCSs with NSS = 1 if the STA eliciting the response is a VHT STA

MCS values from the CandidateMCSSet that cannot be transmitted with the selected CH_BANDWIDTH parameter value shall be eliminated from the CandidateMCSSet.

The choice of a response MCS is made as follows:

- a) If the frame eliciting the response is within a non-HT PPDU,
 - 1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have a data rate greater than the data rate of the received PPDU (the mapping of MCS to data rate is defined in 19.5).
 - 2) Find the highest indexed MCS from the CandidateMCSSet. The index of this MCS is the index of the MCS that is the primary MCS for the response transmission.
 - 3) If the CandidateMCSSet is empty, the primary MCS is the lowest indexed MCS of the mandatory MCSs.
- b) If the frame eliciting the response is within an HT PPDU,
 - 1) Eliminate from the CandidateMCSSet all <VHT-MCS, NSS> tuples. Eliminate all MCSs that have an index that is higher than the index of the MCS of the received frame. Also eliminate all MCSs that have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA.
 - 2) Determine the highest number of spatial streams (N_{SS}) value of the MCSs in the CandidateMCSSet that is less than or equal to the N_{SS} value of the MCS of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an N_{SS} value that is not equal to this N_{SS} value. The mapping from MCS to N_{SS} is dependent on the attached PHY. For the HT PHY, see 19.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM.
 - 3) Find the highest indexed MCS of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS is the primary MCS for the response transmission. The mapping from MCS to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM.
 - 4) If no MCS meets the condition in step 3), remove each MCS from the CandidateMCSSet that has the highest value of N_{SS} in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the HT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.
- c) If the frame eliciting the response is within a VHT PPDU,
 - 1) Eliminate from the CandidateMCSSet all MCSs and all <VHT-MCS, NSS> tuples that meet any of the following conditions:
 - i) Have a data rate that is higher than the data rate of the <VHT-MCS, NSS> tuple of the received frame using the largest possible value of CH_BANDWIDTH that is no larger than the value of CH_BANDWIDTH of the received frame

- ii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 0 from the intended receiver STA, if at least one Operating Mode field with the Rx NSS Type subfield equal to 0 was received from the intended receiver STA
 - iii) Have a number of spatial streams greater than that indicated in the Rx NSS subfield in the most recent Operating Mode field with the Rx NSS Type subfield equal to 1 from the intended receiver STA if at least one Operating Mode field with the Rx NSS Type subfield equal to 1 was received from the receiver STA and the control response frame is an SU PPDU frame with a beamforming steering matrix and the beamforming steering matrix was derived from a VHT Compressed Beamforming report with Feedback Type subfield indicating MU in the VHT Compressed Beamforming frame(s)
- 2) Determine the highest number of spatial streams (N_{SS}) value of the MCSs and <VHT-MCS, NSS> tuples in the CandidateMCSSet that is less than or equal to the N_{SS} value of the received frame. Eliminate all MCSs from the CandidateMCSSet that have an N_{SS} value that is not equal to this N_{SS} value. The mapping from MCS to N_{SS} is dependent on the attached PHY. For the HT PHY, see 19.5.
 - 3) Find the highest rate MCS or <VHT-MCS, NSS> tuple of the CandidateMCSSet for which the modulation value of each stream is less than or equal to the modulation value of each stream of the MCS of the received frame and for which the coding rate is less than or equal to the coding rate of the MCS from the received frame. This MCS or <VHT-MCS, NSS> tuple is the primary MCS for the response transmission. The mapping from MCS or <VHT-MCS, NSS> tuple to modulation and coding rate is dependent on the attached PHY. For the HT PHY, see 19.5; for the VHT PHY, see 21.5. For the purpose of comparing modulation values, the following sequence shows increasing modulation values: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM.
 - 4) If no MCS meets the condition in step 3), remove each MCS or <VHT-MCS, NSS> tuple from the CandidateMCSSet that has the highest value of N_{SS} in the CandidateMCSSet. If the resulting CandidateMCSSet is empty, then set the CandidateMCSSet to the VHT PHY mandatory MCSs. Repeat step 3) using the modified CandidateMCSSet.

Once the primary MCS or <VHT-MCS, NSS> tuple has been selected, the STA may select an alternate MCS according to 10.7.6.5.4. The STA shall transmit the control response frame using either the primary MCS or the alternate MCS, if one exists.

10.7.6.5.4 Selection of an alternate rate or MCS for a control response frame

An alternate rate may be selected provided that all of the following conditions are met:

- The duration of frame at the alternate rate is the same as the duration of the frame at the primary rate determined by 10.7.6.5.2.
- The alternate rate is in either the BSSBasicRateSet parameter or is a mandatory rate of the attached PHY.
- The modulation class of the frame at the alternate rate is the same class as that of the primary rate selected by 10.7.6.5.2.

An alternate MCS may be selected provided that both of the following conditions are met:

- The duration of the frame at the alternate MCS is the same as the duration of the frame at the primary MCS.
- The alternate MCS is in the CandidateMCSSet that was generated according to the procedure of 10.7.6.5.3.

10.7.6.5.5 Control response frame TXVECTOR parameter restrictions

A STA shall not transmit a control response frame with TXVECTOR parameter GI_TYPE set to SHORT_GI unless it is in response to a reception of a frame with the RXVECTOR parameter GI_TYPE equal to SHORT_GI.

A STA shall not transmit a control response frame with TXVECTOR parameter FEC_CODING set to LDPC_CODING unless it is in response to a reception of a frame with the RXVECTOR parameter FEC_CODING equal to LDPC_CODING.

A STA shall not transmit a control response frame with the TXVECTOR parameter FORMAT set to HT_GF.

10.7.6.6 Channel Width selection for Control frames

The rules in this subclause, combined with the rules in 10.7.6.1, determine the format of control response frames.

If a VHT STA transmits to another VHT STA a Control frame that is not an RTS frame or a CF-End frame, if that Control frame elicits a control response frame or a VHT Compressed Beamforming frame, and

- If the Control frame is transmitted in a non-HT duplicate PPDU (channel width 40 MHz or wider), the transmitting VHT STA shall set the TA field to a bandwidth signaling TA.
- If the Control frame is transmitted in a non-HT PPDU (channel width 20 MHz), the transmitting VHT STA may set the TA field to a bandwidth signaling TA.

If the TA is a bandwidth signaling TA, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

NOTE 1—Such Control frames are BlockAckReq frames, BlockAck frames in the context of HT-delayed Block Ack, PS-Poll frames, VHT NDP Announcement frames, and Beamforming Report Poll frames.

NOTE 2—Control Wrapper frames follow the rules pertaining to the carried Control frame (see 10.10).

Channel width selection rules for RTS frames are described in 10.3.2.6.

A VHT STA that transmits a CF-End frame in a non-HT duplicate PPDU (channel width 40 MHz or wider) addressed to a VHT AP shall set the Individual/Group bit in the BSSID(TA) field to 1.

A VHT STA that transmits a CF-End frame in a non-HT PPDU (channel width 20 MHz) addressed to a VHT AP may set the Individual/Group bit in the BSSID(TA) field to 1.

If the Individual/Group bit in the BSSID(TA) field of the CF-End frame is set to 1, the transmitting VHT STA shall set the TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and CH_BANDWIDTH to the same value.

A STA that sends a Control frame in response to a frame carried in an HT PPDU or a VHT PPDU shall set the TXVECTOR parameter CH_BANDWIDTH to indicate a channel width that is the same as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH of the frame eliciting the response.

A STA that sends a Control frame in response to a frame carried in a non-HT or non-HT duplicate PPDU with a nonbandwidth signaling TA

- Should set the TXVECTOR parameter CH_BANDWIDTH to the same value as the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.
- Shall not set the TXVECTOR parameter CH_BANDWIDTH to a value greater than the RXVECTOR parameter CH_BANDWIDTH for the frame eliciting the response.

NOTE—According to this rule, a STA can respond with a 20 MHz PPDU if it receives a non-HT duplicate frame but is not able to detect the channel width occupied by the frame (whether by design or because the frame was received over a channel that is narrower than the channel on which it was transmitted).

A VHT STA that sends a Control frame that is in response to a non-HT or non-HT duplicate format frame with a bandwidth signaling TA and that is not a CTS shall set the channel width indicated by the TXVECTOR parameter CH_BANDWIDTH to the same value as the channel width indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT for the frame eliciting the response. The RA field of a Control frame that is not a CF-End frame and that is sent in response to a Control frame with a bandwidth signaling TA shall be set to a nonbandwidth signaling TA obtained from the TA field of the immediately previous Control frame. For the channel width selection rules for CTS sent in response to an RTS with a bandwidth signaling TA, see 10.3.2.7.

A frame that is intended to provide protection is transmitted using a channel width selected by the rules defined in 10.26.

An HT STA that uses a non-HT duplicate frame to establish protection of its TXOP shall send any CF-End frame using a non-HT duplicate frame except during the 40 MHz phase of PCO operation. During the 40 MHz phase of PCO operation, the rules in 11.17 apply.

The TXOP holder should set the TXVECTOR parameter CH_BANDWIDTH of a CF-End frame to the maximum bandwidth allowed by the rules in 10.22.2.7.

NOTE—A CF-End frame transmitted by an AP a SIFS duration after receiving a CF-End frame is considered a control response frame.

10.7.6.7 Control frame TXVECTOR parameter restrictions

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter GI_TYPE set to a value of SHORT_GI.

A STA shall not transmit a Control frame that initiates a TXOP with the TXVECTOR parameter FEC_CODING set to a value of LDPC_CODING.

10.7.7 Multirate support for DMG STAs

10.7.7.1 Usage of DMG Control modulation class

The DMG Control modulation class has only one MCS, which is DMG MCS 0 defined in Clause 20. The DMG Beacon, SSW-Feedback, SSW-Ack, RTS, DMG CTS, DMG CTS-to-self, DMG DTS, CF-End, Grant, SPR, Poll and first BRP packet in beam refinement shall be transmitted using the DMG Control modulation class. In the case of an RXSS that was specified through the Beamforming Control field with the value of the RXSSTxRate subfield equal to 1 and the RXSSTxRate Supported field in the DMG Capabilities element of the STA performing the RXSS is 1, the first SSW frame of the RXSS shall be transmitted using the DMG Control modulation class, and the remaining frames of the RXSS shall be transmitted using MCS 1 of the DMG SC modulation class. In all other cases, the SSW frames shall be transmitted using the DMG Control modulation class. Other DMG beamforming training frames may be transmitted using the DMG Control modulation class or the DMG SC modulation class.

10.7.7.2 Rate selection rules for Control frames transmitted by DMG STAs

This subclause describes the rate selection rules for Control frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20.

A Control frame that does not have an MCS defined in 10.7.7.1 and that is not a control response frame shall be transmitted using an MCS from the mandatory MCS set of the DMG SC modulation class or DMG Control modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG low-power SC modulation class shall use an MCS from the DMG low-power SC Supported MCS set of the STA that transmitted the frame that elicited the response as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

A STA transmitting a Grant Ack frame shall use the DMG Control modulation class or any MCS from the mandatory MCS set of the DMG SC modulation class.

A STA transmitting an Ack or a BlockAck frame that is a response to a frame sent using the DMG Control modulation class shall use the DMG Control modulation class.

A STA transmitting an Ack frame or a BlockAck frame in response to a frame sent using the DMG SC modulation class or DMG OFDM modulation class shall use an MCS from the mandatory MCS set of the DMG SC modulation class as long as (a) the selected MCS has a Data Rate that does not exceed the Data Rate of the frame that elicited the response, and (b) no other MCS satisfying condition (a) results in a shorter frame transmission time.

NOTE—A control response frame is a Control frame that is transmitted within an MPDU as a response to a reception SIFS after the PPDU containing the frame that elicits the response, e.g., a DMG CTS frame in response to an RTS frame reception, an Ack frame in response to a Data frame reception, a BlockAck frame in response to a BlockAckReq frame reception. In some situations, the transmission of some of these Control frames is not a control response transmission, such as when a DMG CTS frame is used to initiate a TXOP.

Except in an A-MPDU consisting of one of the combinations listed below, the rules in this subclause do not apply to Control frames that are contained in A-MPDUs that also include at least one MPDU with the Type subfield equal to Data or Management. In the following cases, the rate selection rules are the same as those for a standalone Ack or BlockAck frame:

- An Ack frame and a QoS Null frame
- A BlockAck frame and a QoS Null frame
- A BlockAckReq frame and a QoS Null frame
- A BlockAck frame, a BlockAckReq frame, and a QoS Null frame

10.7.7.3 Rate selection for group addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for group addressed Data and Management frames transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20.

If the transmit antenna pattern of a single transmission of a group addressed frame covers more than one receiver and the supported MCS set of each of the receivers is known to the sender, then the MCS used for the transmission shall be an MCS common to the supported MCS sets of all of the receivers. If such an MCS is not known, the frame shall be transmitted using an MCS from the mandatory MCS set of the DMG control or SC mode.

If the transmit antenna pattern of a single transmission of a group addressed frame covers only one receiver, the frame shall be transmitted following the rate selection rules of individually addressed frames as described in 10.7.7.4.

10.7.7.4 Rate selection for individually addressed Data and Management frames transmitted by DMG STAs

This subclause describes the rate selection rules for individually addressed Data and Management frames as transmitted by DMG STAs. The rate selection rules apply only for MCSs defined in Clause 20.

An individually addressed Data or Management frame shall be sent using an MCS supported by the receiver STA, as reported in the maximum receive MCS subfields in the Supported MCS Set field in Management frames transmitted by the receiver STA.

When the Supported MCS set of the receiving STA is not known, the transmitting STA shall transmit using an MCS from the mandatory MCS set of the DMG control or SC mode.

A DMG STA shall transmit a TPA Request frame and a TPA Response frame using MCS 1.

The rules in this subclause also apply to A-MPDUs that contain at least one MPDU with Type subfield equal to Control and at least one MPDU with Type subfield equal to Data or Management.

10.7.7.5 Rate selection for BRP packets

The first BRP packet transmitted from the initiator to the responder after the SLS phase shall use MCS 0.

The first BRP packet transmitted from the responder to the initiator after the SLS phase shall use MCS 0.

A BRP packet transmitted during beam refinement at the start of a SP (as defined in 10.36.6.2) should use MCS 0, otherwise a BRP packet transmitted during beam refinement should use MCS 1. A BRP packet transmitted during beam refinement shall not use any MCS greater than MCS 12.

BRP packets transmitted during the BRP setup subphase, the MID subphase, and the BC subphase shall use MCS 0.

BRP packets transmitted during a BC subphase, as part of a BC subphase only training, may use MCS 0 to MCS 12.

BRP packets transmitted during beam tracking may use any MCS.

10.7.8 Multiple BSSID Rate Selection

If the multiple BSSID capability is supported, Beacon frames shall be transmitted using any basic rate valid for all of the BSSs supported. If no such rate exists, then Beacon frames shall be transmitted using any mandatory PHY rate for any PHY type that all BSSs have in common.

10.7.9 Modulation classes

Table 10-6 defines modulation classes for the rules for response frames in 9.7.

Table 10-6—Modulation classes

| Description of modulation | Condition that selects this modulation class | | |
|---------------------------|--|---|--|
| | Clause 15 to Clause 18 PHYs or Clause 20 PHY | Clause 19 PHY | Clause 21 PHY |
| DSSS and HR/DSSS | Clause 15 or Clause 16 transmission | FORMAT is NON_HT. NON_HT_MODULATION is ERP-DSSS or ERP-CCK. | N/A |
| ERP-OFDM | 18.4 transmission | FORMAT is NON_HT. NON_HT_MODULATION is ERP-OFDM. | N/A |
| OFDM | Clause 17 transmission | FORMAT is NON_HT. NON_HT_MODULATION is OFDM or NON_HT_DUP_OFDM. | FORMAT is NON_HT. NON_HT_MODULATION is OFDM or NON_HT_DUP_OFDM. |
| HT | N/A | FORMAT is HT_MF or HT_GF. | FORMAT is HT_MF or HT_GF. |
| DMG Control | Clause 20 transmission and MCS is 0 | N/A | N/A |
| DMG SC | Clause 20 transmission and $1 \leq \text{MCS} \leq 12.6$ | N/A | N/A |
| DMG OFDM | Clause 20 transmission and $13 \leq \text{MCS} \leq 24$ | N/A | N/A |
| DMG Low-power SC | Clause 20 transmission and $25 \leq \text{MCS} \leq 31$ | N/A | N/A |
| VHT | N/A | N/A | FORMAT is VHT. |

10.7.10 Non-HT basic rate calculation

This subclause defines how to convert an HT MCS or a VHT-MCS to a non-HT basic rate for the purpose of determining the rate of the response frame. It consists of two steps as follows:

- a) Use the modulation and coding rate determined from the HT MCS (defined in 19.5) or VHT-MCS (defined in 21.5) to locate a non-HT reference rate by lookup into Table 10-7.²⁹ In the case of an MCS with UEQM, the modulation of stream 1 is used.
- b) The non-HT basic rate is the highest rate in the BSSBasicRateSet that is less than or equal to this non-HT reference rate.

NOTE—In a TVWS band, the non-HT reference rate is scaled as described in 22.2.4.

²⁹ For example, if an HT PPDU transmission uses 64-QAM and coding rate of 3/4, the related non-HT reference rate is 54 Mb/s.

Table 10-7—Non-HT reference rate

| Modulation | Coding rate (R) | Non-HT reference rate (Mb/s) |
|-------------------|------------------------|-------------------------------------|
| BPSK | 1/2 | 6 |
| BPSK | 3/4 | 9 |
| QPSK | 1/2 | 12 |
| QPSK | 3/4 | 18 |
| 16-QAM | 1/2 | 24 |
| 16-QAM | 3/4 | 36 |
| 64-QAM | 1/2 | 48 |
| 64-QAM | 2/3 | 48 |
| 64-QAM | 3/4 | 54 |
| 64-QAM | 5/6 | 54 |
| 256-QAM | 3/4 | 54 |
| 256-QAM | 5/6 | 54 |

10.7.11 Channel Width in non-HT and non-HT duplicate PPDUs

A non-VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in either of the TXVECTOR or RXVECTOR for NON_HT PPDUs. A non-VHT STA shall not set the TA field to a bandwidth signaling TA. A VHT STA shall include neither the CH_BANDWIDTH_IN_NON_HT parameter nor the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR of a non-HT PPDU addressed to a non-VHT STA. A VHT STA shall not set the TA field to a bandwidth signaling TA in a frame addressed to a non-VHT STA. A VHT STA that includes the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR shall also include the CH_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall not include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR for transmitted frames other than RTS frames with bandwidth signaling TA and that are sent in a non-HT PPDU. A STA that transmits an RTS frame with a bandwidth signaling TA shall include the DYN_BANDWIDTH_IN_NON_HT parameter in the TXVECTOR. A VHT STA shall include both the CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT parameters in the RXVECTOR if the detected PPDU format is NON_HT.

A bandwidth signaling TA may be included in non-HT and non-HT duplicate PPDUs and shall not be included in other PPDUs. If the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT is present and a control MPDU other than a CTS is being transmitted, then the TA field shall be set to a bandwidth signaling TA; otherwise, the TA field shall be set to an individual address.

NOTE—A CTS frame, even though it does not have a TA field, can also be transmitted with the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT present.

The TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT shall not be present in PPDUs carrying Management or Data frames.

10.7.12 Rate selection constraints for VHT STAs

10.7.12.1 Rx Supported VHT-MCS and NSS Set

The Rx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second VHT STA for each <VHT-MCS, NSS> tuple NSS = 1, ..., 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the VHT-MCS for NSS spatial streams at that bandwidth is mandatory (see 21.5), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive.
- Otherwise, if the Max VHT-MCS For n SS subfield ($n = \text{NSS}$) in the Rx VHT-MCS Map subfield indicates support and the Rx Highest Supported Long GI Data Rate subfield is equal to 0, then
 - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-250 if no OMN has been received from the first STA, otherwise, according to Table 9-75, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS For n SS subfield ($n = \text{NSS}$) in the Rx VHT-MCS Map subfield indicates support and the data rate for long GI of the MCS for NSS spatial streams at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Rx Highest Supported Long GI Data Rate subfield, then
 - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on receive, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-250 if no OMN has been received from the first STA, otherwise, according to Table 9-75, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on receive.

The <VHT-MCS, NSS> tuples excluded by 10.7.12.3 are also eliminated from the Rx Supported VHT-MCS and NSS Set.

A VHT STA shall not, unless explicitly stated otherwise, transmit a VHT PPDU unless the <VHT-MCS, NSS> tuple and bandwidth used are in the Rx Supported VHT-MCS and NSS Set of the receiving STA(s).

NOTE 1—Support for a <VHT-MCS, NSS> tuple at a given bandwidth implies support for both long GI and short GI on receive, if short GI is supported at that bandwidth.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

10.7.12.2 Tx Supported VHT-MCS and NSS Set

The Tx Supported VHT-MCS and NSS Set of a first VHT STA is determined by a second STA for each <VHT-MCS, NSS> tuple NSS = 1, ..., 8 and bandwidth (20 MHz, 40 MHz, 80 MHz, and 160 MHz or 80+80 MHz) from the Supported VHT-MCS and NSS Set field received from the first STA as follows:

- If support for the <VHT-MCS, NSS> tuple at that bandwidth is mandatory (see 21.5), then the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit.
- Otherwise, if the Max VHT-MCS for n SS subfield ($n = \text{NSS}$) in the Tx VHT-MCS Map subfield indicates support and the Tx Highest Supported Long GI Data Rate subfield is equal to 0, then

- the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-250 if no OMN has been received from the first STA, otherwise, according to Table 9-75, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, if the Max VHT-MCS for n SS subfield ($n = \text{NSS}$) in the Tx VHT-MCS Map subfield indicates support and the data rate for long GI of the <VHT-MCS, NSS> tuple at that bandwidth (expressed as the largest integer in Mb/s that is less than or equal to the data rate) is less than or equal to the rate represented by the Tx Highest Supported Long GI Data Rate subfield, then
 - the <VHT-MCS, NSS> tuple at that bandwidth is supported by the first STA on transmit, except that if dot11VHTExtendedNSSBWCapable of the second STA is true, the supported bandwidth values and NSS values of each <VHT-MCS, NSS> tuple are updated according to Table 9-250 if no OMN has been received from the first STA, otherwise, according to Table 9-75, wherein the VHT Capabilities Information field and the Operating Mode field have been transmitted by the first STA.
- Otherwise, the <VHT-MCS, NSS> tuple at that bandwidth is not supported by the first STA on transmit.

NOTE 1—In contrast to reception, support for short GI transmissions by a STA cannot be determined by other STAs.

NOTE 2—A STA can determine the expected interpretation of its Supported Channel Width Set and Channel Width and 160/80+80 BW and Extended NSS BW Support fields at a recipient by examining the VHT Extended NSS BW Capable field value in the Supported VHT-MCS and NSS Set field of the recipient.

10.7.12.3 Additional rate selection constraints for VHT PPDUs

The following apply for a STA that transmits a VHT PPDU with a number of spatial streams (NSS) less than or equal to 4:

- If the channel width of the PPDU is equal to CBW20 or CBW40, then the STA should not use a <VHT-MCS, NSS> tuple if the VHT-MCS is equal to 0, 1, 2, or 3 and the HT MCS with value VHT-MCS + $8 \times (\text{NSS} - 1)$ is marked as unsupported in the Rx MCS bitmask of the HT Capabilities element of the receiver STA.
- If the channel width of the PPDU is equal to CBW80, CBW160, or CBW80+80, then the STA should not use a <VHT-MCS, NSS> tuple if the VHT-MCS is equal to 0 or 1 and both the HT MCS values $2 \times \text{VHT-MCS} + 8 \times (\text{NSS} - 1)$ and $2 \times (\text{VHT-MCS} + 1) + 8 \times (\text{NSS} - 1)$ are marked as unsupported in the Rx MCS bitmask of the HT Capabilities element of the receiver STA.

An example tabulation of this behavior is given in Table 10-8.

Table 10-8—Example of rate selection for VHT PPDUs

| HT MCSs that are marked as unsupported | <VHT-MCS, NSS> tuples that are not used for CBW20 and CBW40 | <VHT-MCS, NSS> tuples that are not used for CBW80, CBW160, and CBW80+80 |
|---|--|--|
| 0, 8, 16 | <0, 1>, <0, 2>, <0, 3> | — |
| 1, 9 | <1, 1>, <1, 2> | — |
| 10 | <2, 2> | — |
| 3 | <3, 1> | — |

Table 10-8—Example of rate selection for VHT PPDUs (continued)

| HT MCSs that are marked as unsupported | <VHT-MCS, NSS> tuples that are not used for CBW20 and CBW40 | <VHT-MCS, NSS> tuples that are not used for CBW80, CBW160, and CBW80+80 |
|--|---|---|
| 0, 1 | <0, 1>, <1, 1> | <0, 1> |
| 2, 3 | <2, 1>, <3, 1> | <1, 1> |
| 0, 1, 8, 9 | <0, 1>, <1, 1>, <0, 2>, <1, 2> | <0, 1>, <0, 2> |

10.8 MSDU transmission restrictions

To avoid reordering MSDUs between pairs of LLC entities and/or unnecessarily discarding MSDUs, the following restrictions shall be observed by any STA that is able to concurrently process multiple outstanding MSDUs for transmission. The term *outstanding* refers to an MPDU containing all or part of an MSDU or MMPDU for which transmission has been started, and for which delivery of the MSDU or MMPDU has not yet been completed (i.e., an acknowledgment of the final fragment has not been received and the MSDU or MMPDU has not been discarded due to retries, lifetime, or for some other reason). A STA may have any number (greater than or equal to one) of eligible MSDUs outstanding concurrently, subject to the restrictions below.

A non-QoS STA shall not have more than one MSDU or MMPDU from a particular SA to a particular individual RA outstanding at a time.

NOTE—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU with a particular individual RA be outstanding at a time.

For frames that are not sent within the context of a block ack agreement, a QoS STA shall not have more than one MSDU or A-MSDU for each TID or MMPDU from a particular SA to a particular individual RA outstanding at any time.

NOTE—A simpler, more restrictive alternative to the rule in the above paragraph that might be used is that no more than one MSDU or A-MSDU with any particular TID with a particular individual RA be outstanding at any time.

In a STA where the optional StrictlyOrdered service class has been implemented, that STA shall not have any group addressed (multidestination) MSDU of the StrictlyOrdered service class outstanding from the SA of any other outstanding MSDU (either individual or group addressed). This is because a group addressed MSDU is implicitly addressed to a collection of peer STAs that could include any individual RA.

A STA should select a value of dot11MaxTransmitMSDULifetime that is sufficiently large that the STA does not discard MSDUs or A-MSDUs due to excessive Transmit MSDU timeouts under normal operating conditions.

An A-MSDU shall contain only MSDUs of a single service class and inherits that service class for the purpose of the following rules. For MSDUs or A-MSDUs belonging to the service class of QoSACK when the receiver is a QoS STA, set to Normal ACK or Implicit Block ACK Request, PSMP ACK, or Block ACK. For MSDUs or A-MSDUs belonging to the service class of QoSNoACK when the receiver is a QoS STA, the QoS Data frames that are used to send these MSDUs or A-MSDUs shall have the ACK Policy subfield in the QoS Control field set to No ACK.

10.9 HT Control field operation

If dot11HTControlFieldSupported is true, a STA shall set the +HTC-HT Support subfield of the HT Extended Capabilities field of the HT Capabilities element to 1 in HT Capabilities elements that it transmits. If dot11VHTControlFieldOptionImplemented is true, a STA shall set the +HTC-VHT Support subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1 in VHT Capabilities elements that it transmits.

A STA in which at least one of dot11RDResponderOptionImplemented, dot11MCSFeedbackOptionImplemented, and dot11AlternateEDCAActivated is true shall set dot11HTControlFieldSupported or dot11VHTControlFieldOptionImplemented or both to true.

An HT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-HT in the HT Extended Capabilities field of its HT Capabilities element (see 9.4.2.56).

A VHT variant HT Control field shall not be present in a frame addressed to a STA unless that STA declares support for +HTC-VHT in the VHT Capabilities Information field of its VHT Capabilities element.

NOTE—An HT STA that does not support +HTC (HT or VHT variant) that receives a +HTC frame addressed to another STA still performs the CRC on the actual length of the MPDU and uses the Duration/ID field to update the NAV, as described in 10.3.2.4.

If the HT Control field is present in an MPDU aggregated in an A-MPDU, then all MPDUs of the same frame type (i.e., having the same value of the Type subfield of the Frame Control field) aggregated in the same A-MPDU shall contain an HT Control field. The HT Control field of all MPDUs containing the HT Control field aggregated in the same A-MPDU shall be set to the same value.

If the HT variant HT Control field is present in an MPDU, the DEI subfield provides information on the drop eligibility of the contents of the received MPDU. When there are insufficient resources in a STA, the STA arbitrarily discards frames in order to recover from the lack of resources. With the information from the DEI subfield, a STA may selectively drop frames with the DEI subfield set to 1 in preference to frames with the DEI subfield set to 0, if resources are insufficient. Note that this might not help in the recovery in all conditions, and the STA might still have to fall back to the arbitrary discard strategy. The mechanisms for determining whether resources are insufficient or when to discard MSDUs or A-MSDUs are beyond the scope of this standard.

10.10 Control Wrapper operation

A STA supporting the HT Control field that receives a Control Wrapper frame shall process it as though it received a frame of the subtype of the wrapped frame.

10.11 MSDU processing

A STA can use the U-PID element transmitted in ADDTS Request, DMG ADDTS Request, ADDTS Response and DMG ADDTS Response frames to indicate the upper layer protocol responsible for handling MSDUs corresponding to the TID indicated within the frame carrying the U-PID element (see 11.4.4.4).

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 shall strip the number of octets in the LLC Header Copy field of the U-PID element from the start of an MSDU (received in an MA-UNITDATA.request.primitive) corresponding to the TID indicated in the ADDTS exchange before transmission of the MSDU to the peer STA. The MSDU in the MA-UNITDATA.request.primitive must start with the octets specified in the LLC Header Copy field.

NOTE—The STA does not verify that the MSDU does indeed start with the octets specified in the LLC Header Copy field.

A STA that participates in a successful ADDTS exchange that included a U-PID element in the ADDTS Response or DMG ADDTS Response frame with the LLC Header Removed field equal to 1 and that receives from the peer STA an MSDU corresponding to the TID indicated in the ADDTS exchange shall insert the octets in the LLC Header Copy field of the U-PID element at the start of the MSDU before delivery of the MSDU (in an MA-UNITDATA.indication.primitive).

NOTE—If the LLC Header Removed field is equal to 0, the LLC Header Copy field in the U-PID element is ignored, except for possible implementation-dependent local optimizations.

10.12 A-MSDU operation

An A-MSDU contains only MSDUs whose DA parameter values map to a single RA value (see 9.3.2.2). An A-MSDU contains only MSDUs whose SA parameter values map to a single TA value (see 9.3.2.2).

For the Short A-MSDU case, an A-MSDU contains only MSDUs whose SA and DA parameter values are the same. The Short A-MSDU subframe structure is used only between a pair of STAs that communicate directly (see 9.3.2.1). The Short A-MSDU subframe structure cannot be used for frame forwarding. The constituent MSDUs of an A-MSDU shall all have the same priority parameter value from the corresponding MA-UNITDATA.request primitive.

An A-MSDU shall be carried, without fragmentation, within a single QoS Data frame.

The Address 1 field of an MPDU carrying an A-MSDU shall be set to an individual address or to the GCR concealment address.

The channel access rules for a QoS Data frame carrying an A-MSDU are the same as a Data frame carrying an MSDU (or fragment thereof) of the same TID.

The expiration of the A-MSDU lifetime timer occurs only when the lifetime timer of all of the constituent MSDUs of the A-MSDU have expired.

NOTE 1—This rule implicitly allows an MSDU that is a constituent of an A-MSDU to potentially be transmitted after the expiration of its lifetime.

NOTE 2—Selecting any other value for the timeout would result in loss of MSDUs. Selecting the maximum value avoids this loss of MSDUs at the cost of transmitting MSDUs that have exceeded their lifetime.

The following rules apply to the transmission of an A-MSDU:

- A non-DMG STA that has a value of false for dot11HighThroughputOptionImplemented shall not transmit an A-MSDU.
- A non-DMG STA shall not transmit an A-MSDU to a STA from which it has not received a frame containing an HT Capabilities element.

A STA shall support the reception of an A-MSDU, where the A-MSDU is carried in a QoS Data frame with Ack Policy equal to Normal Ack in the following cases:

- By an HT STA when the A-MSDU is not aggregated within an A-MPDU
- By a VHT STA when the A-MSDU is sent as a VHT single MPDU

The use of an A-MSDU carried in a QoS Data frame under a block ack agreement is determined for each block ack agreement. A STA shall not transmit an A-MSDU within a QoS Data frame under a block ack agreement

unless the recipient indicates support for A-MSDU by setting the A-MSDU Supported field to 1 in its BlockAck Parameter Set field of the ADDBA Response frame.

A STA shall not transmit an A-MSDU to a STA if the A-MSDU length exceeds the value indicated by the Maximum A-MSDU Length field of the HT Capabilities element received from the recipient STA.

A VHT STA that sets the value of the Maximum MPDU Length subfield in the VHT Capabilities Information field of the VHT Capabilities element to indicate 3895 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 3839 octets. A VHT STA that sets the Maximum MPDU Length in the VHT Capabilities element to indicate 7991 octets or 11 454 octets shall set the Maximum A-MSDU Length in the HT Capabilities element to indicate 7935 octets.

The length of an A-MSDU transmitted in a VHT PPDU is limited by the maximum MPDU size supported by the recipient STA (see 10.13.5).

NOTE 1—An A-MSDU that meets the A-MSDU length limit for transmission in a VHT PPDU might exceed the A-MSDU length limit for an HT PPDU, in which case it cannot be retransmitted in an HT PPDU.

NOTE 2—Support for A-MSDU aggregation does not affect the maximum size of MSDU transported by the MA-UNITDATA primitives.

A VHT STA shall not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA. An HT STA should not transmit an A-MSDU that includes a number of MSDUs greater than the value indicated by the Max Number Of MSDUs In A-MSDU field in any Extended Capabilities element sent by the recipient STA.

A DMG STA shall not transmit an A-MSDU that includes a number of Basic A-MSDU subframes greater than the value indicated by the Maximum Number Of Basic A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA shall not transmit an A-MSDU that includes a number of Short A-MSDU subframes greater than the value indicated by the Maximum Number Of Short A-MSDU Subframes In A-MSDU subfield in any DMG Capabilities element sent by the recipient STA. A DMG STA that sets the A-MSDU Subframe subfield to 1 in a DMG Attributes field of TSPEC element (9.4.2.30), which indicates Short A-MSDU subframe support, shall be capable of receiving at least 32 Short A-MSDU subframes in A-MSDU.

The transmitter of frames for a TID established using a PTP TSPEC shall use an A-MSDU subframe format that is the result of the PTP TSPEC negotiation for that TID. The A-MSDU subframe format is negotiated using the PTP TSPEC (9.4.2.30): the Short A-MSDU subframe format shall not be used for frames of the corresponding TID if the A-MSDU subframe field of the PTP TSPEC element is 0 either in the ADDTS Request frame or in the ADDTS Response frame used to set up the TID. Prior to PTP TSPEC negotiation, a STA shall use the Basic A-MSDU subframe format if the STA employs MSDU aggregation.

A non-PCP DMG STA in a PBSS may use the PCP of the PBSS to forward MSDUs to another non-PCP STA in the PBSS if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 1. A non-PCP DMG STA in a PBSS shall not use the PCP to forward MSDUs if the value of the PCP Forwarding field within the PCP's DMG Capabilities element is 0. To forward an MSDU via the PCP, a non-PCP STA shall encapsulate the MSDU within an individually addressed A-MSDU sent to the PCP. The DA field of the A-MSDU shall be set to the destination's individual or group address.

10.13 A-MPDU operation

10.13.1 A-MPDU contents

According to its context (defined in Table 9-424), an A-MPDU shall be constrained so that it contains only MPDUs as specified in the relevant table referenced from Table 9-424.

When an A-MPDU contains multiple QoS Control fields, bits 4 and 8–15 of these QoS Control fields shall be identical.

A DMG STA that transmits an A-MPDU shall do so only in the Data Enabled Immediate Response context or the Control Response context, with contents as specified in Table 9-425 and Table 9-428, respectively.

10.13.2 A-MPDU length limit rules

A STA indicates in the Maximum A-MPDU Length Exponent field in its HT Capabilities element the maximum A-MPDU length that it can receive in an HT PPDU. A STA indicates in the Maximum A-MPDU Length Exponent field in its VHT Capabilities element the maximum length of the A-MPDU pre-EOF padding that it can receive in a VHT PPDU. A DMG STA indicates in the Maximum A-MPDU Length Exponent field in its DMG Capabilities element the maximum A-MPDU length that it can receive. The encoding of these fields is defined in Table 9-163 for an HT PPDU, in Table 9-249 for a VHT PPDU, and in Table 9-229 for a DMG STA.

A VHT STA that sets the Maximum A-MPDU Length Exponent field in its VHT Capabilities element to a value in the range 0 to 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities to the same value. A VHT STA that sets the Maximum A-MPDU Length Exponent field in the VHT Capabilities element to a value larger than 3 shall set the Maximum A-MPDU Length Exponent in its HT Capabilities element to 3.

Using the Maximum A-MPDU Length Exponent fields in the HT Capabilities and VHT Capabilities elements, the STA establishes at association the maximum length of an A-MPDU pre-EOF padding that can be sent to it. An HT STA shall be capable of receiving A-MPDUs of length up to the value indicated by the Maximum A-MPDU Length Exponent field in its HT Capabilities element. A VHT STA shall be capable of receiving A-MPDUs where the A-MPDU pre-EOF padding length is up to the value indicated by the Maximum A-MPDU Length Exponent field in its VHT Capabilities element.

A STA shall not transmit an A-MPDU in an HT PPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the HT Capabilities element received from the intended receiver. MPDUs in an A-MPDU carried in an HT PPDU shall be limited to a maximum length of 4095 octets. A STA shall not transmit an A-MPDU in a VHT PPDU where the A-MPDU pre-EOF padding length is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the VHT Capabilities element received from the intended receiver. A DMG STA shall not transmit an A-MPDU that is longer than the value indicated by the Maximum A-MPDU Length Exponent field in the DMG Capabilities element received from the intended receiver.

10.13.3 Minimum MPDU Start Spacing field

A STA shall not start the transmission of more than one MPDU within the time limit described in the Minimum MPDU Start Spacing field declared by the intended receiver. To satisfy this requirement, the number of octets between the start of two consecutive MPDUs in an A-MPDU, measured at the PHY SAP, shall be equal to or greater than

$$t_{MMSS} \times r / 8$$

where

- t_{MMSS} is the time (in microseconds) defined in the “Encoding” column of Table 9-163 for an HT STA and of Table 9-229 for a DMG STA for the value of the Minimum MPDU Start Spacing field
- r is the value of the PHY Data Rate (in megabits per second) defined in 19.5 for HT PPDUs, in 21.5 for VHT PPDUs, and in Clause 20 for a DMG STA

If necessary, in order to satisfy this requirement, a STA shall add padding between MPDUs in an A-MPDU. Any such padding shall be in the form of one or more MPDU delimiters with the MPDU Length field set to 0.

QoS Null frames transmitted by DMG STAs are not subject to this spacing, i.e., no MPDU delimiters with zero length need to be inserted after the MPDU immediately preceding the QoS Null frame in an A-MPDU.

10.13.4 A-MPDU aggregation of group addressed Data frames

A STA that is neither an AP nor a mesh STA shall not transmit an A-MPDU containing an MPDU with a group addressed RA.

NOTE 1—An HT AP and an HT mesh STA can transmit an A-MPDU containing MPDUs with a group addressed RA.

NOTE 2—As a VHT STA is an HT STA, NOTE 1 also applies to VHT APs and VHT mesh STAs.

NOTE 3—An AP providing GCR service can transmit an A-MPDU containing MPDUs with a group addressed RA.

A STA that is an AP or a mesh STA shall not transmit an A-MPDU containing group addressed MPDUs if the HT Protection field is equal to non-HT mixed mode.

A DMG STA may transmit an A-MPDU containing MPDUs with a group addressed RA.

When a STA transmits a PPDU containing at least one A-MPDU that contains MPDUs with a group addressed RA, the following shall apply:

- If the PPDU is an HT PPDU transmitted by an AP, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the HT Capabilities element of all HT STAs associated with the AP.
- If the PPDU is an HT PPDU transmitted by a mesh STA, the maximum A-MPDU length exponent value is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the HT Capabilities element of all peer HT mesh STAs.
- If the PPDU is a VHT PPDU, the value of maximum A-MPDU length exponent that applies is the minimum value in the Maximum A-MPDU Length Exponent subfields of the A-MPDU Parameters fields of the VHT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs.
- If the PPDU is a VHT PPDU, the value of minimum MPDU start spacing that applies is the maximum value in the Minimum MPDU Start Spacing subfields of the A-MPDU Parameters fields of the HT Capabilities elements across all VHT STAs associated with the transmitting AP or across all peer VHT mesh STAs of the transmitting mesh STA.
- If the PPDU is an HT PPDU transmitted by an AP, the minimum MPDU start spacing value that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities element of all HT STAs associated with the AP.
- If the PPDU is an HT PPDU transmitted by a mesh STA, the minimum MPDU start spacing value that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the HT Capabilities element of all peer HT mesh STAs.
- If the PPDU is a DMG PPDU, the maximum A-MPDU length exponent value that applies is the minimum value in the Maximum A-MPDU Length Exponent subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.

- If the PPDU is a DMG PPDU, the minimum MPDU start spacing value that applies is the maximum value in the Minimum MPDU Start Spacing subfield of the A-MPDU Parameters field of the DMG Capabilities element of all DMG STAs associated with the AP or PCP.

10.13.5 Transport of A-MPDU by the PHY data service

An A-MPDU shall be transmitted in a PSDU associated with a PHY-TXSTART.request primitive with the TXVECTOR parameter AGGREGATION set to 1 or the TXVECTOR parameter FORMAT set to VHT. A received PSDU is determined to be an A-MPDU when the associated PHY-RXSTART.indication primitive RXVECTOR parameter AGGREGATION is equal to 1 or the RXVECTOR parameter FORMAT is equal to VHT.

10.13.6 A-MPDU padding for VHT PPDU

A VHT STA that transmits a VHT PPDU that contains one or more PSDUs, each of which contains an A-MPDU, shall construct the A-MPDU(s) as described in this subclause.

An A-MPDU pre-EOF padding (see 10.13.2) is constructed for each user from any of the following:

- A-MPDU subframes constructed from the MPDUs available for transmission that have a TID value that maps to the primary AC
- A-MPDU subframes with 0 in the MPDU Length field and 0 in the EOF field

provided that each added subframe and the A-MPDU pre-EOF padding meet all of the following:

- A-MPDU content constraints (see 10.13.1) for the intended recipient
- Format and length limit constraints (see 9.7.1 and 10.13.2) for the intended recipient
- Minimum MPDU start spacing constraints (see 10.13.3) for the intended recipient
- TXOP duration limits (see 10.22.2.8) for the primary AC

The A-MPDU_Length[n] for user n is initialized as the length of the resulting A-MPDU pre-EOF padding.

This initial value of A-MPDU_Length[n] for user n is used as the APEP_LENGTH[n] parameter value for the PLME-TXTIME.request primitive (see 6.5.5). The PLME-TXTIME.request primitive is then invoked once for the VHT PPDU. The PLME-TXTIME.confirm primitive (see 6.5.6) provides the TXTIME parameter and PSDU_LENGTH[] parameters for all of the users for the transmission.

Subsequently, for each user n , as permitted by the rules for EDCA TXOP Sharing (see 10.22.2.6), a VHT STA may add A-MPDU subframes to the A-MPDU for that user that meets either of the following conditions:

- Have a TID that maps to an AC that is not the primary AC
- Have 0 in the MPDU Length field and 0 in the EOF field

provided that each added subframe and the resulting A-MPDU meet all of the following:

- A-MPDU content constraints (see 10.13.1) for the intended recipient
- Length limit constraints (see 9.7.1 and 10.13.2) for the intended recipient
- MPDU start spacing constraints (see 10.13.3) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[n] with the length of each such added A-MPDU subframe, the relationship $A\text{-MPDU_Length}[n] \leq PSDU_LENGTH[n]$ is true.

Subsequently, for each user n , a VHT STA may add A-MPDU subframes to the A-MPDU for that user that meet the following condition:

- Have 0 in the MPDU Length field

provided that each added subframe and the resulting A-MPDU meet the following condition:

- Length limit constraints (see 9.7.1 and 10.13.2) for the intended recipient

and provided that, after incrementing the A-MPDU_Length[n] with the length of each such added A-MPDU subframe, the relationship $A\text{-MPDU_Length}[n] \leq PSDU\text{_LENGTH}[n]$ is true.

An implementation may reduce the A-MPDU_Length[n] by the amount of padding for user n that was added subsequent to the addition of a subframe for user n that contains 1 in the EOF field.

The final value of A-MPDU_Length[] shall be used as APEP_LENGTH[] in the PHY-TXSTART.request primitive for the VHT PPDU.

Padding is then added for each user such that the resulting A-MPDU contains exactly PSDU_LENGTH octets for that user as follows:

- First, while $A\text{-MPDU_Length}[n] < PSDU\text{_LENGTH}[n]$ and $A\text{-MPDU_Length}[n] \bmod 4 \neq 0$, add an octet to the final A-MPDU subframe's Padding subfield and increment A-MPDU_Length[n] by 1.
- Then, while $A\text{-MPDU_Length}[n] + 4 \leq PSDU\text{_LENGTH}[n]$, add an EOF padding subframe to the EOF Padding Subframes field and increment A-MPDU_Length[n] by 4.
- Finally, while $A\text{-MPDU_Length}[n] < PSDU\text{_LENGTH}[n]$, add an octet to the EOF Padding Octets subfield and increment A-MPDU_Length[n] by 1.

An A-MPDU subframe with EOF set to 0 shall not be added after any A-MPDU subframe with EOF set to 1.

An A-MPDU subframe with EOF set to 1 and with MPDU Length field set to 0 shall not be added before an A-MPDU subframe that contains a VHT single MPDU (see 10.13.7).

10.13.7 Setting the EOF field of the MPDU delimiter

The EOF field may be set to 1 in an A-MPDU subframe carried in a VHT PPDU if the subframe's MPDU Length field is nonzero and the subframe is the only subframe that has a nonzero MPDU Length field. The EOF field of each A-MPDU subframe with an MPDU Length field with a nonzero value that is not the only A-MPDU subframe with MPDU Length field with a nonzero value in the A-MPDU carried in a VHT PPDU shall be set to 0. The EOF field shall be set to 0 in all A-MPDU subframes that are carried in an HT PPDU.

An MPDU that is the only MPDU in an A-MPDU and that is carried in an A-MPDU subframe with 1 in the EOF field is called a *VHT single MPDU*.

10.13.8 Transport of VHT single MPDUs

The rules for VHT single MPDU operation are the same as the rules for non-A-MPDU frame operation with other types of non-A-MPDU.

NOTE—This affects the following behavior:

- The frame could carry a fragment of an MSDU or MMPDU (see 10.2.7).
- Rate selection of control responses (see 10.7).
- A Data frame cannot indicate an Ack Policy of “Implicit Block Ack”, and does not generate a BlockAck frame response (see 9.2.4.5.4).
- A Data frame could indicate an Ack Policy of “Normal Ack”, which solicits an Ack frame immediate response. No block ack agreement is needed in this case (see 9.2.4.5.4).
- The frame could be a Management frame that solicits an Ack frame response (see 9.7.3).

10.14 PPDU duration constraint

A STA shall not transmit an HT PPDU that has a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.6 that is greater than aPPDUMaxTime defined in Table 19-25).

A STA shall not transmit a DMG PPDU that has a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.6 that is greater than aPPDUMaxTime defined in Table 20-32).

A STA shall not transmit a VHT PPDU that has a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.6 that is greater than aPPDUMaxTime defined in Table 21-29).

A STA shall not transmit a VHT PPDU in TVWS bands that has a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.6 that is greater than aPPDUMaxTime defined in Table 22-25).

10.15 DMG A-PPDU operation

A DMG STA is aggregate PPDU (A-PPDU) capable if the A-PPDU supported field within the STA's DMG Capabilities element is 1. Otherwise, the STA is not A-PPDU capable.

A DMG STA shall not transmit an A-PPDU aggregate to a STA that is not A-PPDU capable.

An A-PPDU is a sequence of two or more PPDU transmitted without IFS, preamble, and with a PHY-dependent separation between PPDU transmissions. All PPDU within an A-PPDU shall have the ADD-PPDU parameter of the TXVECTOR set to ADD-PPDU, except for the last PPDU in the A-PPDU that shall have this parameter set to NO-ADD-PPDU. The value of a TXVECTOR parameter of a PPDU belonging to an A-PPDU might differ from the value of the same TXVECTOR parameter of another PPDU in the same A-PPDU, including the MCS parameter.

A PPDU within an A-PPDU shall contain an A-MPDU. All MPDUs within A-MPDUs within an A-PPDU shall have the same values for the TA and RA fields. All QoS Data frames within A-MPDUs within an A-PPDU shall have the same value of the Ack Policy subfield of the QoS Control field. If a frame that requires an immediate response is present within an A-PPDU, it shall be transmitted in the last A-MPDU of the A-PPDU.

The transmission duration of an A-PPDU shall be no greater than aPPDUMaxTime (see Table 20-32).

10.16 LDPC operation

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_MF or HT_GF and the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to an HT STA for which the LDPC Coding Capability subfield of the HT Capabilities element received from that STA contained a value of 1 and dot11LDPCCodingOptionActivated is true.

A VHT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to VHT and the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a VHT STA for which the Rx LDPC subfield of the VHT Capabilities element received from that STA contained a value of 1 and dot11VHTLDPCCodingOptionActivated is true.

A VHT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to VHT and the TXVECTOR parameter FEC_CODING set to LDPC_CODING unless the RA of the frame corresponds to a VHT STA for which the Rx LDPC subfield of the VHT Capabilities element received from that STA contained a value of 1 and dot11VHTLDPCCodingOptionActivated is true.

A STA should not transmit a frame with the TXVECTOR parameter FORMAT set to HT_MF, HT_GF or VHT and the TXVECTOR parameter FEC_CODING set to LDPC_CODING if the RA of the frame corresponds to a STA from which it has received a frame containing an Operating Mode field and the most recent Operating Mode field it has received from that STA had the No LDPC subfield equal to 1.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.26 and 10.7.

10.17 STBC operation

A STA that has not set the Tx STBC subfield to 1 in the HT Capabilities element shall not transmit HT PPDUs with a TXVECTOR parameter STBC set to a nonzero value. A STA that has not set the Tx STBC subfield to 1 in the VHT Capabilities element shall not transmit VHT SU PPDUs with a TXVECTOR parameter STBC set to a nonzero value.

A STA shall not send an HT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its HT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the HT PPDU. A STA shall not send a VHT PPDU with the TXVECTOR parameter STBC set to a nonzero value to a recipient STA unless the recipient STA has indicated in the Rx STBC field of its VHT Capabilities element that it supports the reception of PPDUs using STBC with a number of spatial streams greater than or equal to the number of spatial streams in the VHT PPDU.

10.18 Short GI operation

A STA may transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to CBW20 and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is an HT STA.
- The TXVECTOR parameter FORMAT is equal to HT_MF, HT_GF, or VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 20 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInTwentyActivated is present and is true.

A STA may transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to CBW40 and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is an HT STA.
- The TXVECTOR parameter FORMAT is equal to HT_MF, HT_GF, or VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 40 MHz subfield of the HT Capabilities element contained a value of 1.
- dot11ShortGIOptionInFortyActivated is present and is true.

A STA shall not transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to CBW80 and GI_TYPE set to SHORT_GI unless all of the following conditions are met:

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 80 MHz/TVHT_MODE_4C subfield of the VHT Capabilities element contained a value of 1.
- dot11VHTShortGIOptionIn80Activated is present and is true.

A STA may transmit a frame with TXVECTOR parameters CH_BANDWIDTH set to CBW160 or CBW80+80 and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RA of the frame corresponds to a STA for which the Short GI for 160 and 80+80 MHz subfield of the VHT Capabilities element contained a value of 1.
- dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

A STA may transmit a frame with TXVECTOR parameters FORMAT set to VHT, NUM_USERS set to greater than 1, and GI_TYPE set to SHORT_GI only if all of the following conditions are met:

- The STA is a VHT STA.
- The TXVECTOR parameter FORMAT is equal to VHT.
- The RAs of all MPDUs in the VHT MU PPDU correspond to STAs for which the Short GI subfield of the following conditions are satisfied:
 - If the TXVECTOR parameter CH_BANDWIDTH is set to CBW20, the Short GI for 20 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInTwentyActivated is present and is true.
 - If the TXVECTOR parameter CH_BANDWIDTH is set to CBW40, the Short GI for 40 MHz subfields of the HT Capabilities element contained a value of 1, and dot11ShortGIOptionInFortyActivated is present and is true.
 - If the TXVECTOR parameter CH_BANDWIDTH is set to CBW80, the Short GI for 80 MHz/TVHT_MODE_4C subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn80Activated is present and is true.
 - If the TXVECTOR parameter CH_BANDWIDTH is set to CBW160 or CBW80+80, the Short GI for 160 MHz and 80+80 MHz subfields of the VHT Capabilities element contained a value of 1, and dot11VHTShortGIOptionIn160and80p80Activated is present and is true.

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_GF and the GI_TYPE parameter set to SHORT_GI when the MCS parameter indicates a single spatial stream.

Further restrictions on TXVECTOR parameter values may apply due to rules found in 10.26 and 10.7.

10.19 Greenfield operation

An HT STA shall not transmit a frame with the TXVECTOR parameter FORMAT set to HT_GF unless the RA of the frame corresponds to a STA for which the HT-Greenfield subfield of the HT Capabilities element contained a value of 1 and dot11HTGreenfieldOptionActivated is true. Further restrictions may apply due to rules found in 10.26, 10.7, and 11.9.8.5.

10.20 Group ID and partial AID in VHT PPDUs

The partial AID is a nonunique STA identifier defined in Table 10-9. The partial AID is carried in the TXVECTOR parameter PARTIAL_AID of a VHT SU PPDU and is limited to 9 bits.

A STA transmitting a VHT SU PPDU carrying one or more group addressed MPDUs or transmitting a VHT NDP intended for multiple recipients shall set the TXVECTOR parameters GROUP_ID to 63 and PARTIAL_AID to 0. The intended recipient of a VHT NDP is defined in 10.34.6.

A STA transmitting a VHT SU PPDU carrying one or more individually addressed MPDUs or a VHT NDP intended for a single recipient shall set the TXVECTOR parameters GROUP_ID and PARTIAL_AID as shown in Table 10-9.

Table 10-9—Settings for the TXVECTOR parameters GROUP_ID and PARTIAL_AID

| Condition | GROUP_ID | PARTIAL_AID |
|---|----------|---|
| Addressed to AP | 0 | BSSID[39:47] |
| Addressed to Mesh STA | 0 | RA[39:47] |
| Sent by an AP and addressed to a STA associated with that AP or sent by a DLS or TDLS STA in a direct path to a DLS or TDLS peer STA | 63 | $(AID + (BSSID[44:47] \oplus BSSID[40:43]) \times 2^5) \bmod 2^9$ (10-12) |
| Otherwise (see NOTE) | 63 | 0 |
| NOTE—The last row covers the following cases: — A PPDU sent to an IBSS STA — A PPDU sent by an AP to a non associated STA — Any other condition not explicitly listed elsewhere in the table | | |

In Table 10-9, BSSID[b:c] and RA[b:c] represent bits b to c inclusive of the BSSID and RA, respectively, with bit 0 being the Individual/Group bit and bit 47 being the last transmitted bit, in which bit position b is then scaled by 2^0 and c by 2^{c-b} .

A STA shall include the values computed in Table 10-9 in the PHYCONFIG_VECTOR parameters PARTIAL_AID_LIST_GID00 and PARTIAL_AID_LIST_GID63.

A STA that transmits a VHT PPDU to a DLS or TDLS peer STA obtains the AID for the peer STA from the DLS Setup Request, DLS Setup Response, TDLS Setup Request or TDLS Setup Response frame.

An AP should not assign an AID to a STA that results in a 0 value PARTIAL_AID (as computed using Equation (10-12)).

A STA transmitting a VHT MU PPDU sets the TXVECTOR parameter GROUP_ID as described in 21.3.11.4.

As an example of the GROUP_ID and PARTIAL_AID setting, consider the case of a BSS with BSSID 00-21-6A-AC-53-52³⁰ that has as a member a non-AP STA assigned AID 5. In VHT PPDUs sent to an AP, the GROUP_ID is set to 0 and the PARTIAL_AID is set to 164. In VHT PPDUs sent by the AP to the non-AP STA associated with that AP, the GROUP_ID is set to 63 and PARTIAL_AID is set to 229.

³⁰As described in IEEE Std 802-2014, the use of hyphens for the BSSID indicates hexadecimal representation rather than bit-reversed representation.

10.21 Operation across regulatory domains

10.21.1 General

The PHY of a WLAN is subject to regulations that might vary significantly from one regulatory domain to another. This subclause provides the framework for operation across regulatory domains and describes the mechanism that supports cross-domain mobility and operation in multiple regulatory domains. When this mechanism is active, `dot11MultiDomainCapabilityActivated` attribute be true.

NOTE—This subclause does not eliminate the need to obtain type acceptance, regulatory approval, equipment authorization, or equipment certification in each of the regulatory domains in which the equipment operates. The mechanisms described in this subclause provide the information to the STA to identify the regulatory domain in which it is located and to cease operation while in those domains for which it does not have type approval. It is incumbent upon the implementer to provide proof of compliance to the requirements of individual regulatory agencies.

The method for configuring individual STAs is outside the scope of this standard. A STA needs to be properly configured for operation in a particular regulatory domain prior to beginning normal operation. Particular care needs to be taken when operating in an IBSS configuration.

10.21.2 Operation upon entering a regulatory domain

A STA that is enabled for operation across regulatory domains uses passive scanning when it has lost connectivity with its ESS. Passive scanning is performed using only the receive capabilities of the STA and is, thus, compatible with regulatory requirements. The timeout for determining the loss of connectivity is system dependent and beyond the scope of this standard.

When a STA with `dot11MultiDomainCapabilityActivated` true enters a regulatory domain, before transmitting, it shall passively scan to learn at least one valid channel, i.e., a channel upon which it detects IEEE 802.11 frames. The Beacon frame transmitted by non-DMG STAs and the DMG Beacon or Announce frame transmitted by DMG STAs contains information on the country code, the maximum allowable transmit power, and the channels that may be used for the regulatory domain. Optionally, these frames may also include in the Country element, on a periodic basis, the regulatory information that would be returned in a Probe Response frame. When DSE dependent STA operation is required in a regulatory domain, a dependent STA may be required to receive a Beacon, DMG Beacon, or an Announce frame signaling dependent enablement (11.12.5), and until one of these frames is received, the STA may continue passive scanning to receive one such frame directly from an enabling STA. Once the STA has acquired the information so that it is able to meet the transmit requirements of the regulatory domain, it shall transmit a Probe Request frame to an AP or PCP to gain the additional necessary regulatory domain information contained in the Probe Response frame, unless the information was previously received in a Beacon, DMG Beacon, or Announce frame. The STA then has sufficient information available to configure its PHY for operation in the regulatory domain.

10.21.3 Operation with operating classes

The following, and only the following, are extended spectrum management capable: a VHT STA and a STA that has `dot11ExtendedSpectrumManagementImplemented` true. A non-VHT STA that has `dot11ExtendedSpectrumManagementImplemented` true shall indicate that it is extended spectrum management capable using the Extended Spectrum Management Capable field of the Extended Capabilities element.

When communicating with a STA that supports global operating classes, all requests and Action frames that convey elements containing operating classes shall use global operating class values.

When `dot11OperatingClassesImplemented` is true, the following statements apply:

- When `dot11OperatingClassesRequired` is false, or where operating classes domain information is not present in a STA, that STA is not required to change its operation in response to an element that contains an operating class.

- When dot11OperatingClassesRequired is true, or where operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element, except that a VHT STA may omit, from the Country element, any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of “80+” and “UseEirpForVHTTxPowEnv.”
- When dot11OperatingClassesRequired and dot11ExtendedChannelSwitchActivated are true and a STA is capable of operating as specified in more than one operating class, the STA shall include the Supported Operating Classes element in Association frames and Reassociation frames.
- When dot11OperatingClassesRequired is true, or where operating classes domain information is present and the STA parsing a Country element finds an invalid First Channel Number field or Operating Class field with a value that is reserved, the STA shall ignore the remainder of the Country element and shall parse any remaining management frame body for additional elements.
- When dot11OperatingClassesRequired is true and the STA supports one or more global operating classes, or where global operating classes domain information is present in a STA, the STA shall indicate current operating class information in the Country element and Supported Operating Classes element using the country string for the global operating classes, except that a VHT STA may omit from the Country element any Operating Triplet field for an Operating Class for which the Channel spacing (MHz) column indicates 80 MHz or wider and for which the Behavior limits set column in the applicable table in Annex E contains only a blank entry or either or both of “80+” and “UseEirpForVHTTxPowEnv.”

10.21.4 Operation with the Transmit Power Envelope element

A STA that is extended spectrum management capable and that has dot11SpectrumManagementRequired or dot11RadioMeasurementActivated equal to true shall determine a local maximum transmit power from a Transmit Power Envelope element for which the Local Maximum Transmit Power Unit Interpretation subfield indicates EIRP.

A STA that sends two or more Transmit Power Envelope elements in a frame shall order the elements by increasing values of their Local Maximum Transmit Power Unit Interpretation subfields.

If a STA that is extended spectrum management capable finds an unknown value in the Local Maximum Transmit Power Unit Interpretation subfield in a Transmit Power Envelope element, then the STA shall ignore that and subsequent Transmit Power Envelope elements.

A STA that receives two or more Transmit Power Envelope elements in the same frame with known values in their Local Maximum Transmit Power Unit Interpretation subfields shall process all of the elements according to the local regulations known at the STA.

NOTE—If a STA receives two Transmit Power Envelope elements, each with a known value in the Local Maximum Transmit Power Unit Interpretation subfield, then the expected possibilities are as follows:

- The STA complies with either element (shared spectrum),
- The STA complies with both elements (tightened regulations), or
- The STA complies with the second element (changed regulations).

10.21.5 Operation with coverage classes

The attribute aSlotTime and other MAC timings are based on the PHY timing parameters, as specified in 10.3.2.3, 10.3.7 and 10.22.2.5, and in particular on aAirPropagationTime. If dot11OperatingClassesRequired is true, it is possible to manage the MAC timings of STAs to increase fairness in contending for the medium. Radio waves propagate at $\sim 300 \text{ m}/\mu\text{s}$ in free space, and, for example, $3 \mu\text{s}$ would be the ceiling for BSS maximum one-way distance of $\sim 450 \text{ m}$ ($\sim 900 \text{ m}$ round trip). The Coverage Class field of the Country element

indicates a value of aAirPropagationTime (see Table 9-79), and the MAC can use the value to calculate aSlotTime (as specified in the relevant PHY clause) and other timings.

If dot11OperatingClassesRequired is true and a Country element containing a Coverage Class field has been received from the AP of the BSS with which a STA is associated, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS, an associated STA, dependent STA, member of an IBSS, or member of an MBSS shall, if the relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, use MAC timings that correspond to the value of aAirPropagationTime indicated (as specified in the relevant PHY clause).

NOTE 1—Some PHYs do not specify a dependency of aSlotTime on aAirPropagationTime.

NOTE 2—Operation over larger BSS diameters is facilitated by relaxing some PHY timing parameters, while maintaining compatibility with existing implementations in small BSS diameters.

aAirPropagationTime is 0 μ s if:

- the relevant PHY clause specifies that aAirPropagationTime is indicated by the coverage class, and
- at least one of the following applies:
 - dot11OperatingClassesRequired is false
 - no Country element containing a Coverage Class field has been received from the AP of the BSS with which a STA is associated, from the DO of the IBSS of which a STA is a member, or from another mesh STA in the same MBSS

10.22 HCF

10.22.1 General

Under HCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length. In a non-DMG BSS, the TXOP may be obtained by a STA winning an instance of EDCA contention (see 10.22.2) during the CP or by a STA receiving a QoS (+)CF-Poll frame (see 10.22.3) during the CP or CFP. The former is called *EDCA TXOP*, while the latter is called *HCCA TXOP* or *polled TXOP*.

In a DMG BSS, the EDCAF operates only during CBAPs. Operation of the EDCAF is suspended at the end of a CBAP and is resumed at the beginning of the following CBAP. See 10.36.5 and 10.36.5 for additional rules regarding contention based access in DMG BSSs.

HCCA is not used by DMG STAs.

10.22.2 HCF contention based channel access (EDCA)

10.22.2.1 Reference model

The EDCA channel access protocol is derived from the DCF procedures described in 10.3 by adding four independent enhanced distributed channel access functions (EDCAFs) to provide differentiated priorities to transmitted traffic, through the use of four different access categories (ACs).

For the case in which dot11AlternateEDCAActivated is false or not present, a model of the reference implementation is shown in Figure 10-24 and for the case in which dot11AlternateEDCAActivated is true, a model is shown in Figure 10-25. These figures illustrate a mapping from frame type or UP to the transmit queues and the four independent EDCAFs. The mapping of UP to the transmit queue and the mapping to AC are described in 10.2.4.2 and Table 10-1. The mapping of frame types to ACs is also described in 10.2.4.2.

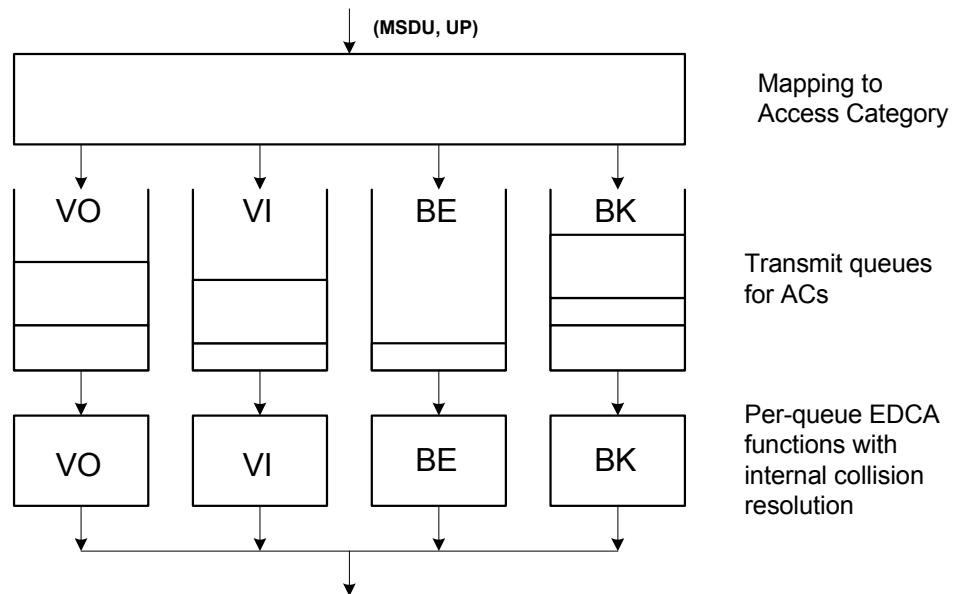

Figure 10-24—Reference implementation model when `dot11AlternateEDCAActivated` is false or not present

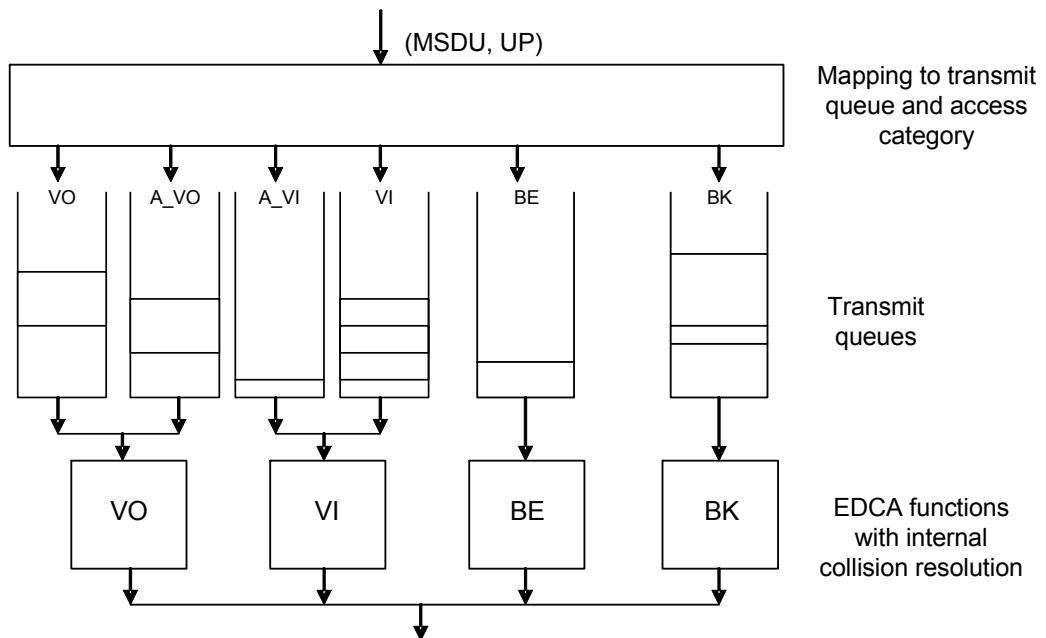

Figure 10-25—Reference implementation model when `dot11AlternateEDCAActivated` is true

A DMG STA may implement a single AC. If the STA implements a single AC, all UP and frame types shall be mapped to AC_BE.

NOTE—A DMG STA that implements a single AC has only one queue in Figure 10-24.

10.22.2.2 EDCA backoff procedure

Each EDCAF shall maintain a state variable CW[AC], which shall be initialized to the value of the parameter CWmin[AC], for that EDCAF's AC.

For the purposes of this subclause, transmission failure of an MPDU is defined as follows:

- After transmitting an MPDU (even if it is carried in an A-MPDU or as part of a VHT MU PPDU that is sent using TXVECTOR parameter NUM_USERS > 1) that requires an immediate response:
- The STA shall wait for a timeout interval of duration aSIFSTime + aSlotTime + aRxPHYStartDelay, starting when the MAC receives a PHY-TXEND.confirm primitive. If a PHY-RXSTART.indication primitive does not occur during the timeout interval, the transmission of the MPDU has failed.
- If a PHY-RXSTART.indication primitive does occur during the timeout interval, the STA shall wait for the corresponding PHY-RXEND.indication primitive to recognize a valid response MPDU (see Annex G) that either does not have a TA field or is sent by the recipient of the MPDU requiring a response. If anything else, including any other valid frame, is recognized, the transmission of the MPDU has failed.
- The nonfinal (re)transmission of an MPDU that is delivered using the GCR unsolicited retry retransmission policy (10.22.2.11.2)) is defined to be a failure.
- In all other cases, the transmission of the MPDU has not failed.

The TXNAV timer is a single timer, shared by the EDCAFs within a STA, that is initialized with the duration from the Duration/ID field in the frame most recently successfully transmitted by the TXOP holder, except for PS-Poll frames. The TXNAV timer begins counting down from the end of the transmission of the PPDU containing that frame. An HT STA may retransmit unacknowledged MPDUs within the same TXOP or in a subsequent TXOP. The Reservation Allocation Vector (RAV) timer for a mesh STA that has dot11MCCAActivated true is initialized with the MCCAOP Duration in the MCCAOP Reservation field at the start of an MCCAOP reservation. The RAV timer begins counting down from the start of an MCCAOP reservation (see 10.23.3.9.2).

The backoff procedure shall be invoked by an EDCAF when any of the following events occurs:

- a) An MA-UNITDATA.request primitive is received that causes a frame with that AC to be queued for transmission such that one of the transmit queues associated with that AC has now become non-empty and any other transmit queues associated with that AC are empty; the medium is busy on the primary channel as indicated by any of the following:
 - physical CS;
 - virtual CS;
 - a nonzero TXNAV timer value;
 - a mesh STA that has dot11MCCAActivated true and a nonzero RAV timer value, and the backoff timer has a value of 0 for that AC.
- b) The transmission of the MPDU in the final PPDU transmitted by the TXOP holder during the TXOP for that AC has completed and the TXNAV timer has expired, and the AC was a primary AC. (See 10.22.2.6).
- c) The transmission of an MPDU in the initial PPDU of a TXOP fails, as defined in this subclause, and the AC was a primary AC.
- d) The transmission attempt collides internally with another EDCAF of an AC that has higher priority, that is, two or more EDCAFs in the same STA are granted a TXOP at the same time.

- e) The transmission attempt of a STA coordinated by an MM-SME collides internally with another STA coordinated by the same MM-SME (see 11.34), which is indicated to the first MAC entity with a PHY-TXBUSY.indication(BUSY) primitive as response to the PHY-TXSTART.request primitive.

In addition, the backoff procedure may be invoked by an EDCAF when:

- f) The transmission by the TXOP holder of an MPDU in a non-initial PPDU of a TXOP fails, as defined in this subclause.

NOTE—A STA can perform a PIFS recovery, as described in 10.22.2.7, or perform a backoff, as described in the previous paragraph, as a response to transmission failure within a TXOP. How it chooses between these two is implementation dependent.

A STA that performs a backoff within its existing TXOP shall not extend the TXNAV timer value (see 10.22.2.7).

NOTE—In other words, the backoff is a continuation of the TXOP, not the start of a new TXOP.

If the backoff procedure is invoked for reason a) above, the value of CW[AC] shall be left unchanged. If the backoff procedure is invoked for reason b) above, the value of CW[AC] shall be reset to CWmin[AC].

If the backoff procedure is invoked for reason c), d), e), or f) above, or the transmission failure of a non-initial frame by the TXOP holder, the value of CW[AC] shall be updated as follows before invoking the backoff procedure:

- If the QSRC[AC] or the QLRC[AC] has reached dot11ShortRetryLimit or dot11LongRetryLimit respectively, CW[AC] shall be reset to CWmin[AC].
- If dot11RobustAVStreamingImplemented is true and either the QSDRC[AC] or the QLDRC[AC] has reached dot11ShortDEIRetryLimit or dot11LongDEIRetryLimit, respectively, CW[AC] shall be reset to CWmin[AC].
- Otherwise,
 - If CW[AC] is less than CWmax[AC], CW[AC] shall be set to the value $(CW[AC] + 1) \times 2 - 1$.
 - If CW[AC] is equal to CWmax[AC], CW[AC] shall be left unchanged.

10.22.2.3 EDCA TXOPs

There are three modes of EDCA TXOP defined: initiation of an EDCA TXOP, sharing an EDCA TXOP, and multiple frame transmission within an EDCA TXOP. Initiation of the TXOP occurs when the EDCA rules permit access to the medium. Sharing of the EDCA TXOP occurs when an EDCAF within an AP that supports DL-MU-MIMO has obtained access to the medium, making the corresponding AC the primary AC, and includes traffic from queues associated with other ACs in VHT MU PPDUs transmitted during the TXOP. Multiple frame transmission within the TXOP occurs when an EDCAF retains the right to access the medium following the completion of a frame exchange sequence, such as on receipt of an Ack frame.

10.22.2.4 Obtaining an EDCA TXOP

Each EDCAF shall maintain a backoff timer, which has a value measured in backoff slots as described below.

When the backoff procedure is invoked, the backoff timer is set to an integer value chosen randomly with a uniform distribution taking values in the range 0 to CW[AC].

The duration AIFS[AC] is a duration derived from the value AIFSN[AC] by the relation

$$AIFS[AC] = AIFSN[AC] \times aSlotTime + aSIFSTime.$$

In an infrastructure BSS, AIFSN[AC] is advertised by an EDCA AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP. The value of AIFSN[AC] shall be greater than or equal to 2 for non-AP STAs. The value of AIFSN[AC] shall be greater than or equal to 1 for APs. An EDCA TXOP is granted to an EDCAF when the EDCAF determines that it shall initiate the transmission of a frame exchange sequence. Transmission initiation shall be determined according to the following rules:

EDCAF operations shall be performed at slot boundaries, defined as follows on the primary channel, for each EDCAF:

- a) Following $\text{AIFSN[AC]} \times \text{aSlotTime} - \text{aRxTxTurnaroundTime}$ of idle medium after SIFS (not necessarily idle medium during the SIFS) after the last busy medium on the antenna that was the result of a reception of a frame with a correct FCS.
- b) Following EIFS – DIFS + AIFSN[AC] × aSlotTime + aSIFSTime – aRxTxTurnaroundTime of idle medium after the last indicated busy medium as determined by the physical CS mechanism that was the result of a frame reception that has resulted in FCS error, or PHY-RXEND.indication (RXERROR) primitive where the value of RXERROR is not NoError.
- c) When any other EDCAF at this STA transmitted a frame requiring acknowledgment, the earlier of
 - 1) The end of the AckTimeout interval timed from the PHY-TXEND.confirm primitive, followed by $\text{AIFSN[AC]} \times \text{aSlotTime} + \text{aSIFSTime} - \text{aRxTxTurnaroundTime}$ of idle medium, and
 - 2) The end of the first $\text{AIFSN[AC]} \times \text{aSlotTime} - \text{aRxTxTurnaroundTime}$ of idle medium after SIFS (not necessarily medium idle during the SIFS, the start of the SIFS implied by the length in the PHY header of the previous frame) when a PHY-RXEND.indication primitive occurs as specified in 10.3.2.9.
- d) Following $\text{AIFSN[AC]} \times \text{aSlotTime} - \text{aRxTxTurnaroundTime}$ of idle medium after SIFS (not necessarily medium idle during the SIFS) after the last busy medium on the antenna that was the result of a transmission of a frame for any EDCAF and which did not require an acknowledgment and after the expiration of the TXNAV timer if nonzero, and, if dot11MCCAActivated is true, the expiration of the RAV timer if nonzero.
- e) Following $\text{AIFSN[AC]} \times \text{aSlotTime} + \text{aSIFSTime} - \text{aRxTxTurnaroundTime}$ of idle medium after the last indicated busy medium as indicated by the CS mechanism that is not covered by a) to d).
- f) Following aSlotTime of idle medium, which occurs immediately after any of these conditions, a) to f), is met for the EDCAF.

On these specific slot boundaries, each EDCAF shall make a determination to perform one and only one of the following functions:

- Decrement the backoff timer.
- Initiate the transmission of a frame exchange sequence.
- Invoke the backoff procedure due to an internal collision.
- Do nothing.

NOTE—If an EDCAF gains access to the channel and transmits MSDUs, A-MSDUs, or MMPDUs from a secondary AC, the EDCAF of the secondary AC is not affected by this operation. If the EDCAF of a secondary AC experiences an internal collision with the EDCAF that gained access to the channel, it performs the backoff procedure regardless of the transmission of any of its MSDUs, A-MSDUs, or MMPDUs (see 10.22.2.6).

At each of the above-described specific slot boundaries, each EDCAF shall decrement the backoff timer if the backoff timer for that EDCAF has a nonzero value.

At each of the above-described specific slot boundaries, each EDCAF shall initiate a transmission sequence if

- There is a frame available for transmission at that EDCAF, and
- The backoff timer for that EDCAF has a value of 0, and

- Initiation of a transmission sequence is not allowed to commence at this time for an EDCAF of higher UP.

At each of the above-described specific slot boundaries, each EDCAF shall report an internal collision (which is handled in 10.22.2.4) if

- There is a frame available for transmission at that EDCAF, and
- The backoff timer for that EDCAF has a value of 0, and
- Initiation of a transmission sequence is allowed to commence at this time for an EDCAF of higher UP.

An example showing the relationship between AIFS, AIFSN, DIFS, and slot times immediately following a medium busy condition (and assuming that medium busy condition was not caused by a frame in error) is shown in Figure 10-26. In this case, with AIFSN = 2, the EDCAF may decrement the backoff counter for the first time at $2 \times$ aSlotTime following the TxSIFS (where TxSIFS is the time at which the MAC responds to the end of the medium busy condition if it is going to respond “after SIFS”). If, in this example, the backoff counter contained a value of 1 at the time the medium became idle, transmission would start as a result of an EDCA TXOP on-air at a time

$aSIFSTime + 3 \times aSlotTime$

following the end of the medium busy condition.

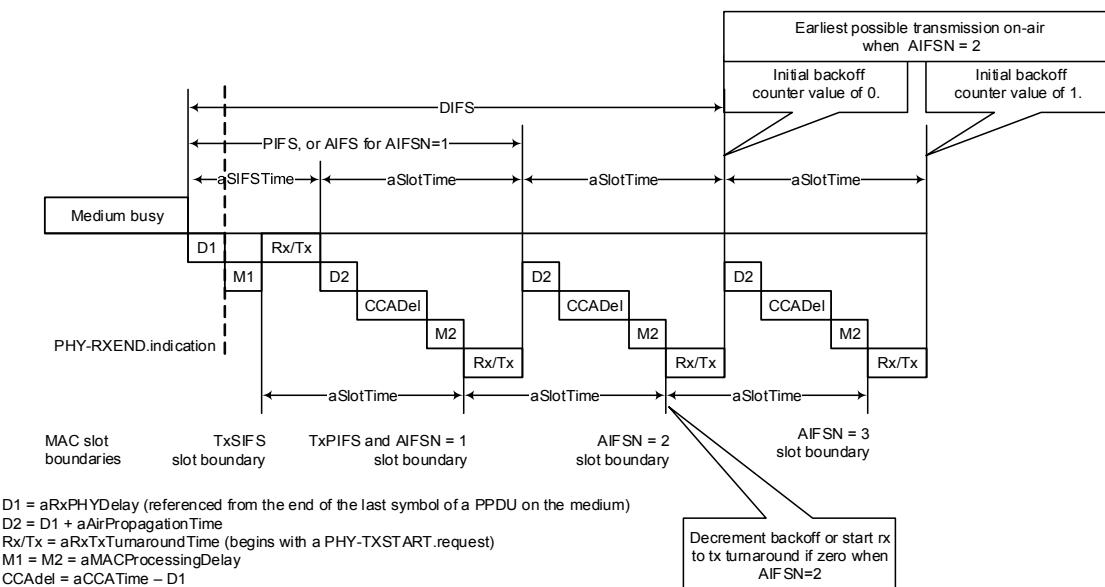

Figure 10-26—EDCA mechanism timing relationships

A STA shall save the TXOP holder address for the BSS in which it is associated, which is the MAC address from the Address 2 field of the frame that initiated a frame exchange sequence except when this is a CTS frame, in which case the TXOP holder address is the Address 1 field. If the TXOP holder address is obtained from a Control frame, a VHT STA shall save the nonbandwidth signaling TA value obtained from the Address 2 field. If a non-VHT STA receives an RTS frame with the RA address matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after SIFS, without regard for, and without resetting, its NAV. If a VHT STA receives an RTS frame with the RA address matching the MAC address of the STA and the nonbandwidth signaling TA value obtained from the Address 2 field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after SIFS, without regard for, and without

resetting, its NAV. When a STA receives a frame addressed to it that requires an immediate response, except for RTS, it shall transmit the response independent of its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

10.22.2.5 EDCA channel access in a VHT or TVHT BSS

If the MAC receives a PHY-CCA.indication primitive with the channel-list parameter present, the channels considered idle are defined in Table 10-10.

Table 10-10—Channels indicated idle by the channel-list parameter

| PHY-CCA.indication primitive channel-list element | Idle channels |
|---|--|
| primary | None |
| secondary | Primary 20 MHz channel |
| secondary40 | Primary 20 MHz channel and secondary 20 MHz channel |
| secondary80 | Primary 20 MHz channel, secondary 20 MHz channel, and secondary 40 MHz channel |

When a STA and the BSS, of which the STA is a member, both support multiple channel widths, an EDCA TXOP is obtained based solely on activity of the primary channel. “Idle medium” in this subclause means “idle primary channel.” Likewise “busy medium” means “busy primary channel.” Once an EDCA TXOP has been obtained according to this subclause, further constraints defined in 11.16.9 and 10.22.3 might limit the width of transmission during the TXOP or deny the channel access, based on the state of CCA on secondary channel, secondary 40 MHz channel, or secondary 80 MHz channel.

In the following description, the CCA is sampled according to the timing relationships defined in 10.3.7. Slot boundaries are determined solely by activity on the primary channel. “Channel idle for an interval of PIFS” means that the STATE parameter of the most recent PHY-CCA.indication primitive was IDLE, and no PHY-CCA.indication(BUSY) occurred during the period of PIFS that ends at the start of transmission, the CCA for that channel was determined to be idle.

If a STA is permitted to begin a TXOP (as defined in 10.22.2.4) and the STA has at least one MSDU pending for transmission for the AC of the permitted TXOP, the STA shall perform exactly one of the following actions:

- a) Transmit a 160 MHz or 80+80 MHz mask PPDU if the secondary channel, the secondary 40 MHz channel, and the secondary 80 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
- b) Transmit an 80 MHz mask PPDU on the primary 80 MHz channel if both the secondary channel and the secondary 40 MHz channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
- c) Transmit a 40 MHz mask PPDU on the primary 40 MHz channel if the secondary channel was idle during an interval of PIFS immediately preceding the start of the TXOP.
- d) Transmit a 20 MHz mask PPDU on the primary 20 MHz channel.
- e) Restart the channel access attempt by invoking the backoff procedure as specified in 10.22.2 as though the medium is busy on the primary channel as indicated by either physical or virtual CS and the backoff timer has a value of 0.

- f) Transmit a TVHT_4W or TVHT_2W+2W mask PPDU if the secondary TVHT_W channel and the secondary TVHT_2W channel were idle during an interval of PIFS immediately preceding the start of the TXOP.
- g) Transmit a TVHT_2W or TVHT_W+W mask PPDU if the secondary TVHT_W channel was idle during an interval of PIFS immediately preceding the start of the TXOP.
- h) Transmit a TVHT_W mask PPDU on the primary TVHT_W channel.

NOTE 1—In the case of rule e), the STA selects a new random number using the current value of CW[AC], and the retry counters are not updated (as described in 10.22.2.7; backoff procedure invoked for event a)).

NOTE 2—For both an HT and a VHT STA, an EDCA TXOP is obtained based on activity on the primary channel (see 10.22.2.4). The width of transmission is determined by the CCA status of the nonprimary channels during the PIFS interval before transmission (see VHT description in 10.3.2).

10.22.2.6 Sharing an EDCA TXOP

This mode applies only to an AP that supports DL-MU-MIMO. The AC associated with the EDCAF that gains an EDCA TXOP becomes the primary AC. TXOP sharing is allowed when primary AC traffic is transmitted in a VHT MU PPDU and resources permit traffic from secondary ACs to be included, targeting up to four STAs. The inclusion of secondary AC traffic in a VHT MU PPDU shall not increase the duration of the VHT MU PPDU beyond that required to transport the primary AC traffic. If a destination is targeted by frames in the queues of both the primary AC and at least one secondary AC, the frames in the primary AC queue shall be transmitted to the destination first, among a series of downlink transmissions within a TXOP. The decision of which secondary ACs and destinations are selected for TXOP sharing, as well as the order of transmissions, are implementation specific and out of scope of this standard.

When sharing, the TXOP limit that applies is the TXOP limit of the primary AC.

NOTE—An AP can protect an immediate response by preceding the VHT MU PPDU (which might have TXVECTOR parameter NUM_USERS > 1) with an RTS/CTS exchange or a CTS-to-self transmission.

An illustration of TXOP sharing is shown in Figure 10-27. In this figure, the AP has frames in queues of three of its ACs. It is assumed that the TXOP was obtained by AC_VI and is shared by AC_VO and AC_BE. It is also assumed that these frames are targeting three STAs, STA-1 to STA-3.

10.22.2.7 Multiple frame transmission in an EDCA TXOP

A frame exchange, in the context of multiple frame transmission in an EDCA TXOP, may be one of the following:

- A frame not requiring immediate acknowledgment (such as a group addressed frame or a frame transmitted with an acknowledgment policy that does not require immediate acknowledgment) or an A-MPDU containing only such frames
- A frame requiring acknowledgment (such as an individually addressed frame transmitted with an acknowledgment policy that requires immediate acknowledgment) or an A-MPDU containing at least one such frame, followed after SIFS by a corresponding acknowledgment frame
- Either
 - a VHT NDP Announcement frame followed after SIFS by a VHT NDP followed after SIFS by a PPDU containing one or more VHT Compressed Beamforming frames, or
 - a Beamforming Report Poll frame followed after SIFS by a PPDU containing one or more VHT Compressed Beamforming frames

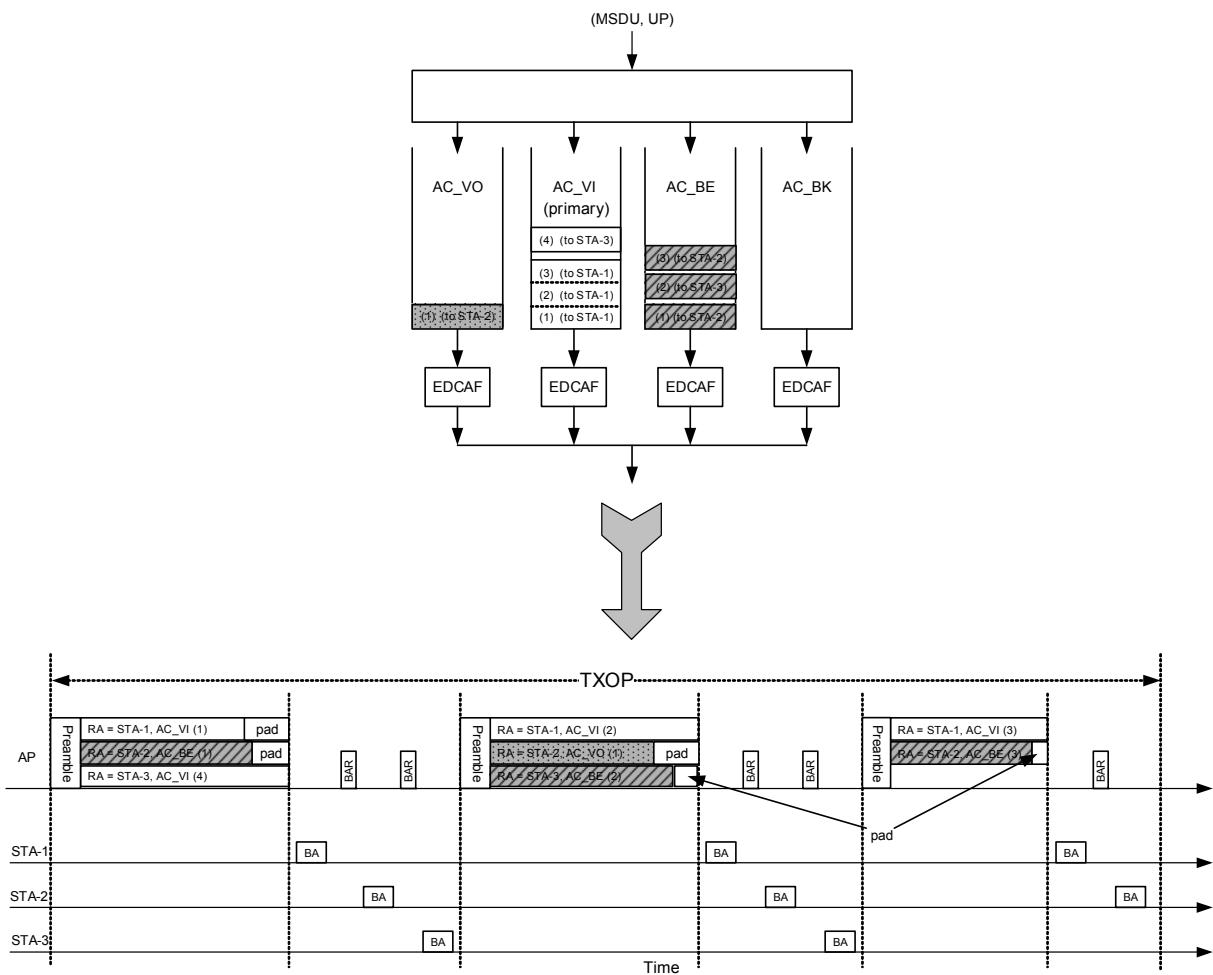

Figure 10-27—Illustration of TXOP sharing and PPDU construction

Multiple frames may be transmitted in an EDCA TXOP that was acquired following the rules in 10.22.2.4 if there is more than one frame pending in the primary AC for which the channel has been acquired. However, those frames that are pending in other ACs shall not be transmitted in this EDCA TXOP except when sent in a VHT MU PPDU with TXVECTOR parameter NUM_USERS > 1 and if allowed by the rules in 10.22.2.6. If a TXOP holder has in its transmit queue an additional frame of the primary AC and the duration of transmission of that frame plus any expected acknowledgment for that frame is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value, then the TXOP holder may commence transmission of that frame a SIFS (or RIFS, if the conditions defined in 10.3.2.3.2 are met) after the completion of the immediately preceding frame exchange sequence, subject to the TXOP limit restriction as described in 10.22.2.8. A STA shall not commence the transmission of an RTS with a bandwidth signaling TA until at least a PIFS after the immediately preceding frame exchange sequence. An HT STA that is a TXOP holder may transmit multiple MPDUs of the same AC within an A-MPDU as long as the duration of transmission of the A-MPDU plus any expected BlockAck frame response is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the remaining RAV timer value.

NOTE 1—PIFS is used by a VHT STA to perform CCA in the secondary 20 MHz, 40 MHz, and 80 MHz channels before receiving RTS (see 10.3.2).

NOTE 2—An RD responder can transmit multiple MPDUs as described in 10.28.4.

After a valid response (see Annex G) to the initial frame of a TXOP, if the Duration/ID field is set for multiple frame transmission and there is a subsequent transmission failure, the corresponding channel access function may transmit after the CS mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-26) provided that the duration of that transmission plus the duration of any expected acknowledgment and applicable IFS is less than the remaining TXNAV timer value and, if dot11MCCAActivated is true, the RAV timer. At the expiration of the TXNAV timer and if dot11MCCAActivated is true, the RAV timer, if the channel access function has not regained access to the medium, then the EDCAF shall invoke the backoff procedure that is described in 10.22.2.4. Transmission failure is defined in 10.22.2.11.

All other channel access functions at the STA shall treat the medium as busy until the expiration of the TXNAV timer.

Note that, as for an EDCA TXOP, a multiple frame transmission is granted to an EDCAF, not to a STA, so that the multiple frame transmission is permitted only for the transmission of a frame of the same AC as the frame that was granted the EDCA TXOP, unless the EDCA TXOP obtained is used by an AP for a PSMP sequence or a VHT MU PPDU with TXVECTOR parameter NUM_USERS > 1.

In the case of PSMP, this AC transmission restriction does not apply to either the AP or the STAs participating in the PSMP sequence, but the specific restrictions on transmission during a PSMP sequence described in 10.29 do apply.

If a TXOP is protected by an RTS or CTS frame carried in a non-HT or a non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU as follows:

- To be the same or narrower than RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the last received CTS frame in the same TXOP, if the RTS frame with a bandwidth signaling TA and TXVECTOR parameter DYN_BANDWIDTH_IN_NON_HT set to Dynamic has been sent by the TXOP holder in the last RTS/CTS exchange.
- Otherwise, to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the RTS frame that has been sent by the TXOP holder in the last RTS/CTS exchange in the same TXOP.

If there is no RTS/CTS exchange in non-HT duplicate format in a TXOP, and the TXOP includes at least one non-HT duplicate frame exchange that does not include a PS-Poll, then the TXOP holder shall set the CH_BANDWIDTH parameter in TXVECTOR of a PPDU sent after the first non-HT duplicate frame that is not a PS-Poll to be the same or narrower than the CH_BANDWIDTH parameter in TXVECTOR of the initial frame in the first non-HT duplicate frame exchange in the same TXOP.

If there is no non-HT duplicate frame exchange in a TXOP, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a non-initial PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the preceding PPDU that it has transmitted in the same TXOP.

If a TXOP is protected by a CTS-to-self frame carried in a non-HT or non-HT duplicate PPDU, the TXOP holder shall set the TXVECTOR parameter CH_BANDWIDTH of a PPDU to be the same or narrower than the TXVECTOR parameter CH_BANDWIDTH of the CTS-to-self frame in the same TXOP.

Note that when transmitting multiple frames in a TXOP using acknowledgment mechanisms other than Normal Ack, a protective mechanism should be used (such as RTS/CTS or the protection mechanism described in 10.26). A QoS AP or a mesh STA may send group addressed frames without using any protection mechanism. In a QoS IBSS, group addressed frames shall be sent one at a time, and backoff shall be performed after the transmission of each of the group addressed frames. In an MBSS, a mesh STA may send multiple group addressed frames in a TXOP, bounded by the TXOP limit, without performing backoff after the TXOP is obtained.

10.22.2.8 TXOP limits

The duration of a TXOP is the time a STA obtaining a TXOP (the TXOP holder) maintains uninterrupted control of the medium, and it includes the time required to transmit frames sent as an immediate response to TXOP holder transmissions. The TXOP holder shall, subject to the exceptions below, ensure that the duration of a TXOP does not exceed the TXOP limit, when nonzero.

The TXOP limits are advertised by the AP in the EDCA Parameter Set element in Beacon and Probe Response frames transmitted by the AP.

A TXOP limit of 0 indicates that the TXOP holder may transmit or cause to be transmitted (as responses) the following within the current TXOP:

- a) One of the following at any rate, subject to the rules in 10.7
 - 1) One or more SU PPDUs carrying fragments of a single MSDU or MMPDU
 - 2) An SU PPDU or a VHT MU PPDU carrying a single MSDU, a single MMPDU, a single A-MSDU, or a single A-MPDU
 - 3) A VHT MU PPDU carrying A-MPDUs to different users (a single A-MPDU to each user)
 - 4) A QoS Null frame or PS-Poll frame
- b) Any required acknowledgments
- c) Any frames required for protection, including one of the following:
 - 1) An RTS/CTS exchange
 - 2) CTS to itself
 - 3) Dual CTS as specified in 10.3.2.8
- d) Any frames required for beamforming as specified in 10.30, 10.34.5 and 10.38.
- e) Any frames required for link adaptation as specified in 10.31
- f) Any number of BlockAckReq frames

NOTE 1—This is a rule for the TXOP holder. A TXOP responder need not be aware of the TXOP limit nor of when the TXOP was started.

