An optional enhanced performance specification is provided for systems requiring improved immunity to out-of-channel interfering emissions. If a STA has dot11ACRTyp equal to 2, the nonadjacent channel rejection shall be no less than specified in Table 17-19. The interfering signal in the nonadjacent channel shall be a signal compliant with the OFDM PHY, using transmit mask M (see D.2.4), unsynchronized with the signal in the channel under test. The corresponding minimum receiver sensitivities for each modulation and coding rate are the same as in Table 17-18.

17.3.10.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 1000 octets, for a maximum input level of -30 dBm measured at the antenna for any baseband modulation.

17.3.10.6 CCA requirements

The PHY shall indicate a medium busy condition by issuing a PHY-CCA.indication primitive when the carrier sense/clear channel assessment (CS/CCA) mechanism detects a channel busy condition.

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

The start of a valid OFDM transmission at a receive level greater than or equal to the minimum modulation and coding rate sensitivity (-82 dBm for 20 MHz channel spacing, -85 dBm for 10 MHz channel spacing, and -88 dBm for 5 MHz channel spacing) shall cause CS/CCA to detect a channel busy condition with a probability $> 90\%$ within $4 \mu s$ for 20 MHz channel spacing, $8 \mu s$ for 10 MHz channel spacing, and $16 \mu s$ for 5 MHz channel spacing.

NOTE—CS/CCA detect time is based on finding the short sequences in the preamble, so when T_{SYM} doubles, so does CS/CCA detect time.

Additionally, the CS/CCA mechanism shall detect a medium busy condition within $4 \mu s$ of any signal with a received energy that is 20 dB above the minimum modulation and coding rate sensitivity (minimum modulation and coding rate sensitivity + 20 dB resulting in -62 dBm for 20 MHz channel spacing, -65 dBm for 10 MHz channel spacing, and -68 dBm for 5 MHz channel spacing).

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold. The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition for any signal 20 dB above the minimum modulation and coding rate sensitivity (minimum modulation and coding rate sensitivity + 20 dB resulting in -62 dBm for 20 MHz channel spacing, -65 dBm for 10 MHz channel spacing, and -68 dBm for 5 MHz channel spacing) is a mandatory energy detect requirement on all Clause 17 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

17.3.10.7 Received Channel Power Indicator Measurement

The RCPI indicator is a measure of the received RF power in the selected channel for a received frame. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the entire received frame or by other equivalent means that meet the specified accuracy.

The RCPI encoding is defined in 15.4.6.6.

RCPI shall equal the received RF power within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel bandwidth multiplied by 1.1.

17.3.11 Transmit PHY

The transmit PHY is shown in Figure 17-17. In order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through STA management via the PLME. Other transmit parameters, such as DATARATE and TX power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 17.2.2.