NOTE 2—This rule prevents the use of RD when the TXOP limit is 0.

When dot11OCBActivated is true, TXOP limits shall be 0 for each AC.

The TXOP holder may exceed the TXOP limit only if it does not transmit more than one Data or Management frame in the TXOP, and only for the following situations:

- Retransmission of an MPDU, not in an A-MPDU consisting of more than one MPDU
- Initial transmission of an MSDU under a block ack agreement, where the MSDU is not in an A-MPDU consisting of more than one MPDU and the MSDU is not in an A-MSDU
- Transmission of a Control MPDU or a QoS Null MPDU, not in an A-MPDU consisting of more than one MPDU
- Initial transmission of a fragment of an MSDU or MMPDU, if a previous fragment of that MSDU or MMPDU was retransmitted
- Transmission of a fragment of an MSDU or MMPDU fragmented into 16 fragments
- Transmission of an A-MPDU consisting of the initial transmission of a single MPDU not containing an MSDU and that is not an individually addressed Management frame
- Transmission of a group addressed MPDU, not in an A-MPDU consisting of more than one MPDU
- Transmission of a null data packet (NDP)

- Transmission of a VHT NDP Announcement frame and NDP or transmission of a Beamforming Report Poll frame, where these fit within the TXOP limit and it is only the response and the immediately preceding SIFS that cause the TXOP limit to be exceeded.

Except as described above, a STA shall fragment an individually addressed MSDU or MMPDU so that the initial transmission of the first fragment does not cause the TXOP limit to be exceeded.

NOTE—The TXOP limit is not exceeded for the following situations:

- Initial transmission of an MPDU containing an unfragmented though fragmentable (see 10.2.7) MSDU/MMPDU
- Initial transmission of the first fragment of a fragmented MSDU/MMPDU, except for an MSDU/MMPDU fragmented into 16 fragments
- Initial transmission of an A-MSDU
- Initial transmission of a fragment of a fragmented MSDU/MMPDU, if no previous fragment of that MSDU/MMPDU was retransmitted, except for an MSDU/MMPDU fragmented into 16 fragments
- Transmission of an A-MPDU consisting of a single MPDU containing an A MSDU or individually addressed Management frame, unless this is a retransmission of that MPDU
- Transmission of an A-MPDU consisting of more than one MPDU, even if some or all of the MPDUs are retransmissions

If the TXOP holder exceeds the TXOP limit, it should use as high a PHY rate as possible to minimize the duration of the TXOP.

The duration of a TXOP for a mesh STA that has dot11MCCAActivated true shall not exceed the time between the start of the TXOP and the end of the current MCCAOP reservation.

NOTE—The rules in this subclause also apply to priority-downgraded MSDUs and A-MSDUs (see 10.22.4.2).

10.22.2.9 Truncation of TXOP

When a STA gains access to the channel using EDCA and empties its transmission queue, it may transmit a CF-End frame provided that the remaining duration is long enough to transmit this frame. By transmitting the CF-End frame, the STA is explicitly indicating the completion of its TXOP. In a DMG BSS, the STA shall not send a CF-End frame with a nonzero value in the Duration/ID field if the remaining duration is shorter than $2 \times T_{CF-End} + 2 \times SIFS$, where T_{CF-End} is the duration of a CF-End frame.

A TXOP holder that transmits a CF-End frame shall not initiate any further frame exchange sequences within the current TXOP.

A non-AP STA that is not the TXOP holder shall not transmit a CF-End frame.

In a non-DMG BSS, a STA shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the PPDU containing this frame. After receiving a CF-End frame with a matching BSSID(TA) without comparing Individual/Group bit, an AP may respond by transmitting a CF-End frame after SIFS.

NOTE 1—The transmission of a single CF-End frame by the TXOP holder resets the NAV of STAs hearing the TXOP holder. There may be STAs that could hear the TXOP responder that had set their NAV that do not hear this NAV reset. Those STAs are prevented from contending for the medium until the original NAV reservation expires.

NOTE 2—A CF-End sent by a non-AP VHT STA that is a member of a VHT BSS can include the TXVECTOR parameter CH_BANDWIDTH_IN_NON_HT as defined in 10.7.6.6 in case it elicits a CF-End response.

In a DMG BSS, a STA that is not in the listening mode (10.36.6.6) shall interpret the reception of a CF-End frame as a NAV reset, i.e., it resets its NAV to 0 at the end of the time interval indicated in the value of the Duration/ID field of the received frame. The interval starts at PHY-RXEND.indication primitive of the frame reception. The STA shall not transmit during the interval if the RA field of the frame is not equal to the STA

MAC address. The STA may transmit a CF-End frame if the RA field of the received frame is equal to the STA MAC address and the value of the Duration/ID field in the received frame is not equal to 0.

Figure 10-28 shows an example of TXOP truncation. In this example, the STA accesses the medium using EDCA channel access and then transmits a nav-set sequence (e.g., RTS/CTS for non-DMG STAs or RTS/DMG CTS for DMG STAs) (using the terminology of Annex G). After a SIFS, it then transmits an initiator-sequence, which may involve the exchange of multiple PPDUs between the TXOP holder and TXOP responders. At the end of the second sequence, the TXOP holder has no more data that it can send that fits within the TXOP limit; therefore, it truncates the TXOP by transmitting a CF-End frame.

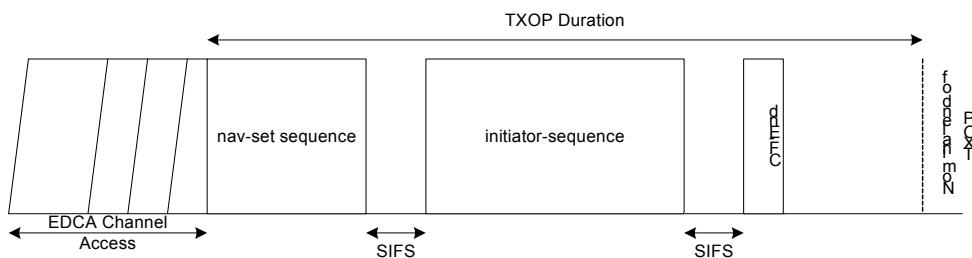

Figure 10-28—Example of TXOP truncation

Non-DMG STAs that receive a CF-End frame reset their NAV and can start contending for the medium without further delay. A DMG STA that receives a CF-End frame can start contending for the medium at the end of the time interval equal to the value in Duration/ID field of the frame if none of its NAVs has a nonzero value (10.36.10).

TXOP truncation shall not be used in combination with L-SIG TXOP protection when the HT Protection field of the HT Operation element is equal to nonmember protection mode or non-HT mixed mode.

10.22.2.10 Termination of TXOP

A TXOP holder that transmits a PPDU using one of the modulation classes in Table 10-11 should transmit a short control frame as the final transmission in a TXOP, under the conditions specified in Table 10-12.

Table 10-11—Modulation classes eligible for TXOP termination

| Modulation classes eligible for TXOP termination (see Table 10-6) |
|--|
| DSSS |
| HR/DSSS |
| ERP-OFDM |
| OFDM (20 MHz channel spacing) |
| HT |
| VHT |

Table 10-12—Rate and modulation class of a final transmission in a TXOP

| Modulation class and data rate of immediately preceding frame in TXOP | Rate and modulation class of final transmission |
|--|--|
| DSSS or HR/DSSS with long preamble, data rate > 1 Mb/s | 1 Mb/s DSSS |
| HR/DSSS with short preamble, data rate > 2 Mb/s | 2 Mb/s HR/DSSS short preamble |
| Other eligible modulation classes, data rate > 6 Mb/s | 6 Mb/s OFDM |

The final transmission can be a CF-End, or a CTS-to-self when no NAV needs to be truncated.

NOTE—The final transmission at the lowest data rate within the modulation class is needed because a final transmission at a higher rate can cause spurious EIFSs to occur, because the PHY header of such frames travels farther than the MPDU.

10.22.2.11 Retransmit procedures

10.22.2.11.1 General

A QoS STA shall maintain a short retry counter and a long retry counter for each MSDU, A-MSDU, or MMPDU that belongs to a TC that requires acknowledgment. The initial value for the short and long retry counters shall be 0. QoS STAs also maintain a short retry counter and a long retry counter for each AC. They are defined as QSRC[AC] and QLRC[AC], respectively, and each is initialized to a value of 0. When dot11RobustAVStreamingImplemented is true, a QoS STA shall maintain a short drop-eligible retry counter and a long drop-eligible retry counter for each AC. They are defined as QSDRC[AC] and QLDRC[AC], respectively, and each is initialized to a value of zero. APs with dot11RobustAVStreamingImplemented true and mesh STAs with dot11MeshGCRImplemented true, shall maintain an unsolicited retry counter.

After an RTS frame is transmitted to protect an MSDU or MMPDU, a QoS STA performs the CTS procedure, as defined in 10.3.2.7. If a valid CTS frame is not received, the short retry counter for the MSDU or MMPDU and the QSRC[AC] for the corresponding AC shall be incremented. If a valid CTS frame is received, the QSRC[AC] for the corresponding AC shall be reset to 0.

After transmitting a frame that requires an immediate acknowledgment, the STA shall perform either of the acknowledgment procedures, as appropriate, that are defined in 10.3.2.9 and 10.24.3. The short retry count for an MSDU or A-MSDU that is not part of a block ack agreement or for an MMPDU shall be incremented every time transmission of a frame in a PSDU of length less than or equal to dot11RTSThreshold fails for that MSDU, A-MSDU, or MMPDU. The unsolicited retry counter shall be incremented after the transmission of every A-MSDU that is transmitted using the GCR unsolicited retry retransmission policy.

QSRC[AC] shall be incremented every time transmission of an A-MPDU or frame in a PSDU of length less than or equal to dot11RTSThreshold fails, regardless of the presence or value of the DEI field. When dot11RobustAVStreamingImplemented is true, QSDRC[AC] shall be incremented every time transmission of an A-MPDU or frame in which the HT variant HT Control field is present, the DEI field is equal to 1 and the length of the PSDU is less than or equal to dot11RTSThreshold fails. This short retry count and the QoS STA QSRC[AC] shall be reset when an A-MPDU or frame of length in a PSDU less than or equal to dot11RTSThreshold succeeds. When dot11RobustAVStreamingImplemented is true, the QSDRC[AC] shall be reset when an A-MPDU or frame in a PSDU of length less than or equal to dot11RTSThreshold succeeds, regardless of the presence or value of the DEI field.

The long retry count for an MSDU or A-MSDU that is not part of a block ack agreement or for an MMPDU shall be incremented every time transmission of a MAC frame in a PSDU of length greater than dot11RTSThreshold fails for that MSDU, A-MSDU, or MMPDU.

QLRC[AC] shall be incremented every time transmission of an A-MPDU or frame in a PSDU of length greater than dot11RTSThreshold fails, regardless of the presence or value of the DEI field. This long retry count and the QLRC[AC] shall be reset when an A-MPDU or frame in a PSDU of length greater than dot11RTSThreshold succeeds. When dot11RobustAVStreamingImplemented is true, QLDRC[AC] shall be incremented every time transmission fails for an A-MPDU or frame in a PSDU of length greater than dot11RTSThreshold in which the HT variant HT Control field is present and the DEI field is equal to 1. The QLDRC[AC] shall be reset when an A-MPDU or frame in a PSDU of length greater than dot11RTSThreshold succeeds, regardless of the presence or value of the DEI field.

All retransmission attempts by a non-DMG STA for an MPDU with the Type subfield equal to Data or Management that is not sent under a block ack agreement and that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1. All retransmission attempts by a DMG STA for an MPDU with the Type subfield equal to Data or Management that has failed the acknowledgment procedure one or more times shall be made with the Retry subfield set to 1.

Retries for failed transmission attempts shall continue until one or more of the following conditions occurs:

- The short retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortRetryLimit.
- The long retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11LongRetryLimit.
- The short drop-eligible retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11ShortDEIRetryLimit.
- The long drop-eligible retry count for the MSDU, A-MSDU, or MMPDU is equal to dot11LongDEIRetryLimit.
- The unsolicited retry count for the A-MSDU is equal to dot11UnsolicitedRetryLimit.

When any of these limits is reached, retry attempts shall cease, and the MSDU, A-MSDU, or MMPDU shall be discarded.

For internal collisions occurring with the EDCA access method, the appropriate retry counters (short retry counter for MSDU, A-MSDU, or MMPDU and QSRC[AC] or long retry counter for MSDU, A-MSDU, or MMPDU and QLRC[AC]) are incremented. For internal collisions occurring with the EDCA access method where dot11RobustAVStreamingImplemented is true, the appropriate drop-eligible retry counters (QSDRRC[AC], and QLDRC[AC]) are incremented when the collision occurs for an MSDU, A-MSDU, or MMPDU that has drop eligibility equal to 1. For transmissions that use block ack, the rules in 10.24.3 also apply. A STA shall retry failed transmissions until the transmission is successful or until the relevant retry limit is reached.

With the exception of a frame belonging to a TID for which block ack agreement is set up, a QoS STA shall not initiate the transmission of any Management or Data frame to a specific RA while the transmission of another Management or Data frame with the same RA and having been assigned its sequence number from the same sequence counter has not yet completed to the point of success, retry fail, or other MAC discard (e.g., lifetime expiration).

A QoS STA shall maintain a transmit MSDU timer for each MSDU passed to the MAC. dot11EDCATableMSDULifetime specifies the maximum amount of time allowed to transmit an MSDU for a given AC. The transmit MSDU timer shall be started when the MSDU is passed to the MAC. If the value of this timer exceeds the appropriate entry in dot11EDCATableMSDULifetime, then the MSDU, or any remaining, undelivered fragments of that MSDU, shall be discarded by the source STA without any further attempt to complete delivery of that MSDU.

When A-MSDU aggregation is used, the HT STA maintains a single timer for the whole A-MSDU. The timer is restarted each time an MSDU is added to the A-MSDU. The result of this procedure is that no MSDU in the A-MSDU is discarded before a period of dot11EDCATableMSDULifetime has elapsed.

10.22.2.11.2 Unsolicited retry procedure

When using the GCR unsolicited retry retransmission policy for a group address, an AP or mesh STA may retransmit an MPDU to increase the probability of correct reception at the STAs that are listening to this group address (i.e., the group address is in their dot11GroupAddressesTable). The set of MPDUs that may be retransmitted is dependent upon whether block ack agreements are active with the STAs that are listening to this group address and is defined in 11.24.16.3.6. How an AP or a mesh STA chooses which MPDUs to retransmit is an implementation decision and beyond the scope of this standard.

A protective mechanism (such as a mechanism described in 10.26) should be used to reduce the probability of other STAs transmitting during the GCR TXOP. When using a protection mechanism that requires a response from another STA, the AP should select a STA that is a member of the GCR group.

The TXOP initiation rules defined in 10.22.2.2 and 10.22.3.3 shall be used for initiating a GCR TXOP. The duration of a GCR TXOP shall be subject to the TXOP limits defined in 10.22.2.8.

When transmitting MPDUs using the GCR service with retransmission policy equal to GCR unsolicited retry, the following rules apply:

- Following a MAC protection exchange that includes a response frame, in all GCR unsolicited retry retransmissions, the STA shall either transmit the frames within a GCR TXOP separated by SIFS or invoke its backoff procedure as defined in 10.22.2.2. The STA shall not transmit an MPDU and a retransmission of the same MPDU within the same GCR TXOP. The final frame transmitted within a GCR TXOP shall follow the backoff procedure defined in 10.22.2.2
- Without MAC protection or with MAC protection that lacks a response frame, in all transmissions, the STA shall invoke the backoff procedure defined in 10.22.2.2, using a value of CWmin[AC] for CW, at the PHY-TXEND.confirm primitive that follows the transmission of each unsolicited retry GCR MPDU.
- All retransmissions of an MPDU shall have the Retry subfield in their Frame Control fields set to 1.
- During a GCR TXOP, frames may be transmitted within the GCR TXOP that do not use the GCR unsolicited retry retransmission policy.

10.22.3 HCF controlled channel access (HCCA)

10.22.3.1 General

The HCCA mechanism manages access to the WM using an HC that has higher medium access priority than non-AP STAs. This allows it to transfer MSDUs to STAs and to allocate TXOPs to STAs.

The HC is a type of centralized coordinator, but differs from the PC used in PCF in several significant ways, although it may implement the functionality of a PC. Most important is that HCF frame exchange sequences may be used among STAs associated in an infrastructure BSS during both the CP and the CFP. Another significant difference is that the HC grants a STA a polled TXOP with duration specified in a QoS (+)CF-Poll frame. A STA may transmit multiple frame exchange sequences within given polled TXOPs, subject to the limit on TXOP duration.

All STAs inherently obey the NAV rules of the HCF because each frame transmitted under HCF contains a duration value chosen to cause STAs in the BSS to set their NAVs to protect the expected subsequent frames.

A non-AP QoS STA shall be able to respond to QoS (+)CF-Poll frames received from an HC with the Address 1 field matching their own addresses.

The HC shall perform delivery of buffered non-GCR-SP group addressed MSDUs/MMPDUs following DTIM Beacon frames. The HC may also operate as a PC, providing (non-QoS) CF-Polls to associated CF-Pollable STAs using the frame formats, frame exchange sequences, and other applicable rules for PCF specified in 10.4.³¹

An HC may perform a backoff following an interruption of a frame exchange sequence due to lack of an expected response under the rules described in 10.22.3.2.4, using the parameters dot11HCCWmin, dot11HCCWmax, and dot11HCCAIFSN and the backoff rules in 10.2 and 10.22.2.2. The decision to perform a backoff by the HC is dependent on conditions such as interference from an overlapping BSS. The mechanism to detect the interference from an overlapping BSS and the decision to perform a backoff, DFS (such as in 11.6), or other techniques (such as inter-BSS scheduling) is beyond the scope of this standard.

10.22.3.2 HCCA procedure

10.22.3.2.1 General

The HC gains control of the WM as needed to send QoS traffic and to issue QoS (+)CF-Poll frames to STAs by waiting a shorter time between transmissions than the STAs using the EDCA procedures. The duration values used in QoS frame exchange sequences reserve the medium to permit completion of the current sequence.

The HC may include a CF Parameter Set element in the Beacon frames it generates. This causes the BSS to appear to be a point-coordinated BSS to STAs. This causes STAs to set their NAVs to the CFPDurRemaining value in the CF Parameter Set element value at TBTT, as specified in 10.4.4.3. This prevents most contention in the CFP by preventing nonpolled transmissions by STAs regardless of whether they are CF-Pollable.

10.22.3.2.2 CFP generation

The HC may function as a PC that uses the CFP for delivery, generating a CFP as shown in Figure 10-20, with the restriction that the CFP initiated by an HC shall end with a CF-End frame. The HC may also issue QoS (+)CF-Poll frames to associated STAs during the CFP. However, because the HC can also grant polled TXOPs, by sending QoS (+)CF-Poll frames, during the CP, the HC might not use the CFP for QoS data transfers.

Only an AP that also issues non-QoS CF-Poll frames to associated CF-Pollable A STA may end a CFP with a CF-End +CF-Ack frame and only when the CF-End +CF-Ack is acknowledging a reception from a CF-Pollable non-QoS STA. The use of a non-QoS CF-Poll frame by an AP to a QoS STA is deprecated (for further discussion; see 9.4.1.4).

10.22.3.2.3 CAP generation

When the HC needs access to the WM to start a CFP or a TXOP in CP, the HC shall sense the WM. When the WM is determined to be idle at the TxPIFS slot boundary as defined in 10.3.7, the HC shall transmit the first frame of any permitted frame exchange sequence, with the duration value set to cover the CFP or the TXOP. An HCCA TXOP shall not extend across a TBTT. The occurrence of a TBTT implies the end of the HCCA TXOP, after which the regular channel access procedure (EDCA or HCCA) is resumed. It is possible that no frame was transmitted during the TXOP. The shortened termination of the HCCA TXOP does not imply an error condition. The first permitted frame in a CFP after a TBTT is the Beacon frame. CAPs along with the CFPs and the CPs are illustrated in Figure 10-29.

³¹Attempting to intersperse HCF frame exchange sequences and PCF frame exchange sequences in a single CFP might be extremely complex.

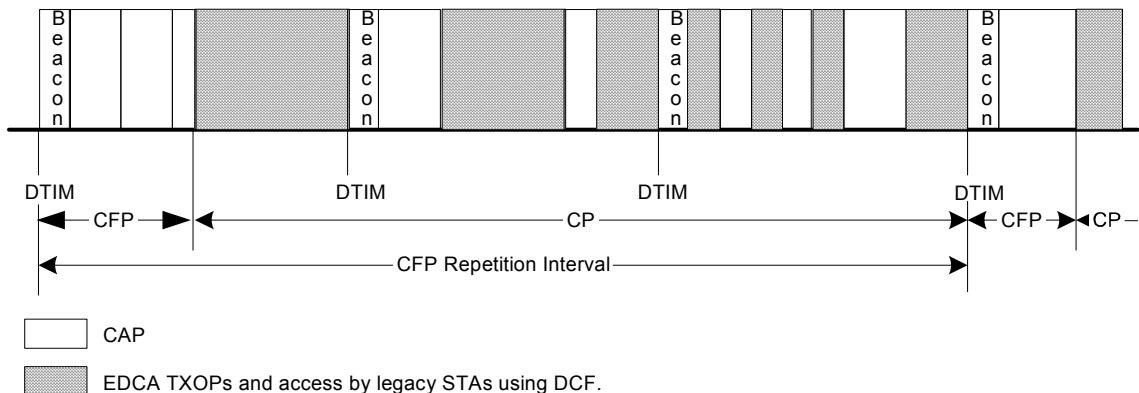

Figure 10-29—CAP/CFP/CP periods

After the last frame of all other nonfinal frame exchange sequences (e.g., sequences that convey individually addressed QoS Data or Management frames) during a TXOP, the holder of the current TXOP shall wait for one SIFS before transmitting the first frame of the next frame exchange sequence. The HC may sense the channel and reclaim the channel if the WM is determined to be idle at the TxPIFS slot boundary after the TXOP (see Figure 10-26). A CAP ends when the HC does not reclaim the channel at the TxPIFS slot boundary after the end of a TXOP.

10.22.3.2.4 Recovery from the absence of an expected reception

This subclause describes recovery from the absence of an expected reception in a CAP. Note that the recovery rules from the absence of an expected reception are different from EDCA because in this case the NAVs of all of the STAs in the BSS have already been set up by the transmissions by the HC. The recovery rules for the multiple frame transmission are different because a STA may always be hidden and may have not set its NAV due to the transmission by another STA. Finally, since an HC is collocated with the AP, the AP may recover using the rules described in this subclause even if the recovery is from the absence of an expected reception.

The beginning of reception of an expected response is detected by the occurrence of PHY-CCA.indication(BUSY,channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes “primary.”

If the beginning of such reception does not occur during the first slot time following a SIFS, then:³²

- If the transmitting STA is the HC, it may initiate recovery by transmitting at the TxPIFS slot boundary after the end of the HC’s last transmission only if the PHY-CCA state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary as shown in 10-19.
- If the transmitting STA is a non-AP QoS STA, and there is an MPDU for transmission, it shall initiate recovery by transmitting at a PIFS after the end of the last transmission if the PHY-CCA state indicates IDLE during the CCAdel period preceding the TxPIFS slot boundary, the polled TXOP limit is nonzero and at least one frame (re)transmissions can be completed within the remaining duration of a nonzero polled TXOP limit.

³² This restriction is intended to avoid collisions due to inconsistent CCA reports in different STAs, not to optimize the bandwidth usage efficiency.

If the transmitted frame is not of type QoS (+)CF-Poll and the expected response frame is not received correctly, regardless of the occurrence of the PHY-RXSTART.indication primitive, the QoS STA may initiate recovery following the occurrence of PHY-CCA.indication(IDLE) primitive so that a SIFS occurs between the last energy on the WM and the transmission of the recovery frame.

When there is a transmission failure within a polled TXOP, the long or short retry counter (as described in 10.22.2.11) corresponding to the AC of the failed MSDU or MMPDU shall be incremented. An MPDU belonging to a TC is subject to the respective retry limit as well as the dot11EDCATableMSDULifetime and is discarded when either of them is exceeded. An MPDU belonging to a TS with a specified delay bound is subject to delay bound and is discarded if the MPDU could not be transmitted successfully since it has been delivered to the MAC. An MPDU belonging to a TS with an unspecified delay is subject to dot11MaxTransmitMSDULifetime and is discarded when it is exceeded.

Non-AP STAs that receive a QoS (+)CF-Poll frame shall respond within a SIFS, regardless of the NAV setting. If a response is not received but a PHY-CCA.indication(BUSY) primitive occurs during the slot following a SIFS and is followed by a PHY-RXSTART.indication or PHY-RXEND.indication primitive prior to a PHY-CCA.indication(IDLE) primitive, then the HC assumes that the transmitted QoS (+)CF-Poll frame was received by the polled STA. In the cases of QoS Data +CF-Poll, QoS Data +CF-Ack +CF-Poll, or QoS CF-Ack +CF-Poll, the PHY-CCA.indication(BUSY) primitive is used only to determine whether the transfer of control of the channel has been successful. The PHY-CCA.indication(BUSY) primitive is not used for determining the success or failure of the transmission. If the CF-Poll is piggybacked onto a QoS Data frame, the HC may have to retransmit that QoS Data frame subsequently.

If an HC receives a frame from a STA with a duration/ID covering only the response frame, the HC shall assume that the STA is terminating its TXOP, and the HC may initiate other transmissions, send a CF-End frame (see 10.22.3.4), or allow the channel to go into the CP.

If a polled QoS STA has no queued traffic to send or if the MPDUs available to send are too long to be transmitted within the specified TXOP limit, the QoS STA shall send a QoS (+)Null frame. In the case of no queued traffic, this QoS (+)Null frame shall have a QoS Control field that reports a queue size of 0 for any TID with the duration/ID set to the time required for the transmission of one Ack frame, plus one SIFS. In the case of insufficient TXOP size, such as when the maximum MSDU size is not specified, this QoS (+)Null frame shall have a QoS Control field that contains the TID and TXOP duration or a nonzero queue size needed to send the MPDU that is ready for transmission. When a queue size is transmitted, the HC shall combine the queue size information with the rate of the received QoS (+)Null frame to determine the required size of the requested TXOP.

Within a polled TXOP, the unused portion of TXOPs shall not be used by the STA and may be reallocated by the HC as follows:

- a) The recipient of the final frame, with the Ack Policy subfield equal to Normal Ack, shall be the HC if there will be time remaining in the TXOP after the transmission of the final frame and its expected Ack frame. If there are no frames to be sent to the HC, then the QoS STA shall send to the HC a QoS Null with the Queue Size subfield in the QoS Control field set to 0.
 - 1) If a PHY-CCA.indication(BUSY) primitive occurs at the STA that is expecting the Ack frame during the first slot following a SIFS after the end of the transmission of the final frame, it shall be interpreted as indicating that the channel control has been successfully transferred and no further frames shall be transmitted by the STA in the TXOP, even though the Ack frame from HC may be incorrectly received.³³
 - 2) If the beginning of the reception of an expected Ack frame to the final frame does not occur, detected as the nonoccurrence of the PHY-CCA.indication(BUSY) primitive at the QoS STA

³³Note that while the PHY-CCA.indication(BUSY) primitive is used in this instance to determine the control of the channel, it is not used for determining the success or failure of the transmission.

that is expecting the response during the first slot time following a SIFS, the QoS STA shall retransmit the frame or transmit a QoS Null frame, with the Ack Policy subfield set to Normal Ack and the Queue Size subfield set to 0, after PIFS from the end of last transmission, until such time that it receives an acknowledgment or when there is not enough time remaining in the TXOP for sending such a frame.³⁴

- b) If there is not enough time within the unused portion of the TXOP to transmit either the QoS Null frame or the frame with the Duration/ID field covering only the response frame, then the STA shall cease control of the channel.³⁵

10.22.3.3 HCCA TXOP structure and timing

Any QoS Data frame of a subtype that includes CF-Poll contains a TXOP limit in its QoS Control field. The ensuing polled TXOP is protected by the NAV set by the Duration field of the frame that contained the QoS (+)CF-Poll function, as shown in Figure 10-30. Within a polled TXOP, a STA may initiate the transmission of one or more frame exchange sequences, with all such sequences nominally separated by a SIFS. The STA shall not initiate transmission of a frame unless the transmission and any acknowledgment or other immediate response expected from the peer MAC entity are able to complete prior to the end of the remaining TXOP duration. All transmissions, including response frames, within the polled TXOP are considered to be the part of the TXOP, and the HC shall account for these when setting the TXOP limit. If the TXOP Limit subfield in the QoS Control field of the QoS Data frame that includes CF-Poll is equal to 0, then the STA to which the frame is directed to shall respond with either one MPDU or one QoS Null frame.

A TXOP or transmission within a TXOP shall not extend across TBTT, dot11CFPMaxDuration (if during CFP), or dot11CAPLimit. The HC shall verify that the full duration of any granted TXOP meets these requirements so that a STA may use the time prior to the TXOP limit of a polled TXOP without checking for these constraints. Subject to these limitations, all decisions regarding what MSDUs, A-MSDUs, and/or MMPDUs are transmitted during any given TXOP are made by the STA that holds the TXOP.^{36,37}

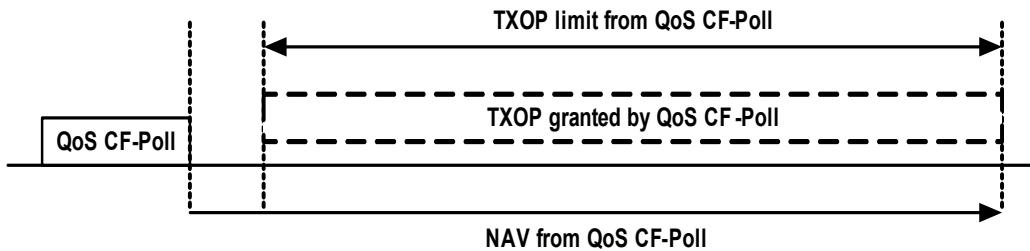

Figure 10-30—Polled TXOP

³⁴This is to avoid the situation where the HC might not receive the frame and might result in an inefficient use of the channel.

³⁵In this case the channel is not accessed until the NAVs expire at all of the STAs.

³⁶In certain regulatory domains, channel sensing needs to be done at periodic intervals (for example, in Japan, this period is 4 ms). This means that the duration of a TXOP in these regulatory domains might not be more than this periodic interval. In order to extend the TXOP beyond the limit implied by this periodic interval, the TXOP holder needs to sense the channel at least once in the limit imposed in the regulatory domain, by waiting for at least for the duration of one PIFS during which it senses the channel. If it does not detect any energy, it may continue by sending the next frame. In other words, the total TXOP size assigned should include an extra time allocated (i.e., $n \times \text{aSlotTime}$, where n is the number of times the STA needs to sense the channel) and is given by $\lfloor \text{TXOP limit}/\text{limit imposed in the regulatory domain} \rfloor$.

³⁷The TID value in the QoS Control field of a QoS Data +CF-Poll frame pertains only to the MSDU or fragment thereof in the Frame Body field of that frame. This TID value does not pertain to the TXOP limit value and does not place any constraints on what frame(s) the addressed STA may send in the granted TXOP.

10.22.3.4 NAV operation of a TXOP under HCCA

An HC shall set its own NAV to prevent it from transmitting during a TXOP that it has granted to a STA through an HCCA poll. However, the HC may reclaim the TXOP if a STA is not using it or ends the TXOP early (see 10.22.3.2.4).

In a CFP or CP, if the HC has no more STAs to poll and it has no more Data, Management, BlockAckReq, or BlockAck frames to send, it may reset the NAVs of all QoS STAs in the BSS by sending a QoS CF-Poll frame with the RA matching its own MAC address and with the Duration/ID field set to 0. When the AP contains a PC, during the CFP, it may reset the NAVs of all receiving STAs by sending a CF-End frame, regardless of how the NAVs have been originally set.

A STA that receives a QoS (+)CF-Poll frame with a MAC address in the Address 1 field that matches the HC's MAC address and the Duration/ID field value equal to 0 shall reset the NAV value to 0.

NOTE—A STA resets its NAV when it receives a CF-End or CF-End +CF-Ack frame according to the procedures described in 10.4.3.3.

When a STA receives a QoS (+)CF-Poll frame containing the BSSID of the BSS in which the STA is associated, that STA shall update the NAV if necessary and shall save the TXOP holder address for that BSS, which is the MAC address from the Address 1 field of the frame containing the QoS (+)CF-Poll. If an RTS frame is received with the RA address matching the MAC address of the STA and the MAC address in the TA field in the RTS frame matches the saved TXOP holder address, then the STA shall send the CTS frame after SIFS, without regard for, and without resetting, its NAV. The saved TXOP holder address shall be cleared when the NAV is reset or when the NAV counts down to 0.

When a STA receives a frame addressed to it and requires an acknowledgment, it shall respond with an Ack or QoS +CF-Ack frame independent of its NAV. A non-AP STA shall accept a polled TXOP by initiating a frame exchange sequence independent of its NAV.

10.22.3.5 HCCA transfer rules

10.22.3.5.1 General

A TXOP obtained by receiving a QoS (+)CF-Poll frame uses the specified TXOP limit consisting of one or more frame exchange sequences with the sole time-related restriction being that the final sequence shall end not later than the TXOP limit. In QoS CF-Poll and QoS CF-Ack +CF-Poll frames, the TID subfield in the QoS Control field indicates the TS for which the poll is intended. The requirement to respond to that TID is nonbinding, and a STA may respond with any frame. Upon receiving a QoS (+)CF-Poll frame, a STA may send any frames, i.e., QoS Data frames belonging to any TID as well as Management frames in the obtained TXOP. MSDUs may be fragmented in order to fit within TXOPs.

The QoS CF-Poll frames shall be sent only by an HC. Non-AP STAs are not allowed to send QoS (+)CF-Poll frames. A STA shall not send QoS (+)Data frames in response to any Data frame other than the QoS (+)CF-Poll frames.

The TXOP limit is inclusive of the PHY and IFS overhead, and an AP should account for the overhead when granting TXOPs.

If a STA has set up at least one TS for which the Aggregation subfield in the associated TSPEC is equal to 0, the AP shall use only QoS CF-Poll or QoS CF-Ack +CF-Poll frames to poll the STA and shall never use QoS (+)Data +CF-Poll to poll the STA. Note that although QoS (+)CF-Poll is a Data frame, but it should be transmitted at one of the rates in the BSSBasicRateSet parameter in order to set the NAV of all STAs that are not being polled (see 10.7). If a CF-Poll is piggybacked with a QoS Data frame, then the frame containing all

or part of an MSDU or A-MSDU may be transmitted at a rate that is below the negotiated minimum PHY rate in the TSPEC related to that data.

A QoS STA shall use QoS Data frames for all MSDU transfers to another QoS STA. The TID in the QoS Control fields of these frames shall indicate the TC or TS to which the MPDU belongs. Furthermore, either the Queue Size subfield shall indicate the amount of queued traffic present in the output queue that the STA uses for traffic belonging to this TC or TS, or the TXOP Duration Requested subfield shall indicate the duration that the STA requests for use in the next TXOP for traffic belonging to this TC or TS. The queue size value reflects the amount on the appropriate queue not including the present MPDU. The queue size value may remain constant in all QoS Data frames that carry fragments of the same MSDU even if the amount of queued traffic changes as successive fragments are transmitted. In order to inform the HC of queue status, a STA may use the QoS Null frame indicating the TID and the queue size or TXOP duration request (also see 10.22.3.5.2).

A QoS STA shall be able to receive QoS +CF-Ack frames. The HC may use QoS Data +CF-Ack frames to send frames to the same STA a SIFS after receiving the final transmission of the previous TXOP. The HC may also use QoS Data +CF-Ack frames to send frames to any other STA a SIFS after receiving the final transmission of the previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1. In both CFP and CP, a STA shall respond to QoS Data frames having the Ack Policy subfield in the QoS Control field equal to Normal Ack with an Ack frame, unless the acknowledgment is piggybacked in which case it shall use a QoS +CF-Ack frame. Piggybacked frames are allowed only in CFP or within TXOPs initiated by the HC. The HC shall not send a QoS Data frame containing a +CF-Ack with an Address 1 that does not correspond to the address of the STA for which the +CF-Ack is intended, unless the STA to which the +CF-Ack is intended, sets the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame. STAs are not required to be able to transmit QoS Data frames with subtypes that include +CF-Ack.

An AP that has dot11QAckOptionImplemented true may allow associations with STAs advertising support for the Q-Ack option. Such associations do not require the AP to employ piggyback acknowledgments directed toward that associated STA in frames that are not directed to that associated STA. A QoS STA shall be able to process received QoS Data frames with subtypes that include +CF-Ack when the STA to which the acknowledgment is directed is the same as the STA addressed by the Address 1 field of that Data frame. A STA that does not set the Q-Ack subfield to 1 in the QoS Capability element in the (Re)Association Request frame is not required to handle the received QoS (+)Data +CF-Ack frames that are addressed to other STAs. The net effect of these restrictions on the use of QoS +CF-Ack frames is that the principal QoS +CF-Ack subtype that is useful is the QoS Data +CF-Ack frame, which can be sent by a STA as the first frame in a polled TXOP when that TXOP was conveyed in a QoS Data +CF-Poll (+CF-Ack) frame and the outgoing frame is directed to the HC's STA address. QoS (Data+)CF-Poll +CF-Ack frames are useful to allow the HC to grant another TXOP to the same STA a SIFS after receiving the final transmission of that STA's previous TXOP. QoS (Data+)CF-Poll +CF-Ack frames are also useful to allow the HC to grant another TXOP to a different STA a SIFS after receiving the final transmission of a STA's previous TXOP, if the STA that sent the final transmission of the previous TXOP has set the Q-Ack subfield in the QoS Capability element in the (Re)Association Request frame to 1.

HCF contention based channel access shall not be used to transmit MSDUs belonging to an established TS (with the HC's acceptance of the associated TSPEC), unless the granted TSPEC indicates it is permitted to do so when the Access Policy subfield of the TS Info field is equal to "HCCA, EDCA mixed mode" (HEMM), the polled STA utilized the full TXOP provided by the HC, and it has more MPDUs to send. When this STA sends frames belonging to a TS using contention based channel access, it shall encode the TID subfield in the QoS Data frame with the TID associated with the TS. When the AP grants a TSPEC with the Access Policy subfield equal to HEMM and if the corresponding AC needs admission control, the AP shall include the medium time that specifies the granted time for EDCA access in the ADDTS Response frame.

10.22.3.5.2 TXOP requests

STAs may send TXOP requests during polled TXOPs or EDCA TXOPs using the QoS Control field in a QoS Data frame or a QoS Null frame directed to the HC, with the TXOP Duration Requested or Queue Size subfield value and TID subfield value indicated to the HC. APs indicate whether they process TXOP request or queue size in the QoS Info field in the Beacon, Probe Response, and (Re)Association Response frames. An AP shall process requests in at least one format. The AP may reallocate TXOPs if the request belongs to TS or update the EDCA parameter set if the above request belongs to TC. A STA shall use only the request format that the AP indicates it can process.

TXOP Duration Requested subfield values are not cumulative. A TXOP duration requested for a particular TID supersedes any prior TXOP duration requested for that TID. A value of 0 in the TXOP Duration Requested subfield may be used to cancel a pending unsatisfied TXOP request when its MSDU is no longer queued for transmission. The TXOP duration requested is inclusive of the PHY and IFS overhead, and a STA should account for this when attempting to determine whether a given transmission fits within a specified TXOP duration.

The AP may choose to assign a TXOP duration shorter than that requested in the TXOP Duration Requested subfield.

Even if the value of TXOP Duration Requested subfield or Queue Size subfield in a QoS Data frame is 0, the HC shall continue to poll according to the negotiated schedule.

10.22.3.5.3 Use of RTS/CTS

In order to provide improved NAV protection, a STA may send an RTS frame as the first frame of any frame exchange sequence, during either the CP or CFP, and without regard for dot11RTSThreshold.³⁸

If a QoS STA sends an RTS frame and does not receive an expected CTS frame, then the recovery rules are as specified in 10.22.3.2.4.

In order to provide NAV protection for a transmission to the AP in response to a QoS Data frame with a subtype that includes CF-Poll, the polled STA may send a CTS frame with the RA containing its own MAC.

NOTE 1—The CTS frame is shorter than a QoS Data frame and has a higher probability that it will be received by other STAs.

NOTE 2—The transmission of the CTS sets the NAV in its own vicinity without the extra time required to send an RTS frame.³⁹

10.22.3.5.4 HCCA transfer rules for a VHT STA

A VHT STA that is a member of a BSS that supports multiple channel widths is granted a TXOP for a specified duration and for a channel width that is equal to the channel width of the frame containing the QoS CF-Poll.

³⁸The sending of an RTS frame during the CFP is usually unnecessary, but might be used to confirm that the addressed recipient QoS STA is within range and awake and to elicit a CTS frame response that sets the NAV at STAs in the vicinity of the addressed recipient. This is useful when there are nearby STAs that are members of other BSSs and are out of range to receive Beacon frames from this BSS. Sending an RTS frame during the CFP is useful only when the recipient is a QoS STA, because a non-QoS STA in the same BSS has its NAV set to protect the CFP, which renders those non-QoS STAs unable to respond. Using the same duration calculation during the CFP as specified for the CP is directly applicable for all cases except when the RTS frame is sent by the HC and the following frame includes a QoS (+)CF-Poll.

³⁹This is unnecessary because the NAVs in the vicinity of the QoS AP were set by the QoS (+)CF-Poll frame.

10.22.4 Admission control at the HC

10.22.4.1 General

An IEEE 802.11 network may use admission control to administer policy or regulate the available bandwidth resources. Admission control is used to attempt to provide a guarantee of the amount of time that a STA has available to access the channel. The HC, which is in the AP, is used to administer admission control in the network. As the QoS facility supports two access mechanisms, there are two distinct admission control mechanisms: one for contention based access and another for controlled access.

Admission control, in general, depends on vendors' implementation of the scheduler, available channel capacity, link conditions, retransmission limits, and the scheduling requirements of a given stream. All of these criteria affect the admissibility of a given stream. If the HC has admitted no streams that require polling, it might not find it necessary to perform the scheduler or related HC functions.

10.22.4.2 Contention based admission control procedures

10.22.4.2.1 General

A non-AP STA may support admission control procedures in 10.22.4.2.3 to send frames in the AC where admission control is mandated; but, if it does not support that procedure and dot11RejectUnadmittedTraffic is false or not present, it shall use EDCA parameters of a lower priority AC, as indicated in Table 10-1, that does not require admission control. When a STA uses the EDCA parameters of a lower AC for this purpose, it affects only the EDCA parameters used for channel access, i.e., it has no effect on the contents of the transmitted frame. An AP shall support admission control procedures, at least to the minimal extent of advertising that admission is not mandatory on its ACs.

The AP uses the ACM (admission control mandatory) subfields advertised in the EDCA Parameter Set element to indicate whether admission control is required for each of the ACs. While the CWmin, CWmax, AIFS, and TXOP limit parameters may be adjusted over time by the AP, the ACM bit shall be static for the duration of the lifetime of the BSS. A STA shall transmit an ADDTS Request frame to the HC in order to request admission of traffic in any direction (i.e., uplink, downlink, direct, or bidirectional) employing an AC that requires admission control. The ADDTS Request frame shall contain the UP associated with the traffic and shall indicate EDCA as the access policy. The AP shall associate the received UP of the ADDTS Request frame with the appropriate AC per the UP-to-AC mappings described in 10.2.4.2. The STA may transmit unadmitted traffic for the ACs for which the AP does not require admission control. If dot11RejectUnadmittedTraffic is false, a STA may send data without admission control for an AC that mandates admission control by using the EDCA parameters that correspond to a lower priority AC that does not require admission control. When a STA uses a lower priority AC for this purpose, the lower priority AC affects only the EDCA parameters used for channel access, i.e., it has no effect on the contents of the transmitted frame. All ACs with priority higher than that of an AC with an ACM flag equal to 1 should have the ACM flag set to 1. The HC contained within an AP when dot11SSPNIInterfaceActivated is true shall admit a non-AP STA's request based on dot11NonAPStationAuthAccessCategories stored in that non-AP STA's dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies the EDCA access classes and throughput limitations on each access class for which a non-AP STA is permitted to transmit.

10.22.4.2.2 Procedures at the AP

Regardless of the AC's ACM setting, the AP shall respond to an ADDTS Request frame with an ADDTS Response frame that may be to accept or deny the request. On receipt of an ADDTS Request frame from a non-AP STA, the AP shall make a determination about whether to:

- a) Accept the request, or
- b) Deny the request.

The algorithm used by the AP to make this determination is implementation dependent. An AP when dot11SSPNInterfaceActivated is true shall use the policies delivered by the SSPN that are stored in the dot11InterworkingEntry, which is part of the dot11InterworkingTable. If the AP decides to accept the request, the AP shall also derive the medium time from the information conveyed in the TSPEC element in the ADDTS Request frame. The AP may use any algorithm in deriving the medium time, but K.2.2 provides a procedure that may be used. Having made such a determination, the AP shall transmit a TSPEC element to the requesting non-AP STA contained in an ADDTS Response frame. If the AP is accepting the request, the Medium Time field shall be specified. If the AP is accepting a request for a downlink TS, the Medium Time field shall be set to 0. If the AP is accepting a request corresponding to an AC for which ACM is 0 (e.g., the TSPEC is to change APSD behavior), the Medium Time field shall be set to 0.

10.22.4.2.3 Procedure at non-AP STAs

Each EDCAF shall maintain two variables: admitted_time and used_time.

The admitted_time and used_time shall be set to 0 at the time of (re)association. The STA may subsequently decide to explicitly request medium time for the AC that is associated with the specified priority.

In order to make such a request, the STA shall transmit a TSPEC element contained in an ADDTS Request frame with the following fields specified (i.e., nonzero): Nominal MSDU Size, Mean Data Rate, Minimum PHY Rate, Inactivity Interval, and Surplus Bandwidth Allowance. The Medium Time field is not used in the request frame and shall be set to 0.

On receipt of a TSPEC element contained in an ADDTS Response frame indicating that the request has been accepted, the STA shall recompute the admitted_time for the specified EDCAF as follows:

$$\text{admitted_time} = \text{admitted_time} + \text{dot11EDCAAveragePeriod} \times \text{medium time of TSPEC}.$$

The STA may choose to tear down the explicit request at any time. For the teardown of an explicit admission, the STA shall transmit a DELTS frame containing the TSID and direction that specify the TSPEC to the AP.

If the STA sends or receives a DELTS frame, it shall recompute the admitted_time for the specified EDCAF as follows:

$$\text{admitted_time} = \text{admitted_time} - \text{dot11EDCAAveragePeriod} \times \text{medium time of TSPEC}.$$

To describe the behavior at the STA, two parameters are defined. The parameter used_time signifies the amount of time used, in units of 32 μ s, by the STA in dot11EDCAAveragePeriod. The parameter admitted_time is the medium time allowed by the AP, in units of 32 μ s, in dot11EDCAAveragePeriod. The STA shall update the value of used_time:

- a) At dot11EDCAAveragePeriod second intervals

$$\text{used_time} = \max((\text{used_time} - \text{admitted_time}), 0)$$
- b) After each successful or unsuccessful MPDU (re)transmission attempt,

$$\text{used_time} = \text{used_time} + \text{MPDUExchangeTime}$$

The MPDUExchangeTime equals the time required to transmit the MPDU sequence. For the case of an MPDU transmitted with Normal Ack policy and without RTS/CTS protection, this equals the time required to transmit the MPDU plus the time required to transmit the expected response frame plus one SIFS. Frame exchange sequences for Management frames are excluded from the used_time update. If the used_time value reaches or exceeds the admitted_time value, the corresponding EDCAF shall no longer transmit QoS Data frames or QoS Null MPDUs using the EDCA parameters for that AC as specified in the QoS Parameter Set element. However, a STA may choose to temporarily replace the EDCA parameters for that EDCAF with those specified for an AC of lower priority, if no admission control is required for those ACs.

NOTE—When a frame is transmitted using temporary EDCA parameters, the TID field of that frame is not modified.

If, for example, a STA has made and had accepted an explicit admission for a TS and the channel conditions subsequently worsen, possibly including a change in PHY data rate so that it requires more time to send the same data, the STA may make a request for more admitted_time to the AP and at the same time downgrade the EDCA parameters for that AC for short intervals in order to send some of the traffic at the admitted priority and some at the unadmitted priority, while waiting for a response to the admission request.

10.22.4.3 Controlled-access admission control

This subclause describes the schedule management of the admitted HCCA streams by the HC. When the HC provides controlled channel access to STAs, it is responsible for granting or denying polling service to a TS based on the parameters in the associated TSPEC. If the TS is admitted, the HC is responsible for scheduling channel access to this TS based on the negotiated TSPEC fields. The HC should not initiate a modification of TSPEC fields of an admitted TS unless requested by the STA. The HC should not tear down a TS unless explicitly requested by the STA or at the expiration of the inactivity timer. The polling service based on admitted TS provides a “guaranteed channel access” from the scheduler in order to have its QoS requirements met. This is an achievable goal when the WM operates free of external interference (such as operation within the channel by other technologies and co-channel overlapping BSS interference). The nature of wireless communications may preclude absolute guarantees to satisfy QoS requirements.

The following are rules for the operation of the scheduler:

- The scheduler shall be implemented so that, under controlled operating conditions, all STAs with admitted TS are offered TXOPs that satisfy the service schedule.
- Specifically, if a TS is admitted by the HC, then the scheduler shall service the STA during an SP. An SP is a period of time during which a set of one or more downlink individually addressed frames and/or one or more polled TXOPs are granted to the STA. An SP starts at fixed intervals of time specified in Service Interval field. The first SP starts when the lower order 4 octets of the TSF timer equals the value specified in Service Start Time field.⁴⁰ Additionally, the minimum TXOP duration shall be at least the time to transmit one maximum MSDU size successfully at the minimum PHY rate specified in the TSPEC. If maximum MSDU size is not specified in the TSPEC, then the minimum TXOP duration shall be at least the time to transmit one nominal MSDU size successfully at the minimum PHY rate. The vendors are free to implement any optimized algorithms, such as reducing the polling overheads, increasing the TXOP duration, etc., within the parameters of the transmitted schedule.
- The HC shall admit its request based on Infrastructure Authorization Information in dot11InterworkingEntry, which is part of the dot11InterworkingTable. The dot11InterworkingEntry specifies whether a non-AP STA is permitted to use HCCA, its throughput limitation and its minimum delay bound.

When the HC aggregates the admitted TS, it shall set the Aggregation field in the granted TSPEC to 1. An AP shall schedule the transmissions in HCCA TXOPs and communicate the service schedule to the STA. The HC shall provide an aggregate service schedule if the STA sets the Aggregation field in its TSPEC request. If the AP establishes an aggregate service schedule for a STA, it shall aggregate all HCCA streams for the STA. The service schedule is communicated to the STA in a Schedule element contained in an ADDTS Response frame. In the ADDTS Response frame, the modified service start time shall not exceed the requested service start time, if specified in ADDTS Request frame, by more than one maximum service interval (SI). The HC uses the maximum SI for the initial scheduling only as there might be situations that HC is not be able to service the TS at the scheduled timing, due to an EDCA or DCF transmission or other interferences interrupting the schedule.

⁴⁰The lower order 4 octets of the TSF timer cover a span of around 71 min. Due to TSF timer wrapover and due to the possibility of receiving the schedule frame after the indicated start time timer, ambiguity may occur. This ambiguity is resolved by using the nearest absolute TSF timer value in past or future when the lower order 4 octets match the Start Time field in the Schedule element.

The Service Interval field value in the Schedule element shall be greater than the minimum SI. The service schedule could be subsequently updated by an AP as long as it meets TSPEC requirements.

The HC may update the service schedule at any time by sending a Schedule element in a Schedule frame. The updated schedule is in effect when the HC receives the Ack frame for the Schedule frame. The service start time in the Schedule element in the Schedule frame shall not exceed the beginning of the immediately previous SP by more than the maximum SI. The service start time shall not precede the beginning of the immediately previous SP by more than the minimum SI.

A STA may affect the service schedule by modifying or deleting its existing TS as specified in 11.4.

K.3.1 provides guidelines for deriving an aggregate service schedule for a single STA from the STA's admitted TS. The schedule shall meet the QoS requirements specified in the TSPEC.

During any time interval $[t_1, t_2]$ including the interval that is greater than the specification interval, the cumulative TXOP duration shall be greater than the time required to transmit all MSDUs (of nominal MSDU size) arriving at the mean data rate for the stream, over the period $[t_1, t_2 - D]$. The parameter D is set to the specified maximum SI in the TSPEC. If maximum SI is not specified, then D is set to the delay bound in the TSPEC.

The HC shall use the minimum PHY rate in calculating TXOPs if the minimum PHY rate is present in the TSPEC field in the ADDTS response. Otherwise, the HC may use an observed PHY rate in calculating TXOPs. A STA may have an operational rate lower than the minimum PHY rate due to varying conditions on the channel for a short time and still may be able to sustain the TS without changing the minimum PHY rate in the TSPEC.

A minimum set of TSPEC fields shall be specified during the TSPEC negotiation. The specification of a minimum set of parameters is required so that the scheduler can determine a schedule for the stream that is to be admitted. These parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and at least one of Maximum Service Interval and Delay Bound in the ADDTS Request frame. In the ADDTS Response frame, these parameters are Mean Data Rate, Nominal MSDU Size, Minimum PHY Rate, Surplus Bandwidth Allowance, and Maximum Service Interval and shall be nonzero when a stream is admitted.

If any of the elements in the minimum set of parameters does not have the required nonzero value, as specified above in this subclause, in the ADDTS Request frame, the HC may replace the unspecified parameters with nonzero values and admit the stream, or it may reject the stream. If the HC admits the stream with the alternative set of TSPEC fields, these parameters are indicated to the STA through the ADDTS Response frame. If both maximum SI and delay bound are specified, the HC may use only the maximum SI. If any other parameter is specified in the TSPEC element, the scheduler may use it when calculating the schedule for the stream. The HC may also use the UP value in the TS Info field for admission control or scheduling purposes; however, this decision is outside the scope of this standard. The mandatory set of parameters might be set by any higher layer entity or may be generated autonomously by the MAC.

If a STA specifies a nonzero minimum SI and if the TS is admitted, the HC shall generate a schedule that conforms to the specified minimum SI.

A reference design for a sample scheduler and admission control unit is provided in Annex K. A sample use of the TSPEC for admission control is also described in Annex K.

10.23 Mesh coordination function (MCF)

10.23.1 General

Under MCF, the basic unit of allocation of the right to transmit onto the WM is the TXOP. Each TXOP is defined by a starting time and a defined maximum length.

There are two types of TXOP in MCF: EDCA TXOPs and MCCA TXOPs. The EDCA TXOP is obtained by a mesh STA winning an instance of EDCA contention (see 10.22.2). The MCCA TXOP is obtained by a mesh STA gaining control of the WM during an MCCAOP. The MCCAOP is an interval of time for frame transmissions that has been reserved by means of the exchange of MCCA frames (see 10.23.3).

EDCA TXOPs of a mesh STA that has dot11MCCAActivated true shall not overlap with the time periods of any of its tracked MCCAOP reservations.

The process of tracking MCCAOP reservations involves the recording of the MCCAOP reservations and the data that structure the MCCAOP advertisements of these reservations, namely the advertisement set sequence number, advertisement elements bitmap, and the advertisement element indexes, in a local database, and the updating of this database on the basis of received advertisements as described in 10.23.3.7.5.

10.23.2 MCF contention based channel access

MCF implements the same EDCA (see 10.22.2) as does HCF.

10.23.3 MCF controlled channel access (MCCA)

10.23.3.1 General

MCF controlled channel access (MCCA) is an optional access method that allows mesh STAs to access the WM at selected times with lower contention than would otherwise be possible. This standard does not require all mesh STAs to use MCCA. MCCA might be used by a subset of mesh STAs in an MBSS. However, MCCAOP reservations may be set up among mesh STAs that have dot11MCCAActivated true and that operate on the same channel; MCCAOP reservations shall not be set up otherwise. The performance of MCCA might be impacted by STAs that do not respect MCCAOP reservations.

MCCA enabled mesh STAs use Management frames to make reservations for transmissions. The mesh STA transmitting an MCCA Setup Request frame to initiate a reservation becomes the MCCAOP owner of the MCCAOP reservation. The receivers of the MCCA Setup Request frame are the MCCAOP responders. The MCCAOP owner and the MCCAOP responders advertise this MCCAOP reservation to their neighbors via an MCCAOP advertisement. An MCCA enabled neighbor mesh STA shall not transmit during these reserved MCCAOP time periods. During its MCCAOP, the MCCAOP owner obtains a TXOP by winning an instance of EDCA contention. Because of its reservation, the MCCAOP owner experiences no competition from other MCCA enabled neighbor mesh STAs. At the start of an MCCAOP, the EDCAF of the MCCAOP owner replaces the AIFSN, CWmin, and CWmax value of its dot11EDCATable with MCCA access parameters.

In order to use MCCA, a mesh STA maintains synchronization with its neighboring mesh STAs. Mesh STAs that use MCCA shall use a DTIM interval with a duration of $2^n \times 100$ TU with n being a non-negative integer less than or equal to 17. Additionally, a mesh STA shall track the reservations of its neighboring mesh STAs.

NOTE 1—The DTIM interval of this form was chosen so that the starting times of the reservations do not change relative to each other between consecutive DTIM intervals. The restriction that n be less than or equal to 17 was chosen for compatibility with the maximum DTIM interval as well as the compatibility of the reservation's MCCAOP offset range (see 9.4.2.106.2) with the maximal DTIM interval length.

NOTE 2—It is allowed that a different value for the DTIM interval is used for mesh STAs that use MCCA in an MBSS that is centrally controlled and the central authority provides a coordination of the DTIM interval of the mesh STAs that use MCCA in the MBSS.

10.23.3.2 MCCA activation

When it receives an MLME-ACTIVATEMCCA.request primitive from its SME, a mesh STA shall set the MCCA Enabled subfield of the Mesh Capability field in the Mesh Configuration element to 1 in Beacon and Probe Response frames it transmits. It shall not initiate or accept MCCA Setup Request frames for dot11MCCAScanDuration TUs after the receipt of the MLME-ACTIVATEMCCA.request primitive.

During the dot11MCCAScanDuration waiting period, the mesh STA learns its neighborhood MCCAOP periods by receiving Beacon, Probe Response, or MCCA Advertisement frames from neighboring mesh STAs.

After this period, the mesh STA may initiate and accept MCCA Setup Request frames as per 10.23.3.6.

10.23.3.3 MCCAOP reservations

An MCCAOP reservation specifies a schedule for frame transmissions. The time periods scheduled for frame transmissions in the reservation are called *MCCAOPs*. The schedule is set up between an MCCAOP owner and one (for individually addressed frames) or more (for group addressed frames) MCCAOP responders. MCCAOPs are set up by means of the procedure defined in 10.23.3.6. Once an MCCAOP reservation is set:

- Access to the channel by MCCA enabled mesh STAs is governed by the procedures in 10.23.3.9.
- The MCCAOP reservation is advertised according to the procedures in 10.23.3.7.

The schedule is defined by means of the MCCAOP Reservation field defined in 9.4.2.106.2. An MCCAOP reservation schedules a series of MCCAOPs with a common duration given in the MCCAOP Duration subfield of the MCCAOP Reservation field. This series is started after the first DTIM Beacon following the successful completion of the MCCAOP setup procedure and terminated when the MCCAOP reservation is torn down.

The reservation defines a regular schedule of MCCAOPs in the DTIM interval of the MCCAOP owner. The number of MCCAOPs in the DTIM interval is given by the value of the MCCAOP Periodicity subfield of the MCCAOP Reservation field. The MCCAOP Offset subfield specifies the offset of the first scheduled MCCAOP of the transmission schedule relative to the beginning of the DTIM interval of the MCCAOP owner. The following MCCAOPs are separated by a time interval with a duration equal to the length of the DTIM period divided by the value in the MCCAOP Periodicity subfield.

An example of an MCCAOP reservation schedule is shown in Figure 10-31. In this example, the MCCAOP Periodicity equals two, so that there are two MCCAOPs in each DTIM interval. As further illustrated in the figure, the MCCAOP Offset value indicates the beginning of the first MCCAOP in each DTIM interval.

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT adjustment request, it shall adjust the MCCAOP reservations by modifying the MCCAOP Offset of each MCCAOP reservation.

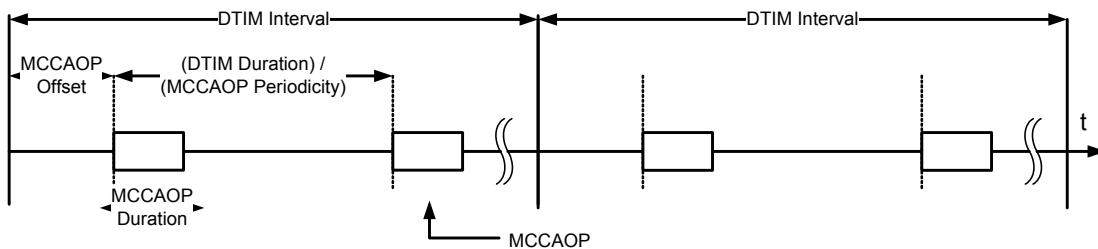

Figure 10-31—Example MCCAOP reservation with MCCAOP Periodicity equal to 2

An MCCAOP reservation is identified by an MCCAOP reservation ID. The MCCAOP owner shall select an MCCAOP reservation ID that is unique among all of its MCCAOP reservations. The MCCAOP reservation ID and MAC address of the MCCAOP owner uniquely identify the MCCAOP reservation in the mesh BSS. The MCCAOP reservation ID is an 8-bit unsigned integer and included in the MCCAOP Reservation ID field of an MCCAOP Setup Request element. If this MCCAOP setup request is for an individually addressed transmission, the MCCAOP Reservation ID is between 0 and 127. If this MCCAOP setup request is for a group addressed transmission, the MCCAOP Reservation ID is between 128 and 254. The value 255 is not used to identify a specific MCCAOP reservation but is reserved for usage in the MCCAOP teardown procedure as described in 10.23.3.8.

A mesh STA with `dot11MCCAAActivated` equal to true shall be able to track at least `dot11MCCAMinTrackStates` MCCAOP reservations, including its own reservations. If the number of tracked MCCAOP reservations is less than `dot11MCCAMaxTrackStates`, the mesh STA shall be able to track, set up, and accept additional reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 1 in the MCCAOP Advertisement Overview elements it transmits.

If the number of tracked MCCAOP reservations is greater than or equal to `dot11MCCAMaxTrackStates`, the mesh STA shall not track, set up, or accept additional reservations. In this case, the mesh STA shall set the Accept Reservations subfield in the Flags field to 0 in the MCCAOP Advertisement Overview elements it transmits. Moreover, it shall reply to MCCA Setup Request frames with an MCCA Setup Reply frame with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 3: Reject: MCCAOP track limit exceeded.

The tracked MCCAOP reservations are advertised as described in 10.23.3.7. How to access the medium during the tracked MCCAOP reservations is specified in 10.23.3.9.

10.23.3.4 Neighborhood MCCAOP periods at a mesh STA

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for individually addressed transmissions are referred to as the *TX-RX periods of this mesh STA*.

The set of MCCAOP reservations in which a mesh STA is involved as an MCCAOP owner or an MCCAOP responder and that are used for group addressed transmissions are referred to as the *broadcast periods of this mesh STA*. Optionally, the broadcast periods of a mesh STA includes known Target Beacon Transmission Time of Beacon frames for which this mesh STA is either the transmitter or the receiver, and transmission or reception periods of a STA that is collocated with the reporting mesh STA, for example, beacon or HCCA times of a collocated AP.

The interference periods of a mesh STA comprise the TX-RX periods and the broadcast periods of its neighbor mesh STAs in which the mesh STA is not involved as the owner or as a responder. The TX-RX periods, the broadcast periods, and the interference periods of a mesh STA shall not be used for a new MCCAOP reservation with the mesh STA as transmissions in these periods might experience interference from the transmissions in the new MCCAOPs or might cause interference to them.

The interference periods are directly derived from the TX-RX Periods Report field and Broadcast Periods Report field of the MCCAOP Advertisement elements transmitted by the neighbor mesh STAs. The Interference Periods Report field reflects the latest TX-RX Periods Report and Broadcast Periods Report fields received from the neighbor mesh STAs.

The MCCAOP reservations of a mesh STA and its neighbors define a set of MCCAOPs that are already reserved for frame transmissions in the mesh neighborhood of a mesh STA. This set of MCCAOPs is referred to as the *neighborhood MCCAOP periods for the mesh STA*. Thus, neighborhood MCCAOP periods at a mesh STA include all MCCAOPs for which the mesh STA or one of its neighbors, including neighbors from other MBSSs, is either transmitter or receiver.

10.23.3.5 MCCA access fraction (MAF)

The MCCA access fraction at a mesh STA is the ratio of the time reserved for MCCAOPs in the DTIM interval of this mesh STA to the duration of the DTIM interval. This parameter is reported in the MCCA Access Fraction field of the MCCAOP Advertisement Overview elements. The maximum value for the MAF that is allowed at a mesh STA is specified by dot11MAFlimit. The dot11MAFlimit is copied into the MAF Limit field of the MCCAOP Advertisement Overview element as described in 9.4.2.108.

The MAF and the MAF Limit may be used to limit the use of MCCA in the mesh neighborhood of a mesh STA, as specified in 10.23.3.6. Before attempting to set up an MCCAOP reservation with a neighbor peer mesh STA, a mesh STA shall verify that the new MCCAOP reservation does not cause its MAF to exceed its MAF Limit and that the new MCCAOP reservation does not cause the MAF of any of its neighbor peer mesh STAs to exceed their MAF Limit. An MCCAOP setup request shall be refused by the intended MCCAOP responder if the MAF limit of one of its neighbors is exceeded due to the new setup.

10.23.3.6 MCCAOP setup procedure

The setup of an MCCAOP reservation is initiated by the MCCAOP owner and is accepted or rejected by the MCCAOP responder. The setup procedure for an MCCAOP reservation is as follows:

- a) The MCCAOP owner shall build a map of the neighborhood MCCAOP periods in the DTIM interval after hearing advertisements from all of its neighbor mesh STAs with the MCCA Enabled subfield of the Mesh Capability field in the Mesh Configuration element equal to 1. It shall request an MCCAOP advertisement, as described in 10.23.3.7.8, from each neighbor mesh STA from which no advertisement was heard in the last dot11MCCAAdvertPeriodMax DTIM intervals.
- b) The MCCAOP owner shall determine the MCCAOP reservation. The MCCAOP parameters shall be chosen in such a way that they satisfy the following conditions:
 - 1) The reservation shall not overlap with the neighborhood MCCAOP periods of the MCCAOP owner.
 - 2) The reservation shall not overlap with the interference periods of the intended MCCAOP responder or responders.
 - 3) The reservation shall not cause the MAF limit to be exceeded for either itself or its neighbor mesh STAs.
 - 4) The Accept Reservations subfield of the Flags field equals 1 in the most recent MCCAOP Advertisement Overview element received from all intended MCCAOP responders.

- c) If the conditions in item b) are satisfied, the MCCAOP owner shall transmit an MCCAOP Setup Request element to the intended MCCAOP responder with the chosen MCCAOP parameters.
- d) The MCCAOP responder shall verify the following conditions:
 - 1) The reservation does not overlap with its neighborhood MCCAOP periods.
 - 2) The reservation does not cause the MAF limit to be exceeded for itself or its neighbor mesh STAs.
 - 3) The number of reservations in its neighborhood MCCAOP periods does not exceed dot11MCCAMaxTrackStates.
- e) If the conditions in item d) are satisfied, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 0: Accept, as defined in Table 9-223.
- f) If the conditions in item d) are satisfied and the MCCAOP request has been intended for group addressed transmissions, the responder shall include the reservation in its MCCAOP advertisement only after the MCCAOP advertisement from the MCCAOP owner is received.
- g) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for individually addressed transmissions, the responder shall transmit to the MCCAOP owner an MCCA Setup Reply frame that is constructed as follows:
 - 1) If the condition in item d)1) is not satisfied and both conditions in item d)2) and item d)3) are satisfied, the responder may calculate an alternative MCCAOP reservation and include it in the MCCAOP Reservation field of the MCCAOP Setup Reply element. It shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 1: Reject: MCCAOP reservation conflict, as defined in Table 9-223.
 - 2) If the condition in item d)2) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 2: Reject: MAF limit exceeded, as defined in Table 9-223.
 - 3) If the condition in item d)2) is satisfied and the condition in item d)3) is not satisfied, it shall set the MCCA Reply Code field of the MCCAOP Setup Reply element to 3: Reject: MCCAOP track limit exceeded, as defined in Table 9-223.
- h) If not all of the conditions in item d) are satisfied and the MCCAOP request is intended for group addressed transmissions, the responder shall send an MCCA Setup Reply frame to the MCCAOP owner with the MCCA Reply Code field in the MCCAOP Setup Reply element equal to 1: Reject: MCCAOP reservation conflict.
- i) If the MCCAOP owner receives an MCCA Setup Reply frame with MCCA Reply Code equal to Accept, the MCCAOP reservation is established. Otherwise, the mesh STA may repeat the MCCAOP setup procedure using a modified MCCAOP Setup Request. If an alternative MCCAOP reservation is included in the MCCAOP Setup Reply element, the mesh STA may consider this alternative in its modified MCCAOP Setup Request.

10.23.3.7 MCCAOP advertisement

10.23.3.7.1 General

A mesh STA with dot11MCCAActivated equal to true tracks MCCAOP reservations. The tracked MCCAOP reservations contain the neighborhood MCCAOP periods and optionally other periodic transmission of itself or of neighboring STAs.

The MCCAOP advertisement set contains all MCCAOP reservations tracked by the mesh STA. The MCCAOP advertisement set is represented by an MCCAOP Advertisement Overview element and zero (if the MCCAOP advertisement set is empty) or more (if the MCCAOP advertisement set is nonempty) MCCAOP Advertisement elements. An MCCAOP Advertisement element contains one or more tracked MCCAOP reservations.

The mesh STA advertises its MCCAOP advertisement set to its neighbor mesh STAs.

This subclause describes how the mesh STA constructs the MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements. Further, this subclause describes the procedure to advertise an MCCAOP advertisement set, the procedure to request an MCCAOP advertisement from a neighboring mesh STA, and the procedure to process a received MCCAOP advertisement.

10.23.3.7.2 Construction of an MCCAOP advertisement set

The following terminology is used in this subclause:

- TX-RX report: an MCCAOP Reservation field contained in the TX-RX Periods Report field of an MCCAOP Advertisement element
- Broadcast report: an MCCAOP Reservation field contained in the Broadcast Periods Report field of an MCCAOP Advertisement element
- Interference report: an MCCAOP Reservation field contained in the Interference Periods Report field of an MCCAOP Advertisement element

Each MCCAOP reservation tracked by a mesh STA is one of the following types:

- TX-RX period:
 - An MCCAOP reservation for individually addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
- Broadcast period:
 - An MCCAOP reservation for group addressed frames for which the mesh STA is the MCCAOP owner or the MCCAOP responder.
 - Optionally, a known Target Beacon Transmission Time of Beacon frames for which the mesh STA is either the transmitter or the receiver.
 - Optionally, a transmission or reception period of a STA that is collocated with the mesh STA, for example, beacon or HCCA times of a collocated AP.
- Interference period:
 - A TX-RX or a broadcast period reported by a neighbor peer mesh STAs of the mesh STA excluding those periods for which this mesh STA is either the MCCAOP owner or the MCCAOP responder.
 - Optionally, a TX-RX or a broadcast period reported by neighbor nonpeer mesh STAs of the mesh STA.

The MCCAOP reservations are grouped into the following sets:

- MCCAOP TX-RX advertisement set, which includes all TX-RX periods
- MCCAOP broadcast advertisement set, which includes all broadcast periods
- MCCAOP interference advertisement set, which includes all interference periods

These three sets constitute the MCCAOP advertisement set. The mesh STA uses the MCCAOP Overview element and MCCAOP Advertisement elements to advertise its MCCAOP advertisement set to its neighbor mesh STAs.

The mesh STA acts as follows to construct the MCCAOP Overview elements and the MCCAOP Advertisement elements:

- a) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP reports according to the format described in 9.4.2.109.3 as follows:

- 1) If the MCCAOP TX-RX advertisement set is nonempty, the mesh STA constructs one or more TX-RX reports according to the format described in 9.4.2.109.3 such that each reservation in the MCCAOP TX-RX advertisement set occurs exactly in one TX-RX report.
 - 2) If the MCCAOP broadcast advertisement set is nonempty, the mesh STA constructs one or more broadcast reports according to the format described in 9.4.2.109.3 such that each reservation in the MCCAOP broadcast advertisement set occurs exactly in one broadcast report.
 - 3) If the MCCAOP interference advertisement set is nonempty, the mesh STA constructs one or more interference reports according to the format described in 9.4.2.109.3 such that each reservation in the MCCAOP interference advertisement set occurs exactly in one interference report.
- b) If the MCCAOP advertisement set is nonempty, the mesh STA constructs one or more MCCAOP Advertisement elements as follows:
- 1) The MCCAOP Advertisement Set Sequence Number field is set to the MCCAOP advertisement set sequence number as explained in 10.23.3.7.3.
 - 2) The MCCAOP Advertisement Element Index subfield is set to an identifier that uniquely identifies the MCCAOP Advertisement element in the MCCAOP advertisement set.
 - 3) Each MCCAOP Advertisement element includes at least one of the TX-RX reports, broadcast reports, or interference reports. Moreover, it includes at most one of the TX-RX reports, at most one of the broadcast reports, and at most one of the interference reports. In case the MCCAOP Advertisement element contains a TX-RX report, the TX-RX Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains a broadcast report, the Broadcast Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise this subfield is set to 0. In case the MCCAOP Advertisement element contains an interference report, the Interference Report Present subfield of the MCCAOP Advertisement Element Information field is set to 1; otherwise, this subfield is set to 0.
 - 4) Each report as constructed in step a) is present in exactly one MCCAOP Advertisement element.
- c) The mesh STA constructs one MCCAOP Advertisement Overview element such that
- 1) The MCCAOP Advertisement Set Sequence Number field is set to the advertisement set sequence number as explained in 10.23.3.7.3.
 - 2) The Medium Access Fraction field is set to the medium access fraction.
 - 3) The MAF limit field is set to dot11MAFLimit.
 - 4) The Accept Reservations field is set to 1 if the number of tracked reservations of this mesh STA is less than dot11MCCAMaxTrackStates, and set to 0 otherwise.
 - 5) Bit i of the Advertisement Elements Bitmap field is set to 1 if an MCCAOP Advertisement element with the MCCAOP Advertisement Element Index subfield equal to i is part of the representation of this MCCAOP advertisement set, and set to 0 otherwise.

10.23.3.7.3 Setting the MCCAOP advertisement set sequence number

The MCCAOP advertisement set sequence number identifies an MCCAOP advertisement set. Mesh STAs with dot11MCCAActivated equal to true assign MCCAOP advertisement set sequence numbers from a single modulo 256 counter. The MCCAOP advertisement set sequence number is initialized to 0. The MCCAOP advertisement set sequence number shall be incremented by 1 if one of the following conditions holds:

- a) The mesh STA sets the bit for an MCCAOP Advertisement element in the Advertisement Elements Bitmap from 0 to 1 and this bit has been set to 1 under the same MCCAOP Advertisement Sequence Number before.

- b) The bit of the Advertisement Elements Bitmap corresponding to an MCCAOP Advertisement element is equal to 1 and the content of this MCCAOP Advertisement element changes.

However, the MCCAOP advertisement set sequence number may remain unchanged if

- The mesh STA changes a bit in the Advertisement Element Bitmap from 0 to 1 and this bit has not been set to 1 under the same MCCAOP Advertisement Sequence Number before, or
- The mesh STA changes a bit in the Advertisement Elements Bitmap from 1 to 0.

NOTE—The Advertisement Set Sequence Number identifies the current distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements. Using a new MCCAOP advertisement set sequence number signals a new, (possibly) completely different distribution of the MCCAOP advertisement set over the MCCAOP Advertisement elements, and requires an advertisement of all reservations of the MCCAOP advertisement set. Leaving the MCCAOP advertisement set sequence number unchanged as in the previous MCCAOP Advertisement Overview element indicates MCCAOP Advertisement elements that have previously been advertised are not changed and remain current. This enables a limited advertisement procedure in which only new MCCAOP Advertisement elements are advertised. Additionally, this enables mesh STAs that operate in light or deep sleep mode to request a limited update of the MCCAOP advertisement set of a neighboring mesh STA in which only new MCCAOP Advertisement elements are included.

10.23.3.7.4 Advertisement procedure

To advertise its MCCAOP advertisement set, the mesh STA constructs a representation of the MCCAOP advertisement set as described in 10.23.3.7.2. The MCCAOP advertisement set is advertised by transmitting an MCCAOP Advertisement Overview element and zero or more MCCAOP Advertisement elements (see 10.23.3.7.2) to neighbor peer mesh STAs. The MCCAOP Advertisement Overview element and the MCCAOP Advertisement elements are transmitted in Beacon frames, Probe Response frames, or MCCA Advertisement frames.

The mesh STA shall advertise its MCCAOP advertisement set according to the following rules:

- a) The mesh STA shall advertise at least one MCCAOP Advertisement Overview element in every dot11MCCAAdvertPeriodMax DTIM intervals.
- b) The mesh STA shall advertise its MCCAOP Advertisement Overview element and any new MCCAOP Advertisement elements at the latest with the transmission of its next Beacon frame after its MCCAOP advertisement set has changed.
- c) The mesh STA shall advertise the requested MCCAOP Advertisement elements as described in 10.23.3.7.8 if the mesh STA receives an MCCA Advertisement Request frame.

10.23.3.7.5 Receipt of an MCCAOP advertisement

Upon receipt of an MCCAOP advertisement a mesh STA with dot11MCCAActivated shall compare the Advertisement Set Sequence Number contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement with the last advertisement set sequence number that this mesh STA tracked for the sender of the received MCCAOP advertisement.

If the tracked advertisement set sequence number does not equal the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.23.3.7.6.

If the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement, the mesh STA shall compare the Advertisement Elements Bitmap contained in the received MCCAOP Advertisement Overview element with the last Advertisement Elements Bitmap that this mesh STA tracked for the sender of the received MCCAOP advertisement. If the tracked Advertisement Elements Bitmap does not equal the Advertisement Elements Bitmap of the received MCCAOP advertisement, the mesh STA shall perform the procedure described in 10.23.3.7.7.

NOTE—If both the tracked advertisement set sequence number equals the Advertisement Set Sequence Number of the received MCCAOP advertisement and the tracked Advertisement Elements Bitmap equals the Advertisement Elements Bitmap of the received MCCAOP advertisement, the MCCAOP advertisement set of the sender of the MCCAOP advertisement tracked by the mesh STA is current, and no update of the MCCAOP advertisement set is needed.

10.23.3.7.6 Complete update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.23.3.7.5 and detected that the MCCAOP advertisement set sequence number has been updated. Consequently, the mesh STA shall operate as follows.

The mesh STA shall discard all MCCAOP reservations that it tracked for the sender of the received MCCAOP advertisement. The mesh STA shall record the Advertisement Set Sequence Number and the source address (SA) of the received MCCAOP advertisement. The mesh STA shall record all reservations in the MCCAOP Advertisement elements of the received MCCAOP advertisement.

If the mesh STA does not receive all MCCAOP Advertisement elements of the sender of the MCCAOP advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP advertisement request procedure as described in 10.23.3.7.8.

10.23.3.7.7 Partial update of the tracked MCCAOP reservations of a neighbor mesh STA

The mesh STA performed the steps in 10.23.3.7.5 and detected that part of the MCCAOP advertisement set of the sender of the MCCAOP advertisement has been updated. Consequently, the mesh STA shall operate as follows for each bit in the Advertisement Elements Bitmap contained in the MCCAOP Advertisement Overview element of the received MCCAOP advertisement.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 0 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 1, the mesh STA shall delete the reservations with the same Advertisement Sequence Number and the same MCCAOP Advertisement Element Index received from the same sender from its tracked reservations.

If the bit in position n of the Advertisement Elements Bitmap in the received MCCAOP Advertisement is equal to 1 and if the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement is equal to 0, the mesh STA shall add the reservations of the received MCCAOP Advertisement element with the MCCAOP Advertisement Element Index set to n to its tracked reservations. If the mesh STA does not receive this MCCAOP Advertisement element of the sender of the MCCAOP Advertisement before a frame exchange sequence on the wireless medium causes the mesh STA to set its NAV, the mesh STA shall perform the MCCAOP Advertisement request procedure as described in 10.23.3.7.8.

NOTE—If the bit in position n of the received Advertisement Elements Bitmap contained in the received MCCAOP Advertisement is equal to the bit in position n of the Advertisement Elements Bitmap tracked for the sender of the received MCCAOP advertisement, then the Advertisement element with the MCCAOP Advertisement Element Index equal to n is current, and no update of this Advertisement element is needed.

10.23.3.7.8 MCCAOP advertisement request procedure

To request all MCCAOP Advertisement elements from a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame without an MCCAOP Advertisement Overview element.

To request a subset of the MCCAOP Advertisement elements of a neighbor peer mesh STA, the mesh STA transmits an MCCA Advertisement Request frame including an MCCAOP Advertisement Overview element. The mesh STA shall set the contents of the MCCAOP Advertisement Overview element as follows. The mesh STA sets

- a) The Advertisement Set Sequence Number field to the Advertisement Sequence Number that it tracks for the recipient of this frame
- b) In the Advertisement Element Bitmap, the bit to 1 for each MCCAOP Advertisement element that the mesh STA requests from the recipient of this frame
- c) The Flags field, the MCCA Access Fraction field, and the MAF Limit field to 0

The mesh STA shall discard the MCCA Advertisement Request frame from its frame queue if it receives all of the MCCAOP Advertisement elements that it requests in the MCCAOP Advertisement Request.

10.23.3.8 MCCAOP teardown

10.23.3.8.1 Conditions that trigger an MCCAOP teardown

The MCCAOP owner and the MCCAOP responder may initiate a teardown of an MCCAOP reservation, e.g., when the reservation is no longer needed. A mesh STA shall act as follows to resolve conflicts between MCCAOP reservations in its neighborhood MCCAOP periods. If the conflict is caused by overlapping reservations from its TX-RX periods and broadcast periods, it shall select one of these reservations and initiate a teardown for it. If the conflict is caused by an overlap between a reservation from its TX-RX periods or broadcast periods, and another reservation from its interference periods, it shall act as follows. It creates a first unsigned integer by inverting the bit order of its MAC address and a second unsigned integer by inverting the bit order of the lowest of the known MAC addresses of the owner and responder(s) of the reservation in the interference periods. If the first unsigned integer is smaller than the second unsigned integer, it shall initiate a teardown of the reservation in its TX-RX or broadcast periods. Otherwise, it may initiate a teardown of the reservation in its TX-RX or broadcast periods.

There are also other conditions that trigger the MCCAOP owner and responder to delete a reservation, without an explicit tear down. An MCCAOP owner shall delete a reservation for an individually addressed transmission when it has not received an acknowledgment for any frame transmission in the MCCAOPs corresponding to the reservation for greater than dot11MCCAOPtimeout time. An MCCAOP responder shall delete a reservation for individually addressed transmission or group addressed transmissions when it has not received a frame transmission in any of the MCCAOPs corresponding to the reservation for greater than dot11MCCAOPtimeout time.

10.23.3.8.2 MCCAOP teardown procedure

The teardown is initiated by transmitting an MCCA Teardown frame. The MCCAOP Reservation ID field in the MCCAOP Teardown element is set to the MCCAOP Reservation ID of the reservation that is to be torn down. In case the tear down is initiated by an MCCAOP responder, the MCCAOP Owner field of the MCCAOP Teardown element is set to the MAC address of the MCCAOP owner.

The transmitter of the MCCA Teardown frame deletes the reservation after the MCCA Teardown frame has been successfully transmitted. The receiver of the MCCA Teardown frame acts as follows. In case the MCCAOP Reservation ID field corresponds to a reservation for individually addressed transmissions, it deletes the reservation. If the reservation is for group addressed transmissions for which it is the MCCAOP owner, it deletes the reservation if there are no other MCCAOP responders for this reservation.

The MCCAOP owner acts as follows when deleting a reservation:

- It stops executing the access procedure described in 10.23.3.9.1 at the start of the MCCAOPs corresponding to the reservation that was deleted.
- In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.

- In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

The MCCAOP responder acts as follows when deleting a reservation:

- It stops executing the procedure described in 10.23.3.9.2 during the MCCAOPs corresponding to the reservation that was deleted.
- In case the reservation was for individually addressed frames, it stops advertising the MCCAOP reservation in its TX-RX Periods Report field.
- In case the reservation was for group addressed frames, it stops advertising the MCCAOP reservation in its Broadcast Periods Report field.

10.23.3.9 Access during MCCAOPs

10.23.3.9.1 Access by MCCAOP owners

At the start of the MCCAOP, the EDCAF of the MCCAOP owner shall set AIFSN[AC] equal to dot11MCCAAIFSN, CWmax[AC] equal to dot11MCCACWmax, CW[AC] equal to dot11MCCACWmin, QSRC[AC] to 0, and QLRC[AC] to 0 for all ACs. The TXOP limit shall specify a duration value no larger than the MCCAOP Duration.

During the MCCAOP, the EDCAFs of the ACs operates as specified in 10.22.2, with the following modifications.

- During the MCCAOP, the EDCAF of each AC shall consider only those frame whose RA matches the MAC address of the MCCAOP responder.
- When the access to the medium is delayed, the TXOP limit shall specify a duration to end no later than the MCCAOP start time plus the MCCAOP Duration.
- As specified in 10.23.3.9.2, a neighboring STA shall not access the WM during an MCCAOP, until it receives a frame from either the MCCAOP owner or the MCCAOP responder. With the exception of truncation of an MCCAOP by means of a CF-End, standard EDCA TXOP rules apply for the remainder of the MCCAOP. For HT mesh STAs, these include the reverse direction protocol as specified in 10.28.
- At the end of the MCCAOP, the parameters used by the EDCAF of the MCCAOP owner shall be set to dot11EDCATable, and QSRC[AC] and QLRC[AC] shall be set to 0 for all ACs.

The MCCAOP owner may adjust the duration of an MCCAOP by setting the Duration/ID field in the frames it transmits. In particular, if an MCCAOP owner has no data to transmit in an MCCAOP corresponding to an MCCAOP reservation that is intended for individually addressed frames, it may transmit an individually addressed QoS Null frame during the MCCAOP to end the MCCAOP.

NOTE—It is recommended to send a QoS Null frame to end the MCCAOP although there might be situations in which the transmission of a QoS Null is not needed or undesirable.

If an MCCAOP owner has no data to transmit in an MCCAOP reservation that is intended for group addressed frames, it may transmit a group addressed QoS Null frame during the MCCAOP to end the MCCAOP.

10.23.3.9.2 Access during an MCCAOP by mesh STAs that are not the MCCAOP owner

The MAC of a mesh STA with dot11MCCAActivated is true shall provide a Reservation Allocation Vector (RAV) mechanism to indicate a busy medium from the start of an MCCAOP corresponding to a reservation in its interference periods until the receipt of a frame transmitted by either the MCCAOP owner or the MCCAOP responder. The RAV mechanism is provided in addition to the PHY and virtual CS mechanisms described in 10.3.2.1. It is different from the virtual CS mechanism in two aspects. Firstly, a mesh STA

might be neighbor to multiple ongoing MCCAOPs corresponding to different reservations and the regular NAV setting and updating rules do not suffice to prevent interference during these reservations. Secondly, the virtual CS mechanism is set immediately upon receipt of a frame, whereas the RAV mechanism is based on reservation frames received at some earlier time instant. When either the CS function provided by the PHY, the virtual CS function provided by the MAC via the NAV, or the RAV mechanism indicate a busy medium during an MCCAOP for which the mesh STA is neither the MCCAOP owner nor the MCCAOP responder, the medium shall be considered busy; otherwise, it shall be considered idle.

The RAV mechanism maintains an index of future MCCAOPs based on the reservation information that is available in the interference periods of a mesh STA. At the start of each MCCAOP corresponding to a reservation in the interference periods, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. At the start of each MCCAOP corresponding to a reservation in the TX-RX or broadcast periods for which the mesh STA is an MCCAOP responder, a RAV is set to indicate a busy medium for the duration of the MCCAOP given in the MCCAOP Duration subfield of the MCCAOP reservation. The RAV may be thought of as a counter, corresponding to an MCCAOP corresponding to a reservation in the interference periods. The RAV counts down to zero at a uniform rate. When the counter is zero, the RAV indication is that the medium is idle; when nonzero, the indication is busy.

The mesh STA clears the RAV timer, i.e., sets it to 0, upon receipt of a frame from either the MCCAOP owner or responder. If a mesh STA receives an RTS frame during an MCCAOP for which it is a MCCAOP responder, with the RA address matching its MAC address and with the MAC address in the TA field in the RTS frame matching the MAC address of the MCCAOP owner, then the STA shall send the CTS frame after SIFS, without regard for the NAV and the RAV, and without resetting its NAV. The RAV for an MCCAOP is not cleared upon receipt of a frame originating from stations that are not the MCCAOP owner or responder. Since the NAV is set upon receipt of frames with a Duration/ID field, the MCCAOP owner and responder adjust the reservation period of an MCCAOP to their actual traffic needs by the Duration/ID field in the transmitted frame and obtain protection of the frame transmission via the NAV setting.

The RAV mechanism might be represented by a number of counters, where each counter corresponds to one MCCAOP. The number of counters needed at any instant is equal to the number of MCCAOPs at this instant corresponding to reservations in the interference periods of the mesh STA.

10.23.3.10 Interaction with time synchronization

If a mesh STA adjusts its TBTT, e.g., in response to a TBTT Adjustment Request, it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations. If a mesh STA adjusts its timing offset value with respect to a neighbor mesh STA, as specified in 14.13.2.2, it shall adjust the reservations by modifying the MCCAOP Offset of each of the tracked MCCAOP reservations for which this neighbor mesh STA is the owner. In either case, an MCCAOP advertisement of a mesh STA shall always contain the most recent MCCAOP Offsets.

10.24 Block acknowledgment (block ack)

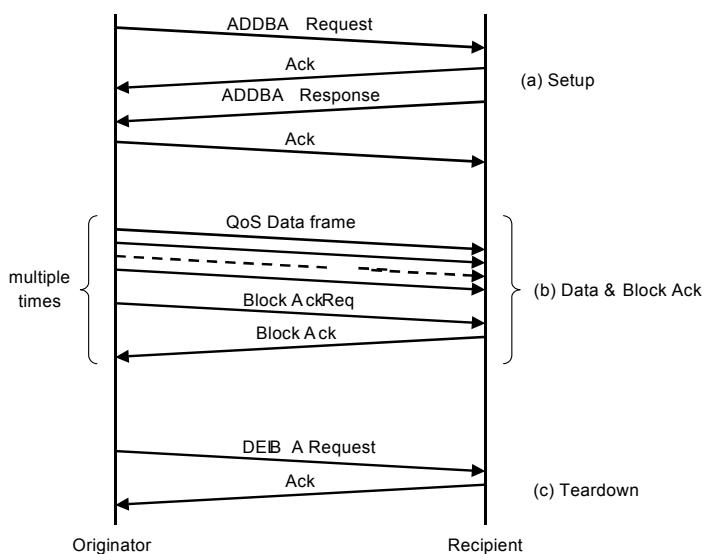

10.24.1 Introduction

The block ack mechanism improves channel efficiency by aggregating several acknowledgments into one frame. There are two types of block ack mechanisms: immediate and delayed. Immediate block ack is suitable for high-bandwidth, low-latency traffic while the delayed block ack is suitable for applications that tolerate moderate latency. In this subclause, the STA with data to send using the block ack mechanism is referred to as the *originator*, and the receiver of that data as the *recipient*.

The block ack mechanism is initialized by an exchange of ADDBA Request/Response frames. After initialization, blocks of QoS Data frames may be transmitted from the originator to the recipient. A block may be started within a polled TXOP, within an SP, or by winning EDCA contention. The number of frames in the block is limited, and the amount of state that is to be kept by the recipient is bounded. The MPDUs within the block of frames are acknowledged by a BlockAck frame, which is requested by a BlockAckReq frame.

The block ack mechanism does not require the setting up of a TS; however, QoS STAs using the TS facility may choose to signal their intention to use block ack mechanism for the scheduler's consideration in assigning TXOPs. The block ack mechanism is also used by the GCR service. Acknowledgments of frames belonging to the same TID, but transmitted during multiple TXOPs/SPs, may also be combined into a single BlockAck frame. This mechanism allows the originator to have flexibility regarding the transmission of Data frames. The originator may split the block of frames across TXOPs/SPs, separate the data transfer and the block ack exchange, and interleave blocks of MPDUs carrying all or part of MSDUs or A-MSDUs for different TIDs or RAs.

Figure 10-32 illustrates the message sequence chart for the setup, data and block ack transfer, and the teardown of the block ack mechanism, which are discussed in detail in 10.24.2 to 10.24.5.

**Figure 10-32—Message sequence chart for block ack mechanism:
 (a) setup, (b) data and acknowledgment transfer, and (c) teardown**

All operations on sequence numbers are performed modulo 2^{12} . Comparisons between sequence numbers are circular modulo 2^{12} , i.e., the sequence number space is considered divided into two parts, one of which is “old” and one of which is “new,” by means of a boundary created by adding half the sequence number range to the current start of receive window (modulo 2^{12}).

10.24.2 Setup and modification of the block ack parameters

An originator that intends to use the block ack mechanism for the transmission of QoS Data frames to an intended recipient should first check whether the intended recipient STA is capable of participating in block ack mechanism by discovering and examining its Delayed Block Ack and Immediate Block Ack capability bits. If the intended recipient STA is capable of participating, the originator sends an ADDBA Request frame indicating the TID for which the block ack agreement is being set up. When a block ack agreement is set up between HT STAs, the Buffer Size and Block Ack Timeout fields in the ADDBA Request frame are advisory. When a block ack agreement is set up between HT or DMG STAs, the Buffer Size and Block Ack Timeout

fields in the ADDBA Request frame are advisory. When a block ack agreement is set up between a non-HT non-DMG STA and another STA, the Block Ack Policy and Buffer Size fields in the ADDBA Request frame are advisory.

The recipient STA shall respond by an ADDBA Response frame. The recipient STA has the option of accepting or rejecting the request. When the recipient STA accepts, then a block ack agreement exists between the originator and recipient.

When the recipient STA accepts, it indicates the type of block ack and the number of buffers that it shall allocate for the support of this block ack agreement within the ADDBA Response frame and the block ack timeout that is used. Each block ack agreement that is established by a STA may have a different buffer allocation. If the intended recipient STA rejects the request, then the originator shall not use the block ack mechanism.

When the Block Ack Policy subfield value is set to 1 by the originator of an ADDBA Request frame between HT STAs, then the ADDBA Response frame accepting the ADDBA Request frame shall contain 1 in the Block Ack Policy subfield.

For each accepted block ack agreement, the originator shall set the sequence number of the first frame transmitted under the agreement to the value of the Block Ack Starting Sequence Control field of the ADDBA Request frame of the accepted block ack agreement.

When a block ack agreement is established between two HT STAs or two DMG STAs, the originator may change the size of its transmission window if the value in the Buffer Size field of the ADDBA Response frame is larger than the value in the ADDBA Request frame. If the value in the Buffer Size field of the ADDBA Response frame is smaller than the value in the ADDBA Request frame, the originator shall change the size of its transmission window (WinSizeO) so that it is not greater than the value in the Buffer Size field of the ADDBA Response frame and is not greater than the value 64.

The originator STA may send an ADDBA Request frame in order to update block ack timeout value. If the updated ADDBA Request frame is accepted, both STAs initialize the timer to detect block ack timeout. Even if the updated ADDBA Request frame is not accepted, the original block ack setup remains active.

NOTE—A block ack associated with a GCR group address does not use an inactivity timer because the GCR originator might switch between the DMS delivery method, the GCR unsolicited retry retransmission policy, and the GCR block ack retransmission policy during the lifetime of a GCR agreement.

The A-MSDU Supported field indicates whether an A-MSDU may be sent under the particular block ack agreement. The originator sets this field to 1 to indicate that it might transmit A-MSDUs with this TID. The recipient sets this field to 1 to indicate that it is capable of receiving an A-MSDU with this TID.

NOTE—The recipient is free to respond with any setting of the A-MSDU supported field. If the value in the ADDBA Response frame is not acceptable to the originator, it can delete the block ack agreement and transmit data using normal acknowledgment.

If the block ack mechanism is being set up for a TS, bandwidth negotiation (using ADDTS Request and Response frames) should precede the setup of the block ack mechanism. If the block ack mechanism is being set up for the GCR service, then the following steps apply:

- One or more GCR Request/Response exchanges precede the setup of the block ack mechanism.
- The ADDBA Request and Response frames exchanged to set up the block ack shall include the GCR Group Address element indicating the group address of the GCR service.

Once the block ack exchange has been set up, Data and Ack frames are transferred using the procedure described in 10.24.3.

10.24.3 Data and acknowledgment transfer using immediate block ack policy and delayed block ack policy

After setting up either an immediate block ack agreement or a delayed block ack agreement following the procedure in 10.24.2, and having gained access to the medium and established protection, if necessary, the originator may transmit a block of QoS Data frames separated by SIFS, with the total number of frames not exceeding the Buffer Size subfield value in the associated ADDBA Response frame and subject to any additional duration limitations based on the channel access mechanism. Each of the frames shall have the Ack Policy subfield in the QoS Control field set to Block Ack. The RA field of the frames that are not delivered using the GCR block ack retransmission policy shall be the recipient's individual address. The RA field of GCR frames delivered using the GCR block ack retransmission policy shall be set to the GCR concealment address. The originator requests acknowledgment of outstanding QoS Data frames by sending a Basic BlockAckReq frame. The recipient shall maintain a block ack record for the block.

Subject to any constraints in this subclause about permitted use of TXOP or SP according to the channel access mechanism used, the originator may

- Separate the block of QoS data frames and the Basic BlockAckReq frames into separate TXOPs or SPs
- Split transmission of Data frames sent under block ack policy across multiple TXOPs or SPs
- Interleave MPDUs with different TIDs within the same TXOP or SP
- Sequence or interleave MPDUs for different RAs within a TXOP or SP

A protective mechanism (such as transmitting using HCCA, RTS/CTS, RTS/DMG CTS, SP, protected period, or the mechanism described in 10.26) should be used to reduce the probability of other STAs transmitting during the TXOP or SP. If no protective mechanism is used, then the first frame that is sent as a block shall have a response frame and shall have the Duration field set so that the NAVs are set to appropriate values at all STAs in the BSS.

The originator shall use the block ack starting sequence control to signal the first MPDU in the block for which an acknowledgment is expected. MPDUs in the recipient's buffer with a sequence control value that precedes the starting sequence control value are called *preceding MPDUs*. The recipient shall reassemble any complete MSDUs from buffered preceding MPDUs and indicate these to its higher layer. The recipient shall then release any buffers held by preceding MPDUs. The range of the outstanding MPDUs (i.e., the reorder buffer) shall begin on an MSDU boundary. The total number of frames that can be sent depends on the total number of MPDUs in all of the outstanding MSDUs. The total number of MPDUs in these MSDUs shall not exceed the reorder buffer size in the receiver.

The recipient of an accepted block ack agreement that did not contain a GCR Group Address element in the ADDBA Request frame shall maintain a block ack record consisting of originator address, TID, and a record of reordering buffer size indexed by the received MPDU sequence control value. This record holds the acknowledgment state of the Data frames received from the originator. The recipient of an accepted block ack agreement that contained a GCR Group Address element in the ADDBA Request frame shall maintain a block ack record consisting of the DA address from the A-MSDU subframe header, TID, and a record of reordering buffer size indexed by the received MPDU sequence control value. This record holds the acknowledgment state of the group addressed Data frames received from the originator.

If the immediate block ack policy is used, the recipient shall respond to a Basic BlockAckReq frame with a Basic BlockAck frame. If the recipient sends the Basic BlockAck frame, the originator updates its own record and retries any frames that are not acknowledged in the Basic BlockAck frame, either in another block or individually.

If the delayed block ack policy is used, the recipient shall respond to a Basic BlockAckReq frame with an Ack frame. The recipient shall then send its Basic BlockAck frame response in a subsequently obtained TXOP.

Once the contents of the Basic BlockAck frame have been prepared, the recipient shall send this frame in the earliest possible TXOP using the highest priority AC. The originator shall respond with an Ack frame upon receipt of the Basic BlockAck frame. If delayed block ack policy is used and if the HC is the recipient, then the HC may respond with a +CF-Ack frame if the Basic BlockAckReq frame is the final frame of the polled TXOP's frame exchange. If delayed block ack policy is used and if the HC is the originator, then the HC may respond with a +CF-Ack frame if the Basic BlockAck frame is the final frame of the TXOP's frame exchange.

The Basic BlockAck frame contains acknowledgments for the MPDUs of up to 64 previous MSDUs. In the Basic BlockAck frame, the STA acknowledges only the MPDUs starting from the starting sequence control value until the MPDU with the highest sequence number that has been received, and the STA shall set bits in the Block Ack Bitmap subfield corresponding to all other MPDUs to 0. The status of MPDUs that are considered “old” and prior to the sequence number range for which the receiver maintains status shall be reported as successfully received (i.e., the corresponding bit in the bitmap shall be set to 1). If the Basic BlockAck frame indicates that an MPDU was not received correctly, the originator shall retry that MPDU subject to that MPDU's appropriate lifetime limit.

A typical block ack sequence using immediate block ack for a single TID is shown in Figure 10-33.

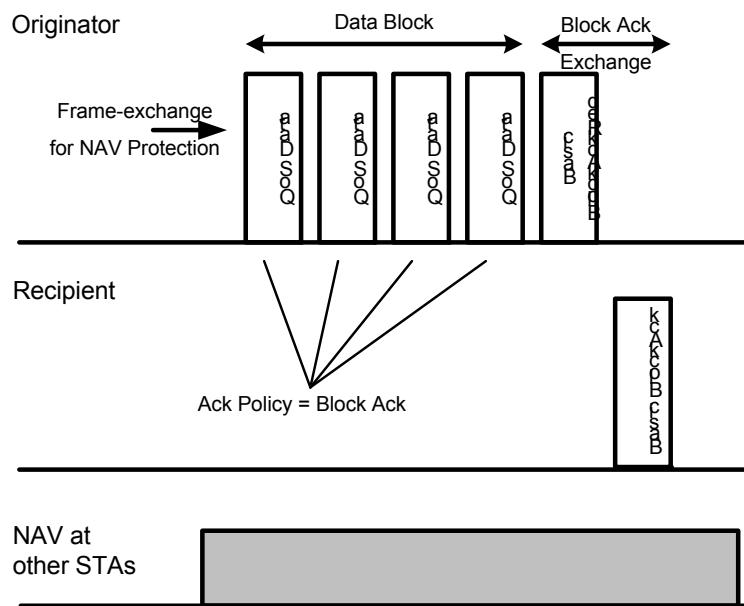

Figure 10-33—Typical block ack sequence when immediate policy is used

A typical block ack sequence using the delayed block ack is shown in Figure 10-34.

The subsequent Basic BlockAckReq frame's starting sequence number shall be higher than or equal to the starting sequence number of the immediately preceding Basic BlockAckReq frame for the same TID.

The originator may continue to transmit MPDUs (subject to the negotiated buffer size constraint) to the recipient after transmitting the Basic BlockAckReq frame, but before receiving the Basic BlockAck frame (applicable only to delayed block ack). The bitmap in the Basic BlockAck frame shall include the status of frames received between the start sequence number and the transmission of the Basic BlockAckReq frame. A recipient sending a delayed Basic BlockAck frame may update the bitmap with information on QoS Data frames received between the receipt of the Basic BlockAckReq frame and the transmission of the Basic BlockAck frame.

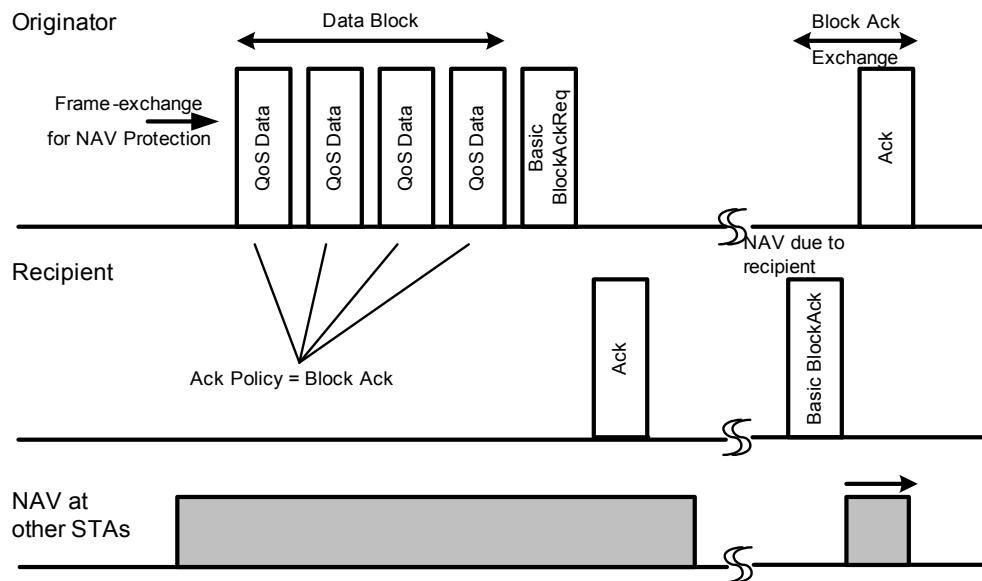

Figure 10-34—Typical block ack sequence when delayed policy is used

If there is no response (i.e., neither a Basic BlockAck frame nor an Ack frame) to the Basic BlockAckReq frame, the originator may retransmit the Basic BlockAckReq frame within the current TXOP or SP (if time permits) or within a subsequent TXOP or SP. MSDUs that are sent using the block ack mechanism are not subject to retry limits but only to MSDU lifetime. A non-DMG originator does not need to set the Retry subfield to 1 for any possible retransmissions of the MPDUs. A DMG originator shall set the Retry subfield to 1 for any possible retransmissions of the MPDUs.

The Basic BlockAckReq frame shall be discarded if all MSDUs referenced by this frame have been discarded from the transmit buffer due to the expiration of their lifetime limit.

Under a block ack agreement, the Normal Ack policy may be used in order to improve efficiency. A STA shall respond with an Ack frame to the reception of frames that are covered by a block ack agreement, but that are not part of an A-MPDU and that are received with their Ack Policy subfield in the QoS Control field equal to Normal Ack.

The block ack record shall be updated irrespective of the acknowledgment type (Normal or Block Ack) for the TID/TSID with a block ack agreement.

The reception of QoS Data frames using Normal Ack policy shall not be used by the recipient as an indication to reset the timer employed in detecting a block ack timeout (see 11.5). The block ack timeout allows the recipient to delete the block ack if the originator does not switch back to using block ack.

The frame exchange sequences are provided in Annex G.

10.24.4 Receive buffer operation

For each block ack agreement, the recipient maintains a MAC variable NextExpectedSequenceNumber. The NextExpectedSequenceNumber is initialized to the value of the Block Ack Starting Sequence Control field of the ADDBA Request frame of the accepted block ack agreement.

Upon the receipt of a QoS Data frame from the originator for which a block ack agreement exists, the recipient buffers the MSDU regardless of the value of the Ack Policy subfield within the QoS Control field of the QoS

Data frame, unless the sequence number of the frame is older than the NextExpectedSequenceNumber for that block ack agreement, in which case the frame is discarded because it is either old or a duplicate.

The recipient flushes received MSDUs from its receive buffer as described in this subclause.

If a BlockAckReq frame is received, all complete MSDUs and A-MSDUs with lower sequence numbers than the starting sequence number contained in the BlockAckReq frame shall be passed up to the next MAC process as shown in Figure 5-1. Upon arrival of a BlockAckReq frame, the recipient shall pass up the MSDUs and A-MSDUs starting with the starting sequence number sequentially until there is an incomplete or missing MSDU or A-MSDU in the buffer. If no MSDUs or A-MSDUs are passed up to the next MAC process after the receipt of the BlockAckReq frame and the starting sequence number of the BlockAckReq frame is newer than the NextExpectedSequenceNumber for that block ack agreement, then the NextExpectedSequenceNumber for that block ack agreement is set to the sequence number of the BlockAckReq frame.

If, after an MPDU is received, the receive buffer is full, the complete MSDU or A-MSDU with the earliest sequence number shall be passed up to the next MAC process.

If, after an MPDU is received, the receive buffer is not full, but the sequence number of the complete MSDU or A-MSDU in the buffer with the lowest sequence number is equal to the NextExpectedSequenceNumber for that block ack agreement, then the MPDU shall be passed up to the next MAC process.

Each time that the recipient passes an MSDU or A-MSDU for a block ack agreement up to the next MAC process, the NextExpectedSequenceNumber for that block ack agreement is set to the sequence number of the MSDU or A-MSDU that was passed up to the next MAC process plus one.

The recipient shall pass MSDUs and A-MSDUs up to the next MAC process in order of increasing sequence number.

10.24.5 Teardown of the block ack mechanism

When the originator has no data to send and the final block ack exchange has completed, it shall signal the end of its use of the block ack mechanism by sending the DELBA frame to its recipient. The recipient does not generate a Management frame in response to the DELBA frame.⁴¹ The recipient of the DELBA frame shall release all resources allocated for the block ack transfer.

The block ack agreement may be torn down if there are no BlockAck, BlockAckReq, or QoS Data frames (sent under block ack policy) for the block ack's TID received from the peer within a duration of block ack timeout value (see 11.5.4).

The DELBA frame transmitted to release the block ack setup of a GCR service shall include the GCR Group Address element to indicate the group address of the GCR service.

10.24.6 Selection of BlockAck and BlockAckReq variants

The Compressed Bitmap subfield of the BA Control field or BAR Control field shall be set to 1 in all BlockAck and BlockAckReq frames sent from one HT STA to another HT STA and shall be set to 0 otherwise.

The Multi-TID subfield of the BA Control field shall be set to 1 in all BlockAck frames related to an HT-immediate agreement transmitted inside a PSMP sequence and shall be set to 0 otherwise. The Multi-TID subfield of the BAR Control field shall be set to 1 in all BlockAckReq frames related to an HT-immediate agreement transmitted inside a PSMP sequence and shall be set to 0 otherwise.

⁴¹Normal Ack rules apply.

In a DMG BSS, if the Compressed Bitmap subfield of the BAR Control field within a BlockAckReq frame related to an HT-immediate agreement is equal to 1, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall have the Compressed Bitmap subfield of the BA Control and BAR Control fields set to 1. In this case, the Multi-TID subfield of the BA Control field and BAR Control field shall be set to 0 in all BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement.

In a DMG BSS, if the Compressed Bitmap subfield of the BAR Control field within a BlockAckReq frame related to an HT-immediate agreement is equal to 0, then all of the following BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement shall have the Compressed Bitmap subfield of the BA Control and BAR Control fields set to 0. In this case, the Multi-TID subfield of the BA Control field and BAR Control field shall be set to 1 in all BlockAck and BlockAckReq frames transmitted as part of the HT-immediate agreement.

Where the terms BlockAck and BlockAckReq are used within 10.24.7 and 10.24.8, the appropriate variant according to this subclause (e.g., Compressed, Multi-TID) is referenced by the generic term.

The GCR subfield of the BAR Control field shall be set to 1 in all BlockAckReq frames where the block ack agreement is for a group address delivered using the GCR block ack retransmission policy and shall be set to 0 otherwise. The GCR subfield of the BA Control field shall be set to 1 in all BlockAck frames where the block ack agreement is for a group address delivered using the GCR block ack retransmission policy and shall be set to 0 otherwise.

10.24.7 HT-immediate block ack extensions

10.24.7.1 Introduction to HT-immediate block ack extensions

An HT extension to the block ack feature (defined in 10.24.1 through 10.24.5), called *HT-immediate block ack*, is defined in 10.24.7.2 through 10.24.7.9.

The HT-immediate extensions simplify immediate block ack use with A-MPDUs and reduce recipient resource requirements.

An HT STA shall support HT-immediate block ack in the role of recipient.

A DMG STA shall support HT-immediate block ack.

10.24.7.2 HT-immediate block ack architecture

The HT-immediate block ack rules are explained in terms of the architecture shown in Figure 10-35 and explained in this subclause.

The originator contains a transmit buffer control that uses $WinStart_O$ and $WinSize_O$ to submit MPDUs for transmission and releases transmit buffers upon receiving BlockAck frames from the recipient.

$WinStart_O$ is the starting sequence number of the transmit window, and $WinSize_O$ is the number of buffers negotiated in the block ack agreement.

The Aggregation control creates A-MPDUs. It may adjust the Ack Policy field of transmitted QoS Data frames according to the rules defined in 10.24.7.7 in order to solicit BlockAck frame responses.

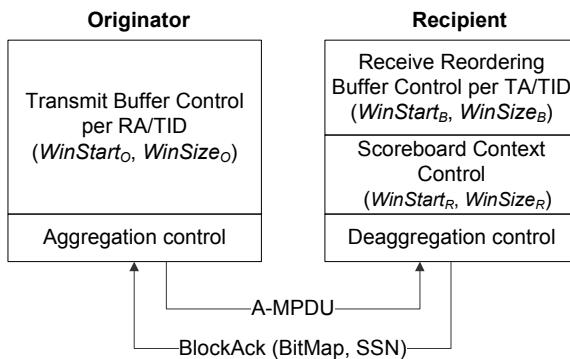

Figure 10-35—HT-immediate block ack architecture

The recipient contains a receive reordering buffer control per TA/TID, which contains a related control state. The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number. It is also responsible for identifying and discarding duplicate frames (i.e., frames that have the same sequence number as a currently buffered frame) that are part of this block ack agreement. It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.24.7.6.

For each HT-immediate block ack agreement, the recipient chooses either full-state or partial-state operation (this choice is known only to the recipient). A STA may simultaneously use full-state operation for some agreements and partial-state operation for other agreements. The scoreboard context control stores an acknowledgment bitmap containing the current reception status of MSDUs or A-MSDUs for HT-immediate block ack agreements. Under full-state operation, status is maintained in statically assigned memory. Under partial-state operation, status is maintained in a cache memory; therefore, the status information is subject to cache replacement. This entity provides the bitmap and the value for the Starting Sequence Number subfield to be sent in BlockAck frame responses to the originator.

The deaggregation control entity separates frames contained in an A-MPDU.

Each received MPDU is analyzed by the scoreboard context control as well as by the receive reordering buffer control.

Each HT-immediate block ack agreement is uniquely identified by a tuple of Address 1, Address 2, and TID from the ADDBA Response frame that successfully established the HT-immediate block ack agreement. The STA that corresponds to Address 1 of the ADDBA Response frame is the originator. The STA that corresponds to Address 2 of the ADDBA Response frame is the recipient. Data frames that contain the same values for Address 1, Address 2, and TID as a successful ADDBA Response frame are related with the HT-immediate block ack agreement that was established by the receipt of that ADDBA Response frame provided that the HT-immediate block ack agreement is still active.

10.24.7.3 Scoreboard context control during full-state operation

For each HT-immediate block ack agreement that uses full-state operation, a recipient shall maintain a block acknowledgment record as defined in 10.24.3. This record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer starting sequence number, $WinStart_R$, representing the lowest sequence number position in the bitmap; a variable $WinEnd_R$; and the maximum transmission window size, $WinSize_R$, which is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA implementing full-state operation for an HT-immediate block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

- a) At HT-immediate block ack agreement establishment:
 - 1) $WinStart_R = SSN$ from the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement.
 - 2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
- b) For each received Data frame that is related with a specific full-state operation HT-immediate block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SN is the value of the Sequence Number subfield of the received Data frame:
 - 1) If $WinStart_R \leq SN \leq WinEnd_R$, set to 1 the bit in position SN within the bitmap.
 - 2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
 - i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.
 - ii) Set $WinStart_R = SN - WinSize_R + 1$.
 - iii) Set $WinEnd_R = SN$.
 - iv) Set to 1 the bit at position SN in the bitmap.
 - 3) If $WinStart_R + 2^{11} \leq SN < WinStart_R$, make no changes to the record.

NOTE—A later-arriving Data frame might validly contain a sequence number that is lower than an earlier-arriving one. This might happen because the transmitter may choose to send Data frames in a nonsequential sequence number order or because a previous Data frame transmission with lower sequence number is not successful and is being retransmitted.
- c) For each received BlockAckReq frame that is related with a specific full-state operation HT-immediate block ack agreement that is not a protected block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number subfield of the received BlockAckReq frame:
 - 1) If $WinStart_R < SSN \leq WinEnd_R$,
 - i) Set $WinStart_R = SSN$.
 - ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ through $WinStart_R + WinSize_R - 1$.
 - iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
 - 2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
 - i) Set $WinStart_R = SSN$.
 - ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
 - iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.
 - 3) If $WinStart_R + 2^{11} \leq SSN \leq WinStart_R$, make no changes to the record.

10.24.7.4 Scoreboard context control during partial-state operation

In an HT-immediate block ack agreement that uses partial-state operation, a recipient shall maintain a temporary block acknowledgment record, as defined in 10.24.3. This temporary record includes a bitmap, indexed by sequence number; a 12-bit unsigned integer $WinStart_R$ (the lowest sequence number represented in the bitmap); a 12-bit unsigned integer $WinEnd_R$ (the highest sequence number in the bitmap); the originator address; TID; and the maximum transmission window size, $WinSize_R$, which is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement.

During partial-state operation of scoreboard context control, the recipient retains the current record for an HT-immediate block ack agreement at least as long as it receives data from the same originator. If a frame for an HT-immediate block ack agreement from a different originator is received, the temporary record may be discarded if the resources it uses are needed to store the temporary record corresponding to the newly arriving frame.

A STA implementing partial-state operation for an HT-immediate block ack agreement shall maintain the temporary block acknowledgment record for that agreement according to the following rules:

- a) During partial-state operation, $WinStart_R$ is determined by the Sequence Number subfield value of received Data frames and by the Starting Sequence Number subfield value of received BlockAckReq frames as described below.
- b) For each received Data frame that is related with a specific partial-state operation HT-immediate block ack agreement, when no temporary record for the agreement related with the received Data frame exists at the time of receipt of the Data frame, a temporary block acknowledgment record is created as follows, where SN is the value of the Sequence Number subfield of the received Data frame:
 - 1) $WinEnd_R = SN$.
 - 2) $WinStart_R = WinEnd_R - WinSize_R + 1$.
 - 3) Create a bitmap of size $WinSize_R$, with the first bit corresponding to sequence number $WinStart_R$ and the last bit corresponding to sequence number $WinEnd_R$, and set all bits in the bitmap to 0.
 - 4) Set to 1 the bit in the position in the bitmap that corresponds to SN .
- c) For each received Data frame that is related with a specific partial-state operation HT-immediate block ack agreement, when a temporary record for the agreement related with the received Data frame exists at the time of receipt of the Data frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.24.7.3.
- d) For each received BlockAckReq frame that is related with a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when no temporary record for the agreement related with the received frame exists at the time of receipt of the frame, a temporary block acknowledgment record is created as follows, where SSN is the starting value of the Sequence Number subfield of the received BlockAckReq frame:
 - 1) $WinStart_R = SSN$.
 - 2) $WinEnd_R = WinStart_R + WinSize_R - 1$.
 - 3) Create a bitmap of size $WinSize_R$, and set all bits in the bitmap to 0.
- e) For each received BlockAckReq frame that is related with a specific partial-state operation HT-immediate block ack agreement that is not a protected block ack agreement, when a temporary record for the agreement related with the received frame exists at the time of receipt of the frame, the temporary block acknowledgment record for that agreement is modified in the same manner as the acknowledgment record for a full-state agreement described in 10.24.7.3.

10.24.7.5 Generation and transmission of BlockAck frames by an HT STA or DMG STA

Except when operating within a PSMP exchange, a STA that receives a PPDU that contains a BlockAckReq frame in which the Address 1 field matches its MAC address during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response. A STA that receives an A-MPDU that contains one or more MPDUs in which the Address 1 field matches its MAC address with the Ack Policy field equal to Normal Ack (i.e., implicit block ack request) during either full-state operation or partial-state operation shall transmit a PPDU containing a BlockAck frame that is separated on the WM by a SIFS from the PPDU that elicited the BlockAck frame as a response.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received A-MPDU with Ack Policy equal to Normal Ack (i.e., implicit block ack request) during either full-state operation or partial-state operation, any adjustment to the value of $WinStart_R$ according to the procedures defined within 10.24.7.3 and 10.24.7.4 shall be performed before the generation and transmission of the response BlockAck frame. The Starting Sequence Number subfield of the Block Ack Starting Sequence Control subfield of the BlockAck frame shall be set to any value in the range ($WinEnd_R - 63$) to $WinStart_R$. The values in the recipient's record of status of MPDUs beginning with the MPDU for which the Sequence Number subfield value is equal to $WinStart_R$ and ending with the MPDU for which the Sequence Number subfield value is equal to $WinEnd_R$ shall be included in the bitmap of the BlockAck frame.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received A-MPDU with Ack Policy equal to Normal Ack (i.e., implicit block ack request) during either full-state or partial-state operation, if the adjusted value of $WinStart_R$ is greater than the value of the starting sequence number of the BlockAck frame, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are less than the adjusted value of $WinStart_R$ may be set to any value.

When responding with a BlockAck frame to either a received BlockAckReq frame or a received A-MPDU with Ack Policy equal to Normal Ack (i.e., implicit block ack request) during either full-state or partial-state operation, if the adjusted value of $WinEnd_R$ is less than the value of the starting sequence number of the BlockAck frame plus 63, within the bitmap of the BlockAck frame, the status of MPDUs with sequence numbers that are greater than the adjusted value of $WinEnd_R$ shall be reported as unsuccessfully received (i.e., the corresponding bit in the bitmap shall be set to 0).

If a BlockAckReq frame is received and no matching partial state is available, the recipient shall send a null BlockAck frame in which the bitmap is set to all 0s.

10.24.7.6 Receive reordering buffer control operation

10.24.7.6.1 General

The behavior described in this subclause, 10.24.7.6.2, and 10.24.7.6.3 applies to a STA that uses either partial-state operation or full-state operation for an HT-immediate block ack agreement.

A receive reordering buffer shall be maintained for each HT-immediate block ack agreement. Each receive reordering buffer includes a record comprising the following:

- Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process
- A $WinStart_B$ parameter, indicating the value of the Sequence Number subfield of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received
- A $WinEnd_B$ parameter, indicating the highest sequence number expected to be received in the current reception window
- A $WinSize_B$ parameter, indicating the size of the reception window

$WinStart_B$ is initialized to the Starting Sequence Number subfield value of the ADDBA Request frame that elicited the ADDBA Response frame that established the HT-immediate block ack agreement.

$WinEnd_B$ is initialized to $WinStart_B + WinSize_B - 1$, where $WinSize_B$ is set to the smaller of 64 and the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement.

Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer.

The recipient shall always pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number subfield value.

10.24.7.6.2 Operation for each received Data frame

For each received Data frame that is related to a specific HT-immediate block ack agreement, the receive reordering buffer record shall be modified as follows, where SN is the value of the Sequence Number subfield of the received MPDU:

- a) If $WinStart_B \leq SN \leq WinEnd_B$,
 - 1) Store the received MPDU in the buffer, if no MSDU with the same sequence number is already present; otherwise discard the MPDU.
 - 2) Pass MSDUs or A-MSDUs up to the next MAC process if they are stored in the buffer in order of increasing value of the Sequence Number subfield starting with the MSDU or A-MSDU that has $SN=WinStart_B$ or if $SN > WinStart_B$, the STA is a DMG STA, and one of the following conditions is met:
 - i) The MPDU is received as non-first frame in the A-MPDU; the bit at position $SN=WinStartR - 1$ is set to 1; and all delimiters between the received MPDU and the preceding MPDU ($SN=WinStartR - 1$) are valid.
 - ii) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStartR - 1$ is set to 1; and all delimiters after the MPDU($SN=WinStartR - 1$) in the preceding A-MPDU are valid.
 - iii) The MPDU is received in SIFS or RIFS after an A-MPDU or in SIFS after transmission of a BlockAck frame; the bit at position $SN=WinStartR - 1$ is set to 1; and all delimiters after the MPDU ($SN=WinStartR - 1$) in the preceding A-MPDU are valid.
 - iv) The MPDU is received as first frame in the A-MPDU; the A-MPDU is received in SIFS or RIFS after an MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStartR - 1$ is set to 1.
 - v) The MPDU is received in SIFS or RIFS after the preceding MPDU or in SIFS after transmission of an Ack frame; and the bit at position $SN=WinStartR - 1$ is set to 1.

This process is continued sequentially until there is no buffered MSDU or A-MSDU for the next sequential value of the Sequence Number subfield.

- 3) Set $WinStart_B$ to the value of the Sequence Number subfield of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.
- 4) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.
- b) If $WinEnd_B < SN < WinStart_B + 2^{11}$,
 - 1) Store the received MPDU in the buffer, if no MSDU with the same sequence number is already present; otherwise discard the MPDU.
 - 2) Set $WinEnd_B = SN$.
 - 3) Set $WinStart_B = WinEnd_B - WinSize_B + 1$.
 - 4) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.
 - 5) In a non-DMG STA, pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing value of the Sequence Number subfield starting with $WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value. For a DMG STA, follow rules defined in item a) 2) above.

- 6) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.
- 7) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.
- c) If $WinStart_B + 2^{11} \leq SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, and do not pass the MSDU or A-MSDU up to the next MAC process).

10.24.7.6.3 Operation for each received BlockAckReq

For each received BlockAckReq frame that is related with a specific HT-immediate block ack agreement, the receive reordering buffer record is modified as follows, where SSN is the Starting Sequence Number subfield value of the received BlockAckReq frame:

- a) If $WinStart_B < SSN < WinStart_B + 2^{11}$,
 - 1) In a block ack agreement that is not a protected block ack agreement, set $WinStart_B = SSN$. See 10.24.9 for a protected block ack agreement.
 - 2) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.
 - 3) Pass any complete MSDUs or A-MSDUs stored in the buffer with Sequence Number subfield values that are lower than the new value of $WinStart_B$ up to the next MAC process in order of increasing Sequence Number subfield value. Gaps may exist in the Sequence Number subfield values of the MSDUs or A-MSDUs that are passed up to the next MAC process.
 - 4) Pass MSDUs or A-MSDUs stored in the buffer up to the next MAC process in order of increasing Sequence Number subfield value starting with $SN=WinStart_B$ and proceeding sequentially until there is no buffered MSDU or A-MSDU for the next sequential Sequence Number subfield value.
 - 5) Set $WinStart_B$ to the Sequence Number subfield value of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.
 - 6) Set $WinEnd_B = WinStart_B + WinSize_B - 1$.
- b) If $WinStart_B + 2^{11} \leq SSN < WinStart_B$, do not make any changes to the receive reordering buffer record.

10.24.7.7 Originator's behavior

A STA may send a block of data in a single A-MPDU where each Data frame has its Ack Policy field set to Normal Ack. The originator expects to receive a BlockAck frame response immediately following the A-MPDU if at least one Data frame is received without error.

Alternatively, the originator may send an A-MPDU where each Data frame has its Ack Policy field set to Block Ack under an HT-immediate block ack agreement if it does not require a BlockAck frame response immediately following the A-MPDU.

If the BlockAck frame is lost, the originator may transmit a BlockAckReq frame to solicit an immediate BlockAck frame or it may retransmit the Data frames.

A BlockAckReq frame sent using HT-delayed operation may be transmitted within an A-MPDU provided that its BAR Ack Policy subfield is set to No Acknowledgment.

The originator may transmit QoS Data frames with a TID matching an established block ack agreement in any order provided that their sequence numbers lie within the current transmission window. The originator may transmit an MPDU with a sequence number that is beyond the current transmission window ($SN > WinStart_O + WinSize_O - 1$), in which case the originator's transmission window (and the recipient's window) is moved forward. The originator should not transmit MPDUs that are lower than (i.e., $SN < WinStart_O$) the current transmission window.

The originator shall not retransmit an MPDU after that MPDU's appropriate lifetime limit.

The originator may send a BlockAckReq frame for block ack agreement that is not a protected block ack agreement or a robust ADDBA Request frame for protected block ack agreement when a Data frame that was previously transmitted within an A-MPDU that had the Ack Policy field equal to Normal Ack is discarded due to exhausted MSDU lifetime. The purpose of this BlockAckReq or robust ADDBA Request frame is to shift the recipient's $WinStart_B$ value past the hole in the sequence number space that is created by the discarded Data frame and thereby to allow the earliest possible passing of buffered frames up to the next MAC process.

An originator that is a DMG STA shall transmit MPDUs sent under a BA agreement such that:

- MPDUs that need to be retransmitted are transmitted first, in sequential order of sequence number, starting from the oldest MPDU that needs to be retransmitted
- MPDUs that are being transmitted for the first time are sent after any MPDUs that need to be retransmitted, in sequential order of sequence number, starting from the oldest MPDU that has not been transmitted
- MPDUs are transmitted with the Ack Policy subfield set to Block Ack if the A-MPDU that contains them is followed after SIFS or RIFS by another A-MPDU

An originator that is a DMG STA shall not start a new TXOP or SP with an MPDU or A-MPDU that has an Ack policy other than Normal Ack if at least one frame transmitted by the originator to the recipient in the last PPDU did not require an immediate response.

10.24.7.8 Maintaining block ack state at the originator

If an originator successfully receives a BlockAck frame in response to a BlockAckReq frame, the originator shall maintain block ack state as defined in 10.24.3.

If the originator receives a BlockAck frame in response to an HT-immediate BlockAckReq frame, it shall, in addition,

- Not update the status of MPDUs with Sequence Number subfield values between $WinStart_O$ and SSN of the received BlockAck frame, and
- NOTE—It is possible for the Starting Sequence Number subfield value (SSN) of the received BlockAck frame to be greater than $WinStart_O$ because of the failed reception of a nonzero number of MPDUs beginning with the MPDU with Sequence Number subfield value equal to $WinStart_O$ at a recipient that is using partial-state operation.
- Not update the status of MPDUs that have been already positively acknowledged.

NOTE—This second rule means that if an originator successfully delivered an MPDU and received the BlockAck frame in one TXOP and then receives a BlockAck frame in a later TXOP in which the MPDU is not indicated as successfully received (because the partial state has been reset), the originator knows not to retry the MPDU.

10.24.7.9 Originator's support of recipient's partial state

A recipient may choose to employ either full-state operation or partial-state operation for each individual block ack agreement. An originator is unaware of the recipient's choice of full-state or partial-state operation.

NOTE—The originator might solicit a BlockAck frame as the last activity associated with that block ack agreement in the current TXOP to reduce the probability that data are unnecessarily retransmitted due to loss of partial state.

10.24.8 HT-delayed block ack extensions

10.24.8.1 Introduction

Subclauses 10.24.8.2 and 10.24.8.3 define an HT extension to the block ack feature to support operation on delayed block ack agreements established between HT STAs. Other than the exceptions noted in 10.24.8.1 through 10.24.8.3, the operation of HT-delayed block ack is the same as is described in 10.24.7.

The HT-delayed extensions simplify the use of delayed block ack in an A-MPDU and reduce resource requirements.

A DMG STA shall not use HT-delayed block ack.

10.24.8.2 HT-delayed block ack negotiation

HT-delayed block ack is an optional feature. An HT STA declares support for HT-delayed block ack in the HT Capabilities element.

An HT STA shall not attempt to create a block ack agreement under HT-delayed block ack policy unless the recipient HT STA declares support for this feature.

10.24.8.3 Operation of HT-delayed block ack

The BlockAck frame response to an HT-delayed BlockAckReq frame is transmitted after an unspecified delay and when the recipient of the BlockAckReq frame next has the opportunity to transmit. This response may be transmitted in a later TXOP owned by the recipient of the BlockAckReq frame or in the current or a later TXOP owned by the sender of the BlockAckReq frame using the RD feature (see 10.28).

The BAR Ack Policy subfield of a BlockAckReq frame and the BA Ack Policy subfield of a BlockAck frame may be set to No Acknowledgment under an HT-delayed block ack agreement.

A BlockAckReq or BlockAck frame containing a BAR Ack Policy or BA Ack Policy subfield equal to 1 indicates that no acknowledgment is expected to these Control frames. Otherwise, a response that is an Ack frame is expected after a SIFS.

Setting of the BAR Ack Policy and BA Ack Policy subfields may be performed independently for BlockAckReq and BlockAck frames associated with the same HT-delayed block ack agreement. All four combinations of the values of these fields are valid.

Setting of the BAR Ack Policy and BA Ack Policy subfields is dynamic and may change from PPDU to PPDU.

10.24.9 Protected block ack agreement

A STA indicates support for protected block ack by setting the RSN Capabilities field subfields Management Frame Protection Capable (MFPC), Management Frame Protection Required (MFPR) and PBAC to 1. Such a STA is a PBAC STA; otherwise, the STA is a non-PBAC STA. A block ack agreement that is successfully negotiated between two PBAC STAs is a protected block ack agreement. A block ack agreement that is successfully negotiated between two STAs when either or both of the STAs is not a PBAC STA is a block ack agreement that is not a protected block ack agreement.

A PBAC STA may choose to negotiate a block ack agreement with a non-PBAC STA if dot11RSNAPBACRequired is 0; otherwise, it shall negotiate a block ack agreement only with other PBAC

STAs. If a PBAC STA is communicating with a non-PBAC STA, it shall follow the rules for a nonprotected block ack agreement.

A STA that has successfully negotiated a protected block ack agreement shall obey the following rule as a block ack originator in addition to rules specified in 10.24.7.7 and 10.24.7.8:

- To change the value of $WinStart_B$ at the receiver, the STA shall use a robust ADDBA Request frame.

A STA that has successfully negotiated a protected block ack agreement shall obey the following rules as a block ack recipient in addition to rules specified in 10.24.7.3 to 10.24.7.6:

- The recipient STA shall respond to a BlockAckReq frame from a PBAC enabled originator with an immediate BlockAck frame. The Block Ack Starting Sequence Control subfield value shall be ignored for the purposes of updating the value of $WinStart_B$. The Block Ack Starting Sequence Control subfield value may be utilized for the purposes of updating the value of $WinStart_R$. If the Block Ack Starting Sequence Control subfield value is greater than $WinEnd_B$ or less than $WinStart_B$, dot11PBACErrors shall be incremented by 1.
- Upon receipt of a valid robust ADDBA Request frame for an established protected block ack agreement whose TID and transmitter address are the same as those of the block ack agreement, the STA shall update its $WinStart_R$ and $WinStart_B$ values based on the starting sequence number in the robust ADDBA Request frame according to the procedures outlined for reception of BlockAckReq frames in 10.24.7.3, 10.24.7.4, 10.24.7.6.1, and 10.24.7.6.3, while treating the starting sequence number as though it were the SSN of a received BlockAckReq frame. Values in other fields of the ADDBA Request frame shall be ignored.

10.24.10 GCR block ack

10.24.10.1 Introduction

Subclause 10.24.10 extends the block ack mechanism to group addressed frames that are transmitted using the GCR block ack retransmission policy. Other than the exceptions noted in 10.24.10.2 through 10.24.10.3, the operation of GCR block ack is the same as is described in 10.24.7.

10.24.10.2 Scoreboard context control during GCR block ack

For each GCR block ack agreement, each recipient shall maintain a block acknowledgment record as defined in 10.24.3. This record includes the following information:

- A bitmap, indexed by sequence number
- A 12-bit unsigned integer starting sequence number
- $WinStart_R$, representing the lowest sequence number position in the bitmap
- A variable $WinEnd_R$
- The maximum transmission window size, $WinSize_R$

$WinSize_R$ is set to the smaller of 64 and the value of the Buffer Size field of the associated ADDBA Response frame that established the block ack agreement. $WinEnd_R$ is defined as the highest sequence number in the current transmission window. A STA implementing a GCR block ack agreement shall maintain the block acknowledgment record for that agreement according to the following rules:

- a) At GCR block ack agreement establishment:
 - 1) $WinStart_R$ = the Starting Sequence Number subfield value (SSN) from the ADDBA Request frame that elicited the ADDBA Response frame that established the GCR block ack agreement.
 - 2) $WinEnd_R$ = $WinStart_R + WinSize_R - 1$.

- b) For each received Data frame that is related with a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SN is the value of the Sequence Number subfield of the received Data frame:
 - 1) If $WinStart_R \leq SN \leq WinEnd_R$, set to 1 the bit in position SN within the bitmap.
 - 2) If $WinEnd_R < SN < WinStart_R + 2^{11}$,
 - i) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ to $SN - 1$.
 - ii) Set $WinStart_R = SN - WinSize_R + 1$.
 - iii) Set $WinEnd_R = SN$.
 - iv) Set to 1 the bit at position SN in the bitmap.
 - 3) If $WinStart_R + 2^{11} \leq SN \leq WinStart_R$, make no changes to the record.
- c) For each received BlockAckReq frame that is related with a specific GCR block ack agreement, the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number subfield of the received BlockAckReq frame:
 - 1) If $WinStart_R < SSN \leq WinEnd_R$,
 - i) Set $WinStart_R = SSN$.
 - ii) Set to 0 the bits corresponding to MPDUs with Sequence Number subfield values from $WinEnd_R + 1$ through $WinStart_R + WinSize_R - 1$.
 - iii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
 - 2) If $WinEnd_R < SSN < WinStart_R + 2^{11}$,
 - i) Set $WinStart_R = SSN$.
 - ii) Set $WinEnd_R = WinStart_R + WinSize_R - 1$.
 - iii) Set to 0 bits the corresponding to MPDU with Sequence Number subfield values from $WinStart_R$ to $WinEnd_R$.
 - 3) If $WinStart_R + 2^{11} \leq SSN \leq WinStart_R$, make no changes to the record.

10.24.10.3 GCR block ack BlockAckReq and BlockAck frame exchanges

A protective mechanism (such as transmitting an HCCA CAP, MCCA, or RTS/CTS; setting the Duration field in the first frame and response frames to update the NAVs of STAs in the BSS and OBSS(s); or using another mechanism described in 10.26 and 10.3.2.8) should be used to reduce the probability of other STAs transmitting during the GCR TXOP.

When the retransmission policy for a group address is GCR Block Ack, an originator shall not transmit more than the GCR buffer size number of A-MSDUs with RA set to the GCR concealment address and the DA field of the A-MSDU subframe set to the GCR group address before sending a BlockAckReq frame to one of the STAs that has a GCR block ack agreement for this group address. The RA field of the BlockAckReq frame shall be set to the MAC address of the destination STA. Upon reception of the BlockAck frame, an originator may send a BlockAckReq frame to another STA that has a block ack agreement for this group address, and this process may be repeated multiple times.

NOTE—If the originator sends a BlockAckReq frame to a STA with a MAC address that matches the SA in any of the A-MSDUs transmitted during the GCR TXOP, the Block Ack Bitmap subfield does not indicate the MSDUs sourced from this STA. This is because the STA will have discarded all group addressed MPDUs transmitted by the AP that have the source address equal to their MAC address (see 10.3.6).

When a recipient receives a BlockAckReq frame with the GCR Group Address subfield equal to a GCR group address, the recipient shall transmit a BlockAck frame at a delay of SIFS after the BlockAckReq frame. The BlockAck frame acknowledges the STA's reception status of the block of group addressed frames requested by the BlockAckReq frame.

Figure 10-36 shows an example of a frame exchange when the GCR block ack retransmission policy is used. The AP sends several A-MSDUs using the GCR block ack retransmission policy. The AP then sends a BlockAckReq frame to group member 1 of the GCR group, waits for the BlockAck frame, and then sends a BlockAckReq frame to group member 2. After receiving the BlockAck frame from GCR group member 2, the AP determines whether any A-MSDUs need to be retransmitted and sends additional A-MSDUs (some of which might be retransmissions of previous A-MSDUs) using the GCR block ack retransmission policy.

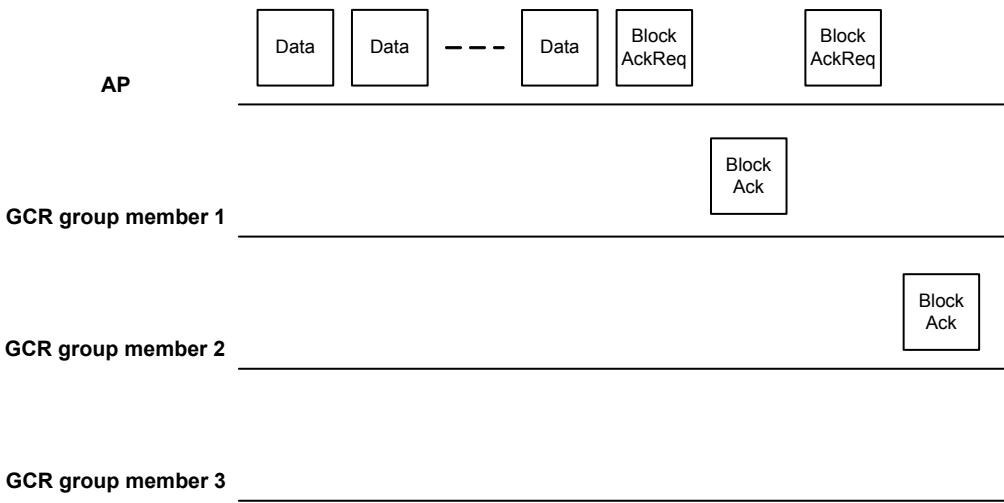

Figure 10-36—Example of frame exchange with GCR block ack retransmission policy

After completing the BlockAckReq and BlockAck frame exchanges, the originator determines from the information provided in the BlockAck bitmap and from the missing BlockAck frames which, if any, A-MSDUs need to be retransmitted.

An originator adopting the GCR block ack retransmission policy for a GCR group address chooses a lifetime limit for the group address. The originator may vary the lifetime limit for the group address at any time and may use different lifetime limits for different GCR group addresses. The originator transmits and retries each A-MSDU until the appropriate lifetime limit is reached or until each one has been received by all group members to which a BlockAckReq frame has been sent, whichever occurs first.

For GCR streams with retransmission policy equal to GCR Block Ack, an originator may regularly send a BlockAckReq frame with the GCR Group Address subfield in the BAR Information field set to the GCR group address and the Block Ack Starting Sequence Control subfield set to the Sequence Number field of the earliest A-MSDU of the GCR stream that has not been acknowledged by all group members and has not expired due to lifetime limits, in order to minimize buffering latency at receivers in the GCR group.

NOTE—This is because an originator might transmit Management frames, QoS Data frames with a group address in the Address 1 field (including different GCR streams), and non-QoS Data frames intermingled. Since these are transmitted using a single sequence counter, missing frames or frames sent to group addresses absent from a receiving STA's dot11GroupAddresses table complicate receiver processing for GCR streams with a GCR block ack retransmission policy since the cause of a hole in a receiver's block ack bitmap is ambiguous: it is due either to an MPDU being lost from the GCR stream or to transmissions of MPDUs not related to the GCR service using the same sequence number counter.

If an originator accepts two or more GCR agreements with multiple STAs where the GCR agreements have the same Ethernet classifiers, but different additional classifiers, then each STA receives multiple GCR flows from the originator and sends them to upper layers where the MSDUs irrelevant to the STA are discarded, in the same manner that non-GCR MSDUs irrelevant to the STA are discarded. In the Block Ack Bitmap field sent to the originator, each STA sets bits corresponding to MPDUs received from any of the multiple GCR streams. The originator should not retry MPDUs to the STA for the bit positions that are irrelevant to that STA.

The beginning of reception of an expected response to a BlockAckReq frame is detected by the occurrence of a PHY-CCA.indication(BUSY, channel-list) primitive at the STA that is expecting the response where the channel-list parameter is absent or, if present, includes “primary.”

If the beginning of such reception does not occur during the first slot time following a SIFS, then the originator may perform error recovery by retransmitting a BlockAckReq frame PIFS after the previous BlockAckReq frame when both of the following conditions are met:

- The carrier sense mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-26) after the expected start of a BlockAck frame, and
- The remaining duration of the GCR TXOP is longer than the total time required to retransmit the GCR BlockAckReq frame plus one slot time.

NOTE—If an originator fails to receive a BlockAck frame in response to a BlockAckReq frame and there is insufficient time to transmit a recovery frame, the AP retransmits the BlockAckReq frame in a new TXOP.

10.24.11 DMG block ack with flow control

10.24.11.1 General

A DMG STA indicates that it is capable of supporting DMG block ack with flow control by setting the BA with Flow Control field to 1 within the STA’s DMG Capabilities element. A DMG block ack agreement with flow control can be established only when both originator and recipient support this capability.

10.24.11.2 DMG block ack architecture with flow control

The DMG block ack rules are explained in terms of the architecture shown in Figure 10-37 and explained in this subclause.

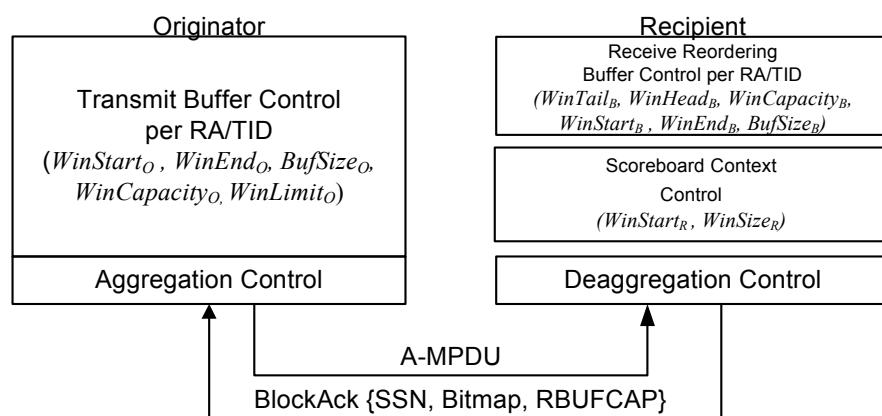

Figure 10-37—DMG block ack architecture

The originator contains a transmit buffer control that uses $WinStart_O$, $BufSize_O$, and $WinLimit_O$ to submit MPDUs for transmission, and releases transmit buffers upon receiving BlockAck frames from the recipient or when it advances the transmit control buffer window.

$WinStart_O$ is the starting sequence number of the transmit range, $WinLimit_O$ is the last sequence number expected to exhaust the receiver buffer capacity, and $BufSize_O$ is the number of buffers negotiated in the block ack agreement.

Figure 10-38 shows the DMG block ack with flow control and its associated parameters from the originator perspective.

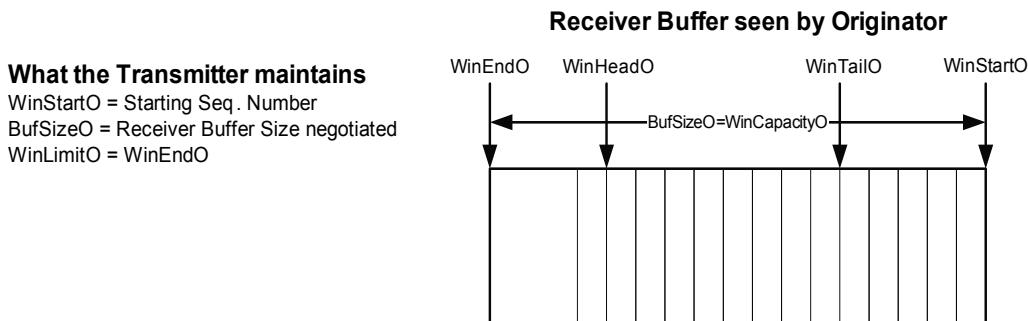

Figure 10-38—Flow control and its associated parameters as a function of receiver buffer size

The Aggregation control creates A-MPDUs. It can adjust the Ack Policy field of transmitted Data frames according to the rules defined in 10.24.7.7 in order to solicit block ack responses.

The recipient contains a Receive Reordering Buffer Control per TA/TID, which contains related control state.

The receive reordering buffer is responsible for reordering MSDUs or A-MSDUs so that MSDUs or A-MSDUs are eventually passed up to the next MAC process in order of received sequence number (SN). It maintains its own state independent of the scoreboard context control to perform this reordering as specified in 10.24.7.6. The delivery of in order MSDUs or A-MSDUs to the next MAC process is implementation dependent. In some cases, the receiver reordering buffer might be forced to hold on to MSDUs ready for in order delivery due to deferred reception at the next MAC process. This behavior can impose additional buffering requirements on the receiver, causing the actual available buffer capacity to vary dynamically. The reordering buffer is required to manage its lowest and highest (in order) SN, which are marked as $WinTail_B$ and $WinHead_B$, respectively.

The scoreboard context control provides the $WinCapacity_B$, actually controlled by the Reordering buffer in addition to the bitmap field and the Starting Sequence Number (SSN) field to be sent in BlockAck frame responses to the originator.

10.24.11.3 Scoreboard context control with flow control

The scoreboard context control with flow control is defined in 10.24.7.3 and 10.24.7.4.

10.24.11.4 Receive Reordering Buffer with flow control operation

10.24.11.4.1 General

A recipient shall maintain a receive reordering buffer for each DMG block ack agreement. Each receive reordering buffer includes a record comprising the following:

- Buffered MSDUs or A-MSDUs that have been received, but not yet passed up to the next MAC process
- A $WinStart_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been received
- A $WinEnd_B$ parameter, indicating the highest SN expected to be received in the current reception range
- A $BufSize_B$ parameter, indicating the size of the reception window

- A $WinTail_B$ parameter, indicating the value of the Sequence Number field (SN) of the first (in order of ascending sequence number) MSDU or A-MSDU that has not yet been delivered to the next MAC process
- A $WinHead_B$ parameter, indicating the highest SN received in the current reception range

$WinStart_B$ is initialized to the Starting Sequence Number field value (SSN) of the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement.

$WinEnd_B$ is initialized to $WinStart_B + BufSize_B - 1$, where $BufSize_B$ is set to the value of the Buffer Size field of the ADDBA Response frame that established the block ack agreement.

Both $WinTail_B$ and $WinHead_B$ are initialized to the preceding Starting Sequence Number field value (SSN – 1), to indicate no MPDU was received, within the current reception window.

Any MSDU or A-MSDU that has been passed up to the next MAC process shall be deleted from the receive reordering buffer, advancing the $WinTail_B$.

The recipient shall pass MSDUs or A-MSDUs up to the next MAC process in order of increasing Sequence Number field value.

10.24.11.4.2 Operation for DMG block ack agreement initialization

At DMG block ack agreement establishment:

- a) $WinStart_B = SSN$ from the ADDBA Request frame that elicited the ADDBA Response frame that established the DMG block ack agreement
- b) $WinEnd_B = WinStart_B + BufSize_B - 1$
- c) $WinCapacity_B = BufSize_B$
- d) $WinHead_B = SSN - 1$, where SSN is taken from the ADDBA Request, similar to $WinStart_B$
- e) $WinTail_B = SSN - 1$

10.24.11.4.3 Operation for each received Data frame

For each received Data frame that is related to a specific DMG block ack agreement, the receive reordering buffer record is modified as follows, where SN is the value of the Sequence Number field of the received MPDU:

- a) If $WinStart_B \leq SN \leq WinEnd_B$
 - 1) Store the received MPDU in the buffer.
 - i) If $SN > WinHead_B$, Set $WinHead_B = SN$.
 - ii) If $SN > (WinTail_B + BufSize_B)$,
 - 1) All MSDU buffers with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
 - 2) Set $WinTail_B = SN - BufSize_B$.
 - iii) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
 - 2) Set $WinStart_B$ to the value of the Sequence Number field of the first MSDU or A-MSDU that is missing to allow in-order delivery to the next MAC process.
 - 3) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
- b) If $WinEnd_B < SN < WinStart_B + 2^{11}$
 - 1) Store the received MPDU in the buffer.
 - 2) Set $WinEnd_B = SN$.

- 3) Set $WinStart_B = WinEnd_B - BufSize_B + 1$.
- 4) All MSDU buffers with sequence numbers from $WinTail_B$ to $SN - BufSize_B$ that were received correctly are passed to the next MAC process.
- 5) Set $WinTail_B = SN - BufSize_B$.
- 6) Set $WinHead_B = SN$.
- 7) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
- c) If $WinStart_B + 2^{11} \leq SN < WinStart_B$, discard the MPDU (do not store the MPDU in the buffer, do not pass the MSDU or A-MSDU up to the next MAC process).
- d) For each received BlockAckReq frame the block acknowledgment record for that agreement is modified as follows, where SSN is the value from the Starting Sequence Number field of the received BlockAckReq frame:
 - 1) If $WinStart_B < SSN \leq WinEnd_B$
 - i) Set $WinStart_B = SSN$.
 - ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
 - iii) If $SSN > WinHead_B$, set $WinHead_B = SSN - 1$.
 - iv) If $SSN > (WinTail_B + BufSize_B)$,
 - 1) All MSDU buffers with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
 - 2) Set $WinTail_B = SSN - BufSize_B$.
 - v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
 - 2) If $WinEnd_B < SSN < WinStart_B + 2^{11}$
 - i) Set $WinStart_B = SSN$.
 - ii) Set $WinEnd_B = WinStart_B + BufSize_B - 1$.
 - iii) Set $WinHead_B = SSN - 1$.
 - iv) If $SSN > (WinTail_B + BufSize_B)$,
 - 1) All MSDU buffers with sequence numbers from $WinTail_B$ to $SSN - BufSize_B$, are discarded from the buffer.
 - 2) Set $WinTail_B = SSN - BufSize_B$.
 - v) Set $WinCapacity_B = WinTail_B + BufSize_B - WinHead_B$.
 - 3) If $WinStart_B + 2^{11} \leq SSN \leq WinStart_B$, make no changes to the record.

10.24.11.4.4 Operation for ongoing release of received MPDUs

The reordering buffer shall continue to pass MSDUs or A-MSDUs up to the next MAC process that are stored in the buffer in order of increasing value of the Sequence Number field, starting with the MSDU or A-MSDU that has $SN = WinTail_B$ and proceeding sequentially until there is no ready in-order MSDU or A-MSDU buffered for the next sequential value of the Sequence Number field.

- a) Set $WinTail_B$ to the value of the Sequence Number field of the last MSDU or A-MSDU that was passed up to the next MAC process plus one.

10.24.11.5 Generation and transmission of BlockAck frame by a STA with flow control

In addition to the behavior specified in 10.24.7.5 when responding with a BlockAck frame, the RBUFCAP field shall be updated with the value of $WinCapacity_B$.

10.24.11.6 Originator's behavior with flow control support

If the BA with Flow Control field within a recipient's DMG Capabilities element is equal to 1, the originator shall not transmit an MPDU with a SN that is beyond the current recipient's buffer capacity ($WinLimit_O$).

The BlockAck frame indicates the number of free buffer slots available at the recipient for reception of additional MPDUs.

The originator shall update the variable $WinLimit_O$ upon reception of a valid BlockAck:

- Set $WinCapacity_O$ to the received value of the RBUFCAP field in the BlockAck frame.
- Set $MostSuccSN$ to the highest SN of positively acknowledged MPDUs
- Set $WinLimit_O = MostSuccSN + WinCapacity_O$

NOTE—Updating the variable $WinLimit_O$ limits the transmission of the following MPDUs.

Originator's support of recipient's partial state is defined in 10.24.7.9.

10.25 No Acknowledgment (No Ack)

When a QoS Data frame is transmitted with the Ack Policy subfield set to No Ack, there is no MAC-level recovery, and the reliability of this traffic is reduced, relative to the reliability of traffic with other acknowledgment policies, due to the increased probability of lost frames from interference, collisions, or time-varying channel parameters. A protective mechanism (such as transmitting using HCCA, RTS/CTS, or the mechanism described in 10.26) should be used to reduce the probability of other STAs transmitting during the TXOP.

10.26 Protection mechanisms

10.26.1 Introduction

These protection mechanisms cause a STA that is a potential interferer to defer any transmission for a known period of time. When these mechanisms are used, non-ERP STAs do not interfere with frame exchanges using ERP PPDUs between ERP STAs and non-HT STAs do not interfere with frame exchanges using HT PPDUs between HT STAs.

10.26.2 Protection mechanism for non-ERP receivers

The intent of a protection mechanism is to cause a STA not to transmit an MPDU with the Type subfield equal to Data or an MMPDU with an ERP-OFDM preamble and header unless it has attempted to update the NAV of receiving NonERP STAs. The updated NAV period shall be longer than or equal to the total time required to send the Data and any required response frames. An ERP STA shall use protection mechanisms (such as RTS/CTS or CTS-to-self) for ERP-OFDM MPDUs with the Type subfield equal to Data or an MMPDU when the Use_Protection field of the ERP element is equal to 1 (see the requirements of 10.7). Protection mechanisms frames shall be sent using one of the mandatory Clause 15 or Clause 16 rates and using one of the mandatory Clause 15 or Clause 16 waveforms, so all STAs in the BSA are able to learn the duration of the exchange even if they cannot detect the ERP-OFDM signals using their CCA function.

In the case of a BSS composed of only ERP STAs, but with knowledge of a neighboring co-channel BSS having NonERP traffic, the AP might need protection mechanisms to protect the BSS's traffic from interference. This provides propagation of NAV to all attached STAs and all STAs in a neighboring co-channel BSS within range by messages sent using rates contained in the BSSBasicRateSet parameter. The frames that propagate the NAV throughout the BSS include RTS/CTS/Ack frames, all Data frames with the More

Fragments field equal to 1, all Data or Management frames sent in response to PS-Poll frame that are not proceeded in the frame exchange sequence by a Data frame with the More Fragments field equal to 1, Beacon frames with nonzero CFDurRemaining, CF-End frames, and CF-End +CF-Ack frames.

When RTS/CTS is used as the protection mechanism, cases exist such as NAV resetting (discretionary, as indicated in 10.3.2.4), where a hidden STA may reset its NAV and this may cause a collision. The likelihood of occurrence is low, and it is not considered to represent a significant impairment to overall system operation. A mechanism to address this possible situation would be to use alternative protection mechanisms or to revert to alternative modulation methods.

The rules for calculating RTS/CTS NAV fields are unchanged when using RTS/CTS as a protection mechanism.

Additionally, if any of the rates in the BSSBasicRateSet parameter of the protection mechanism frame transmitting STA's BSS are Clause 15 or Clause 16 rates, then the protection mechanism frames shall be sent at one of those Clause 15 or Clause 16 basic rates.

The NonERP_Present bit shall be set to 1 when a NonERP STA is associated with the BSS. In an IBSS if a member of an IBSS detects one or more NonERP STAs that are members of the same IBSS the NonERP_Present bit should be set to 1. Examples of when the NonERP present bit may additionally be set to 1 include, but are not limited to, when:

- a) A NonERP infrastructure BSS or NonERP IBSS is overlapping (a NonERP BSS may be detected by the reception of a Beacon frame where the supported rates contain only Clause 15 or Clause 16 rates).
- b) In an IBSS if a Beacon frame is received from one of the IBSS participants where the operational rate set contains no Clause 18 rates and no BSS membership selectors.
- c) A Management frame (excluding a Probe Request) is received where the operational rate set contains no Clause 18 rates and no BSS membership selectors.

A NonERP mesh STA shall set the NonERP_Present and Use_Protection bits to 1, when establishing a mesh peering with a mesh STA.

When a mesh STA establishes a mesh peering with a NonERP mesh STA, the mesh STA shall set the NonERP_Present bit to 1 and the mesh STA should set the Use_Protection bit to 1. In addition, a mesh STA should set the NonERP_Present bit and the Use_Protection bit to 1 when

- A mesh STA detects the overlapped presence of either a NonERP BSS, a NonERP IBSS, or a NonERP MBSS, or
- A Beacon frame is received from a neighbor STA where the operational rate set contains no Clause 18 rates and no BSS membership selectors, or
- A Management frame (excluding Probe Request) is received where the operational rate set contains no Clause 18 rates and no BSS membership selectors.

A mesh STA may set the NonERP_Present and the Use_Protection bits to 1 based on its internal policies, which is beyond the scope of the standard.

The Use_Protection bit may be set to 1 when the NonERP_Present bit is 1.

If one or more NonERP STAs are associated in the BSS, the Use_Protection bit shall be set to 1 in transmitted ERP elements.

In an IBSS the setting of the Use_Protection bit is left to the STA. In an IBSS there is no uniform concept of association; therefore, a typical algorithm for setting the Use_Protection bit takes into account the traffic

pattern and history on the network. If a member of an IBSS detects one or more NonERP STAs that are members of the same IBSS or receives a Beacon from a member of the same IBSS with the Use_Protection bit equal to 1, then the Use_Protection bit should be set to 1 in the ERP element of transmitted Beacon and Probe Response frames.

An ERP STA shall invoke the use of a protection mechanism after transmission or reception of the Use_Protection bit with a value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started. An ERP STA may additionally invoke protection mechanism use at other times. An ERP STA may disable protection mechanism use after transmission or reception of the Use_Protection bit with a value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started.

An ERP mesh STA shall invoke the use of a protection mechanism after the transmission of the Use_Protection bit with a value of 1 in an MMPDU. In addition, an ERP mesh STA may invoke protection mechanism at other times. An ERP mesh STA may disable protection mechanism use after transmission of the Use_Protection bit with a value of 0 in an MMPDU.

When there are no NonERP STAs associated with the BSS and the ERP element sender's dot11ShortPreambleOptionImplemented is true, then the Barker_Preamble_Mode bit may be set to 0. The Barker_Preamble_Mode bit shall be set to 1 by the ERP element sender if one or more associated NonERP STAs are not short preamble capable as indicated in their Capability Information field, or if the ERP element senders dot11ShortPreambleOptionImplemented is false.

When dot11ShortPreambleOptionImplemented is true and all peer mesh STAs support the short preamble, the mesh STA may set the Barker_Preamble_Mode bit to 0. When dot11ShortPreambleOptionImplemented is false or any of its peer mesh STAs do not support the short preamble, the mesh STA shall set the Barker_Preamble_Mode field to 1.

If a member of an IBSS detects one or more nonshort-preamble-capable STAs that are members of the same IBSS, then the Barker_Preamble_Mode bit should be set to 1 in the transmitted ERP element.

An ERP STA shall use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of the value of the short preamble capability bit from the same received or transmitted MMPDU that contained the ERP element. An ERP STA may additionally use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames at other times. An ERP STA may use short preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 0 in an MMPDU to or from the BSS that the ERP STA has joined or started, regardless of the value of the short preamble capability bit from the same received or transmitted MMPDU. A NonERP STA may also follow the rules given in this paragraph.

An ERP mesh STA shall use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames after transmission or reception of an ERP element with a Barker_Preamble_Mode value of 1 in an MMPDU to or from the MBSS to which the ERP mesh STA belongs. A Mesh STA may use long preambles when transmitting Clause 15, Clause 16, and Clause 18 frames at other times.

10.26.3 Protection mechanisms for transmissions of HT PPDUs

10.26.3.1 General

Transmissions of HT PPDUs, referred to as *HT transmissions*, are protected if there are other STAs present that cannot interpret HT transmissions correctly. The HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element within Beacon and Probe Response frames are used to indicate the protection requirements for HT transmissions.

The HT Protection field may be set to no protection mode only if the following are true:

- All STAs detected (by any means) in the primary or the secondary channel are HT STAs, and
- All STAs that are known by the transmitting STA to be a member of this BSS are either
 - 20/40 MHz HT STAs in a 20/40 MHz BSS, or
 - 20 MHz HT STAs in a 20 MHz BSS.

The HT Protection field may be set to nonmember protection mode only if the following are true:

- A non-HT STA is detected (by any means) in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting STA to be a member of this BSS, and
- All STAs that are known by the transmitting STA to be a member of this BSS are HT STAs.

The HT Protection field may be set to 20 MHz protection mode only if the following are true:

- All STAs detected (by any means) in the primary channel and all STAs detected (by any means) in the secondary channel are HT STAs and all STAs that are members of this BSS are HT STAs, and
- This BSS is a 20/40 MHz BSS, and
- There is at least one 20 MHz HT STA associated with this BSS.

The HT Protection field is set to non-HT mixed mode otherwise.

NOTE—The rules stated above allow an HT AP to select non-HT mixed mode at any time.

In an IBSS, the HT Protection field is reserved, but an HT STA shall protect HT transmissions as though the HT Protection field were equal to non-HT mixed mode. A STA that is a member of an IBSS shall protect HT-greenfield format PPDUs and RIFS sequences, adhering to the same requirements as described in the line of Table 10-13 labeled “Use_Protection = 0 or ERP element is not present (HT Protection field equal to non-HT mixed mode).”

**Table 10-13—Protection requirements for HT Protection field values
 nonmember protection mode and non-HT mixed mode**

| Condition | Requirements |
|--|--|
| Use_Protection = 0 or ERP element is not present (HT Protection field equal to non-HT mixed mode) | The protection requirements for HT transmissions using HT-greenfield format are specified in 10.26.3.1. The protection requirements for HT transmissions using RIFS within the HT transmission burst are specified in 10.26.3.3. The protection mechanism for other transmissions not already described above is based on one of the sequences defined in Table 10-14. |
| Use_Protection = 1 (HT Protection field equal to nonmember protection mode or non-HT mixed mode) | All HT transmissions shall be protected using mechanisms as described in 10.26.2. |

In an MBSS, the HT Protection field and the Nongreenfield HT STAs Present field are determined as described in 10.26.3.5.

In an IBSS and an MBSS, the RIFS Mode field of the HT Operation element is reserved, but an HT STA shall operate as though this field were equal to 1.

During the 40 MHz phase of PCO operation, a PCO active STA may act as though the HT Protection field were equal to no protection mode, regardless of the actual value of the HT Protection field transmitted by the AP.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 0, no protection is required since all HT STAs in the BSS are capable of decoding HT-mixed format and HT-greenfield format transmissions.

When the HT Protection field is equal to no protection mode or 20 MHz protection mode and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions that use the HT-greenfield format shall be protected. This protection may be established by transmitting a PPDU with the TXVECTOR FORMAT parameter set to HT_MF or any of the methods described in Table 10-14.

Table 10-14—Applicable HT protection mechanisms

| HT protection mechanism |
|--|
| Control frames such as RTS/CTS or CTS-to-self prior to the HT transmissions: — 20 MHz transmissions use the rates defined in Clause 17 or Clause 18 — 40 MHz transmissions use non-HT duplicate frames defined in Clause 19 |
| L-SIG TXOP protection As the first PPDU in the TXOP, send one of: — a non-HT PPDU containing a frame that requires an immediate response — an HT-mixed format at PPDU containing a frame that requires an immediate response in a non-HT PPDU PPDUs after the first PPDU exchange may be HT-greenfield format PPDUs and/or be separated by RIFS. |

When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the ERP element is equal to 0, HT transmissions should be protected. When the HT Protection field is equal to nonmember protection mode, the Use_Protection field in the ERP element is equal to 0, and the Nongreenfield HT STAs Present field is equal to 1, HT transmissions using HT-greenfield format shall be protected. When the HT Protection field is equal to nonmember protection mode and the Use_Protection field in the ERP element is equal to 1, HT transmissions shall be protected according to the requirements described in Table 10-13.

When the HT Protection field is equal to non-HT mixed mode, HT transmissions shall be protected. The type of protection required depends on the type of transmission as well as the type of the non-HT STAs that are present in the BSS. Protection requirements that apply when the HT Protection field is equal to non-HT mixed mode are described in Table 10-13.

If the transmission requires protection and the Use_Protection field within the ERP element is equal to 0 or the ERP element is not present in the Beacon, HT transmissions shall be protected using one of the mechanisms identified in Table 10-14.

NOTE—Rules for rate selection for the HT protection mechanisms listed in Table 10-14 are described in 10.7.

If the HT Protection field is equal to no protection mode and the Secondary Channel Offset field is equal to SCA or SCB, a STA may transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP provided that the restrictions specified in 10.7 are obeyed. When the HT Protection field is not equal to no protection mode or the Secondary Channel Offset field is equal to SCN, a

STA shall not transmit a 40 MHz HT PPDU (TXVECTOR parameter CH_BANDWIDTH set to HT_CBW40) to initiate a TXOP.

10.26.3.2 Protection rules for HT STA operating a direct link

An HT STA operating a direct link with another HT STA in a non-HT BSS shall operate according to the rules found in 10.26 as though the following fields have the settings indicated:

- a) The RIFS Mode field of the HT Operation element equal to 1
- b) The HT Protection field equal to non-HT mixed mode
- c) The Nongreenfield HT STAs Present field equal to 1
- d) The OBSS Non-HT STAs Present field equal to 1
- e) The L-SIG TXOP Full Support field equal to 0
- f) The PCO Active field equal to 0
- g) The Basic HT-MCS Set field equal to all 0s

10.26.3.3 RIFS protection

If the HT Protection field is equal to nonmember protection mode or non-HT mixed mode, the AP may set the RIFS Mode field to 0 according to implementation-specific criteria (i.e., such as to protect overlapping non-HT BSSs in the primary or secondary channels).

If the HT Protection field is not equal to nonmember protection mode and it is not equal to non-HT mixed mode, the RIFS Mode field shall be set to 1.

If the RIFS Mode field of an AP's HT Operation element is equal to 1:

- a) A STA that is associated with the AP may protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to nonmember protection mode.
- b) A STA that is associated with the AP shall protect RIFS sequences when the HT Protection field of the HT Operation element transmitted by the AP is equal to non-HT mixed mode.

10.26.3.4 Use of OBSS Non-HT STAs Present field

The OBSS Non-HT STAs Present field allows HT APs to report the presence of non-HT STAs that are not members of its BSS in the primary channel, the secondary channel, or in both primary and secondary channels.

A second HT AP that detects a first HT AP's Beacon frame with the OBSS Non-HT STAs Present field equal to 1 may cause HT-greenfield format and RIFS sequence transmissions of the second AP's BSS to be protected by setting the HT Protection field of its HT Operation element to non-HT mixed mode. If the NonERP_Present field is equal to 1 in the first AP's Beacon frame, the Use_Protection field may also be set to 1 by the second AP.

An HT STA may also scan for the presence of non-HT devices either autonomously or, for example, after the STA's AP transmits an HT Operation element with the HT Protection field equal to nonmember protection mode. Non-HT devices can be detected as follows:

- Reception of a Management frame that does not carry an HT Capabilities element and the frame is required to carry this element when transmitted by an HT STA, or
- Reception of a Beacon frame containing an HT Operation element with the OBSS Non-HT STAs Present field equal to 1.

When non-HT devices are detected, the STA may enable protection of its HT-greenfield format and RIFS sequence transmissions.

NOTE—If a non-HT device is detected and the STA determines that its HT-greenfield format or RIFS sequence transmissions are affecting the operation of the non-HT device, then the STA might enable protection of its HT-greenfield format and RIFS sequence transmissions.

See also 11.9.8.5, which defines rules for the OBSS Non-HT STAs Present field related to HT-greenfield transmissions in certain operating classes.

10.26.3.5 Protection rules for an HT mesh STA

A mesh STA determines the HT Protection and Nongreenfield HT STAs Present fields in the HT Operation element in the transmitting frame as follows:

The HT Protection field in a mesh STA may be set to no protection mode only if

- All STAs detected in the primary or the secondary channel are HT STAs, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are either:
 - 20/40 MHz HT mesh STAs in a 20/40 MHz MBSS, or
 - 20 MHz HT mesh STAs in a 20 MHz MBSS.

The HT Protection field in a mesh STA may be set to nonmember protection mode only if

- A non-HT STA is detected in either the primary or the secondary channel or in both the primary and secondary channels, that is not known by the transmitting mesh STA to be a member of this MBSS, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs.

The HT Protection field in a mesh STA may be set to 20 MHz protection mode only if

- All STAs detected in the primary and all STAs detected in the secondary channel are HT STAs, and
- All mesh STA members of this MBSS that are one-hop neighbors of the transmitting mesh STA are HT mesh STAs, and
- The MBSS is a 20/40 MHz MBSS, and
- There is at least one 20 MHz HT mesh STA that is one-hop neighbor of the transmitting mesh STA.

The HT Protection field in a mesh STA is set to non-HT mixed mode otherwise.

If two peer HT mesh STAs report the same protection mode in HT Protection field, the protection mechanisms of the related mode shall be used to protect the transmission between the peer HT mesh STAs.

If an HT mesh STA and its peer HT mesh STA report different protection modes in HT Protection field, the following rules shall be used:

- a) If an HT mesh STA or its peer HT mesh STA reports non-HT mixed mode, the protection mechanisms of non-HT mixed mode shall be used to protect the transmission between the peer HT mesh STAs.
- b) If an HT mesh STA or its peer HT mesh STA reports nonmember protection mode and non-HT mixed mode is not reported by any of these HT mesh STAs, the protection mechanisms of nonmember protection mode shall be used to protect the transmission between the peer HT mesh STAs.
- c) If an HT mesh STA or its peer HT mesh STA reports 20 MHz protection mode and neither non-HT mixed mode nor nonmember protection mode is reported by any of these HT mesh STAs, the protection mechanisms of 20 MHz protection mode shall be used to protect the transmission between the peer HT mesh STA.

If at least one HT peer mesh STA in its mesh neighborhood indicates the Nongreenfield HT STAs Present equal to 1, the protection rules related to Nongreenfield HT STAs Present should also be applied to the communication between HT peer mesh STAs.

10.26.4 L_LENGTH and L_DATARATE parameter values for HT-mixed format PPDUs

L_LENGTH and L_DATARATE determine the duration that non-HT STAs do not transmit, equal to the remaining duration of the HT PPDU or the L-SIG duration when L-SIG TXOP protection is used as defined in 10.26.5, following the non-HT portion of the preamble of the HT-mixed format PPDU.

The L_DATARATE parameter of the TXVECTOR shall be set to the value 6 Mb/s.

A STA that is transmitting a PPDU with the FORMAT parameter of the TXVECTOR equal to HT_MF and that is not operating by the L-SIG TXOP protection rules described in 10.26.5 shall set the value of the L_LENGTH parameter to the value (in octets) given by Equation (10-13):

$$L_LENGTH = \left\lceil \frac{((TXTIME - \text{Signal Extension}) - (\text{aPreambleLength} + \text{aPHYHeaderLength}))}{\text{aSymbolLength}} \right\rceil \\ \times N_{OPS} - \left\lceil \frac{\text{aPHYServiceLength} + \text{aPHYConvolutionalTailLength}}{8} \right\rceil \quad (10-13)$$

where

| | |
|--------------------------------------|--|
| TXTIME | is the duration (in microseconds) of the HT PPDU defined in 6.5.5 |
| Signal Extension | is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is aSignalExtension as defined in Table 19-25 of 19.4.4 when TXVECTOR parameter NO_SIG_EXTN is false |
| aSymbolLength | is the duration of a symbol (in microseconds), defined in 6.5.4 |
| (aPreambleLength + aPHYHeaderLength) | is the duration (in microseconds) of the non-HT PHY preamble and L-SIG, defined in 6.5.4 |
| N_{OPS} | is the number of octets transmitted during a period of aSymbolLength at the rate specified by L_DATARATE |
| aPHYServiceLength | is the number of bits in the PHY SERVICE field, defined in 6.5.4 (PLME-CHARACTERISTICS.confirm) |
| aPHYConvolutionalTailLength | is the number of bits in the convolutional code tail bit sequence, defined in 6.5.4 |

NOTE 1—The last term of the L_LENGTH definition corrects for the fact that non-HT STAs add the length of the SERVICE field and tail bits (assuming a single convolutional encoder) to the value communicated by the L_LENGTH field.

NOTE 2—for a Clause 19 PHY, this equation simplifies to $L_LENGTH = \left\lceil \frac{((TXTIME - \text{Signal Extension}) - 20)}{4} \right\rceil \times 3 - 3$.

A STA that is operating under L-SIG TXOP protection shall set the L_LENGTH parameter according to rules described in 10.26.5.

A STA shall not transmit a PPDU with the FORMAT parameter set to HT_MF in TXVECTOR if the corresponding L_LENGTH value calculated with Equation (10-13) exceeds 4095 octets.

NOTE—The transmission of frames with L_LENGTH above 2332 octets (i.e., a Data frame containing an unencrypted 2304 octet MSDU) might be accompanied by a protection mechanism (e.g., RTS/CTS or CTS-to-self protection) if it is determined that the use of L_LENGTH fails to effectively suppress non-HT transmissions. How this is determined is outside the scope of this standard.

10.26.5 L-SIG TXOP protection

10.26.5.1 General rules

The L-SIG TXOP protection mechanism is obsolete. Consequently, this subclause might be removed in a later revision of this standard.

Figure 10-39 illustrates protection by the SIG Length and Rate fields. The terms used in this figure are defined below and in 19.3.2.

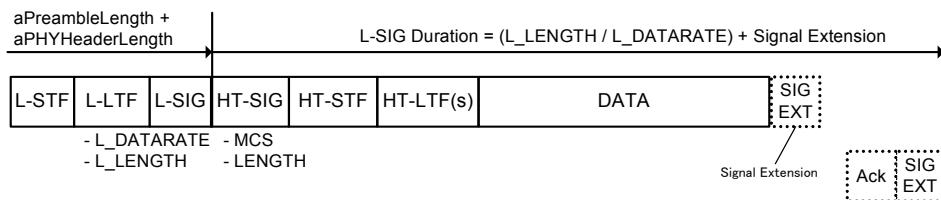

Figure 10-39—Basic concept of L-SIG TXOP protection

The AP determines whether all HT STAs associated with its BSS support L-SIG TXOP protection and indicates this determination in the L-SIG TXOP Protection Full Support field of its HT Operation element. This field shall not be set to 1 unless the L-SIG TXOP Protection field is equal to 1 for all HT STAs in the BSS.

Support for L-SIG TXOP protection at an intended recipient can be determined through examination of its HT Capability element.

In an IBSS and an MBSS the L-SIG TXOP Protection Full Support field of the HT Operation element is reserved, but an HT STA shall operate as though the field were equal to 0.

A VHT AP shall set the HT Operation element HT Operation Information field L-SIG TXOP Protection Full Support subfield to 0.

A VHT STA shall set the HT Capabilities element HT Capability Information field L-SIG TXOP Protection Support subfield to 0 during (re)association.

A STA shall not transmit a frame using L-SIG TXOP protection directed to a recipient that does not support L-SIG TXOP protection.

A STA that transmits an L-SIG TXOP Protected frame should use an MCS from the Basic HT-MCS Set field of the HT Operation parameter of the MLME-START.request primitive or Basic HT-MCS Set field of the HT Operation parameter of the SelectedBSS parameter of the MLME-JOIN.request primitive for the transmission of that frame if

- The frame initiates a TXOP in an IBSS or in an MBSS, or
- The L-SIG TXOP Protection Full Support field is equal to 0 by its AP.

Under L-SIG TXOP protection operation, the L-SIG field with an HT-mixed format PHY preamble represents a duration value equivalent (except in the case of the initial frame that establishes the TXOP, as described below) to the sum of:

- a) The value of Duration/ID field contained in the MAC header and
- b) The duration remaining in the current packet after the L-SIG, which is equal to the duration of the current packet less (aPreambleLength + aPHYHeaderLength)

A duration value determined from the L_DATARATE and L_LENGTH parameters of the TXVECTOR or RXVECTOR rounded up to a multiple of aSymbolLength that is not equal to the remaining duration of the frame is called an *L-SIG duration*. The TXVECTOR L_LENGTH (defined in 19.2.2), when L-SIG TXOP protection is used, shall contain the value (in octets) given by Equation (10-14).

$$\begin{aligned} L_LENGTH = & \left\lceil \frac{L\text{-SIG Duration} - \text{Signal Extension}}{a\text{SymbolLength}} \right\rceil \times N_{OPS} \\ & - \left\lceil \frac{a\text{PHYServiceLength} + a\text{PHYConvolutionalTailLength}}{8} \right\rceil \end{aligned} \quad (10-14)$$

where

| | |
|-----------------------------|--|
| Signal Extension | is defined in 10.26.4 |
| aSymbolLength | is the duration of symbol, defined in 6.5.4 |
| N_{OPS} | is the number of octets transmitted during a period of aSymbolLength at the rate specified by L_DATARATE |
| aPHYServiceLength | is the number of bits in the PHY SERVICE field, defined in 6.5.4 |
| aPHYConvolutionalTailLength | is the number of bits in the convolutional code tail bit sequence, defined in 6.5.4 |
| durations | are expressed in microseconds |

NOTE—For a Clause 19 PHY, this equation simplifies to $L_LENGTH = \left\lceil \frac{(L\text{-SIG Duration} - \text{Signal Extension})}{4} \right\rceil \times 3 - 3$.

Non-HT STAs are not able to receive any PPDUs that start during the L-SIG duration. Therefore, no frame shall be transmitted to a non-HT STA during an L-SIG protected TXOP.

See also 10.3.2.4, which describes a rule for resetting a NAV value that was set by an L-SIG TXOP protected frame.

10.26.5.2 L-SIG TXOP protection rules at the TXOP holder

Figure 10-40 illustrates an example of how L-SIG durations are set when using L-SIG TXOP protection.

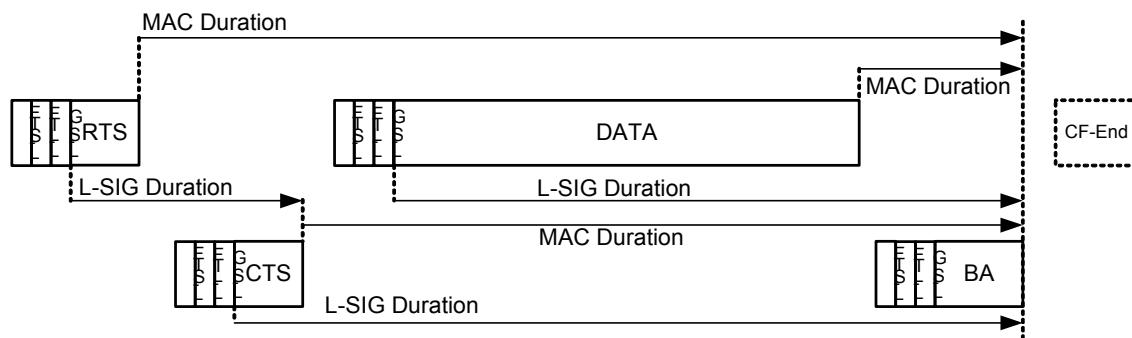

Figure 10-40—Example of L-SIG duration setting

An L-SIG TXOP protected sequence shall start with one of the following:

- an initial handshake, which is the exchange of two frames (each inside an HT-mixed format PPDUs) that establish protection (e.g., RTS/CTS) or
- an initial frame that establishes protection but generates no response (e.g., a CTS to self)

provided that this initial sequence is also valid for the start of a TXOP. The term *L-SIG TXOP protected sequence* includes these initial frames and any subsequent frames transmitted within the protected duration.

Under L-SIG TXOP protection operation, when the initial PPDU that establishes protection requires a response, the L-SIG duration of the initial PPDU shall be as follows:

$$\text{L-SIG Duration} = (T_{\text{Init_PPDU}} - (\text{aPreambleLength} + \text{aPHYHeaderLength})) + \text{SIFS} + T_{\text{Res_PPDU}}$$

where

$T_{\text{Init_PPDU}}$ is the length in time (in microseconds) of the entire initial PPDU

$T_{\text{Res_PPDU}}$ is the length in time (in microseconds) of the expected response PPDU

$(\text{aPreambleLength} + \text{aPHYHeaderLength})$ is the length in time (in microseconds) of the non-HT PHY header, defined in 6.5.4

When the initial PPDU that establishes protection requires no response, the L-SIG duration shall contain the following value:

$$\text{L-SIG Duration} = (T_{\text{Init_MACDur}} + T_{\text{Init_PPDU}} - (\text{aPreambleLength} + \text{aPHYHeaderLength}))$$

where

$T_{\text{Init_MACDur}}$ is the Duration/ID field value carried in the MAC header of the initial PPDU

An HT STA using L-SIG TXOP protection should use an accurate prediction of the TXOP duration inside the Duration/ID field of the MAC header to avoid inefficient use of the channel capability.

The L-SIG duration of the initial frame shall allow for the longest possible duration of the response frame (i.e., taking into account wrapped +HTC in the case of control response frames). If the actual duration of the response frame is less than this allowed duration, the TXOP holder shall delay transmission of the third PPDU in the L-SIG TXOP protected sequence until a SIFS after this L-SIG duration expires.

NOTE—A result of this step is that a non-HT STA sees a SIFS between the end of the first PPDU and the start of the third PPDU.

If the initial frame handshake succeeds (i.e., upon reception of a response frame with L-SIG TXOP protection addressed to the TXOP holder), all HT-mixed format PPDU transmitted inside an L-SIG TXOP protection protected TXOP shall contain an L-SIG duration that extends to the endpoint indicated by the MAC Duration/ID field. The first PPDU transmitted after a successful initial handshake (i.e., upon reception of a response frame with L-SIG TXOP protection addressed to the TXOP holder) shall have the TXVECTOR FORMAT parameter set to HT_MF.

NOTE—The requirement to use HT_MF for the third PPDU arises as follows. A third-party STA receives the first PPDU, but does not receive any MPDU correctly from it. It sets its NAV based on the L-SIG duration. The STA does not receive the second PPDU. It is necessary for the STA to be able to determine either an L-SIG duration or MAC duration value from the third PPDU in order to protect the remaining time in the TXOP. The ability of the STA to make this determination is enabled by sending the third PPDU using HT-mixed format, containing an L-SIG duration as shown in Figure 10-40.

The TXOP holder should transmit a CF-End frame starting a SIFS after the L-SIG TXOP protected period. This step enables STAs to terminate the EIFS procedure to avoid potential unfairness or a capture effect.

NOTE—This case is not an instance of TXOP truncation, because it is not transmitted to reset the NAV.

10.26.5.3 L-SIG TXOP protection rules at the TXOP responder

On receiving a PPDU containing an L-SIG duration addressed to itself, a TXOP responder that set the L-SIG TXOP Protection Support field to 1 on association shall generate an L-SIG TXOP protection response frame with the L-SIG duration equivalent to the following:

$$\text{L-SIG Duration} = (T_{MACDur} - \text{SIFS} - (\text{aPreambleLength} + \text{aPHYHeaderLength}))$$

where

T_{MACDur} is the Duration/ID field value carried in the MAC header of frame(s) received in the PPDU that generated the response

A STA shall not transmit a response frame containing an L-SIG duration unless it is in response to a frame that also contained an L-SIG duration.

10.26.5.4 L-SIG TXOP protection NAV update rule

An HT STA that set the L-SIG TXOP Protection Support field to 1 on association that receives a PHY-RXSTART.indication primitive with RXVECTOR parameter FORMAT equal to HT_MF and LSIGVALID equal to true and that receives no valid MPDU from which a Duration/ID field value can be determined shall, when the PHY-RXEND.indication primitive is received, update its NAV to a value equal to the following:

$$\text{L-SIG duration} - (\text{TXTIME} - (\text{aPreambleLength} + \text{aPHYHeaderLength}))$$

where

TXTIME is the time required to send the entire PPDU

10.26.6 Protection rules for VHT STAs

A VHT STA is subject to all of the rules for HT STAs that apply to its operating band, except that a PPDU with the TXECTOR FORMAT parameter set to VHT may be substituted for a PPDU with the TXVECTOR FORMAT parameter set to HT_MF.

10.27 MAC frame processing

10.27.1 Introduction

Subclauses 10.27.2 to 10.27.9 describe MAC frame and element processing requirements to provide frame, Action frame, element, and subelement extensibility.

10.27.2 Revision level field processing

A MAC entity that receives a frame with a higher revision level than it supports shall discard the frame without indication to the sending STA or to LLC.

10.27.3 Duration/ID field processing

When the contents of a received Duration/ID field, treated as an unsigned integer and without regard for address values, type, and subtype (even when type or subtype contain reserved values), are less than 32 768,

the duration value is used to update the network allocation vector (NAV) according to the procedures defined in 10.3.2.4, 10.22.3.4, or 10.36.10, as appropriate.

When the contents of a received Duration/ID field, treated as an unsigned integer, are greater than 32 768, the contents are interpreted as appropriate for the frame type and subtype or ignored if the receiving MAC entity does not have a defined interpretation for that type and subtype.

10.27.4 Response to an invalid Action frame

If a STA receives an individually addressed Action frame with an unrecognized Category field or some other syntactic error and the MSB of the Category field equal to 0, then the STA shall return the Action frame to the source without change except that the MSB of the Category field is set to 1.

10.27.5 Operation of the Dialog Token field

A dialog token is an integer value that assists a STA in grouping Management frames sent or received at different times as part of the same dialog. The algorithm by which the integer value for the dialog is selected is implementation specific, but should be selected in a manner that minimizes the probability of a frame associated with one dialog being incorrectly associated with another dialog.

10.27.6 Element parsing

A STA that encounters an element with an unknown or reserved element ID value, or an element with an element ID extension whose element ID extension value is unknown or reserved, in a Management frame received without error, shall ignore that element and shall parse any remaining management frame body for additional elements with recognizable element ID (and, if present, element ID extension) values.

The MME of a Vendor-Specific Protected Action frame is located at the end of the frame body.

NOTE—It is not necessary to be able to parse the vendor-specific content to locate the MME.

10.27.7 Vendor specific element parsing

A STA receiving a vendor-specific element that it does not support shall ignore the vendor-specific element.

10.27.8 Extensible element parsing

Table 9-77 indicates which elements are considered extensible in future revisions of the standard, by placing a Yes in the Extensible column. A STA that receives an extensible element in which the Length field plus two exceeds the value indicated in Table 9-77 shall discard any part of the element beyond the maximum length indicated in this table and shall otherwise process the element as though this truncated element had been received.

10.27.9 Extensible subelement parsing

A subelement has the structure defined in 9.4.3 and is contained within an element or subelement.

A STA that encounters an unknown, unsupported, or reserved subelement ID value contained in an element or subelement shall ignore the subelement with that subelement ID value and shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

A STA that receives an element or subelement for which a vendor-specific subelement is defined and that contains a vendor-specific subelement that it does not support shall ignore this vendor-specific subelement and

shall continue to parse any remaining element or subelement body for additional subelements with recognizable subelement ID values.

Subelements are defined locally in each subclause that defines a structure containing subelements. Subelement ID numbering is private to that structure. A STA that receives an extensible subelement that is not extensible using subelements and in which the Length field exceeds the length of the structure of the subelement defined in this standard shall discard any part of the subelement beyond that length and shall otherwise process the subelement as though this truncated subelement had been received.

10.27.10 Extensible TLV parsing

A TVHT STA that receives a frame containing a TLV tuple with an unknown Type value shall discard the tuple and continue processing the next tuple.

10.28 Reverse direction protocol

10.28.1 General

The RD protocol may be supported by an HT STA and by a DMG STA. A STA receiving an RDG is never required to use the grant. The RD protocol defined in this subclause applies to both types of STAs.

An HT STA indicates support of the RD feature as an RD responder using the RD Responder subfield of the HT Extended Capabilities field of the HT Capabilities element. A STA shall set the RD Responder subfield to 1 in frames that it transmits containing the HT Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the RD Responder subfield to 0. In an HT STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the HTC field.

A DMG STA indicates support of the RD feature using the Reverse Direction subfield of the DMG STA Capability Information field of the DMG Capabilities element. A STA shall set the Reverse Direction subfield to 1 in frames that it transmits containing the DMG Capabilities element if dot11RDResponderOptionImplemented is true. Otherwise, the STA shall set the Reverse Direction subfield to 0. In a DMG STA, the RDG/More PPDU subfield and the AC Constraint subfield are present in the QoS Control field.

10.28.2 Reverse direction (RD) exchange sequence

An RD exchange sequence comprises the following:

- a) The transmission of a PPDU by a TXOP holder or SP source containing an RD grant (the *RDG PPDU*), which is indicated by the PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 1. The STA that transmits this PPDU is known as the *RD initiator*. The rules for an RD initiator apply only during a single RD exchange sequence, i.e., after the transmission of an RDG PPDU and up to the end of the last PPDU in the RD exchange sequence.
- b) The transmission of one or more PPDU (the *RD response burst*) by the STA addressed in the MPDUs of the RDG PPDU. The first (or only) PPDU of the RD response burst contains at most one immediate BlockAck or Ack frame. The last (or only) PPDU of the RD response burst contains any MPDUs requiring a response that is an immediate BlockAck or Ack frame. The STA that transmits the RD response burst is known as the *RD responder*. The rules for an RD responder apply only during a single RD exchange sequence, i.e., following the reception of an RDG PPDU and up to the transmission of a PPDU by the RD responder in which the RDG/More PPDU subfield is equal to 0.
- c) The transmission of a PPDU by the RD initiator containing an immediate BlockAck frame or Ack frame (the *RD initiator final PPDU*), if so required by the last PPDU of the RD response burst.

NOTE 1—An RD initiator might include multiple RD exchange sequences within a single TXOP or SP. Each RD exchange sequence within a single TXOP or SP might be addressed to a different recipient, and any single recipient might be given more than one RDG within a single TXOP or SP.

NOTE 2—if the RD responder is a VHT AP, the RD response burst can contain VHT MU PPDUs that might have TXVECTOR parameter NUM_USERS > 1.

An example of an RD exchange sequence is given in O.3.

10.28.3 Rules for RD initiator

An RDG shall not be present unless the MPDU carrying the grant, or every MPDU carrying the grant in an A-MPDU, matches one of the following conditions:

- A QoS Data frame with the Ack Policy field equal to any value except PSMP Ack (i.e., including Implicit Block Ack Request), or
- A BlockAckReq frame related to an HT-immediate block ack agreement, or
- An MPDU not needing an immediate response (e.g., block ack under an HT-immediate block ack agreement, or Action No Ack).

An RDG shall not be present within a PSMP sequence.

NOTE 1—These rules together with the rules in 9.7.3 cause an RDG to be delivered in a PPDU that either requires no immediate response or requires an immediate response that is a BlockAck or Ack frame.

NOTE 2—An RD initiator is not required to examine the RD Responder field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

NOTE 3—An RD initiator is required according to 10.9 to examine the +HTC-HT Support field of a potential responder before deciding whether to send a PPDU to that STA in which the RDG/More PPDU subfield is set to 1.

Transmission of a +HTC or DMG frame by an RD initiator with the RDG/More PPDU subfield equal to 1 (either transmitted as a non-A-MPDU frame, as a VHT single MPDU, or within an A-MPDU) indicates that the duration indicated by the Duration/ID field is available for the RD response burst and RD initiator final PPDU (if present).

An RD initiator that sets the RDG/More PPDU field to 1 in a +HTC or DMG frame transmitted during a TXOP shall set the AC Constraint subfield to 1 in that frame if the TXOP was gained through the EDCA channel access mechanism and shall otherwise set it to 0. An RD initiator that sets the RDG/More PPDU field to 1 in a DMG frame transmitted during an SP can set the AC Constraint subfield to 1 to limit the Data frames transmitted by the RD responder.