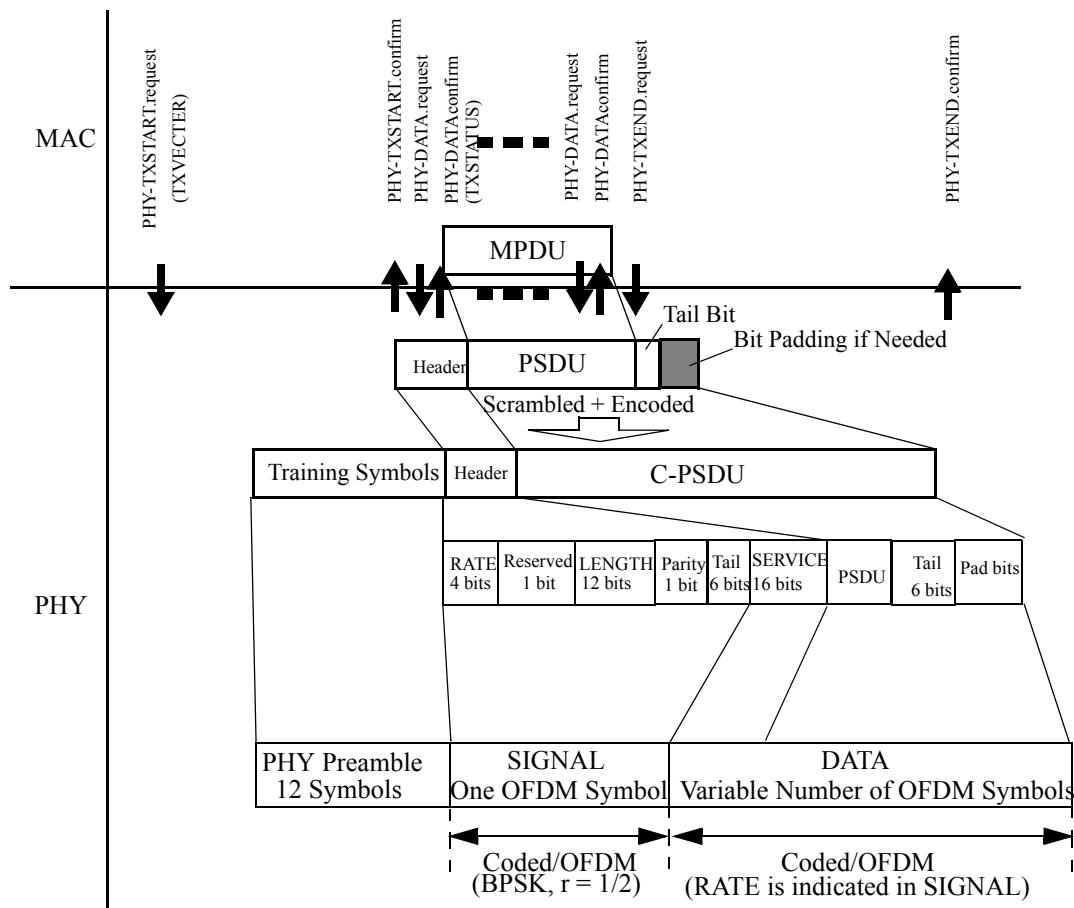

Figure 17-17—Transmit PHY

The PHY shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive. The MAC considers this indication before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are the PHY header parameters DATARATE, SERVICE, and LENGTH and the PHY parameters TXPWR_LEVEL_INDEX and TIME_OF_DEPARTURE_REQUESTED.

The PHY is configured with the TXVECTOR elements DATARATE and TXPWR_LEVEL_INDEX. Transmission of the PHY preamble and PHY header, based on the parameters passed in the PHY-TXSTART.request primitive, shall be immediately initiated.