An RD initiator shall not transmit a +HTC or DMG frame with the RDG/More PPDU subfield set to 1 that requires a response MPDU that is not one of the following frames:

- Ack
- Compressed BlockAck

Subject to TXOP or SP constraints, after transmitting an RDG PPDU, an RD initiator may transmit its next PPDU as follows:

- a) *Normal continuation:* The RD initiator may transmit its next PPDU a minimum of a SIFS after receiving a response PPDU that meets one of the following conditions:
 - 1) Contains one or more received +HTC or DMG frames with the RDG/More PPDU subfield equal to 0
 - 2) In an HT STA, contains one or more received frames that are capable of carrying the HT Control field but did not contain an HT Control field
 - 3) Contains a received frame that requires an immediate response

- 4) In a DMG STA, none of the correctly received frames in the PPDU carry the QoS Control field
- b) *Error recovery*: The RD initiator may transmit its next PPDU when the CS mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-26) (this transmission is a continuation of the current TXOP or SP).

NOTE 1—Error recovery of the RDG mechanism is the responsibility of the RD initiator.

NOTE 2—After transmitting a PPDU containing an RDG, if the response is corrupted so that the state of the RDG/More PPDU subfield is unknown, the RD initiator of the RD exchange is not allowed to transmit after a SIFS. Transmission can occur a PIFS after deassertion of CS.

A STA that transmits a QoS +CF-Ack Data frame according to the rules in 10.22.3.5 may also include an RDG in that frame provided that

- It is a non-A-MPDU frame or VHT single MPDU, and
- The target of the +CF-Ack is equal to the Address 1 field of the frame.

NOTE 1—In a non-DMG BSS, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.22.2.9 following an RD transmit sequence. An RD responder never transmits a CF-End.

NOTE 2—In a DMG network, the RD initiator can transmit a CF-End frame according to the rules for TXOP truncation in 10.22.2.9 or SP truncation in 10.36.8, as appropriate, following an RD transmit sequence. An RD responder never transmits a CF-End.

10.28.4 Rules for RD responder

An RD responder shall transmit the initial PPDU of the RD response burst a SIFS after the reception of the RDG PPDU. PPDUUs in a response burst are separated by SIFS or RIFS. The RIFS rules in the RD are the same as in the forward direction; the use of RIFS is constrained as defined in 10.3.2.3.2 and 10.26.3.3.

NOTE—The transmission of a response by the RD responder does not constitute a new channel access but a continuation of the RD initiator's TXOP or SP. An RD responder ignores the NAV when responding to an RDG.

The recipient of an RDG may decline the RDG by

- Not transmitting any frames following the RDG PPDU when no response is otherwise required, or
- Transmitting a control response frame with the RDG/More PPDU subfield set to 0, or
- Transmitting a control response frame that contains no HT Control field

An RD responder that is a non-DMG STA may transmit a +CF-Ack non-A-MPDU frame or +CF-Ack VHT single MPDU in response to a QoS Data +HTC non-A-MPDU frame or VHT single MPDU that has the Ack Policy field equal to Normal Ack and the RDG/More PPDU subfield equal to 1.

The RD responder shall ensure that its PPDU transmission(s) and any expected responses fit entirely within the remaining TXOP or SP duration, as indicated in the Duration/ID field of MPDUs within the RDG PPDU.

An RD responder shall not transmit an MPDU (either individually or aggregated within an A-MPDU) that is not one of the following frames:

- Ack
- Compressed BlockAck
- Compressed BlockAckReq
- Extended Compressed BlockAck
- Extended Compressed BlockAckReq
- QoS data
- Management

If the AC Constraint subfield is equal to 1, the RD responder shall transmit Data frames of only the same AC as the last frame received from the RD initiator. For a BlockAckReq or BlockAck frame, the AC is determined by examining the TID field. For a Management frame, the AC is AC_VO. The RD initiator shall not transmit a +HTC or DMG MPDU with the RDG/More PPDU subfield set to 1 from which the AC cannot be determined. If the AC Constraint subfield is equal to 0, the RD responder may transmit Data frames of any TID.

During an RD response burst any PPDU transmitted by an RD responder shall contain at least one MPDU with an Address 1 field that matches the MAC address of the RD initiator, and the inclusion of traffic to STAs other than the RD initiator in a VHT MU PPDU shall not increase the duration of the VHT MU PPDU beyond that required to transport the traffic to the RD initiator. The RD responder shall not transmit any frame causing a response after SIFS with an Address 1 field that does not match the MAC address of the RD initiator. The RD responder shall not transmit any PPDUs with a CH_BANDWIDTH that is wider than the CH_BANDWIDTH of the PPDU containing the frame(s) that delivered the RD grant.

If an RDG PPDU also requires an immediate block ack response, the BlockAck frame shall be included in the first PPDU of the response.

When a PPDU is not the final PPDU of a response burst, an HT Control field carrying the RDG/More PPDU subfield set to 1 shall be present in every MPDU within the PPDU capable of carrying the HT Control field, or if the PPDU is transmitted in a DMG BSS, the RDG/More PPDU subfield within the QoS Control field shall be set to 1 in every MPDU within the PPDU. The last PPDU of a response burst shall have the RDG/More PPDU subfield set to 0 in all +HTC or DMG MPDUs contained in that PPDU.

The RD responder shall not set the RDG/More PPDU subfield to 1 in any MPDU in a PPDU that contains an MPDU that requires an immediate response.

NOTE—If the RD responder transmits a PPDU that expects a transmission by the RD initiator after SIFS and no such transmission is detected, the RD responder has to wait for either another RDG or its own TXOP or SP before it can retry the exchange.

After transmitting a PPDU containing one or more +HTC or DMG MPDUs in which the RDG/More PPDU subfield is equal to 0, the RD responder shall not transmit any more PPDUs within the current response burst.

NOTE—If an RD-capable STA that is not the TXOP holder or SP source receives a PPDU that does not indicate an RDG, there is no difference in its response compared to a STA that is not RD-capable.

10.29 PSMP operation

10.29.1 General

A DMG STA shall not use PSMP.

10.29.2 Frame transmission mechanism during PSMP

10.29.2.1 PSMP frame transmission (PSMP-DTT and PSMP-UTT)

The attribute aDTT2UTTTime is the minimum time between the end of the PSMP-DTT and the start of a PSMP-UTT addressed to the same STA. This value represents the minimum time the STA is provided to react to Multi-TID BlockAck, BlockAck, Multi-TID BlockAckReq, BlockAckReq, and Data frames received during the PSMP-DTT with data, BlockAck, BlockAckReq, Multi-TID BlockAckReq, and Multi-TID BlockAck frames transmitted in the PSMP-UTT. In a PSMP sequence, if the traffic conditions are such that the time between the PSMP-DTT and PSMP-UTT of a STA would otherwise be less than the value of aDTT2UTTTime, the AP shall delay the start of entire PSMP-UTT phase to meet this requirement.

A PSMP sequence may be used to transmit non-GCR-SP group addressed frames along with individually addressed frames. Individually addressed frames shall be scheduled after group addressed frames.

In a PSMP frame the STA_ID subfields of all its STA_Info fields with STA_INFO Type equal to 2 (individually addressed) shall be unique, i.e., each STA identified in the PSMP frame is identified exactly once.

Individually addressed entries in the PSMP frame should have their PSMP-DTT and PSMP-UTT start offsets scheduled to minimize the number of on/off transitions or to maximize the delay between their PSMP-DTT and PSMP-UTT periods. Entries that have only PSMP-DTT should be scheduled closer to the start of the PSMP-DTTs. Entries that have only PSMP-UTT should be scheduled toward the end of PSMP-UTTs. Entries that have both PSMP-DTT and PSMP-UTT should be scheduled closer to the transition point from downlink to uplink transmissions.

NOTE—For effective resource allocation the AP needs to precisely estimate the PSMP-UTT duration for each STA using the information indicated in a TSPEC, such as Minimum Data Rate, Mean Data Rate, Peak Data Rate, Burst Size, and Delay Bound fields. However, when the traffic characteristic is quite bursty (e.g., a real-time video application), precise estimation of PSMP-UTT duration is difficult without timely and frequent feedback of the current traffic statistics. In order to avoid wasting the available bandwidth by overestimating the PSMP-UTT duration, the AP can allocate the minimum amount of time to each STA using the PSMP-UTT Duration subfield in the PSMP frame, based on the value of the Minimum Data Rate field specified in the TSPEC. When the STA receives the PSMP frame, it decides whether the allocated resource indicated by the PSMP-UTT duration is sufficient for its queued data. If the allocated resource is sufficient, the STA can transmit all of the queued data at the allocated time.

Frames of different TIDs may be transmitted within a PSMP-DTT or PSMP-UTT allocation of a PSMP sequence without regard to user priority.

Within a PSMP-DTT or PSMP-UTT between HT STAs, BlockAckReq and BlockAck frames for which an HT-immediate block ack agreement exists shall be the multi-TID variants, i.e., Multi-TID BlockAckReq and Multi-TID BlockAck, respectively. Within a PSMP-DTT or PSMP-UTT between STAs where one is not an HT STA, BlockAckReq and BlockAck frames shall be exchanged through the use of an immediate block ack agreement and shall be the basic variants, i.e., Basic BlockAckReq and Basic BlockAck, respectively.

10.29.2.2 PSMP downlink transmission (PSMP-DTT)

During a PSMP sequence, a STA shall be able to receive frames during its scheduled PSMP-DTT and is not required to be able to receive frames at other times.

The AP shall verify that any transmissions within a PSMP sequence to a STA participating in the PSMP sequence occur wholly within the STA's PSMP-DTT.

The PSMP-DTT may contain one or more PPDUs, each of which may contain either an A-MPDU or a single MPDU. Data may be transmitted using either format, provided that the format is supported by both the transmitter and the receiver.

PPDUs within a PSMP-DTT may be separated using RIFS or SIFS. The use of RIFS is limited as defined in 10.3.2.3.2 and 10.26.3.3.

Each PSMP-DTT shall contain only frames addressed to the RA signaled by the corresponding STA_INFO field. PPDUs from adjacent PSMP-DTTs shall be separated by at least SIFS. In other words, PPDUs to a different RA are separated by at least SIFS.

10.29.2.3 PSMP uplink transmission (PSMP-UTT)

A STA that has frames to send that are valid for transmission within the PSMP-UTT shall start transmission without performing CCA and regardless of NAV at the start of its PSMP-UTT.

The STA shall complete its transmission within the allocated PSMP-UTT, even if it has more data queued than can be transmitted during its allocated PSMP-UTT.

NOTE—PSMP-UTT is a scheduled transmission period for the STA, and transmission within a PSMP-UTT does not imply that the STA is a TXOP holder. This lack of being a TXOP holder disallows a STA from using TXOP truncation during PSMP-UTT.

The uplink schedule in a PSMP frame shall include an interval between the end of one PSMP-UTT and the start of the following PSMP-UTT within the same PSMP sequence. This interval shall be either aiUStime or SIFS. The aiUStime value shall not be used unless the use of RIFS is permitted, as defined in 10.26.3.3. The PSMP-UTT Duration subfield in the PSMP frame does not include this interval.

PPDUs transmitted within a PSMP-UTT may be separated using RIFS or SIFS. The use of RIFS is limited as defined in 10.3.2.3.2 and 10.26.3.3.

An AP may transmit a PSMP frame (called a *PSMP recovery frame*) during a PSMP-UTT when both of the following conditions are met:

- The CS mechanism (see 10.3.2.1) indicates that the medium is idle at the TxPIFS slot boundary (see Figure 10-26) after the start of the PSMP-UTT, and
- The PSMP-UTT duration is longer than the total time of the PSMP recovery frame plus PIFS.

The PSMP recovery frame shall not modify the schedule of a STA that is not scheduled to use this PSMP-UTT. The schedules of other STAs shall remain unchanged. The PSMP recovery frame may include:

- a) A modified PSMP-UTT (and/or PSMP-DTT) for the currently scheduled STA by adjusting the time remaining by a PIFS plus the duration of the PSMP recovery frame, and
- b) PSMP-UTTs for other STAs that were originally scheduled after this PSMP-UTT in the PSMP sequence in which the PSMP-UTT start offset values are reduced by the time difference between the end of the original PSMP frame and the end of the PSMP recovery frame.

If the currently scheduled PSMP-UTT duration is shorter than the total time of PSMP recovery frame plus PIFS, no PSMP recovery frame is transmitted.

Figure 10-41 illustrates a PSMP sequence with and without PSMP recovery.

10.29.2.4 PSMP burst

After transmission of an initial PSMP sequence, additional PSMP sequences may be transmitted by the AP in order to support resource allocation and error recovery. An initial PSMP sequence followed by one or more PSMP sequences is termed a *PSMP burst* and is shown in Figure 10-42.

A STA shall not transmit a +HTC MPDU in which the RDG/More PPDUs subfield is set to 1 during a PSMP burst.

An AP may transmit a CF-End frame a SIFS after the end of a PSMP sequence to end the PSMP burst.

NOTE—A non-AP STA does not transmit a CF-End frame during the PSMP burst because it is not a TXOP holder during its PSMP-UTT.

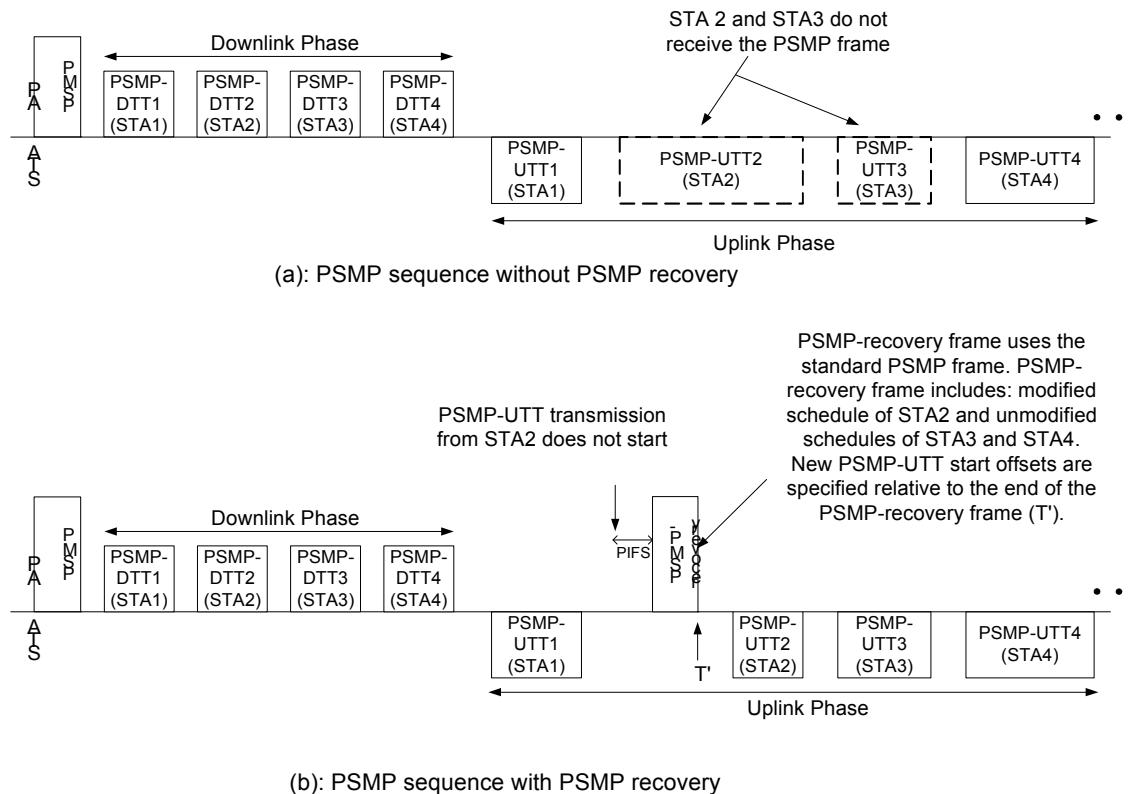

Figure 10-41—Illustration of PSMP sequence with and without PSMP recovery

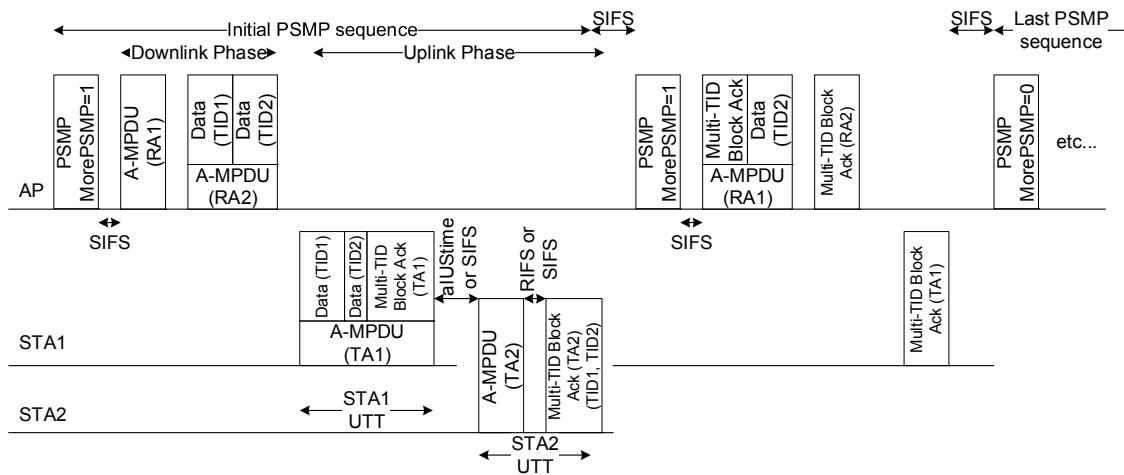

Figure 10-42—PSMP burst

During the PSMP-DTT or PSMP-UTT, a STA shall not transmit a frame unless it is one of the following:

- Multi-TID BlockAck under HT-immediate policy
- Multi-TID BlockAckReq under HT-immediate policy
- BlockAck under an immediate policy with the BA Ack Policy subfield set to 1 (representing No Acknowledgment)
- BlockAckReq under an immediate policy with the BAR Ack Policy subfield set to 1 (representing No Acknowledgment)
- QoS data
- PSMP (a PSMP recovery frame as described in 10.29.2.3)
- BlockAckReq under HT-delayed policy with the BAR Ack Policy subfield set to 1 (representing No Acknowledgment)
- BlockAck under HT-delayed policy with the BA Ack Policy subfield set to 1 (representing No Acknowledgment)
- An MPDU that does not require an immediate response (e.g., Action No Ack)

NOTE—An AP can gain access to the channel after a PIFS in order to start transmission of a PSMP sequence.

10.29.2.5 Resource allocation within a PSMP burst

If the allocated PSMP-UTT duration is not long enough for its queued data, the STA transmits only the part of the queued data that fits within the allocated PSMP-UTT duration and may transmit a resource request to the AP within that PSMP-UTT. The resource request is communicated by setting either the Queue Size field or the TXOP Duration Request field of the QoS Control field that is carried in a QoS Data frame (see Figure 10-43).

If a STA receives an PSMP-UTT that is not long enough to transmit data from its queues, it may transmit within the PSMP-UTT a QoS Null frame containing information about the state of its transmit queues.

NOTE 1—An HT AP might use this information to schedule a PSMP-UTT either in the current PSMP burst or a later PSMP burst.

NOTE 2—An HT AP might allocate a PSMP-UTT duration in the next PSMP sequence based on the resource request from the STA sufficient to allow transmission of the remaining queued data.

NOTE 3—The PSMP burst supports retransmission as well as additional resource allocation (see Figure 10-44). Frames transmitted under an HT-immediate block ack agreement during the PSMP-DTT are acknowledged by a Multi-TID BlockAck frame during the PSMP-UTT period of the current PSMP sequence. Frames transmitted under an immediate block ack agreement during the PSMP-DTT are acknowledged by a Basic BlockAck frame during the PSMP-UTT period of the current PSMP sequence. Frames transmitted under an HT-immediate block ack agreement during the PSMP UTT can be acknowledged using a Multi-TID BlockAck frame during the PSMP-DTT period of the next PSMP sequence. Frames transmitted under an immediate block ack agreement during the PSMP-UTT can be acknowledged using a Basic BlockAck frame during the PSMP-DTT period of the next PSMP sequence. Any failed transmissions during the PSMP-DTT or PSMP-UTT periods can be respectively retransmitted during the PSMP-DTT or PSMP-UTT period of the next PSMP sequence.

Figure 10-43 and Figure 10-44 illustrate the operation of resource allocation. STA1 requests the AP to provide additional resources in its transmission to the AP. The box labeled “Queued data” represents the duration that would be required to transmit data queued for transmission at the STA. In Figure 10-44, since the AP does not receive an acknowledgment from STA2, the AP retransmits the data addressed to STA2 and also allocates resources to STA2 so that STA2 can transmit in the next PSMP sequence.

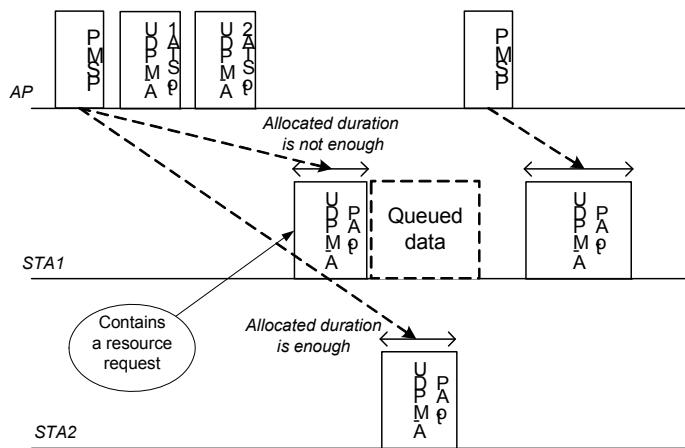

Figure 10-43—PSMP burst showing resource allocation

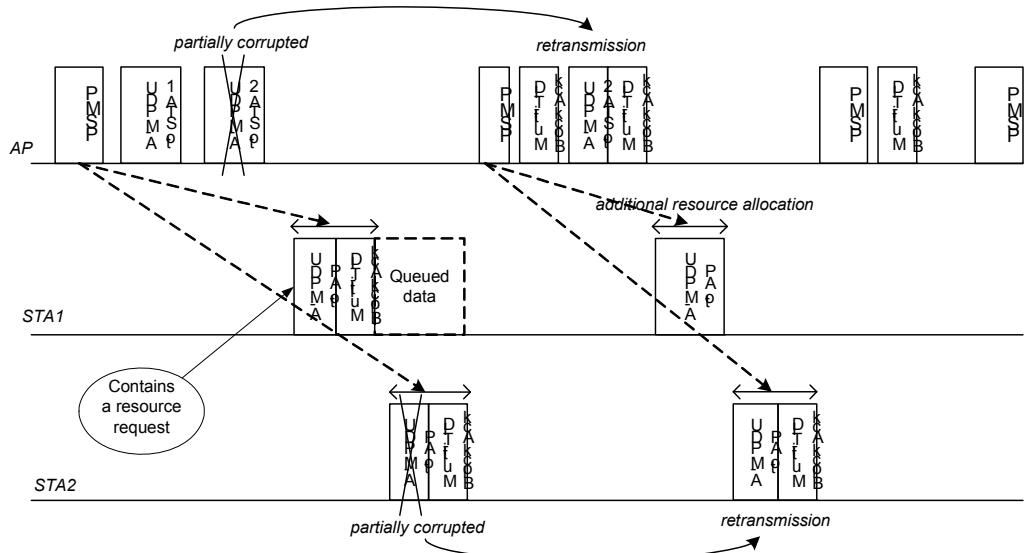

Figure 10-44—PSMP burst showing retransmission and resource allocation

10.29.2.6 PSMP-UTT retransmission

An AP transmits BlockAck frame or Multi-TID BlockAck frame responses, if any, to a STA's PSMP-UTT data transmissions under an immediate or HT-immediate block ack agreement, respectively, in the PSMP-DTT of a subsequent PSMP sequence.

NOTE—An AP might reserve a PSMP-UTT in a subsequent PSMP sequence to allow a STA to retransmit failed frames. The STA can retransmit failed frames in a PSMP sequence of the current PSMP burst if a PSMP-UTT reservation is present or in a subsequent SP.

A STA that cannot complete its retransmissions in the last PSMP sequence of the PSMP burst because not enough time is allocated in its PSMP-UTT may transmit the data outside any PSMP sequence.

NOTE 1—In the case of uplink frames transmitted outside the scheduled SP, the Multi-TID BlockAck frame that acknowledges these frames is delivered in the PSMP-DTT within the next SP.

NOTE 2—A non-AP STA might transmit data outside the PSMP sequence. The acknowledgment of such frames is based on their Ack Policy field value and whether a block ack agreement has been established, as follows:

- An Ack Policy of Block Ack, Normal Ack, or Implicit Block Ack Request results in the behavior defined in 9.2.4.5.4.
- An Ack Policy of PSMP Ack causes the AP to record the received Data frame and results in the transmission of a Multi-TID BlockAck frame in the next PSMP-DTT allocated to the STA.

10.29.2.7 PSMP acknowledgment rules

A non-AP STA shall transmit a Multi-TID BlockAck frame during its PSMP-UTT for data received with the Ack Policy field set to PSMP Ack or for TIDs in a received Multi-TID BlockAckReq frame for which a BlockAck frame (Compressed BlockAck or Multi-TID BlockAck) has not yet been transmitted. An AP shall transmit a Multi-TID BlockAck frame during a PSMP-DTT addressed to the STA for the data received from that STA with the Ack Policy field set to PSMP Ack or for TIDs in a Multi-TID BlockAckReq frame received from that STA for which a BlockAck frame (Compressed BlockAck or Multi-TID BlockAck) has not yet been transmitted.

Data sent and received by a non-AP STA within a PSMP sequence may be contained in an A-MPDU that contains MPDUs of multiple TIDs. Frames of differing TIDs may be transmitted in the same PSMP-DTT or PSMP-UTT and are not subject to AC prioritization.

The subtype subfield of Data frames and the Ack Policy subfield of QoS Data frames transmitted during either PSMP-DTT or PSMP-UTT periods are limited by the following rules:

- A QoS Data frame transmitted under an immediate or HT-immediate block ack agreement during either a PSMP-DTT or a PSMP-UTT shall have one of the following Ack Policy values: PSMP Ack or Block Ack.
- A QoS Data frame transmitted under an HT-delayed block ack agreement during either a PSMP-DTT or a PSMP-UTT shall have the Ack Policy field set to Block Ack.
- A Data frame with the RA field containing an individual address transmitted during either a PSMP-DTT or a PSMP-UTT and for which no block ack agreement exists shall be a QoS data subtype and shall have the Ack Policy field set to No Ack.
- The Ack Policy field of a QoS Data frame transmitted during a PSMP sequence shall not be set to either Normal Ack or Implicit Block Ack.

All TID values within a Multi-TID BlockAck frame or Multi-TID BlockAckReq frame shall identify a block ack agreement that is HT-immediate. QoS Data frames transmitted with Ack Policy field equal to PSMP Ack shall have a TID value that identifies a block ack agreement that is immediate or HT-immediate block ack.

NOTE—In this case, HT-immediate relates to the keeping of acknowledgment state for timely generation of a Multi-TID BlockAck frame. It does not imply that there is any response mechanism for sending a Multi-TID BlockAck frame after a SIFS. The timing of any response is determined by the PSMP schedule.

Acknowledgment for data transmitted under an immediate or HT-immediate block ack agreement may be requested implicitly using PSMP Ack setting of the Ack Policy field in Data frames or explicitly with a Basic BlockAckReq or Multi-TID BlockAckReq frame. An AP that transmits Data frames with the Ack Policy field equal to PSMP Ack or that transmits a Basic BlockAckReq or Multi-TID BlockAckReq frame addressed to a STA in a PSMP-DTT shall allocate sufficient time for the transmission of a Basic BlockAck frame or Multi-TID BlockAck frame, respectively, in a PSMP-UTT allocated to that STA within the same PSMP sequence. A STA that has received a PSMP frame and that receives a QoS Data frame with the Ack Policy field equal to PSMP Ack or that receives a Basic BlockAckReq or Multi-TID BlockAckReq frame shall transmit a Basic BlockAck frame or Multi-TID BlockAck frame, respectively, in the PSMP-UTT of the same PSMP sequence.

NOTE 1—If the STA does not receive the PSMP frame, it might still receive the downlink data, in which case it can record the status of the data in its block ack buffer, but it cannot transmit a Multi-TID BlockAck frame.

NOTE 2—A Multi-TID BlockAck frame or Multi-TID BlockAckReq frame might contain any TID related to an HT-immediate block ack agreement regardless of the contents of any prior transmission of Multi-TID BlockAck, Multi-TID BlockAckReq, or QoS Data frames.

An AP that receives a QoS Data frame with the Ack Policy field equal to PSMP Ack during a PSMP-UTT shall transmit a response that is a Basic BlockAck frame or Multi-TID BlockAck frame in the next PSMP-DTT that it schedules for that STA, except if it has transmitted a BlockAck frame for such TIDs to the STA outside the PSMP mechanism.

NOTE 1—The exception might occur if the non-AP STA transmits one or more BlockAckReq frames or QoS Data frames with Ack Policy set to Implicit Block Ack outside the PSMP mechanism.

NOTE 2—An AP might receive a Multi-TID BlockAck frame in the PSMP-UTT of the current PSMP sequence. If the Multi-TID BlockAck frame indicates lost frames or if the AP does not receive an expected Multi-TID BlockAck frame, the AP might schedule and retransmit those frames in a PSMP sequence within the current PSMP burst or in the next SP.

A Multi-TID BlockAck frame shall include all of the TIDs for which data were received with Ack Policy field equal to PSMP Ack and for the TIDs listed in any Multi-TID BlockAckReq frame received during the previous PSMP-DTT (STA) or PSMP-UTT (AP). The originator may ignore the bitmap for TIDs in the Multi-TID BlockAck frame for which the originator has not requested a Multi-TID BlockAck frame to be present either implicitly (by the transmission of Data frames with the Ack Policy field set to PSMP Ack) or explicitly (by the transmission of a Multi-TID BlockAckReq frame).

If a BlockAckReq frame for an HT-delayed block ack agreement is transmitted during a PSMP sequence, the BAR Ack Policy subfield of the BlockAckReq frame shall be set to the value representing No Acknowledgment.

10.29.2.8 PSMP group addressed transmission rules

10.29.2.8.1 Rules at the AP

This subclause defines rules that shall be followed by a PSMP-capable AP for the transmission of group addressed Data and Management frames during a PSMP sequence.

Each separate group address for which frames are transmitted during a PSMP sequence shall have a single STA_INFO record with STA_INFO Type set to 1 (group addressed) present in the PSMP frame and transmit frames with the matching Address 1 field only during the PSMP-DTT indicated in this record.

The DA of the PSMP shall be set to the broadcast address, except if the PSMP contains only a single non-null PSMP-DTT and this PSMP-DTT contains frames for a group address, in which case the DA of the PSMP frame may be set to this group address.

NOTE—The transmission of a group addressed frame within a PSMP sequence does not change the rules regarding when that frame can be transmitted. In other words, if there is a power-saving STA in the BSS, the group addressed frame is transmitted following a DTIM beacon according to the rules in 11.2.3.

10.29.2.8.2 Rules at the STA

This subclause defines rules that shall be followed by a PSMP-capable STA for the reception of group addressed frames during a PSMP sequence.

The STA shall be awake to receive during all PSMP-DTTs identified by a group addressed STA_INFO record where the PSMP Group Address ID subfield matches the LSBs of any address within its dot11GroupAddressesTable.

10.29.3 Scheduled PSMP

A PSMP session exists while any periodic TS exists that was established by a TSPEC with the APSD field equal to 0 and the Schedule field equal to 1 (representing Scheduled PSMP). The creation of a PSMP session is described in 11.4.6.

While one or more PSMP sessions exist with the same SP, the AP shall periodically initiate a PSMP sequence by transmitting a PSMP frame using the SP indicated to the STA in response to the received TSPEC. Under S-PSMP rules, the AP shall not transmit a PSMP frame containing a STA_INFO record addressed to a STA unless the transmission occurs within a SP of that STA. The PSMP-DTT and PSMP-UTT allocated to a STA shall occur within a SP of that STA.

NOTE—An AP might simultaneously maintain multiple PSMP sessions with distinct SIs. The SIs of an AP’s PSMP sessions are multiples of the SI granularity. An AP might combine the schedule of multiple PSMP sessions into a single PSMP frame if the start times of the PSMP sessions coincide. For example, the schedule carried by a PSMP frame related to a PSMP session at 20 ms and 30 ms SIs can be combined into a single PSMP frame once every 3 SIs of PSMP session at 20 ms or once every 2 SIs of the PSMP session at 30 ms.

The start time of a PSMP sequence should be aligned with the start time of the SP.

10.29.4 Unscheduled PSMP

An HT AP may start an unscheduled PSMP sequence that includes STAs that are PSMP-capable at any time that these STAs are awake.

NOTE—A STA in power save is awake as defined in 11.2.3.5 (U-APSD, S-APSD), as defined in 11.2.3.8 (PS-Poll frame), or during a DTIM period.

U-APSD STAs can signal the queue size or TXOP duration required to transmit its queued data to the AP in the QoS Control field of the trigger frame. This information might be used by the AP to estimate the duration of the PSMP-UTT so that the STA can transmit the queued data.

All of the behavior defined in 11.2.3.5, 11.2.3.6, and 11.2.3.10 applies to unscheduled PSMP with the following exceptions:

- PSMP allows the STA to sleep during PSMP-DTTs and PSMP-UTTs in which it has no interest.
- In addition to the EOSP mechanism, the AP may indicate the end of a SP through the transmission of a PSMP frame with the More PSMP field set to 0 or by transmission of a CF-End frame when a PSMP frame was expected.

10.30 Sounding PPDUs

The behavior described in this subclause is specific to the use of the HT variant HT Control field.

A sounding PPDU is a PPDU for which the SOUNDING parameter of the corresponding RXVECTOR or TXVECTOR has the value SOUNDING. Sounding PPDU are transmitted by STAs to enable the receiving STAs to estimate the channel between the transmitting STA and the receiving STA.

A STA transmits sounding PPDU when it operates in the following roles:

- MFB requester (see 10.31.2)
- HT beamformee responding to a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.32.2.2, 10.32.2.3, and 10.32.2.4)
- HT beamformer involved in explicit transmit beamforming (see 10.32.3)
- ASEL transmitter and ASEL sounding-capable transmitter involved in ASEL (see 10.33.2)

A STA receives sounding PPDU when it operates in the following roles:

- MFB responder (see 10.31.2)
- HT beamformer sending a training request, calibration initiator, or responder involved in implicit transmit beamforming (see 10.32.2.2, 10.32.2.3, and 10.32.2.4)
- HT beamformee involved in explicit transmit beamforming (see 10.32.3)
- Transmit ASEL responder and ASEL receiver involved in ASEL (see 10.33.2)

When transmitting a sounding PPDU, the transmitting STA follows the rules stated below to determine the maximum number of space-time streams for which channel coefficients can be simultaneously estimated:

- When transmitting a sounding PPDU that
 - Contains a +HTC frame with the MRQ subfield equal to 1, or
 - Is sent as a response to a +HTC frame with the TRQ field equal to 1, or
 - Is sent during a calibration sounding exchange, or
 - Is sent by an HT beamformer involved in explicit transmit beamforming, or
 - Is sent in transmit or receive ASEL exchanges,
- Then:
 - If the sounding PPDU is not an NDP sounding PPDU, the NUM_EXTEN_SS parameter in the TXVECTOR shall not be set to a value greater than the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the sounding PPDU.
 - NOTE—The maximum number of space-time streams for which channel coefficients can be simultaneously estimated using the HT-LTFs corresponding to the data portion of the packet is limited by the Rx MCS Bitmask subfield of the Supported MCS Set field and by the Rx STBC subfield of the HT Capability Information field. Both fields are part of the HT Capabilities element.
 - If the sounding PPDU is an NDP, the number of spatial streams corresponding to the MCS parameter of the TXVECTOR shall not exceed the limit indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capabilities field transmitted from the STA that is the intended receiver of the NDP (see 10.34.2 for details on setting the MCS parameter).

If a STA sets the Receive Staggered Sounding Capable bit in the Transmit Beamforming Capabilities field to 1, the STA shall set the Channel Estimation Capability bit in the Transmit Beamforming Capabilities field to indicate a dimension that is greater than or equal to the dimension indicated by the Supported MCS Set field of the HT Capabilities element.

10.31 Link adaptation

10.31.1 Introduction

To fully exploit MIMO channel variations and transmit beamforming on a MIMO link, a STA can request that another STA provide MIMO channel sounding and MFB.

Link adaptation may be supported by immediate response or delayed response as described below. Unsolicited MFB is also possible.

- *Immediate*: An immediate response occurs when the MFB responder transmits the response in the TXOP obtained by the TXOP holder. This approach allows the MFB requester to obtain the benefit of link adaptation within the same TXOP.
- *Delayed*: A delayed response occurs when the MFB responder transmits the response in the role of a TXOP holder in response to an MRQ in a previous TXOP obtained by the MFB requester.

- *Unsolicited*: An unsolicited response occurs when a STA sends MFB independent of any preceding MRQ.

10.31.2 Link adaptation using the HT variant HT Control field

The behavior described in this subclause is specific to the HT variant HT Control field.

A STA that supports link adaptation using the HT Control field shall set the MCS Feedback field of the HT Extended Capabilities field to Unsolicited or Both, depending on its specific MFB capability, in HT Capabilities elements that it transmits. A STA shall not send an MRQ to a STA that has not set the MCS Feedback subfield to Both in the HT Extended Capabilities field of the HT Capabilities element. A STA whose MCS Feedback field of the HT Extended capabilities field of the HT Capabilities element is equal to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a +HTC field.

The MFB requester may set the MRQ subfield to 1 in the MAI subfield of the HT Control field of a +HTC frame to request a STA to provide MFB. In each MRQ, the MFB requester shall set the MSI subfield in the MAI subfield to a value in the range 0 to 6. How the MFB requester chooses the MSI value is implementation dependent.

The appearance of more than one instance of an HT Control field with the MRQ subfield equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for MFB.

An MFB requester shall transmit +HTC frames with the MRQ subfield equal to 1 in one of the following ways:

- Within a sounding PPDU, or
- With the HT NDP Announcement subfield in the +HTC frame set to 1 and following the +HTC frame by an NDP transmission

The number of HT-LTFs sent in the sounding PPDU or in the NDP is determined by the total number of spatial dimensions to be sounded, including any extra spatial dimensions beyond those used by the data portion of the frame.

An MFB-capable STA (identified by the MCS Feedback field in the Extended HT Capability Information field equal to 3) shall support the following:

- MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a sounding PPDU for which the RXVECTOR NUM_EXTEN_SS parameter contains 0 in the PHY-RXSTART.indication primitive.
- MFB estimate computation and feedback on the receipt of MRQ (MRQ=1 in +HTC) in a staggered sounding PPDU if this STA declares support for receive staggered sounding by setting the Receive Staggered Sounding Capable subfield of the Transmit Beamforming Capabilities field to 1.
- MFB estimate computation and feedback on the receipt of NDP (see 10.34) if this STA declares support for receiving NDP sounding by setting the Receive NDP Capable subfield of the Transmit Beamforming Capabilities field to 1. The MFB requester shall set the MRQ subfield to 1 in the frame where the HT NDP Announcement subfield is equal to 1.

On receipt of a +HTC frame with the MRQ subfield equal to 1, an MFB responder initiates computation of the MCS estimate based on the associated sounding PPDU and labels the result of this computation with the MSI value. The MFB responder includes the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this use of MSI and MFSI fields allows the MFB requester to correlate the MFB with the related MRQ.

The responder may send a response frame with any of the following combinations of MFB and MFSI:

- MFB = 127, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include an HT Control field due to other protocols that use this field (i.e., the reverse direction protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.
- MFB = 127, MFSI in the range 0 to 6: the responder is not now providing, and will never provide, feedback for the request that had the MSI value that matches the MFSI value.
- MFB in the range 0 to 126, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.
- MFB in the range 0 to 126, MFSI = 7: the responder is providing unsolicited feedback.

Hardware and buffer capability may limit the number of MCS estimate computations that a MFB responder is capable of computing simultaneously. When a new MRQ is received either from a different MFB requester or from the same MFB requester with a different MSI value, and the MFB responder is not able to complete the computation for MRQ, the MFB responder may either discard the new request or may abandon an existing request and initiate an MCS estimate computation for the new MRQ.

An MFB responder that discards or abandons the computation for an MRQ should indicate this action to the MFB requester by setting the MFB to the value 127 in the next transmission of a frame addressed to the MFB requester that includes the HT Control field. The value of the MFSI is set to the MSI value of the sounding frame for which the computation was abandoned.

When computing the MCS estimate for an MFB requester whose Tx MCS Set Defined field is equal to 1, the number of spatial streams corresponding to the recommended MCS shall not exceed the limit indicated by the Tx Maximum Number Spatial Streams Supported field. The MFB responder shall not recommend an MCS corresponding to UEQM unless the MFB requester supports such modulation, as indicated by the Tx Unequal Modulation Supported bit in the Supported MCS Set field.

If the MFB is in the same PPDU as a Noncompressed Beamforming frame or a Compressed Beamforming frame, the MFB responder should estimate the recommended MCS under the assumption that the MFB requester uses the steering matrices contained therein.

After the MCS estimate computation is completed, the MFB responder should include the MFB in the MFB field in the next transmission of a frame addressed to the MFB requester that includes an HT Control field. When the MFB requester sets the MRQ subfield to 1 and sets the MSI subfield to a value that matches the MSI subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI subfield value.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both MRQ and MFB in the same HT Data frame.

If an HT beamformer transmits a PPDU with the TXVECTOR EXPANSION_MAT_TYPE set to either COMPRESSED_SV or NON_COMPRESSED_SV, it should use the recommended MCS associated with those matrices reported in a Noncompressed Beamforming frame or a Compressed Beamforming frame.

10.31.3 Link adaptation using the VHT variant HT Control field

This subclause applies to frame exchange sequences that include PPDUs containing an HT variant HT Control field.

A STA that supports VHT link adaptation using the VHT variant HT Control field shall set the VHT Link Adaptation Capable subfield in the VHT Capabilities Information field in the VHT Capabilities element to Unsolicited or Both, depending on its specific link adaptation feedback capability. A STA shall not send an MRQ to a STA that has not set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element. A STA whose VHT Link Adaptation Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element is either set to Unsolicited or Both may transmit unsolicited MFB in any frame that contains a VHT variant HT Control field.

The MFB requester may set the MRQ field to 1 in the VHT variant HT Control field of a frame to request a STA to provide link adaptation feedback. In each request the MFB requester shall set the MSI/STBC field to a value in the ranges 0 to 6, 0 to 2, or 0 to 3, depending on the settings in the Unsolicited MFB and STBC fields (see 9.2.4.6.3). The choice of MSI value is implementation dependent.

The appearance of more than one instance of a VHT variant HT Control field with the MRQ field equal to 1 within a single PPDU shall be interpreted by the receiver as a single request for link adaptation feedback.

An MFB responder that has set the VHT Link Adaptation Capable subfield to Both in the VHT Capabilities Information field of the VHT Capabilities element shall support both of the following:

- Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in the VHT variant HT Control field) in a PPDU that is not a VHT NDP Announcement frame
- Computation and feedback of the MFB estimate on the receipt of an MFB request (MRQ equal to 1 in VHT variant HT Control field) in a VHT NDP Announcement frame and the receipt of VHT NDPs (see 10.34) if this STA set the SU Beamformee Capable subfield of the VHT Capabilities Information field of the VHT Capabilities element to 1

On receipt of a VHT variant HT Control field with the MRQ field equal to 1, an MFB responder computes the VHT-MCS, NUM_STS, and SNR estimates based on the PPDU carrying the MRQ or, in the case of a VHT NDP Announcement frame carrying the MRQ, based on the subsequent VHT NDP. The MFB responder labels the result of this computation with the MSI value from the VHT variant HT Control field in the received frame carrying the MRQ. The MFB responder may include the received MSI value in the MFSI field of the corresponding response frame. In the case of a delayed response, this allows the MFB requester to associate the MFB with the soliciting MRQ.

An MFB responder that sends a solicited MFB shall set the Unsolicited MFB subfield in VHT variant HT Control field to 0.

The MFB responder may send a solicited response frame with any of the following combinations of VHT-MCS, NUM_STS, and MFSI:

- VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI = 7: no information is provided for the immediately preceding request or for any other pending request. This combination is used when the responder is required to include a VHT variant HT Control field due to other protocols that use this field (e.g., the Reverse Direction Protocol) and when no MFB is available. It has no effect on the status of any pending MRQ.
- VHT-MCS = 15, NUM_STS = 7 in the MFB subfield, MFSI in the range 0 to 6: the responder is not now providing, and will never provide, feedback for the request that had the MSI value that matches the MFSI value.
- VHT-MCS = valid value, NUM_STS = valid value in the MFB subfield, MFSI in the range 0 to 6: the responder is providing feedback for the request that had the MSI value that matches the MFSI value.

An MFB responder that discards or abandons the MFB estimates computed in response to an MRQ may indicate that it has done so by setting the VHT-MCS to 15 and NUM_STS to 7 in the MFB subfield in the next frame addressed to the MFB requester that includes the VHT variant HT Control field. The value of the MFSI is set to the value of the MSI/STBC subfield of the frame that contains an MRQ for which the computation was abandoned, regardless of whether the MSI/STBC subfield contains an MSI or a Compressed MSI and STBC Indication subfields.

The STA receiving MFB may use the received MFB to compute the appropriate VHT-MCS, SNR, and NUM_STS.

A STA sending unsolicited MFB using the VHT variant HT Control field shall set the Unsolicited MFB subfield to 1.

Unsolicited VHT-MCS, NUM_STS, BW, and SNR estimates reported in the MFB subfield of a VHT variant HT Control field sent by a STA are computed based on the most recent PPDU received by the STA that matches the description indicated by the GID-L, GID-H, Coding Type, STBC Indication, and FB Tx Type fields in the same VHT variant HT Control field.

In an unsolicited MFB response the GID-L, GID-H, Coding Type, STBC Indication, FB Tx Type, and BW fields are set according to the RXVECTOR parameters of the received PPDU from which the VHT-MCS, SNR, BW, and NUM_STS are estimated, as follows:

- If the VHT-MCS, SNR, BW, and NUM_STS are estimated from a VHT MU PPDU, then the GID-L field is set to the 3 least significant bits and the GID-H field to the 3 most significant bits of the parameter GROUP_ID.
- If the VHT-MCS, SNR, BW, and NUM_STS are estimated from an SU PPDU, then the GID-L field and GID-H field are set to all 1s.
- The Coding Type field is set to 0 if the parameter FEC_CODING is equal to BCC_CODING and set to 1 if equal to LDPC_CODING.
- The STBC Indication field is set to 1 if the parameter STBC is equal to 1 and set to 0 if the STBC parameter is equal to 0.
- The FB TX Type field is set to 1 if the parameter BEAMFORMED is equal to 1 and set to 0 if equal to 0.
- The BW field shall indicate a bandwidth less than or equal to the bandwidth indicated by the parameter CH_BANDWIDTH.

In an MFB response solicited by an MRQ that was not carried in a VHT NDP Announcement frame, the MFB is computed based on RXVECTOR parameters CH_BANDWIDTH, GROUP_ID, NUM_STS, FEC_CODING, BEAMFORMED, and STBC of the received PPDU that carried the MRQ and might additionally be based on other factors that are not part of the RXVECTOR. The NUM_STS subfield of the MFB subfield of VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU that triggered the MRQ.

If the MFB is in the same MPDU as a VHT Compressed Beamforming frame, the MFB responder shall estimate the recommended MFB under the assumption that the beamformer will use the steering matrices contained therein for performing an SU beamformed transmission. In this case the value of the NUM_STS field in the MFB subfield of the VHT variant HT Control field shall be the same as the value of the Nc Index field in the VHT MIMO Control field of the VHT Compressed Beamforming frame and, if the MFB is unsolicited, the Coding Type shall be set to BCC and the FB Tx Type shall be set to 0. Additionally, MFB estimate shall be based on the bandwidth indicated by the Channel Width subfield of the VHT MIMO Control field of the VHT Compressed Beamforming frame. In this case the SNR and BW subfields are reserved and set to 0.

If an unsolicited MFB is not in the same MPDU as a VHT Compressed Beamforming frame, the NUM_STS subfield of the MFB subfield of the VHT variant HT Control field shall be set to an equal or smaller value than the RXVECTOR parameter NUM_STS of the received PPDU from which the MFB parameters are estimated.

If the MFB requester sends the MRQ in a VHT NDP Announcement frame, then the MFB responder shall include the corresponding MFB in (all of) the VHT Compressed Beamforming frame(s) sent in response to the same VHT NDP Announcement frame and NDP sequence.

If the value of the NUM_STS subfield of the MFB field (solicited or unsolicited) is a smaller value than the RXVECTOR parameter NUM_STS of the received PPDU on which the MFB is based, the MFB responder shall estimate the recommended VHT-MCS under the assumption that the MFB requester will transmit the first N_{STS} space-time streams in the corresponding PPDU carrying MRQ. If the MFB is based on an SU PPDU the first N_{STS} space-time streams correspond to columns 1, ..., N_{STS} of the spatial mapping matrix Q . If the MFB is based on a VHT MU PPDU, then for the user u the first N_{STS} space-time streams correspond to columns $M_u+1, \dots, M_u+N_{STS,u}$ of the spatial mapping matrix Q (M_u is defined in 21.3.10.11.1). The VHT-MCS recommendation shall be a value from the peer's Tx Supported VHT-MCS and NSS Set (see 10.7.12.2).

A VHT NDP Announcement frame that contains multiple STA Info fields and that contains a VHT format of HT Control field with the MRQ subfield equal to 1 solicits an MFB response from all of the STAs listed in the STA Info fields.

When the MFB requester sets the MRQ subfield to 1 and sets the MSI/STBC subfield to a value that matches the MSI/STBC subfield value of a previous request for which the responder has not yet provided feedback, the responder shall discard or abandon the computation for the MRQ that corresponds to the previous use of that MSI/STBC subfield value and start a new computation based on the new request.

A STA may respond immediately to a current request for MFB with a frame containing an MFSI field value and an MFB field value that correspond to a request that precedes the current request.

Bidirectional request/responses are supported. A STA may act as both the MFB requester for one direction of a duplex link and the MFB responder for the other direction and include both an MRQ and an MFB in the same VHT variant HT Control field.

10.32 Transmit beamforming

10.32.1 HT steering matrix calculations

In order for an HT beamformer to calculate an appropriate steering matrix for transmit spatial processing when transmitting to a specific HT beamformee, the HT beamformer needs to have an accurate estimate of the channel over which it is transmitting. Two methods of calculation are defined as follows:

- *Implicit feedback*: When using implicit feedback, the beamformer receives long training symbols transmitted by the HT beamformee, which allow the MIMO channel between the HT beamformee and HT beamformer to be estimated. If the channel is reciprocal, the HT beamformer can use the training symbols that it receives from the HT beamformee to make a channel estimate suitable for computing the transmit steering matrix. Generally, calibrated radios in MIMO systems can improve reciprocity. See 10.32.2.
- *Explicit feedback*: When using explicit feedback, the HT beamformee makes a direct estimate of the channel from training symbols sent to the HT beamformee by the HT beamformer. The HT beamformee may prepare CSI or steering feedback based on an observation of these training symbols. The HT beamformee quantizes the feedback and sends it to the HT beamformer. The HT beamformer can use the feedback as the basis for determining transmit steering vectors. See 10.32.3.

An HT STA shall not transmit a PPDU with the TXVECTOR EXPANSION_MAT parameter present if dot11BeamFormingOptionActivated is false.

10.32.2 HT transmit beamforming with implicit feedback

10.32.2.1 General

The procedures for HT transmit beamforming with implicit feedback use only HT and non-HT PPDUs, and the HT Control field, when present, is the HT variant HT Control field.

Transmit beamforming with implicit feedback can operate in a unidirectional or bidirectional manner. In unidirectional implicit transmit beamforming, only the HT beamformer sends beamformed transmissions. In bidirectional implicit transmit beamforming, both STAs send beamformed transmissions, i.e., a STA may act as both HT beamformer and HT beamformee.

Calibration of receive/transmit chains should be done to improve performance of transmit beamforming using implicit feedback. Over-the-air calibration is described in 10.32.2.4. For implicit transmit beamforming, only the HT beamformer, which is sending the beamformed transmissions, needs to be calibrated.

A STA that advertises itself as being capable of being an HT beamformer and/or HT beamformee using implicit feedback shall support the requirements in Table 10-15.

Table 10-15—STA type requirements for transmit beamforming with implicit feedback

| STA capability | Required support |
|-----------------------|--|
| Beamformer | <p>Shall set the Implicit Transmit Beamforming Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits.</p> <p>Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element.</p> <p>Shall be capable of receiving a sounding PPDU for which the SOUNDING parameter is SOUNDING and the NUM_EXTEN_SS is equal to 0 in the RXVECTOR in the PHY-RXSTART.indication primitive, independently of the values of the Receive Staggered Sounding Capable and Receive NDP Capable subfields.</p> <p>Shall set the Calibration subfield to 3 of the Transmit Beamforming Capability field of the HT Capabilities element to advertise full calibration support.</p> |
| Beamformee | <p>Shall set the Implicit Transmit Beamforming Receiving Capable subfield to 1 of the Transmit Beamforming Capability field of the HT Capabilities element in HT Capabilities elements that it transmits.</p> <p>Shall be capable of setting the SOUNDING parameter to SOUNDING and the NUM_EXTEN_SS to 0 in the TXVECTOR in the PHY-TXSTART.request primitive when transmitting a sounding PPDU, as a response to TRQ=1, independently of the values of the Transmit Staggered Sounding Capable and Transmit NDP Capable subfields.</p> |

A STA that performs one of the roles related to transmit beamforming with implicit feedback shall support the associated capabilities shown in Table 10-16.

Table 10-16—Transmit beamforming support required with implicit feedback

| Role | Required support |
|--|---|
| HT beamformee: A receiver of transmit beamformed PPDU | Shall transmit sounding PPDUAs a response to TRQ=1. |
| Beamformer: A transmitter of beamformed PPDU | Can receive sounding PPDU. Can compute steering matrices from MIMO channel estimates obtained from long training symbols in sounding PPDU received from the HT beamformee. |
| A responder in a calibration exchange | Can receive and transmit sounding PPDU. Can respond with a CSI frame that contains channel measurement information obtained during reception of a sounding PPDU. |
| An initiator in a calibration exchange | Can receive and transmit sounding PPDU. Can receive a CSI frame sent by a calibration responder. |

When an HT beamformee transmits a sounding PPDU, the SOUNDING parameter in the TXVECTOR in the PHY-TXSTART.request primitive shall be set to SOUNDING. If the HT beamformee is capable of implicit transmit beamforming and the HT beamformer is capable of receiving implicit transmit beamforming, the sounding PPDU from the HT beamformee may be steered.

A PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 shall not be sent to a STA that sets the Implicit Transmit Beamforming Receiving Capable subfield of the Transmit Beamforming field of the HT Capabilities element to 0.

If a PPDU containing one or more +HTC MPDUs in which the TRQ field is equal to 1 requires an immediate response, either the response from the HT beamformee shall be included in a sounding PPDU, or the HT NDP Announcement subfield of the HT Control field shall be set to 1 and the PPDU shall be followed by an NDP. If the PPDU in which the TRQ field is equal to 1 does not require an immediate response, either the HT beamformee shall transmit a sounding PPDU in the next TXOP obtained by the HT beamformee, or the HT beamformee shall transmit a PPDU in the next TXOP obtained by the HT beamformee in which the HT NDP Announcement subfield of the HT Control field is set to 1 and that PPDU shall be followed by an NDP. The use of NDP as a sounding PPDU is described in 10.34.

NOTE—A STA that acts as an HT beamformer using implicit feedback expects to receive a sounding PPDU in response to a training request. The STA can compute steering matrices from the channel estimates obtained from the received sounding PPDU.

At the end of the TXOP the final PPDU from the HT beamformer shall not have the TRQ field set to 1 in a frame that requests an immediate response if there is not enough time left in the TXOP for the HT beamformee to transmit the longest valid sounding PPDU with its response.

10.32.2.2 Unidirectional implicit transmit beamforming

Figure 10-45 shows an example of a PPDU exchange used in unidirectional implicit transmit beamforming using the Clause 19 PHY. In this example, sounding PPDUAs are used that carry MPDUs (i.e., an example of implicit beamforming using NDPs is not shown here.) STA A is the beamformer that initiates the PPDU exchange, and STA B is the beamformee.

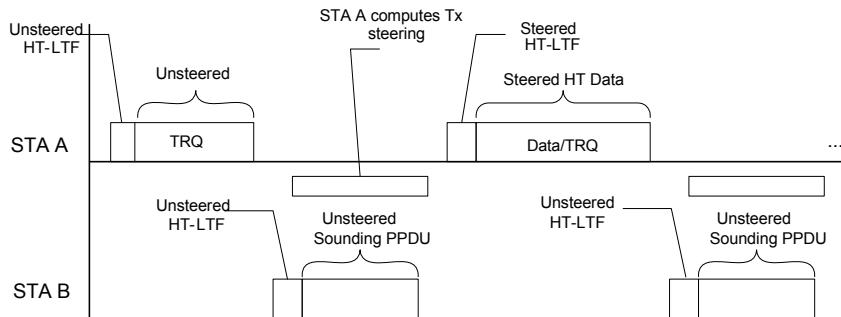

Figure 10-45—Example PPDU exchange for unidirectional implicit transmit beamforming

The PPDU exchange can be summarized as follows:

- STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.
- STA B sends a sounding PPDU in response to the training request from STA A.
- On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B.
- The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training requests (TRQ=1) in a +HTC MPDU. In response to each training request, STA B returns a sounding PPDU to STA A, which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDUs are deemed stale due to delay, the sequence may be restarted by returning to step a).

Step d) in the above PPDU exchange represents steady-state unidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

10.32.2.3 Bidirectional implicit transmit beamforming

Figure 10-46 shows an example of a PPDU exchange used in bidirectional implicit transmit beamforming, using the Clause 19 PHY. In this example, sounding PPDU are used that carry MPDUs. STA A initiates the frame exchange, and STA A and STA B alternate in the roles of HT beamformer and HT beamformee.

The PPDU exchange can be summarized as follows:

- STA A initiates the frame exchange sequence by sending an unsteered PPDU to STA B. The PPDU includes a training request (TRQ= 1) in a +HTC MPDU.
- STA B sends a sounding PPDU in response to the training request. In addition, this PPDU includes a training request in a +HTC MPDU to enable implicit transmit beamforming in the RD.
- On receiving the sounding PPDU, STA A uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA B. This steered PPDU is also a sounding PPDU in response to the training request from STA B.

NOTE—Steering matrices with nonorthonormal columns should not be used in transmitting sounding PPDU for implicit feedback. In general, bidirectional implicit beamforming will not function as described here when the steering matrices have nonorthonormal columns. See 19.3.12.2.

- On receiving the sounding PPDU, STA B uses the resulting channel estimate to compute steering matrices and uses these matrices to send a steered PPDU back to STA A. The steered PPDU transmitted in step c) and subsequent steered PPDUs transmitted by STA A may include training requests in HTC. In response to each training request, STA B returns a sounding PPDU to STA A,

which enables STA A to update its steering vectors. If the steering vectors resulting from step c) or subsequent sounding PPDU are deemed stale due to delay, the sequence may be restarted by returning to step a).

- e) The steered PPDU transmitted in step d) and subsequent steered PPDU transmitted by STA B may include training requests in HTC. In response to each training request, STA A returns a sounding PPDU to STA B, which enables STA B to update its steering vectors. If the steering vectors resulting from step d) or subsequent sounding PPDU are deemed stale due to delay, the sequence may be restarted by returning to step a).

Steps d) and e) in the above PPDU exchange represent steady-state bidirectional transmit beamforming operation.

During the PPDU exchange neither the receiving nor the transmitting STA should switch antennas.

NOTE—The TRQ protocol used with the beamforming training process is not sufficient to permit STA B to transmit Data frames in the RD. In the example shown in Figure 10-46, STA A would additionally have to follow the rules of the reverse direction protocol (see 10.28).

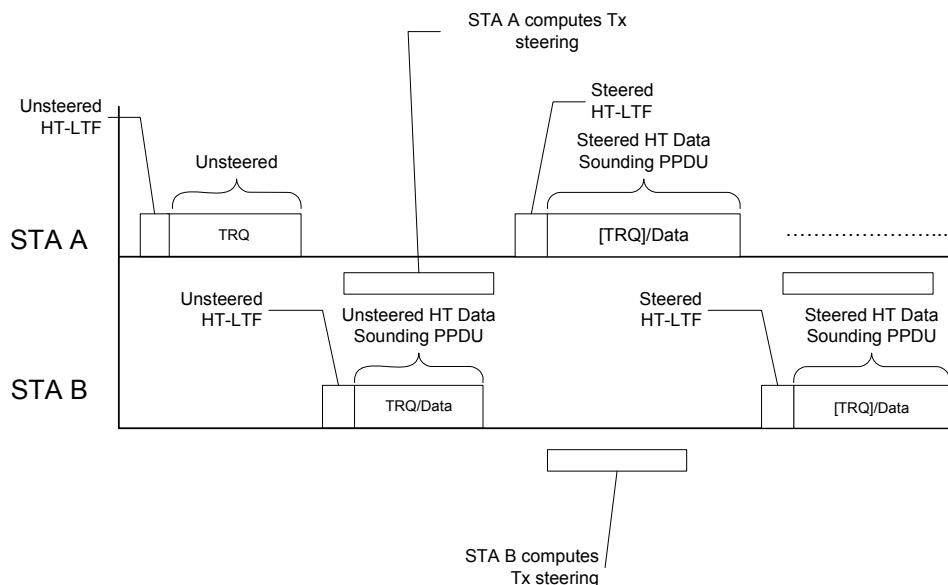

Figure 10-46—Example PPDU exchange for bidirectional implicit transmit beamforming

10.32.2.4 Calibration

10.32.2.4.1 Introduction

Differences between transmit and receive chains in a STA degrade the inherent reciprocity of the over-the-air time division duplex channel and cause degradation of the performance of implicit beamforming. Calibration acts to remove or reduce differences between transmit and receive chains and enforce reciprocity in the observed baseband-to-baseband channels between two STAs.

A STA acting as an HT beamformer should be calibrated to maximize performance. A STA acting only as an HT beamformee does not need to be calibrated. In order to perform calibration, the STA follows the procedure described below.

The calibration procedure involves the computation of correction matrices that cause the observed channel matrices in the two directions of the link to be transposes of each other and thus renders the resultant channel reciprocal. See 19.3.12.2 for a more detailed description. If it is able to do so, a STA should calibrate upon association.

NOTE—STAs with two or more transmit chains should be calibrated in order to engage in implicit transmit beamforming. STAs with any number of RF chains, including those with a single RF chain, can participate in a calibration exchange as a calibration responder.

10.32.2.4.2 Calibration capabilities

A STA that sets the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 shall support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to 3 (indicating full support of calibration) in HT Capabilities elements that it transmits. A STA that does not set the Implicit Transmit Beamforming Capable subfield of the Transmit Beamforming Capabilities field to 1 may support calibration and shall set the Calibration subfield of the Transmit Beamforming Capabilities field to the value that indicates its calibration capability in the Transmit Beamforming Capabilities field in HT Capabilities elements that it transmits (see Table 9-166), when the Transmit Beamforming Capabilities field exists.

A STA that is capable of initiating calibration (the Calibration subfield of the Transmit Beamforming Capabilities field is equal to 3) shall set the CSI Max Number of Rows Beamformer Supported subfield to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

In order to support calibration, a STA that advertises that it is capable of responding to a calibration request shall be capable of transmitting a CSI frame in which the value of the Grouping subfield of the MIMO Control field is 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is 3 ($Nb = 8$ bits) in response to a CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 and the Calibration Position subfield of the HT Control field equal to 3, independently of the advertised values of the Explicit Transmit Beamforming CSI Feedback subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element. A STA that advertises that it is capable of initiating a calibration request shall be capable of receiving a CSI frame in which the value of the Grouping subfield of the MIMO Control field is equal to 0 (no grouping) and the Coefficients Size subfield of the MIMO Control field is equal to 3 ($Nb = 8$ bits) as a response to CSI feedback request indicated by the CSI/Steering subfield of the HT Control field equal to 1 with the Calibration Position subfield equal to 3, independently of the advertised values of the Explicit CSI Transmit Beamforming Capable subfield in the Transmit Beamforming Capabilities field in the HT Capabilities element.

A STA may initiate a calibration training frame exchange sequence with another STA if that STA supports calibration. A STA shall not initiate a calibration training frame exchange with another STA if that STA does not support calibration.

If the Receive NDP Capable field is equal to 1, the value of the Calibration field is equal to 1 or 3, and the device supports transmitting sounding PPDUs for which two or more channel dimensions can be estimated (two or more columns of the MIMO channel matrix), then transmission of NDPs shall be supported (and the Transmit NDP Capable bit shall be set to 1).

10.32.2.4.3 Sounding exchange for calibration

Figure 10-47 illustrates the calibration PPDU exchange using sounding PPDUs that contain an MPDU.

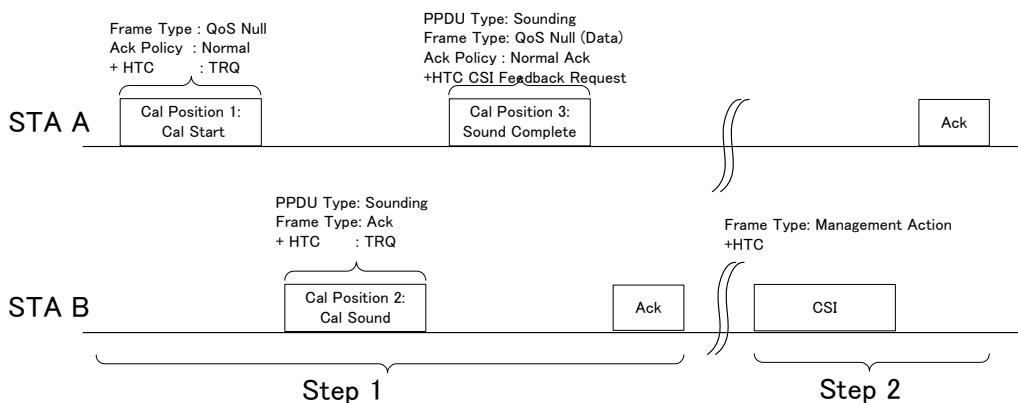

Figure 10-47—Calibration procedure with sounding PPDU containing an MPDU

The calibration procedure begins with a calibration sounding PPDU exchange sequence shown as Step 1 in Figure 10-47. The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

STA A (the calibration initiator) shall transmit a Calibration Start frame (Calibration Position subfield set to 1) with the TRQ field in the HT Control field set to 1. This frame initiates a calibration procedure. It shall be a QoS Null frame with the Ack Policy field set to Normal Ack.

In response, STA B (the calibration responder) shall transmit a Calibration Sounding Response frame (Calibration Position subfield set to 2), a SIFS after the end of the Calibration Start frame, using a sounding PPDU. This step allows STA A to estimate the MIMO channel from STA B to STA A. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is indicated in the Calibration Start frame. The Calibration Sounding Response frame shall have a frame type of Ack+HTC, and the TRQ field in the HT Control field in this frame shall be set to 1.

In response, STA A shall transmit a Calibration Sounding Complete frame (Calibration Position subfield set to 3) that contains the CSI/Steering subfield of the HT Control field set to 1, a SIFS after the end of the Calibration Sounding Response frame, using a sounding PPDU. This step allows STA B to estimate the MIMO channel from STA A to STA B. In this Calibration Sounding Complete frame, the Calibration Sequence subfield in the HT Control field shall be set to the same value that is indicated in the Calibration Sounding Response frame. The Calibration Sounding Complete frame shall be a QoS Null+HTC with the Ack Policy field set to Normal Ack.

A frame in which the Calibration Position subfield is equal to 2 or 3 shall be transmitted in a sounding PPDU (a PPDU for which the SOUNDING parameter is set to SOUNDING). The number of Long Training fields (LTFS) used to obtain MIMO channel estimation that are sent in the sounding PPDU shall be determined by the number of transmit chains (N_{TX}) used in sending these LTFS at the STA transmitting the sounding PPDU. The transmit chains used at the calibration initiator are those for which calibration is required.

The calibration responder may train up to maximum available transmit chains to maximize the quality of the resulting calibration, although the number of space-time streams for data symbols shall be determined by the rule described in 10.7.

When transmitting a sounding PPDU during Step 1 of a calibration procedure, if the Receive Staggered Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

- If the sounding PPDU is not an NDP, the number of antennas used by the sender shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.
- If the sounding PPDU is an NDP, the number of antennas used by the sender shall be less than or equal to the number indicated by the Channel Estimation Capability subfield in the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

Sounding packets in which the Calibration Position subfield is equal to 2 or 3 shall use the spatial mapping matrices defined in 19.3.12.3. The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange.

NOTE—The calibration initiator of this frame exchange is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

The row order in the CSI feedback matrix transmitted from STA B shall correspond to the association of the rows of the spatial mapping matrix (see Equation (19-75)) to its transmit antennas. For example, the receive antenna at STA B associated with row i in the CSI feedback matrix in each subcarrier is the same as its transmit antenna associated with row i in the spatial mapping matrix used for transmitting the sounding response with Calibration Position equal to 2.

Figure 10-48 and Figure 10-49 illustrate the calibration PPDU exchange using NDPs.

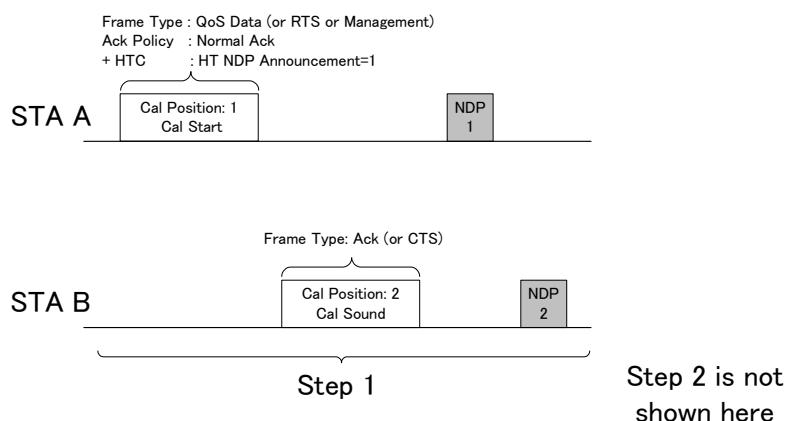

Figure 10-48—Calibration procedure with NDP

The calibration procedure begins with a calibration sounding PPDU exchange sequence, shown as Step 1 in Figure 10-48 and Figure 10-49, when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix). The Calibration Sequence subfield in the HT Control field shall be incremented each time a new calibration procedure is started.

NDP transmission within a calibration procedure follows the rules defined in 10.34.1. STA A transmits a Calibration Start frame (i.e., with the Calibration Position subfield set to 1) with the HT NDP Announcement subfield set to 1 and CSI/Steering subfield of the HT Control field set to 1. Only the current TXOP holder may set both the Calibration Position and HT NDP Announcement subfields to 1. This frame initiates a calibration procedure.

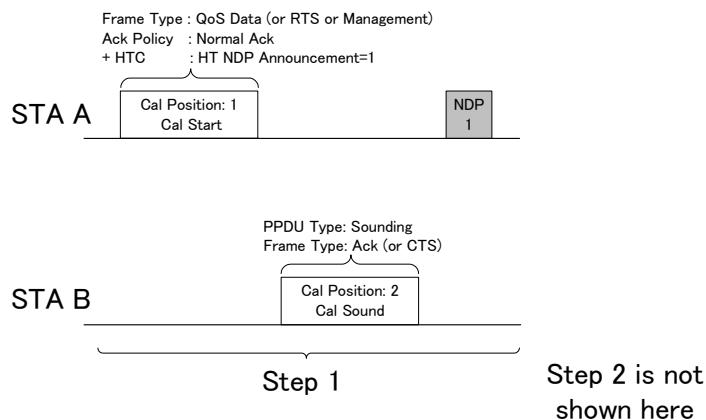

Figure 10-49—Calibration procedure with NDP when STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix)

STA B shall transmit a Calibration Sounding Response frame (i.e., with the Calibration Position subfield set to 2) after a SIFS after the received Calibration Start frame. If STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (i.e., a single column of the MIMO channel matrix), this Calibration Sounding Response frame is sent with the SOUNDING parameter of the TXVECTOR set to SOUNDING (see Figure 10-49).

As determined by NDP rules a) or b) in 10.34.1, STA A sends the first NDP as a sounding PPDU a SIFS after receiving the Calibration Sounding Response frame. This step allows STA B to estimate the MIMO channel from STA A to STA B. In the Calibration Sounding Response frame, the Calibration Sequence subfield in HT Control field shall be set to the same value that is contained in the Calibration Start frame. The Calibration Sounding Response frame shall contain an HT Control field, and the type and subtype of the frame are determined by the Calibration Start frame.

As determined by NDP rule d), STA B might transmit a second NDP as a sounding PPDU a SIFS after receiving the first NDP. This second NDP allows STA A to estimate the channel from STA B to STA A.

NOTE—STA B does not transmit an NDP when it supports transmitting sounding PPDUs for which only one channel dimension can be estimated (see Figure 10-49).

Otherwise (i.e., if STA B supports transmitting sounding PPDUs for which only one channel dimension can be estimated (single column of the MIMO channel matrix)), the transmission of the sounding PPDU in Calibration Position 2 allows STA A to estimate the channel from STA B to STA A.

NDP sounding PPDUs shall use the spatial mapping matrices defined in 19.3.13.3. The calibration responder shall not remove the spatial mapping from the CSI to be fed back to the initiator of the frame exchange.

NOTE—The calibration initiator of this frame exchange is responsible for accounting for the spatial mapping in both its local channel estimate as well as in the quantized CSI fed back to it.

10.32.2.4.4 CSI reporting for calibration

The remaining message exchange in the calibration procedure is not time critical.

The calibration initiator should not transmit any frames that are part of the calibration sequence shown in Step 1 in Figure 10-47 if either of the response frames from the calibration responder (the frames shown as Calibration Position 2 and Ack in Step 1) is not received correctly within an AckTimeout interval (as defined in 10.3.2.9) after the PHY-TXEND.confirm primitive. If the calibration initiator aborts the calibration sequence,

it may restart the calibration sequence with a value of the Calibration Sequence subfield in the Calibration Control subfield of the HT Control field that is different (i.e., incremented) from the value used in the aborted sequence. Within a non-NDP calibration sequence, the calibration responder should not transmit any further frames that are part of the calibration sequence shown in Step 1 if the frame having Calibration Position 3 is not received correctly within an AckTimeout interval (as defined in 10.3.2.9) after the PHY-TXEND.confirm primitive.

When the MIMO channel measurements become available at STA B, STA B shall send one or more CSI frames that contain the CSI report (Step 2 in Figure 10-47). This CSI report shall have full precision, i.e., $N_g=1$ (no grouping) and $N_b=3$ (8 bits). In these CSI frames, the Calibration Sequence subfields in HT Control fields shall be set to the same value that is indicated in the Calibration Sounding Complete frame. These CSI frames shall have a frame type of Management Action +HTC.

STA B should finish transmission of the first CSI frame within aMaxCSIMatricesReportDelay (in milliseconds) after the reception of the frame containing the CSI feedback request or HT NDP announcement.

NOTE—If necessary, the CSI Report field can be split into up to 8 segments as specified in Table 9-51.

A STA that has started but not completed the calibration procedure and that receives some other request that requires the buffering of CSI (such as another calibration initiation frame, MFB request, CSI feedback request for link adaptation, or feedback request for explicit Transmit Beamforming) may ignore the other request.

From the beginning of Step 1 of the calibration procedure and continuing through the end of Step 2 of the calibration procedure, neither the receiving nor the transmitting STA should switch antennas.

10.32.3 Explicit feedback beamforming

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

In this subclause, the terms *HT beamformer* and *HT beamformee* refer to STAs that are involved in explicit feedback beamforming.

An HT beamformer uses the feedback response that it receives from the HT beamformee to calculate a beamforming feedback matrix for transmit beamforming. This feedback response may have one of three formats:

- *CSI*: The HT beamformee sends the MIMO channel coefficients to the HT beamformer.
- *Noncompressed beamforming*: The HT beamformee sends calculated beamforming feedback matrices to the HT beamformer.
- *Compressed beamforming*: The HT beamformee sends compressed beamforming feedback matrices to the HT beamformer.

The supported formats shall be advertised in the HT beamformee's HT Capabilities element.

NOTE—An HT beamformer might discard the feedback response if the TSF time when the PHY-CCA.indication(IDLE) primitive corresponding to the feedback response frame's arrival minus the value from the Sounding Timestamp field in the feedback response frame is greater than the coherence time interval of the propagation channel.

An HT beamformee's responding capabilities shall be advertised in HT Capabilities elements that are transmitted by the HT beamformee. Devices that are capable of acting as an HT beamformee shall advertise one of the following response capabilities in the Explicit Transmit Beamforming CSI Feedback subfield of the Transmit Beamforming Capability field:

- *Immediate*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU and/or is capable of sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP.
- *Delayed*: The HT beamformee is not capable of sending the feedback response within the HT beamformer's TXOP, but it is capable of sending the feedback response in a TXOP that it obtains.
- *Immediate and Delayed*: The HT beamformee is capable of sending a feedback response a SIFS after receiving a sounding PPDU, sending a feedback response aggregated in a PPDU that contains a MAC response within the HT beamformer's TXOP, or sending the feedback response in a TXOP that it obtains.

The sounding frame types supported by the HT beamformee, staggered and/or NDP, are advertised in the HT Capabilities element in frames that are transmitted by the HT beamformee.

A STA that sets any of the Explicit Transmit Beamforming CSI Feedback Capable, Explicit Noncompressed Beamforming Feedback Capable, or Explicit Compressed Beamforming Feedback Capable fields to 1 shall transmit explicit feedback based on the receipt of a +HTC sounding PPDU in which the CSI/Steering subfield has a nonzero value and that does not contain Extension HT-LTFs (HT-ELTFs). This requirement is independent of the values of the Receive Staggered Sounding Capable and the Receive NDP Capable fields.

An HT beamformer shall set the SOUNDING parameter of the TXVECTOR to SOUNDING in the PHY-TXSTART.request primitive corresponding to each packet that is used for sounding.

An HT beamformer shall set the response type format indicated in the CSI/Steering subfield of the HT Control field of any sounding frame excluding the NDP and of any PPDU with the NDP Sounding Announcement field equal to 1 to one of the nonzero values (CSI, Compressed Beamforming, or Noncompressed Beamforming) that corresponds to a type that is supported by the HT beamformee.

The receipt of a PHY-RXSTART.indication primitive with the RXVECTOR SOUNDING parameter value equal to SOUNDING indicates a sounding packet. A non-NDP request for feedback is a sounding PPDU with a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 0.

An NDP request for feedback is the combination of a +HTC MPDU that contains a nonzero value of the CSI/Steering subfield and that has the HT NDP Announcement subfield equal to 1 and the NDP that follows.

An HT beamformee that transmits a feedback frame in response to a sounding PPDU sent by an HT beamformer shall transmit a frame of the type (CSI, Compressed Beamforming, or Noncompressed Beamforming) indicated in the CSI/Steering subfield of the HT Control field transmitted by the HT beamformer.

The HT beamformee decides on any tone grouping to be used in the explicit Beamforming feedback. The value selected shall be a value supported by the HT beamformer as indicated in the Minimal Grouping subfield of the HT beamformer's HT Capabilities element.

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit Explicit CSI feedback after SIFS or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-17. An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Noncompressed Beamforming feedback after SIFS or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-17.

Table 10-17—Rules for HT beamformee immediate feedback transmission responding to non-NDP sounding

| Type of response | Rule |
|--|---|
| CTS response | If the transmission of a CTS is required in response to the non-NDP request for feedback, the transmission of the feedback response frame shall be delayed until the HT beamformee's next transmission within the TXOP. This feedback response frame may be aggregated in an A-MPDU with an Ack or BlockAck frame. |
| Acknowledgment response | If the transmission of an Ack or BlockAck frame is required in response to the non-NDP request for feedback, both the feedback response frame and the control response frame may be aggregated in an A-MPDU. |
| No control response | If the transmission of a control response frame is not required in response to the non-NDP request for feedback, the feedback response frame shall be sent a SIFS after the reception of the sounding PPDU containing the request for feedback. |
| Later aggregation of feedback and acknowledgment | If the immediate-feedback-capable HT beamformee cannot transmit an aggregated or immediate CSI/Steering response in a SIFS after the end of the received sounding packet and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, it may transmit the feedback response in an A-MPDU with the Ack or BlockAck frame. |

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit Explicit Compressed Beamforming feedback after SIFS or later in the HT beamformer's TXOP as a response to a non-NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-17.

An HT beamformee that sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit CSI feedback after SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-18.

Table 10-18—Rules for HT beamformee immediate feedback transmission responding to NDP sounding

| Type of response | Rule |
|------------------|---|
| Control response | <p>If the transmission of a control response frame is required in response to the NDP request for feedback, the control response frame is transmitted a SIFS after reception of the PPDU that elicited the control response, and the feedback response frame may be transmitted a SIFS after the reception of the NDP.</p> <ul style="list-style-type: none"> — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP. |

Table 10-18—Rules for HT beamformee immediate feedback transmission responding to NDP sounding (continued)

| Type of response | Rule |
|---------------------|---|
| No control response | <p>If the transmission of a control response frame is not required in response to the NDP request for feedback, the feedback response frame may be sent a SIFS after the reception of the NDP.</p> <ul style="list-style-type: none"> — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and the HT beamformee is subsequently required to transmit an Ack or BlockAck frame in the same TXOP, then the feedback response may be aggregated with the Ack or BlockAck frame. — If the feedback response frame is not transmitted a SIFS after the reception of the NDP and is not transmitted with an aggregated Ack or BlockAck frame in the same TXOP, then the feedback response frame is delayed until the HT beamformee's next transmission within the TXOP. |

An HT beamformee that sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Noncompressed Beamforming feedback after SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-18.

An HT beamformee that sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 shall transmit the Explicit Compressed Beamforming feedback after SIFS or later in the HT beamformer's TXOP as a response to an NDP request for feedback in a frame that is appropriate for the current frame exchange sequence following Table 10-18.

When the HT beamformee sets the Explicit Transmit Beamforming CSI Feedback field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or an non-NDP Explicit Beamforming CSI feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next packet to the HT beamformee until PIFS after transmitting the sounding request.

When the HT beamformee sets the Explicit Noncompressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or an non-NDP Explicit Noncompressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next packet to the HT beamformee until PIFS after the sounding request.

When the HT beamformee sets the Explicit Compressed Beamforming Feedback Capable field of its HT Capabilities element to either 2 or 3 and the HT beamformer has transmitted an NDP or an non-NDP Explicit Compressed Beamforming feedback request in a frame that does not require immediate control response, the HT beamformer shall not transmit the next packet to the HT beamformee until PIFS after transmitting the sounding request.

An HT beamformee shall not transmit a CSI, Compressed Beamforming, or Noncompressed Beamforming frame except in response to a request for feedback.

NOTE—Error recovery in a TXOP is not affected by sounding. An HT beamformer that is a TXOP holder and that fails to receive an expected response to a sounding PPDU can continue transmission as specified in 10.22.2.7.

An HT beamformee transmitting a feedback response after SIFS or later in the HT beamformer's TXOP shall use an Action No Ack frame or an Action No Ack +HTC frame (defined in 9.3.3.15).

An HT beamformee transmitting delayed feedback response shall use an Action frame or an Action +HTC frame to send this information within a separate TXOP.

If necessary, the CSI Report field, Noncompressed Beamforming Report field, or Compressed Beamforming Report field may be split into up to 8 frames. The length of each segment shall be equal number of octets for all segments except the last, which may be smaller.

NOTE—A STA that has been granted an RDG can act as an HT beamformer during the RDG time period, provided that the RD rules are obeyed.

An HT beamformee that advertises itself as delayed-feedback-capable shall not transmit an immediate feedback response unless it also advertises itself as immediate-feedback-capable.

An HT beamformer may use the following worst-case parameters to estimate the duration of the expected frame that contains the feedback response: lowest rate in basic HT-MCS set, HT-mixed format, no grouping.

An Explicit Feedback Request may be combined with an MRQ. If the response contains a beamforming feedback matrix, the returned MCS shall be derived from the same information that was used to generate this particular beamforming feedback matrix. If the response contains channel coefficients, the returned MCS shall be derived from an analysis of the sounding frame that was used to generate the channel coefficients. The MFB field set to 127 (meaning no feedback) may be used when the HT beamformee is unable to generate the MCS in time for inclusion in the response transmission frame. A CSI-capable STA may be incapable of generating MFB.

Explicit feedback shall be calculated only from a sounding PPDU.

An HT beamformee that transmits a feedback frame of type Compressed Beamforming in response to a sounding PPDU sent by an HT beamformer shall set the value of *Nr* in the MIMO Control field of the feedback frame to be the same value as the number of streams in the sounding PPDU.

10.32.4 VHT MU beamforming

An MU beamformer may transmit a VHT MU PPDU with a single nonzero TXVECTOR parameter NUM_STS[*p*], where $0 \leq p \leq 3$.

An MU beamformer shall not transmit a VHT MU PPDU with a nonzero TXVECTOR parameter NUM_STS[*p*], where $0 \leq p \leq 3$, to a STA whose MU Beamformee Capable field is equal to 0.

When transmitting a VHT MU PPDU, an MU beamformer shall order the per-user arrays of TXVECTOR parameters so that the per-user USER_POSITION array is in ascending order.

10.33 Antenna selection (ASEL)

10.33.1 Introduction

The procedures in this subclause apply only to HT and non-HT PPDUs for which the HT Control field, if present, is the HT variant HT Control field.

ASEL is a time-variant mapping of the signals at the RF chains onto a set of antenna elements when the number of RF chains is smaller than the number of antenna elements. The mapping might be chosen based on instantaneous or averaged CSI. ASEL requires the training of the full size channel associated with all antenna elements, which is obtained by transmitting or receiving sounding PPDUs over all antennas. These sounding PPDUs should be sent within a single TXOP. To avoid channel distortions, these sounding PPDUs shall be transmitted consecutively. The training information is exchanged using the HT Control field. When both transmitter and receiver have ASEL capabilities, training of transmit and receive antennas might be done one after another. ASEL supports up to eight antennas and up to four RF chains.

10.33.2 Procedure

A STA shall not initiate an ASEL training frame exchange sequence with another STA unless that STA supports ASEL, as determined by the ASEL Capability field (see 9.4.2.56.7).

A STA that is capable of supporting ASEL should set each subfield of the ASEL Capability field of the HT Capabilities element to 1 depending on its capabilities in HT Capabilities elements that it transmits (see 9.4.2.56.7).

A STA that sets the Explicit CSI Feedback Based Tx ASEL Capable subfield of the ASEL Capability field (see 9.4.2.56.7) to 1 shall set the CSI Max Number of Rows Beamformer Supported subfield of the Transmit Beamforming Capabilities field to an appropriate value, even if the STA sets the Explicit Transmit Beamforming CSI Feedback subfield to the value 0.

The frame exchange sequence for transmit ASEL is shown in Figure 10-50, where the term *ASEL transmitter* identifies the STA that is conducting transmit ASEL, and the term *transmit ASEL responder* identifies the STA that provides ASEL feedback. The frame exchange comprises the following steps:

- a) (Optional) A transmit ASEL responder may initiate the transmit ASEL training by sending a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Request (TXASSR).
- b) The ASEL transmitter sends out consecutive sounding PPDUs separated by SIFS in a TXOP of which it is the TXOP holder with no acknowledgment over different antenna sets, each PPDU containing a +HTC frame with the ASEL Command subfield set to Transmit Antenna Selection Sounding Indication (TXASSI or TXASSI-CSI). Each sounding PPDUs is transmitted over one antenna set.

If the ASEL transmitter allows antenna indices feedback (by setting the ASEL Command subfield to TXASSI), the antenna sets from which the sounding PPDUs are transmitted shall be disjoint. If the ASEL transmitter uses NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix Q_k shall be set equal to the identity matrix starting with the first NDP. If the ASEL transmitter uses non-NDP sounding PPDUs for the ASEL sounding, the spatial mapping matrix Q_k shall be an FFT matrix. An FFT matrix of size N is defined as a square matrix of dimension $N \times N$ with entries w_{im} ,

$$i=0\dots N-1, m=0\dots N-1 \text{ where } w_{im} = \frac{1}{\sqrt{N}} \times \exp\left(-j2\pi \frac{im}{N}\right).$$

The ASEL transmitter shall not include TXASSI-CSI in the command field of the sounding frame if the last received value of the Explicit CSI Feedback Capable subfield of the ASEL Capability field (see 9.4.2.56.7) from the receiver was 0.

NOTE—For example, in the case of sounding over all disjointed antenna sets, the number of consecutive sounding PPDUs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains. These sounding PPDUs need to be sent within a single TXOP in order to minimize the change in the channel during this procedure.

- c) The transmit ASEL responder estimates the subchannel corresponding to each sounding PPDUs.
- d) If the ASEL Command subfield in the sounding frames is equal to TXASSI-CSI, after receiving all of the sounding PPDUs, the transmit ASEL responder shall respond with the full size CSI in a subsequent TXOP. If the ASEL Command subfield in the sounding frames is equal to TXASSI, after receiving all of the sounding PPDUs, the transmit ASEL responder may either respond with the full size CSI in a subsequent TXOP, or conduct ASEL computation and provide the selected antenna indices in a subsequent TXOP.
 - 1) CSI is transported using the MIMO CSI Matrices frame defined in 9.6.12.6 contained within either an Action No Ack or Action frame. Multiple CSI frames may be required to provide the complete feedback, in which case the value of the Sounding Timestamp field within each of

these CSI frames shall correspond to the arrival time of the sounding frame that was used to generate the feedback information contained in the frame.

- 2) Antenna indices feedback is carried in the Antenna Selection Indices Feedback frame, defined in 9.6.12.9. One octet of the Antenna Selection Indices field is used to carry the selected antenna indices feedback.

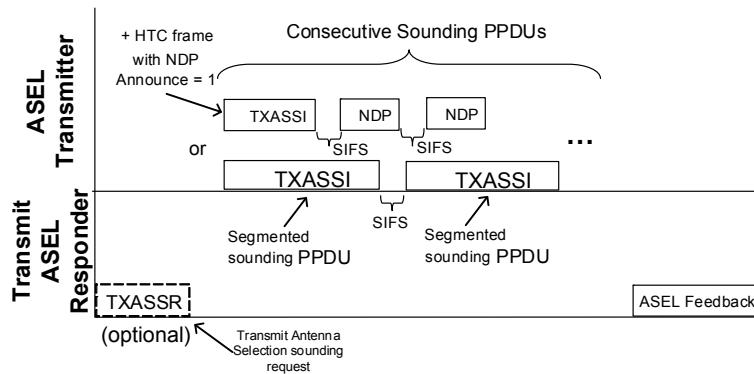

Figure 10-50—Transmit ASEL

If the transmit ASEL responder does not correctly receive all of the sounding PPDUs but has correctly received at least one of the preceding sounding PPDUs, it shall send a +HTC frame with the MAI subfield set to the value ASELI (see Table 9-12), the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback to indicate the failure of the ASEL training process, and the ASEL Data subfield set to either of the following:

- The integer value corresponding to the number in sequence of the first sounding PPDUs that was not properly received, where 0 corresponds to the first sounding PPDUs in the ASEL training sequence or
- The value 0

A transmit ASEL responder that determines that the ASEL feedback is stale shall notify the ASEL transmitter by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield set to 0.

If, in response to the transmission of a sequence of sounding PPDUs, the ASEL transmitter receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to No Feedback Due to ASEL Training Failure or Stale Feedback, and the ASEL Data subfield equal to a nonzero value to indicate a failed ASEL training frame sequence, the ASEL transmitter may perform any of the following actions:

- Do nothing.
- Restart the failed ASEL training frame sequence from the point of failure by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSR, and the ASEL Data subfield set to a nonzero value to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), where the ASEL Data subfield value is the order number (from the original training frame sequence) of the first sounding PPDUs transmitted in the restarted ASEL training frame sequence and where 0 corresponds to the first sounding PPDUs in the original ASEL training sequence.
- Execute a new ASEL training frame sequence by transmitting a +HTC MPDU with the MAI subfield set to ASELI, the ASEL Command subfield set to TXASSI or TXASSI-CSI, and the ASEL Data subfield set to a nonzero value.

If a transmit ASEL responder receives a +HTC MPDU with the MAI subfield equal to ASELI, the ASEL Command subfield equal to TXASSR, and the ASEL Data subfield equal to a nonzero value to correspond to the command Transmit Antenna Selection Sounding Resumption (a Resumption MPDU), the transmit ASEL responder shall respond to the training sequence according to the original command value (i.e., TXASSI or TXASSI-CSI) and shall assume a total number of sounding PPDUs that corresponds to the number of sounding PPDUs from the original command frame. The number of sounding frames that follow the Resumption MPDU is equal to the number of sounding PPDUs from the original command frame minus the order number transmitted in the ASEL Data subfield of the Resumption MPDU.

The frame exchange sequence for receive ASEL is shown in Figure 10-51, where the term *ASEL receiver* identifies the STA that is conducting receive ASEL, and the term *ASEL sounding-capable transmitter* identifies the STA sending the consecutive sounding PPDUs used for receive ASEL calculations. The frame exchange comprises the following steps:

- The ASEL receiver transmits a +HTC frame with the MAI subfield set to ASELI, the ASEL Command subfield set to Receive Antenna Selection Sounding Request (RXASSR), and the ASEL Data subfield set to the number of sounding PPDUs required.

NOTE—For example, in the case of sounding over all disjointed antenna sets, the number of total consecutive sounding PPDUs or NDPs equals the smallest integer that is greater than or equal to the number of antennas divided by the number of RF chains.

- The ASEL sounding-capable transmitter responds with the corresponding number of sounding PPDUs in its subsequent TXOP. These PPDUs are separated by SIFS. When using non-NDP sounding, each PPDU contains a +HTC frame in which the MAI subfield is set to ASELI, the ASEL Command subfield is set to Receive Antenna Selection Sounding Indication (RXASSI), and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted. When using NDP sounding, the PPDU that precedes the first NDP contains a +HTC frame in which the NDP Announce field is set to 1, the MAI subfield is set to ASELI, the ASEL Command subfield is set to RXASSI, and the ASEL Data subfield is set to the remaining number of sounding PPDUs to be transmitted.

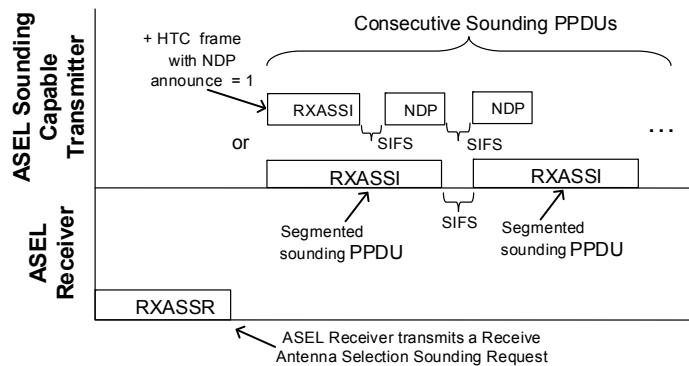

Figure 10-51—Receive ASEL

The ASEL receiver uses different antenna sets to receive these sounding PPDUs, estimates CSI after receiving all these sounding PPDUs, and conducts the ASEL.

When transmitting the consecutive sounding PPDUs in transmit and receive ASEL exchanges (illustrated in Figure 10-50 and Figure 10-51), the transmitter shall not change the TXPWR_LEVEL_INDEX parameter of the TXVECTOR.

When transmitting a sounding PPDU sent in transmit and receive ASEI exchanges (illustrated in Figure 10-50 and Figure 10-51), if the Receive Staggered Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver is 0, then,

- If the sounding PPDU is not an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the maximum number of space-time streams indicated by the Rx MCS Bitmask subfield of the Supported MCS Set field and the Rx STBC subfield of the HT Capabilities element transmitted by the intended receiver.
- If the sounding PPDU is an NDP, the number of antennas used by the sender, as indicated by the ANTENNA_SET parameter in the TXVECTOR, shall be less than or equal to the number indicated by the Channel Estimation Capability subfield of the Transmit Beamforming Capability field of the HT Capabilities element transmitted by the intended receiver.

When both transmitter and receiver have ASEI capabilities, the following constraints apply:

- During a transmit ASEI frame exchange, the transmit ASEI responder shall use a subset of antennas that does not change during the reception of all of the sounding PPDU of the ASEI sounding sequence.
- During a receive ASEI frame exchange, the ASEI sounding-capable transmitter shall use a subset of antennas that does not change during the transmission of all of the sounding PPDU of the ASEI sounding sequence.

NOTE—When a receiver (either a transmit ASEI responder or an ASEI receiver) conducts ASEI computations (for either transmit or receive ASEI), if there is no transmit beamforming conducted at the same time, to achieve the best performance of ASEI, the receiver assumes that the first N_{STS} columns of the same spatial mapping matrix Q_k used for transmitting ASEI sounding PPDU, where N_{STS} is the number of space-time streams, are applied for the spatial mapping at the ASEI transmitter after the ASEI exchange as in Figure 10-50 and Figure 10-51. To achieve the best performance of ASEI, the ASEI transmitter applies the first N_{STS} columns of the same Q_k for spatial mapping after the ASEI exchange as in Figure 10-50 and Figure 10-51.

10.34 Null data packet (NDP) sounding

10.34.1 HT NDP sounding protocol

Sounding may be accomplished using either staggered sounding PPDU or HT NDP, as described in 19.3.13. The MAC rules associated with sounding using HT NDP are described in 10.34.1 to 10.34.4.

An HT STA that has set the Receive NDP Capable field of its HT Capabilities element to 1 during association processes an HT NDP as a sounding packet if the destination of the sounding packet is determined to match itself as described in 10.34.3 and if the source of the sounding packet can be ascertained as described in 10.34.4.

An RXVECTOR LENGTH parameter equal to 0 indicates that an HT PPDU is an HT NDP.

A STA that is a TXOP holder or an RD responder shall not set both the HT NDP Announcement and RDG/More PPDU subfields to 1 simultaneously. The Calibration Position subfield shall not be set to any value except 0 and 1 in any +HTC frame in a PPDU that is also an HT NDP announcement. The Calibration Position subfield shall be set to 0 in any +HTC frame in a PPDU that is an HT NDP announcement that also contains any +HTC frame with the MAI subfield equal to ASELI. The Calibration Position subfield shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement and that contains any +HTC frame with the MRQ subfield equal to 1. The TRQ field shall be set to 0 in all +HTC frames in a PPDU that is an HT NDP announcement.

An NDP sequence contains at least one HT NDP and at least one PPDU that is not an NDP. Only one PPDU in the NDP sequence may contain an HT NDP announcement. An NDP sequence begins with an HT NDP

announcement. The NDP sequence ends at the end of the transmission of the last HT NDP that is announced by the HT NDP announcement. A STA that transmits the first PPDU of an NDP sequence is the NDP sequence owner. In the NDP sequence, only PPDU carrying HT NDP and PPDU carrying single MPDU Control frames may follow the NDP sequence's starting PPDU.

A STA shall transmit only one HT NDP per HT NDP announcement, unless the HT NDP announcement includes a value in the ASEL Data subfield of the ASEL Command subfield of the HTC Control field that is greater than one. Each PPDU in an NDP sequence shall start a SIFS after end of the previous PPDU.

A STA shall not transmit a VHT NDP in a NDP sequence that contains an HT NDP announcement.

A CTS frame that is a +HTC frame shall not contain the HT NDP Announcement subfield set to 1.

NOTE—A CTS frame cannot be used for HT NDP announcement: if the CTS frame is a response to an RTS frame, the optional NAV reset timeout that starts at the end of the RTS frame does not include the additional HT NDP and SIFS (see 10.3.2.4). Also, if the CTS were the first frame of an NDP sequence, it would not be possible to determine the destination address of the HT NDP.

A STA shall transmit an HT NDP as follows:

- a) A SIFS after sending a PPDU that is an HT NDP announcement and that does not contain an MPDU that requires an immediate response.
- b) A SIFS after successfully receiving a correctly formed and addressed immediate response to a PPDU that is an HT NDP announcement and that contains an MPDU that requires an immediate response.
- c) A SIFS after transmitting an HT NDP if the HT NDP announcement contains an ASEL Command subfield equal to TXASSI, TXASSI-CSI, or RXASSI and the ASEL Data subfield is equal to a value greater than 0 and if the number of HT NDPs sent before this one is less than the value in the ASEL Data subfield + 1.

NOTE—The total number of sent HT NDPs is equal to the value of in the ASEL Data subfield + 1.

- d) A SIFS after receiving an HT NDP from a STA whose HT NDP announcement contained one or more +HTC frames with the Calibration Position subfield equal to 1, when the receiving STA supports transmitting sounding PPDU for which more than one channel dimension can be estimated (i.e., more than one column of the MIMO channel matrix).

This rule enables the NDP receiver to know that it will receive an HT NDP and can determine the source and destination of the HT NDP. It enables the receiver and transmitter to know when the immediate response and HT NDP will be transmitted relative to the frame containing the HT NDP announcement indication.

A STA that has transmitted an HT NDP announcement in a frame that requires an immediate response and that does not receive the expected response shall terminate the NDP sequence at that point (i.e., the STA does not transmit an HT NDP in the current NDP sequence).

A STA that has received an HT NDP announcement in a +HTC with the Calibration Position equal to 1 or 2, and that does not receive the HT NDP expected shall terminate the NDP sequence at that point (i.e., does not transmit an HT NDP in the current NDP sequence) and not transmit any further frames that are a part of this calibration sequence shown in Step 1 of Figure 10-48.

Feedback information generated from the reception of an HT NDP is transmitted using any of the feedback rules and signaling as appropriate, e.g., immediate or delayed.

10.34.2 Transmission of an HT NDP

A STA that transmits an HT NDP shall set the LENGTH, SOUNDING, STBC, MCS, and NUM_EXTEN_SS parameters of the TXVECTOR as specified in this subclause.

- LENGTH shall be set to 0.
- SOUNDING shall be set to SOUNDING.
- STBC shall be set to 0.
- MCS shall indicate two or more spatial streams.

The number of spatial streams sounded is indicated by the MCS parameter of the TXVECTOR and shall not exceed the limit indicated by the Channel Estimation Capability field in the Transmit Beamforming Capabilities field transmitted by the STA that is the intended receiver of the HT NDP. The MCS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported MCS Set field of the HT Capabilities field at either the transmitter or recipient of the HT NDP. A STA shall set the NUM_EXTEN_SS parameter of the TXVECTOR to 0 in the PHY-TXSTART.request primitive corresponding to an HT NDP transmission.

A STA shall not transmit an HT NDP announcement with an RA corresponding to another STA unless it has received an HT Capabilities element from the destination STA in which the Receive NDP Capable field is equal to 1.

10.34.3 Determination of HT NDP destination

The destination of an HT NDP is determined at the NDP receiver by examining the HT NDP announcement as follows:

- The destination of the first HT NDP in the NDP sequence is equal to the RA of any MPDU within HT NDP announcement.
- If Calibration Position subfield is equal to 1 in the HT NDP announcement at the NDP receiver, the destination of the second HT NDP is equal to the TA of that frame. Otherwise, the destination of the second and any subsequent HT NDPs is equal to the destination of the previous HT NDP.

See O.4 for an illustration of these rules.

10.34.4 Determination of HT NDP source

The source of an HT NDP is determined at the NDP receiver by examining the NDP sequences's starting PPDU as follows:

- If any MPDU within the HT NDP announcement contains two or more addresses, the source of the first HT NDP is equal to the TA of that frame.
- Otherwise (i.e., the HT NDP announcement contains one address), the source of the first HT NDP is equal to the RA of the MPDU to which the HT NDP announcement is a response.
- If the Calibration Position subfield is equal to 1 in an MPDU in the HT NDP announcement, the source of the second HT NDP is equal to the RA of that MPDU. Otherwise, the source of the second and any subsequent HT NDPs is equal to the source of the previous NDP.

See O.4 for an illustration of these rules.

10.34.5 VHT sounding protocol

10.34.5.1 General

Transmit beamforming and DL-MU-MIMO require knowledge of the channel state to compute a steering matrix that is applied to the transmitted signal to optimize reception at one or more receivers. The STA transmitting using the steering matrix is called the *VHT beamformer*, and a STA for which reception is optimized is called a *VHT beamformee*. An explicit feedback mechanism is used where the VHT beamformee directly measures the channel from the training symbols transmitted by the VHT beamformer and sends back a transformed estimate of the channel state to the VHT beamformer. The VHT beamformer then uses this estimate, perhaps combining estimates from multiple VHT beamformees, to derive the steering matrix.

If dot11VHTSUBeamformerOptionImplemented is true, a STA shall set the SU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTSUBeamformeeOptionImplemented is true, a STA shall set the SU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set the MU Beamformer Capable field in the VHT Capabilities element to 1. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set the MU Beamformee Capable field in the VHT Capabilities element to 1.

If dot11VHTMUBeamformerOptionImplemented is true, a STA shall set dot11VHTSUBeamformerOptionImplemented to true. If dot11VHTMUBeamformeeOptionImplemented is true, a STA shall set dot11VHTSUBeamformeeOptionImplemented to true.

A STA is a VHT SU-only beamformer if it sets the SU Beamformer Capable field to 1 but sets the MU Beamformer Capable field to 0 in transmitted VHT Capabilities elements. A STA is an SU-only beamformee if it sets the SU Beamformee Capable field to 1 but sets the MU Beamformee Capable field to 0 in transmitted VHT Capabilities elements.

If dot11VHTSUBeamformerOptionImplemented is false, a STA shall not act in the role of a VHT beamformer. If dot11VHTSUBeamformeeOptionImplemented is false, a STA shall not act in the role of a VHT beamformee.

10.34.5.2 Rules for VHT sounding protocol sequences

A VHT beamformer shall initiate a sounding feedback sequence by transmitting a VHT NDP Announcement frame followed by a VHT NDP after a SIFS. The VHT beamformer shall include in the VHT NDP Announcement frame one STA Info field for each VHT beamformee that is expected to prepare VHT Compressed Beamforming feedback and shall identify the VHT beamformee by including the VHT beamformee's AID in the AID subfield of the STA Info field. The VHT NDP Announcement frame shall include at least one STA Info field.

NOTE—A STA that transmits a VHT NDP Announcement frame to a DLS or TDLS peer STA obtains the AID for the peer STA from the DLS Setup Request, DLS Setup Response, TDLS Setup Request, or TDLS Setup Response frame.

A VHT beamformer shall not transmit either a VHT NDP Announcement+HTC frame or a Beamforming Report Poll+HTC frame that contains an HT variant HT Control field.

A VHT NDP shall be transmitted only following a SIFS after a VHT NDP Announcement frame. A VHT NDP Announcement frame shall be followed by a VHT NDP after SIFS.

A VHT beamformer that has not received a VHT Capabilities element from a STA or where the last VHT Capabilities element received from a STA has the SU Beamformee Capable field set to 0 shall not transmit either of the following:

- A VHT NDP Announcement frame addressed to the STA or that includes the STA's AID in one of the STA Info fields
- A Beamforming Report Poll frame addressed to the STA

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT SU-only beamformee shall include only one STA Info field in the VHT NDP Announcement frame and set the Feedback Type subfield of the STA Info field to SU.

If the VHT NDP Announcement frame includes more than one STA Info field, the RA of the VHT NDP Announcement frame shall be set to the broadcast address. If the VHT NDP Announcement frame includes a single STA Info field, the RA of the VHT NDP Announcement frame shall be set to the MAC address of the VHT beamformee.

A VHT NDP Announcement frame shall not include two or more STA Info fields with same value in the AID subfield.

A VHT beamformer that transmits a VHT NDP Announcement frame to a VHT beamformee that is an AP, mesh STA or STA that is a member of an IBSS, shall include a single STA Info field in the VHT NDP Announcement frame and shall set the AID field in the STA Info field to 0.

A VHT NDP Announcement frame with more than one STA Info field shall not carry a VHT variant HT Control field, unless all of the STAs listed in the AID field of the STA Info fields have set +HTC-VHT Capable to 1 in the VHT Capabilities Information field.

A VHT beamformer that transmits a VHT NDP Announcement frame with more than one STA Info field should transmit any Beamforming Report Poll frames used to retrieve VHT Compressed Beamforming feedback from the intended VHT beamformees in the same TXOP. If the duration of the TXOP that contained the VHT NDP Announcement frame has insufficient duration to accommodate the transmission of all of the feedback reports, the VHT beamformer may poll for the remaining VHT Compressed Beamforming feedback in subsequent TXOPs.

A VHT beamformer may use the following worst-case parameters to estimate the duration of the expected frame(s) that contain(s) the feedback response(s): lowest rate in basic VHT-MCS set, no grouping.

NOTE—The transmission of the VHT NDP Announcement, VHT NDP, VHT Compressed Beamforming, and Beamforming Report Poll frames is subject to the rules in 10.22.2.7.

A VHT beamformer that sets the Feedback Type subfield of a STA Info field to MU shall set the Nc Index subfield of the same STA Info field to a value less than or equal to the minimum of both of the following:

- The maximum number of supported spatial streams for receive operation according to the combination of the corresponding VHT beamformee's Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field and VHT Capabilities Information field
- The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the VHT Extended NSS BW Capable subfield received from the VHT beamformee is 1 and dot11ExtendedNSSSupported is equal to true, the 160/80+80 BW subfield value in the Operating Mode field of the most recently received Operating Mode Notification frame or Operating Mode Notification element with the Rx NSS Type subfield equal to 0 from the corresponding VHT beamformee, as computed according to 10.7.12.1

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established DLS or TDLS session and that contains the VHT beamformee's AID in the AID subfield of the first (or only) STA Info field and also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT Compressed Beamforming

feedback a SIFS after the VHT NDP. A VHT beamformee that is an AP, mesh STA, or STA that is a member of an IBSS, that receives a VHT NDP Announcement frame with the RA matching its MAC address and the AID subfield of the only STA Info field set to 0, and that also receives a VHT NDP a SIFS after the VHT NDP Announcement frame shall transmit the PPDU containing its VHT Compressed Beamforming feedback a SIFS after the VHT NDP. The TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT Compressed Beamforming feedback shall be set to indicate a bandwidth not wider than that indicated in the RXVECTOR parameter CH_BANDWIDTH of the received VHT NDP frame. A STA ignores received VHT NDP Announcement, VHT NDP, and Beamforming Report Poll frames if dot11VHTSBeamformeeOptionImplemented is false.

A VHT beamformee shall indicate the maximum number of space-time streams it can receive in a VHT NDP in the Beamformee STS Capability subfield of the VHT Capabilities Information field of the VHT Capabilities element. If the beamformee is a non-AP STA, this shall be less than or equal to the maximum total number of space-time streams that the STA can receive in a VHT MU PPDU.

An example of the VHT sounding protocol with a single VHT beamformee is shown in Figure 10-52.

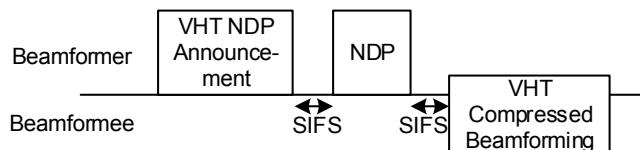

Figure 10-52—Example of the sounding protocol with a single VHT beamformee

A non-AP VHT beamformee that receives a VHT NDP Announcement frame from a VHT beamformer with which it is associated or has an established DLS or TDLS session and that contains the VHT beamformee's AID in the AID subfield of a STA Info field that is not the first STA Info field shall transmit its VHT Compressed Beamforming feedback a SIFS after receiving a Beamforming Report Poll with RA matching its MAC address and a nonbandwidth signaling TA obtained from the TA field matching the MAC address of the VHT beamformer. If the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the received Beamforming Report Poll frame is valid, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing the VHT Compressed Beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH_IN_NON_HT of the Beamforming Report Poll frame; otherwise, the TXVECTOR parameter CH_BANDWIDTH of the PPDU containing VHT Compressed Beamforming feedback shall be set to indicate a bandwidth not wider than that indicated by the RXVECTOR parameter CH_BANDWIDTH of the Beamforming Report Poll frame.

An example of the VHT sounding protocol with more than one VHT beamformee is shown in Figure 10-8.

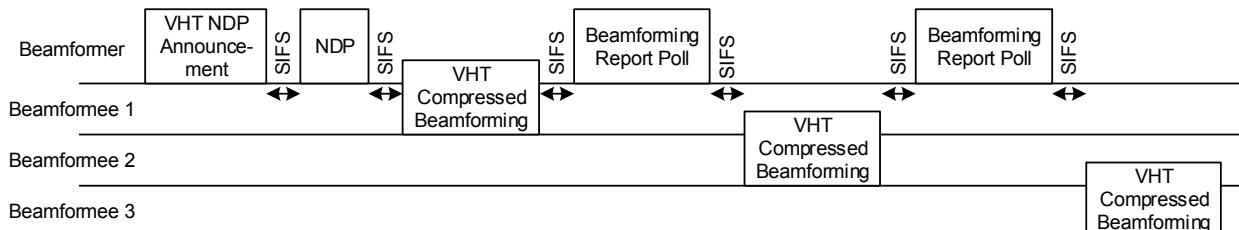

Figure 10-53—Example of the sounding protocol with more than one VHT beamformee

The RA field of the VHT Compressed Beamforming frame(s) of the VHT Compressed Beamforming feedback shall be set to a nonbandwidth signaling TA obtained from the TA field of the VHT NDP Announcement

frame or the Beamforming Report Poll frame to which this VHT Compressed Beamforming feedback is a response.

If the VHT Beamformee is transmitting VHT Compressed Beamforming frame(s) a SIFS after the VHT NDP, then the VHT Compressed Beamforming frame(s) shall include the VHT Compressed Beamforming Report information and, for the case of MU feedback, the MU Exclusive Beamforming Report information.

A VHT beamformee that transmits a VHT Compressed Beamforming frame shall set the Feedback Type field in the VHT MIMO Control field to the same value as the Feedback Type field in the corresponding STA Info field in the VHT NDP Announcement frame. If the Feedback Type field indicates MU, the STA shall send a VHT Compressed Beamforming frame with the Nc Index field value in the VHT MIMO Control field equal to the minimum of all of the following:

- The Nc Index field value in the corresponding STA Info field in the VHT NDP Announcement Frame
- The maximum number of supported spatial streams for receive operation according to the combination of its Rx VHT-MCS Map subfield in the Supported VHT-MCS and NSS Set field, VHT Capabilities Information field and Operating Mode field (see 10.7.12.1)
- The maximum number of supported spatial streams according to the Rx NSS subfield value and, when the value of the most recently transmitted VHT Extended NSS BW Capable subfield is 1, the 160/80+80 BW subfield value in the Operating Mode field of the most recently transmitted Operating Mode Notification frame or Operating Mode Notification element, as computed according to 10.7.12.1

If the Feedback Type indicates SU, the Nc Index field value in the VHT MIMO Control field is determined by the VHT beamformee.

The Nr Index field in the VHT MIMO Control field shall be set to the same value as the RXVECTOR parameter NUM_STS of the corresponding VHT NDP. The Nc Index field shall not be set to a value larger than the Nr Index value in the VHT MIMO Control field. A VHT beamformee shall set the value of the Channel Width subfield in the VHT MIMO Control field of a VHT Compressed Beamforming frame to the same value as the RXVECTOR parameter CH_BANDWIDTH of the corresponding VHT NDP frame.

A VHT beamformee shall not include MU Exclusive Beamforming Report information in VHT Compressed Beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates SU. A VHT beamformee shall include both VHT Compressed Beamforming Report information and MU Exclusive Beamforming Report information in VHT Compressed Beamforming feedback if the Feedback Type subfield in the MIMO Control field of the VHT Compressed Beamforming frame(s) indicates MU.

A VHT beamformee that transmits VHT Compressed Beamforming feedback shall include neither the VHT Compressed Beamforming Report information and nor the MU Exclusive Beamforming Report information if the transmission duration of the PPDU carrying the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information would exceed the maximum PPDU duration.

The value of the Sounding Dialog Token Number subfield in the VHT MIMO Control field shall be set to the same value as the Sounding Dialog Token Number subfield in the Sounding Dialog Token field in the corresponding VHT NDP Announcement frame.

NOTE 1—The VHT beamformer can use the sounding dialog token in the VHT Compressed Beamforming frame(s) of the VHT Compressed Beamforming feedback to associate the feedback with a prior VHT NDP Announcement frame and thus compute the delay between sounding and receiving the feedback. The VHT beamformer can use this delay time when making a decision regarding the applicability of the feedback for the link.

NOTE 2—Recovery in the case of a missing response to a VHT NDP Announcement or Beamforming Report Poll frame follows the rules for multiple frame transmission in an EDCA TXOP (see 10.22.2.7).

VHT Compressed Beamforming feedback comprises the VHT Compressed Beamforming Report information (see Table 9-69) and the MU Exclusive Beamforming Report information (see Table 9-72). Subclause 9.6.23.2 specifies how VHT Compressed Beamforming feedback is converted into a VHT Compressed Beamforming frame, and it also specifies the rules for the presence or absence of the two fields listed here.

In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

10.34.5.3 Rules for fragmented feedback in VHT sounding protocol sequences

VHT Compressed Beamforming feedback shall be transmitted in a single VHT Compressed Beamforming frame unless the result would be a VHT Compressed Beamforming frame that exceeds the VHT beamformer's maximum MPDU length capability.

NOTE—The VHT beamformee might therefore have to transmit an MPDU that is bigger than the VHT beamformee is capable of receiving.

If VHT Compressed Beamforming feedback would result in a VHT Compressed Beamforming frame that exceeds the VHT beamformer's maximum MPDU length capability, the VHT Compressed Beamforming feedback shall be split into up to 8 feedback segments, with each feedback segment sent in a different VHT Compressed Beamforming frame and containing successive portions of the VHT Compressed Beamforming feedback consisting of the VHT Compressed Beamforming Report information followed by any MU Exclusive Beamforming Report information. Each of the feedback segments except the last shall contain the maximum number of octets allowed by the VHT beamformer's maximum MPDU length capability. The last feedback segment may be smaller. Each feedback segment is identified by the value of the Remaining Feedback Segments subfield and the First Feedback Segment subfield in the VHT MIMO Control field as defined in 9.4.1.48; the other nonreserved subfields of the VHT MIMO Control field shall be the same for all feedback segments. All feedback segments shall be sent in a single A-MPDU and shall be included in the A-MPDU in the descending order of the Remaining Feedback Segments subfield values.

NOTE—The feedback segments of a VHT Compressed Beamforming report are not MSDU/MMPDU fragments and can be included in an A-MPDU as described in this subclause.

A VHT beamformer, in its first attempt to retrieve VHT Compressed Beamforming feedback from a VHT beamformee that is not the one indicated by the first STA Info field, shall transmit a Beamforming Report Poll frame to poll all possible feedback segments of the VHT Compressed Beamforming feedback from the VHT beamformee, by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

If a VHT beamformer fails to receive some or all feedback segments of VHT Compressed Beamforming feedback, the VHT beamformer may, subject to the condition on VHT SU-only beamformees described at the end of this subclause, request a selective retransmission of missing feedback segments by transmitting a Beamforming Report Poll frame with the Feedback Segment Retransmission Bitmap field set as described in 9.3.1.21 to indicate the feedback segments requested for retransmission. If the VHT beamformer fails to receive the feedback segment with the First Feedback Segment field set to 1, the VHT beamformer may request a selective retransmission of missing feedback segments assuming the VHT Compressed Beamforming feedback is split into 8 feedback segments. The VHT beamformer may also request the retransmission of all feedback segments by setting all of the bits in the Feedback Segment Retransmission Bitmap field of the Beamforming Report Poll frame to 1.

A VHT beamformee that transmits VHT Compressed Beamforming feedback including the VHT Compressed Beamforming Report information and any MU Exclusive Beamforming Report information in response to a

Beamforming Report Poll frame shall either transmit only the feedback segments indicated in the Feedback Segment Retransmission Bitmap field in the Beamforming Report Poll frame excluding the indicated feedback segments that do not exist at the VHT beamformee or transmit all of the feedback segments that exist at the VHT beamformee disregarding the Feedback Segment Retransmission Bitmap field in the Beamforming Report Poll frame.

A VHT beamformer shall not transmit a Beamforming Report Poll frame to a VHT SU-only beamformee unless the VHT beamformer has received at least one feedback segment of the VHT Compressed Beamforming feedback from the VHT beamformee in the current frame exchange sequence.

In a frame transmitted by a TVHT STA, the TVHT Compressed Beamforming Report field replaces the VHT Compressed Beamforming Report field.

In a frame transmitted by a TVHT STA, the TVHT MU Exclusive Beamforming Report field replaces the MU Exclusive Beamforming Report field.

10.34.6 Transmission of a VHT NDP

A VHT NDP shall use the SU PPDU format as described in 21.1.4. A STA shall transmit a VHT NDP using the following TXVECTOR parameters:

- APEP_LENGTH set to 0
- NUM_USERS set to 1
- NUM_STS indicates two or more space-time streams
- CH_BANDWIDTH set to the same value as the TXVECTOR parameter CH_BANDWIDTH in the preceding VHT NDP Announcement frame
- GROUP_ID and PARTIAL_AID are set as described in 10.20

The number of space-time streams sounded and as indicated by the NUM_STS parameter shall not exceed the value indicated in the Beamformee STS Capability field in the VHT Capabilities element of any intended recipient of the VHT NDP. The NUM_STS parameter may be set to any value, subject to the constraint of the previous sentence, regardless of the value of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element at either the transmitter or recipient of the NDP.

The destination of a VHT NDP is equal to the RA of the immediately preceding VHT NDP Announcement frame.

The source of a VHT NDP is equal to the TA of the immediately preceding VHT NDP Announcement frame.

10.35 Mesh forwarding framework

10.35.1 General

The term *mesh forwarding* refers to forwarding of MSDUs and MMPDUs on paths determined by the mesh path selection between mesh STAs at the link layer. The mesh paths are contained in the forwarding information. The forwarding information, for instance, the lifetime of a mesh path, may be updated as a consequence of mesh forwarding.

The forwarding of MSDUs and MMPDUs within an MBSS is described in 10.35.3, 10.35.4, 10.35.5, and 10.35.8. The forwarding of MSDUs and MMPDUs between the MBSS and the DS at proxy mesh gates is described in 14.11.3.

10.35.2 Forwarding information

Forwarding information is created by the active mesh path selection protocol and is utilized for MSDU/MMPDU forwarding as described in 10.35.3 and 10.35.5.2.

The basic forwarding information to a destination mesh STA consists of the destination mesh STA address, the next-hop address, the precursor list, and the lifetime of this forwarding information.

An entry in the precursor list contains the precursor mesh STA address and the lifetime of this entry. If an existing entry in a precursor list is updated, the lifetime is the maximum of the current and the updated value. If the lifetime of a precursor expires, it will be deleted from the precursor list. Precursors are used to identify legitimate transmitters of individually addressed frames (see 10.35.3.2) and for the notification of link failures (in case of HWMP, see 14.10.11).

The forwarding information shall be considered as invalid if its lifetime has expired. Also, forwarding information is marked as invalid when certain conditions are met in the processing of mesh path selection elements, e.g., path error processing in HWMP (14.10.11.4).

The active path selection protocol may define additional parameters in the forwarding information. Details on the additional parameters of the forwarding information constructed by the hybrid wireless mesh protocol (HWMP) are described in 14.10.8.4.

10.35.3 Addressing and forwarding of individually addressed mesh Data frames

10.35.3.1 At source mesh STAs (individually addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with an individual destination address) and destined to another mesh STA in the MBSS shall be transmitted using a frame with the four-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-20)), where the four address fields are set as follows (see row “Mesh Data (individually addressed)” in Table 9-42):

- Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information—see 10.35.2)
- Address 2: The address of the transmitter mesh STA
- Address 3: The address of the destination mesh STA
- Address 4: The address of the source mesh STA

MSDUs that are sent by a mesh STA as a consequence of an MA-UNITDATA.request primitive with an individual destination address and are destined to an address that is different from the mesh STA at the end of a mesh path shall be transmitted using a frame with the four-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to “Address5&6” (see Table 9-20)], where the Mesh Address Extension subfield in the Mesh Control field carries the addresses of the end stations, as specified in row “Mesh Data (proxied, individually addressed)” of Table 9-42. The additional addresses 5 and 6 are defined as follows:

- Address 5: The address of the destination end mesh STA (may be the same as Address 3 if the destination is the mesh STA at the end of the mesh path)
- Address 6: The address of the source end mesh STA (may be the same as Address 4 if the source is the mesh STA at the beginning of the mesh path)

NOTE—The destination address is distinct from the mesh STA at the end of the mesh path in two cases: 1) when the destination is an external address and 2) when the destination is a mesh STA distinct from the destination mesh STA at the end of the mesh path. The former case is described in 14.11.3. The latter case might occur if a source mesh STA

sends the MSDU to another intermediate mesh STA that sends the MSDU on a different mesh path to the destination mesh STA in the MBSS.

The Mesh TTL subfield in the Mesh Control field shall be set to dot11MeshTTL. The MSDUs are forwarded multiple hops, limited by the Mesh TTL value.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

10.35.3.2 At intermediate and destination mesh STAs (individually addressed)

On receipt of an individually addressed mesh Data frame, a mesh STA shall perform the following:

- a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.
- b) The mesh STA shall check to see whether the MAC address in the Address 3 field is a known destination address; if it is an unknown destination address, the mesh STA may perform any of the following three actions:
 - 1) Silently discard the frame.
 - 2) Trigger a path discovery procedure depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.10.9.3 Case A.
 - 3) Inform the mesh STA in Address 2 that the destination is unreachable depending on the path selection protocol that is currently active in the mesh BSS. For HWMP, see 14.10.11.3 Case B.
- c) If Address 2 is not one of the precursors for this destination mesh STA (see 10.35.2), the frame shall be discarded.

If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.35.6 and discard them.

If Address 3 does not match the mesh STA's own address, but is a known individual destination MAC address in the forwarding information then the following actions are taken:

- The lifetime of the forwarding information to the destination (Address 3) is set to its initial value.
- The lifetime of the forwarding information to the source (Address 4) is set to its initial value.
- The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.
- The lifetime of the precursor list entry for the precursor to the source (next hop to the destination) is set to the maximum of the initial value and the current value.
- The Mesh TTL in the corresponding Mesh Control field of the collected MSDU is decremented by 1. If zero has been reached, the MSDU shall be discarded.
- If the MSDU has not been discarded, the mesh STA shall forward the MSDU via a frame with the Address 1 field set to the MAC address of the next-hop mesh STA as determined from the forwarding information (see 10.35.2) and the Address 2 field set to its own MAC address and queue the frame for transmission.

If Address 3 matches the mesh STA's own MAC address, the following actions are taken:

- The lifetime of the forwarding information to the source (Address 4) is set to its initial value.
- The lifetime of the precursor list entry for the precursor to the destination (Address 2) is set to the maximum of the initial value and the current value.

- If the Address Extension Mode subfield in the Mesh Control field is “None” (see Table 9-20), the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.
- If the Address Extension Mode subfield in the Mesh Control field is “Address5&6” (see Table 9-20) and Address 5 is equal to Address 3, the mesh STA is the final destination of the MSDU, and the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.
- If the Address Extension Mode subfield in the Mesh Control field is “Address5&6” (see Table 9-20) and Address 5 is a known destination MAC address in the forwarding information (mesh STA), the mesh STA shall forward the MSDU via a frame as described in 10.35.3.1 with the Address 3 field set to the MAC Address of the Address 5 field.
- If the Address Extension Mode subfield in the Mesh Control field is “Address5&6” (see Table 9-20), the MSDU is forwarded according to 14.11.3.2 in all other cases.

If Address 3 matches the group address, the mesh STA shall perform the procedures as given in 10.35.4.2.

Note that during the forwarding process at intermediate mesh STAs, the content of the MSDU is not changed.

10.35.4 Addressing and forwarding of group addressed mesh Data frames

10.35.4.1 At source mesh STAs (group addressed)

MSDUs sent by a mesh STA (as a consequence of an MA-UNITDATA.request primitive with a group destination address) shall be transmitted using a group addressed mesh Data frame (with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-20)) (see row “Mesh Data (group addressed)” in Table 9-42). An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed mesh Data frames to each peer mesh STA as described in 10.35.3.1 with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

In group addressed mesh Data frames, the address fields are set as follows:

- Address 1: The group address
- Address 2: The address of the transmitter mesh STA
- Address 3: The address of the source mesh STA

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL in order to control the hop count. The MSDUs are forwarded multiple hops, limited by the Mesh TTL value. For example, if the Mesh TTL subfield is 1, MSDUs are delivered only to immediate neighbors.

The source mesh STA shall set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

10.35.4.2 At recipient mesh STAs (group addressed)

On receipt of a group addressed mesh Data frame with Address 1 (DA) equal to the group address, or on receipt of an individually addressed mesh Data frame with Address 3 (Mesh DA) equal to the group address, a mesh STA shall perform the following:

- a) The mesh STA shall decipher the frame and check it for authenticity. If it is not from a peer mesh STA, the frame shall be silently discarded.
- b) If the frame is not discarded and one or more MSDUs are collected from the frame, the mesh STA may detect duplicate MSDUs according to 10.35.6 and discard them.
- c) The mesh STA decrements the Mesh TTL in the Mesh Control field. If the Mesh TTL value has reached zero, the corresponding MSDU shall not be forwarded to other mesh STAs.
- d) If the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the mesh STA shall forward the MSDU via a group address mesh Data frame with the Address 2 field set to its own MAC address.
- e) If the Address Extension Mode is “Address4” (see Table 9-20) and the recipient mesh STA is a proxy mesh gate and if the Mesh TTL value has not reached zero and if dot11MeshForwarding is true, the MSDU is forwarded according to 14.11.3.2.

When the SA and the Mesh SA are not identical (the source address is therefore an external address), the MSDU shall be forwarded by using a frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to “Address4” (see Table 9-20)] as specified in row “Mesh Data (proxied, group addressed)” of Table 9-42. Otherwise, the MSDU shall be forwarded by using a frame with the three-address MAC header format [with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-20)] as specified in row “Mesh Data (group addressed)” of Table 9-42.

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed mesh Data frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as an individually addressed mesh Data frame to each peer mesh STAs as described in 10.35.3.2 with the Address 3 field set to the group address. If the Address Extension Mode subfield in the Mesh Control field in the group addressed mesh Data frame is equal to “Address4” (see Table 9-20), the Address Extension Mode subfield in the Mesh Control field in the individually addressed mesh Data frames is set to “Address5&6” (see Table 9-20), the Address 5 field is set to the group address, and the Address 6 field set to the Source Address contained in the Address 4 field of the group addressed mesh Data frame. The circumstances for choosing this method and the ability to determine all of the addresses of the neighbor peer mesh STAs are beyond the scope of the standard.

If one or more MSDUs collected from the frame have not been discarded, the MA-UNITDATA.indication primitive is passed from the MAC sublayer entity to the LLC sublayer entity or entities.

10.35.5 Addressing of Management frames and MMPDU forwarding

10.35.5.1 General

All MMPDUs except MMPDUs transmitted using Multihop Action frames are transmitted over only one hop to peer mesh STAs.

NOTE—In several cases, the reception and processing of an Action frame leads to the transmission of a new Action frame of the same type that might include an identical or a modified version of the contents from the elements of the received Action frame. This is called *propagation* in contrast to *forwarding*.

A mesh STA may convert a group addressed Management frame to individually addressed Management frames and transmit them as individually addressed frames to each peer mesh STA, if the frame is intended

to be delivered only to its peer mesh STAs. The circumstances for choosing this method are outside the scope of the standard.

10.35.5.2 MMPDU forwarding using individually addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to another mesh STA in the MBSS using individually addressed Multihop Action frames (see 9.6.18) shall be transmitted using a Management frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to “Address4” (see Table 9-20)), where the four address fields are set as follows (see row “Multihop Action (individually addressed)” in Table 9-42):

- Address 1: The address of the next-hop mesh STA (toward the destination mesh STA according to the forwarding information—see 10.35.2).
- Address 2: The address of the transmitter mesh STA.
- Address 3: The address of the destination mesh STA.
- Address 4: The address of the source mesh STA.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

At intermediate and destination mesh STAs, on receipt of an individually addressed Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.35.3.2, and the MMPDU is forwarded according to the forwarding information and the procedures in 10.35.3.2.

At intermediate mesh STAs, frame fields following the Mesh Control field are not required to be examined.

If the Address 3 in the received Multihop Action frame matches the mesh STA’s own MAC address or the group address, the mesh STA (destination mesh STA) shall process the content of the MMPDU.

10.35.5.3 MMPDU forwarding using group addressed Multihop Action frames

MMPDUs sent by a mesh STA and destined to all other mesh STAs in the MBSS using group addressed Multihop Action frames (see 9.6.18) shall be transmitted using a Management frame with the three-address MAC header format (with the Address Extension Mode subfield in the Mesh Control field set to “None” (see Table 9-20)), where the three address fields are set as follows (see row “Multihop Action (group addressed)” in Table 9-42):

- Address 1: The group address
- Address 2: The address of the transmitter mesh STA
- Address 3: The address of the source mesh STA

An implementation may circumvent the unreliability of group addressed transmissions by using multiple individually addressed Multihop Action frames, which are individually acknowledged. In such case, the frame may be converted to individually addressed frames and transmitted as individually addressed Multihop Action frames to each peer mesh STA as described in 10.35.5.2 with the Address 3 field set to the group address. The circumstances for choosing this method are outside the scope of the standard.

The source mesh STA shall set the Mesh TTL subfield in the Mesh Control field to dot11MeshTTL, and set the Mesh Sequence Number subfield in the Mesh Control field to a value from a modulo 2^{32} counter that is incremented by 1 for each new MSDU transmitted with a Mesh Control field and for each new MMPDU transmitted using a Multihop Action frame.

At recipient mesh STAs, on receipt of Multihop Action frame, the address matching, the reception procedures, the forwarding information update, and the Mesh TTL decrement are performed as described in 10.35.4.2, and the MMPDU is forwarded according to the forwarding information and the procedures in 10.35.4.2.

If the Address 1 in the received Multihop Action frame matches the group address, the mesh STA shall process the content of the MMPDU.

Procedures that enhance the reliability or efficiency of group addressed transmissions are outside the scope of this standard.

10.35.6 Detection of duplicate MSDUs/MMPDUs

A mesh STA may receive multiple copies of the same MSDU or MMPDU from different neighbor peer mesh STAs.

The filtering of such duplicates is facilitated through the inclusion of a Mesh Sequence Number subfield in the Mesh Control field in mesh Data frames and Multihop Action frames as specified in 9.2.4.7.3.

The receiving mesh STA shall keep a cache of recently received <Mesh SA, Mesh Sequence Number> tuples. The Mesh Source Address (Mesh SA) is contained in Address 4 for individually addressed mesh Data frames and Multihop Action frames. The Mesh Source Address (Mesh SA) is contained in Address 3 for group addressed mesh Data frames.

A mesh STA shall reject an MSDU/MMPDU with a Mesh Control field as a duplicate if it matches a <Mesh SA, Mesh Sequence Number> tuple of an entry in the cache.

The rules in 10.3.2.11 also apply to the filtering of duplicates sent by the same neighbor peer mesh STA.

10.35.7 Mesh STAs that do not forward

A mesh STA that has dot11MeshForwarding equal to false does not forward either MSDUs, or Multihop Action frames. The circumstances in which a mesh STA may be allowed to become a non-forwarding entity and the authority to set dot11MeshForwarding to false are beyond the scope of this standard.

A mesh STA that does not forward is a special case of a mesh STA. Such mechanism depends on whether the path selection protocol provides a mechanism to allow mesh STAs not to participate in forwarding. The HWMP path selection protocol provides such a mechanism; see 14.10.

10.35.8 MSDU forwarding and unknown destination

A source mesh STA in the MBSS might not be able to forward an MSDU that it has received as a consequence of an MA-UNITDATA.request primitive with an individual destination address. This is the case if the destination of the MSDU is unknown to the mesh STA. The destination is unknown to a mesh STA if the mesh STA has no forwarding information for this destination or if the destination is not in its proxy information as an external STA (see 14.11.4.2). Note that the procedure to determine that an address is unknown depends on the active path selection protocol. It might require an attempt to establish a path to the destination (see 14.8).

If the source mesh STA is not able to forward the MSDU because its destination is unknown, the mesh STA shall assume that the destination is outside the MBSS and shall forward the MSDU to known mesh gates in the MBSS as one or more individually addressed frames according to the procedures for frame addressing and data forwarding of individually addressed frames at source mesh STAs in an MBSS (10.35.3.1). These frame(s) shall be transmitted using the four-address MAC header format (with the Address Extension Mode

subfield in the Mesh Control field set to “Address5&6” (see Table 9-20)), where the Mesh Address Extension subfield in the Mesh Control field carries the address of the destination end station, as specified in row “Mesh Data (proxied, individually addressed)” of Table 9-42. The address fields are set as follows:

- Address 1: The address of the next-hop mesh STA (toward the known mesh gate in the MBSS according to the forwarding information—see 10.35.2).
- Address 2: The address of the source mesh STA.
- Address 3: The address of the known mesh STA in the MBSS.
- Address 4: The address of the source mesh STA.
- Address 5: The address of the destination end mesh STA, which is the unknown destination address of the MSDU
- Address 6: The address of the source mesh STA, which is the same as Address 4

If there is no mesh gate available, the mesh STA shall silently discard the MSDU.

Discovery of mesh gates by mesh STAs is performed using propagated elements, such as a GANN (14.11.2). Other methods specific to the HWMP path selection protocol are also available, such as the proactive PREQ mechanism (14.10.4.2) or the proactive RANN mechanism (14.10.4.3), when the Gate Announcement subfield in the Flags field in these HWMP elements is set to 1.

10.36 DMG channel access

10.36.1 General

Channel access by a DMG STA is related to beacon interval timing and is coordinated using a schedule. A DMG STA operating as an AP or PCP generates the schedule and communicates it to STAs using DMG Beacon and Announce frames. A non-PCP STA that is a non-AP STA and that receives scheduling information accesses the medium during the scheduled periods using the access rules specific to that period. Medium access rules to establish a BSS are defined in 10.37 and 11.1.4.

10.36.2 Access periods within a beacon interval

Medium time within a DMG BSS is divided into beacon intervals. Subdivisions within the beacon interval are called *access periods*. Different access periods within a beacon interval have different access rules. The access periods are described in a schedule that is communicated by the AP or PCP to the non-PCP and non-AP STAs within the BSS. The schedule communicated by the AP or PCP can include the following access periods:

- *BTI*: An access period during which one or more DMG Beacon frames is transmitted. Not all DMG Beacon frames are detectable by all non-PCP and non-AP STAs (see 10.38.4). Not all beacon intervals contain a BTI. A non-PCP STA that is a non-AP STA shall not transmit during the BTI of the BSS of which it is a member.
- *A-BFT*: An access period during which beamforming training is performed with the STA that transmitted a DMG Beacon frame during the preceding BTI (see 10.38.5. The presence of the A-BFT is optional and signaled in DMG Beacon frames.
- *ATI*: A request-response based management access period between the AP or PCP and non-AP and non-PCP STAs (see 10.36.3). The presence of the ATI is optional and signaled in DMG Beacon frames.
- *CBAP*: An access period during which frame exchanges between STAs that use the channel access rules described in 10.36.5.
- *SP*: An access period during which frame exchanges between STAs use the channel access rules described in 10.36.6.2.

The BHI comprises the BTI, A-BFT and ATI. The DTI, in turn, comprises contention based access periods (CBAPs) and scheduled service periods (SPs). There is a single BHI and a single DTI per beacon interval.

Figure 10-54 illustrates an example of access periods within a beacon interval comprising a BTI, an A-BFT, an ATI, and two CBAPs and SPs within the DTI. Any combination in the number and order of SPs and CBAPs can be present in the DTI.

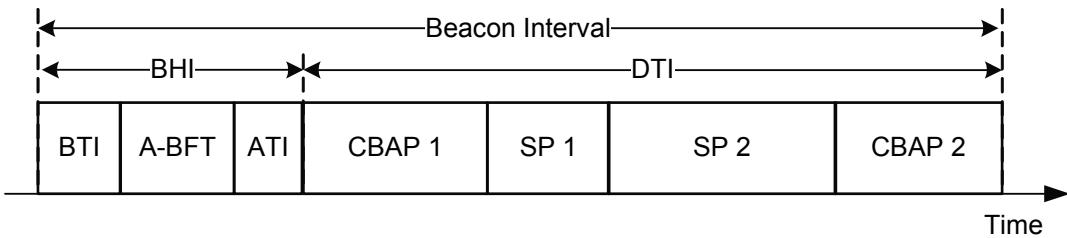

Figure 10-54—Example of access periods within a beacon interval

The details of the access protocol within each of the access periods are described in the remaining subclauses of 10.36 and within 10.38.

In the ATI, a non-AP and non-PCP STA shall be ready to receive a transmission from the AP or PCP at least RxAdvanceTime before the expected transmission of a request frame. The destination STA of an SP shall be ready to receive a transmission from the source STA of the SP at least RxAdvanceTime before the start of the SP. A STA that participates in a CBAP shall be ready to receive a transmission within the CBAP at least RxAdvanceTime before the start of the CBAP plus DIFS. In the A-BFT, the AP or PCP should be ready to receive a transmission from a non-AP and non-PCP STA at least RxAdvanceTime before the start of an SSW slot. In all of the preceding rules, RxAdvanceTime is defined as follows:

$$\text{RxAdvanceTime} = \text{Ceil}\left(\left(\frac{C \times T_{DI}}{10^6} + T_P\right), T_{TR}\right)$$

where

- C is aDMGTSFAccuracy, in ppm
- T_{DI} is the time elapsed since a synchronizing reference event, in μs . The synchronizing event is the reception of the Timestamp field from the AP or PCP
- T_P is aAirPropagationTime, in μs
- T_{TR} is aTSFResolution, in μs

10.36.3 ATI transmission rules

The presence of an ATI in the current beacon interval is signaled by the ATI Present field set to 1 in the current DMG Beacon frame(9.3.4.2). The Next DMG ATI element (9.4.2.135) transmitted in the Announce frame or in the DMG Beacon frame indicates the earliest start time for the next ATI in a subsequent beacon interval and ATI duration.

An example of an ATI is shown in Figure 10-55.

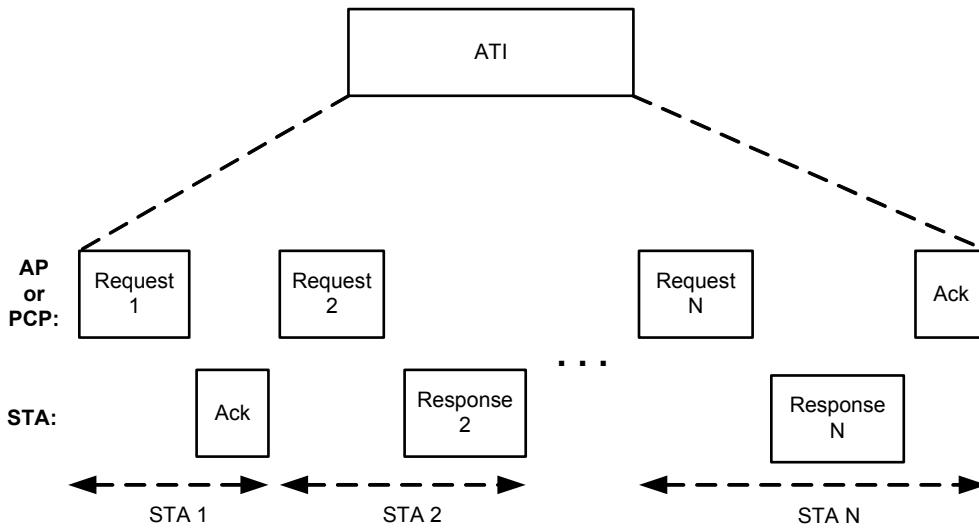

Figure 10-55—Example of frame exchanges during the ATI

During an ATI, request and response frames are exchanged between the AP or PCP and any subset of STAs. The AP or PCP initiates all frame exchanges that occur during the ATI. The ATI shall not start sooner than Max(guard time, MBIFS), where guard time is defined in 10.36.6.5, following the end of the previous A-BFT when an A-BFT is present in the beacon interval or following the end of the previous BTI when an A-BFT is not present but a BTI is present in the beacon interval. The ATI shall not start before TBTT if the ATI is the first period in the beacon interval (the ATI is never the first period in the beacon interval in an infrastructure BSS; see 11.1.2.1). Once the ATI starts, the AP or PCP may start transmission of a request frame immediately or it may delay the transmission of the request frame if the medium is determined by the CCA mechanism to be busy.

During each ATI the AP or PCP shall schedule transmissions to a non-AP and non-PCP STA if the non-AP and non-PCP STA Heartbeat field in the STA's DMG Capabilities element within the Association Request frame of the last successful association attempt is 1. If the non-AP and non-PCP STA does not respond to the frame transmitted by the AP or PCP, the AP or PCP shall use the DMG Control modulation class (10.7.7.1) at its next transmission attempt to the non-AP and non-PCP STA. The AP or PCP shall use the DMG Control modulation class for all subsequent transmissions to the non-AP and non-PCP STA until it receives a valid frame from the non-AP and non-PCP STA.

A non-AP and non-PCP STA shall not transmit during the ATI except in response to a received individually addressed frame whose TA field contains the AP's or PCP's MAC address and whose RA field contains the STA's MAC address.

During the ATI a STA shall not transmit frames that are not request or response frames. Request and response frames transmitted during the ATI shall be one of the following:

- A Management frame
- An Ack frame
- A Grant, Poll, RTS or DMG CTS frame when transmitted as a request frame
- An SPR or DMG CTS frame when transmitted as a response frame
- A frame with the Type subfield equal to Data only as part of an authentication exchange to reach a RSNA security association

NOTE—The Announce frame is designed to be used primarily during the ATI and can perform functions of a DMG Beacon frame.

The transmission of Poll frames during the ATI follows the rules described in 10.36.7. The Response Offset field within a Poll frame transmitted during the ATI shall be set to 0.

The transmission of Grant frame during the ATI follows the rules described in 10.36.7.3.

Individually addressed request frames transmitted during the ATI shall not be sent using Action No Ack frames.

During the ATI, after an AP or PCP transmits an individually addressed request frame (such as an Announce frame) to a non-AP and non-PCP STA, and the STA receives that frame, the STA shall transmit a response frame addressed to the AP or PCP. The transmission of the response frame shall commence one SIFS after the reception of the request frame. The AP or PCP shall interpret the receipt of the response frame as an acknowledgment of the request frame. Response frames transmitted by non-AP and non-PCP STAs during the ATI shall be individually addressed to the AP or PCP.

NOTE—STAs do not transmit a response frame to the AP or PCP when they receive a request frame from the AP or PCP with the RA equal to a group address (see 10.3.6).

The Duration field of a request frame transmitted during the ATI shall be set to cover the remaining duration of the ATI at the end of the request frame transmission. The Duration field of a response frame transmitted during the ATI shall be set to the value of the Duration field within the previously received request frame minus SIFS and minus the duration of the response frame transmission.

When a transmission by a STA is expected by an AP or PCP and a SIFS elapses without its receipt, the AP or PCP may either repeat its individually addressed transmission to that STA or, as early as one PIFS after the end of its previous transmission, transmit a frame to any other STA.

NOTE—if acknowledgment is required, the AP or PCP transmits an Ack frame to acknowledge the reception of a response frame during the ATI (see Figure 10-55).

Multiple request and response frame exchanges between the AP or PCP and a STA might occur during a single ATI.

10.36.4 DTI transmission rules

During the DTI, a STA may initiate a frame exchange (following the DMG channel access rules) if any of the following conditions are met:

- a) During a CBAP for which the STA is identified or included as source or destination (10.36.6.3, 10.36.7, and 10.36.8)
- b) During an SP for which the STA is identified as source or destination (10.36.6.2 and 10.36.7)

and shall not initiate a frame exchange if none of these conditions are met. A STA initiating data transfer shall check that the transaction, including acknowledgments, completes before the end of the CBAP or SP in which it was initiated.

When the entire DTI is allocated to CBAP (that is, the CBAP Only field is 1 in the DMG Parameters field), the ATI Present field within the DMG Beacon frame containing the DMG Parameters field shall be set to 0.

A DMG STA shall be capable of processing Grant frames. A non-AP and non-PCP DMG STA shall be capable of processing Poll frames and the Extended Schedule element. An AP or PCP shall be capable of processing SPR frames transmitted by a non-AP and non-PCP STA and responding to an SPR frame with a Grant frame.

The DMG low-power SC mode (20.7) may be used only within SPs that have the LP SC Used subfield within the Extended Schedule element equal to 1 and shall not be used otherwise. A STA supports the DMG low-power SC mode if the Low-Power SC Mode Supported subfield within its DMG Capabilities element is 1. A STA that supports the DMG low-power SC mode shall not initiate a frame exchange using the DMG low-power SC mode unless the STAs identified in the RA field of all MPDUs contained within the PPDU support the DMG low-power SC mode. A STA can use the procedure described in 11.30.1 to discover the capabilities of another STA.

A STA that receives a Grant frame and that has the Grant Ack Supported field equal to 1 in the STA's DMG Capabilities element shall respond with a Grant Ack frame SIFS interval after reception of the Grant frame. In the transmitted Grant Ack frame, the STA shall copy the Source AID, Destination AID, and Beamforming Training fields from the Grant frame that the Grant Ack frame is being sent in response to. A STA that receives a group addressed Grant frame shall not respond with Grant Ack frame. A STA that receives a Grant frame and that does not have the Grant Ack Supported field equal to 1 in the STA's DMG Capabilities element shall not respond with a Grant Ack frame.

10.36.5 Contention based access period (CBAP) transmission rules

The definition of contention based transmission rules used within a CBAP is provided in 10.3 and in 10.22. This subclause specifies additional rules applicable to the CBAP.

A STA shall not initiate a frame exchange within a CBAP unless at least one of the following conditions is met:

- The value of the CBAP Only field is equal to 1 and the value of the CBAP Source field is equal to 0 within the DMG Parameters field of the DMG Beacon frame that allocates the CBAP
- The STA is an AP or PCP and the value of the CBAP Only field is equal to 1 and the value of the CBAP Source field is equal to 1 within the DMG Parameters field of the DMG Beacon frame that allocates the CBAP
- The value of the Source AID field of the CBAP is equal to the broadcast AID
- The STA's AID is equal to the value of the Source AID field of the CBAP
- The STA's AID is equal to the value of the Destination AID field of the CBAP

If a STA's AID is equal to the value of the Source AID field of a CBAP allocation or if a STA performs in the role of AP or PCP and both the CBAP Only and CBAP Source fields are equal to 1 in the DMG Beacon frame that allocates a CBAP, the STA may initiate a frame transmission within the CBAP immediately after the medium is determined to be idle for one PIFS.

A BF initiator (10.38) should not initiate an SLS phase within a CBAP if there is not enough time within the CBAP to complete the SLS phase.

A STA shall not extend a transmission frame exchange sequence that started during a CBAP beyond the end of that CBAP. A STA that initiates a sequence shall check that the frame exchange sequence, including any control frame responses, completes before the end of the CBAP.

Operation of the EDCAF is suspended at the end of a CBAP and is resumed at the beginning of the following CBAP. When the EDCAF is being suspended, the values of the backoff and NAVs shall remain unchanged until the start of the following CBAP. A TXOP may be obtained by a DMG STA winning an instance of EDCA contention (see 10.22.2)).

At the beginning of a TXOP with a TXOP responder that has the Heartbeat field in the TXOP responder's DMG Capabilities element equal to 1, the following rules apply:

- The TXOP holder shall transmit a frame to the TXOP responder using the DMG Control modulation class before it uses any other modulation class for transmission if the time elapsed since the last frame received from the TXOP responder is larger than or equal to the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's DMG Capabilities element.
- The TXOP holder may transmit a frame using a modulation class other than the DMG Control modulation class at the start of the TXOP if the time elapsed since the last frame received from the TXOP responder is shorter than the Heartbeat Elapsed Time value computed using the Heartbeat Elapsed Indication field within the TXOP responder's DMG Capabilities element.

The frame sent by the STA at the beginning of the TXOP may be an RTS frame or a DMG CTS-to-self frame.

Within a CBAP a STA with multiple DMG antennas should use only one DMG antenna in its frame transmission, CCA and frame reception, except if it is the initiator or responder in an SLS (10.38). The algorithm to select a DMG antenna and switch the active DMG antenna is implementation dependent. Within CBAPs a STA that changed to a different DMG antenna in order to transmit should perform CCA on that DMG antenna until a frame is detected by which it can set its NAV, or until a period of time equal to the dot11DMGNavSync has transpired, whichever is earlier.

10.36.6 Channel access in scheduled DTI

10.36.6.1 General

An AP or PCP schedules each allocation with a specified start time from the TSF and with a fixed duration. An allocation can be an SP, where ownership of channel time is granted to a single STA, or a CBAP, where STAs can compete for channel access. The start time of each allocation is based on the TSF of the AP or PCP.

The AP or PCP may schedule SPs or CBAPs only during the DTI of a beacon interval, following the end of an allocated BTI, A-BFT, and ATI when any of these periods are present in the beacon interval.

The schedule of the DTI of a beacon interval shall be communicated through the Extended Schedule element. The AP or PCP transmits the Extended Schedule element in either or both an Announce frame or a DMG Beacon frame. The Extended Schedule element shall contain the scheduling information of all allocations in the DTI. The same Allocation field shall not appear more than once in the Extended Schedule element transmitted in a beacon interval. The content of the Extended Schedule element communicated in a beacon interval shall not change if transmitted more than once in the beacon interval, except that if the STA transmitting the Extended Schedule element is a PCP with multiple DMG antennas then the value of the PCP Active field of CBAP allocations within the Extended Schedule element might change when this element is transmitted through different DMG antennas. The AP or PCP should schedule SPs for a STA such that the scheduled SPs do not overlap in time with the traffic scheduling constraints indicated by this STA in the Traffic Scheduling Constraint Set field of the associated DMG TSPEC element.

When scheduling a nonpseudo-static allocation or changing the start time of an existing pseudo-static allocation that has a non-AP and non-PCP STA as a source DMG STA or as a destination DMG STA of the allocation, an AP or PCP shall set the start time of the allocation to no less than aMinAllocationDeliveryTime after the last Extended Schedule element containing this allocation is transmitted by the AP or PCP.

NOTE—This rule does not apply to the case when an AP or PCP schedules a new pseudo-static allocation.

When receiving an Extended Schedule element containing a new pseudo-static allocation in which it is expected to participate, a non-AP and non-PCP STA ignores the allocation if the value of the TSF at the time

the frame containing the Extended Schedule element is received is greater than the value of the TSF at the start of the pseudo-static allocation; this allocation is called an *obsolete allocation*. The value of the TSF at the start of the pseudo-static allocation is constructed using the value of the Allocation Start Time field within the Allocation field for the pseudo-static allocation.

An SP or CBAP allocation within an Extended Schedule element may comprise one or more individual allocations. The start time of each individual allocation of an SP or CBAP is given by

$$(A_{start} + (i - 1) \times A_{period})$$

where

- A_{start} is the value of the Allocation Start field for the SP or CBAP
- A_{period} is the value of the Allocation Block Period field for the SP or CBAP
- i is an integer greater than 0 and less than or equal to the value of the Number of Blocks field for the SP or CBAP

The end of the i^{th} individual SP or CBAP allocation is computed by adding the start time of the i^{th} individual allocation to the value of the Allocation Block Duration field for the corresponding SP or CBAP allocation.

If the PCP Active subfield in the Allocation field for an allocation within an Extended Schedule element is 1, the PCP shall be in the receive state for the duration of that allocation, except when transmitting during that allocation. The AP shall set the PCP Active field to 1 for every allocation within an Extended Schedule element transmitted by the AP.

10.36.6.2 Service period (SP) allocation

The AP or PCP shall set the AllocationType subfield to 0 in an Allocation field within an Extended Schedule element to indicate an SP allocation.

An SP is assigned to the source DMG STA identified in the Source AID subfield in an Allocation field that is not an obsolete allocation within the Extended Schedule element. The source DMG STA shall initiate the frame exchange sequence that takes place during the SP at the start of the SP, except when the source DMG STA intends to establish a DMG protected period in which case the rules described in 10.36.6.6 shall be followed before the source DMG STA initiates the frame exchange in the SP. The SP allocation identifies the TC or TS for which the allocation is made; however, the type of traffic transmitted is not restricted to the specified TC or TS (11.4.1).

Except when transmitting a frame as part of the SP recovery procedure (10.36.6.7) or transmitting a response to the source DMG STA or transmitting a PPDU as part of an RD response burst (10.28), the STA identified by the Destination AID field in the Extended Schedule element should be in the receive state for the duration of the SP in order to receive transmissions from the source DMG STA. If the Destination AID field of the scheduled SP is equal to the broadcast AID and if the Source AID field of the scheduled SP is not equal to the broadcast AID, then all STAs on the PBSS/infrastructure BSS should be in the receive state in order to receive transmissions from the source DMG STA for the duration of the SP. Subclause 10.36.7 describes the rules for when the scheduled SP has both the Source and Destination AID fields equal to the broadcast AID.

Only a STA identified as the source DMG STA or destination DMG STA of an SP may transmit during the SP, except when the rules in 10.36.7, 10.36.8, or 10.36.9 are used.

At the beginning of an SP (except when the source DMG STA intends to establish a DMG protected period, see 10.36.6 before the source DMG STA initiates the frame exchange in the SP, a source DMG STA shall

transmit a frame to the destination DMG STA using the DMG Control modulation class before it uses any other modulation class for transmission if the Heartbeat field in the destination DMG STA's DMG Capabilities element is 1. The frame sent by the source STA may be an RTS frame or a DMG CTS-to-self frame. The frame sent by the source STA may be an SSW frame or a BRP packet if the source STA is performing beamforming (10.7.7.5).

At the beginning of an SP, a destination DMG STA shall transmit a frame to the source DMG STA using the DMG Control modulation class before it uses any other modulation for transmission if the Heartbeat field in the source DMG STA's DMG Capabilities element is 1 and the frame sent by the destination DMG STA is the unsolicited DMG DTS as first frame in the SP of the STA performing DMG protected period (10.36.6.6).

Any MAC entity coordinated by an MM-SME that belongs to an MMSL cluster identified by the Source AID and Destination AID that are equal to, respectively, the Source AID and Destination AID of the Allocation field that is not an obsolete allocation in the Extended Schedule element that allocates the SP may transmit during the SP, if the STA sent an MMS element to the peer STA and the BeamLink Cluster field within the MMS element is 1.

The AP or PCP may create SPs in its beacon interval with the source and destination AID subfields within an Allocation field set to 255 to prevent transmissions during specific periods in the beacon interval.

The AP or PCP shall set the Beamforming Training subfield to 1 in the Allocation field for an SP within an Extended Schedule element to indicate that the source DMG STA of this SP initiates beamforming training with the destination DMG STA at the start of that SP. The source DMG STA and destination DMG STA of the SP shall perform beamforming training as described in 10.38.

If the PCP Active subfield is 0 in the Allocation field for an SP within an Extended Schedule element, neither the destination DMG STA of the SP nor the source DMG STA of the SP shall transmit to the PCP during the SP if none of the STAs are the PCP.

In no case shall the source or destination DMG STA extend a transmission frame exchange sequence that started during an SP beyond the end of that SP. A STA that initiates a sequence shall check that the frame exchange sequence, including any control frame responses, completes before the end of the SP.

When scheduling two adjacent SPs, the AP or PCP should allocate the SPs separated by at least aDMGPPMinListeningTime if one or more of the source or destination DMG STAs participate in both SPs.

Except for frames used for beamforming as described in 10.38, the source of an SP may retransmit a frame PIFS after the end of the frame transmission in case a response frame is expected from the destination DMG STA and a SIFS elapses without receipt of the expected transmission.

The source DMG STA can relinquish the remainder of an SP to the destination DMG STA by sending a Grant frame to the destination DMG STA (10.36.7.3).

10.36.6.3 Contention based access period (CBAP) allocation

The AP or PCP shall set the AllocationType subfield to 1, the Source AID subfield to the broadcast AID or to the AID of the source of the CBAP, and the Destination AID subfield to the broadcast AID or to the AID of the destination of the CBAP in an Allocation field within an Extended Schedule element to indicate a CBAP allocation.

All CBAPs are allocated by the AP or PCP, except when allocated by a non-AP and non-PCP STA with the transmission of a Grant frame following an SP truncation (10.36.8). Multiple CBAPs may be present in a beacon interval, with the location and duration of each determined by the AP or PCP and announced in the

Extended Schedule element. When only one CBAP is present and no other allocations exist for the DTI, then the AP or PCP shall announce the presence of the CBAP by setting the CBAP Only field to 1 in the DMG Parameters field of the DMG Beacon. If at least one non-CBAP allocation is present, or more than one CBAP is present, or no allocations are present within a DTI, then the AP or PCP shall set the CBAP Only field to 0 in the DMG Parameters field in the DMG Beacon frame transmitted during the BTI. The AP or PCP shall set the CBAP Only field to 0 in the DMG Parameters field within a transmitted DMG Beacon frame if the DMG Beacon frame contains at least one Extended Schedule element.

When the entire DTI is allocated to CBAP through the CBAP Only field in the DMG Parameters field, then that CBAP is pseudo-static and exists for dot11MaxLostBeacons beacon intervals following the most recently transmitted DMG Beacon frame that contained the indication, except if the CBAP is canceled by the transmission by the AP or PCP of a DMG Beacon frame with the CBAP Only field of the DMG Parameters field equal to 0 or an Announce frame with an Extended Schedule element. A guard time (10.36.6.5) precedes a CBAP that is allocated through the CBAP Only field equal to 1.

Channel access during a CBAP shall follow the rules described in 10.36.5.

10.36.6.4 Pseudo-static allocations

An SP or CBAP allocation is pseudo-static if the Pseudo-static field in the Allocation control field for the SP or CBAP is 1, or when the Extended Schedule element is not used and the CBAP Only field within the DMG Parameters field of the DMG Beacon frame is 1 (10.36.5). A pseudo-static SP or CBAP recurs at the same relative offset to TBTT and with the same duration in up to dot11MaxLostBeacons beacon intervals following the last received Extended Schedule element containing the pseudo-static allocation or DMG Beacon frame with the CBAP Only field equal to 1.

A STA might fail to receive up to (dot11MaxLostBeacons–1) Extended Schedule elements or DMG Beacon frame with the CBAP Only field equal to 1 in consecutive beacon intervals and still may access the channel during the pseudo-static SP or CBAP. The STA shall cease transmission during a pseudo-static allocation if it fails to receive an Extended Schedule element or DMG Beacon frame with the CBAP Only field equal to 1 for dot11MaxLostBeacons consecutive beacon intervals.

The AP or PCP may change the offset relative to TBTT or the duration of a pseudo-static allocation by transmitting a modified Allocation field in an Extended Schedule element before dot11MaxLostBeacons beacon intervals from the last transmitted Extended Schedule element. The AP or PCP may delete a pseudo-static allocation by transmitting an Extended Schedule element that does not include an allocation field containing that allocation's TID, source AID, and destination AID before the completion of dot11MaxLostBeacons beacon intervals from the last transmitted Extended Schedule element. In either case, the AP or PCP should not schedule a new allocation that overlaps with the previous pseudo-static allocation for a minimum of dot11MaxLostBeacons beacon intervals unless both the new and previous allocation are for a CBAP or the new allocation identifies the same source DMG STA as the original pseudo-static allocation.

If the destination DMG STA of a pseudo-static allocation receives an Extended Schedule element with an Allocation field that indicates a change in the schedule of the pseudo-static allocation, the STA should enter receive state during the new pseudo-static allocation and may enter receive state during the previous allocation to account for the time it can take the source DMG STA of the allocation to receive the updated schedule.

10.36.6.5 Guard time

Guard time is the time between the end of one allocation and the start of the following allocation, provided these allocations are not under spatial sharing (11.32). For the purpose of guard time insertion, an allocation is defined as an SP, a CBAP, and a BTI or A-BFT or ATI that is immediately followed by a CBAP allocated

through the CBAP Only field (10.36.6.3). Guard times are used to keep transmissions in adjacent allocations from colliding. Figure 10-56 shows an example of the insertion of the guard time such that the allocations are separated by at least the guard time, in case the STAs participating in the adjacent allocations drift toward each other's allocation.

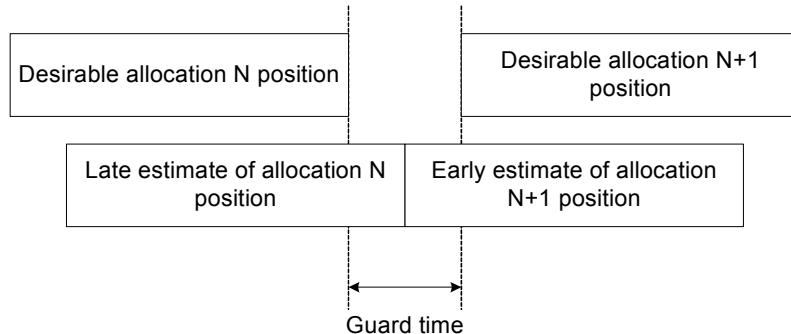

Figure 10-56—The guard time

The AP or PCP shall insert a sufficient guard time between adjacent allocations so that transmissions in adjacent allocations do not overlap in time. For each of the adjacent allocations, guard times are calculated based on the worst case drift and the maximum allowed number of lost DMG Beacons. The AP or PCP shall insert a guard time (T_{guard}) between adjacent allocations that is not shorter than

$$T_{guard} = \text{Ceil}\left(\frac{((A_i + 1) \times C \times D_i) + ((A_{i+1} + 1) \times C \times D_{i+1})}{10^6} + SIFS + T_P, T_{TR}\right)$$

where

- A_i is the value of MLB allocation i , and the value of A_i for each allocation depends on whether the allocation is pseudo-static. A_i is 0 for a nonpseudo-static allocation and is equal to dot11MaxLostBeacons if the allocation is pseudo-static
- C is aDMGTSFAccuracy, in ppm
- D_i is the time elapsed since a synchronizing reference event, in μs . The synchronizing event is the reception of the Timestamp field from the AP or PCP. For a pseudo-static allocation, D_i is equal to the beacon interval
- $SIFS$ is aSIFSTime, in μs
- T_P is aAirPropagationTime, in μs , which accounts for the propagation delay between the STAs participating in the adjacent allocations
- T_{TR} is aTSFResolution, in μs

10.36.6.6 DMG protected period

10.36.6.6.1 Introduction

Communicating STA pairs of neighboring PBSS/infrastructure BSS might be granted SPs that potentially create interference for neighbor PBSS/infrastructure BSS STA pairs. SPs within a PBSS/infrastructure BSS can also experience such interference when spatial diversity conditions change. The intent of DMG protected period is to minimize such interference by allowing any pair of STAs to protect their SP and thereby limit the transmission of frames during the DMG protected period to not more than one pair of potentially interfering pairs of communicating stations.

A DMG protected period can be created by the source DMG STA during an SP, and shall be created by the source DMG STA if at least one of the following conditions is met:

- The source DMG STA is the AP or PCP of the BSS, the ECAPC Policy Enforced subfield within the DMG Parameters field of the last DMG Beacon frame transmitted by the source DMG STA is equal to 1, and the Protected Period Enforced field within the ECAPC Policy Detail field of the last ECAPC Policy element transmitted by the source DMG STA is equal to 1.
- The source DMG STA is not the AP or PCP of the BSS, the ECAPC Policy Enforced subfield within the DMG Parameters field of the last DMG Beacon frame received by the source DMG STA from the AP or PCP of the BSS is equal to 1, and the Protected Period Enforced field within the ECAPC Policy Detail field of the last ECAPC Policy element received by the source DMG STA from the AP or PCP of the BSS is equal to 1.

Both the source DMG STA and destination DMG STA of an SP are owners of the DMG protected period. During any DMG protected period, both stations can receive frames from the other participant.

A DMG STA that creates a DMG protected period during an SP in which it is a source DMG STA or a destination DMG STA moves to and stays in listening mode during time interval that starts before the start of the SP and remains in the listening mode until it is allowed to use the SP. The actual duration of the time the STA stays in the listening mode is limited by the aDMGPPMinListeningTime parameter. The intent of the listening mode is that the STA listens to other STAs that may have an SP that overlaps with the SP where the STA is a source DMG STA or a destination DMG STA. The NAV mechanism is used to indicate the time occupancy and if the STA is in the listening mode, it updates its NAVs. If the NAVs are not equal to 0, the STA does not use the time of the SP in which it is a source DMG STA or a destination DMG STA. If none of the NAVs has a nonzero value at the start of the SP, the STA is allowed to leave the listening mode and use the SP. If at least one of the NAVs has a nonzero value at the start of the SP, the STA is allowed to leave the listening mode and to use the time remaining in the SP after all NAVs become or already have value zero.

Listening mode is a mode of operation during which a DMG STA is in receiving state and meets at least one of the following conditions:

- a) Its receiving antenna are in the quasi-omni mode.
- b) Its receiving antenna are directed to the peer STA for which this DMG STA is either the destination or source DMG STA.

A DMG protected period is established through an RTS/DMG CTS handshake. To create a DMG protected period, the source DMG STA of an SP sends an RTS, and the recipient STA responds with a DMG CTS. If the recipient STA responds with a DMG CTS, then a DMG protected period is established; otherwise, no DMG protected period has been established. In all cases of DMG protected period establishment, the same antenna configurations that are used by the STAs that establish the DMG protected period are used for the exchange of frames during the DMG protected period.

10.36.6.6.2 DMG protected period establishment and maintenance

A DMG STA that attempts to create a DMG protected period during an SP shall transition to listening mode not less than aDMGPPMinListeningTime before the attempt and shall remain in listening mode for at least aDMGPPMinListeningTime before making the attempt.

A STA shall not issue an RTS frame to establish a DMG protected period if any of its NAVs is not equal to 0.

A DMG STA that transmits an RTS frame to establish a DMG protected period during an SP in which it is a source DMG STA shall not transmit the RTS frame outside of the SP and the value of the Duration field of

the RTS frame shall not exceed the duration of the portion of the SP that remains following the RTS frame transmission.

In order to maintain STAs that are not aware of the establishment of the DMG protected period because they have begun listening to the medium after the establishment of a DMG protected period, a STA that established a DMG protected period should transmit additional RTSs. An additional RTS frame should be sent at the end of every $(a\text{DMGPPMinListeningTime} - a\text{RTSTimeoutTime})$ interval during the DMG protected period if the duration of the RTS/DMG CTS exchange is less than the time remaining in the SP.

A DMG STA that transmitted an RTS frame that established a DMG protected period shall use the same antenna configuration as was used for the transmission of the RTS frame during transmission of Data frame(s) during the DMG protected period.

A DMG STA should transition to listening mode not less than $a\text{DMGPPMinListeningTime}$ before the start of an SP in which it is the destination DMG STA.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP shall respond with a DMG CTS frame if the recipient DMG STA has been in listening mode for $a\text{DMGPPMinListeningTime}$ at the start of the reception of the RTS frame and none of its NAVs has a nonzero value.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP shall not respond with a DMG CTS frame if at the start of the reception of the RTS frame the recipient DMG STA has a nonzero value in at least one of its NAVs or the recipient DMG STA has not been in listening mode for at least $a\text{DMGPPMinListeningTime}$.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP may respond with a DMG DTS frame if at the start of the reception of the RTS frame the recipient DMG STA has a nonzero value in at least one of its NAVs.

A DMG STA may transmit a DMG DTS frame after the expiration of the $a\text{RTSTimeoutTime}$ time following the start of an SP in which it is the destination DMG STA, if any of its NAVs has a nonzero value at that time and no RTS has been received from the source DMG STA of the SP and the STA has been in listening mode for $a\text{DMGPPMinListeningTime}$ immediately preceding the start of transmission of the DMG DTS frame. The destination DMG STA shall not transmit a DMG DTS frame if any portion of the DMG DTS frame would be transmitted outside of the SP.

The value in the Duration field of a DMG DTS frame shall be calculated by subtracting the DMG DTS frame transmission time from the NAV in the destination DMG STA that has the largest value at the time of the start of the transmission of the DMG DTS frame. The NAV-DA and NAV-SA fields shall be set to the MAC addresses that identify the NAV in the destination DMG STA that was used to determine the Duration field value of the DMG DTS frame.

During an SP in which it is the destination DMG STA, a DMG STA that receives a valid RTS frame with the RA equal to the recipient DMG STA MAC address and the TA corresponding to the source DMG STA of the SP may respond with a DMG DTS frame if at the start of the reception of the RTS frame the recipient DMG STA has not been in listening mode for at least $a\text{DMGPPMinListeningTime}$. The value of the Duration field of the DMG DTS frame sent by the recipient DMG STA shall include the difference of $a\text{DMGPPMinListeningTime}$ and the elapsed time since the recipient DMG STA has been in listening mode, and the NAV-SA and the NAV-DA fields of the DMG DTS frame shall contain the recipient DMG STA MAC address.

A destination DMG STA that responds to an RTS frame with a DMG CTS or DMG DTS frame shall transmit the response frame a SIFS interval after the end of the received RTS frame. A destination DMG STA that transmits either a DMG CTS or a DMG DTS frame shall use the same antenna configuration for the subsequent transmission of Ack frames and Data frames within the SP as is used for the transmission of the DMG CTS or DMG DTS frame.

The source DMG STA of an SP can send a CF-End frame to the destination DMG STA of the SP to truncate a DMG protected period. Regardless of whether this CF-End frame is sent, a CF-End frame is also sent to the AP or PCP (see 10.36.8).

10.36.6.6.3 NAV update in DMG protected period

STAs in the listening mode shall update their NAVs according to the procedures described in 10.36.10.

NOTE—Support of multiple NAVs as defined in 10.36.10 is not limited to be used in the listening mode only and is also used in any case a NAV update is performed.

When an SP terminates, either through time allocation expiration or truncation, then the source DMG STA of that SP may reset any NAV to 0 that has an associated variable NAV_DTSCANCELABLE with a value of true.

10.36.6.6.4 Interference report

A STA that receives an RTS and/or DMG CTS frame that updates the NAV and that overlaps in time with an SP where the STA is destination or source, may report the overlap to the AP or PCP by sending a DMG ADDTS Request frame variant (9.6.3.3.2) and including in the DMG TSPEC element (9.4.2.134) the indication of interference in the Traffic Scheduling Constraint Set field (Figure 9-523). Transmission of the DMG ADDTS Request frame variant shall follow the rules defined in 11.4, with the following exceptions.

The Allocation ID subfield of the DMG TSPEC element shall identify the allocation during which the interference was detected. One ADDTS Request frame is generated and transmitted for each allocation during which interference is detected.

The Traffic Scheduling Constraint Set field of the DMG TSPEC element may contain one or more Constraint subfields. Each Constraint subfield provides information separately for each overlapping NAV event. The following NAV events should be reported:

- a) Nonzero NAV at start of SP
- b) Extension of NAV during the SP, including extension of an initial nonzero NAV and transitioning of the NAV from zero to nonzero value during the SP
- c) Truncation of the NAV during the SP

The TSCONST Start Time field is set to the TSF value at which the NAV event is detected. For event a) above, the TSCONST Start Time field shall be set to the start of the SP. For event b) above, the TSCONST Start Time field shall be set to the time the NAV was updated or initialized to the value reported in the TSCONST Duration field. For event c) above, the TSCONST Start Time field shall be set to the time the NAV was reset.

The TSCONST Duration field shall be set to the NAV value at the TSCONST Start Time, which is the value zero for event c).

The TSCONST Period shall be set to 0 indicating that the field is not applicable.

The Interferer MAC Address shall be set to the NAVDST of the NAV from which the TSCONST Start Time was derived (10.36.10).

All values conveyed in the Traffic Scheduling Constraint Set field shall refer to the allocation identified by the value of the Allocation ID subfield of the TSPEC.

The value of other fields within the DMG TSPEC element shall comply with the rules specified in 11.4.

Use of the information conveyed in the Traffic Scheduling Constraint Set field is outside the scope of this standard.

10.36.6.7 Service period recovery

When a non-AP and non-PCP STA fails to receive the Extended Schedule element for a beacon interval, the non-AP and non-PCP STA has no knowledge of the nonpseudo-static SPs allocated during the beacon interval that indicate it is the source DMG STA; therefore, it fails to transmit during those SPs. If the destination of the nonpseudo-static SP is an AP or PCP and it does not receive any frames from the source non-AP and non-PCP STA for the dot11SPIdleTimeout interval from the start of the SP, the AP or PCP may truncate the SP and use the mechanism described in 10.36.7 to reallocate the remaining duration of the SP to the source DMG STA of the SP or other STAs provided that it was a truncatable SP. If the SP is not a truncatable SP, the PCP may stay in awake state or may switch to doze state. If the non-AP and non-PCP STA failed to receive the Extended Schedule element from the AP or PCP for that beacon interval, it may switch to doze state or may direct its receive antenna toward the AP or PCP to receive a grant during nonpseudo-static SPs or CBAPs in the current beacon interval.

An AP or PCP may reclaim the entire time allocated in an SP between two non-AP and non-PCP STAs if the following two conditions are met:

- The SP is announced within an Extended Schedule element transmitted during the ATI.
- The AP or PCP does not receive a response frame from at least one of the source and destination non-AP and non-PCP STAs of that SP as part of the ATI exchange (10.36.3).

In either case described in this subclause, the AP or PCP may reallocate the reclaimed SP time as a CBAP, SP, or take no further action. Otherwise, if none of these conditions apply, no time may be reclaimed.

10.36.7 Dynamic allocation of service period

10.36.7.1 General

Dynamic allocation of service period is employed to allocate channel time during scheduled SPs and CBAPs. The procedure includes an optional Polling Period (PP) phase and a Grant Period (GP) phase. Service periods allocated using this mechanism do not persist beyond a beacon interval. Persistent allocations are created using the allocation mechanisms described in 11.4.

The PP Available field in the STA Availability element (9.4.2.133) indicates whether a STA participates in the PP phase of the dynamic allocation of service period mechanism. A STA that participates in PP phase of the dynamic allocation of service periods responds to Poll frames during the PP. A STA that participates in dynamic allocation of service periods uses the time allocated through Grant frames during the GP to transmit frames. A STA may set the PP Available field in a transmitted STA Availability element to 0 to indicate that the STA does not respond to Poll frames during the PP and the GP.

NOTE—A STA can receive a Grant frame in periods of the beacon interval other than the GP, in which case the STA uses the time allocated through the Grant frame.

The AP or PCP shall not transmit Poll frames to a STA whose PP Available field in the STA Availability element is 0. The AP or PCP shall not dynamically allocate a service period to a STA that is in a doze BI (11.2.7). An AP or PCP may transmit Poll frames to a STA from which the AP or PCP has not received a STA Availability element with the PP Available field from the STA equal to 0.

An AP or PCP may dynamically allocate Service Periods during a scheduled SP for which both the source and destination AID fields are set to the broadcast AID by setting the Truncatable subfield to 1 within the Allocation field corresponding to the scheduled SP.

If a non-AP and non-PCP STA is neither source nor an individually addressed destination during a truncatable SP and the non-AP and non-PCP STA participates in dynamic allocation of service periods and the non-AP and non-PCP STA is in an awake BI, then the non-AP and non-PCP STA should be in the awake state for the duration of the truncatable SP.

A non-AP and non-PCP STA that participates in dynamic allocation of service periods shall be in the awake state for dot11MinPPDuration from the start of each truncatable SP for which both the source and the destination AID fields are set to the broadcast AID and that occurs within each awake BI of that STA. Following the expiration of dot11MinPPDuration, the non-AP and non-PCP STA should remain in the awake state until the end of the truncatable SP.

A STA shall be in the awake state for dot11MinPPDuration from the start of each scheduled CBAP that occurs within each awake BI of that STA. A STA that enters the doze state at any time during a CBAP and then returns to the awake state later during that same CBAP shall perform CCA until a frame is detected by which it can set its NAV, or until a period of time equal to the ProbeDelay has expired before it initiates a transmission.

As described in 10.36.8, a STA that participates in dynamic allocation of service periods and that is neither source nor destination during a truncatable SP can be in the receive state with its receive antennas configured in a quasi-omni antenna pattern for the duration of the truncatable SP.

A STA that receives a Grant frame with an SP allocation for which it is either source or destination shall not transmit longer than the time granted to it.

Any STA coordinated by an MM-SME that belongs to an MMSL cluster identified by the Source AID and Destination AID that are equal to, respectively, the Source AID and Destination AID of the Dynamic Allocation Info field in the Grant frame may transmit during the allocation, if the STA sent an MMS element to the peer STA and the BeamLink Cluster field within the MMS element is 1.

An example of dynamic allocation of service period is shown in Figure 10-57.

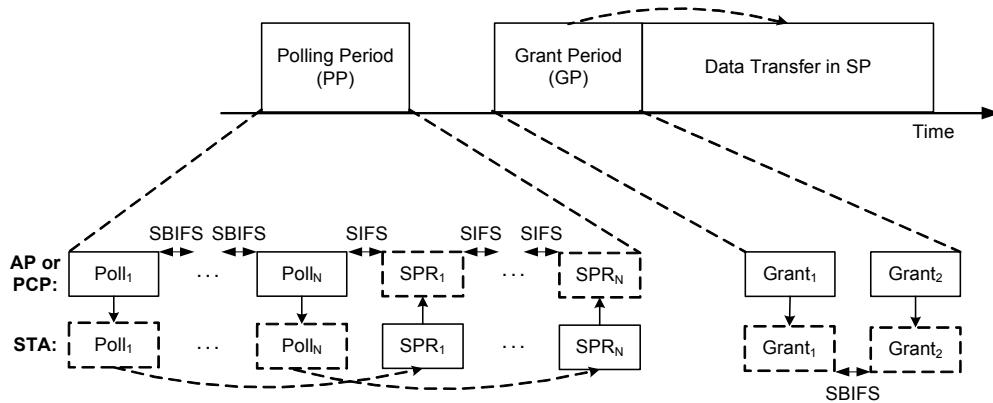

Figure 10-57—Example of dynamic allocation of service period mechanism

10.36.7.2 Polling period (PP)

An AP or PCP that uses a PP to dynamically allocate an SP within the DTI shall commence the PP at a time instant indicated by at least one of the following:

- Any time during a scheduled SP for which the source AID and destination AID are equal to the broadcast AID, excluding any time that has been allocated dynamically
- Any time during a TXOP within a scheduled CBAP for which the destination AID is equal to the broadcast AID, excluding any time that has been allocated dynamically
- Any time during the relinquished channel time following an SP truncation, excluding any time that has been allocated dynamically

The AP or PCP shall not transmit a frame during a PP if any portion of that frame would extend beyond the end of the originally scheduled SP or CBAP.

During the PP, the AP or PCP may transmit individually addressed Poll frames to STAs to solicit SPR frames from those STAs. The Duration field within each Poll frame i out of a total of n ($0 < i \leq n$) transmitted Poll frames in the PP shall be calculated as defined by Equation (10-15).

$$D_i = D_{i,n} + O_m + \text{Ceil}(\text{TXTIME}(\text{SPR}_m), T_{TR}) \quad (10-15)$$

where

$D_{i,n}$ is the duration of the remaining poll transmissions, in μs , given by

$$D_{i,n} = \text{Ceil}\left(\sum_{k=i+1}^n \text{TXTIME}(\text{Poll}_k) + \text{SBIFS} + A_k + S, T_{TR}\right)$$

O_m is the offset of SPR transmission m , in μs

SPR_m is SPR transmission m

T_{TR} is aTSFResolution, in μs

The AP or PCP expects an SPR frame in response to each transmitted Poll frame (i.e., $m=n$). The position of each SPR frame in the sequence of SPR frames is indicated as j . Thus, $j=1$ refers to the first SPR frame transmission in the sequence of SPR frames, and $j=m$ refers to the last SPR frame transmission in the sequence of SPR frames. Based on this, the Response Offset field within each Poll frame i transmitted in the PP shall be calculated as follows:

$$\text{Response Offset}_i = D_{i,n} + O_j$$

where

$D_{i,n}$ is the duration of the remaining poll transmissions, defined in Equation (10-15).

Poll_k is Poll transmission k

SBIFS is aSBIFSTime, in μs

A_k is the antenna switching time, in μs , which is 0 if the AP or PCP uses the same antenna to transmit frame k and frame $k+1$ and is equal to dot11AntennaSwitchingTime otherwise

S is aSBIFSAccuracy, in μs

T_{TR} is aTSFResolution, in μs

O_j is the offset of SPR transmission j , given by

$$O_j = \begin{cases} SIFS, & j = 1 \\ O_{j-1} + \text{Ceil}(\text{TXTIME}(\text{SPR}_j) + SIFS, T_{TR}), & 2 < j \leq m \end{cases}$$

$SIFS$ is aSIFSTime, in μs , the time interval between the end of the last Poll frame transmitted by the AP or PCP and the expected start time of the first SPR frame by the non-AP and non-PCP STA

SPR_j is a SPR transmission j

NOTE—The calculation of O_j guarantees that no less than SIFS or SIFS+dot11AntennaSwitchingTime is provided for the AP or PCP to switch antennas when receiving an SPR from different STAs.

A STA that receives an individually addressed Poll frame shall respond to the AP or PCP with a single directional and individually addressed SPR frame at the time offset from the end of the Poll frame indicated in the Response Offset field within the received Poll frame. The Duration field within the SPR frame shall be set to the value of the Duration field contained in the received Poll frame, minus the value of the Response Offset field contained in the received Poll frame, minus the time taken to transmit the SPR frame.

The PP ends at a time equal to the end of the last Poll frame transmission plus the value of the Response Offset field in that Poll frame plus the expected duration of the SPR transmission that is expected in response to that Poll frame plus SIFS.

10.36.7.3 Grant period (GP)

An AP or PCP that intends to dynamically allocate an SP within the DTI shall commence a GP at a time instant indicated by at least one of the following:

- SIFS interval following the end of a PP if the PP is present
- Any time during a scheduled SP for which the source AID and destination AID are equal to the broadcast AID if a PP does not precede the GP, excluding any time that has been allocated dynamically
- Any time during a TXOP within a scheduled CBAP for which the destination AID is equal to the broadcast AID, excluding any time that has been allocated dynamically
- Any time during the relinquished channel time following an SP truncation if a PP does not precede the GP, excluding any time that has been allocated dynamically

The AP or PCP shall not transmit a frame during a GP if any portion of that frame would extend beyond the end of the originally scheduled SP or CBAP, or beyond the end of an immediately following SP if that SP has the broadcast AID as both source and destination AID, whichever is later.

A non-AP and non-PCP STA may switch to doze state if it does not receive a Grant frame from the AP or PCP within dot11MinPPDuration from the start of the scheduled SP for which the source AID and destination AID are set to the broadcast AID.

To commence the GP, the AP or PCP shall transmit Grant frames to notify the source DMG STA and destination DMG STA about a dynamically allocated service period. The AP or PCP should transmit the last Grant frame within a GP to the source of the dynamically allocated SP if the source of the dynamically allocated SP is not the AP or PCP. In each transmitted Grant frame, the AP or PCP shall set the Duration field within the Grant frame to a time that covers the duration of all remaining Grant frame and Grant Ack frame transmissions, if any, plus all appropriate IFSs (10.3.2.3). In addition, the source AID and destination AID fields shall be set to the source and destination, respectively, of the dynamically allocated SP, the AllocationType field set to indicate the channel access mechanism during the allocation, and the Allocation Duration field set to a value that if added to the value of the Duration field does not overlap in time with another SP that has either the source AID or destination AID different from the broadcast AID. An

allocation that is indicated in this manner begins at the time that is equal to the PHY-TXEND.indication primitive of the Grant frame plus the value from the Duration field of the Grant frame.

The Dynamic Allocation Info field within Grant frames transmitted as part of the same GP shall be the same.

NOTE—This means the AP or PCP can create only one allocation per GP.

During an SP between a source DMG STA and a destination DMG STA, the source DMG STA may transmit a Grant frame to the destination DMG STA to relinquish the remainder of the SP to the destination DMG STA. In the Allocation Info field of the transmitted Grant frame, the source DMG STA shall set source AID field to the AID of the destination DMG STA, the destination AID field to the AID of the source DMG STA, the AllocationType field set to indicate SP, and the Allocation Duration field set to a value of 32 768 as defined in 9.5.2. The Duration field in the Grant frame shall be set to the time remaining in the SP minus TXTIME (Grant frame) minus aSIFSTime. Upon transmission of the Grant frame with the Beamforming Training field equal to 0, for the remainder of the SP the roles of source DMG STA and destination DMG STA are swapped between the STAs.

During a TXOP between a TXOP holder and a TXOP responder, the TXOP holder may transmit a Grant frame to the TXOP responder to relinquish the remainder of the TXOP to the TXOP responder. In the transmitted Grant frame, the TXOP holder shall set source AID field to the AID of the TXOP responder, the destination AID field to the AID of the TXOP holder, the AllocationType field set to indicate CBAP, and the Allocation Duration field set to a value of 32 768 as defined in 9.5.2. The Duration field in the Grant frame shall be set to the time remaining in the TXOP minus TXTIME (Grant frame) minus aSIFSTime. Upon transmission of the Grant frame with the Beamforming Training field equal to 0, for the remainder the TXOP the roles of TXOP holder and TXOP responder are swapped between the STAs.

A STA that receives a Grant frame shall not update its NAV if the value of either the source AID or destination AID fields in the Grant frame are equal to the STA's AID.

The AP or PCP may grant a dynamic allocation of service period to a STA that does not transmit a SPR frame during the PP.

10.36.8 Dynamic truncation of service period

A STA truncates an SP to release the remaining time in the SP. The STA can use the CF-End frame to truncate the SP at the peer STA, to reset NAV in third party STAs and to return to the AP or PCP the time left in the SP, thus allowing the AP or PCP to grant any portion of the released time as part of an SP to any other STA or to allocate any portion of it as a CBAP. The STA can use the Grant frame to release any part of the time left in the SP as a CBAP.

A STA that is neither source nor destination during a truncatable SP may participate in dynamic allocation of service period by being in the receive state with its receive antenna configured in a quasi-omni antenna pattern for the duration of the truncatable SP. If both the source and destination AID fields of a truncatable SP are set to the broadcast AID, a non-AP and non-PCP STA may direct its receive antenna to its AP or PCP for the duration of the truncatable SP if the non-AP and non-PCP STA does not participate in a frame exchange and the truncatable SP is not dynamically allocated to the non-AP and non-PCP STA.

Only the source DMG STA of an SP may truncate the SP, except that the destination DMG STA may truncate the SP if it does not receive an expected transmission from the source DMG STA at the start of the SP as defined in 10.36.6.7.

In order to advertise the availability of truncatable SP time for reuse through AP or PCP dynamic allocation, a non-AP and non-PCP STA shall transmit an CF-End frame to the AP or PCP. A STA is not required to truncate an SP if a portion of the SP is unused.

In order to enable CBAP access during the time released through SP truncation, the STA shall broadcast a Grant frame with the Source AID and Destination AID set to broadcast AID, the AllocationType field set to indicate CBAP and the Duration field set to the time needed to transmit the Grant frame(s) (the Duration field in a Grant frame does not include duration of that frame) plus SIFS and plus the time needed to transmit the following CF-End frame and the response CF-End frame, if required and appropriate IFS (10.3.2.3) values. The Allocation Duration field shall be set to a value that is not greater than the result of the subtraction of the value in the Duration field from the time remaining in the SP. The CBAP that is indicated in this manner begins at the time that is equal to the PHY-TXEND.indication primitive of the Grant frame plus the value from the Duration field of the Grant frame and continues for the time indicated in the Allocation Duration field of the Grant frame.

The STA shall not transmit the Grant frame and shall not transmit the CF-End frame to the AP or PCP if the SP is not indicated as truncatable.

After transmission of the CF-End frame to the AP or PCP or after broadcasting a Grant frame, the STA shall transmit a CF-End frame to the peer STA of the SP. The CF-End frame releases any time remaining in the SP at the recipient and resets the NAV in third party STAs. The NAV is reset only if the RA and TA of the CF-End frame match the addresses of the frame that established the NAV (see 10.36.10). The recipient STA may transmit a CF-End frame SIFS after the reception if the Duration field of the received frame is not equal to 0 and the transmission does not extend beyond the end of the originally scheduled SP.

A STA shall not initiate SP truncation if there is not enough time left in the SP to complete the frame exchange required for truncation of the SP.

After the truncation is completed, the AP or PCP may dynamically allocate any portion of the relinquished channel time that has not been allocated to a CBAP through a transmitted Grant frame (10.36.7).

10.36.9 Dynamic extension of service period

A non-AP and non-PCP STA uses dynamic extension of SP to extend the allocated time in the current SP. The additional time can be used to support variable bit rate traffic, for retransmissions or for other purposes. The SPR frame is sent by a non-AP and non-PCP STA to the AP or PCP to request additional SP time in the current beacon interval.

Except in response to a Poll frame from the AP or PCP, a non-AP and non-PCP STA shall not transmit an SPR frame within an SP if the current SP is not extendable (see 9.4.2.132).

Only the source DMG STA and destination DMG STA of an SP can transmit an SPR frame during that SP.

If the AP or PCP is not the source of an extendable SP, it should be in the receive state and with its receive antennas configured in a quasi-omni antenna pattern for the duration of the extendable SP.

To request an extension of the current SP, a non-AP and non-PCP STA shall transmit an SPR frame to the AP or PCP. The non-AP and non-PCP STA shall not request extension of the current SP if there is not enough time left in the SP to complete the frame exchange required for the SP extension. In the transmitted SPR frame, the STA shall set the RA field to the address of the AP or PCP, the Duration field to the time left in the SP (not including the SPR transmission time), and the Allocation Duration field to the additional amount of time requested by the STA following the end of the current SP.

The AP or PCP may grant the request for an extension of an SP only if the following SP has the broadcast AID as both source and destination AID, and the duration of the following SP is larger than the value of the Allocation Duration field in the received SPR frame. To grant an extension request, the AP or PCP shall transmit a Grant frame with the RA field set to the value of the TA in the received SPR frame, the Duration field set to the value of the Duration field received in the SPR frame minus SIFS and minus the duration of

this Grant frame transmission, and the Allocation Duration field set to the amount of additional time granted by the AP or PCP. If a Grant Ack frame is transmitted following reception of the Grant frame, the frame shall be configured as specified in 10.36.4.

To decline a request for an extension of an SP, the AP or PCP shall transmit a Grant frame with the RA field set to the value of the TA in the received SPR frame, the Duration field set to the value of the Duration field received in the SPR frame minus SIFS and minus the duration of this Grant frame transmission, and the Allocation Duration field set to 0.

The extension request is successful if the non-AP and non-PCP STA receives from the AP or PCP a Grant frame with a nonzero value of the Allocation Duration field SIFS after the SPR. SIFS after the reception of a Grant frame from the AP or PCP with a nonzero value of the Allocation Duration field, the non-AP and non-PCP STA shall transmit a Grant frame to the partner STA of the SP with the Duration field set to the value of the Duration field of the Grant frame received from the AP or PCP minus the duration of this Grant frame transmission minus SIFS, and the Allocation Duration field set to the value of the Allocation Duration field of the Grant frame received from the AP or PCP.

An AP or PCP may extend an SP for which it is the source DMG STA by transmitting a Grant frame to the destination DMG STA of the SP. The Grant frame indicates extension of the SP. The Duration field in the transmitted Grant frame shall be set to the remaining time in the SP. The Allocation Duration field of the Grant frame shall be set to the additional channel time allocated by the AP or PCP following the end of the SP. If a Grant Ack frame is transmitted following reception of the Grant frame the frame shall be configured as specified in 10.36.4.

10.36.10 Updating multiple NAVs

If a DMG STA supports multiple NAVs, the number of available NAVs within the STA shall be not less than aMinNAVTimersNumber. Each NAV is identified by a pair of MAC addresses, NAVSRC and NAVDST, and has associated variables NAV_RTSCANCELABLE and NAV_DTSCANCELABLE. Each STA also maintains a variable UPDATE OPTIONAL. When a STA is enabled for operation, all NAVs shall have NULL values for their NAVSRC and NAVDST identifiers, the value of NAV_RTSCANCELABLE shall be false, the value of NAV_DTSCANCELABLE shall be false, and each NAV shall have the value 0. NAV address pairs correspond to the NAV-SA and NAV-DA fields in DMG DTS frames and correspond to the RA and TA fields of all other received frames that are used to update the NAV. Receipt of any frame can cause an update to the NAV whose identifying address pair corresponds to the specified address fields of the received frame according to the rules in this subclause.

STAs receiving any valid frame shall perform the following NAV update operation expressed using the following pseudocode:

NAV_TIMER_UPDATE(received_frame):

```

        UPDATE OPTIONAL ← false

        If (received_frame = DMG DTS) {
            UPDATE OPTIONAL ← true
        }

        If (received_frame(RA) ≠ This STA MAC address || UPDATE OPTIONAL = true) {
            If (received_frame = DMG DTS) {
                R_DST ← received_frame(NAV-DA)
                R_SRC ← received_frame(NAV-SA)
            } else if (received_frame = Ack) {

```

```

        R_DST ← received_frame(RA)
        R_SRC ← 0
    } else {
        R_DST ← received_frame(RA)
        R_SRC ← received_frame(TA)
    }

    R_DUR ← received_frame(DUR)

    N_TIMER ← -1

    // Searching for a matching NAV
    For (x ← 0; x < aMinNAVTimersNumber; x++) {
        If (received_frame = Ack || NAVSRC(x)=R_DST) {
            If(NAVdst(x) = R_DST) {
                N_TIMER ← x
                Break
            }
        } else if (NAVSRC(x) = R_SRC && (NAVdst(x) = R_DST
            || NAVdst(x) = 0) ||
            (NAVSRC(x)=0 && NAVdst(x) = R_DST) ||
            (NAVdst(x)=R_SRC && NAVSRC(x)=R_DST)) {
                N_TIMER ← x
                Break
            }
        }
    }

    // No NAV has been found that matches the addresses
    If (N_TIMER < 0) {
        For (x ← 0; x < aMinNAVTimersNumber; x++) {
            If (NAVSRC(x) = NULL && NAVdst(x) = NULL
                || NAV(x) = 0) {
                NAVSRC(x) ← R_SRC
                NAVdst(x) ← R_DST
                N_TIMER ← x
                Break
            }
        }
    }

    // Existing NAV found
    If (N_TIMER ≥ 0) {
        If (UPDATE_OPTIONAL = false
            && R_DUR > NAV(N_TIMER) ) {
            NAV(N_TIMER) ← R_DUR
            If (received_frame = RTS) {
                NAV_RTSCANCELABLE(N_TIMER) ← true
            } else {
                NAV_RTSCANCELABLE(N_TIMER) ← false
            }
        }
    }
}

```

```

        } else if (UPDATE_OPTIONAL = true && R_DUR > NAV(N_TIMER)) {
            If ((implementation decision to update = true) ||
                (received_frame(RA) = This STA MAC address &&
                This STA MAC address = source DMG STA MAC address for current SP))
            ) {
                NAV_RTSCANCELABLE(N_TIMER) ← true
                NAV(N_TIMER) ← R_DUR
            }
        }

    } else {
        No change to NAV
    }
}

```

END OF NAV_TIMER_UPDATE

A STA that has updated a NAV as a result of the reception of an RTS may reset its NAV(s) as follows. After the NAV update for a duration of NAVTimeout period (10.3.2.4), the STA shall monitor the channel to determine if a PHY-RXSTART.indication primitive is received from the PHY. If such an event has not occurred during this time period, then the STA may reset to 0 any NAV whose NAV_RTSCANCELABLE value is true.

After each NAV is updated, it counts down until it reaches 0 or is reset to 0.

If a STA receives a valid CF-End frame response with RA and TA values that match the NAVSRC and NAVDST values, in any order, for any NAV, then the STA shall set the associated NAV to the value of the Duration field in the received CF-End frame. If one of NAVSRC or NAVDST of a NAV is 0 and the corresponding NAVDST or NAVSRC, respectively, of the NAV match the RA or the TA value of the received valid CF-End frame, then the STA shall set the associated NAV to the value of the Duration field in the received CF-End frame.

If one of NAVSRC or NAVDST of a NAV is 0 and the nonzero NAVDST or NAVSRC of the NAV match either the RA or the TA value of a received valid frame, the NAVSRC or NAVDST that is 0 shall be set to the RA or TA that does not match the nonzero NAVSRC or NAVDST.

10.37 DMG AP or PCP clustering

10.37.1 General

An AP or PCP may use the AP or PCP clustering mechanism to improve spatial sharing and interference mitigation with other co-channel DMG BSSs. There are two types of clustering:

- Decentralized AP or PCP clustering that involves a single S-AP or S-PCP in the BSA of the S-AP or S-PCP
- Centralized AP or PCP clustering where there can be multiple S-APs in the BSA of any one S-AP, and all S-APs are coordinated via a single centralized coordination service set

AP or PCP clustering allows an AP or PCP that is a member of a cluster to schedule transmissions in nonoverlapping time periods with respect to other members of the same cluster since the AP or PCP can receive DMG Beacon and Announce frames containing the Extended Schedule element of other APs and

PCPs that are members of the cluster and can also receive the Extended Schedule element from another BSS through associated non-AP and non-PCP STAs (10.37.4).

A STA is decentralized AP or PCP clustering capable if it sets the Decentralized AP or PCP Clustering field to 1 within the DMG AP Or PCP Capability Information field in the DMG Capabilities element. A STA is centralized AP or PCP clustering capable if it sets the Centralized AP or PCP Clustering field to 1 within the DMG AP Or PCP Capability Information field in the DMG Capabilities element. The AP or PCP employs the Clustering Control field and ECAPC Policy Enforced field defined in 9.3.4.2 to configure the use of AP or PCP Clustering. A decentralized AP or PCP clustering capable or centralized AP or PCP clustering capable AP or PCP that transmits the Clustering Control field is decentralized clustering enabled or centralized clustering enabled, respectively.

An AP or PCP cluster includes one S-AP or S-PCP and zero or more member APs and PCPs. Decentralized clustering enabled APs and PCPs operating on the same channel may form a decentralized AP or PCP cluster. The Cluster ID of the decentralized AP or PCP cluster shall be set to the MAC address of the S-AP or S-PCP. Centralized clustering enabled APs and PCPs operating on the same channel as a S-AP form a centralized AP or PCP cluster as described in 10.37.2.2. The Cluster ID of the centralized AP or PCP cluster shall be set to the MAC address of the S-AP.

A clustering enabled AP or PCP that is not a member of any cluster shall set the Cluster Member Role subfield to 0 in transmitted frames that contain the Clustering Control field.

Each AP or PCP that is a member of an AP or PCP cluster shall include the Clustering Control field in each DMG Beacon frame it transmits.

For each cluster, there exists a set of ClusterMaxMem Beacon SPs. The n^{th} Beacon SP, Beacon SP_n, begins at $\text{ClusterTimeOffset}_{n-1}$ μs following the TBTT of the S-AP or S-PCP, where

$$\text{ClusterTimeOffset}_{n-1} = 1024 \times (\text{dot11BeaconPeriod}/\text{ClusterMaxMem}) \times (n-1)$$

and $n=2, 3, \dots, \text{ClusterMaxMem}$

The $\text{ClusterTimeOffset}_{n-1}$ and Beacon SP_n where n equals one is reserved for the S-AP or S-PCP.

An AP or PCP that is a member of an AP or PCP cluster shall transmit its DMG Beacon frame during one of the Beacon SPs as specified in 10.37.2.

The maximum size of the Beacon SP Duration field transmitted by a S-AP or S-PCP shall be the beacon interval of the S-AP or S-PCP divided by ClusterMaxMem.

10.37.2 Cluster formation

10.37.2.1 Decentralized AP or PCP cluster formation

A clustering enabled AP or PCP starts a decentralized AP or PCP cluster by becoming an S-AP or S-PCP, subject to the absence of existing clusters as described below and in 10.37.2.2. A decentralized clustering enabled AP or PCP becomes an S-AP or S-PCP of a decentralized AP or PCP cluster by transmitting a DMG Beacon frame at least once every aMinBTIPeriod beacon intervals that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 0 and that includes a Clustering Control field with the Beacon SP Duration subfield set to dot11BeaconSPDuration, the Cluster ID subfield set to the S-AP or S-PCP MAC address, and the Cluster Member Role subfield set to the value for an S-AP or S-PCP. The value of ClusterMaxMem subfield shall be chosen to keep the result of (beacon interval length/ClusterMaxMem) as an integer number of microseconds.

A decentralized clustering enabled AP or PCP that receives a DMG Beacon frame with the ECAPC Policy Enforced subfield in the DMG Parameters field set to 0 from an S-AP or S-PCP on the channel the AP or PCP selects to establish a BSS shall monitor the channel for DMG Beacon frame transmissions during each Beacon SP for an interval of length at least aMinChannelTime. A Beacon SP is empty if no DMG Beacon frame is received during the Beacon SP over an interval of length aMinChannelTime. The AP or PCP shall not become a member of the cluster if no Beacon SP is determined to be empty during aMinChannelTime, in which case, subject to the requirements described in 10.37.2.2, then the AP or PCP may become the S-AP or S-PCP of a new cluster, or may cease its activity on this channel and may attempt operation on a different channel.

A decentralized clustering enabled AP or PCP that operates its BSS on a channel on which it discovered an S-AP or S-PCP within a decentralized AP or PCP cluster and at least one empty Beacon SP shall transmit its DMG Beacon frame during an empty Beacon SP. By transmitting its DMG Beacon frame during an empty Beacon SP and by setting the clustering control field appropriately as described in 9.3.4.2, the AP or PCP becomes a member AP or member PCP.

The member AP or member PCP shall select a beacon interval length that is equal to the beacon interval length of its S-AP or S-PCP.

The member AP or member PCP shall transmit its DMG Beacon frame with the ECAPC Policy Enforced field set to 0, the Beacon SP Duration subfield set to the value of the Beacon SP Duration subfield contained in the S-AP or S-PCP DMG Beacon, the Cluster ID subfield set to the MAC address of the S-AP or S-PCP, the Cluster Member Role subfield set to the member AP or member PCP value, and the ClusterMaxMem subfield set to the value of the ClusterMaxMem field contained in the S-AP or S-PCP DMG Beacon.

An AP or PCP with a value of Cluster Member Role that is not zero shall schedule a Beacon SP that is allocated for DMG Beacon frame transmission of other cluster member APs and PCPs within the decentralized AP or PCP cluster at each of ClusterTimeOffset_n, at any time the AP or PCP transmits its own DMG Beacon. The minimum size of the Beacon SP should be equal to the value of the Beacon SP Duration subfield within the S-AP or S-PCP DMG Beacon.

An S-AP or S-PCP and a member AP or member PCP of a decentralized AP or PCP cluster should not transmit or schedule transmissions during a Beacon SP that is not its own Beacon SP.

Figure 10-58 illustrates, for three APs and PCPs, the Beacon SPs of the S-AP or S-PCP and member APs and PCPs of a decentralized AP or PCP cluster.

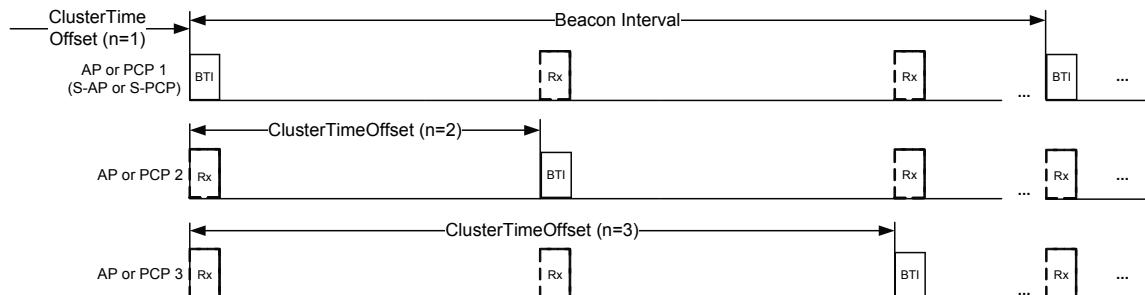

Figure 10-58—Decentralized AP or PCP clustering for 3 APs and PCPs

10.37.2.2 Centralized AP or PCP cluster formation

In order to become an S-AP, a centralized clustering enabled STA that is stationary with respect to its local environment shall successfully perform both the following steps in order:

- Configuration step
- Verification step

Once these steps have been performed successfully, the STA has become an S-AP.

- *Configuration step*: The configuration step is defined to be successful if the following occur:
 - The STA obtains the MAC address of the CCSR; and
 - The STA obtains an ECAPC Policy Detail field, beacon interval, ClusterMaxMem, Beacon SP Duration, TXSS CBAP Offset, TXSS CBAP Duration, TXSS CBAP MaxMem, TSF synchronization parameters, Cluster Time Offset availability information, and a nonempty list of excluded channels for the intended operating class of the STA from the CCSR; and
 - Either channel 2 is an allowed channel in the current regulatory domain and the list of excluded channels includes channel 2, or channel 2 is not an allowed channel in the current regulatory domain; and
 - The beacon interval/ClusterMaxMem is an integer number of microseconds; and
 - At least one of beacon interval/TXSS CBAP MaxMem or TXSS CBAP MaxMem/beacon interval is an integer.

Otherwise, the configuration step is defined to be unsuccessful. If the configuration step is unsuccessful, then the STA can attempt to resolve the problem or quit attempting to start a centralized AP or PCP cluster. The method by which the STA obtains the configuration information from the CCSR is not defined in this standard.

- *Verification step*: The verification step is defined to be the following procedure:
 - The centralized clustering enabled STA monitors the channel for DMG Beacon frames over an interval of at least aMinChannelTime.
 - During this monitoring period, for each distinct Cluster ID received in a DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 in the DMG Parameters field and Cluster Member Role set to 1 (S-AP or S-PCP of the cluster) or 2 (a member AP or member PCP of the cluster), the centralized clustering enabled STA determines if an S-AP with a MAC address equal to the Cluster ID belongs to the same CCSS as the centralized clustering enabled STA, via i) attempting to receive an Announce frame from the S-AP that transmitted the DMG Beacon frame according to the channel access rules described in 10.36 in order to solicit an ECAPC Policy element or ii) any other means. Any such DMG Beacon frame whose transmitter cannot be determined in this way to belong to the same CCSS as the centralized clustering enabled STA is defined to be from another ECAPC.

The verification step is defined to be unsuccessful if, at the end of the monitoring period, there are one or more received DMG Beacon frames that are from another ECAPC. Otherwise, the verification step is defined to be successful.

If a centralized clustering enabled STA receives at least one DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 and from a member AP, S-AP, or member PCP of another ECAPC during the monitoring period and the STA is not an ECAPC policy blind AP or PCP, the STA

- Shall cease its activity on this channel and may attempt operation on a different channel, or
- If one of the received DMG Beacon frames was sent by an S-AP, may elect to unenroll from its current CCSS and join the cluster of the S-AP as a member AP or member PCP.

If a centralized clustering enabled STA receives at least one DMG Beacon frame that has the ECAPC Policy Enforced field set to 1 from an S-AP from the same CCSS during the monitoring period and the STA is not

an ECAPC policy blind AP or PCP, the STA may elect either to unenroll from its current CCSS and join the cluster of the S-AP as a member AP or member PCP or to continue and become an S-AP in the CCSS.

In order to become an S-AP in a centralized AP or PCP cluster, a centralized clustering enabled STA shall take the following actions:

- Set dot11ChannelUsageImplemented to true
- Start a BSS as an AP
 - On a channel that is not listed as excluded by the CCSR, and
 - At the start time and with the beacon interval configured by the CCSR
- Include in transmitted DMG Beacon frames
 - The ECAPC Policy Enforced field set to 1 in the DMG Parameters field, and
 - A Clustering Control field with the ClusterMaxMem subfield set to the values configured by the CCSR, the Beacon SP Duration subfield set to the value most recently configured by the CCSR, the Cluster ID subfield set to the S-AP MAC address, and the Cluster Member Role subfield set to 1 (S-AP or S-PCP of the cluster).

An S-AP in a centralized AP or PCP cluster shall set the ECAPC Policy Enforced subfield in the DMG Parameters field to 1 for the lifetime of the BSS.

An S-AP within a centralized AP or PCP cluster shall include the ECAPC Policy element in (Re)Association Response, Announce, and Information Response frames with the ECAPC Policy Detail, TXSS CBAP Offset, and TXSS CBAP Duration fields set to the respective values most recently configured by the CCSR for the S-AP, the TXSS CBAP MaxMem subfield set to the policy configured by the CCSR, the CCSR ID subfield set to the MAC address of the CCSR, and bits in the Available Cluster Time Offset Bitmap subfield set to 0 to indicate the Cluster Time Offsets that are determined to be already in use, excluding the recipient if sent within an individually addressed frame. The means by which a Cluster Time Offset is determined to be in use are unspecified. Bits in the Available Cluster Time Offset Bitmap subfield for other Cluster Time Offsets shall be set to 1.

An AP or PCP that

- receives a DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP on a channel and
- does not receive at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from S-AP on every channel supported by the AP or PCP in the Operating Class within the next aMinChannelTime and
- is not an ECAPC policy blind AP or PCP

shall either join the cluster of the S-AP as a member AP or member PCP if centralized clustering enabled or cease its activity on this channel and may attempt operation on a different channel. S-APs within a CCSS report the channels unused by the ECAPC via the Channel Usage procedures (see 11.24.15).

An AP or PCP within a decentralized AP or PCP cluster that

- receives a DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP and
- does not receive at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 from an S-AP on every channel supported by the AP or PCP in the Operating Class within the next aMinChannelTime (i.e., does not become a ECAPC policy blind AP or PCP) and
- is not already an ECAPC policy blind AP or PCP

shall quit the decentralized AP or PCP cluster before the next TBTT + beacon interval length, then the AP or PCP shall either join the cluster of the S-AP as a member AP or member PCP if centralized AP or PCP clustering enabled or cease its activity on this channel and may attempt operation on a different channel.

An AP or PCP that receives at least one DMG Beacon frame that has the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1 sent by an S-AP on every channel supported by the AP or PCP in the Operating Class within the most recent aMinChannelTime ignores the ECAPC Policy Enforced subfield (i.e., treats this subfield as though equal to 0) in DMG Beacon frames received from S-APs for $300 \times aMinChannelTime$. During this period, the AP or PCP is called an *ECAPC policy blind AP or PCP*.

NOTE—An AP or PCP within a decentralized AP or PCP cluster does not cease DMG Beacon frame transmission when quitting a decentralized AP or PCP cluster. Hence, data communication is unaffected while performing these procedures.

A centralized clustering enabled AP or PCP that attempts to join the centralized AP or PCP cluster of an S-AP as a member AP or member PCP shall be a STA coordinated by an MM-SME that also coordinates a second non-AP and non-PCP STA, and shall successfully perform the following steps in order:

- The AP or PCP shall monitor the channel for DMG Beacon frames during each Beacon SP over an interval of length at least aMinChannelTime. A Beacon SP_n is empty if no DMG Beacon frame is received during the Beacon SP_n over an interval of length aMinChannelTime.
- The second non-AP and non-PCP STA shall attempt to associate with the S-AP and thereby receive an Announce frame from the S-AP. The contents of the Announce frame are passed to the AP or PCP.
- Upon receiving an Announce frame that includes the ECAPC Policy element, the AP or PCP shall select a Cluster Time Offset index from the intersection of a) the Cluster Time Offset indices of the empty Beacon SPs with b) the indices indicated by the Available Cluster Offset Bitmap field in the ECAPC Policy element. If the intersection is empty, the AP or PCP shall select a Cluster Time Offset index of an empty Beacon SP. The selected Cluster Time Offset index is passed to the second non-AP and non-PCP STA.
- The second non-AP and non-PCP STA shall respond to the Announce frame with an Information Response frame that includes the Cluster Time Offset element containing the Cluster Time Offset Index set to the selected index.
- The AP or PCP shall operate its BSS at the selected Cluster Time Offset on the channel of the S-AP and include the AP or PCP clustering control field in transmitted DMG Beacon frames.

The AP or PCP shall not become a member of the centralized AP or PCP cluster if no Beacon SP is determined to be empty during aMinChannelTime or if the second non-AP and non-PCP STA did not associate to the S-AP, in which case the AP or PCP may attempt to join the cluster of another S-AP or cease its activity on this channel and may attempt operation on a different channel.

A member AP or member PCP within a centralized AP or PCP cluster shall select a beacon interval that is equal to the beacon interval of the S-AP of the cluster.

The member AP or member PCP within a centralized AP or PCP cluster shall transmit its DMG Beacon frames with the ECAPC Policy Enforced subfield in the DMG Parameters field set to 1, the Beacon SP Duration subfield in the Clustering Control field set to the value of the Beacon SP Duration subfield contained in the most recently received S-AP DMG Beacon, the Cluster ID subfield set to the MAC address of the S-AP, the Cluster Member Role subfield set to 2 (a member AP or member PCP of the cluster), and the ClusterMaxMem subfields set to the value of the ClusterMaxMem field contained in the S-AP DMG Beacon.

A member AP or member PCP within a centralized AP or PCP cluster shall include the ECAPC Policy element in (Re)Association Response, Announce, and Information Response frames with the ECAPC Policy Detail, TXSS CBAP Offset, and TXSS CBAP Duration fields set to the most recently received respective

field from the S-AP of the cluster, the TXSS CBAP MaxMem field set to the value of the TXSS CBAP MaxMem field received from the S-AP of the cluster, with the CCSR ID set to the MAC address of the CCSR field received from the S-AP of the cluster, and with the Available Cluster Time Offset Bitmap field reserved.

At any time an AP or PCP within a centralized AP or PCP cluster transmits a DMG Beacon frame, the AP or PCP shall schedule a Beacon SP that reserves time for BHI transmission by other APs and PCPs within the centralized AP or PCP cluster at each in use $\text{ClusterTimeOffset}_{n-1}$ as indicated by the most recently transmitted (if S-AP) or received (if member AP or member PCP) Available Cluster Time Offset Bitmap. The minimum size of the Beacon SP shall be equal to the value of the Beacon SP Duration subfield within the DMG Beacon frame of the S-AP of the centralized AP or PCP cluster. A member AP, S-AP, or member PCP of a centralized AP or PCP cluster shall not transmit or schedule transmissions during a Beacon SP of another member AP, S-AP, or member PCP.

10.37.3 Cluster maintenance

10.37.3.1 General cluster maintenance

The TBTT of the S-AP or S-PCP provides a timing reference for the Beacon SPs of the member APs and PCPs. Timing synchronization among the member APs and PCPs facilitates equitable sharing of the common medium among the member APs and PCPs. As long as a member AP or member PCP periodically receives DMG Beacons from the S-AP or S-PCP, the member AP or member PCP is able to maintain synchronization with the S-AP or S-PCP and hence the other member APs and PCPs.

10.37.3.2 Decentralized AP or PCP cluster maintenance

In the case when the S-AP or S-PCP of a decentralized AP or PCP cluster is lost, or appears to a member AP or member PCP to have been lost, another AP or PCP needs to become the S-AP or S-PCP of the decentralized AP or PCP cluster in order to allow the remaining member APs and PCPs to maintain synchronization with the cluster. The creation of a new S-AP or S-PCP is called *S-AP or S-PCP handover*. After an S-AP or S-PCP handover, the cluster might continue to function as before, except with altered membership, or the cluster might no longer exist, or there might be one or more new clusters.

A member AP or member PCP of the decentralized AP or PCP cluster shall start an S-AP or S-PCP handover if, within a time period of $4 \times \text{aMinBTIPeriod}$ beacon intervals, it does not receive a DMG Beacon frame with the ECAPC Policy Enforced field set to 0, with the value of the Cluster ID field equal to the Cluster ID of the cluster of which the AP or PCP is a member and with the Cluster Member Role field set to the S-AP or S-PCP value. This is the first cluster monitoring period. During the next step in the S-AP or S-PCP handover, the member AP or member PCP performs another cluster monitoring period. A cluster monitoring period is a time period of $4 \times \text{aMinBTIPeriod}$ beacon intervals during which the AP or PCP listens for DMG Beacons while continuing to transmit DMG Beacons using its current Beacon SP_n.

NOTE—A decentralized clustering enabled AP or PCP does not cease DMG Beacon frame transmission during Cluster Monitoring and S-AP or S-PCP handover. Hence, data communication is unaffected while performing these procedures.

If, during a cluster monitoring period, the member AP or member PCP receives a DMG Beacon frame with the value of Cluster Member Role set to the S-AP or S-PCP value, the member AP or member PCP shall follow the rules in 10.37.2 to become a member AP or member PCP of the cluster corresponding to the detected S-AP or S-PCP or cease operation on the channel; in either case, the cluster monitoring period is terminated.

If, during a cluster monitoring period, the AP or PCP receives no DMG Beacons with the value of Cluster Member Role set to the S-AP or S-PCP value and one or more DMG Beacons with the ECAPC Policy Enforced field set to 0 and with Cluster ID equal to the Cluster ID of its last S-AP or S-PCP, then at the end of the cluster monitoring period the AP or PCP compares the MAC addresses of all such received DMG

Beacons with its own MAC address. If its MAC address is the lowest, the AP or PCP shall become an S-AP or S-PCP according to the rules in 10.37.2. If its MAC address is not the lowest, the AP or PCP shall perform a new cluster monitoring period. If the number of cluster monitoring periods performed by the AP or PCP exceeds `dot11MaxNumberOfClusteringMonitoringPeriods`, the AP or PCP may cease cluster maintenance and initiate cluster formation as described in 10.37.2.

If, during a cluster monitoring period, the AP or PCP does not receive a DMG Beacon frame that contains the value of S-AP or S-PCP in the Cluster Member Role field and does not receive a DMG Beacon frame with the ECAPC Policy Enforced field set to 0 and with Cluster ID equal to the Cluster ID of the cluster of which it is currently a member, then at the end of the cluster monitoring period the AP or PCP may become an S-AP or S-PCP according to the rules of 10.37.2, or it may cease its activity on this channel and may attempt operation on a different channel.

NOTE—An assumption to allow the establishment of an S-AP or S-PCP in this case is that the APs and PCPs cannot hear each other's DMG Beacons. How a STA decides to switch the channel or to establish an S-AP or S-PCP is implementation dependent.

If, during a cluster monitoring period, the member AP or member PCP of a decentralized AP or PCP cluster receives no DMG Beacons from clustering enabled STAs, then the AP or PCP shall establish itself as an S-AP or S-PCP according to the rules in 10.37.2.

If an S-AP or S-PCP of a decentralized AP or PCP cluster detects the presence of a S-AP or S-PCP of another decentralized AP or PCP cluster on the same channel, it should schedule a Beacon SP for the DMG Beacon frame transmission of the other S-AP or S-PCP if the MAC address of the other S-AP or S-PCP is lower than the MAC address of this S-AP or S-PCP. The S-AP or S-PCP with higher MAC address should become a member AP or member PCP of the cluster corresponding to the S-AP or S-PCP with the lower MAC address according to the rules in 10.37.2.

10.37.3.3 Centralized AP or PCP cluster maintenance

A STA, while operating as an S-AP, remains stationary with respect to its local environment.

An S-AP within a centralized AP or PCP cluster, upon a change of the Beacon SP Duration field or the ECAPC Policy element configured by the CCSR, shall update the Clustering Control field sent in subsequent frames and shall send individually addressed Announce or Information Response frames to other STAs within the BSS in order notify them of the changes.

When a member AP or member PCP is coordinated by an MM-SME and the member AP or member PCP elects to change its S-AP within a centralized AP or PCP cluster, then a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP should disassociate from the previous S-AP, and the member AP or member PCP shall perform the steps described in 10.37.2.2 that allow a clustering enabled AP or PCP to join the centralized AP or PCP cluster of an S-AP as a member AP or member PCP.

When a member AP or member PCP is coordinated by an MM-SME and the member AP or member PCP elects to change its Cluster Time Offset within a centralized AP or PCP cluster, then the member AP or member PCP shall pass the updated Cluster Time Offset to a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP, and the second non-AP and non-PCP STA shall send an Information Response frame that includes a Cluster Time Offset element containing the Cluster Time Offset Index set to the updated index to the S-AP of the centralized AP or PCP cluster.

A member AP or member PCP within a centralized AP or PCP cluster, upon a change of the Clustering Control field received from its S-AP, shall update the Clustering Control field sent in subsequent frames. Upon a change of the ECAPC Policy Detail field received from its S-AP, a member AP or member PCP within a centralized AP or PCP cluster shall update the ECAPC Policy element sent in subsequent frames

and send individually addressed Announce or Information Response frames to other STAs within the BSS in order notify them of the changes. The member AP or member PCP within the centralized AP or PCP cluster shall attempt to receive a DMG Beacon frame from its S-AP at least once every dot11DMGEcssPolicyDetailUpdateDurationMax TUs.

In the case when a member AP or member PCP of a cluster has not received DMG Beacon frames from its S-AP for a duration exceeding $4 \times \text{aMinBTIPeriod}$ beacon intervals, and the member AP or member PCP intends to continue to operate a BSS on the channel, the AP or PCP shall either

- a) Stop the current BSS then become an S-AP within the CCSS as described in 10.37.2.2; or
- b) Monitor the channel for DMG Beacon frames for an interval of length at least aMinChannelTime . During this period
 - 1) if one or more DMG Beacon frames are received with the ECAPC Policy Enforced field set to 1 in the DMG Parameters field and the Cluster Member Role set to 1 (S-AP or S-PCP of cluster) from one or more S-APs and the AP or PCP is not an ECAPC policy blind AP or PCP, then the AP or PCP shall join a selected S-AP as a cluster member as described in 10.37.2.2;
 - 2) otherwise, if the AP or PCP is an ECAPC policy blind PCP or AP, then it may join a selected S-AP as a cluster member;
 - 3) otherwise, if, after the period elapses, no DMG Beacon frames are received with the ECAPC Policy Enforced field in the DMG Parameters field set to 1 and the Cluster Member Role set to 1 (S-AP or S-PCP of cluster) and if the AP or PCP is decentralized AP or PCP clustering capable, then the AP or PCP shall attempt to join a decentralized AP or PCP cluster if present as described in 10.37.2.1. If the AP or PCP is not decentralized AP or PCP clustering capable or a decentralized AP or PCP cluster is not present, then the AP or PCP shall set its Cluster Member Role to 0 (not currently participating in a cluster).
- c) In all three cases, the AP or PCP
 - 1) Shall set the ECAPC Policy Enforced bit to 0 and shall not include the ECAPC Policy element in (Re)Association Response, Announce, or Information Response frames and
 - 2) Should send individually addressed Announce or Information Response frames to other STAs within the BSS to notify them of the changes.

10.37.3.4 Centralized AP or PCP cluster MAC requirements

If the most recent ECAPC Policy element transmitted by a member AP, S-AP, or member PCP includes the BHI Enforced field set to 1, the member AP, S-AP, or member PCP shall complete the BTI, A-BFT, and ATI for each subsequent beacon interval before $\text{TBTT} + (8 \times \text{Beacon SP duration})$. The most recently transmitted (if an S-AP) or received (if a member AP, member PCP, or non-AP and non-PCP STA) value of Beacon SP Duration is used.

If the most recent ECAPC Policy element transmitted by a member AP, S-AP, or member PCP has the TXSS CBAP Enforced field set to 1, the member AP, S-AP, or member PCP shall complete each of its TXSSs in the DTI within one or more TXSS CBAPs.

If the most recent ECAPC Policy element, received by a non-AP and non-PCP STA in a BSS from the member AP, S-AP, or member PCP of the BSS, has the TXSS CBAP Enforced field set to 1, then the non-AP and non-PCP STA shall perform each of its TXSSs in the DTI within one or more TXSS CBAPs. If the non-AP and non-PCP STA is the source DMG STA of an SP and if the non-AP and non-PCP determines that it needs to perform a TXSS before continuing to transmit to the destination DMG STA of the SP, then the non-AP and non-PCP STA should truncate the SP (see 10.36.8).

A TXSS CBAP shall last from T_{Start} to T_{End} , as defined below, excluding any time that overlaps a BHI or an SP that has source and destination DMG AIDs set to 255 (such as for a Beacon SP).

$$T_{Start} = T_{TBTT} + 8 \times T_o + \frac{(n - 1) \times 1024 \times T_{BI}}{N}, 1 \leq n \leq N$$

$$T_{End} = T_{TBTT} + 8 \times T_o + \frac{(n - 1) \times 1024 \times T_{BI}}{N} + 8 \times T_d, 1 \leq n \leq N$$

where

- T_{TBTT} is the TBTT
- T_o is the TXSS CBAP Offset, in microseconds
- T_d is the TXSS CBAP Duration, in microseconds
- T_{BI} is the beacon interval, in TU
- N is TXSS CBAP MaxMem

The most recently transmitted (if an S-AP) or received (if a member AP, member PCP, or non-AP and non-PCP STA) value of TXSS CBAP Offset and TXSS CBAP Duration fields are used.

The TXSS CBAP is available to all STAs in an ECAPC. A STA may also use the TXSS CBAP for sending frames not related to transmit sector sweeping. Transmission rules during a TXSS CBAP are defined in 10.36.5.

NOTE—Frames, such as Data frames, sent in a TXSS CBAP when the TXSS CBAP Enforced field is set to 1 might experience erratically higher interference than frames sent at other times due to the TXSSs of other nearby STAs.

Additional centralized AP or PCP cluster requirements are defined in 10.36.6.6 and 11.1.3.3.

10.37.4 Cluster report and re-scheduling

A clustering enabled AP or PCP that receives an Extended Schedule element from another clustering enabled AP or PCP may re-schedule SPs and CBAPs in its beacon interval, or move the BTI (11.1.3.3), in an attempt to mitigate any interference with the transmissions indicated in the received Extended Schedule element. The AP or PCP can create SPs in its beacon interval with the source and destination AID set to 255 to prevent transmissions during specific periods in the beacon interval (10.36.6.2).

A non-AP and non-PCP STA that is a member of a BSS and that receives a DMG Beacon frame should send a Cluster Report element to its AP or PCP if the received DMG Beacon frame meets all of the following conditions:

- The DMG Beacon frame is not from the STA's AP or PCP.
- The DMG Beacon frame contains the Clustering Control field.
- Either
 - The value of the Cluster ID field within the Clustering Control field is different from the MAC address of the STA's AP or PCP; or
 - The value of the Cluster ID field within the Clustering Control field is the same as the MAC address of the STA's AP or PCP, the TBTTs of the two BSSs are less than $\text{dot11BeaconPeriod}/(2 \times \text{ClusterMemMax})$ apart in time, and the ECAPC Policy Enforced field in the DMG Beacon frame received most recently from the STA's AP or PCP is equal to 1.

The non-AP and non-PCP STA shall not send a Cluster Report element to its AP or PCP if the received DMG Beacon frame does not meet the preceding conditions.

A Cluster Report element meeting the conditions above shall be transmitted in an Announce or Information Response frame sent to the STA's AP or PCP. Within the transmitted Cluster Report element, the STA shall

set the Cluster report subfield to 1. The STA shall set the Clustering Control field within a transmitted Cluster Report element to the corresponding field values within the Clustering Control of the received DMG Beacon, shall set the Reported BSSID field to the BSSID of the received DMG Beacon, and shall set the Reference timestamp field to indicate the DMG Beacon frame reception time. The STA shall set the Schedule present subfield to 1 if the Extended Schedule field is present in the transmitted Cluster Report element; otherwise, it shall set Schedule present subfield to 0. The STA shall set the TSCONST present subfield to 1 if the Traffic Scheduling Constraint Set field is present in the transmitted Cluster Report element; otherwise, it shall set TSCONST present subfield to 0.

The STA shall set the ECAPC Policy Enforced field in the Cluster Report Control field to the value of the ECAPC Policy Enforced field in the received DMG Beacon. The STA should attempt to receive an Announce frame from the AP or PCP that transmitted the DMG Beacon frame according to the channel access rules described in 10.36 in order to solicit an ECAPC Policy element. If the STA obtains an ECAPC Policy element from the AP or PCP that transmitted the DMG Beacon, the STA shall set the ECAPC Policy Present subfield to 1 and include the ECAPC Policy element in the transmitted Cluster Report element; otherwise, the STA shall set ECAPC Policy Present subfield to 0 and not include the ECAPC Policy element in the transmitted Cluster Report element. If present, the Extended Schedule Element field within the Cluster Report element shall be set to the corresponding field values within the Extended Schedule element of the received DMG Beacon. If present, the Traffic Scheduling Constraint Set field shall be set to indicate periods of time with respect to the TBTT of the beacon interval of the BSS the STA participates where the transmitting STA experiences poor channel conditions, such as due to interference.

If the received DMG Beacon frame contains more than one Extended Schedule element entry, the STA shall repeat the aforementioned procedure and transmit a Cluster Report element corresponding to each Extended Schedule element entry.

Upon receiving a Cluster Report element from a non-AP and non-PCP STA with the Cluster report field set to 1, a clustering enabled AP or PCP may re-schedule SPs and CBAPs in its beacon interval, move the BTI if the clustering enabled AP or PCP is an S-AP or S-PCP in a decentralized AP or PCP cluster, or change the Cluster Time Offset if the clustering enabled AP or PCP is a member AP or member PCP, or perform other actions, in an attempt to mitigate any interference with the transmissions indicated in the received Cluster Report element. The clustering enabled AP or PCP may also create SPs in its beacon interval with the source and destination AID set to 255 to prevent transmissions during specific periods in the beacon interval.

A member AP or member PCP within a centralized AP or PCP cluster should report new interference information and may report all interference information to the S-AP of the cluster

- When the member AP or member PCP receives one or more of the following:
 - A DMG Beacon frame from another AP or PCP in another centralized AP or PCP cluster within the same CCSS or another CCSS
 - A Cluster Report element with the Cluster Report field set to 1 from a non-AP and non-PCP STA within the same BSS characterizing an AP or PCP in another centralized AP or PCP cluster within the same CCSS or another CCSS; and
- If at least dot11DMGEcssClusterReportDurationMin TUs have elapsed since the last report.

The report should aggregate the information received from all sources and minimize duplication. The member AP or member PCP passes the report to a second non-AP and non-PCP STA coordinated by the MM-SME of the member AP or member PCP, and the second non-AP and non-PCP STA sends the report in an Information Response frame that includes one or more Cluster Report elements to the S-AP of its centralized AP or PCP cluster. If the member AP or member PCP does not elect to change its Cluster Time Offset at this time, the second non-AP and non-PCP STA includes a Cluster Time Offset element with an unchanged Cluster Time Offset Index field.

Via unspecified means, the S-AP might aggregate received DMG Beacon frames and Cluster Report elements and send the aggregate to the CCSR. Upon receiving this information, the CCSR might reconfigure the TSF offsets of an S-AP, reconfigure the ECAPC Policy Detail of an S-AP, update the Cluster Time Offset availability information provided in an individually addressed frame by an S-AP to a member AP or member PCP, or perform other actions.

10.37.5 Decentralized AP or PCP cluster request

A non-AP and non-PCP STA that is a member of a BSS may transmit a Cluster Report element to its AP or PCP to request that decentralized AP or PCP clustering be enabled in the BSS. The non-AP and non-PCP STA can make this request if, for example, the device containing the non-AP and non-PCP STA intends to initialize another co-channel BSS (11.1) in which it performs the role of AP or PCP and, when performing this role, it wishes to become a member AP or member PCP of the decentralized AP or PCP cluster formed by its current AP or PCP.

To request AP or PCP clustering to be enabled in the BSS, the STA shall transmit a Cluster Report element with the Cluster request subfield set to 1 to its AP or PCP. Upon receiving a Cluster Report element with the Cluster request subfield set to 1, the AP or PCP should form and maintain decentralized AP or PCP clustering in the BSS according to the procedures described in 10.37.2 and 10.37.3. In doing that, the AP or PCP should set the minimum duration of the Beacon SP to be equal to the Beacon SP duration.

If the non-AP and non-PCP STA does not receive a DMG Beacon frame from its AP or PCP with decentralized AP or PCP clustering enabled after `dot11ClusterEnableTime` following the transmission to its AP or PCP of a Cluster Report element with the Cluster request subfield set to 1, the non-AP and non-PCP STA may transmit an Announce frame including the last Extended Schedule element transmitted by the AP or PCP. If the Announce frame is transmitted, it shall use MCS 0, and the TA field shall be set to the broadcast address. If a DMG STA receives an Announce frame with the TA field set to the broadcast address and with the BSSID field different from the BSSID of its BSS, the STA may send a Cluster Report element containing the Extended Schedule element within the received Announce frame to its AP or PCP, which might be used by the AP or PCP to reschedule SPs in portions of the beacon interval that are nonoverlapping in time with the SPs contained in the Extended Schedule element reported by the STA.

If a non-AP and non-PCP STA becomes a member AP or member PCP of the clustering enabled by its current AP or PCP, the non-AP and non-PCP STA can synchronize scheduled CBAP allocations, if any, between the BSS in which it performs the role of AP or PCP and the BSS of its current AP or PCP. The non-AP and non-PCP STA can disallow STAs in the BSS in which it plays the role of AP or PCP from transmitting during the Beacon SPs of the cluster it is a part of, and this can be done by allocating an SP time-overlapping with each Beacon SP such that each allocated SP has both the source AID and destination AID fields within the Extended Schedule element set to the AID of the non-AP and non-PCP STA.

10.38 DMG beamforming

10.38.1 General

Beamforming (BF) is a mechanism that is used by a pair of STAs to achieve the necessary DMG link budget for subsequent communication. BF training is a bidirectional sequence of BF frame transmissions that uses sector sweep and provides the necessary signaling to allow each STA to determine appropriate antenna system settings for both transmission and reception. After the successful completion of BF training, BF is said to be established. A BF frame is an SSW frame, a DMG Beacon frame, an SSW-Feedback frame, an SSW-Ack frame or a BRP frame. Figure 10-59 gives an example of the beamforming training procedure.

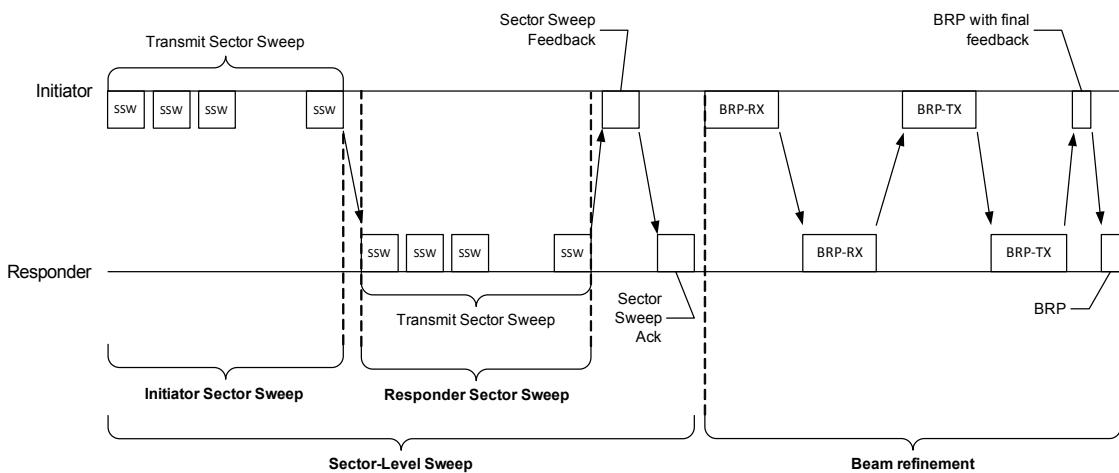

Figure 10-59—An example of beamforming training

In this subclause, the STA that initiates BF training through the transmission of a BF frame is referred to as the *initiator*, and the recipient STA of the BF frame that participates in BF training with the initiator is referred to as the *responder*. For BF training that occurs within the A-BFT allocation, the AP or PCP is the initiator and a non-AP and non-PCP STA becomes the responder. For BF training that occurs during an SP allocation, the source DMG STA of the SP is the initiator and the destination DMG STA of the SP becomes the responder. For BF training during a CBAP allocation, the TXOP holder is the initiator and the TXOP responder is the responder and the value of the Duration field in the transmitted BF frames does not limit the duration of the BF training procedure. The duration of the BF training procedure is specified in 10.38.6.2 and 10.38.6.4.

The link from the initiator to the responder is referred to as the *initiator link*, and the link from the responder to the initiator is referred to as the *responder link*.

BF training starts with a SLS from the initiator. A beam refinement protocol (BRP) may follow, if requested by either the initiator or the responder. The purpose of the SLS phase is to enable communications between the two participating STAs at the DMG control mode rate or higher MCS. Normally, the SLS phase provides only transmit BF training. The purpose of the BRP phase is to enable receive training and enable iterative refinement of the AWV of both transmitter and receiver at both participating STAs. If one of the participating STAs chooses to use only one transmit antenna pattern, receive training may be performed as part of the SLS.

Any BF information obtained by an initiator or a responder during a BF training attempt shall be considered invalid if either or both of the following conditions are satisfied:

- a) The SLS phase was not completed within `dot11MaxBFTime` beacon intervals from the start of the SLS phase.
- b) The BRP phase, if initiated, was not completed within `dot11MaxBFTime` beacon intervals from the start of the BRP phase.

A STA shall abort an SLS if the SLS is not completed within `dot11MaxBFTime` beacon intervals from the start of the SLS, and shall abort a BRP if the BRP is not completed within `dot11MaxBFTime` beacon intervals from the start of the BRP.

A STA can have one or more DMG antennas. A DMG antenna can be used to create sectors through which a STA can transmit or receive frames. The number of sectors per DMG antenna shall not be greater than 64. The total number of sectors across all DMG antennas in a STA shall not be greater than 128.

Table 10-19 shows the mandatory and optional procedures in the beamforming mechanism described in this subclause.

Table 10-19—Mandatory and optional procedures in the Beamforming mechanism

| Beamforming item | | Support mandatory | Notes |
|--------------------------------|--------------------------------|-------------------|---|
| SLS phase (10.38.2, 10.38.6.2) | | Yes | A DMG STA is capable to participate in an SLS with any other STA as described in 10.38.2 and 10.38.6.2 |
| Beamforming in BTI (10.38.4) | | Yes | When operating as an AP or PCP, a DMG STA is capable to perform beamforming in the BTI as described in 10.38.4 |
| Beamforming in A-BFT (10.38.5) | | Yes | When operating as an AP or PCP, a DMG STA is capable to perform beamforming in the A-BFT as described in 10.38.5 |
| BRP setup subphase (10.38.3.2) | | Yes | A DMG STA is capable to negotiate BRP settings with any other STA as described in 10.38.3.2 |
| MIDC subphase (10.38.6.3) | MID subphase | No | A DMG STA does not have to be capable to perform MID as described in 10.38.6.3 |
| | BC subphase | No | A DMG STA does not have to be capable to perform BC as described in 10.38.6.3 |
| BRP phase (10.38.3, 10.38.6.4) | Feedback = BS-FBCK | Yes | A DMG STA is capable to perform the BRP with any other STA as described in 10.38.3 and 10.38.6.4 and is capable to return the BS-FBCK |
| | Feedback = Channel measurement | No | A DMG STA is capable to perform the BRP with any other STA as described in 10.38.3 and 10.38.6.4, but does not have to be capable to return channel measurements |
| Beam tracking (10.38.7) | Feedback = BS-FBCK | Yes | A DMG STA is capable of responding to a receive beam tracking request. A DMG STA is capable of responding to a transmit beam tracking request with the BS-FBCK. |
| | Feedback = Channel measurement | No | A DMG STA is capable of responding to a receive beam tracking request. A DMG STA does not have to be capable of responding to a transmit beam tracking request with channel measurements. |

An SLS between an initiator and a responder is successful for the initiator if, after the completion of the SLS, the initiator receives a response to a frame transmitted to the responder using the sector and antenna selected during the SLS. The SLS is successful for the responder if, after the completion of the SLS, the responder receives a response to a frame transmitted to the initiator using the sector and antenna selected during the SLS.

In this subclause, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field held by the initiator with respect to the responder refer to the last value of the corresponding field received by the initiator from the responder and that the SLS between the initiator and responder using this value was successful for the initiator. Similarly, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field held by the responder with respect to the initiator refer to the last value of the corresponding field received by the responder from the

initiator and that the SLS between the responder and initiator using this value was successful for the responder.

Until an SLS is successful between an initiator and a responder, the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field used by the initiator with respect to the responder refer to the value of these fields in the responder's DMG Capabilities element, and the last negotiated Total Number of Sectors field, Number of RX DMG Antennas field, and RXSS Length field used by the responder with respect to the initiator refer to the value of these fields in the initiator's DMG Capabilities element.

If an MMSL cluster capable STA has successfully transmitted to a peer STA an MMS element with the BeamLink Cluster field set to 1, then all MAC entities coordinated by the same MM-SME as the MMSL cluster capable STA shall use a single beamformed link for the MMSL cluster. Also, the MAC address used by the MMSL cluster capable STA to initiate the beamforming procedure shall remain the same until the completion of the beamforming procedure.

10.38.2 Sector-level sweep (SLS) phase

10.38.2.1 General

The SLS phase can include as many as four components: an initiator sector sweep (ISS) to train the initiator link as described in 10.38.2.2, a responder sector sweep (RSS) to train the responder link as described in 10.38.2.3, an SSW feedback procedure as described in 10.38.2.4, and an SSW ack procedure as described in 10.38.2.5.

An initiator shall begin the SLS phase by transmitting the frames of the ISS.

A responder shall not begin transmitting the frames of an RSS before the ISS is successfully completed (as defined in 10.38.1), except when the ISS occurs in the BTI (10.38.5).

An initiator shall not begin an SSW feedback procedure before the RSS phase is successfully completed (as defined in 10.38.1), except when the RSS occurs in the A-BFT.

A responder shall not begin an SSW ack procedure with an initiator in the A-BFT. A responder shall begin an SSW ack procedure with an initiator immediately following the successful completion (as defined in 10.38.1) of the SSW feedback procedure with the initiator.

During the SLS phase the only BF frames an initiator may transmit are the DMG Beacon frame, the SSW frame, and the SSW-Feedback frame. During the SLS phase the only BF frames a responder may transmit are the SSW frame and the SSW-Ack frame.

If during the SLS the initiator and responder each execute a TXSS, then at the end of the SLS phase both the initiator and the responder possess their own transmit sector. If either the ISS or the RSS employs a receive sector sweep, then the responder or the initiator, respectively, possesses its own receive sector.

The following rule applies to all channel access in DMG BSSs. A STA shall not transmit a frame as part of a sector sweep comprising at least two sectors if a response is expected within SIFS interval from the STA identified in the RA field of the transmitted frame.

A STA shall not change its transmit power during a sector sweep.

A frame transmitted as part of a sector sweep does not include training fields. A STA shall set the TRN-LEN parameter of the TXVECTOR to 0 for a frame transmitted as part of a sector sweep.

Two examples of the SLS phases are shown in Figure 10-60 and Figure 10-61.

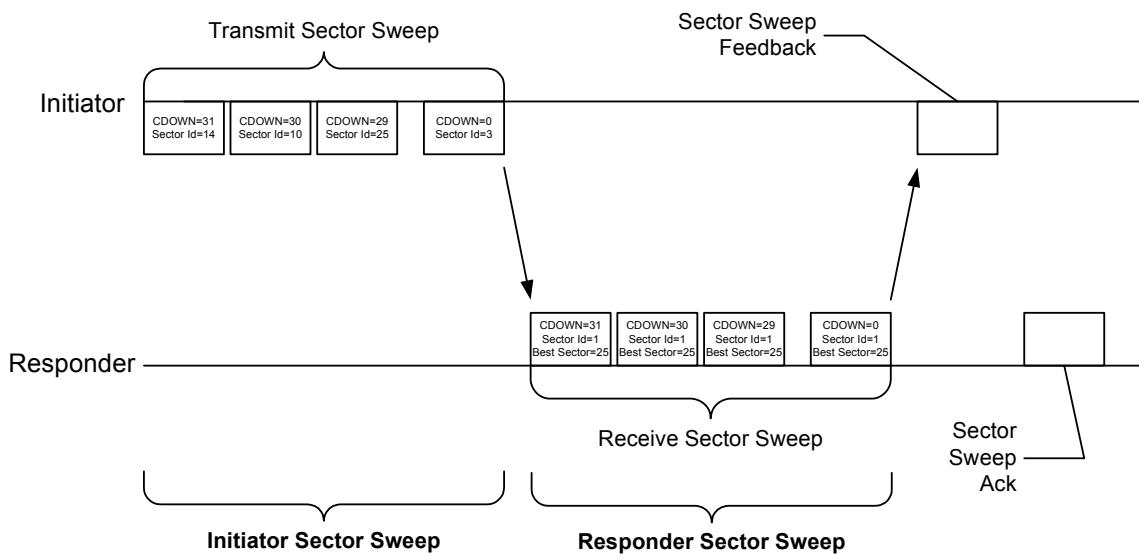

Figure 10-60—An example of SLS

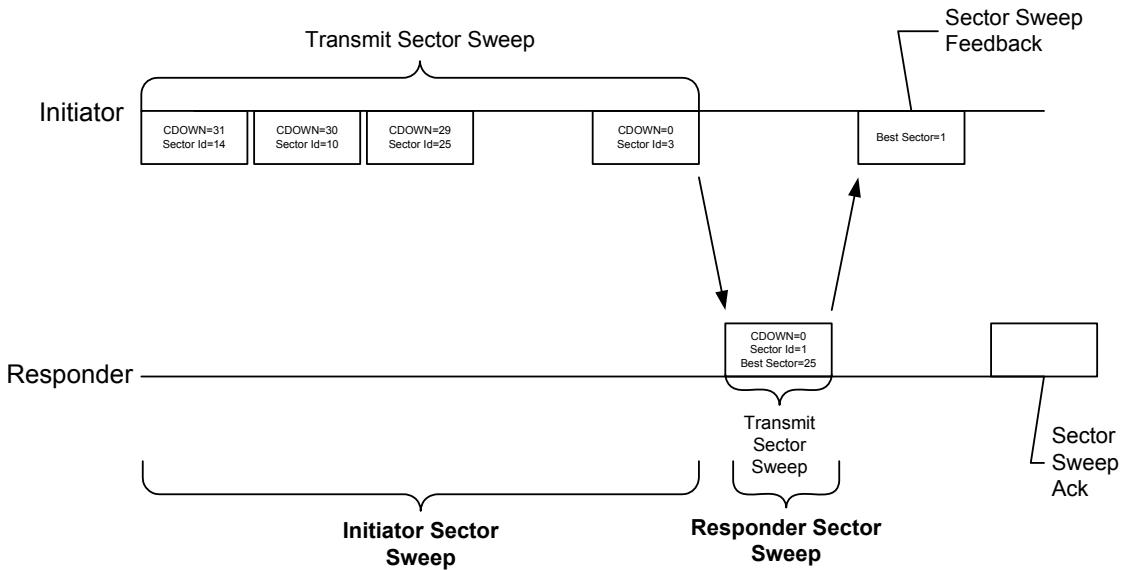

Figure 10-61—An example of SLS

In Figure 10-60 the initiator has many sectors, the responder has only one transmit sector and receive sector sweep is used at the responder sector sweep (the responder is transmitting all responder SSW frames through the same transmit sector, the initiator is switching receive antennas at the same time).

In Figure 10-61 the initiator has many transmit sectors, the responder has one transmit sector. In this case, receive training for the initiator is performed in the BRP phase.

10.38.2.2 Initiator sector sweep (ISS)

10.38.2.2.1 General

An ISS comprises either an initiator TXSS or an initiator RXSS.

An initiator RXSS may be performed in an ISS when the initiator chooses to use only one transmit antenna pattern across each of its DMG antennas.

An initiator may employ either DMG Beacon frames or SSW frames in the ISS. If the initiator begins an ISS with the transmission of a DMG Beacon frame, it shall use the DMG Beacon frame for all subsequent transmissions during the ISS. Conversely, if the initiator begins an ISS with the transmission of an SSW frame, it shall use the SSW frame for all subsequent transmissions during the ISS. A responder never begins an ISS.

The initiator shall set the Direction subfield in the Sector Sweep field to 0 within each DMG Beacon and SSW frame transmitted during an ISS.

The initiator shall set the Total Sectors in ISS subfield within the SSW Feedback field to the total number of sectors that it is using in the ISS. The total is computed as the sum of all sectors employed on all antennas in the ISS multiplied by the number of the responder's receive DMG antennas. For example, if 4 sectors are used on antenna 0, 3 sectors on antenna 1, 5 sectors on antenna 2, and the responder has two receive DMG antennas, then the Total Sectors in ISS subfield is set to 24.

10.38.2.2.2 Initiator TXSS

When the IsInitiatorTXSS field for a specific SP is 1 in a received Extended Schedule element (see 9.4.2.132) or Grant frame (see 9.3.1.13) and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains an initiator TXSS, and the initiator shall start an initiator TXSS at the start of the next SP as indicated by the received Extended Schedule element or Grant frame.

During the BTI, the initiator shall start an initiator TXSS (see also 10.38.4).

During a CBAP, an initiator may obtain a TXOP with an initiator TXSS or use an existent TXOP for the initiator TXSS. If transmission of a Grant frame to the responder is used to initiate the TXSS, the Beamforming Training and IsInitiatorTXSS fields of the BF Control field is set to 1. If a Grant Ack frame is transmitted by the responder, it shall comply with 10.36.4. In the Grant Ack frame, the responder shall set the Beamforming Training field to 1. The initiator starts the initiator TXSS SIFS interval after transmission of the Grant frame or after the reception of the Grant Ack frame if the Grant Ack Supported field in the responder's DMG Capabilities element is 1 or PIFS interval after the transmission the Grant frame otherwise.

During an initiator TXSS, the Sector ID field in each BF frame shall be set to a value that uniquely identifies the transmit antenna sector employed when the BF frame is transmitted. The CDOWN field in each transmitted frame shall contain the total number of transmissions remaining until the end of the initiator TXSS, including any LBIFS if required, such that the last BF frame transmission of the initiator TXSS has the CDOWN field set to 0. Each transmitted BF frame shall be separated by a time interval equal to SBIFS, unless the allocation ends as described in 10.38.6. This is indicated in Figure 10-62.

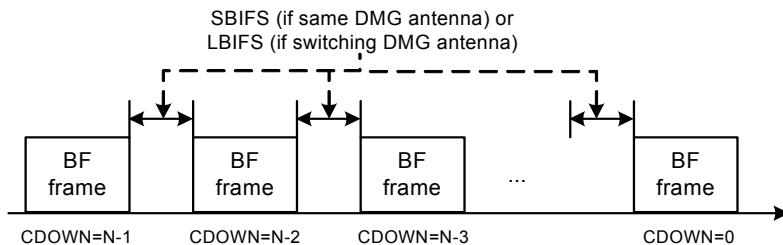

Figure 10-62—Initiator TXSS or initiator RXSS

If the initiator has more than one DMG antenna, the initiator transmits the BF frame through a number of sectors equal to the value of the last negotiated Total Number of Sectors field that was transmitted by the initiator to the responder. In each transmitted BF frame, the initiator shall set the Sector ID and DMG Antenna ID fields to uniquely identify the sector and the DMG Antenna ID, respectively, the initiator is using for the frame transmission and shall set the CDOWN field to the total number of transmissions remaining from all of the initiator's DMG antennas.

If an ISS is outside the BTI and if the responder has more than one DMG antenna, the initiator repeats its initiator sector sweep for the number of DMG antennas indicated by the responder in the last negotiated Number of RX DMG Antennas field that was transmitted by the responder. Repetitions of the initiator sector sweep are separated by an interval equal to LBIFS. In this case CDOWN indicates the number of sectors until the end of transmission from all initiator's DMG antennas to all responder's DMG antennas. At the start of an initiator TXSS, the responder should have its first receive DMG antenna configured to a quasi-omni pattern and should not change its receive antenna configuration for a time corresponding to the value of the last negotiated Total Number of Sectors field transmitted by the initiator multiplied by the time to transmit a single SSW frame, plus appropriate IFSs (10.3.2.3). After this time, the responder may switch to a quasi-omni pattern in another DMG antenna.

The initiator TXSS ends at the end time of the BF frame from the initiator with the CDOWN field set to 0. If the responder is unable to receive this frame, the responder shall assume that the initiator TXSS has completed at the expected end time of this frame.

10.38.2.2.3 Initiator RXSS

An initiator RXSS may be requested only when an initiator is aware of the capabilities of a responder, which includes the RXSS Length field. An initiator can obtain the capabilities of a responder using the Information Request and Response procedure as described in 11.30.1.

When the IsInitiatorTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 0 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP shall contain an initiator RXSS, and the initiator shall start an initiator RXSS at the start of the next SP described by the received Extended Schedule element or Grant frame.

The initiator never performs an initiator RXSS during the BTI.

During a CBAP, an initiator shall not obtain a TXOP with an initiator RXSS. When transmission of a Grant frame to the responder is used to initiate the RXSS the Beamforming Training field set to 1 and the IsInitiatorTXSS field set to 0. If a Grant Ack frame is transmitted by the responder it shall comply with 10.36.4. In the Grant Ack frame, the responder shall set the Beamforming Training field to 1. The initiator starts the initiator RXSS SIFS interval after transmission of the Grant frame or after the reception of the

Grant Ack frame if the Grant Ack Supported field in the responder's DMG Capabilities element is 1 or PIFS interval after the transmission the Grant frame otherwise.

If the initiator uses more than one transmit sector or more than one transmit DMG antenna to perform beamforming with the responder, the initiator shall perform an initiator TXSS with the responder before participating in an initiator RXSS with the responder.

During the initiator RXSS the initiator shall transmit from the DMG antenna and sector that were selected during the preceding TXSS with the responder the number of BF frames indicated by the responder in the last negotiated RXSS Length field transmitted by the responder. Each transmitted BF frame shall be transmitted with the same fixed antenna sector or pattern. The initiator shall set the Sector ID and DMG Antenna ID fields in each transmitted BF frame to a value that uniquely identifies the single sector through which the BF frame is transmitted. The initiator shall set the CDOWN field in each transmitted BF frame to contain the total number of transmissions remaining to the end of the initiator RXSS, such that the last BF frame transmission of the initiator RXSS has the CDOWN field set to 0. Each transmitted BF frame shall be separated by a time interval equal to SBIFS, except if the allocation ends as described in 10.38.6. This is indicated in Figure 10-62.

During an initiator RXSS, the responder should have its receive antenna array configured to sweep RXSS Length sectors, including any LBIFS if required, while attempting to receive SSW frames from the initiator.

The initiator RXSS ends at the end time of the SSW frame from the initiator with the CDOWN field set to 0. If the responder is unable to receive this frame, the responder shall assume that the initiator RXSS has completed at the expected end time of this frame.

10.38.2.3 Responder sector sweep (RSS)

10.38.2.3.1 General

An RSS comprises either a responder TXSS or a responder RXSS.

A responder RXSS may be performed in an RSS when the responder chooses to use only one transmit antenna pattern across each of its DMG antennas.

The responder initiates an RSS with the transmission of an SSW frame, which is the only frame allowed during an RSS.

The responder shall set the Direction subfield in the Sector Sweep field to 1 within each SSW frame transmitted during an RSS.

10.38.2.3.2 Responder TXSS

If the DMG Beacon frame immediately preceding an A-BFT contained a value of one in the IsResponderTXSS subfield of the Beacon Interval Control field, then the A-BFT is a responder TXSS A-BFT.

When the IsResponderTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 1 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains a responder TXSS, and the responder shall initiate a TXSS following the completion of the ISS in the SP described by the received Extended Schedule element or Grant frame.

When the RXSS Length field within an SSW frame used to obtain a TXOP during a CBAP is 0, the responder shall initiate a TXSS following the completion of the ISS in the TXOP described by the received SSW frame.

During a responder TXSS, the responder shall set the Sector ID and the DMG Antenna ID fields in each transmitted SSW frame to a value that uniquely identifies the sector through which the SSW frame is transmitted. The initial value of CDOWN is set to the total number of sectors in the responder (covering all DMG antennas) multiplied by the number of DMG antennas at the initiator minus one. The responder shall set the CDOWN field in each transmitted SSW frame to contain the total number of transmissions remaining to the end of the responder TXSS, including any LBIFS if required, such that the last SSW frame transmission of the responder TXSS has the CDOWN field set to 0. The responder shall transmit from its DMG antennas in increasing order of Antenna ID. Each transmitted SSW frame shall be separated by an interval of time equal to SBIFS. Transmissions are not separated by SBIFS if the allocation ends as described in 10.38.4 and 10.38.6 or if the end of an SSW slot is reached as described in 10.38.5 or when the responder completed a full sweep of all its transmit sectors and is ready to transmit to another DMG antenna of the initiator. In the latter case, the next transmission is separated from the previous transmission by LBIFS interval. This is indicated in Figure 10-63.

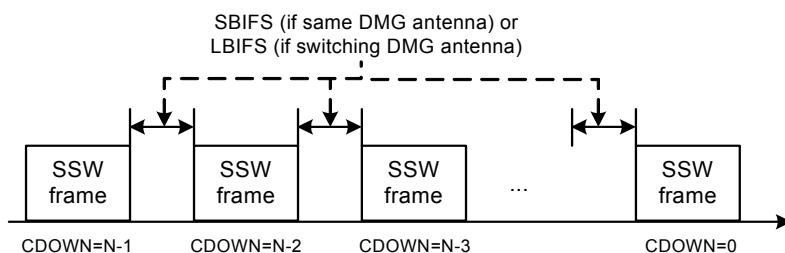

Figure 10-63—Responder TXSS or responder RXSS

A responder that has more than one DMG antenna and has set the value of the DMG Antenna Reciprocity field in its DMG Capabilities element to 0 transmits sequentially through all of the sectors of all of its DMG antennas. A responder that has more than one DMG antenna and has set the value of the DMG Antenna Reciprocity field in the responder's DMG Capabilities element to 1 transmits through the DMG antenna from which it had the best reception in the initiator sector sweep. The length of the sector sweep to each of the initiator's DMG antennas is not dependent on the value of the DMG Antenna Reciprocity field.

A responder that has only one DMG antenna should transmits through all its sectors, regardless of the setting of the DMG Antenna Reciprocity field.

The responder shall set the Sector Select field and the DMG Antenna Select field in each transmitted SSW frame to the value of the Sector ID field and DMG Antenna ID field, respectively, of the frame received with the best quality during the ISS. The determination of which frame is received with best quality is implementation dependent and beyond the scope of this standard. The responder shall set the SNR Report field to the SNR measured for the frame indicated by the Sector Select field and DMG Antenna Select field.

If the initiator has more than one DMG antenna, the responder repeats its responder sector sweep for the number of DMG antennas indicated by the initiator in the last negotiated Number of RX DMG Antennas field transmitted by the initiator. At the start of a responder TXSS, the initiator should have its receive antenna array configured to a quasi-omni antenna pattern in one of its DMG antennas for a time corresponding to the value of the last negotiated Total Number of Sectors field transmitted by the responder multiplied by the time to transmit a single SSW frame, plus any appropriate IFSs (10.3.2.3). After this time, the initiator may switch to a quasi-omni pattern in another DMG antenna.

The responder TXSS ends at the end time of the SSW frame from the responder with the CDOWN field set to 0. If the initiator is unable to receive this frame, the initiator shall assume that the responder TXSS has completed at the expected end time of this frame.

10.38.2.3.3 Responder RXSS

If the DMG Beacon frame immediately preceding an A-BFT contained a value of zero in the IsResponderTXSS subfield of the Beacon Interval Control field within the DMG Beacon, then the A-BFT is a responder RXSS A-BFT.

When the IsResponderTXSS field for a specific SP in a received Extended Schedule element or Grant frame is 0 and the Beamforming Training field of the BF Control field for that SP in the same Extended Schedule element or Grant frame is 1, then the SP contains a responder RXSS, and the responder shall initiate an RXSS following the completion of the ISS in the SP described by the received Extended Schedule element or Grant frame.

When the RXSS Length field within an SSW frame used to obtain a TXOP during a CBAP is equal to a nonzero value, the responder shall initiate an RXSS following the completion of the ISS in the TXOP described by the received SSW frame.

If the responder chooses to use more than one transmit sector or more than one transmit DMG antenna to perform beamforming with the initiator, the responder shall perform a responder TXSS with the initiator before participating in a responder RXSS with the initiator.

During the responder RXSS, the responder shall transmit the number of SSW frames indicated by the initiator in the initiator's most recently transmitted RXSS Length field (non-A-BFT) or FSS field (A-BFT) from the DMG antenna and sector that were selected during the preceding TXSS with the initiator. The responder shall set the Sector ID and DMG Antenna ID fields in each transmitted frame to a value that uniquely identifies the sector and DMG antenna, respectively, through which the BF frame is transmitted. The responder shall set the CDOWN field in each transmitted SSW frame to contain the total number of transmissions remaining until the end of the responder RXSS, such that the last SSW frame transmission of the responder RXSS has the CDOWN field equal to 0. Each transmitted SSW frame shall be separated by an interval of time equal to SBIFS, except if the allocation ends as described in 10.38.6 or if the end of an SSW slot is reached as described in 10.38.5. This is indicated in Figure 10-63.

The responder shall set the Sector Select field and the DMG Antenna Select field in each transmitted SSW frame to the value of the Sector ID field and the DMG Antenna ID field, respectively, of the frame received with the best quality during the ISS. The determination of which frame is received with best quality is implementation dependent and beyond the scope of this standard.

At the start of a responder RXSS, the initiator should have its receive antenna array configured to sweep over RXSS Length sectors, including any LBIFS if required, when it attempts to receive frames from the responder until the completion of the responder RXSS.

The responder RXSS ends at the end time of the SSW frame from the responder with the CDOWN field set to 0. If the initiator is unable to receive this frame, the initiator shall assume that the responder RXSS has completed at the expected end time of this frame.

10.38.2.4 Sector sweep (SSW) feedback

An SSW feedback procedure occurs following each RSS.

During an SSW feedback procedure, the initiator shall transmit an SSW-Feedback frame to the responder.

During an SSW feedback procedure, the responder should have its receive antenna array configured to a quasi-omni antenna pattern in the DMG antenna through which it received with the highest quality during the ISS, or to the best antenna configuration it has found during RXSS if RXSS has been performed during the ISS, and should not change its receive antenna configuration when it communicates with the initiator until the expected end of the SSW feedback procedure.

When responder TXSS was performed during the preceding RSS, the initiator shall set the Sector Select field and the DMG Antenna Select field in the SSW-Feedback frame it transmits to the value of the Sector ID field and DMG Antenna ID field, respectively, of the frame received with the best quality during the responder TXSS. The determination of which frame is received with the best quality is implementation dependent and beyond the scope of this standard. In addition, the initiator shall set the SNR Report field to the SNR measured for the frame received by the sector and DMG antenna indicated by the Sector Select field and DMG Antenna Select field. The SSW-Feedback frame shall be transmitted through the sector identified by the value of the Sector Select field and DMG Antenna Select field received from the responder during the preceding responder TXSS.

When responder RXSS was performed during the preceding RSS, the Sector Select field and the DMG Antenna select field in the transmitted SSW-Feedback frame are reserved. The initiator shall set the SNR Report field to the SNR measured on the frame on the receive sector designated by the RSS. The SSW-Feedback frame shall be transmitted through the sector identified by the value of the Sector Select field received from the responder during its most recently completed RSS with the initiator.

The initiator may include transmit training as part of the beam refinement phase by setting the TX-TRN-REQ field to 1 in the SSW Feedback frame and setting the L-RX field to indicate the length of the training sequence it requests the responder to use in the beam refinement phase. The initiator may carry out the MIDC subphase as part of the beam refinement by setting the BC-REQ field to 1 (to request a BC subphase) and setting the MID-REQ field to 1 (to request an MID subphase); in this case, the L-RX field shall be set to indicate the number of receive AWVs the initiator uses during the MID subphase.

If the responder receives an SSW-Feedback frame from the initiator before it completes the RSS with the initiator such as described in 10.38.5, the responder may cease the RSS.

10.38.2.5 SSW ack

When present, the SSW ack procedure occurs following an SSW feedback procedure.

When a responder TXSS is performed during an RSS, the responder shall transmit an SSW-Ack frame to the initiator to perform an SSW ack procedure. The SSW-Ack frame shall be transmitted through the sector identified by the value of the Sector Select field and the DMG Antenna Select field received from the initiator in the last SSW-Feedback frame.

When an RXSS was performed during an RSS, an SSW-Ack frame shall be sent by the responder to the initiator. The SSW-Ack frame should be sent using the DMG antenna indicated in the DMG Antenna Select field in the last SSW-Feedback frame.

The responder may include transmit training as part of the beam refinement phase by setting the TX-TRN-REQ field to 1 in the SSW-Ack frame and setting the L-RX field to indicate the length of the training sequence it requests the initiator to use in the beam refinement phase, as described in 9.5.4. The responder may carry out a MID subphase by setting the MID-REQ bit to 1 in the BRP Request field of the SSW frame. In this case, it shall also set the L-RX field to indicate the number of receive AWVs it uses during the MID subphase. The responder may carry out a BC subphase by setting the BC-REQ bit to 1. If the initiator has set either the MID-REQ or the BC-REQ fields to 1 in the SSW-Feedback frame, the responder may set the MID-Grant or the BC-Grant fields to 1, or both, to grant the requests.

At the start of an SSW ack procedure, the initiator should have its receive antenna array configured to a quasi-omni antenna pattern using the DMG antenna through which it received with the highest quality during the RSS, or the best receive sector if an RXSS has been performed during the RSS, and should not change its receive antenna configuration while it attempts to receive from the responder until the expected end of the SSW ack procedure.

10.38.3 Beam Refinement Protocol (BRP) phase

10.38.3.1 General

BRP is a process in which a STA trains its RX and TX antenna array(s) and improves its TX antenna configuration and RX antenna configuration using an iterative procedure. BRP may be used regardless of the antenna configuration a STA supports.

The BRP phase is composed of a BRP setup subphase, a Multiple sector ID Detection (MID) subphase, a Beam Combining (BC) subphase, a subset of the previous subphases, and one or more beam refinement transactions. BRP setup allows STAs to exchange beam refinement capability information and to request the execution of the other BRP subphases. MID and BC (collectively, the MIDC subphase) are optionally used to find better initial AWVs for iterative beam refinement than might have been found by SLS due to imperfect quasi-omni receive antenna patterns. In MID, a quasi-omni transmit pattern is tested against a number of receive AWVs; this reverses the scanning roles from the transmit sector sweep. In BC, a small set of transmit and receive AWVs are tested in pairwise combinations, thus avoiding the use of quasi-omni patterns. Finally, given the starting point from SLS or MIDC, STAs can explore a broader set of transmit and receive AWVs using a request/response exchange referred to as a *beam refinement transaction*.

The BRP setup subphase may be skipped if the BRP follows an SSW-Ack frame and no MID or BC subphases were requested during the SLS. MID and BC subphases can be skipped if either STA indicates that the subphase is not needed by setting the MID-REQ and BC-REQ fields to 0 or by setting the MID-Grant and BC-Grant fields to 0. The beam refinement transaction can be skipped if both sides indicate that the transaction is not needed by setting the L-RX and TX-TRN-REQ fields to 0.

The BRP setup subphase is defined in 10.38.3.2.

The MID subphase is composed of either an R-MID subphase or an I-MID subphase or both, which are composed of one or more transmissions of BRP-RX packets (20.10.2.2), followed by feedback contained in the next BRP frames from the initiator and responder.

The BC subphase is composed of either an R-BC subphase or an I-BC subphase or both, which are composed of transmission of BRP-RX packets to select a beam, followed by feedback.

A beam refinement transaction is a set of BRP frames consisting of beam refinement requests and responses. A beam refinement request can be either a transmit beam refinement request or a receive beam refinement request or both.

A transmit beam refinement request (TX-TRN-REQ field within the BRP Request field set to 1) indicates the need for transmit antenna array training by the transmitting STA. The BRP packet that has the TX-TRN-REQ set to 1 (or the next BRP packet from this STA) shall include transmit training (TRN-T) subfields appended to it. The STA responding to the BRP packet shall include feedback based on measurements it performed during the reception of the BRP packet. The feedback type is dictated by the FBCK-TYPE field within the DMG Beam Refinement element contained in the BRP packet.

A receive beam refinement request (L-RX field within the BRP Request field greater than zero) indicates the need of the receive antenna array training for the transmitting STA. The responding STA shall respond with a BRP packet with receive training (TRN-R) subfields appended to it.

Requests and responses can be combined in the same frame. As an example, the same frame can be both a transmit beam refinement request and a receive beam refinement request. The same frame can also be used as receive beam refinement response and a receive beam refinement request. See the example in Figure 10-64.

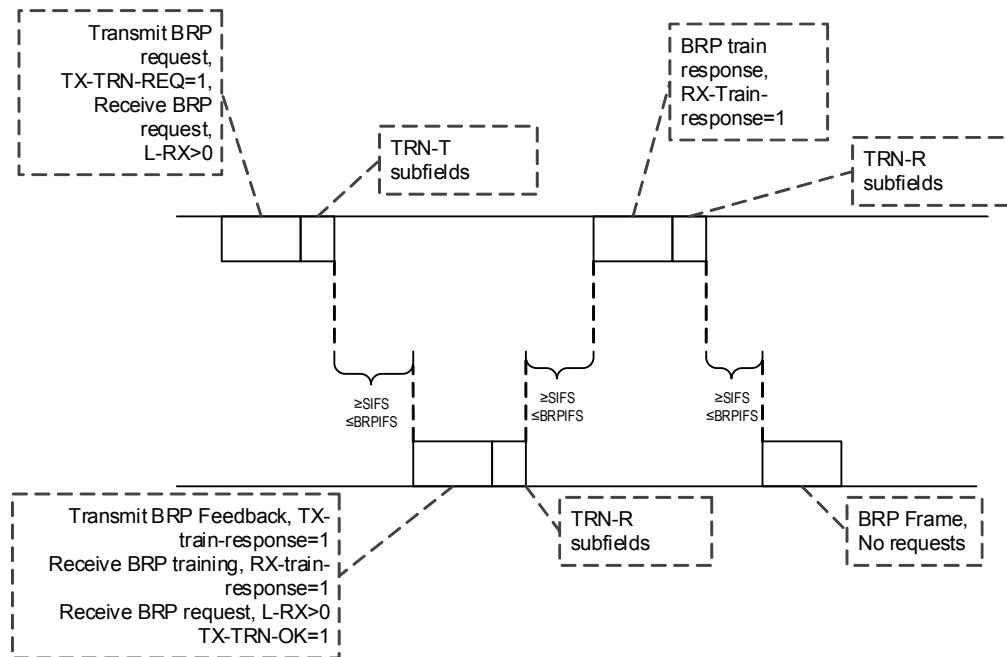

Figure 10-64—Example of beam refinement transaction

A beam refinement response is separated from a preceding beam refinement request by at least a SIFS interval and at most a BRPIFS interval provided sufficient time is available for the complete transmission of those frames within the SP allocation or TXOP. Similarly, a beam refinement request, if any, is separated from a preceding beam refinement response by at least a SIFS interval and at most a BRPIFS interval provided sufficient time is available for the complete transmission of the beam refinement request within the SP allocation or TXOP.

When performing BRP, if a responding STA requires longer than SIFS to transmit a BRP frame as a response for beam refinement training request from a requesting STA, the responding STA should keep the IFS not longer than SIFS by transmitting one or more PPDUs to the requesting STA.

When the beam refinement occurs within the same allocation as the SLS, the SLS initiator is the beam refinement initiator. If the beam refinement occurs in a separate allocation, the STA that transmits the first beam refinement request is the beam refinement initiator. The other STA is the beam refinement responder.

A beam refinement transaction is complete when one of the following conditions is met:

- the initiator determines that it does not need further training and it has received a BRP frame with no training requests from the beam refinement responder.
- a duration equal to BRPIFS plus aSlotTime has elapsed since the last transmission from the beam refinement initiator to the refinement responder without a response from the beam refinement responder.

In Figure 10-64, the first packet (from the initiator) has TX-TRN-REQ=1, the L-RX field has a value greater than zero and TRN-T subfields are appended to the packet. The second packet (from the responder) has a

value greater than zero in the L-RX field, the TX-train-response field set to 1, the RX-train-response field set to 1, and TRN-R subfields are appended to the packet. The last packet (from the initiator) has RX-train-response set to 1 and TRN-R subfields are appended to the packet.

10.38.3.2 BRP setup subphase

The BRP setup subphase is used to exchange the intent and capabilities to conduct some or all of the subphases and beam refinement transactions in a subsequent BRP phase. The BRP setup subphase is used to set up the MIDC subphase, but can also be used to set up beam refinement transactions.

The BRP setup subphase shall be used in the following two cases:

- When the RSS part of the SLS phase occurred in an A-BFT, in which case the SSW-Ack frame was not part of the SLS.
- When the initiator set the MID-REQ or BC-REQ fields in the SSW-Feedback frame to 1 or the responder set the MID-REQ or BC-REQ fields in the SSW-Ack frame to 1.

The BRP setup subphase starts with the initiator sending a BRP packet with the Capability Request subfield set to 1 and with the remaining subfields within the BRP Request field set according to the initiator's need for an MID subphase, a BC subphase, and a beam refinement subphase. The BRP setup subphase can also start when the responder grants a MID-REQ or BC-REQ through the SSW-Ack frame or when the responder requests MID or BC in the SSW-Ack frame. Upon receiving a BRP packet with the Capability Request subfield set to 1, the responder shall respond with a BRP packet with the subfields within the BRP Request field set to indicate the presence of an MID subphase, a BC subphase and a beam refinement subphase. This process is repeated until the responder transmits to the initiator a BRP packet with the Capability Request subfield set to 0 and the initiator sends as a response a BRP packet with the Capability Request subfield also set to 0. The BRP packet from the initiator that initiates the termination of the BRP setup subphase can be the first BRP packet of the BRP phase, either as part of beam refinement or as part of a MID or BC subphase.

A DMG STA (either initiator or responder) requests MID and BC subphases (see 10.38.6.3.2) by setting both the MID-REQ and BC-REQ subfields to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack or BRP frame. It shall also set the L-RX subfield in the BRP Request field to the number of RX AWV settings it needs in each BRP-RX packet during the MID subphase. The peer STA grants the request by setting the MID-Grant and BC-Grant subfields to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting DMG STA. If either the MID or BC were not granted by the peer STA, the MID and BC subphases shall not occur.

A DMG STA (either initiator or responder) requests an MID only subphase (see 10.38.6.3.3) by setting the MID-REQ subfield to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack or BRP frame. The STA shall also set the L-RX subfield in the BRP Request field to the number of RX AWV settings it needs in each BRP-RX packet during the MID-subphase. The peer STA grants the request by setting the MID-Grant subfield to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting DMG STA. The Capability Request subfield and request subfields (TX-TRN-REQ, L-RX, MID-REQ, BC-REQ) within the granting frame shall be set to 0.

If the MID-REQ was granted, the requesting STA shall transmit a BRP frame with the SNR Present and Sector ID Order Present subfields set to 1 and with the Number of Measurements field in the FBCK-TYPE field indicating the number of SNR measurements from the last SLS phase. In the Channel Measurement Feedback element, the requesting STA sets the SNR subfields to the SNRs corresponding to the TX sectors received during the SLS phase. In the Sector ID Order subfield, the requesting STA lists the sector IDs of the received sectors. The Capability Request field within the BRP frame shall be set to 0. The MID subphase starts with the transmission of a BRP packet from the peer STA after the reception of the list of sectors. A STA that has granted a MID only request shall not request MID or BC in the response packet. The STA may

request MID or BC in the last packet it transmits to the requesting STA as part of the MID. The MID only subphase shall not occur if it was not granted by the peer STA.

A DMG STA (either initiator or responder) requests a BC only subphase (see 10.38.6.3.4) by setting the BC-REQ subfield to 1 in the BRP Request field of an SSW-Feedback, SSW-Ack, or BRP frame. The peer STA (either a responder or initiator) grants the request by setting the BC-Grant subfield to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the requesting STA. The BC subphase shall not occur if the peer STA does not grant the request.

A DMG STA indicates that beam refinement transactions (10.38.6.4.2) occur by setting the L-RX field to a value greater than 0 to indicate the need for receive beam refinement or by setting the value of the TX-TRN-REQ field to 1 to indicate the need for transmit beam refinement or by setting both. The beam refinement transactions shall occur if at least one of these conditions is met.

If the initiator has requested an MID subphase by setting the MID-REQ subfield or the BC-REQ subfield to 1 and the responder rejected by setting in the response the MID-Grant subfield or the BC-Grant subfield to 0, respectively, the initiator should send a BRP frame with the MID-REQ field set to 0 and the L-RX field set to indicate the number of TRN-R fields the initiator requests for use in the BRP transaction.

If the responder has requested an MID subphase by setting the MID-REQ subfield or the BC-REQ subfield to 1 and the initiator rejected by setting in the response the MID-Grant or the BC-Grant subfields to 0, the initiator should send a BRP frame with the Capability Request subfield set to 1. The responder shall respond with a BRP frame with the MID-REQ field set to 0 and the L-RX field set to indicate the number of TRN-R fields the responder requests for use in the BRP transaction.

Beam refinement transactions shall occur following a MIDC subphase when one or both of the following conditions are met at the last BRP frame transmitted by either the initiator or responder as part of the MID or BC subphases:

- a) Either the initiator or the responder set the L-RX field to a value greater than 0.
- b) Either the initiator or responder has set the value of the TX-TRN-REQ field to 1.

If within the appropriate IFS the initiator does not receive a response from the responder to a packet transmitted to the responder, the initiator may retransmit the packet.

After the BRP setup subphase, beamforming training shall immediately continue to the next phase (i.e., either MIDC subphase or the beam refinement transactions). Examples of BRP setup subphase procedures are illustrated in Figure 10-65, Figure 10-66, Figure 10-70, Figure 10-71, and Figure 10-77.

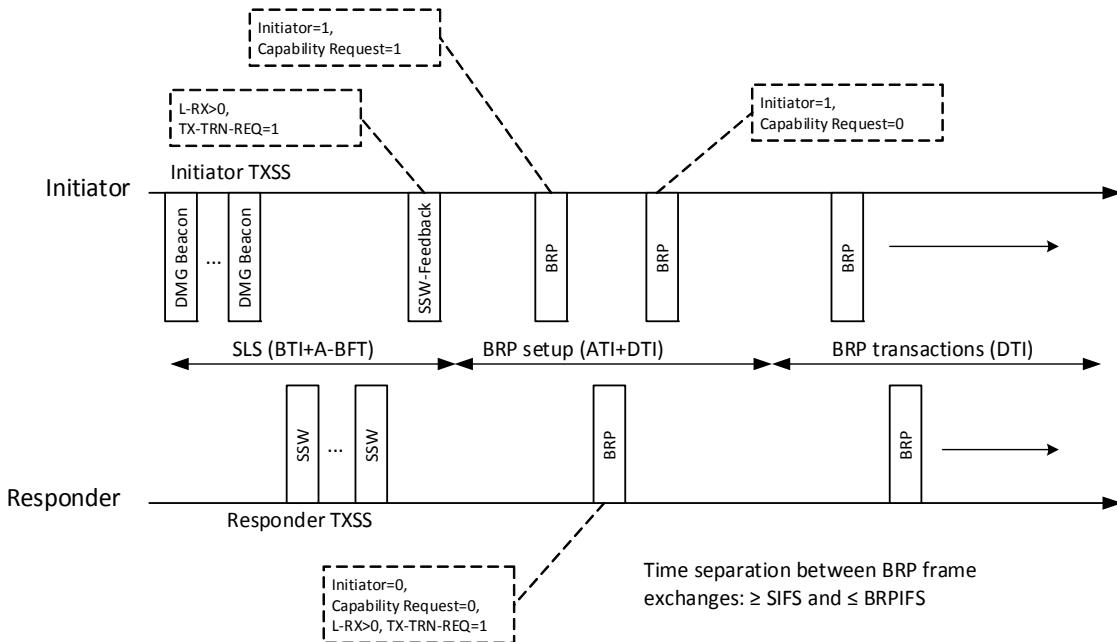

Figure 10-65—Example of BRP setup subphase procedure (SLS in BTI and A-BFT)

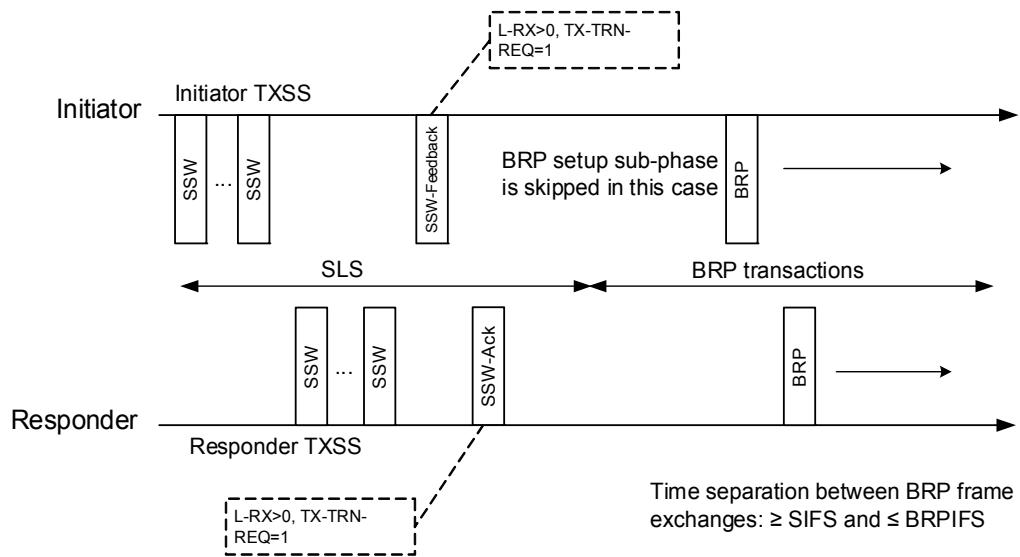

Figure 10-66—Example of skipping the BRP setup subphase (SLS in DTI)

10.38.4 Beamforming in BTI

In the BTI, the AP or PCP performs an initiator TXSS as the first part of the SLS with the transmission of at least one DMG Beacon frame. The AP or PCP does not transmit SSW frames in the BTI (10.38.2.2.1).

The AP or PCP may fragment the initiator TXSS over multiple consecutive BTIs by not transmitting a DMG Beacon frame through all sectors available to the AP or PCP in a single BTI. In a BTI with a fragmented initiator TXSS, the AP or PCP shall transmit DMG Beacon frames with the Fragmented TXSS field set to 1.

Otherwise, the AP or PCP shall set the Fragmented TXSS field to 0. The AP or PCP shall not change the duration of the next BTI if at least one of the DMG Beacon frames transmitted in the current BTI have the Fragmented TXSS field set to 1. The CDOWN field shall be set to the total number of transmissions remaining to the end of the initiator TXSS, such that the last DMG Beacon frame transmission of the initiator TXSS has the CDOWN field set to 0 (i.e., in a fragmented TXSS, the value of the CDOWN field covers the total number of transmissions remaining in the fragmented TXSS). The TXSS Span field shall be set to the total number of beacon intervals it takes the AP or PCP to complete the entire TXSS phase. The Duration field within each transmitted DMG Beacon frame shall be set to the time remaining until the end of the current BTI.

When an AP or PCP has more than one DMG antenna, the TXSS shall cover all of the sectors in all DMG antennas. The TXSS Span field indicates the total number of beacon intervals it takes the AP or PCP to cover all sectors in all DMG antennas. The value of the TXSS Span field shall be lower than dot11MaximalSectorScan. The AP or PCP shall not change DMG antennas within a BTI. The AP or PCP has a regular schedule of transmitting through each DMG antenna (see 10.38.5.4).

NOTE—If an unassociated responder receives a DMG Beacon frame in the BTI with a fragmented initiator TXSS, the responder may start a responder TXSS in the following A-BFT, or it may scan for the number of beacon intervals indicated in a received TXSS Span field in order to cover a complete initiator TXSS and find a suitable TX sector from the AP or PCP.

Each subfield in the Beacon Interval Control field and DMG Parameters field of each DMG Beacon frame transmitted by the AP or PCP shall retain the same value from start to completion of a TXSS phase.

10.38.5 Beamforming in A-BFT

10.38.5.1 Allocation of A-BFT

The AP or PCP shall allocate an A-BFT period MBIFS following the end of a BTI that included a DMG Beacon frame transmission with Next A-BFT equal to 0.

Following the end of a BTI, the AP or PCP shall decrement the value of the Next A-BFT field by 1 provided it is not equal to 0 and shall announce this value in the next BTI. The AP or PCP may increase the Next A-BFT field value following a BTI in which the Next A-BFT field was equal to 0. A STA shall consider that a BTI is completed at the expiration of the value within the Duration field of the last DMG Beacon frame received in that BTI.

All DMG Beacon frames transmitted within the number of beacon intervals specified within the most recently updated TXSS Span field have the same value for each subfield within the Beacon Interval Control field (11.1.3.3).

10.38.5.2 Operation during the A-BFT

Beamforming training in the A-BFT consists of the RSS and SSW feedback procedures of the SLS between the AP or PCP and a STA.

In the A-BFT, the AP or PCP is the initiator and the STA is the responder in the RSS part of the SLS (10.38.2.3). The BRP phase shall not be performed within the A-BFT. A STA shall not transmit in the A-BFT of a beacon interval if it does not receive at least one DMG Beacon frame during the BTI of that beacon interval.

A DMG STA that receives a DMG Beacon frame with the Discovery Mode field equal to 1 may transmit in the A-BFT following the BTI where the DMG Beacon frame is received if at least one of the following conditions is met:

- The CC Present field within the received DMG Beacon frame is equal to 1 and the STA's MAC address is equal to the value of the A-BFT Responder Address subfield within the received DMG Beacon frame.
- The CC Present field within the received DMG Beacon frame is equal to 1, the value of the A-BFT Responder Address subfield within the received DMG Beacon frame is a group address of a group to which the STA belongs, and the responding STA's role matches the role identified by the value of the BSS Type subfield within the received DMG Beacon frame and the "Responding STA role" column of Table 9-65.
- The CC Present field within the received DMG Beacon frame is equal to 0

If none of these conditions is met following the reception of a DMG Beacon frame with the Discovery Mode field equal to 1, the STA shall not transmit in the A-BFT.

The A-BFT is slotted and the length of the A-BFT is an integer multiple of the sector sweep slot time. The structure of the A-BFT is shown in Figure 10-67. The AP or PCP shall announce the size of the A-BFT in the A-BFT Length subfield of the Beacon Interval Control field (9.3.4.2). The first SSW slot begins at the start of the A-BFT, and the following SSW slots are adjacent and nonoverlapping. An SSW slot (Figure 10-68) is a period of time within the A-BFT that can be used by a responder to transmit at least one SSW frame. An SSW slot has a duration of aSSSlotTime. aSSSlotTime is defined to be

$$\text{aSSSlotTime} = \text{aAirPropagationTime} + \text{aSSDuration} + \text{MBIFS} + \text{aSSFBDuration} + \text{MBIFS}$$

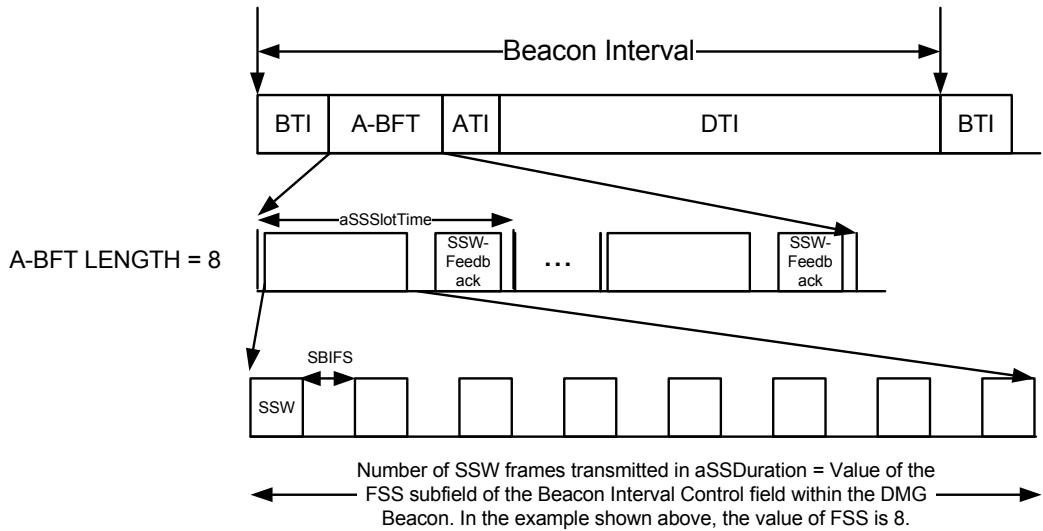

where

| | |
|---------------------|---|
| aAirPropagationTime | accounts for the propagation delay between the initiator and the responder |
| aSSDuration | (11.39) provides time for a responder to transmit up to the number of SSW frames announced in the FSS subfield of the Beacon Interval Control field in the DMG Beacon |
| aSSFBDuration | provides time for the initiator to perform an SSW feedback procedure (see 11.39) |

The initiator shall set the FSS subfield of the Beacon Interval Control field in the DMG Beacon frame to a value that is no less than aSSFramesPerSlot.

If the IsResponderTXSS subfield of the Beacon Interval Control field is equal to 1, the A-BFT shall be used to perform a responder TXSS. Otherwise, the A-BFT shall be used to perform a responder RXSS. In the case of a responder RXSS, the same slotted structure described above is used and the responder shall transmit the number of SSW frames announced in the FSS field in the DMG Beacon. If the AP or PCP allocates the A-BFT as a responder RXSS, it should set the value of the FSS field within the Beacon Interval Control to the number of receive sectors supported by the AP or PCP. The AP or PCP shall allocate the A-BFT as a responder TXSS at least once every dot11ABFRTXSSSwitch beacon intervals in which an A-BFT is present.

At the start of each A-BFT, the responder(s) shall invoke a random backoff procedure to initiate or resume an RSS as follows. The random backoff procedure begins at the start of the A-BFT with the responder selecting a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length), i.e., 0 to A-BFT Length – 1, where A-BFT Length is the value of the A-BFT Length field in the last received DMG Beacon. The responder shall decrement the backoff count by one at the end of each SSW slot, even if the CS function at the responder indicates the medium busy condition for that SSW slot. The responder may initiate the RSS only at the start of the SSW slot for which the backoff count is 0 at the beginning of the SSW slot.

Example of A-BFT with length 8 and with each SSW slot accommodating 8 SSW frames. A possible contention between 3 STAs is shown in the figure below: STAs A, B and C are competing for access. All STAs choose a random value between [0,7]. STA A chooses value = 2, while STAs B and C choose value = 5, which might result in a collision.

Figure 10-67—A-BFT structure

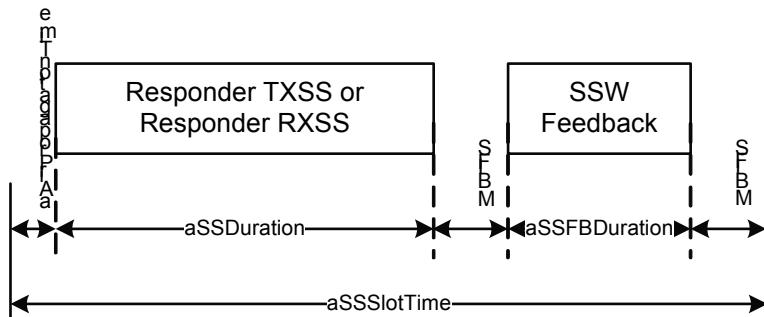

Figure 10-68—SSW slot (aSSSlotTime) definition

The responder shall transmit no more SSW frames within an SSW slot than indicated in the value of the FSS subfield in the DMG Beacon. If the responder has more SSW frames to transmit as part of the RSS, but is not allowed to send any more SSW frames in the current SSW slot, then the responder may resume the RSS at the start of the following SSW slot provided that the A-BFT has not ended. If the responder cannot complete the RSS before the end of the A-BFT, it may use the same backoff procedure described above to resume the RSS at the next A-BFT for which the value of the IsResponderTXSS field is the same as the current A-BFT.

The initiator shall initiate an SSW feedback procedure to a responder (10.38.2.4) at a time such that the beginning of the first symbol of the SSW-Feedback frame on the WM occurs at aSSFBDuration + MBIFS before the end of the SSW slot. A responder that transmitted at least one SSW frame within an SSW slot shall be in quasi-omni receive mode for a period of aSSFBDuration ending MBIFS before the end of the

SSW slot. The initiator may initiate an SSW feedback procedure to the responder at an SSW slot even if the responder did not complete RSS within that SSW slot. If the initiator transmits an SSW-Feedback under this circumstance, it can transmit an Announce frame to the responder in an ATI. Following the reception of the Announce frame, the responder can respond with an SPR frame requesting time for the responder to continue with the RSS. Alternatively, the responder can transmit an SPR frame to the AP or PCP in accordance with the channel access rules.

The information contained in an SSW-Feedback frame is based on the SSW frames received during the SSW slot in which the SSW-Feedback frame was transmitted. To communicate with each other following an SLS, an initiator and responder should use the information contained within the SSW-Feedback frame that had the highest value in its SNR Report field and was transmitted or received, respectively, as part of the most recent SLS between the initiator and responder.

A responder that receives an SSW-Feedback frame from the initiator during an A-BFT that was allocated with a DMG Beacon frame with Discovery Mode equal to 1 should not attempt to access the following aMaxABFTAccessPeriod A-BFT allocations to redo beamforming with the initiator, unless in the BTI preceding the A-BFT the responder receives a DMG Beacon frame that has the Discovery Mode field equal to 1, the CC Present field equal to 1 and the value of the A-BFT Responder Address subfield equal to the responder's MAC address. This allows other STAs the opportunity to successfully contend for A-BFT access and perform beamforming with the initiator.

The responder may attempt to restart the RSS within the same A-BFT if it does not receive an SSW-Feedback frame from the initiator by the end of the SSW slot in which it completes the RSS. To do this, the responder shall invoke the random backoff procedure beginning at the start of the SSW slot following the completion of the RSS. The responder shall select a backoff count as a random integer drawn from a uniform distribution [0, A-BFT Length), i.e., 0 to A-BFT Length – 1, where A-BFT Length is the value of the A-BFT Length field in the last received DMG Beacon. The responder shall decrement the backoff count by one at the end of each SSW slot, even if the CS function at the responder indicates the medium busy condition for that SSW slot. The responder may restart the RSS at the start of the SSW slot for which the backoff count is 0 at the beginning of the SSW slot provided the A-BFT still has SSW slots available.

At the end of an A-BFT the responder shall cancel a backoff procedure that was started during the A-BFT, but has not been completed at the end of the A-BFT. As described above, the responder invokes a random backoff procedure at the start of each A-BFT.

Each STA maintains a counter, FailedRSSAttempts, of the consecutive number of times the STA initiates RSS during A-BFTs but does not successfully receive an SSW-Feedback frame as a response. If FailedRSSAttempts exceeds dot11RSSRetryLimit, the STA shall select a backoff count as a random integer drawn from a uniform distribution [0, dot11RSSBackoff), i.e., 0 to dot11RSSBackoff – 1. The responder shall decrement the backoff count by one at the end of each A-BFT period in the following beacon intervals. The responder may re-initiate RSS only during an A-BFT when the backoff count becomes zero. The STA shall set FailedRSSAttempts to 0 upon successfully receiving an SSW-Feedback frame during the A-BFT.

In an A-BFT, the responder shall not initiate an SSW ack procedure (10.38.2.5) in response to the reception of an SSW-Feedback frame from the initiator. The SSW ack procedure occurs within the DTI of a beacon interval (10.38.6.2); it does not occur otherwise.

If the AP or PCP receives an SSW frame from the responder during the RSS with the Poll Required field within the SSW frame equal to 1 and the TDDTI field within the AP's or PCP's DMG Capabilities element is 1, the AP or PCP shall allocate time for the responder and the AP or PCP to communicate during the ATI or within an SP of the DTI of at least one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the SSW frame was received. This can be done through the Extended Schedule element or the transmission of a Poll or Grant frame addressed to the responder, and the allocated time can be used for at least one of association, authentication, and service period request.

After transmitting an SSW-Feedback frame to the responder, the initiator shall send a BRP frame with the Capability Request subfield within the BRP Request field set to 1 and addressed to the responder. The BRP frame shall be sent in one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the RSS phase with the responder was last completed. The BRP frame shall be transmitted at MCS 0 using the sector identified by the Sector Select field received from the responder during the RSS.

In an ATI after the completion of the SSW feedback procedure, a responder should have its receive antenna configured to a quasi-omni antenna pattern in the DMG antenna in which it received the best sector from the initiator during the preceding ISS in order to receive an Announce, Grant, or BRP frame (with the Capability Request subfield within the BRP Request field set to 1) from the initiator, while the initiator should configure its transmit DMG antenna to the value of the Sector Select and the DMG Antenna Select fields received from the responder during the preceding RSS. If the responder does not receive an Announce or Grant frame from the initiator with the RA address equal to the responder's MAC address until aMinBTIPeriod beacon intervals after the beacon interval in which the SLS phase with the initiator was last attempted, it may retry BF with the initiator in the A-BFT.

NOTE—Due to the multiple access nature of RSS in the A-BFT, the AP or PCP might not receive the best sector for communication with the STA. The AP or PCP might schedule an SP to perform BF again with the STA to find the best sector for communication with the STA.

10.38.5.3 STA Beamforming after A-BFT

The initiator shall either initiate BRP execution with the responder in the next CBAP or shall schedule time in the DTI for BRP execution with the responder if the initiator needs BRP training or the responder indicated a need for training (by setting any of the L-RX, TX-TRN-REQ, MID-REQ, or BC-REQ fields to a nonzero value) as a response to an SSW-Feedback or BRP frame with Capability Request subfield within the BRP Request field set to 1.

The responder may initiate BRP in a CBAP by sending a BRP frame with any of the training request fields (i.e., L-RX, TX-TRN-REQ, MID-REQ, BC-REQ) set to 1.

To schedule time in the DTI for BRP execution with a responder, the initiator may use any of the following methods:

- 1) Allocate an SP with the Beamforming Training subfield set to 1 in the Allocation field within an Extended Schedule element. The source of the SP shall be the initiator and the destination of the SP shall be the responder. The Extended Schedule element is carried in DMG Beacon or Announce frames, as defined in 10.36.4. The source AID of the allocation shall be set to the AID of the initiator. The destination AID of the allocation shall be set to the AID of the responder or the broadcast AID.
- 2) Allocate a CBAP in which the initiator or responder may start beamforming training with each other. The CBAP allocation is announced in an Extended Schedule element carried in a DMG Beacon or an Announce frame, as defined in 10.36.4. The source AID of the CBAP shall be set to the AID of the initiator or to the broadcast AID. The destination AID of the CBAP may be set to the AID of the responder or to the broadcast AID.
- 3) Use a Grant frame to allocate either a CBAP or an SP in which the initiator or responder may start beamforming with each other. In the Grant frame, the initiator shall set the RA field to the MAC address of the responder and the TA field to the MAC address of the initiator. In the Dynamic Allocation Info field of the Grant frame, the AllocationType field shall be set to indicate CBAP or SP, the source AID field shall be set to the AID of the initiator, the destination AID field shall be set to the AID of the responder or the broadcast AID, and the Allocation Duration field shall be set to the expected duration of the BRP phase.
- 4) Allocate a DTI as CBAP only as defined in 10.36.4.

At least one of the above allocations shall occur during one of the following aMinBTIPeriod beacon intervals beginning with the beacon interval in which the SLS phase with the responder was last completed.

The duration of the allocation, as specified in the Allocation Block Duration (see 9.4.2.132), shall cover at least the expected duration of the BRP phase.

If the initiator receives at least one SSW frame from a responder within an A-BFT but did not transmit an SSW-Feedback frame to the responder within that A-BFT, the initiator may schedule time in the DTI to perform the ISS and RSS. To do that, the initiator may use one of the methods above. The Allocation Block Duration field shall be set to cover at least the ISS and RSS.

The initiator may transmit an Announce frame to the responder during the ATI to announce a CBAP allocation in the beacon interval. If the responder receives the Announce frame with a CBAP allocation, the responder may contend for a TXOP during a CBAP to perform the BRP execution with the initiator or continue the RSS with the initiator.

Any Announce or Grant frame the initiator sends to a responder after initiating beamforming with the responder in the A-BFT but before beamforming with the responder is completed shall be transmitted at MCS 0 using the sector identified by the Sector Select field received from the responder in the RSS.

The execution of the beamforming procedure in an allocation in the DTI is described in 10.38.6.

10.38.5.4 Beamforming in A-BFT with multiple DMG antennas

An AP or PCP shall receive through a quasi-omni antenna pattern from a single DMG antenna throughout an A-BFT unless RXSS is used in the A-BFT, in which case it switches through antenna patterns as described in 10.38.5.2.

An AP or PCP shall have an A-BFT every k beacon intervals, where k is the value indicated by the N BIs A-BFT subfield in the Beacon Interval Control field. In an A-BFT, the AP or PCP shall receive in a quasi-omni antenna pattern using the DMG antenna indicated by the value of the DMG Antenna ID subfield within the SSW field transmitted in the DMG Beacon. An AP or PCP with multiple DMG antennas has a regular schedule of receiving through each DMG antenna corresponding to the DMG antenna in which a DMG Beacon frame is transmitted through. The AP or PCP shall switch RX DMG antenna every l allocations, where l is the value of the N A-BFT in Ant subfield within the Beacon Interval Control field.

In each DMG Beacon, the A-BFT Count subfield in the Beacon Interval Control field indicates the number of A-BFTs that have passed since the AP or PCP last switched RX DMG antennas.

10.38.6 Beamforming in DTI

10.38.6.1 General

An initiator and responder may perform BF training within an SP or CBAP.

An initiator shall determine the capabilities of the responder prior to initiating BF training with the responder if the responder is associated. A STA may obtain the capabilities of other STAs through the Information Request and Information Response frames (11.30.1) or following a STA's association with the PBSS/infrastructure BSS. The initiator should use its own capabilities and the capabilities of the responder to compute the required allocation size and TXOP duration to perform BF training and BF training related timeouts.

An initiator may request the AP or PCP to schedule an SP to perform BF training with a responder by setting the Beamforming Training subfield in the BF Control field of the DMG TSPEC element or SPR frame to 1.

The AP or PCP shall set the Beamforming Training subfield to 1 in the Allocation field of the Extended Schedule element if the Beamforming Training subfield in the BF Control field of the DMG TSPEC element or SPR frame that generated this Allocation field is equal to 1. The AP or PCP should set the Beamforming Training subfield in an Allocation field of the Extended Schedule element to 0 if this subfield was equal to 1 when the allocation was last transmitted by the AP or PCP in an Extended Schedule element and if, since that last transmission, the AP or PCP did not receive a DMG TSPEC element for this allocation with the Beamforming Training subfield equal to 1.

10.38.6.2 SLS phase execution

For BF training in the DTI, both the initiator and responder shall use the SSW frame for the ISS and RSS.

The initiator shall begin an ISS (10.38.2.2) at the start of an SP allocation or TXOP with an initiator TXSS, except in the case of an SP allocation that has the IsInitiatorTXSS field for this SP is equal to 0 in which case the initiator shall begin an ISS with an initiator RXSS.

If the responder has more than one DMG antenna, the initiator shall repeat its ISS $k+1$ times, where k is the value indicated by the responder in the last negotiated Number of RX DMG Antennas field transmitted by the responder. Repetitions of the ISS are separated by an interval equal to LBIFS. The value of the CDOWN field within SSW frames transmitted in the ISS indicates the number of sectors until the end of transmissions from all of the initiator's DMG antennas to all of the responder's DMG antennas. The ISS phase shall not be fragmented across multiple allocations.

The RSS comprises a responder TXSS unless the allocation is an SP and the IsResponderTXSS field for this SP is equal to 0 or the allocation is a CBAP and the RXSS Length field within the SSW frame received by the responder during the ISS is equal to a nonzero value. The responder shall begin an RSS (10.38.2.3) MBIFS following the completion of an ISS, provided the responder received an SSW frame from the initiator during the ISS and there is sufficient time in the allocation for the responder to transmit all SSW frames necessary to complete the RSS phase. The responder shall not begin or continue the RSS phase in a different allocation from the allocation that contained the ISS phase.

NOTE—The responder can begin an RSS if there is not sufficient time in the allocation to complete the RSS phase. The RSS phase does not continue in a subsequent allocation in this case.

The initiator shall begin an SSW feedback procedure (10.38.2.4) MBIFS following the completion of an RSS, provided the initiator received an SSW frame from the responder during the RSS and there is sufficient time left in the allocation to complete the SSW feedback procedure followed by an SSW ack procedure (10.38.2.5) from the responder in an MBIFS. If there is not sufficient time left in the allocation for the completion of the SSW feedback and SSW ack procedures, the initiator may begin the SSW feedback procedure in the following allocation between the initiator and the responder.

The responder shall begin an SSW ack procedure (10.38.2.5) to the initiator an MBIFS following the reception of an SSW-Feedback frame from the initiator.

The initiator may restart the SSW feedback procedure up to dot11BFRetryLimit times if it does not receive an SSW-Ack frame from the responder an MBIFS following the completion of the SSW feedback procedure. The initiator shall restart the SSW feedback procedure PIFS following the expected end of the SSW-Ack frame by the responder, provided there is sufficient time left in the allocation for the initiator to begin the SSW feedback procedure followed by an SSW ack procedure from the responder in an MBIFS. If there is not sufficient time left in the allocation for the completion of the SSW feedback and SSW ack procedures, the initiator may restart the SSW feedback procedure in the following allocation between the initiator and the responder.

Once started, the initiator and responder shall complete the SLS phase before any additional frame exchange takes place between these STAs.

10.38.6.3 Multiple sector ID capture (MIDC) subphase

10.38.6.3.1 General

In practice, the quasi-omni RX antenna patterns used in the SLS phase might exhibit imperfections that lead to an incorrect choice of the best TX sector and consequently a sub-optimal starting point for beam refinement in the BRP phase. To remedy this, a multiple sector ID capture (MIDC) subphase may be used. Instead of selecting the starting point for the beam refinement transactions (i.e., the best TX sector) based on information obtained with quasi-omni RX antenna patterns from the SLS phase, the MIDC subphase enables the use of additional information based on the trial of multiple transmit and receive sectors.

The MIDC subphase can be implemented in two ways. The first option is to conduct a trial between a small set of transmit and receive AWV settings with wide (e.g., quasi-omni) antenna patterns. The second option is to carry out a trial between a small set of TX sectors and a set of RX AWV settings, chosen by the receiver in an implementation dependent manner, that maximizes the probability of determining the RX AWVs that best match the chosen set of TX sectors. Note that this may involve using a set of RX AWVs that correspond to the “full set” of RX sectors (from the SLS phase). The set of TX sectors are chosen from a TX sector sweep with a quasi-omni RX antenna pattern. With either option, the end result from the MIDC subphase can be the better starting point transmit and receive sector pair for further beam refinement.

For the first option above, the MIDC subphase consists of a MID subphase and a BC subphase. This is further elaborated upon in 10.38.6.3.2, and a sample time allocation is illustrated in Figure 10-69. For the second option, the MIDC subphase consists only of a MID subphase. This is further elaborated upon in 10.38.6.3.3, and a sample time allocation is illustrated in Figure 10-70.

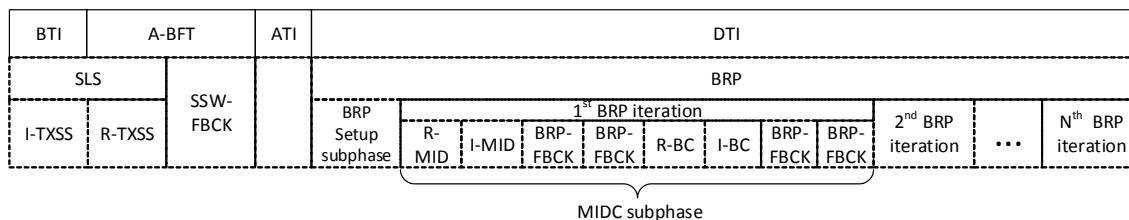

Figure 10-69—Example of time allocation for the MIDC subphase with MID and BC subphases

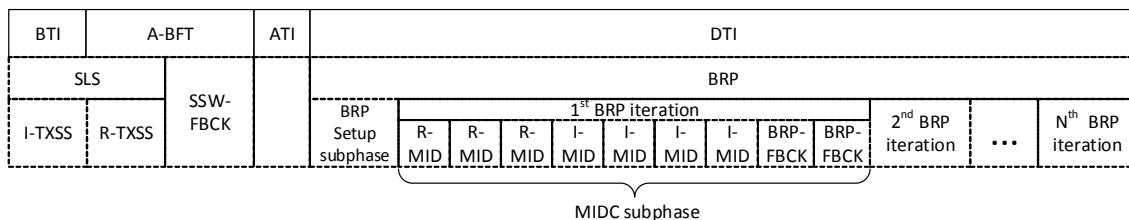

Figure 10-70—Example of time allocation for the MIDC subphase with the MID subphase only

Prior to the beginning of the MIDC subphase, a BRP setup subphase is carried out as specified in 10.38.3.2. This subphase enables the two DMG STAs involved to negotiate whether and how the MIDC subphase is carried out.

In 10.38.6.3 the following terminology is used:

- Nbeam: the value of the Number of Beams subfield of the FBCK-TYPE field
- Nbeam(Link Type,Antenna Type): represents a combination of Nbeam, Link Type (I for Initiator, R for Responder), and Antenna Type (TX for Transmitter, RX for Receiver)
- Number of Measurements: the value of the Number of Measurements subfield of the FBCK-TYPE field.

Examples of how the MIDC subphase is set up, depending on whether beamforming is initiated in the BTI and A-BFT or in the DTI, are illustrated in Figure 10-71 and Figure 10-72, respectively. Note that the MIDC subphase is applicable only when both the initiator and the responder have the ability to switch among their sectors.

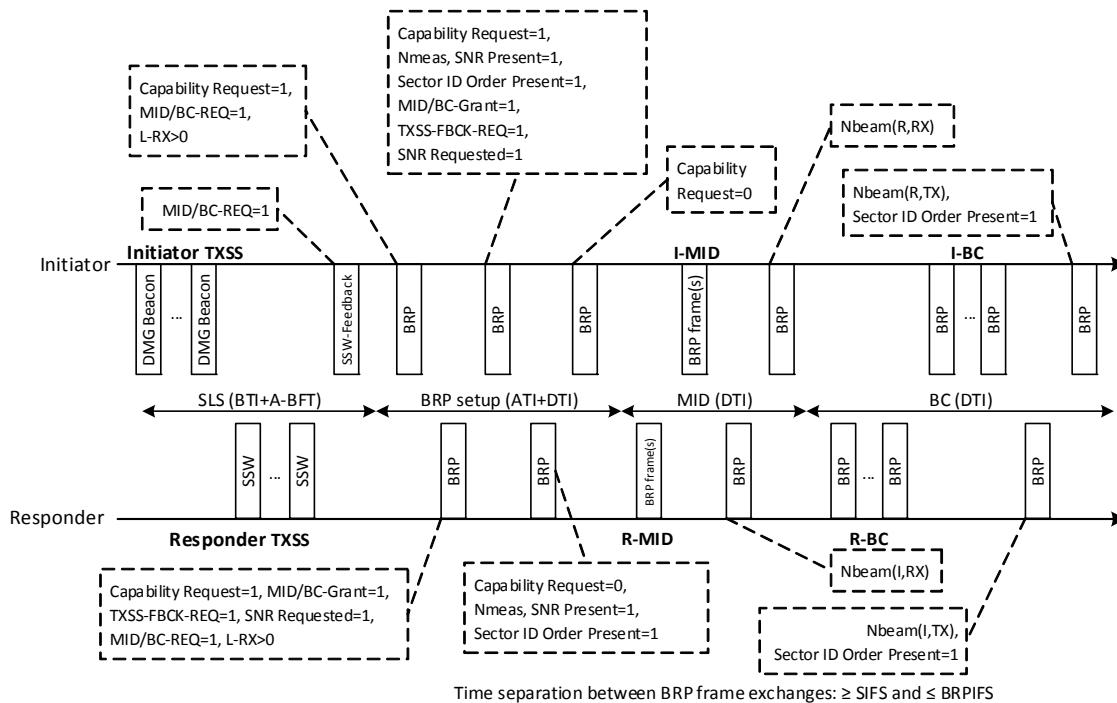

Figure 10-71—Example of using BRP setup subphase to set up subsequent MIDC subphase in A-BFT and DTI

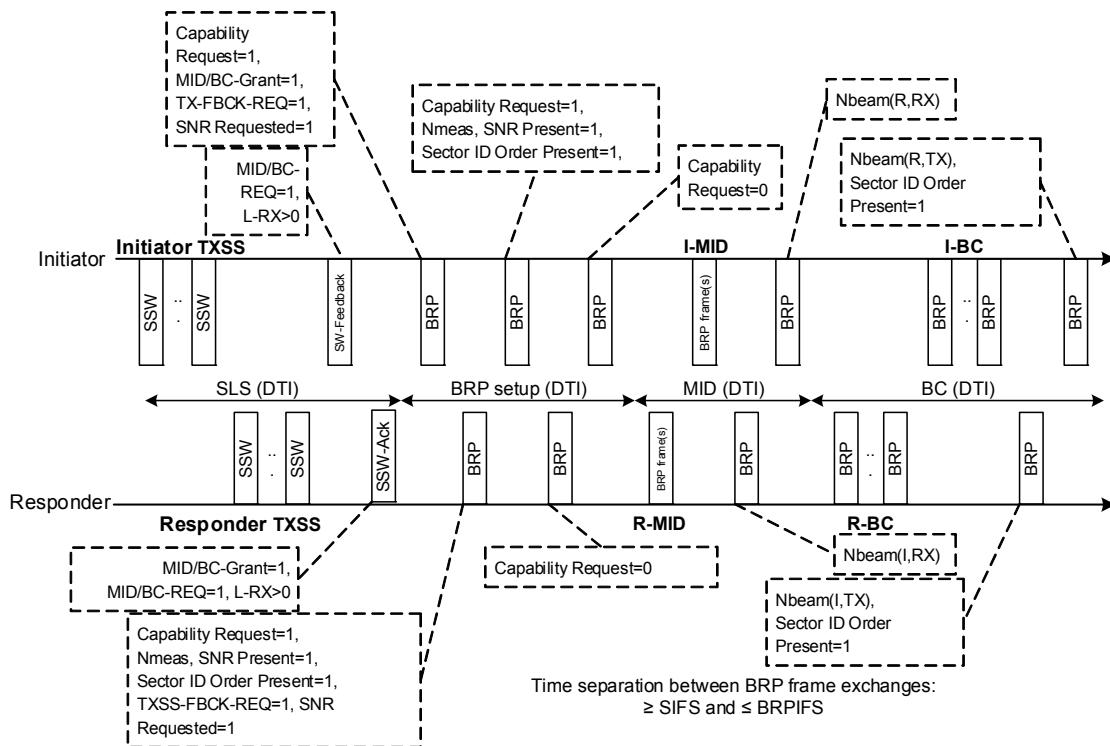

Figure 10-72—Example of using BRP setup subphase to set up subsequent MIDC subphase in DTI

10.38.6.3.2 MIDC subphase with MID and BC subphases

The MIDC subphase can be implemented such that small subsets of TX sector IDs and RX AWVs are first chosen, followed by trials between these subsets to determine the optimal starting TX sector ID and RX AWV pair. The set of TX sectors is chosen from an a priori TX sector sweep with a quasi-omni RX antenna pattern (in the SLS phase). To enable the selection of the RX sectors, and the subsequent trial between the transmit and receive sectors, the MIDC subphase consists of an MID subphase and a BC (or beam combining) subphase. In the MID subphase, a wide TX beam (e.g., quasi-omni) is used while the receiver sweeps through its choice of AWV settings to determine the set of RX AWVs with the highest link quality. This is followed by the BC subphase, which involves testing the multiple RX AWVs together with multiple TX AWVs.

This is conceptually illustrated in Figure 10-73. Note that the consecutive numbering of TX sector IDs (e.g., TX sector ID1, TX sector ID2, ...) or RX AWVs is just used for representation purposes. It is used to indicate the subset of TX sector IDs without placing any restrictions on how these sector IDs are selected (i.e., consecutive numbering of TX sector IDs does not mean that the selected TX sector IDs should be those that are consecutively numbered).

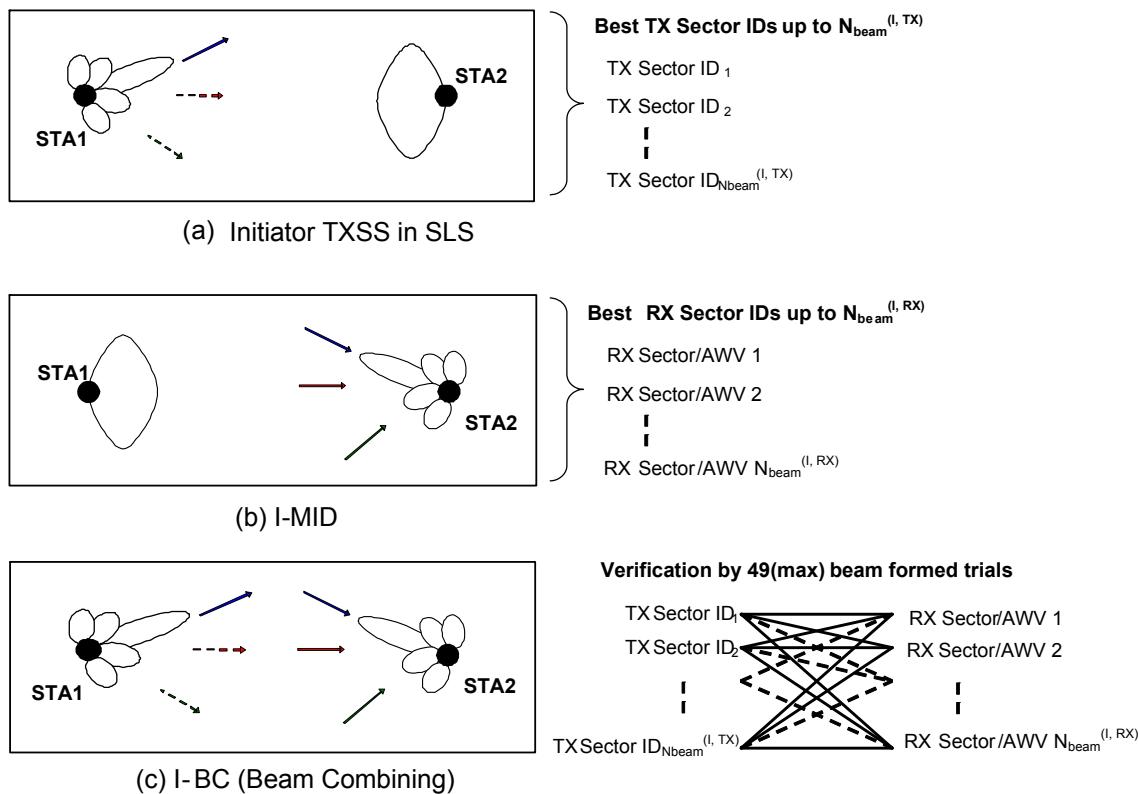

Figure 10-73—Conceptual flow of sample MIDC subphase execution with MID and BC subphases for initiator link

- a) *Setting up the MID and BC subphases:* To request a MIDC subphase with the MID and the BC subphases, the initiator shall transmit an SSW-Feedback or BRP frame with the MID-REQ and the BC-REQ fields set to 1 in the BRP Request field. The responder may grant this request by setting the MID-Grant and the BC-Grant fields to 1 in the BRP Request field within the next SSW-Ack or BRP frame transmitted to the initiator. The R-MID and R-BC subphases are performed if the request is granted and are not performed otherwise.

The responder shall transmit an SSW-Ack or BRP frame to request a MIDC subphase, with the I-MID and I-BC subphases. It shall do so by setting the MID-REQ and the BC-REQ fields to 1 in the BRP Request field within the transmitted frame. The initiator may grant this request by setting the MID-Grant and the BC-Grant fields to 1 in the BRP Request field within the next BRP frame transmitted to the responder. The I-MID and I-BC subphases are performed if the request is granted and are not performed otherwise.

If all of R-MID, R-BC, I-MID, and I-BC subphases are performed, the MID subphases are performed before the BC subphases. Within the MID subphase, R-MID is performed before I-MID. Within the BC subphase, R-BC is performed before I-BC (see Figure 10-69 and Figure 10-70).

In addition to the MID-REQ, BC-REQ, MID-Grant and BC-Grant fields, the responder (and/or initiator) needs to obtain the number of RX AWV settings to be appended to BRP-RX packets in the R/I-MID subphase. To do this, the initiator (and/or responder) should use the L-RX field in the BRP Request field to convey this information. Similarly, the responder (and/or initiator) needs to obtain the IDs and SNRs of the TX sectors received during the SLS phase for use in the R-BC and I-BC subphases. To do this, the responder (and/or initiator) shall send a BRP packet with the TXSS-FBCK-REQ subfield and SNR Requested subfield set to 1 in the FBCK-REQ field of the DMG

Beam Refinement element. In response, the initiator (and/or responder) should send a BRP frame with both the SNR Present subfield and the Sector ID Order Present subfield set to 1. The Number of Measurements subfield in the FBCK-TYPE field is set to indicate the number of sectors received during the last SLS for which an SNR measurement is included. In the Channel Measurement field, the initiator (or responder) should set the SNR subfield to the SNRs corresponding to the TX sectors trialled during the SLS phase. In the Sector ID subfield, it should list the sector IDs of the received sectors. The responder (and/or initiator) should then use the SNR information, and any additional information such as angular separation between sectors, to determine the TX sectors for use in the BC subphase. The responder (or initiator) shall inform the initiator (or responder) of the number of TX sectors using the Number of Beams subfield in the FBCK-TYPE field during the BRP setup subphase. After the R/I-MID subphases, the same field is used to exchange information about the number of RX AWVs to be trialled during the BC subphase.

- b) *Executing the MID subphase:* If R-MID was requested and granted during the SLS and/or subsequent BRP setup subphase, then after the BRP setup subphase, the R-MID shall be initiated by the responder sending a BRP frame with TRN-R fields (as requested in the BRP setup subphase). This packet may be transmitted using a wide pattern, approaching an omni transmit pattern, or using a sector antenna pattern. The receiver may use the TRN-R fields for receive training.

If the MID Extension field in the packet is equal to 1, the responder shall transmit another BRP-RX packet, which may be transmitted using another transmit pattern. It may continue transmitting BRP-RX packets as long as the MID Extension field in all of them is equal to 1. The last BRP-RX packet transmitted by the responder shall have the MID Extension field set to 0.

If the initiator does not receive a BRP-RX packet within BRPIFS after transmitting the last packet of the BRP setup subphase, it may retransmit the last packet of the BRP setup subphase.

After the initiator receives a BRP-RX packet with the MID Extension field set to 0, it shall respond with a BRP frame with the appropriate feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the responder should use a quasi-omni pattern to receive this frame. The feedback included in this BRP frame is the number of RX AWVs to be tested in the subsequent R-BC subphase using the Number of Beams subfield in the FBCK-TYPE field.

If I-MID was granted in addition to R-MID, the initiator shall send a BRP frame with TRN-R fields (as requested in the BRP setup subphase). The initiator shall continue to send BRP packets if the MID Extension was set to 1 as in the R-MID.

After the responder receives a BRP-RX packet with the MID Extension set to 0, it shall respond by sending a BRP frame with feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the initiator should use a quasi-omni pattern to receive this frame. The feedback included in this BRP frame is the number of RX AWVs to be tested in the subsequent I-BC subphase using the Number of Beams subfield in the FBCK-TYPE field. The initiator shall respond with a BRP frame with the TX-TRN-OK field set to 1 as an acknowledgment. The R-BC subphase then follows.

If I-MID does not follow R-MID, the BC subphase follows immediately.

- c) *Executing the BC subphase:* The execution of an I-BC subphase is used as an example. In an I-BC subphase, the initiator shall transmit Nbeam(I,TX) BRP-RX frames using the number of TX sectors specified during the BRP setup subphase. Each BRP-RX frame shall be appended with Nbeam(I,RX) TRN-R subfields, and shall include the Sector ID subfield of the TX sector used. While receiving these TRN-R subfields, the responder shall switch through the RX AWVs selected during the prior I-MID subphase. To conclude the I-BC subphase, the responder shall feed back to the initiator a BRP frame with (a) the BS-FBCK field set to the TX sector ID of the BRP-RX packet received with the highest link quality, and (b) the ordered list of transmit sectors (based on received link quality during the I-BC) using the Sector ID Order subfield in the Channel Measurement Feedback element. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the initiator should use a quasi-omni pattern to receive this frame. The complete procedure is illustrated in Figure 10-74, while Figure 10-75 depicts the beam combining subphase.

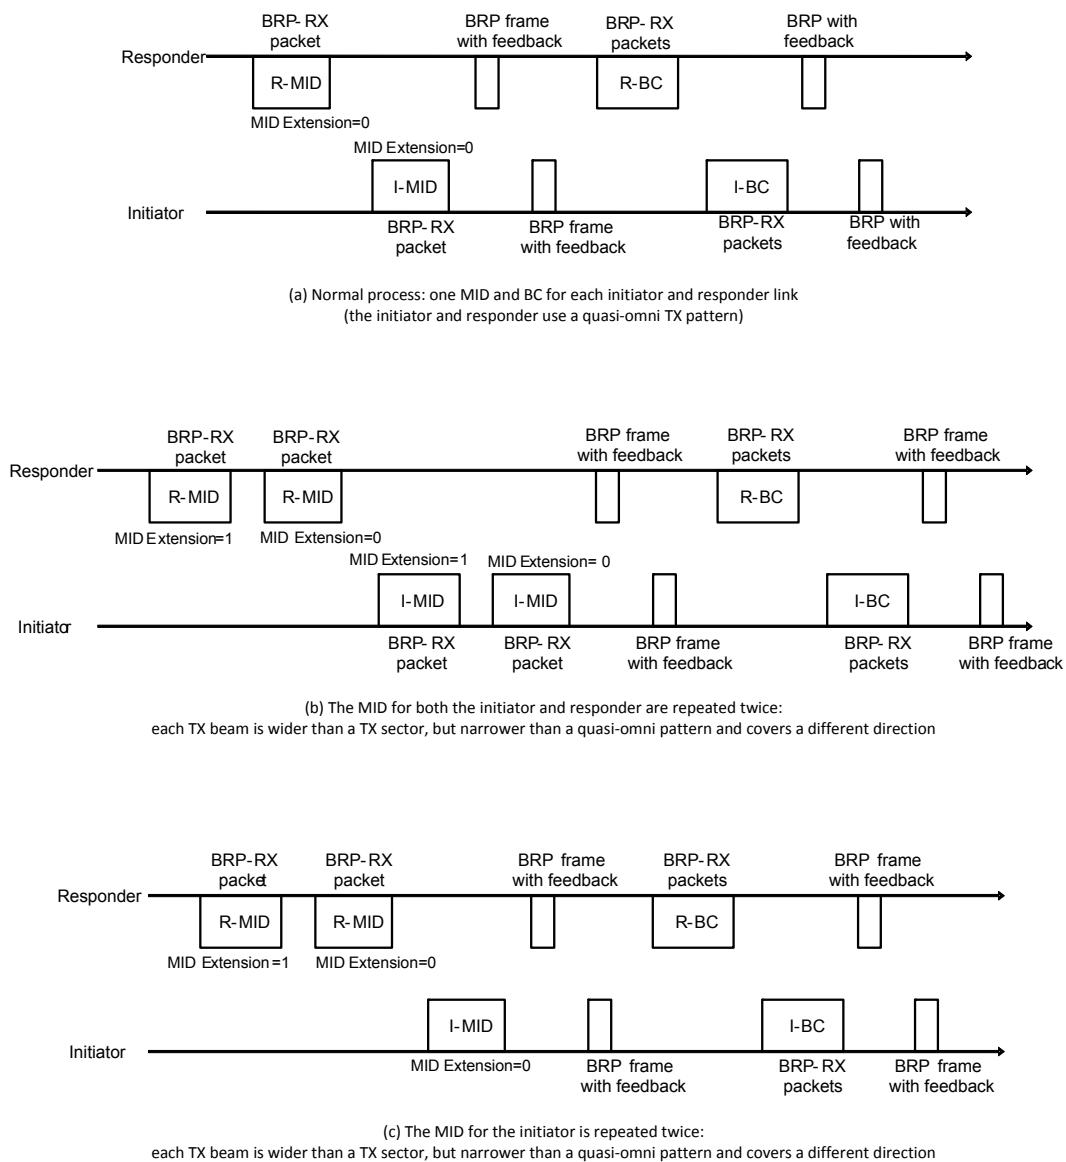

Figure 10-74—Examples of using MID Extension field during execution of MID subphase

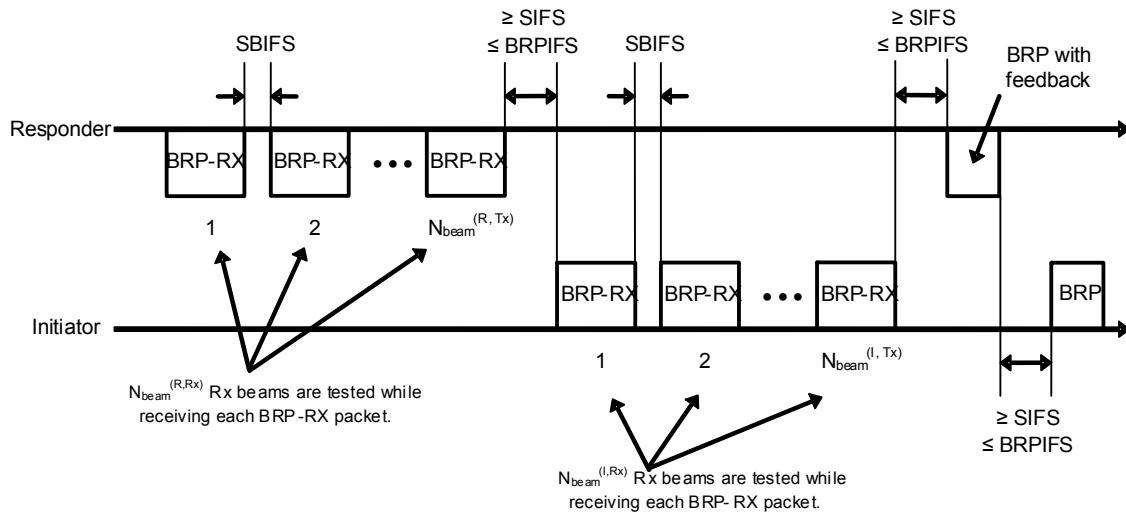

Figure 10-75—Beam combining

10.38.6.3.3 MIDC subphase with MID subphase only

The MIDC subphase may also be implemented such that multiple TX sectors, obtained from the TXSS in the SLS phase, are used instead of wide TX beams. Here, the receiver employs multiple RX AWVs for each TX sector chosen by the transmitter. Based on this joint trial of transmit and receive AWVs, the optimal starting transmit and receive AWV pair is chosen for further refinement in the BRP phase. In this case, the MIDC subphase consists only of the MID subphase. This is conceptually illustrated in Figure 10-76.

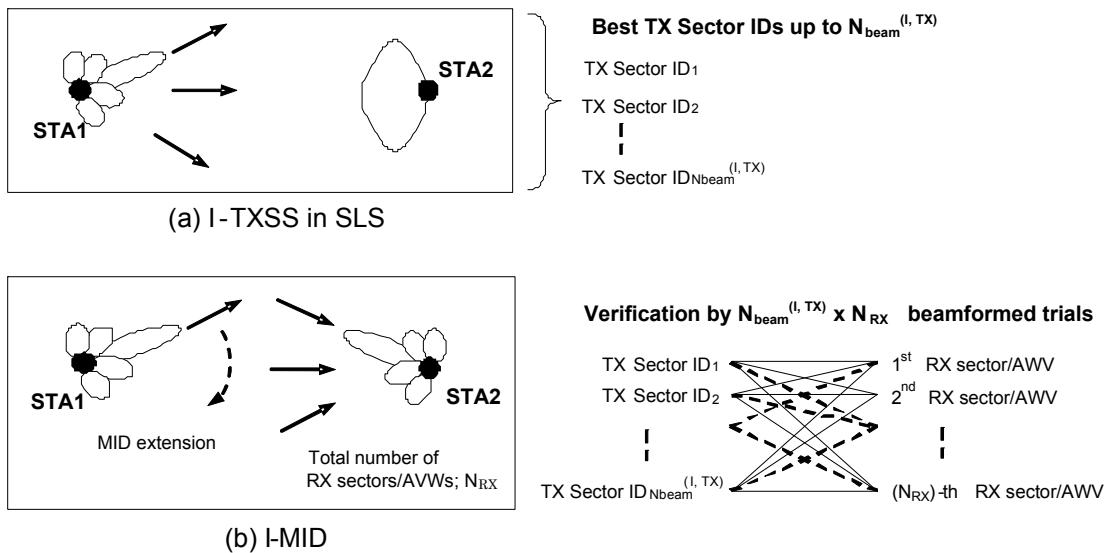

Figure 10-76—Conceptual flow of sample MIDC subphase execution with only MID subphase for initiator link

- a) *Setting up the MID subphase:* The procedure of setting up the MID-subphase is described in 10.38.3.2.

In the example of Figure 10-77, the initiator transmits an SSW-Feedback frame with the MID-REQ subfield set to 1 and the BC-REQ subfield set to 0 in the BRP Request field, thus requesting an MIDC with only the R-MID subphase. The responder grants the MID-REQ by setting the MID-Grant subfield to 1 in the SSW-Ack frame. The initiator then sends a frame with the SNR Present and Sector ID Order Present subfields both set to 1, the Number of Measurement subfield in the FBCK-TYPE field indicating the number of SNR measurements from the last SLS phase, and the SNR and Sector ID subfields with the SNRs measured during the SLS phase and the list of received sectors, respectively. The L-RX subfield is set according to the number of training fields the initiator needs in each packet as part of the R-MID. The responder then starts the R-MID process by transmitting BRP-RX packets.

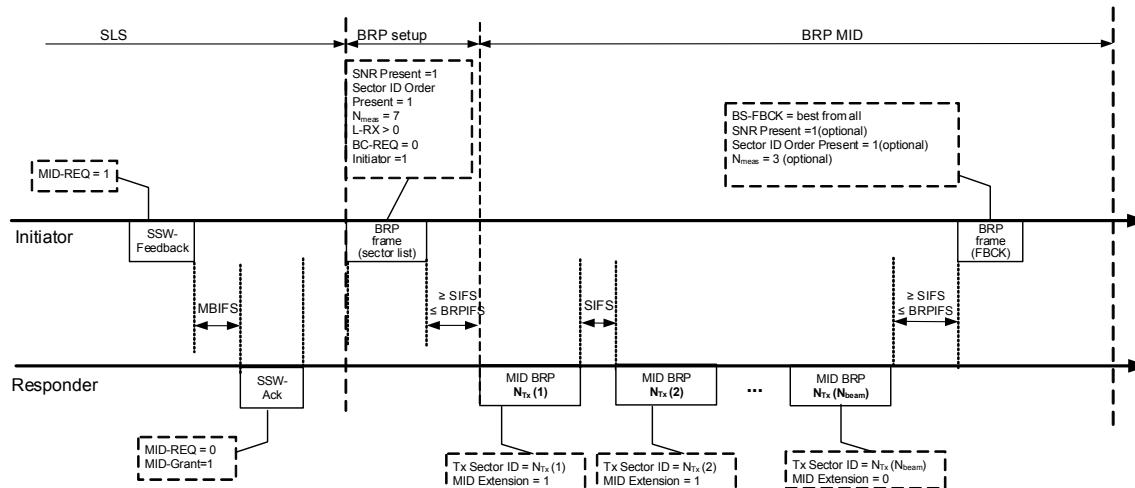

Figure 10-77—Example of using BRP setup subphase to set up subsequent R-MID subphase

- b) *Executing the MID subphase:* The execution of the MID subphase for the responder link (i.e., R-MID) is used as an example. Execution of the MID subphase for the initiator link (i.e., I-MID) is similar, except for a change in the direction of the corresponding frames. In an R-MID subphase, the responder shall transmit one BRP-RX packet each from one of the chosen TX sectors. In each packet, it shall indicate the sector ID of the TX sector used using the Sector ID field in the BRP Request field. Each transmitted BRP-RX packet should be appended with multiple TRN-R subfields such that the initiator can train its receiver antenna during the R-MID subphase. The initiator shall train its receiver antenna by cycling through its choice of RX AWVs while receiving the TRN-R subfields. The initiator shall indicate to the responder the number of TRN-R subfields to be appended using the *L-RX* field in the BRP Request field during the SLS phase or the BRP setup subphase. For all BRP-RX packets except the last one, the responder shall also set the MID Extension field to 1.

In the R-MID subphase, the initiator shall send a BRP frame with feedback. This BRP frame should be sent using the best TX sector as determined in the SLS phase, while the responder should use a quasi-omni pattern to receive this frame. The feedback included in this BRP frame should be (a) the BS-FBCK field set to the TX sector ID of the BRP-RX packet received with the highest link quality, and (b) the ordered list of transmit sectors (based on received link quality during the R-MID) using the Sector ID Order subfield.

10.38.6.3.4 MIDC subphase with BC subphase only

An MIDC subphase with only the BC subphase is carried out when the MID and BC subphases have been carried out earlier. In this case, the initiator and responder keep track of the transmit and receive sectors, for use in the BC subphase, from earlier iterations. Since the best transmit and receive sectors (in terms of link quality) are kept track of, this information can be used to deal with link blockage events. STAs can utilize only the chosen set of TX sectors in the SLS phase to reduce beamforming training time, and jump to the BC subphase directly without executing the MID subphase. In this manner, fast recovery is possible when some of the backup links are available after partial blockage around the STA.

To carry out the MIDC subphase with the BC subphase only, the MID-REQ field is set to 0 and the BC-REQ field is set to 1 in SSW-Feedback or SSW-Ack or BRP frames, and the BC-Grant field is set to 1 in the following SSW-Ack or BRP frame. The BC subphase can include an I-BC and/or an R-BC (10.38.6.3.2).

10.38.6.4 BRP phase execution

10.38.6.4.1 General

Beam refinement is a request/response based process. A STA requests receive beam refinement training by sending a BRP frame with a nonzero value in the L-RX field. The STA that receives the BRP frame shall respond with a BRP packet (20.10.2.2) including as many TRN-R fields as indicated in the value of the L-RX field within the received BRP frame and with the RX-train-response field in the DMG Beam Refinement element set to 1.

A STA requests transmit beam refinement training by sending a BRP frame as follows. In the BRP Request field, the TX-TRN-REQ field is set to 1, and the FBCK-REQ field indicates the feedback type. In the PHY header, the Packet Type and the Training Length fields are set to indicate the number of AGC and TRN-T fields appended to the packet.

The responding STA shall reply to the transmit beam refinement training with a BRP frame containing a DMG Beam Refinement element with the TX-TRN-OK field and TX-train-response field both set to 1 and the BS-FBCK field set to indicate the TRN-T field on which the responding STA received the best signal (the determination of best signal is implementation dependent). The FBCK-TYPE field shall be set to according to the format of the Channel Measurement Feedback element, if one is included in the frame. If the SNR Present and Channel Measurement Present subfields of this FBCK-TYPE field are set to 0, the Channel Measurement Feedback element shall not be included. The number of taps indicated in the FBCK-TYPE field shall be less than or equal to the number of taps indicated in the FBCK-REQ field of the request frame.

If a STA requests transmit beam refinement training, but does not send TRN-T fields, the responding STA shall reply with a BRP frame containing a DMG Beam Refinement element with the TX-TRN-OK field set to 1. In this case (i.e., when the TX-train-response field is equal to 0), the responding STA shall set L-RX field to 0. The requesting STA shall then transmit a BRP packet with TRN-T fields. The responding STA shall then respond with a BRP frame with the TX-train-response field set to 1 and the BS-FBCK and Channel Measurement Feedback element as above.

Beam refinement can be performed following SLS (10.38.6.4.3). If the responder receives an SSW-Feedback frame from the AP or PCP in an A-BFT, the AP or PCP allocates an SP for the beam refinement if required (see 10.38.5.3). A STA may transmit a BRP packet to another STA whenever the STA transmits a frame to that STA, provided that the transmitting STA knows that the recipient STA's receive antennas are directed to it or are in a quasi-omni antenna pattern.

A STA shall set the Initiator field to 1 within a DMG Beam Refinement element if the previous received frame was not a BRP frame, or the last packet the STA transmitted was a BRP frame with the Initiator field set to 1.

A STA that has transmitted a BRP frame with the Initiator field set to 1 and has not received a response BRPIFS after the transmission may retransmit the frame.

A STA may request a TXSS sector list feedback by sending a BRP frame with the TXSS-FBCK-REQ field set to 1, the SNR Requested subfield within the FBCK-REQ field set to 1 and the remaining subfields within the FBCK-REQ field set to 0. The responding STA shall respond with a BRP frame with the SNR Present subfield within the FBCK-TYPE field set to 1 and Sector ID Order Present subfield set to 1, with a list of sector IDs indicating the sector IDs of the received SSW frames or DMG Beacon frames, and with the SNR values with which those frames were received in the last TXSS. The Number of Measurements subfield in the FBCK-TYPE field is set to indicate the number of sectors received during the last SLS for which an SNR measurement is included.

A STA shall not set the TXSS-FBCK-REQ and the TX-TRN-REQ fields to 1 in the same BRP frame.

Two or more BRP frames shall not be aggregated in the same A-MPDU. A BRP frame may be aggregated with another frame in the same A-MPDU only if the other frame is a single Ack, BA or QoS Null frame.

The Duration field within each BRP frame is set to the time remaining until the end of the current allocation, when transmitted within an SP. Otherwise it is set to the time remaining until the end of the TXOP.

10.38.6.4.2 Beam refinement transaction

A beam refinement transaction is a set of BRP frames composed of request and responses.

A beam refinement transaction starts with the beamforming initiator STA sending a BRP frame with the Initiator field set to 1.

A beam refinement responder is a STA that receives a BRP frame (which is directed to it) with the Initiator field set to 1.

A beam refinement transaction participant shall respond to a BRP frame with a BRP frame.

If the beam refinement transaction initiator received a BRP frame from the responder with no training requests, the initiator may terminate the transaction by not transmitting any further BRP packets.

Figure 10-78, Figure 10-79, and Figure 10-80 show examples of beam refinement transactions.

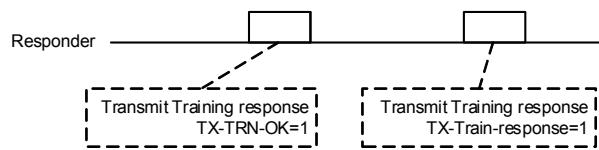

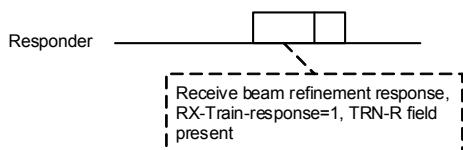

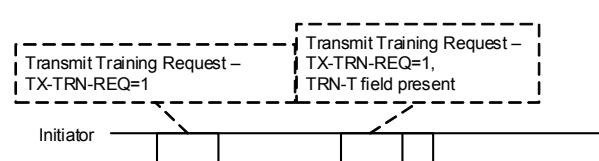

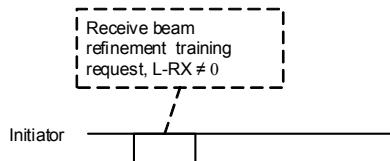

Figure 10-78—Example beam refinement transaction (receive training)

Figure 10-79—Example beam refinement transaction (transmit training)

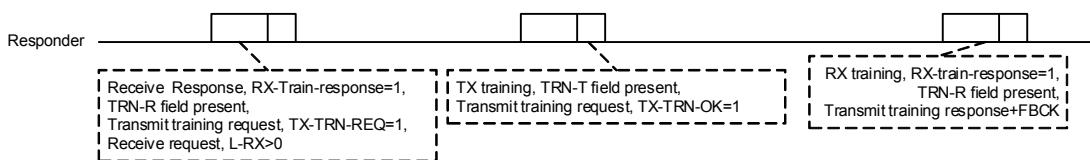

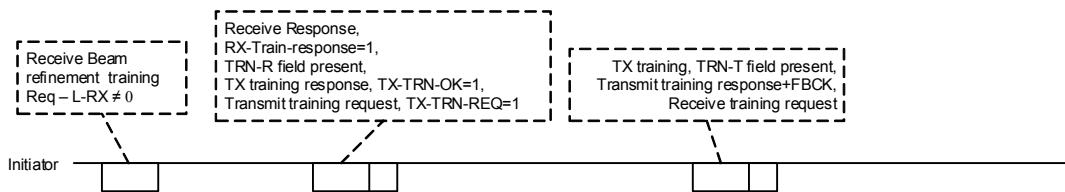

Figure 10-80—Example beam refinement transaction (combination of receive and transmit training)

10.38.6.4.3 Beam refinement transaction after SLS

If either L-RX or TX-TRN-REQ is nonzero within the BRP Request field in the SSW-Ack frame of the most recent SLS phase execution, no MID or BC was granted during the BRP setup subphase, and no beam refinement transaction has been done since the most recent SLS phase execution, then the initiator shall initiate the beam refinement transaction with the responder by sending a BRP frame to the responder. If the value of the L-RX field is greater than 0 in the SSW-Ack frame, the first BRP frame the initiator transmits to the responder is a BRP-RX frame. If the value of the L-RX field is 0 and the value of the TX-TRN-REQ

field is 1, the first BRP frame the initiator transmits to the responder shall have either the TX-TRN-OK field set to 1 or the L-RX field greater than 0.

10.38.6.4.4 Antenna configuration setting during a beam refinement transaction

A STA that has requested beam refinement receive training shall, except when receiving TRN-R fields, set its receive antenna configuration to the best known receive antenna configuration based on previous beam refinement receive training or RXSS. If the STA has not received a BRP frame since the last SLS and the SLS did not include an RXSS, the STA should set its receive antenna configuration to a quasi-omni antenna pattern in the DMG antenna through which the STA received the best sector during the SLS.

A STA that has received a beam refinement transmit training request shall send the response frame and then set its antenna configuration to the best known receive antenna configuration based on previous beam refinement receive training or RXSS, except if both the initiator STA and responder STA support the Other_AID subfield as indicated through the Supports Other_AID field set to 1 within the STA's DMG Capabilities element and the value of the Other_AID subfield within the BRP Request field is different from 0, in which case the STA sets its antenna configuration to the best known receive antenna configuration for receiving from the STA with AID equal to the value of the Other_AID subfield within the BRP Request field. If the STA has not received a BRP frame since the last SLS and the SLS did not include an RXSS, the STA should set its antennas to a quasi-omni antenna pattern.

In a BRP-RX packet, all TRN-R fields shall be transmitted using the same TX AWV configuration as the preamble and data fields of the packet, except if both the transmitting and receiving STAs support the Other_AID subfield as indicated through the Supports Other_AID field set to 1 within the STA's DMG Capabilities element and the value of the Other_AID subfield within the BRP Request field is different from 0, in which case the TRN-R fields shall be transmitted using the best known TX AWV configuration for transmitting to the STA with AID equal to the value of the Other_AID subfield within the BRP Request field.

A STA that has the DMG Antenna Pattern Reciprocity subfield within the DMG STA Capability Information field of the DMG Capabilities element equal to 1 and that has received a BRP-RX packet from a peer STA that also has the DMG Antenna Pattern Reciprocity subfield within the DMG STA Capability Information field of the peer STA's DMG Capabilities element equal to 1 shall use the same AWV that was configured with the BRP-RX packet in subsequent transmissions and receptions with the peer STA during the DTI. This allows STAs that use reciprocity to shorten the beamforming training time.

10.38.7 Beam tracking

A STA (beam tracking initiator) may request a peer STA (beam tracking responder) to perform receive beam tracking by setting, in a transmitted packet, the TXVECTOR parameter BEAM_TRACKING_REQUEST to Beam Tracking Requested, TRN-LEN to the number of requested TRN fields as described in 20.10.2.2.3 and packet type to TRN-R-PACKET. Otherwise, the BEAM_TRACKING_REQUEST parameter shall be set to Beam Tracking Not Requested.

A beam tracking responder that receives a packet with the Beam Tracking Request field in the PHY header equal to 1 (corresponding to the BEAM_TRACKING_REQUEST parameter in the RXVECTOR set to Beam Track Requested) and the Packet Type field in the PHY header equal to 0 (corresponding to PACKET-TYPE field in the RXVECTOR set to TRN-R-PACKET) shall follow the rules described in 20.10.2.2 and shall include a beam refinement AGC field and TRN-R subfields appended to the following packet transmitted to the initiator in the same allocation, with an MCS index greater than 0. The value of TRN-LEN in the following packet from the responder to the initiator shall be equal to the value of the TRN-LEN parameter in the RXVECTOR of the packet from the initiator. A responder may ignore a request for beam tracking within an allocation if no packets with an MCS index greater than 0 are transmitted from the responder to the initiator within the allocation.

A beam tracking initiator requesting transmit beam tracking shall set the BEAM_TRACKING_REQUEST parameter in the TXVECTOR to Beam Tracking Requested, Packet Type to TRN-T-PACKET, TRN-LEN to the number of TRN-Units as described in 20.10.2.2.3, and append an AGC field and TRN-T subfields to the packet. The beam tracking responder may append the feedback to any packet from the responder to the initiator. The initiator may allocate time for the feedback through a reverse direction grant, provided the reverse direction protocol is supported by both the initiator and responder. The feedback type shall be the same as the feedback type in the last BRP frame that was transmitted from the initiator to the responder with TX-TRN-REQ equal to 1. If the responder has never received a BRP frame from the initiator with TX-TRN-REQ equal to 1, the responder shall respond with all subfields of the FBCK-TYPE field equal to 0 and set the BS-FBCK field to the index of the TRN-T subfield that was received with the best quality.

A beam tracking initiator may also request a beam tracking responder to perform receive beam tracking by setting, in the PHY header of a transmitted packet, the Beam Tracking Request field to 0, the Training Length field to a nonzero value, the Packet Type field to 0, and append an AGC field and TRN-R subfields to the transmitted packet.

A beam tracking responder that receives a packet with the Beam Tracking Request field in the PHY header equal to 0, the Training Length field in the PHY header equal to a nonzero value and the Packet Type field in the PHY header equal to 0 shall follow the rules described in 20.10.2.2 and may use the beam refinement AGC field and TRN-R subfields appended to the received packet to perform receive beam training.

BRP frames transmitted during beam tracking may be aggregated within A-MPDUs. Figure 10-81 illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-R fields, while Figure 10-82 illustrates a beam tracking frame exchange sequence when the beam tracking initiator requests TRN-T fields.

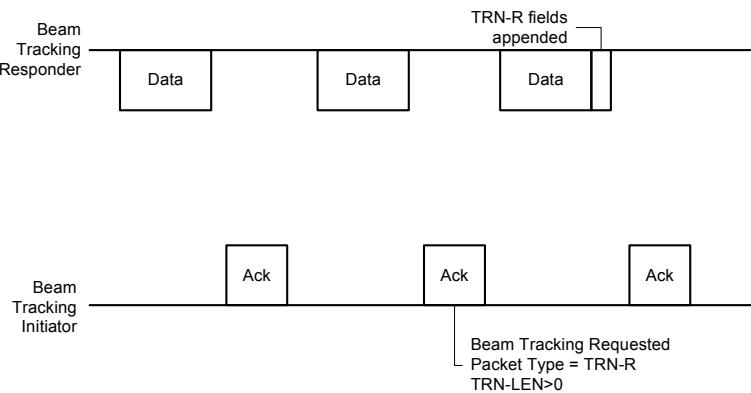

Figure 10-81—Example of beam tracking procedure with initiator requesting TRN-R

A beam tracking initiator may transmit to the beam tracking responder a PPDU requesting transmit beam tracking if at least one of the following conditions is met:

- The time duration since the last PPDU it transmitted to the beam tracking responder that requested transmit beam tracking is greater than dot11BeamTrackingTimeLimit plus BRPIFS.
- A BRP frame with the channel measurement feedback from the beam tracking responder has been received.

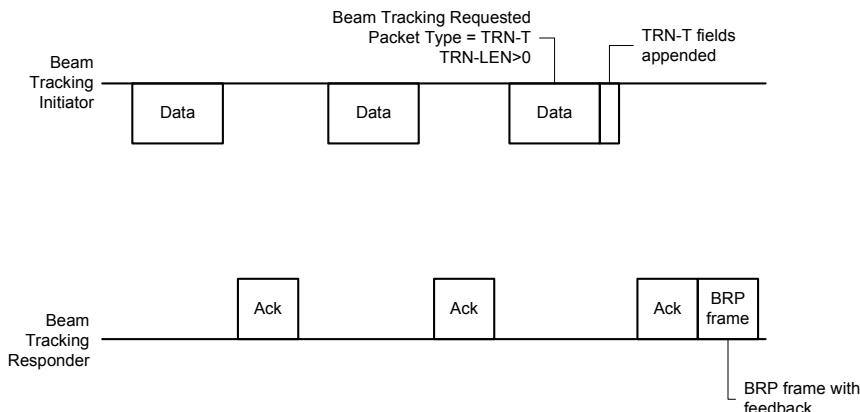

Figure 10-82—Example of beam tracking procedure with initiator requesting TRN-T

If the beam tracking initiator does not receive the expected feedback from the beam tracking responder within a time period that is less than `dot11BeamTrackingTimeLimit` of the last request, the beam tracking request has failed. If the initiator receives the expected feedback from the responder within time that is greater than or equal to `dot11BeamTrackingTimeLimit` of the last request, the beam tracking initiator should ignore it.

The time of arrival of the beam tracking responder's feedback is indicated by the `PHY-RXEND.indication` primitive of PPDU that contains the BRP MMPDU.

The time of transmit completion of the beam tracking initiator's PPDU is indicated by the `PHY-TXEND.confirm` primitive.

The beam tracking responder shall not transmit a BRP frame with feedback to the beam tracking initiator if the time period between `PHY-RXEND.indication` primitive of the PPDU that contains the beam tracking request and of `PHY-TXEND.confirm` primitive of the response BRP frame is longer than `dot11BeamTrackingTimeLimit`.

10.38.8 State machines

Figure 10-83 depicts an example state machine of the SLS phase for the initiator, and Figure 10-84 illustrates an example state machine of the SLS phase for the responder. These state machines describe the behavior of the initiator and responder during BF and are applicable for any period of the beacon interval where BF is performed.

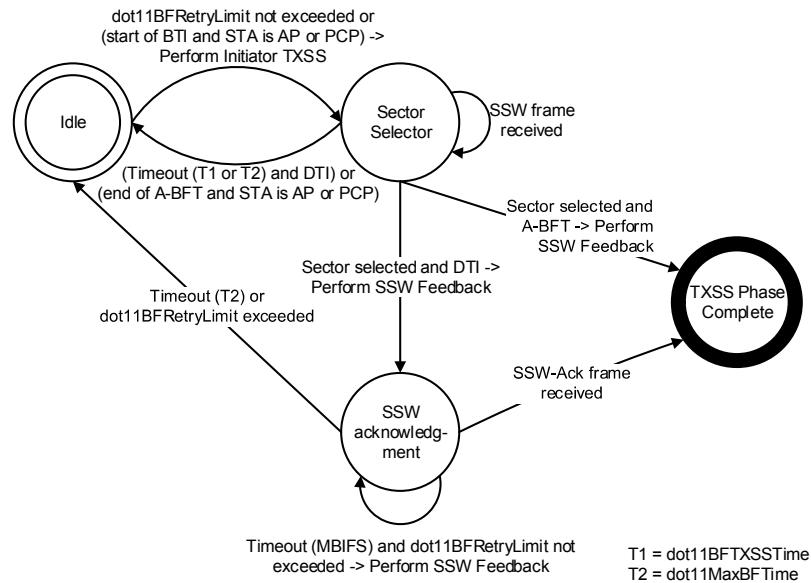

Figure 10-83—SLS phase state machine (initiator)

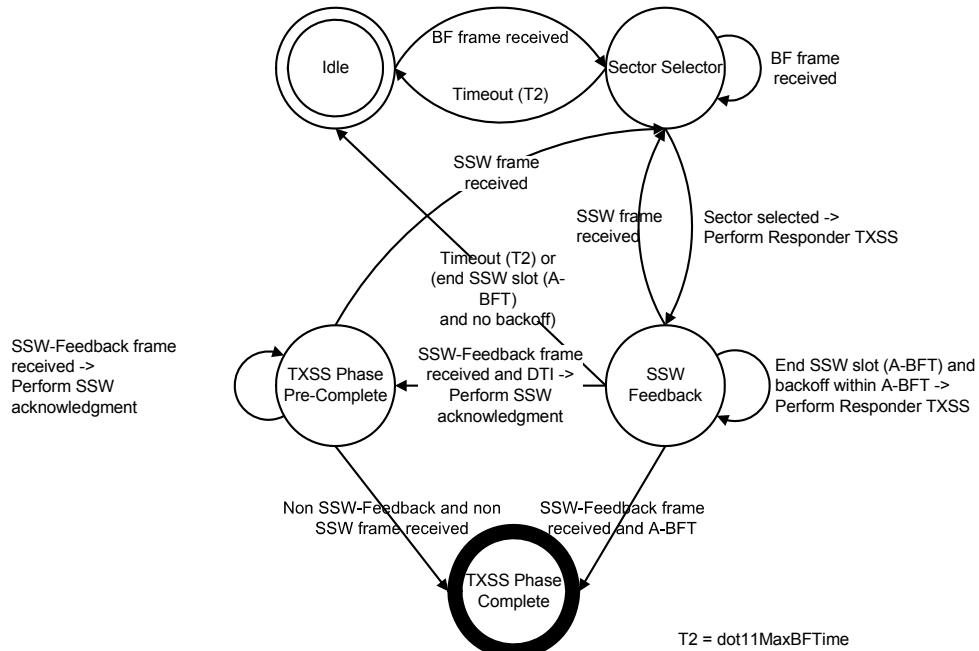

Figure 10-84—SLS phase state machine (responder)

10.39 DMG link adaptation

10.39.1 General

A STA may transmit a Link Measurement Request frame to request a STA indicated in the RA field of the frame to respond with a Link Measurement Report frame (9.6.7.5). If the Link Measurement Request frame is sent within a PPDU defined in Clause 20, the Link Measurement Report frame shall contain the DMG Link Margin element. The requesting STA may use values of the MCS, of the SNR and of the Link Margin to transmit frames to the STA indicated in the RA field of the Link Measurement Request frame.

The requesting STA may aggregate a Link Measurement Request frame in an A-MPDU as defined in Table 9-425 and Table 9-428.

If the Dialog Token field in the Link Measurement Request frame is equal to a nonzero value, the responding STA shall perform the measurement on the next frame received from the requesting STA and shall send back a Link Measurement Report frame corresponding to the received frame.

The responding STA may aggregate a Link Measurement Report frame in a A-MPDU as defined in Table 9-425 and Table 9-428.

The DMG STA whose MAC address equals the value of the Link Measurement Request frame RA field shall transmit a Link Measurement Report frame addressed to the requesting STA. The RA field of the Link Measurement Report frame shall be equal to the TA field of the Link Measurement Request frame.

If the Dialog Token field in the Link Measurement Report frame is equal to the nonzero Dialog Token field of the Link Measurement Request frame, then the MCS, SNR, and Link Margin fields of the Link Measurement Report frame shall be computed using the measurements of the PPDU that is the next frame received from the requesting STA.

If the Dialog Token field in the Link Measurement Request frame is equal to 0, the responding STA may set the MCS field in the Link Measurement Report frame to the MCS value computed based on any of the received frames from the requesting STA.

The SNR field and Link Margin field in the Link Measurement Report frame shall indicate the corresponding measurements based on the reception of the PPDU that was used to generate the MCS feedback contained in the same Link Measurement Report frame.

The Link Measurement Request and Report frames can be used to obtain link margin information, which can be used to determine appropriate action by the requesting STA (e.g., change MCS or control transmit power or initiate FST).

A STA may send an unsolicited Link Measurement Report frame with the Dialog Token field set to 0.

10.39.2 DMG TPC

A DMG STA that receives a Link Measurement Report frame containing a DMG Link Margin element that indicates increase or decrease transmit power behaves according to the following rules:

- If the STA implements the recommendation indicated in the Activity field of the Link Measurement Report, it shall send a Link Measurement Report frame containing a DMG Link Adaptation Acknowledgment element. The Activity field of the DMG Link Adaptation Acknowledgment element shall be set to the value of the Activity field in the received DMG Link Margin Subelement.
- If the STA does not implement the recommendation indicated in the Activity field of the Link Measurement Report, it may send a Link Measurement report containing a DMG Link Adaptation

Acknowledgment element. The Activity field of the DMG Link Adaptation Acknowledgment element shall be set to 0, indicating that the STA did not change its transmit power.

- A STA shall not send a Link Measurement Report later than $2 \times \text{aPPDUMaxTime}$ after it acknowledged the reception of the Link Measurement report.

A DMG STA shall not include the DMG Link Adaptation Acknowledgment element in a Link Measurement Report frame, unless the frame is being transmitted in response to a received Link Measurement Report frame whose Activity field is equal to increase or decrease transmit power.

10.39.3 Fast link adaptation

A STA indicates support for fast link adaptation by setting the Fast Link Adaptation field in the STA's DMG Capabilities element to 1. A STA that does not support fast link adaptation sets the Fast Link Adaptation field in the STA's DMG Capabilities element to 0. A STA that supports fast link adaptation shall not initiate fast link adaptation with a peer STA that does not support fast link adaptation.

A STA that supports fast link adaptation shall support the reverse direction protocol (see 10.28). The STA that transmits a Link Measurement Request frame as part of fast link adaptation shall be the RD initiator and the STA that responds with a Link Measurement Report frame shall be the RD responder. Transmission of Link Measurement Request, Link Measurement Report and the frames defined below shall follow the rules of the reverse direction protocol.

A STA initiates fast link adaptation by transmitting a Link Measurement Request frame that is of subtype Action No Ack and has its Dialog Token field set to 0. The PPDU containing the frame shall have the AGGREGATION parameter in the TXVECTOR set to AGGREGATED, shall not contain any other frame that requires immediate response, and shall have a duration (as determined by the PHY-TXTIME.confirm primitive defined in 6.5.6) that is greater than aMinPPDUDurationForDMGMeasurement.

NOTE—The PPDUs have the AGGREGATION parameter in the TXVECTOR set to AGGREGATED to allow padding of the PSDUs with MPDU delimiters of size 0, therefore meeting the transmission duration requirement.

A STA that supports fast link adaptation and receives a Link Measurement Request frame of subtype Action No Ack, with the Dialog Token field equal to 0 and contained in a PPDU with the AGGREGATION parameter in the RXVECTOR equal to AGGREGATED shall respond with a Link Measurement Report frame in no longer than BRPIFS from the reception of the Link Measurement Request frame. The TPC Report element, DMG Link Margin element and other fields transmitted in the Link Measurement Report frame shall reflect measurements on the PPDU that contained the last received Link Measurement Request frame from the initiating STA.

The STA responding with the Link Measurement Report frame shall keep the IFS not longer than SIFS by transmitting PPDUs that do not contain frames requiring immediate response and that have a duration that is greater than aMinPPDUDurationForDMGMeasurement. All transmitted PPDUs should use the same MCS and the same transmit power.

The transmitted Link Measurement Report frame shall be of subtype Action No Ack, shall be sent using MCS 1, and shall be sent within a PPDU with the AGGREGATION parameter in the TXVECTOR set to AGGREGATED. In addition, the PPDU shall not contain any frame that requires immediate response and shall have a duration that is greater than aMinPPDUDurationForDMGMeasurement.

If at least one of the conditions above for the transmission of the Link Measurement Report frame is not met, the STA may follow the rules in 10.39.1 to respond to the received Link Measurement Request frame.

A STA that supports fast link adaptation and that receives a Link Measurement Report frame should respond with an unsolicited Link Measurement Report frame in no longer than BRPIFS from the reception of the

Link Measurement Report frame. The TPC Report element, DMG Link Margin element and other fields transmitted in the unsolicited Link Measurement Report frame shall reflect measurements taken on one or more of the PPDUs received by the STA transmitting the unsolicited Link Measurement Report frame, starting with the received Link Measurement Report frame itself. If the unsolicited Link Measurement Report frame is transmitted longer than SIFS from the reception of the Link Measurement Report frame, the STA transmitting the unsolicited Link Measurement Report frame shall keep the IFS not longer than SIFS by transmitting one or more PPDUs before issuing the unsolicited Link Measurement Report frame.

An example of the fast link adaptation procedure is shown in Figure 10-85.

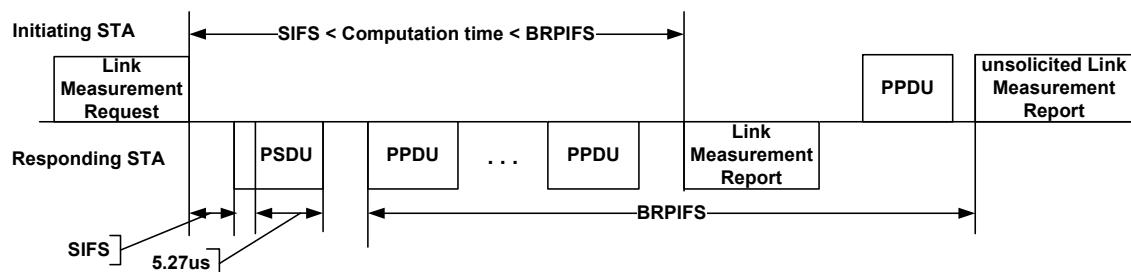

Figure 10-85—Example of fast link adaptation procedure

10.40 DMG dynamic tone pairing (DTP)

A pair of communicating STAs shall employ DTP modulation only if both STAs support DTP as indicated through the DTP Supported field within the STA's DMG Capabilities element.

A DTP capable STA may use DTP with another DTP capable STA by setting the DTP_TYPE in the TXVECTOR to dynamic; otherwise, the DTP_TYPE is set to static. The transmitting STA may stop using DTP by setting the DTP_TYPE in the TXVECTOR to static.

A transmitting STA requests a DTP report from a receiving STA by sending a DTP Request frame to that STA. Upon receiving a DTP Request frame, the receiving STA shall respond with a DTP Report frame carrying the DTP configuration. The DTP Report frame should be sent no later than dot11BeaconPeriod TUs after the receiving STA transmits an Ack frame in response to the reception of the DTP Request frame. If the transmitting STA does not receive a DTP Report frame from the receiving STA within dot11BeaconPeriod TUs from the transmitting STA's reception of the Ack frame corresponding to its most recent DTP Request frame transmission to the receiving STA, the transmitting STA may retransmit the DTP Request frame to the receiving STA. The Dialog Token field of the DTP Report frame is set to the value of the Dialog Token field in the corresponding DTP Request frame.

The transmitting STA should switch to the updated DTP configuration after a DTP Report frame is received.

If a STA transmits a DTP Report frame in response to the reception of a DTP Request frame, the STA shall not send an updated DTP Report frame unless it receives another DTP Request frame.

A STA that transmits an unsolicited DTP Report frame should not send a new unsolicited updated DTP Report frame unless the STA has received a frame from the peer STA indicating that the peer STA has switched to the DTP configuration last sent.

Both the transmitting and receiving STAs maintain two copies of DTP configurations: the current configuration that is in use for transmission and an updated configuration, if any, received after the current configuration. The transmitting STA determines when to switch from the current to the updated DTP

configuration. The transmitting STA shall indicate the switch from the current configuration to the updated configuration by toggling the DTP Indicator bit field in the PHY header. The value of the DTP Indicator field shall be kept unchanged until the transmitting STA decides to switch to the new DTP configuration. By receiving an Ack frame in response to a Data frame from the receiving STA, the switching operation is completed.

The transmitting STA may send another DTP Request frame to a receiving STA even if it decided not to switch to the DTP configuration indicated by the receiving STA's last transmitted, if any, DTP Report frame.

If the Beam link cluster field is 0, then the links within the MMSL cluster that use DTP may maintain independent DTP configurations.

10.41 DMG relay operation

10.41.1 General

The DMG relay procedures are specified in 11.36. This subclause specifies the supported types of DMG relay.

DMG relay operation is not supported by an IBSS STA. An IBSS STA shall set dot11RelayActivated to false.

A source REDS, a destination REDS and an RDS can establish two types of relay operation:

- Link switching (10.41.2): If the direct link between the source REDS and destination REDS is disrupted, the source REDS redirects the transmission of frames addressed to the destination REDS via the RDS. The RDS forwards frames received from the source REDS to the destination REDS and from the destination REDS to the source REDS. Direct communication between the source REDS and destination REDS might resume after the direct link between them is recovered.
- Link cooperation (10.41.3): In this case, the RDS is actively involved in the direct communication between the source REDS and the destination REDS. A frame transmission from the source REDS to the destination REDS is simultaneously repeated by the RDS, which might possibly increase the signal quality received at the destination REDS.

10.41.2 Link switching

10.41.2.1 General

A source REDS that has successfully completed an RLS procedure with a destination REDS for which the value of the Cooperation-Mode subfield within the negotiated Relay Transfer Parameter Set element is 0 may use the selected RDS between the source REDS and destination REDS for the purpose of link switching. This is described in this subclause.

10.41.2.2 SP request and allocation

The source REDS uses the procedures described in 11.4 to request an SP allocation between itself and the destination REDS.

Upon receiving an ADDTS Request frame for which the source AID and the destination AID fields within the DMG TSPEC element are equal to a pair of a source REDS and a destination REDS, respectively, that have successfully completed the RLS procedure defined in 11.36.2.4, the AP or PCP schedules an SP with the source DMG STA as the source REDS and the destination DMG STA as the destination REDS.

An RDS shall check the value of the source AID and the destination AID fields of each SP allocation within an Extended Schedule element it receives in a DMG Beacon or Announce frame from the AP or PCP. If the value of the source AID and the destination AID fields of an SP allocation correspond to a source REDS and a destination REDS, respectively, that have successfully completed the RLS setup procedure (11.36.2), the RDS shall operate as an RDS during that SP allocation.

10.41.2.3 Usage of RDS

In link switching, an RDS operates either in FD-AF mode or in HD-DF mode. An RDS capable of FD-AF relaying shall be in one of two frame transmission modes:

- *Normal mode*: A pair of source REDS and destination REDS exchange frames via either the direct link or the relay link until this link is determined to become unavailable due to, for example, blockage or channel degradation.
- *Alternation mode*: A source REDS and a destination REDS exchange frames via two separate links, where the use of each link alternates at each link change interval. The link change interval specifies the time instants at which a source REDS is allowed to change the link used for a frame transmission to the destination REDS as specified in 9.4.2.149.

An RDS that supports only HD-DF shall operate in the Normal mode.

The frame transmission mode is indicated in the Relay Transfer Parameter Set element exchanged by the source REDS, destination REDS, and RDS during the RLS procedure. A source REDS or destination REDS may change the transmission mode used in a relay link following a successful exchange of RLS Request and RLS Response frames as described in 11.36.2.4.

An RDS shall start to operate as RDS at the start of an SP for which the value of the source AID and destination AID fields for that SP are equal to the source REDS and destination REDS, respectively, for which the RDS has successfully completed the RLS procedure. The RDS can determine the SPs for which it operates as an RDS upon the reception of an Extended Schedule element.

10.41.2.4 Relay frame exchange rules

10.41.2.4.1 General

Following the completion of the RLS procedure and SP allocation, each of the source REDS, destination REDS, and RDS have a direct link with one another.

The values of link change interval and data sensing time are indicated within the Relay Transfer Parameter Set transmitted by the source REDS to the destination REDS during the RLS procedure. Either the link change interval period or the first period begins at the start of an SP between the source REDS and the destination REDS, and any transmission by the source REDS, destination REDS, and RDS within a link change interval period shall use the same link that is used at the start of the link change interval period. A new link change interval period starts immediately after another link change interval period, but shall not exceed the end of the SP.

In the normal mode, a source REDS shall use the direct link to initiate frame transmission to the destination REDS at the start of the first SP allocated between the source REDS and destination REDS for a particular TID. At the start of the following SP allocations for that same TID, the source REDS uses the last link in which a frame transmission to the destination REDS via this link was successful. In the alternation mode, the source DMG STA shall alternate the frame transmission to the destination REDS between direct frame transmission to the destination REDS and frame transmission through the RDS. The source REDS shall alternate the link used for a frame transmission at the start of each link change interval.

If a source REDS transmits a frame to the destination REDS via the direct link but does not receive an expected Ack frame or BlockAck frame from the destination REDS during a link change interval period, the source REDS should change the link used for frame transmission at the start of the following link change interval period and use the RDS to forward frames to the destination REDS.

If a source REDS transmits a frame to the destination REDS via the RDS but does not receive an expected Ack frame or BlockAck frame from the RDS during a link change interval period or a first period, the source REDS should change the link used for frame transmission at the start of the following link change interval period or the following first period and transmit frames directly to the destination REDS.

10.41.2.4.2 Additional frame exchange rules for FD-AF RDS

If the source REDS decides to change the link at the start of the following link change interval period and the Normal mode is used, the source REDS shall start its frame transmission after data sensing time from the start of the following link change interval period. If the Alternation mode is used, the source REDS alternates the link used for frame transmission at the start of each link change interval period, and the value of data sensing time is ignored.

In the Normal mode, if the destination REDS does not receive a valid frame from the source REDS within data sensing time after the start of a link change interval, the destination REDS shall immediately change the link to attempt to receive frames from the source REDS through the RDS. If the More Data subfield in the last frame received from the source REDS is equal to 0, then the destination REDS shall not switch to the link in the next link change interval period even if it does not receive a frame during the data sensing time. An example of frame transfer under Normal mode with FD-AF RDS is illustrated in Figure 10-86.

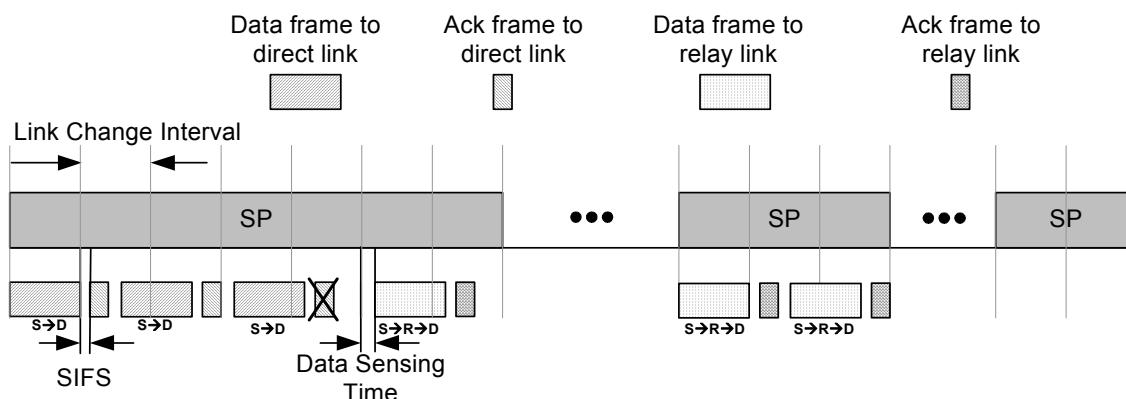

Figure 10-86—Example of Normal mode operation with FD-AF relay

In the Alternation mode, if the destination REDS receives an out of order frame, the destination REDS shall remain at the current link. If the More Data subfield in the last frame received from the source REDS is equal to 0, then the destination REDS shall not switch links in the next link change interval period. If the source REDS uses either the direct or the relay link and decides to resume alternate frame transmission, the source REDS should transmit a frame to the other link data sensing time after the next link change interval to inform the destination REDS that operation on the other link has been resumed. Note that this is the only situation when data sensing time is used in the Alternation mode.

10.41.2.4.3 Additional frame exchange rules for HD-DF RDS

When the RDS is operating as a HD-DF RDS and the RDS is used in the frame exchange between the source REDS and the destination REDS, the frame exchange is performed in two periods, which are repeated for as long as the RDS is used. In the first period, the source REDS shall transmit a frame to the RDS and then the RDS responds after SIFS if needed. In the second period, the RDS shall forward the frame received from the source REDS to the destination REDS, and then the destination REDS responds after SIFS if needed. The duration of the first period and the second period are specified in the last Relay Transfer Parameter Set element transmitted from the source REDS.

The first period and second period are valid only when the source REDS and destination REDS exchange frames via the RDS. The link change interval is valid only when the source REDS and destination REDS exchange frames via the direct link. The first period begins at the end of the link change interval when a change to the relay link occurs. The link change interval begins at the end of the second period when a change to the direct link occurs.

The source REDS may transmit a Relay Ack Request frame to the RDS to determine whether all frames forwarded through the RDS were received by the destination REDS. Upon reception of a Relay Ack Request frame, the RDS shall respond with a Relay Ack Response frame and set the BlockAck Bitmap field to indicate which frames have been received by the destination REDS.

If the source REDS decides to change to the relay link at the start of the following link change interval period, the source REDS shall start its frame transmission at the start of the following link change interval period. If the current link is the direct link and the destination REDS does not receive a valid frame from the source REDS within data sensing time after the start of each link change interval, the destination REDS shall change the link and consider the first period to begin at the start of the link change interval.

If a link change to the direct link occurs, the source REDS shall start to transmit a frame using the direct link at the end of the second period when the link change interval begins. The destination REDS shall switch to the direct link at each first period and listen to the medium toward the source REDS. If the destination REDS receives a valid frame from the source REDS, the destination REDS shall remain on the direct link and consider the link change interval to begin at the start of the first period. Otherwise, the destination REDS shall change the link at the start of the next second period and attempt to receive frames from the source REDS through the RDS. If the active link is the relay link and the More Data subfield in the last frame received from the RDS is equal to 0, then the destination REDS shall not switch to the direct link even if it does not receive any frame during the second period.

The source REDS that intends to use the block ack mechanism through the RDS shall perform the block ack setup procedure with the RDS using the same TID as it is used for the direct communication between the source REDS and the destination REDS. Similarly, the RDS shall perform the block ack setup procedure with the destination REDS before transmitting data using the block ack mechanism. Upon reception of an ADDBA Request frame from the source REDS, the RDS shall send an ADDBA Request frame to the destination REDS with the same content for all corresponding fields as the ADDBA Request frame received from the source REDS, except for Buffer Size field, which contains the buffer size of the RDS. Following the reception of the ADDBA Response frame from the destination REDS, the RDS shall send an ADDBA Response frame to the source REDS. The ADDBA Response frame shall have the same content for all corresponding fields as the ADDBA Response frame received from the destination REDS, except for the Buffer Size field, which shall be set to the minimum between the buffer size of the RDS and the destination REDS.

An example of frame transfer with HD-DF RDS is illustrated in Figure 10-87.

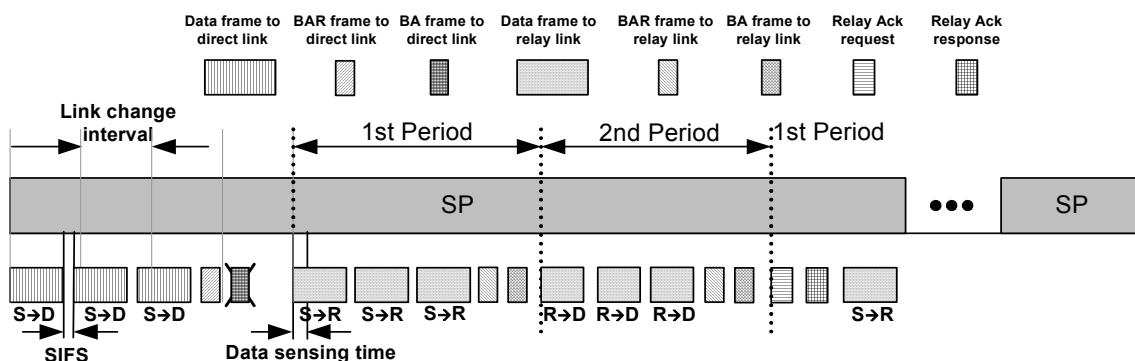

Figure 10-87—Example of operation with HD-DF relay

10.41.2.4.4 Operation of FD-AF RDS

In an SP allocated for relay operation, a FD-AF RDS operates in an amplify-and-forward manner. This means that for each frame detected at the RF in the receive state within an SP in which it operates as a FD-AF RDS, the RDS amplifies the received signal and simultaneously retransmits it via the RF in transmit state.

At the start of the SP where it operates as a FD-AF RDS, the RDS shall initiate an RF antenna module in the receive state directed toward the source REDS and another RF antenna module in transmit state directed toward the destination REDS.

For each frame received at the RDS during the SP, the RDS shall follow the same rules for frame exchange sequences as described in Annex G and 10.36. This includes switching the state of each RF available to the RDS from receive to transmit, and vice-versa, depending upon the frame type and its ack policy.

10.41.2.5 Link monitoring

After a link change, the source REDS might periodically monitor the quality of the previous link. To do that, the source REDS can use the link change mechanism described in 10.41.2.4. If the previous link is the relay link, the source REDS can acquire the channel status by using relay link measurement mechanism as described in 10.41.4. If the previous link is the direct link, the source REDS can acquire the channel status via the link adaptation mechanism defined in 10.39. If the channel quality of the previous link is better than the one on the current link, which is an implementation dependent decision, the source REDS may switch to the previous link.

10.41.3 Link cooperation

10.41.3.1 TPA procedure

A source REDS, a destination REDS, and an RDS use the common relay setup procedure defined in 11.36.2 to set up a link cooperation relay. In addition, to establish a link cooperation relay, the source REDS, destination REDS, and RDS shall perform the TPA procedure described in this subclause and shown in Figure 10-88.

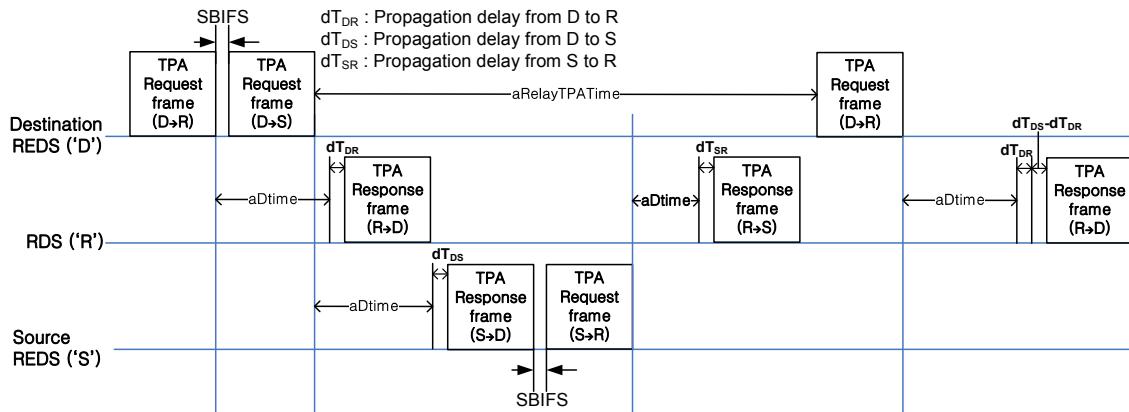

Figure 10-88—TPA mechanism

The TPA procedure is triggered by the destination REDS following the common relay setup procedure with the source REDS and RDS. First, the destination REDS uses the procedures described in 11.4 to request the allocation of an SP to perform TPA, wherein the source of the SP is the destination REDS and the destination of the SP is the source REDS. If the value of a source AID and the destination AID fields of an SP allocation correspond to a destination REDS and a source REDS, respectively, that have successfully completed the RLS setup procedure, a STA that performs as an RDS in that SP allocation shall operate during the allocation as a non-RDS-capable DMG STA.

Within the allocated SP, the destination REDS sends a TPA Request frame to the RDS and sets the Timing Offset field to 0 (see Figure 10-88). SBIFS interval following the end of the first TPA Request frame transmission, the destination REDS shall send the second TPA Request frame to the source REDS and set the Timing Offset field to 0. aDtime interval (11.39) following the reception of the first TPA Request frame, the RDS shall transmit a TPA Response frame back to the destination REDS. Upon receiving the TPA Response frame from the RDS, the destination REDS shall estimate the TPA value of the RDS and the time deviation (i.e., $2 \times dT_{DR}$) between the expected Dtime and the actual arrival time of the TPA Response frame. aDtime interval following the reception of the second TPA Request frame, the source REDS shall transmit a TPA Response frame back to the destination REDS. The destination REDS shall repeat the same procedure upon reception of the TPA Response frame received from the source REDS.

SBIFS interval following the end of the transmission of the TPA Response frame to the destination REDS, the source REDS shall send a TPA Request frame to the RDS and set the Timing Offset field to 0. aDtime interval following the reception of the TPA Request frame, the RDS shall transmit a TPA Response frame back to the source REDS. Upon reception of the TPA Response frame from the RDS, the source REDS shall estimate the TPA value of the RDS and the time deviation (i.e., $2 \times dT_{SR}$) between aDtime and the actual arrival time of the TPA Response frame.

At aRelayTPATime (11.39) from the end of the last TPA Request frame transmitted by the destination REDS to the source REDS, the destination REDS shall send a TPA Request frame to the RDS and set the Timing Offset field to $dT_{DS}-dT_{DR}$. Upon reception of the TPA Request frame, the RDS shall transmit a TPA Response frame to the destination REDS at $aDtime+dT_{DR}+(dT_{DS}-dT_{DR})$ from the end of the TPA Request frame. Upon reception of the TPA Response frame, the destination REDS shall estimate the time deviation (i.e., $2 \times dT_{DR}+(dT_{DS}-dT_{DR})$) between aDtime and the actual arrival time of the TPA Response frame. If the destination REDS determines that the estimated deviation is equal to $2 \times dT_{DR}+(dT_{DS}-dT_{DR})$, then the destination REDS considers that the TPA procedure was successful. As the last step of the TPA procedure, the destination REDS shall send a TPA Report frame to the source REDS that includes the information regardless of whether the last TPA procedure succeeded.

If it is not successful, the TPA procedure is repeated until it is successful or upon the decision of the destination REDS to stop performing the TPA procedure. The TPA procedure includes the estimation of the sampling frequency-offset (SFO), in order for the source REDS and RDS to adjust their SFOs.

10.41.3.2 Frame exchange operation

10.41.3.2.1 General

A source REDS that has successfully completed an RLS procedure with a destination REDS for which the value of the Cooperation-Mode subfield within the negotiated Relay Transfer Parameter Set element is equal to 1 and has successfully completed the TPA procedure shall use the selected RDS between the source REDS and destination REDS for the purpose of link cooperation. This is described in this subclause.

10.41.3.2.2 Cooperative transmission SP request and allocation

If the source REDS receives a TPA Report frame that indicates the successful completion of the TPA procedure with the RDS and the destination REDS, the source REDS uses the procedure in 11.4 to request an SP allocation with the destination REDS. The source REDS might use the SP allocation for communication with the destination REDS with the assistance of the RDS.

10.41.3.2.3 Data transmission rules

As shown in the example of Figure 10-89, in the allocated SP the first time interval (T1) and the second time interval (T2) for a cooperative Data frame transfer are determined by the packet transmission time at each transmission from the source REDS to the destination REDS within the SP.

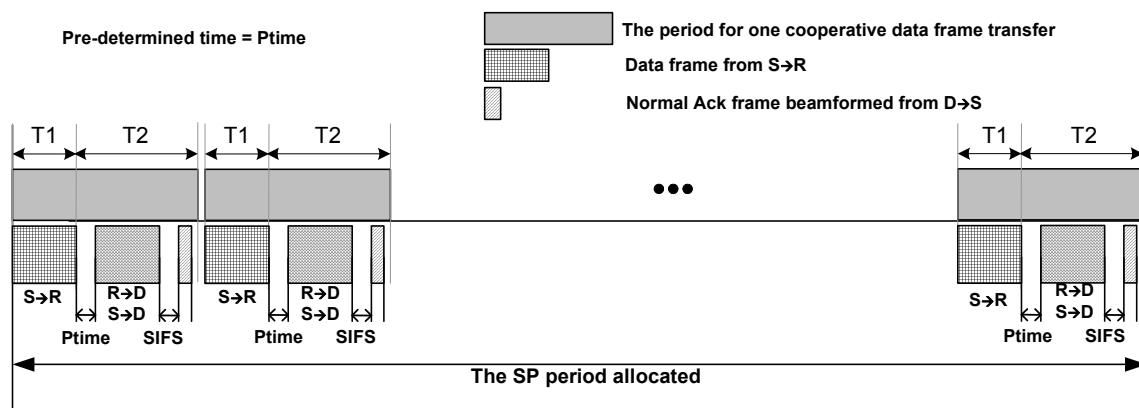

Figure 10-89—Example of data transmission in SP with link cooperation relay

The data transmission rules are as follows. At the start of each time T1, the source REDS transmits a frame with its transmit antenna pattern directed toward the RDS and with the TA and the RA fields in the MAC header set to the MAC address of the source REDS and destination REDS, respectively. After $Ptime + dT_{SR}$ from the start of T2, the source REDS retransmits the same frame sent to the RDS during the previous time T1 but now with its transmit antenna pattern directed toward the destination REDS. Similarly, after $Ptime + (dT_{DS} - dT_{DR})$ from the start of T2, the RDS retransmits the same frame it received from the source REDS during the previous time T1. So that the destination REDS might take advantage of the improved received signal level from both of these transmissions, the destination REDS should set its receive antenna pattern during T2 such that it simultaneously covers the links toward both the source REDS and the RDS.

10.41.4 Relay link adaptation

When a relay link is used for communication between a source REDS and a destination REDS, the link qualities of the S-R link, the R-D link, and the S-D link might be required.

The source REDS, destination REDS, and RDS use the procedure described in 10.39 to request and report the link quality among themselves with the following exception. In the Link Measurement Report frame the RDS transmits to the source REDS, the RDS shall include two Link Margin elements in this order:

- The first Link Margin element shall report the link quality between the source REDS and the RDS.
- The second Link Margin element shall report the link quality between the RDS and the destination REDS.

Upon reception of a Link Measurement Report frame, the source REDS might take several actions including changing the MCS it uses for frame transmission to the RDS and destination REDS.

11. MLME

11.1 Synchronization

11.1.1 General

STAs in a single infrastructure BSS, PBSS, or IBSS are synchronized to a common clock using the mechanisms defined in 11.1.

STAs in mesh BSSs use a synchronization method that is part of the extensible synchronization framework. The synchronization in an MBSS is described in 14.13.

A STA for which `dot11OCBActivated` is true is not a member of a BSS and, therefore, is not required to synchronize to a common clock or to use these mechanisms.

A timing synchronization function (TSF) keeps the timers for all STAs in the same BSS synchronized. All STAs in which `dot11OCBActivated` is false maintain a local TSF timer. STAs in which `dot11OCBActivated` is true may maintain a TSF timer for purposes other than synchronization.

A multi-band capable device (11.33) shall maintain a local TSF timer for each channel in which the STA operates.

11.1.2 Basic approach

11.1.2.1 TSF for an infrastructure BSS or a PBSS

In an infrastructure BSS or in a PBSS, the AP in the infrastructure BSS or the PCP in the PBSS shall be the timing master for the TSF. In a non-DMG BSS, the AP shall periodically transmit frames called *Beacon frames*. In a DMG BSS, the AP or PCP shall periodically transmit frames called *DMG Beacon frames* and *Announce frames*, which provide a similar function to the Beacon frame in a non-DMG BSS. Beacon, DMG Beacon, and Announce frames contain the value of the AP's or PCP's TSF timer in order to synchronize the TSF timers of other STAs in a BSS. A receiving STA shall accept the timing information in Beacon, DMG Beacon, and Announce frames sent from the AP or PCP servicing its BSS. If a STA's TSF timer is different from the timestamp in the received Beacon, DMG Beacon, or Announce frame, the receiving STA shall set its local TSF timer to the received timestamp value.

In a non-DMG BSS, Beacon frames shall be generated for transmission by the AP once every `dot11BeaconPeriod` TUs.

NOTE—The beacon interval, and hence the valid values of `dot11BeaconPeriod`, is constrained for APs in which `dot11PublicHCCATXOPNegotiationActivated` is true or `dot11ProtectedHCCATXOPNegotiationActivated` is true as specified in 11.28.4.1.

In a DMG infrastructure BSS, zero or more DMG Beacon frames shall be generated for transmission by the AP every `dot11BeaconPeriod` TUs (see 11.1.3.3). The AP shall transmit at least one DMG Beacon frame through each sector available to the AP within a time interval that is not longer than $\text{dot11BeaconPeriod} \times \text{dot11MaxLostBeacons}$ TUs. The TXSS Span field in the DMG Beacon frame shall be set to a value that is less than or equal to `dot11MaxLostBeacons`.

In a PBSS, the value of the TSF timer is delivered to the STA by the DMG Beacon frames generated at each BTI and by the Announce frames generated during the ATI. In a PBSS, at TBTTs that do not start with a BTI, the PCP begins a beacon interval with an ATI sequence (see 11.1.3.3.2). The time interval in between two consecutive BTIs shall be an integer multiple of `dot11BeaconPeriod` TUs. The PCP shall transmit at least one DMG Beacon frame to each associated STA within a time interval that is not longer than

dot11BeaconPeriod \times dot11MaxLostBeacons TUs. The PCP shall transmit at least one DMG Beacon frame through each possible antenna configuration in a full-coverage set of antenna configurations within the number of beacon intervals specified within the most recently updated TXSS Span field.

11.1.2.2 TSF for an IBSS

The TSF in an IBSS is implemented via a distributed algorithm that is performed by all of the members of the BSS. Each STA in the IBSS shall transmit Beacon frames according to the algorithm described in this clause. Each IBSS STA shall adopt the TSF value received from any Beacon frame or probe response from the IBSS of which it is a member and which has a TSF value later than its own TSF timer.

11.1.2.3 TSF for an MBSS

The TSF in an MBSS is provided by the MBSS's active synchronization method. A mesh STA shall initialize its TSF timer according to the MBSS's active synchronization method. The mesh STA shall periodically transmit Beacon frames that contain the value of its TSF timer to announce its local time reference. Mesh STAs receiving a Beacon frame use the timing information in the Beacon frame as specified by the MBSS's active synchronization method. See 14.13.2 for details.

11.1.3 Maintaining synchronization

11.1.3.1 General

Each STA shall maintain a TSF timer with modulus 2^{64} counting in increments of microseconds. STAs expect to receive Beacon frames at a nominal rate. In a non-DMG infrastructure BSS, the interval between Beacon frames is defined by dot11BeaconPeriod. In a DMG infrastructure BSS, the STAs expect to receive at least one DMG Beacon frame every dot11BeaconPeriod \times dot11MaxLostBeacons TUs. In a PBSS, STAs expect to receive at least one DMG Beacon frame or one Announce frame every dot11BeaconPeriod \times dot11MaxLostBeacons TUs.

A STA sending a Beacon frame shall set the value of the Beacon frame's timestamp so that it equals the value of the STA's TSF timer at the time that the data symbol containing the first bit of the timestamp is transmitted to the PHY plus the transmitting STA's delays through its local PHY from the MAC-PHY interface to its interface with the WM [e.g., antenna]. A STA sending a DMG Beacon or an Announce frame shall set the value of the frame's timestamp field to equal the value of the STA's TSF timer at the time that the transmission of the data symbol containing the first bit of the MPDU is started on the WM (which can be derived from the PHY-TXHEADEREND.indication primitive), including any transmitting STA's delays through its local PHY from the MAC-PHY interface to its interface with the WM.

11.1.3.2 Beacon generation in non-DMG infrastructure networks

The AP shall define the timing for the entire BSS by transmitting Beacon frames according to dot11BeaconPeriod. This defines a series of TBTTs exactly dot11BeaconPeriod TUs apart. Time 0 is defined to be a TBTT with the Beacon frame being a DTIM. At each TBTT, the AP shall schedule a Beacon frame as the next frame for transmission according to the medium access rules specified in Clause 10.

NOTE—To achieve this requirement, the AP suspends any pending transmissions until the beacon has been transmitted. In the case of a DTIM, the AP also suspends any pending individually addressed transmissions until any pending group addressed transmissions have been performed (see 11.2.3.4).

The beacon period is included in Beacon and Probe Response frames, and a STA shall adopt that beacon period when joining the BSS, i.e., the STA sets dot11BeaconPeriod to that beacon period.

NOTE—Though the transmission of a Beacon frame might be delayed because of CSMA deferrals, subsequent Beacon frames are scheduled at the undelayed nominal beacon interval. This is shown in Figure 11-1.

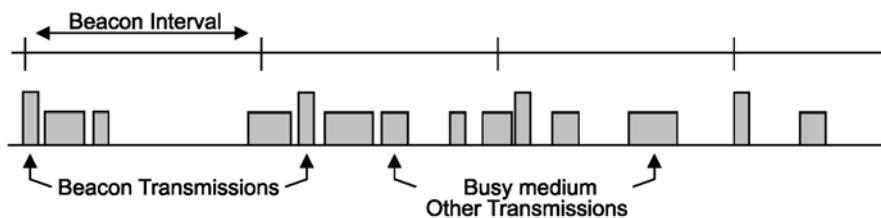

Figure 11-1—Beacon transmission on a busy network

If a STA that does not support short slot time associates with an AP that supports Clause 18 operation, and the AP is using short slot time, the AP shall use long slot time beginning at the first Beacon frame subsequent to the association of the long slot time STA.

An AP whose last transmitted values for the Tx STBC subfield and Rx STBC subfield of the HT Capability Information field of the HT Capabilities element are both nonzero may transmit an STBC Beacon frame and group addressed traffic using the basic STBC MCS, as defined in 10.7.3. An AP that transmits an STBC Beacon frame shall set the Dual Beacon field to 1 in transmitted HT Operation elements. A VHT AP shall set the Dual Beacon field to 0 in transmitted HT Operation elements. The STBC Beacon field shall be set to 1 to identify an STBC Beacon frame. The TBTT for the STBC Beacon frame shall be offset by half of a beacon interval from the TBTT of the non-STBC Beacon frame. Except for the setting of the STBC Beacon field, TIM field, and TSF field, all other fields inside the STBC Beacon frame shall be identical to the non-STBC Beacon frame.

The use of the dual beacon mechanism is deprecated.

11.1.3.3 Beacon generation in a DMG infrastructure BSS and in a PBSS

11.1.3.3.1 General

A DMG STA acting as an AP or PCP follows the DMG channel access procedures (see 10.36) and the rules described in this subclause to transmit DMG Beacon frames.

Each DMG Beacon frame transmitted by a PCP and by a DMG AP shall have the Discovery Mode field within the DMG Beacon frame set to 0.

The Duration field of each transmitted DMG Beacon frame shall be set to the time remaining until the end of the current BTI.

A PCP and a DMG AP establish a series of Target Beacon Transmission Times (TBTTs) spaced dot11BeaconPeriod TUs apart. The period between two TBTTs is referred to as the *beacon interval*. The beacon interval length shall be no more than aMaxBIDuration. Time value zero of the TSF is defined to be a TBTT.

The length of the beacon interval is included in the DMG Beacon, Announce, and Probe Response frames, and a DMG STA shall adopt that beacon interval when joining the BSS.

A PCP and a DMG AP that move the TBTT (11.31.2) or change the beacon interval duration (11.31.3) shall reestablish the TBTT by resetting the TSF to 0 at the time the BSS parameter change takes effect in the BSS.

At each BTI, a PCP and a DMG AP schedule DMG Beacon frames for transmission according to the procedure specified in 10.38.4. Subject to this constraint, the AP or PCP may delay the DMG Beacon frame transmission if the medium is determined by the CCA mechanism to be busy. When delaying a DMG

Beacon frame transmission, the AP or PCP shall check that the BTI, A-BFT, and ATI do not overlap in time with pseudo-static SPs for which the AP or PCP is not the source DMG STA and, if AP or PCP clustering is in use, that the DMG Beacon frame transmission follows the additional rules described in 10.37.

An AP or PCP may transmit DMG Beacon frames through different antenna configurations during the BTI, but shall not transmit more than one DMG Beacon frame through the same antenna configuration during the BTI of any beacon interval. For any beacon interval that does not include a DMG Beacon frame transmission in the BTI, the AP shall begin the beacon interval with an ATI, and the PCP may begin the beacon interval with an ATI (11.2.7.3).

When the DMG Beacon frame transmission is performed as multiple directional transmissions, an AP or PCP should change the sequence of directions through which a DMG Beacon frame is transmitted after it has transmitted a DMG Beacon frame through each direction in the current sequence of directions. When the ECAPC Policy Enforced field is equal to 1 in the DMG Beacon frame most recently transmitted by an AP or PCP, then

- When the AP or PCP transmits a DMG Beacon frame as multiple directional transmissions, the AP or PCP shall change the sequence of directions through which a DMG Beacon frame is transmitted after it has transmitted a DMG Beacon frame through each direction in the current sequence of directions.
- When the AP or PCP transmits a DMG Beacon frame as a single transmission, the AP or PCP shall randomly delay the transmission of the DMG Beacon frame by up to $\min(4 \times \text{TXTIME(DMG Beacon)}, 1024 \times \text{dot11MinBHIDuration}) \mu\text{s}$ after the TBTT.

This is done to randomize and potentially minimize interference to/from the DMG Beacon. One such example is indicated in Figure 11-2. If the sequence of directions is changed, the sequence of directions shall be pseudorandomly chosen from a sequence of directions covering the full set of directions available to an AP or PCP.

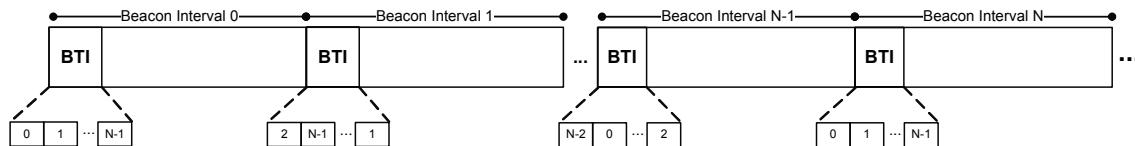

Figure 11-2—Example of DMG beacon transmission by an AP or PCP during the BTI

NOTE—An AP or PCP operating in a DMG BSS can transmit Announce frames during the ATI (10.36.3). An Announce frame can perform the function of a DMG Beacon frame, can be transmitted as an individually addressed frame directed to a STA, and can provide a much more spectrally efficient access than using a DMG Beacon frame.

A DMG STA that is an AP or a PCP shall include a DMG Operation element within a transmitted DMG Beacon frame if the CBAP Only field within the DMG Beacon frame is equal to 1. A DMG STA that is an AP or a PCP shall include a DMG Operation element within a transmitted DMG Beacon frame if the CBAP Only field within the DMG Beacon frame is equal to 0 and the Extended Schedule element is included in the DMG Beacon frame. A DMG STA that is an AP or a PCP shall include a DMG Operation element within a transmitted Announce frame if the Extended Schedule element is included in the Announce frame.

11.1.3.3.2 Beacon generation in a PBSS

In a PBSS, every beacon interval shall start with a BTI or ATI, except in PCP power save (PPS) mode, where a PCP doze BI may not start with a BTI or ATI.

A PCP that transmits a DMG Beacon frame with the CBAP Only field equal to 1 within a BTI shall include a BTI in any following beacon intervals until the completion of the TXSS of which the DMG Beacon frame is a part.

11.1.3.3 Beacon generation in a DMG infrastructure BSS

A DMG AP shall set dot11MaxLostBeacons to the value of the aMinBTIPeriod parameter.

11.1.3.4 DMG beacon generation before establishment of a BSS

A DMG STA can transmit DMG Beacon frames before establishment of a BSS to discover and perform beamforming during the A-BFT with another DMG STA so that the following frame exchanges between these STAs do not have to be done as a sector sweep (see 11.1.4.3.3).

A DMG STA that transmits DMG Beacon frames before establishment of a BSS shall set the Discovery Mode field in each transmitted DMG Beacon frame to 1 to indicate that the establishment of a BSS procedure defined in 11.1.4.4 has not been performed. In addition, the STA shall set the Next A-BFT field to 0.

Before establishment of a BSS, the spacing between TBTTs can change, and the time to the next TBTT is contained in each DMG Beacon frame transmitted at the last BTI. At each TBTT, the STA should generate a random value for the Beacon Interval field within the DMG Beacon frame from a uniform distribution between [10 TUs, 200 TUs], i.e., 10 TUs to 199 TUs. Every DMG Beacon frame transmission in the same BTI shall have the same value in its Beacon Interval field.

The TSF shall be set to 0 at the first TBTT for which the Discovery Mode field within the DMG Beacon frame is equal to 1. After that, the TSF shall be set to 0 at the TBTT of the beacon interval in which the STA changes the value of the Beacon Interval field.

A STA shall transmit the first DMG Beacon frame of the next BTI at the time indicated by the start of the transmission of the first DMG Beacon frame within the last BTI and the value of the Beacon Interval field contained in the DMG Beacon frame transmitted within the last BTI, unless the medium is determined by the CCA mechanism to be busy in which case the STA may delay the transmission of the first DMG Beacon frame transmission.

A STA that transmits a DMG Beacon frame with the Discovery Mode field equal to 1 may indicate the STA(s) that is allowed to respond in the A-BFT following the BTI where the DMG Beacon frame is transmitted. To do that, in the DMG Beacon frame the STA shall set the CC Present field to 1 and shall set the A-BFT Responder Address subfield to an individual address or to a group address of a group that includes the STA(s) that is allowed to respond in the A-BFT.

A DMG STA that is transmitting DMG Beacon frames with the Discovery Mode field equal to 1 should configure its receive antenna to a quasi-omni antenna pattern and stay in receiving state during portions of the DTI defined by the DMG Beacon frame transmissions. This enables the STA to receive frames transmitted by any STA that is covered by this antenna pattern.

A STA that is transmitting DMG Beacon frames with the Discovery Mode field equal to 1 should cease transmitting these beacons when it has received a DMG Beacon frame from another STA, or when it has received acknowledgment of a transmitted Probe Response frame. If a BSS is not initialized as a result of the channel scanning, the STA can resume transmitting DMG Beacon frames with the Discovery Mode field equal to 1.

The procedure of TBTT change described in the preceding paragraph is applicable for DMG Beacon frame generation before establishment of a BSS, whereas the procedures defined in 11.31.2 and 11.31.3 are used to change the DMG BSS parameters after an infrastructure BSS or PBSS has been established.

A STA shall set the Duration field of each transmitted DMG Beacon frame to the time remaining until the end of the current BTI.

11.1.3.5 Beacon generation in an IBSS

Beacon generation in an IBSS is distributed. The beacon period is included in Beacon, Announce, and Probe Response frames, and a STA shall adopt that beacon period when joining the IBSS. All members of the IBSS participate in beacon generation. Each STA shall maintain its own TSF timer that is used for dot11BeaconPeriod timing. The beacon interval within an IBSS is established by the STA at which the MLME-START.request primitive is performed to create the IBSS. This defines a series of TBTTs exactly dot11BeaconPeriod TUs apart. Time zero is defined to be a TBTT. At each TBTT the STA shall

- a) Suspend the decrementing of the backoff timer for any pending transmission that is not a Beacon or DMG Beacon frame,
- b) Calculate a random delay uniformly distributed in the range between zero and twice aCWmin × aSlotTime when the STA is a non-DMG STA, and between zero and the result of two multiplied by aCWminDMGIBSS multiplied by the duration of the STA's following BTI when the STA is a DMG STA,
- c) Wait for the period of the random delay, decrementing the random delay timer using the same algorithm as for backoff, except that SIFS + aSlotTime should be used as the initial medium idle period within the backoff procedure. If the ATIM window in use within the IBSS is greater than 0 and the end of the ATIM window occurs before the random delay timer expires, cancel the remaining random delay and pending Beacon frame transmission and proceed to step f),
- d) Cancel the remaining random delay and the pending Beacon frame transmission or BTI (DMG only), if a Beacon frame arrives from the IBSS of which the STA is a member before the random delay timer has expired,
- e) Send a Beacon frame in a non-DMG BSS or DMG Beacon frame(s) in a DMG BSS if the random delay has expired and no Beacon frame in a non-DMG BSS or no DMG Beacon frame in a DMG BSS has arrived from the IBSS of which the STA is a member during the delay period,
- f) If the ATIM window in use within the IBSS is greater than 0, then
 - 1) Resume decrementing the backoff timer for any pending transmission allowed inside the ATIM window and
 - 2) At the end of the ATIM window duration resume the backoff for any pending frames intended for transmission outside the ATIM window,
- g) If the ATIM window in use within the IBSS is 0, then resume decrementing the backoff timer for any pending transmissions.

Figure 11-3 illustrates beacon transmission in an IBSS.

11.1.3.6 Beacon generation in an MBSS

Beacon generation in an MBSS is described in 14.13.3.1.

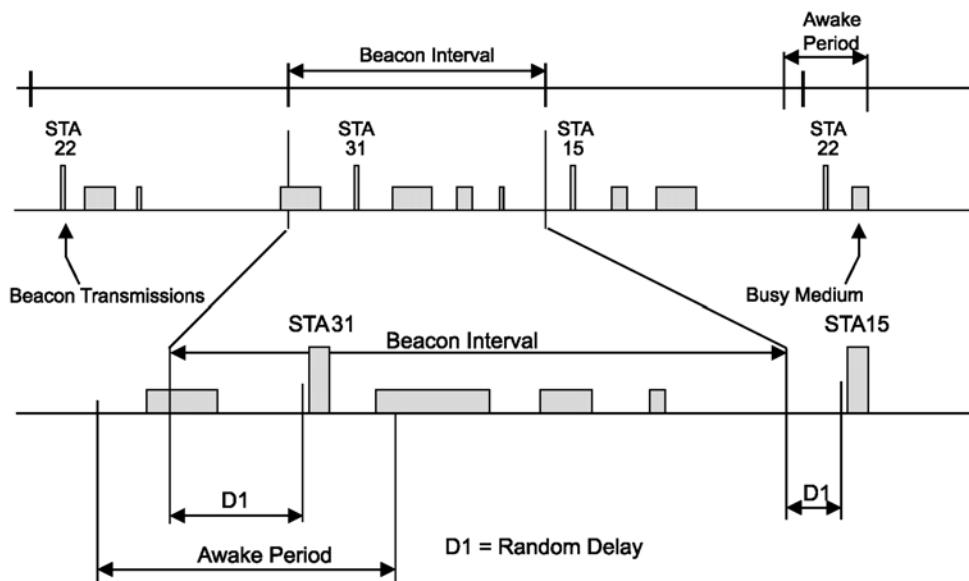

Figure 11-3—Beacon transmission in an IBSS

11.1.3.7 Beacon reception

A STA shall use information from the CF Parameter Set element of all received Beacon frames, without regard for the BSSID, to update their NAV as specified in 10.4.3.3.

STAs in an infrastructure network or PBSS shall use information that is not in the CF Parameter Set element in received Beacon frames, DMG Beacon frames, or Announce frames only if the BSSID field is equal to the MAC address currently in use by the STA contained in the AP of the BSS or to the MAC address currently in use by the PCP of the PBSS. A non-AP STA in an infrastructure BSS and a non-PCP STA in a PBSS that supports the Multiple BSSID capability shall use other information in received Beacon or DMG Beacon frames only if the BSSID field of the non-AP or non-PCP STA is equal to the MAC address currently in use by the STA contained in the AP or PCP, respectively, of the BSS corresponding to the transmitted BSSID or if the BSSID field of the non-AP or non-PCP STA is equal to one of the nontransmitted BSSIDs.

STAs in a non-DMG IBSS shall use information that is not in the CF Parameter Set element in any received Beacon frame for which the IBSS subfield of the Capability field is 1, the content of the SSID element is equal to the SSID of the IBSS, and the TSF value is later than the receiving STA's TSF timer. Use of this information is specified in 11.1.5.

STAs in an MBSS shall use information in received Beacon frames as described in 14.13.3.2.

A non-AP STA in which `dot11MultiBSSIDActivated` is true shall support frame filtering for up to two BSSIDs; one for the transmitted BSSID and one for the nontransmitted BSSID. The STA, when associated with a BSS corresponding to a nontransmitted BSSID, shall discard all Data and Management frames that use the transmitted BSSID as the transmit address, except for Beacon, Probe Response, and TIM broadcast frames.

DMG IBSS STAs shall use other information in any received DMG Beacon (excluding those with the Discovery Mode field equal to 1) and Announce frames for which the BSS Type subfield is 1, the content of

the SSID element is equal to the SSID of the IBSS, and the TSF value is later than the receiving STA's TSF timer. Use of this information is specified in 11.1.5.

A STA shall ignore the BSS Type field contained in a received DMG Beacon frame if the Discovery Mode field within the DMG Beacon frame is 1.

An active DMG STA operating in a BSS shall be ready to receive from its AP or PCP for a period of time of at least dot11MinBHIDuration following the TBTT or expected ATI start time as specified in the last Next DMG ATI element (9.4.2.135) transmitted by the AP or PCP.

An active DMG STA that is receive beamforming trained with the AP or PCP shall direct its receive antenna pattern toward the AP or PCP or use a quasi-omni antenna pattern during this time.

A non-PCP STA that receives a DMG Beacon frame from a PCP in which the PCP Association Ready field is 0 shall not transmit an Association Request frame addressed to the PCP that transmitted the received DMG Beacon. A non-PCP STA that receives a DMG Beacon frame from a PCP with the PCP Association Ready field set to 1 may transmit an Association Request frame addressed to the PCP that transmitted the received DMG Beacon.

11.1.3.8 Multiple BSSID procedure

Implementation of the Multiple BSSID capability is optional for a WNM STA and for a DMG STA. A STA that implements the Multiple BSSID capability has dot11MultiBSSIDImplemented equal to true. When dot11MultiBSSIDImplemented is true, dot11WirelessManagementImplemented shall be equal to true except for a DMG STA, in which case it may be equal to false. A STA in which dot11MultiBSSIDActivated is true is defined as a STA that supports the Multiple BSSID capability. The STA shall set to 1 the Multiple BSSID field of the Extended Capabilities elements that it transmits.

The nontransmitted BSSID profile shall include the SSID element (see 9.4.2.2) and Multiple BSSID-Index element (see 9.4.2.74) for each of the supported BSSIDs. The AP or PCP may include all other elements in the nontransmitted BSSID profile. The AP or PCP may include two or more Multiple BSSID elements containing elements for a given BSSID index in one Beacon frame or DMG Beacon frame. If two or more are given, the profile is considered to be the complete set of all elements given in all such Multiple BSSID elements sharing the same BSSID index. Since the Multiple BSSID element is also present in Probe Response frames, an AP or PCP may choose to advertise the complete or a partial profile of a BSS corresponding to a nontransmitted BSSID only in the Probe Response frames. In addition, the AP or PCP may choose to include only a partial list of nontransmitted BSSID profiles in the Beacon frame or DMG Beacon frame or to include different sets of nontransmitted BSSID profiles in different Beacon frames or DMG Beacon frames.

When a station receives a Beacon frame or DMG Beacon frame with a Multiple BSSID element that consists of a nontransmitted BSSID profile with only the mandatory elements, it may inherit the complete profile from a previously received Beacon frame, DMG Beacon frame, or Probe Response frame, or it may send a Probe Request frame to obtain the complete BSSID profiles. Each Beacon element not transmitted in a nontransmitted BSSID subelement is inherited from previous Beacon, DMG Beacon, or Probe Response frame in which the element is present, except for the Quiet element, which shall take effect only in the Beacon frame or DMG Beacon frame that contains it and not carry forward as a part of the inheritance. An AP or PCP is not required to include all supported nontransmitted BSSID profiles in a Probe Response frame, and may choose to only include a subset based on any criteria. When a nontransmitted BSSID profile is present in the Multiple BSSID element of the Probe Response frame, the AP or PCP shall include all elements that are specific to this BSS. If any of the optional elements are not present in a nontransmitted BSSID profile, the corresponding values are the element values of the transmitted BSSID.

A non-AP and non-PCP STA derives its nontransmitted BSSID value according to 9.4.2.46 and 9.4.2.74.

The Partial Virtual Bitmap field in the transmitted BSSID Beacon frame or DMG Beacon frame shall indicate the presence or absence of traffic to be delivered to all stations associated to a transmitted or nontransmitted BSSID. The first 2^n bits of the bitmap are reserved for the indication of group addressed frame for the transmitted and all nontransmitted BSIDs. The AID space is shared by all BSSs and the lowest AID value that shall be assigned to a station is 2^n (see 9.4.2.6).

Operation in a non-DMG BSS is subject to the following additional rules. If the Contention Free Period is supported and if more than one BSS's CFPCount becomes 0 in the same Beacon frame, the AP shall concatenate the Contention Free Periods of all CFPs that coincide and shall not transmit a CF-End or CF-End+Ack frame until the end of the concatenated CFP, indicated with a single CF-End or CF-End+Ack frame, if required. The CF Parameter Set in the transmitted BSSID contains times that are an aggregate of CFP times of the nontransmitted BSIDs.

Multiple BSSID rate selection is defined in 10.7.8.

11.1.3.9 TSF timer accuracy

A non-DMG STA's TSF timer shall be accurate to within ± 100 ppm. A DMG STA's TSF timer shall be accurate to within ± 20 ppm.

NOTE—The worst-case drift between two non-DMG STAs is, therefore, ± 200 ppm, and between two DMG STAs, ± 40 ppm.

Upon receiving a Beacon, a DMG Beacon, or an Announce frame for the BSS, as described in 11.1.3.7, a STA shall update its TSF timer according to the following algorithm

- Non-DMG STA: The received timestamp value shall be adjusted by adding an amount equal to the receiving STA's delay through its local PHY components plus the time since the first bit of the timestamp was received at the MAC/PHY interface. In the case of an infrastructure BSS, the STA's TSF timer shall then be set to the adjusted value of the timestamp.
- DMG STA: The received timestamp value shall be adjusted by adding an amount equal to the receiving STA's delay through its local PHY components plus the time since the last data symbol of the PHY header, excluding any guard interval, was received as indicated by the PHY-RXSTART.indication primitive.

In the case of an infrastructure BSS or a PBSS, the STA's TSF timer shall then be set to the adjusted value of the timestamp. In the case of an IBSS, the STA's TSF timer shall be set to the adjusted value of the received timestamp, if the adjusted value of the timestamp is later than the value of the STA's TSF timer.

When a STA is associated to a BSS with a nontransmitted BSSID, it shall use the TSF from the transmitted BSSID Beacon frame.

11.1.4 Acquiring synchronization, scanning

11.1.4.1 General

A STA shall operate in either a Passive Scanning mode or an Active Scanning mode depending on the current value of the ScanMode parameter of the MLME-SCAN.request primitive.

NOTE—Active scanning is restricted in some frequency bands and regulatory domains.

Upon receipt of the MLME-SCAN.request primitive, a STA shall perform scanning. The SSID parameter indicates the SSID for which to scan. The SSID List parameter indicates one or more SSIDs for which to scan.

To become a member of a particular ESS using passive scanning, a STA shall scan for Beacon and DMG Beacon frames containing that ESS's SSID, returning all Beacon and DMG Beacon frames matching the desired SSID in the BSSIDDescriptionSet parameter of the corresponding MLME-SCAN.confirm primitive with the appropriate bits in the Capability Information field or DMG Capabilities field indicating whether the Beacon frame or DMG Beacon frame came from an infrastructure BSS, PBSS, or IBSS. If dot11RM-MeasurementPilotActivated is greater than 1, the STA shall additionally scan for Measurement Pilot frames, returning in the BSSIDDescriptionFromMeasurementPilotSet parameter all Measurement Pilot frames that equal the requested BSSID of the corresponding MLME-SCAN.request primitive and are not already members of the BSSIDDescriptionSet.

To actively scan, the STA shall transmit Probe Request frames containing the desired SSID or one or more SSID List elements, but a DMG STA might also have to transmit DMG Beacon frames or perform beam-forming training prior to the transmission of Probe Request frames. When the SSID List element is present in the Probe Request frame, one or more of the SSID elements may include a wildcard SSID (see 9.4.2.2). The exact procedure for determining the SSID or SSID List values in the MLME-SCAN.request primitive is not specified in this standard. When a STA scans for a BSS whose AP does not support the SSID List element, or for a BSS for which AP support of the SSID List element is unknown, the SSID element with an SSID or wildcard SSID shall be included in the MLME-SCAN.request primitive.

NOTE—MLME-SCAN.request primitives and resulting Probe Request frames might include a Request element or Extended Request element(s) that can be used to request radio measurement information from the scanned BSSs. Requested radio measurement information from the scanned BSSs is included in the Probe Response frames and in the MLME-SCAN.confirm primitive.

Upon completion of scanning, an MLME-SCAN.confirm primitive is issued by the MLME indicating all of the BSS information received.

In DMG BSSs, the Active Scan procedure (11.1.4.3) can be used for device discovery prior to initializing or joining a BSS.

Upon receipt of an MLME-JOIN.request primitive, the nonmesh STA shall use the synchronization procedure described in 11.1.4.5. The MLME-JOIN.request primitive is not used to start synchronization in an MBSS. The synchronization in an MBSS is described in 14.13.

Upon receipt of an MLME-SCAN.request primitive with the SSID parameter equal to the wildcard SSID, the STA shall passively scan for any Beacon, DMG Beacon, or Measurement Pilot frames, or actively transmit Probe Request or DMG Beacon frames containing the wildcard SSID, as appropriate depending upon the value of ScanMode.

If a STA's scanning does not result in finding a BSS with the target SSID and of the target type, or does not result in finding any BSS, the STA may start an IBSS upon receipt of the MLME-START.request primitive.

NOTE—Starting an IBSS is restricted in some frequency bands and regulatory domains.

When scanning MBSSs, the STA shall process the procedures described in 14.2.

When a STA starts a BSS, that STA shall determine the BSSID of the BSS. If the BSSType indicates an infrastructure BSS, then the STA shall start an infrastructure BSS and the BSSID shall be equal to the STA's dot11StationID. If the BSSType indicates a PBSS, then the STA shall start a PBSS. For both the infrastructure BSS and the PBSS, the value of the BSSID shall remain unchanged, even if dot11StationID is changed after the completion of the MLME-START.request primitive. If the BSSType indicates an IBSS, the STA shall start an IBSS, and the BSSID shall be an individual locally administered IEEE MAC address as defined in Clause 8 of IEEE Std 802-2014. The remaining 46 bits of that MAC address shall be a number selected in a manner that minimizes the probability of STAs generating the same number, even when those STAs are subjected to the same initial conditions. The value SSID parameter shall be used as the SSID of the

new BSS. It is important that designers recognize the need for statistical independence among the random number streams among STAs.

11.1.4.2 Passive scanning

11.1.4.2.1 Passive scanning for non-DMG STAs

If the ScanType parameter indicates a passive scan, the STA shall listen to each channel scanned for no longer than a maximum duration defined by the MaxChannelTime parameter.

11.1.4.2.2 Passive scanning for DMG STAs

Upon receipt of the MLME-SCAN.request primitive with the ScanType parameter set to Passive, a DMG STA shall passively scan for transmissions on each channel specified within the ChannelList parameter of the MLME-SCAN.request primitive. The channel traversal order during passive scanning is implementation specific.

That is, the STA shall be in the receive state scanning for a period of time in a channel no less than MinChannelTime and return information on all DMG Beacon frames received matching a particular BSSID or SSID parameters specified in the MLME-SCAN.request primitive. If no DMG beacon scan parameters are specified in the request, then the STA shall return information on all received DMG Beacon frames.

If at any time during the scan the STA detects a frame that is not a DMG Beacon frame, the STA shall continue to scan the current channel until the scanning timer expires. After scanning one channel, the STA shall initiate scanning in another channel if at least one channel within the ChannelList parameter has not yet been scanned.

When the STA has completed scanning all indicated channels, it returns the scan results via the MLME-SCAN.confirm primitive.

11.1.4.3 Active scanning

11.1.4.3.1 Introduction

Active scanning involves the generation of Probe Request frames and the subsequent processing of received Probe Response frames. The details of the active scanning procedures are as specified in the following subclauses.

11.1.4.3.2 Active scanning procedure for a non-DMG STA

Upon receipt of the MLME-SCAN.request primitive with ScanType indicating an active scan, a STA shall use the following procedure.

For each channel to be scanned:

- a) Wait until the ProbeDelay time has expired or a PHY-RXSTART.indication primitive has been received.
- b) Perform the basic access procedure as defined in 10.3.4.2.
- c) Send a probe request to the broadcast destination address. The probe request is sent with the SSID and BSSID from the received MLME-SCAN.request primitive.
- d) When the SSID List is present in the invocation of the MLME-SCAN.request primitive, send zero or more Probe Request frames, to the broadcast destination address. Each probe request is sent with an SSID indicated in the SSID List and the BSSID from the MLME-SCAN.request primitive. The basic access procedure (10.3.4.2) is performed prior to each probe request transmission.

- e) Initialize a timer to 0 and start it running.
- f) If a PHY-CCA.indication (BUSY) primitive is not received before the timer reaches MinChannelTime, proceed to step h).
- g) Process all probe responses received until the timer reaches MaxChannelTime, constructing BSSDescriptions corresponding to the probe responses that match the criteria specified in the MLME-SCAN.request primitive.
- h) Set the NAV to 0 and scan the next channel.

See Figure 11-4 for non-DMG STAs.

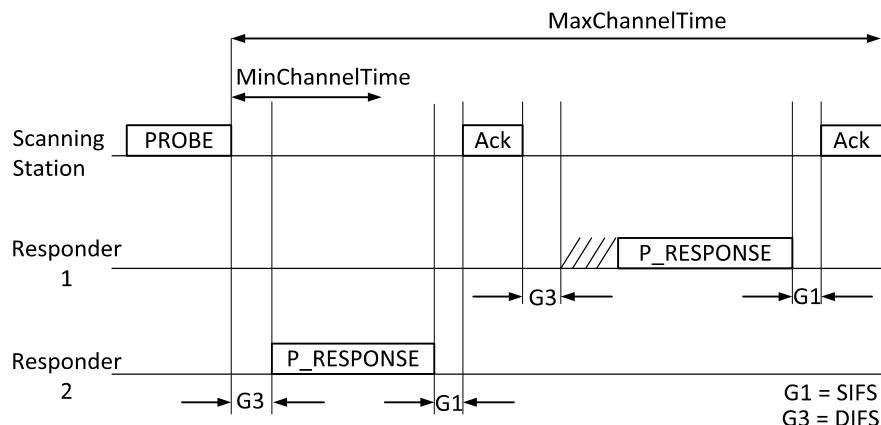

Figure 11-4—Probe response

When all channels in the ChannelList have been scanned, the MLME shall issue an MLME-SCAN.confirm primitive with the BSSDescriptionSet containing all the BSSDescriptions constructed during the scan.

11.1.4.3 Active scanning procedure for a DMG STA

Upon receipt of the MLME-SCAN.request primitive with ScanType indicating an active scan, a DMG STA shall use the following procedure.

For each channel to be scanned:

- a) Wait until the ProbeDelay time has expired or a PHY-RXSTART.indication primitive has been received.
- b) Initialize a timer to 0 and start it running.
- c) If the DiscoveryMode parameter of the MLME-SCAN.request primitive is equal to 1, generate DMG Beacon frames as (described in 11.1.3.4) for a period no longer than MaxChannelTime.
- d) If a DMG Beacon frame is received before the timer reaches MaxChannelTime and beamforming training is required (see 10.38), perform beamforming training defined in 10.38.5.
- e) Perform the basic access procedure defined in 10.3.4.2
- f) If an SSW-Feedback frame is transmitted or received in step d), then:
 - 1) Send a probe request to the broadcast destination address or
 - Following the transmission of an SSW-Feedback frame, send a probe request to the MAC address of the STA addressed by the SSW-Feedback frame.
 - Optionally, following the reception of an SSW-Feedback frame, send a probe request to the MAC address of the STA that transmitted the SSW-Feedback frame.

In all probe requests sent under step f) 1), the probe request is sent with the SSID and BSSID from the received MLME-SCAN.request primitive and includes the DMG Capabilities element. The basic access procedure (10.3.4.2) is performed prior to the probe request transmission.

- 2) When the SSID List is present in the invocation of the MLME-SCAN.request primitive, send zero or more probe requests to the broadcast destination address. Each probe request is sent with an SSID indicated in the SSID List and the BSSID from the received MLME-SCAN.request primitive and includes the DMG Capabilities element. The basic access procedure (10.3.4.2) is performed prior to each probe request transmission.
- g) If an SSW-Feedback frame is neither transmitted nor received in step d), then:
 - 1) Optionally send a probe request to the broadcast destination address. The probe request is sent with the SSID and BSSID from the received MLME-SCAN.request primitive and includes the DMG Capabilities element. The basic access procedure (10.3.4.2) is performed prior to the probe request transmission.
 - 2) When the SSID List is present in the invocation of the MLME-SCAN.request primitive, send zero or more probe requests to the broadcast destination address. Each probe request is sent with an SSID indicated in the SSID List and the BSSID from the MLME-SCAN.request primitive and includes the DMG Capabilities element. The basic access procedure (10.3.4.2) is performed prior to each probe request transmission.
- h) Process all probe responses received until the timer reaches MaxChannelTime, constructing BSSDescriptions corresponding to the probe responses that match the criteria specified in the MLME-SCAN.request primitive.
- i) Set the NAV to 0 and scan the next channel.

When all channels in the ChannelList have been scanned, the MLME shall issue an MLME-SCAN.confirm primitive with the BSSDescriptionSet containing all the BSSDescriptions constructed during the scan.

See Figure 11-5 for DMG STAs that generate DMG Beacon frames with the Discovery Mode field set to 1.

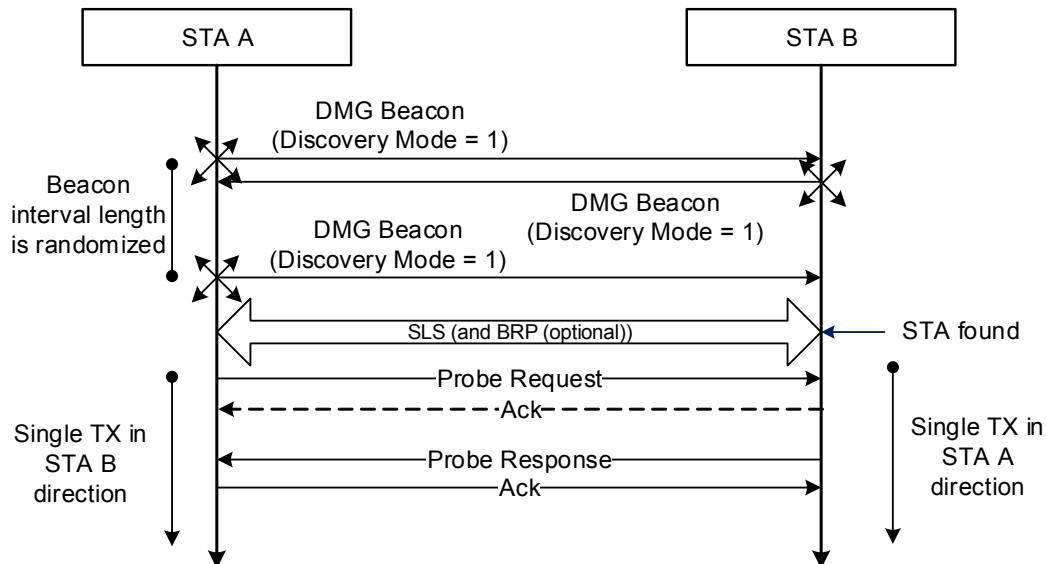

Figure 11-5—Active scanning for DMG STAs

11.1.4.3.4 Criteria for sending a probe response

A STA that receives a Probe Request frame shall not respond if any of the following apply:

- a) The STA does not match any of the following criteria:
 - 1) The STA is an AP.
 - 2) The STA is an IBSS STA.
 - 3) The STA is a mesh STA.
 - 4) The STA is a DMG STA that is not a member of a PBSS and that is performing active scan as defined in 11.1.4.3.3.
 - 5) The STA is a PCP.
- b) The Address 1 field of the Probe Request frame contains an individual address that is not the MAC address of the STA.
- c) The STA is a non-AP STA in an infrastructure BSS and the Address 1 field of the Probe Request frame contains the broadcast address.
- d) The STA is a non-PCP STA in a PBSS and the Address 1 field of the Probe Request frame contains the broadcast address.
- e) The STA is in an IBSS and did not transmit a Beacon or DMG Beacon frame since the last TBTT, and the Address 1 field of the Probe Request frame contains the broadcast address.
- f) The STA is a mesh STA and either of the following criteria are met:
 - 1) The Probe Request frame does not contain a Mesh ID element.
 - 2) The Mesh ID element in the Probe Request frame is present but does not contain the wildcard Mesh ID and does not match the Mesh ID of the MBSS with which the STA is peered.
- g) The STA is not a mesh STA and none of the following criteria are met:
 - 1) The SSID in the Probe Request frame is the wildcard SSID.
 - 2) The SSID in the Probe Request frame matches the SSID of the STA's.
 - 3) The SSID List element is present in the Probe Request frame and includes the SSID of the STA's BSS.
- h) The STA is not a mesh STA and the Address 3 field of the Probe Request frame does not contain a wildcard BSSID and does not match the BSSID of the STA's BSS.
- i) The STA has dot11InterworkingServiceActivated equal to true and the Probe Request frame contains an Interworking element and an Extended Capabilities element whose Interworking field contains the value 1, and at least one of the following criteria is not met:
 - 1) The HESSID field of the Interworking element is absent, or is present and contains the wildcard HESSID or matches the HESSID field of the InterworkingInfo parameter of the last MLME-START.request or MLME-JOIN.request primitive.
 - 2) The Access Network Type field of the Interworking element contains the wildcard access network type or matches the access network type of the STA.
- j) The STA has dot11RadioMeasurementActivated equal to true and the Probe Request frame contains a DSSS Parameter Set element in which the Current Channel field contains a value that is not the same as dot11CurrentChannel.
- k) The STA is a DMG STA and the transmit antenna of the DMG STA is not trained to transmit to the STA from which the Probe Request frame was received.

An AP shall remain in the awake state, and shall respond to probe requests, subject to the criteria above.

An IBSS STA that sent a Beacon or DMG Beacon frame shall remain in the awake state, and shall respond to probe requests, subject to the criteria above, until a Beacon or DMG Beacon frame with the BSSID of the STA's IBSS is received.

A mesh STA or PCP that is awake shall respond to probe requests, subject to the criteria above.

NOTE—A result of the procedures defined in this subclause is that:

- Infrastructure BSS: the AP is always awake to respond to probe requests.
- IBSS: at least one STA will be awake to respond to probe requests. More than one STA might respond to any given probe request, particularly when more than one STA transmitted a Beacon or DMG Beacon frame following the most recent TBTT, either due to not receiving successfully a previous Beacon or DMG Beacon frame or due to collisions between beacon transmissions.
- MBSS or PBSS: At any given time it might be the case that no STA is awake to respond to probe requests.

11.1.4.3.5 Contents of a probe response

A STA that responds to a Probe Request frame according to 11.1.4.3.4 shall transmit a Probe Response frame individually addressed to the STA that transmitted the Probe Request frame.

If there was a Request element or Extended Request element in the Probe Request frame, then:

- Each element that is listed in the Request element or Extended Request element(s) and that is supported by the STA shall be included in the Probe Response frame. An element that is listed in a Request element or Extended Request element and that is not supported by the STA shall not be included.
- Elements that would not have been included otherwise shall be included after all of the elements that would have been included even in the absence of the Request element or Extended Request element.
- Elements that would have been included even in the absence of the Request element or Extended Request element shall be included in their normal position (see Table 9-34), and may be included again after all of the elements that would have been included even in the absence of the Request element.

NOTE—An element that would necessarily be included anyway is not expected to be requested.

- Elements after all of the elements that would have been included even in the absence of the Request element or Extended Request element shall be included in the order that they appear in the (Extended) Request element(s) of the Probe Request frame.
- If dot11RadioMeasurementActivated is true and the RCPI element was requested, an RCPI element containing the RCPI of the Probe Request frame shall be included. If no measurement result is available, the RCPI value shall be set to indicate “Measurement not available” (see Table 9-154).
- If dot11RadioMeasurementActivated is true and the RSNI element was requested, an RSNI element containing the RSNI of the Probe Request frame shall be included. If no measurement result is available, the RSNI value shall be set to indicate that a measurement is not available. (see 9.4.2.41).

11.1.4.3.6 PCP selection in a PBSS

The PCP selection procedure is performed by the SME when:

- An MLME-SCAN.confirm primitive is received in response to an MLME-SCAN.request primitive with the value of the ScanType parameter equal to ACTIVE and BSSType parameter equal to PERSONAL
- There is a PCP handover (see 11.29.2)

The decision of whether a STA or its peer STA is the PCP depends on a comparison of their respective PCP factors (self_PCP_factor and peer_PCP_factor). The PCP factor, defined in Figure 11-6, is the concatenation of the value of some of the fields from the DMG Capabilities element transmitted by the STA (see 9.4.2.128).

NOTE—According to convention, the least significant bit is the leftmost bit (B0).

| B0 | B6 | B7 | B14 | B15 | B21 | B22 | B23 | B24 | B25 | B26 | B31 |
|----------|----------------------------|-------------------------|----------------------------|-------|------------------------------------|--------------|----------|-----|-----|-----|-----|
| Reserved | MAX Associate d STA Number | Total Number of Sectors | Pseudo-Static Allocation s | TDDTI | Decentralized AP or PCP clustering | Power Source | Reserved | | | | |

Bits: 7 8 7 1 1 1 1 6

Figure 11-6—PCP factor for a DMG STA

For each peer STA reported as part of an MLME-SCAN.confirm primitive or considered as part of a PCP handover, the STA proceeds as follows. If the STA's value of self_PCP_factor is greater than the value of peer_PCP_factor or if the values are equal and the MAC address of the STA is greater than (see 12.7.1 for MAC address comparison) the MAC address of the peer STA contained in the peer STA's DMG Capabilities element, the STA becomes a candidate PCP. Otherwise, the STA does not become a candidate PCP.

Subclause 11.1.4.4.2 specifies the rules followed by the SME of a candidate PCP to start a PBSS.

11.1.4.4 Initializing a BSS

11.1.4.4.1 General

Upon receipt of an MLME-START.request primitive, a STA shall determine the BSS's BSSID (as described in 11.1.4), select channel synchronization information, select a beacon period, initialize and start its TSF timer, and begin transmitting Beacon frames if the STA is a non-DMG STA or DMG Beacon frames if the STA is a DMG STA. See 9.3.3.3 for the description of a Beacon frame, and see 9.3.4.2 for the description of a DMG Beacon frame.

11.1.4.4.2 Initializing a DMG BSS

Prior to choosing a suitable operating channel and starting a BSS, the SME of a DMG STA should perform a channel scan to ascertain the quality of each channel that the STA supports. The rules for choosing a suitable operating channel are implementation specific and might be subject to regulatory requirements.

When a STA's MAC receives an MLME-START.request primitive, the MAC shall attempt to start a BSS. The STA may listen for a duration of aMinChannelTime, the listening duration, in the channel specified by the SME in the request. If the STA determines the channel is suitable for BSS operation at the end of this listening duration, the STA initializes the BSS by commencing transmission of DMG Beacon frames according to 11.1.3.3 in the case of a PBSS or an infrastructure BSS and according to 11.1.3.5 in the case of an IBSS. If AP or PCP clustering is in use on the selected channel, the DMG Beacon frame transmission by an AP or PCP commences following the additional rules described in 10.37.

If the STA determines that no channels are suitable or available, it responds with an MLME-START.confirm primitive with a ResultCode of NOT_SUPPORTED. Otherwise, the MLME shall respond with an MLME-START.confirm primitive with a ResultCode of SUCCESS.

The SME should issue an MLME-START.request primitive with BSSType parameter equal to PERSONAL for at least one network in which the STA becomes a candidate PCP as defined in 11.1.4.3.6. If the STA becomes a candidate PCP of more than one network, the SME may issue an MLME-START.request primitive with BSSType parameter equal to PERSONAL for any of the remaining networks. In either case, the MLME-START.request primitive should be issued no later than $4 \times \text{aMaxBIDuration}$ after the MAC receives an MLME-SCAN.confirm primitive.

The SME should not issue an MLME-START.request primitive with BSSType parameter equal to PERSONAL for networks in which the STA does not become a candidate PCP as defined in 11.1.4.3.6. If the SME issues the MLME-START.request primitive under this circumstance, it shall not be issued if less than $4 \times \text{aMaxBIDuration}$ has elapsed since the MAC received the MLME-SCAN.confirm primitive.

11.1.4.5 Synchronizing with a BSS

Upon receipt of an MLME-JOIN.request primitive, a STA shall adopt the BSSID in the request. Upon receipt of a Beacon frame from the BSS, a STA shall adopt the TSF timer value of the parameters in the Beacon frame using the algorithm described in 11.1.3.9, and the MLME shall issue an MLME-JOIN.confirm primitive indicating the operation was successful.

In addition to these synchronization parameters, a STA joining an infrastructure BSS adopts each of the parameters found in the SelectedBSS parameter of the MLME-JOIN.request primitive except Local time, Capability Information, BSSBasicRateSet parameters, and HT Capabilities element. Local time is not adopted but is used as a local variable in adopting the TSF as described in 11.1.3.9. The Capability Information reflects the capabilities of the sender and is not adopted but may be used to determine local configuration or behavior. The BSSBasicRateSet parameter is not adopted but may determine if the STA can join the BSS.

If the JoinFailureTimeout timer expires prior to the receipt of a Beacon frame from the BSS, the MLME shall issue an MLME-JOIN.confirm primitive indicating the operation was unsuccessful.

If dot11MultiDomainCapabilityActivated is true, a STA that is joining an infrastructure BSS and receives a Beacon or Probe Response frame containing a Country element shall adopt the applicable parameters included in that Country element, and the dot11RegDomainsSupportedEntry shall be set to Other.

In addition to adopting the synchronization parameters as described in the first paragraph of this subclause, a STA joining an IBSS shall adopt each of the parameters found in the SelectedBSS parameter of the MLME-JOIN.request primitive according to the rule found for that parameter in the “IBSS adoption” column of the matching row of the BSSDescription table found in 6.3.3.3.2 when those parameters exist at the STA. Parameters adopted by a STA when joining an IBSS shall not be changed by the STA except when adopting parameters following the reception of a Beacon frame with a later timestamp as described in 11.1.5. When an IBSS contains STAs with a mix of STA capabilities, e.g., non-HT and HT, a STA in the IBSS adopts the behavioral parameters of the last beacon with the highest TSF (e.g., a HT STA does not continue use of HT and does not include an HT Operations element in its beacons).

In addition to the table entries in 6.3.3.3.2, if dot11MultiDomainCapabilityActivated is true, a STA that is joining an IBSS and receives a Beacon or Probe Response frame containing a Country element shall adopt the applicable parameters included in that Country element, and the dot11RegDomainsSupportedEntry shall be set to Other.

A DMG STA shall be capable of transmitting DMG Beacon frames. A DMG STA obtains the operational parameters in use by its AP or PCP through the DMG Operation Information field of the DMG Operation element. A DMG STA shall update the value of its local MIB variables with the corresponding field value transmitted by its AP or PCP within the DMG BSS Parameter Configuration field of the DMG Operation element (9.4.2.129). Except for the prefix “dot11” used in the MIB variable naming convention, the name of the field is the same as the name of the corresponding MIB variable.

11.1.4.6 Operation of Supported Rates and BSS Membership Selectors element and Extended Supported Rates and BSS Membership Selectors element

The Supported Rates and BSS Membership Selectors element and Extended Supported Rates and BSS Membership Selectors element in Beacon and Probe Response frames is used by STAs in order to avoid

associating with a BSS if they do not support all of the data rates in the BSSBasicRateSet parameter or all of the BSS membership requirements in the BSSMembershipSelectorSet parameter.

If the combined total of the number of rates in the OperationalRateSet parameter and the number of BSS membership selectors does not exceed eight, the Extended Supported Rates and BSS Membership Selectors element is optional for inclusion in all of the frame types that include the Supported Rates and BSS Membership Selectors element. If the combined total of the number of rates in the OperationalRateSet parameter and the number of BSS membership selectors exceeds eight, an Extended Supported Rates and BSS Membership Selectors element shall be included to specify the remaining supported rates and BSS membership selectors in all of the frame types that include the Supported Rates and BSS Membership Selectors element.

The Supported Rates and BSS Membership Selectors element in Beacon and Probe Response frames is delivered to the management entity in a STA via the BSSBasicRateSet parameter in the MLME-SCAN.confirm primitive. The BSS membership selector information in Beacon and Probe Response frames is delivered to the management entity in a STA via the BSSMembershipSelectorSet parameter in the MLME-SCAN.confirm primitive. Together, these parameters are used by the management entity in a STA to avoid associating with a BSS if the STA cannot receive and transmit all of the data rates in the BSSBasicRateSet parameter or does not support all of the features represented in the BSSMembershipSelectorSet parameter.

NOTE—A STA that was implemented before the existence of the BSSMembershipSelectorSet parameter interprets each BSS membership selector in the Supported Rates and BSS Membership Selectors element that is contained in the BSSMembershipSelectorSet parameter of the transmitting STA as though it were a rate from the BSSBasicRateSet parameter. The value of each BSS membership selector does not match a rate that is known to the STA and, therefore, the management entity in the STA avoids associating with the BSS because it determines that the STA cannot receive or transmit at what appears to be a required rate.

A STA that is implemented after the existence of the BSSMembershipSelectorSet parameter includes each octet of the Supported Rates and BSS Membership Selectors element that is encoded with the MSB (bit 7) equal to 1 and that it does not recognize as a rate in its BSSMembershipSelectorSet parameter. The STA then determines if it can support all of the features represented in its BSSMembershipSelectorSet parameter before attempting to join the network. If some BSSMembershipSelectorSet parameter values are not recognized by the STA, the STA does not attempt to join the network.

11.1.5 Adjusting STA timers

A STA in an infrastructure BSS or PBSS shall adopt the TSF timer value in a Beacon, Probe Response, DMG Beacon, or Announce frame transmitted by the BSS's AP or PCP. The STA shall use the algorithm specified in 11.1.3.9.

To response to an MLME-JOIN.request primitive, a STA joining an IBSS shall initialize its TSF timer to 0 and shall not transmit a Beacon, Probe Response, or DMG Beacon frame until it receives from a member of the IBSS a Beacon, Probe Response or DMG Beacon frame that has a matching SSID. Consequently, the STA joining an IBSS adopts the timer from the next Beacon, Probe Response, or DMG Beacon frame from its IBSS.

All Beacon, Probe Response, DMG Beacon, and Announce frames carry a Timestamp field. A STA receiving such a frame from another IBSS STA with the same SSID shall compare the Timestamp field with its own TSF time. If the Timestamp field of the received frame is later than its own TSF timer, a non-DMG STA in the IBSS shall adopt all parameters contained in the Beacon frame according to the rule for that parameter found in the “IBSS adoption” column of the matching row of the BSSDescription table found in 6.3.3.3.2. A DMG IBSS STA shall adopt each parameter contained in the DMG Beacon or Announce frames. Parameters adopted by a STA due to the receipt of a later timestamp shall not be changed by the

STA except when adopting parameters due to a subsequently received Beacon, DMG Beacon, or Announce frame with a later timestamp.

11.1.6 Terminating a BSS

At any time an infrastructure BSS or PBSS may be terminated. At any time a STA may cease support for an IBSS that it formed. Upon receipt of an MLME-STOP.request primitive, a STA shall stop transmitting Beacon, Probe Response, DMG Beacon, and Announce frames and deauthenticate all associated STAs.

11.1.7 Supported rates and extended supported rates advertisement

A STA shall include the rates from its OperationalRateSet parameter and the rates from the BSSBasicRateSet parameter and the BSS membership selectors from the BSSMembershipSelectorSet parameter in frames it transmits containing Supported Rates and BSS Membership Selectors elements and Extended Supported Rates and BSS Membership Selectors elements according to the rules described in this subclause, except that a non-AP STA may omit the HT and VHT BSS membership selectors, as the (V)HT capabilities are indicated through the presence of a (V)HT Capabilities element.

A STA that supports a combined total of eight or fewer data rates and BSS membership selectors may include the Extended Supported Rates and BSS Membership Selectors element in all of the frame types that include the Supported Rates and BSS Membership Selectors element.

A STA that supports a combined total of the number of rates in the OperationalRateSet parameter and the number of BSS membership selectors that exceeds eight shall generate an Extended Supported Rates and BSS Membership Selectors element to specify the supported rates and BSS membership selectors that are not included in the Supported Rates and BSS Membership Selectors element. If the BSSMembershipSelectorSet parameter contains at least one BSS membership selector, then the STA shall include at least one BSS membership selector value from the BSSMembershipSelectorSet parameter in the Supported Rates and BSS Membership Selectors element.

NOTE—Inclusion of at least one BSS membership selector in the Supported Rates and BSS Membership Selectors element causes a receiving STA that does not process the Extended Supported Rates and BSS Membership Selectors element to still receive a BSS membership selector (which it considers to be a basic rate) that it does not support. Any values from the BSSMembershipSelectorSet parameter that are not transmitted in the Supported Rates and BSS Membership Selectors element are transmitted in the Extended Supported Rates and BSS Membership Selectors element.

11.2 Power management

11.2.1 General

A STA can be in one of two power states:

- Awake: STA is fully powered.
- Doze: STA is not able to transmit or receive and consumes very low power.

The manner in which a STA transitions between power states is determined by its power management mode and reflected in dot11PowerManagementMode.

The power management mode of a STA is selected by the PowerManagementMode parameter of the MLME-POWERMGT.request primitive or MLME-MESHPOWERMGT.request primitive. Once the STA updates its power management mode, the MLME shall issue an MLME-POWERMGT.confirm primitive or MLME-MESHPOWERMGT.confirm primitive respectively indicating the success of the operation.

When MSDUs or A-MSDUs are buffered for power management purposes, the information in the MAC service tuple(s) for the MSDU(s) shall be maintained (and reordered) as a unit.

11.2.2 Bufferable MMPDUs

MMPDUs are categorized as bufferable or nonbufferable, as shown in Table 11-1. Bufferable MMPDUs are eligible to be queued for delivery using a power-saving mechanism.

Nonbufferable MMPDUs are delivered without reference to a power-saving mechanism.

Table 11-1—Bufferable/nonbufferable classification of MMPDUs

| Description | Classification |
|--|-----------------------|
| An MMPDU that is carried in one or more Action (except for Fine Timing Measurement frame and Fine Timing Measurement Request frame), Disassociation, or Deauthentication frame | Bufferable |
| An individually addressed MMPDU that is carried in one or more Probe Response frames and that is sent in an IBSS in response to an individually addressed Probe Request frame. | Bufferable |
| All other MMPDUs. | Nonbufferable |

11.2.3 Power management in a non-DMG infrastructure network

11.2.3.1 General

A STA that is associated with an AP and that changes power management mode shall inform the AP of this fact using the Power Management subfield within the Frame Control field of transmitted frames. The STA shall remain in its current power management mode until it informs the AP of a power management mode change via a frame exchange that includes an acknowledgment from the AP. Power management mode shall not change during any single frame exchange sequence, as described in Annex G.

NOTE—This means the Power Management subfield is the same for all MPDUs in an A-MPDU.

The AP shall buffer individually addressed BUs addressed to STAs operating in a PS mode. These buffered BUs shall be transmitted only at designated times.

If any STA in its BSS is in PS mode, the AP shall buffer all non-GCR-SP group addressed BUs and deliver them to all STAs immediately following the next Beacon frame containing a DTIM transmission.

The STAs that currently have buffered BUs (excluding those BUs for a STA associated with ACs that are U-APSD delivery-enabled when not all ACs are delivery-enabled by that STA) within the AP are identified in a TIM, which shall be included as an element within all Beacon frames generated by the AP. A STA shall determine that a BU is buffered for it by receiving and interpreting a TIM.

A STA operating in PS mode that is not in WNM sleep mode shall periodically listen for Beacon frames, as determined by the ListenInterval parameter of the MLME-ASSOCIATE.request or MLME-REASSOCIATE.request primitive and the ReceiveDTIMs parameter of the MLME-POWERMGT.request primitive.

WNM sleep mode enables an extended power save mode for non-AP STAs in which a non-AP STA need not listen for every DTIM Beacon frame, and need not perform GTK/IGTK updates. STAs in WNM sleep

mode can wake up as infrequently as once every WNM sleep interval to check whether the corresponding TIM bit is set or group addressed traffic is pending.

NOTE—A STA may use both WNM sleep mode and PS mode simultaneously.

The Power Management subfield of the Frame Control field may be set to 0 or 1 within a frame sent by a STA in WNM sleep mode.

When a STA is in WNM sleep mode and in PS mode, the AP buffers unicast frames according to the traffic filtering agreement established between the AP and STA, as specified in 11.24.12.2. When a STA is in WNM sleep mode but not in PS mode, the traffic filtering agreement between the AP and STA and the timer for the WNM sleep interval remain in place, and the AP queues for nonbuffered delivery all matched frames (i.e., matched by the traffic filtering agreement) destined to the STA.

In a BSS operating under the DCF or EDCA, or during the CP of a BSS using the PCF, upon determining that a BU is currently buffered in the AP, a STA operating in the normal (non-APSD) PS mode transmits a PS-Poll frame to the AP, which responds with the corresponding buffered BU immediately, or acknowledges the PS-Poll frame and responds with the corresponding BU at a later time. If the TIM indicating the buffered BU is sent during a CFP, a CF-Pollable STA operating in the PS mode does not send a PS-Poll frame, but remains active until the buffered BU is received (or the CFP ends).

A non-AP QoS STA may be in PS mode before the setup of DLS or block ack. Once DLS is set up, both of the QoS STAs associated with a DLS link suspend the PS mode and shall be awake. BUs for a TID without a schedule are sent using Normal Ack following a PS-Poll frame as described in rest of 11.2.3. Uplink block ack agreements, block ack agreements for any TID with a schedule, and any block ack agreements to APSD STAs continue to operate normally.

NOTE—When a STA is in normal (non-APSD) PS mode, the rules described in 11.2.3.6 for PS-Poll operation apply to any downlink block ack agreement without an associated schedule. An (A-)MSDU delivered for this block ack agreement in response to the PS-Poll frame might be delivered in an A-MPDU.

11.2.3.2 STA power management modes

A non-AP STA can be in one of two power management modes:

- Active mode: The STA receives and transmits frames at any time. The STA remains in the awake state.
- Power save (PS) mode: The STA enters the awake state to receive or transmit frames. The STA remains in the doze state otherwise.

A non-AP STA shall be in active mode upon (re)association.

A STA that has transmitted a frame to an AP with which it is not associated and from which it expects a response shall remain in the awake state until such a response is received or until the procedure has timed out.

To change power management modes a STA shall inform the AP by completing a successful frame exchange (as described in Annex G) that is initiated by the STA. This frame exchange shall include a Management frame, Extension frame or Data frame from the STA, and an Ack or a BlockAck frame from the AP. The Power Management subfield(s) in the Frame Control field of the frame(s) sent by the STA in this exchange indicates the power management mode that the STA shall adopt upon successful completion of the entire frame exchange, except where the Power Management subfield is reserved (see 9.2.4.1.7). A non-AP STA shall not change power management mode using a frame exchange that does not receive an Ack or BlockAck frame from the AP, or using a BlockAckReq frame.

NOTE 1—A PS-Poll frame exchange does not necessarily result in an Ack frame from the AP, so a non-AP STA cannot change power management mode using a PS-Poll frame.

NOTE 2—The Power Management subfield is ignored in frame exchanges initiated by the AP.

A STA that is changing from doze to awake state in order to transmit shall perform CCA until a frame is detected by which it can set its NAV, or until a period of time indicated by the NAVSyncDelay from the MLME-JOIN.request primitive has transpired.

To change power management mode, a STA that is coordinated by an MM-SME shall inform the AP through a successful frame exchange initiated by the STA. The Power Management subfield in the Frame Control field of the frame sent by the STA in this exchange indicates the power management mode that the STAs coordinated by the MM-SME and advertised in the MMS element sent by the STA shall adopt upon successful completion of the entire frame exchange. To change the power management mode of the coordinated STA, the frame may be sent using any of the MMSLs within the MMSL cluster established with the AP.

11.2.3.3 AP TIM transmissions

The TIM shall identify the STAs for which traffic is pending and buffered in the AP. This information is coded in a *partial virtual bitmap*, as described in 9.4.2.6. In addition, the TIM contains an indication whether group addressed traffic is pending. Every STA is assigned an AID by the AP as part of the association process. AID 0 (zero) is reserved to indicate the presence of buffered non-GCR-SP group addressed BUs. The AP shall identify those STAs for which it is prepared to deliver⁴² buffered BUs by setting bits in the TIM’s partial virtual bitmap that correspond to the appropriate AIDs.

11.2.3.4 TIM types

Two different TIM types are distinguished: TIM and DTIM. After a DTIM, the AP shall transmit buffered non-GCR-SP group addressed BUs, before transmitting any individually addressed frames.

The AP shall transmit a TIM with every Beacon frame. Every dot11DTIMPeriod, a TIM of type *DTIM* is transmitted within a Beacon frame, rather than an ordinary TIM.

Figure 11-7 illustrates the AP and STA activity under the assumptions that no PCF is operating and that a DTIM is transmitted once every three TIMs. The top line in Figure 11-7 represents the time axis, with the beacon interval shown together with a DTIM Interval of three beacon intervals. The second line depicts AP activity. The AP schedules Beacon frames for transmission every beacon interval, but the Beacon frames may be delayed if there is traffic at the TBTT. This is indicated as “busy medium” on the second line. For the purposes of this figure, the important fact about Beacon frames is that they contain TIMs, some of which are DTIMs. Note that the second STA with ReceiveDTIMs equal to false does not power-on its receiver for all DTIMs.

The third and fourth lines in Figure 11-7 depict the activity of two STAs operating with different power management requirements. Both STAs power-on their receivers when they need to listen for a TIM. This is indicated as a ramp-up of the receiver power prior to the TBTT. The first STA, for example, powers up its receiver and receives a TIM in the first Beacon frame; that TIM indicates the presence of a buffered BU for the receiving STA. The receiving STA then generates a PS-Poll frame, which elicits the transmission of the buffered BU from the AP. Non-GCR-SP group addressed BUs are sent by the AP subsequent to the transmission of a Beacon frame containing a DTIM. The DTIM is indicated by the DTIM count field of the TIM element having a value of 0.

⁴²How the AP or mesh STA determines the traffic it is prepared to deliver is outside the scope of this standard.

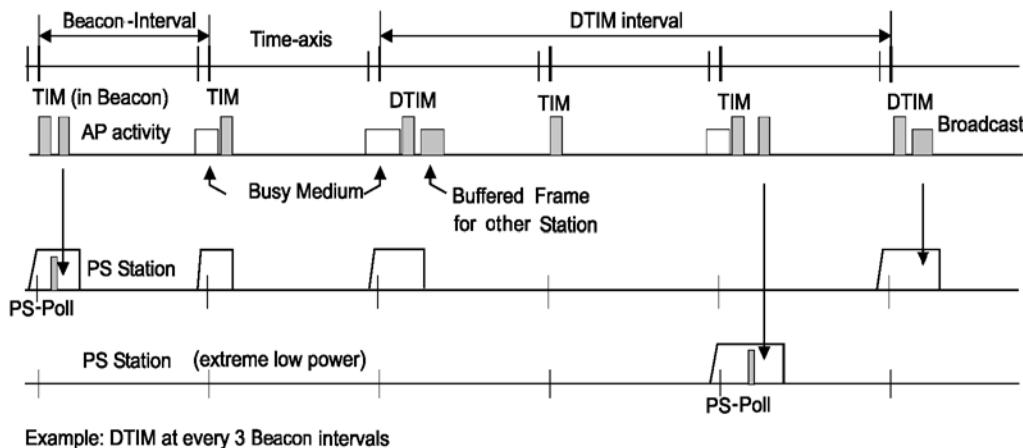

Figure 11-7—Infrastructure power management operation (no PCF operating)

11.2.3.5 Power management with APSD

11.2.3.5.1 Power management with APSD procedures

QoS APs capable of supporting automatic power save delivery (APSD) shall signal this capability through the use of the APSD subfield in the Capability Information field in Beacon, Probe Response, and (Re)Association Response frames.

QoS STAs use the Power Management subfield in the Frame Control field of a frame to indicate whether it is in active or PS mode. As APSD is a mechanism for the delivery of downlink BUs to power-saving STAs, the frames transmitted by a STA in PS mode that is using APSD have the Power Management subfield in the Frame Control field set to 1, thereby causing buffering to take place at the AP.

APSD defines two delivery mechanisms, namely *unscheduled APSD* (U-APSD) and *scheduled APSD* (S-APSD). STAs may use U-APSD to have some or all of their BUs delivered during unscheduled SPs. STAs may use S-APSD to schedule delivery of some or all of their BUs during scheduled SPs.

If there is no unscheduled SP in progress, the unscheduled SP begins when the AP receives a trigger frame from a STA, which is a QoS Data or QoS Null frame using an AC the STA has configured to be trigger-enabled. An A-MPDU that contains one or more trigger frames acts as a trigger frame. An unscheduled SP ends after the AP has attempted to transmit at least one BU using a delivery-enabled AC and destined for the STA, but no more than the number indicated in the Max SP Length field of the QoS Capability element of the STA's (Re)Association Request frame if the field has a nonzero value.

NOTE—The transmission of one or more fragments of a BU counts as the transmission of one BU for the purposes of the constraint indicated by the Max SP Length field.

By setting the EOSP subfield to 1 in the last frame sent during the SP, an unscheduled SP may be terminated before the maximum number of BUs in the SP has been reached. The times at which an AP may transmit during an unscheduled SP might be constrained by the U-APSD coexistence mechanism (see 11.2.3.5.2).

In order to configure an AP to deliver BUs during an unscheduled SP, a STA designates one or more of its ACs to be delivery-enabled and one or more of its ACs to be trigger-enabled. A STA may configure an AP to use U-APSD using two methods. First, the STA may set individual U-APSD Flag bits in the QoS Info subfield of the QoS Capability element carried in (Re)Association Request frames. When a U-APSD Flag bit is 1, it indicates that the corresponding AC is both delivery- and trigger-enabled. When all four U-APSD

Flag subfields are equal to 1 in (Re)Association Request frames, all of the ACs associated with the STA are trigger- and delivery-enabled during (re)association. When all four U-APSD Flag subfields are equal to 0 in (Re)Association Request frames, none of the ACs associated with the STA is trigger- or delivery-enabled during (re)association.

Alternatively, the STA may designate one or more AC as trigger-enabled and one or more AC as delivery-enabled by sending an ADDTS Request frame per AC to the AP with the APSD subfield set to 1 and the Schedule subfield set to 0 in the TS Info field in the TSPEC element. APSD settings in a TSPEC request take precedence over the static U-APSD settings carried in the QoS Capability element. In other words, a TSPEC request overwrites any previous U-APSD setting of an AC.

NOTE—Such an ADDTS Request frame can be sent regardless of the ACM setting of the AC.

A STA may set an AC to be trigger- or delivery-enabled for its own use by setting up TSPECs with the APSD subfield set to 1 and the Schedule subfield set to 0 in the uplink or downlink direction, respectively. An uplink TSPEC plus a downlink TSPEC, or a bidirectional TSPEC with the APSD subfield equal to 1 and the Schedule subfield equal to 0, makes an AC both trigger- and delivery-enabled. An uplink TSPEC plus a downlink TSPEC, or a bidirectional TSPEC with the APSD and the Schedule subfields both equal to 0, makes an AC neither trigger- nor delivery-enabled.

A scheduled SP starts at fixed intervals of time specified in the Service Interval field. The following rules describe scheduled SP operation:

- a) If the scheduled Service Interval field equals 0 (for example, with the GCR-A delivery method), the scheduled SP starts from the service start time without a fixed delivery interval.
- b) To use a scheduled SP for a TS when the access policy is controlled channel access, a STA shall send an ADDTS Request frame to the AP with the APSD subfield of the TS Info field in the TSPEC element set to 1.
- c) To use a scheduled SP for a TS for an AC when the access policy is contention based channel access, a STA shall send an ADDTS Request frame to the AP with the APSD and Schedule subfields of the TS Info field in the TSPEC element both set to 1. If the APSD mechanism is supported by the AP and the AP accepts the corresponding ADDTS Request frame from the STA, the AP shall respond to the ADDTS Request frame with a response containing the Schedule element indicating that the requested service can be accommodated by the AP.
- d) When the access policy is contention based channel access for a GCR group addressed stream, a scheduled SP is set up according to 11.24.16.3.3. The first scheduled SP starts when the lower order 4 octets of the TSF timer equals the value specified in the Service Start Time field.
- e) If the SI is nonzero, a STA using scheduled SP shall first wake up at the service start time to receive downlink individually addressed and/or GCR-SP group addressed BUs buffered and/or to receive polls from the AP/HC. The STA shall wake up subsequently at a fixed time interval equal to the SI.
- f) The AP may modify the non-GCR service start time by indicating so in the Schedule element in a successful ADDTS Response frame (which is sent in response to an ADDTS Request frame) and in Schedule frames (which are sent at other times).
- g) The AP may modify the GCR service start time by indicating so in the Schedule element in the GCR Response subelements (see 9.4.2.89 and 11.24.16.3.4).
- h) In both non-GCR and GCR cases, the service start time shall be updated (using the previously described service start time modification procedures) whenever the upper 4 octets of the TSF timer change.

A scheduled SP begins at the scheduled wakeup time that corresponds to the SI and the service start time indicated in the Schedule element sent in response to a TSPEC or GCR Request. If the SI is nonzero, the STA shall wake up at a subsequent time when

$(TSF - T_{service-start}) \bmod SI_{min} = 0$.

where

$T_{service-start}$ is the service start time

SI_{min} is the minimum SI.

If the SI is nonzero, a scheduled SP for a GCR group ends after the AP has attempted to transmit at least one BU associated with the GCR group but no more than the number indicated in the Max SP Length field of the QoS Capability element of the STA's (Re)Association Request frame. The last frame of the GCR SP shall have the EOSP subfield set to 1.

NOTE—The transmission of one or more fragments of a BU counts as the transmission of one BU for the purposes of the constraint indicated by the Max SP Length field.

If a scheduled SP overlaps the period during which the AP is required to transmit non-GCR-SP group addressed frames and individually addressed frames to STAs in PS mode that follow a DTIM beacon that has at least 1 bit set to 1 in the partial virtual bitmap of its TIM, the scheduled SP shall be deferred until the AP has transmitted all such buffered frames.

When the GCR-A delivery method is used, the scheduled Service Interval field is 0. If a STA has a GCR agreement with an AP for a group address using the GCR-A delivery method, there is no defined end of the scheduled SP. The STA in PS mode shall enter the awake state and shall remain awake in order to receive the buffered group addressed BUs until the AP changes the delivery method of the stream to a method other than GCR-A or until the GCR agreement is canceled.

If scheduled SPs are supported in a BSS, a STA may use both unscheduled and scheduled APSD on different ACs at the same time. The GCR-SP delivery method may be used on any AC, irrespective of any non-GCR unscheduled or scheduled APSD flows. When a STA establishes scheduled delivery for an AC the AP shall not transmit BUs using that AC during an SP that is initiated by a trigger frame, and it shall not treat BUs using the AC that are received from the STA as trigger frames. The AP shall decline any ADDTS Request frame that indicates the use of both scheduled and unscheduled APSD to be used on non-GCR-SP frames of the same AC at the same time.

APSD shall be used only to deliver individually addressed BUs and GCR-SP BUs to a STA. Non-GCR and non-GCR-SP group addressed BU delivery shall follow the frame delivery rules defined for group addressed BUs as defined in 11.2.3.7.

11.2.3.5.2 U-APSD coexistence

A non-AP STA that uses U-APSD might not be able to receive all AP transmitted frames during the service period due to interference observed at the non-AP STA. Although the AP might not observe the same interference, it is able to determine that the frames were not received correctly by the non-AP STA. The U-APSD coexistence capability enables the non-AP STA to indicate a requested transmission duration to the AP for use during U-APSD service periods. Use of the transmission duration enables the AP to transmit frames during the service period and improve the likelihood that the non-AP STA receives the frames when the non-AP STA is experiencing interference. The U-APSD coexistence capability reduces the likelihood that the AP transmits frames during the service period that are not received successfully.

A STA whose dot11UAPSDCoexistenceActivated is true shall support U-APSD coexistence and shall set to 1 the U-APSD Coexistence field of the Extended Capabilities elements that it transmits. Otherwise it shall set this field to 0.

A non-AP STA that is associated to an AP where both have previously advertised support for the U-APSD coexistence capability may transmit ADDTS Request frames including the U-APSD Coexistence element to the AP.

The content of the ADDTS Request frame excluding the U-APSD Coexistence element is referred to in subsequent text as the base ADDTS request. Upon reception of the ADDTS Request frame, the AP shall process the content of the base ADDTS request as described in 11.2.3.5. If the AP determines that the base ADDTS request cannot be granted it shall respond as described in 11.2.3.5, without processing the U-APSD Coexistence element. If the AP determines the base ADDTS request can be granted, it shall process the U-APSD Coexistence element. If the AP supports transmission of frames during the U-APSD service period for the duration value specified in the U-APSD Coexistence element Interval/Duration field, it shall grant the ADDTS request as described in 11.2.3.5. Otherwise, it shall deny the ADDTS Request.

If the AP has previously granted an ADDTS request with U-APSD coexistence, a non-AP STA that continues using QoS services provided by an ADDTS Request frame without U-APSD coexistence may terminate the use of U-APSD coexistence by transmitting an ADDTS Request frame without the U-APSD Coexistence element. A non-AP STA may terminate use of all QoS services (including U-APSD coexistence) resulting from an ADDTS Request frame by transmitting a DELTS Request frame to the AP.

The non-AP STA may transmit multiple ADDTS Request frames to the AP where the last received ADDTS Request frame will override any previously received ADDTS Request frame.

An AP that supports U-APSD coexistence and accepts an ADDTS request limits the U-APSD coexistence service period according to the parameters specified in the ADDTS frame U-APSD Coexistence element, and shall transmit frames to the requesting non-AP STA according to the rules in 10.2.4.2 and the following rules:

- If the non-AP STA specified a nonzero TSF 0 Offset value in the U-APSD Coexistence element, the AP should not transmit frames to the non-AP STA outside of the U-APSD Coexistence Service Period, which begins when the AP receives the U-APSD trigger frame and ends after the transmission period specified by the result of the following calculation:

$$\text{End of transmission period} = T + (\text{Interval} - ((T - \text{TSF 0 Offset}) \bmod \text{Interval}))$$

where

T is the time the U-APSD trigger frame was received at the AP

Interval is the UAPSD Coexistence element Duration/Interval field value (see 9.4.2.91)

or upon the successful transmission of a frame with the EOSP subfield set to 1, whichever is earlier.

- If the non-AP STA specified a TSF 0 Offset value of 0 in the U-APSD Coexistence element, the AP should not transmit frames to the non-AP STA outside of the U-APSD coexistence service period, which begins when the AP receives a U-APSD trigger frame and ends after the transmission period specified by the result of the following calculation:

$$\text{End of transmission period} = T + \text{Duration}$$

where

T is the time the U-APSD trigger frame was received at the AP

Duration is the UAPSD Coexistence element Duration/Interval field value (see 9.4.2.91)

or upon the successful transmission of a frame with the EOSP subfield set to 1, whichever is earlier.

Throughout the U-APSD coexistence service period, the AP shall set the More bit to 1 if it has more frames to be transmitted and it can determine the frame might be received successfully before the service period expires.

The AP should set the EOSP subfield to 1 in the frame that it expects to be the last frame transmitted to the non-AP STA during the U-APSD coexistence duration. If the last frame expected to be transmitted cannot be successfully transmitted to the non-AP STA before the termination of the U-APSD SP, or does not have QoS Control field, the AP should transmit a QoS Null frame with the EOSP subfield set to 1.

The non-AP STA may enter doze state at the end of the U-APSD coexistence service period.

11.2.3.6 AP operation during the CP

An AP shall maintain for each currently associated STA a Power Management status that indicates in which power management mode the STA is currently operating. APs that implement and signal their support of APSD shall maintain for each currently associated STA an APSD and an access policy status that indicates whether the STA is presently using APSD and shall maintain the schedule (if any) for the STA. An AP shall, depending on the power management mode of the STA, temporarily buffer BUs destined to the STA. An AP implementing APSD shall, if a STA is using APSD and is in PS mode, temporarily buffer BUs destined to that STA. No BUs addressed directly to STAs operating in the active mode shall be buffered for power management reasons.

The following rules describe operation during the CP:

- a) BUs destined for PS STAs shall be temporarily buffered in the AP. The algorithm to manage this buffering is beyond the scope of this standard, with the exception that if the AP is QoS-enabled, it shall preserve the order of arrival of frames on a per-TID, per-STA basis.
- b) Nonbufferable MMPDUs and BUs destined for STAs in the active mode shall be directly transmitted to those STAs.
- c) At every beacon interval, the AP shall assemble the partial virtual bitmap containing the buffer status per destination for STAs in the PS mode and shall send this out in the TIM field of the Beacon frame. At every beacon interval, the APSD-capable AP shall assemble the partial virtual bitmap containing the buffer status of nondelivery-enabled ACs (if there exists at least one nondelivery-enabled AC) per destination for STAs in PS mode and shall send this out in the TIM field of the Beacon frame. When all ACs are delivery-enabled, the APSD-capable AP shall assemble the partial virtual bitmap containing the buffer status for all ACs per destination. If FMS is enabled, the AP shall include the FMS Descriptor element in every Beacon frame. The FMS Descriptor element shall indicate all FMS group addressed frames that the AP buffers.
- d) If a STA has set up a scheduled SP, it shall automatically wake up at each SP. Therefore, the APSD-capable AP shall transmit frames associated with admitted traffic with the APSD subfield equal to 1 in the TSPECs buffered for the STA during a scheduled SP. If the STA has set up to use unscheduled SPs, the AP shall buffer BUs using delivery-enabled ACs until it has received a trigger frame using a trigger-enabled AC from the non-AP STA, which indicates the start of an unscheduled SP. A trigger frame received by the AP from a STA that already has an unscheduled SP underway shall not trigger the start of a new unscheduled SP. The AP transmits BUs destined for the STA and using delivery-enabled ACs during an unscheduled SP. The bit for AID 0 (zero) in the Bitmap Control field of the TIM element shall be set to 1 when non-GCR-SP group addressed traffic is buffered, according to 9.4.2.6.
- e) If any associated STAs are in PS mode, the AP shall buffer all non-GCR-SP group addressed BUs, except those that have the StrictlyOrdered service class.
- f) When dot11FMSAActivated is false, the AP shall transmit all buffered non-GCR-SP group addressed BUs immediately after every DTIM.

When dot11FMSAActivated is true and the AP has established an FMS delivery interval for a multicast stream, the AP shall transmit all non-GCR-SP group addressed BUs belonging to particular FMS stream immediately after the DTIM that has the Current Count field value of the FMS Counter field set to 0 for that particular FMS stream.

The More Data subfield of each group addressed frame shall be set to indicate the presence of further buffered non-GCR-SP group addressed BUs. If the AP is unable to transmit all of the buffered non-GCR-SP group addressed BUs before the primary or secondary TBTT following the DTIM, the AP shall set the bit for AID 0 (zero) in the TIM element to 1 for a single BSSID or set the corresponding group address bit to 1 for multiple BSSIDs, as defined in 9.4.2.6, and when dot11FMSActivated is true, shall set the appropriate bits in the FMS Descriptor element as described in 9.4.2.75 to indicate for which non-GCR-SP group addresses there are still buffered BUs, until all buffered non-GCR-SP group addressed BUs have been transmitted.

When the AP transmits an STBC DTIM or TIM Beacon frame, the AP shall retransmit all non-GCR-SP group addressed BUs that were transmitted following the non-STBC DTIM or TIM Beacon frame except that they are transmitted using the basic STBC MCS. It may be the case that a complete set of buffered non-GCR-SP group addressed BUs is sent over a period of time during which non-STBC and STBC transmissions are interleaved, but the transition from non-STBC group addressed transmissions to STBC group addressed transmissions shall be preceded by the transmission of an STBC Beacon frame and the transition from STBC group addressed transmissions to non-STBC group addressed transmissions shall be preceded by the transmission of a non-STBC Beacon frame.

- g) When the AP receives a PS-Poll frame from a STA that is in PS mode, it shall forward to the STA a single buffered BU. The AP shall respond after a SIFS either with a Data or Management frame, or with an Ack frame; in which case the corresponding Data or Management frame is delayed. Until the transmission of this BU either has succeeded or is presumed failed (when maximum retries are exceeded), the AP shall acknowledge but ignore all PS-Poll frames from the same STA. This prevents a retried PS-Poll frame from being treated as a new request to deliver a buffered BU.

For a STA using U-APSD, the AP transmits one BU destined for the STA from any AC that is not delivery-enabled in response to PS-Poll frame from the STA. The AP should transmit the BU from the highest priority AC that is not delivery-enabled and that has a buffered BU. When all ACs associated with the STA are delivery-enabled, the AP transmits one BU from the highest priority AC that has a BU.

For a STA in PS mode and not using U-APSD, the AP shall set the More Data subfield of the response Data or Management frame to 1 to indicate the presence of further buffered BUs (not including the BU currently being transmitted) for the polling STA.

For a STA using U-APSD, the AP shall set the More Data subfield to 1 to indicate the presence of further buffered BUs (not including the BU currently being transmitted) that do not use delivery-enabled ACs. When all ACs associated with the STA are delivery-enabled, the AP shall set the More Data subfield to 1 to indicate the presence of further buffered BUs (not including the BU currently being transmitted) using delivery-enabled ACs.

If there are buffered BUs to transmit to the STA, the AP may set the More Data bit in a QoS +CF-Ack frame to 1 in response to a QoS Data frame to indicate that it has one or more pending BUs buffered for the PS STA identified by the RA in the QoS +CF-Ack frame. An AP may also set the More Data bit in an Ack frame to 1 in response to a QoS Data frame to indicate that it has one or more pending BUs buffered for the PS STA identified by the RA in the Ack frame, if that PS STA has set the More Data Ack subfield in the QoS Capability element to 1.

Unless indicated above, the AP shall set the More Data bit to 0.

- h) At each scheduled APSD SP for a STA, the APSD-capable AP (i.e., an AP for which dot11APSDOptionImplemented is true) shall attempt to transmit at least one BU, using admitted TSPECs with the APSD and Schedule subfields both set to 1, that are destined for the STA. At each unscheduled SP for a STA, the AP shall attempt to transmit at least one BU, but no more than the value specified in the Max SP Length field in the QoS Capability element from delivery-enabled ACs, that are destined for the STA.

NOTE—The transmission of one or more fragments of a BU counts as the transmission of one BU for the purposes of the constraint indicated by the Max SP Length field.

The AP shall set to 1 the More Data bit of an individually addressed MPDU containing all or part of a BU, using a delivery-enabled AC and destined for that STA, to indicate that more BUs (not including the BU currently being transmitted) are buffered for the delivery-enabled ACs. The AP shall set to 1 the More Data bit of an individually addressed MPDU containing all or part of a BU, using a nondelivery-enabled AC and destined for that STA, to indicate that more BUs (not including the BU currently being transmitted) are buffered for the nondelivery-enabled ACs.

In all frames except for the final frame of the SP, the AP shall set the EOSP subfield, if present, to 0 to indicate the continuation of the SP. An AP may also set the More Data bit to 1 in a QoS +CF-Ack frame in response to a QoS Data frame to indicate that it has one or more pending BUs buffered for the target STA identified by the RA in the QoS +CF-Ack frame. If the QoS Data frame is using a delivery-enabled AC, the AP shall set the More Data bit in the QoS +CF-Ack frame to 1 to indicate more BUs (not including the BU currently being transmitted) are buffered for the delivery-enabled ACs. If the QoS Data frame is not using a delivery-enabled AC, the AP shall set the More Data bit in the QoS +CF-Ack frame to 1 to indicate more BUs (not including the BU currently being transmitted) are buffered for the ACs that are not delivery-enabled.

Unless indicated above, the AP shall set the More Data bit to 0.

The AP considers an APSD STA to be in awake state after it has sent a QoS +CF-Ack frame, with the EOSP subfield equal to 0, to the APSD STA. If necessary, the AP may generate an extra QoS Null frame, with the EOSP subfield set to 1. When the AP has transmitted an individually addressed frame to the STA with the EOSP subfield set to 1 during the SP except for retransmissions of that frame, the AP shall not transmit any more frames to that STA using this mechanism until the next SP.

The AP shall set the EOSP subfield to 1 to indicate the end of the SP in APSD.

NOTE—Management frames do not have an EOSP subfield and so the end of the SP cannot be indicated in a Management frame. If the SP is to end after a Management, a QoS Null frame is used to indicate this.

The AP should not set the EOSP field to 1 in a frame that is not an individually addressed Data frame that requires acknowledgment.

- i) If the AP does not receive an acknowledgment to an individually addressed MPDU containing all or part of a BU sent to a STA in PS mode following receipt of a PS-Poll frame from that STA, it may retransmit the frame for at most the lesser of the maximum retry limit and dot11QAPMissingAckRetryLimit times before the next Beacon frame, but it shall retransmit that frame at least once before the next Beacon frame, time permitting and subject to its appropriate lifetime limit. If an acknowledgment to the retransmission is not received, it may wait until after the next Beacon frame to further retransmit that frame subject to its appropriate lifetime limit.
- j) If the AP does not receive an acknowledgment in response to a non-A-MPDU frame that is an individually addressed Data frame that is sent with the EOSP subfield equal to 1, and that requires acknowledgment, it shall retransmit that frame at least once within the same SP, subject to applicable retry or lifetime limits. If the AP does not receive a Block Ack frame in response to an A-MPDU that contains one or more individually addressed Data frames that are sent with the EOSP subfield equal to 1, and that require acknowledgment, it shall retransmit at least one of those frames at least once within the same SP, subject to applicable retry or lifetime limits. The maximum number of retransmissions within the same SP is the lesser of the maximum retry limit and dot11QAPMissingAckRetryLimit.

If the AP does not receive an acknowledgment to an individually addressed Data or Management frame that requires acknowledgment and that is not the initial attempt in this SP to send a frame with the EOSP subfield equal to 1, it may retransmit that frame in the next SP, subject to applicable retry or lifetime limits.

An AP that transmits an A-MPDU containing Data frames in which the EOSP subfield is equal to 1 and that receives a BlockAck frame that does not acknowledge all of those MPDUs should not transmit any missed Data frames within the current service period because the destination STA might now be asleep.

- k) An AP may delete buffered BUs for implementation dependent reasons (subject to 11.2.3.12), including the use of an aging function and availability of buffers. The AP may base the aging function on the listen interval indicated by the STA in its (Re)Association Request frame or the WNM sleep interval specified by the non-AP STA in the WNM Sleep Mode Request frame.
- l) When an AP is informed that a STA has changed to the active mode, then the AP shall send buffered BUs (if any exist) to that STA without waiting for a PS-Poll frame. When an AP is informed that an APSD-capable STA is not using APSD, then the AP shall send buffered BUs (if any exist) to that STA according to the rules corresponding to the current PS mode of the STA.

11.2.3.7 AP operation during the CFP

An AP shall maintain for each currently associated CF-Pollable STA a Power Management status that indicates the STA's current power management mode. An AP shall, for STAs in PS mode, temporarily buffer BUs addressed to the STA.

The following rules describe operation during the CFP:

- a) BUs destined for PS STAs shall be temporarily buffered in the AP. The algorithm to manage this buffering is beyond the scope of this standard.
- b) Nonbufferable MMPDUs and all BUs destined to STAs in the active mode shall be transmitted as defined in Clause 10.
- c) Prior to every CFP, and at each beacon interval within the CFP, the AP shall assemble the partial virtual bitmap containing the buffer status per destination for STAs in the PS mode, set to 1 the bits in the partial virtual bitmap for STAs the PC is intending to poll during this CFP, and shall send this out in the TIM field of the DTIM. The bit for AID 0 (zero) in the Bitmap Control field of the TIM element shall be set to 1 when group addressed traffic is buffered, according to 9.4.2.6.
- d) All non-GCR-SP group addressed MSDUs except those with a service class of StrictlyOrdered shall be buffered if any associated STAs are in the PS mode, regardless of whether those STAs are CF-Pollable.
- e) When dot11FMSActivated is false, the AP shall transmit all buffered non-GCR-SP group addressed BUs immediately after every DTIM (Beacon frame with DTIM Count field of the TIM element equal to 0).

When dot11FMSActivated is true and the AP has set up an FMS delivery interval for a multicast stream, the AP shall send all non-GCR-SP group addressed BUs belonging to a particular FMS stream immediately after the DTIM with the Current Count field value of the FMS Counter field set to 0 for that particular FMS stream.