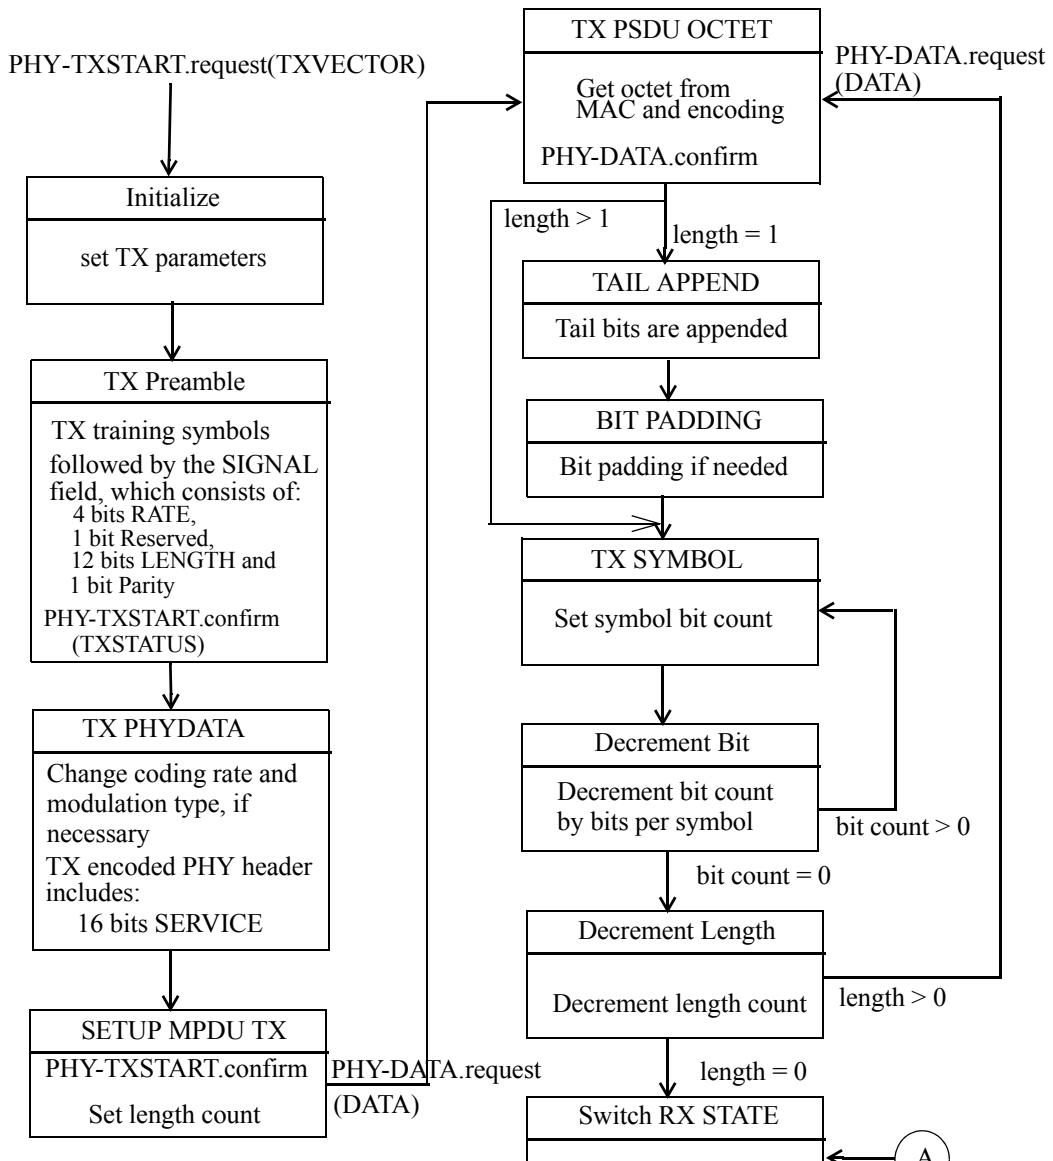

Once PHY preamble transmission is started, the PHY entity shall immediately initiate PHY header encoding then data scrambling and data encoding, where the data shall be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC, and PHY-DATA.confirm primitives issued by the PHY. The modulation rate change, if any, shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2.

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The PHY header parameter, SERVICE, and PSDU are encoded by the convolutional encoder with the bit-stealing function described in 17.3.5.6. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by the issuance of the PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the OFDM PHY preamble LENGTH field.

The packet transmission shall be completed and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the coded PSDU (C-PSDU) length is not a multiple of the OFDM symbol length N_{CBPS} , the PSDU is padded prior to scrambling and coding (see 17.3.5.4).

In the PHY, the GI shall be inserted in every OFDM symbol as a countermeasure against severe delay spread.

A typical state machine implementation of the transmit PHY is provided in Figure 17-18. Requests (.request) and confirmations (.confirm) are issued once with designated states.

(A) At any stage in the above flow diagram, if a PHY-TXEND.request primitive is received.

Figure 17-18—PHY transmit state machine

17.3.12 Receive PHY

The receive PHY is shown in Figure 17-19. In order to receive data, the PHY-TXSTART.request primitive shall be disabled so that the PHY entity is in the receive state. Further, through STA management (via the PLME) the PHY is set to the appropriate frequency. Other receive parameters, such as RSSI, RCPI, and indicated DATARATE, may be accessed via the PHY SAP.

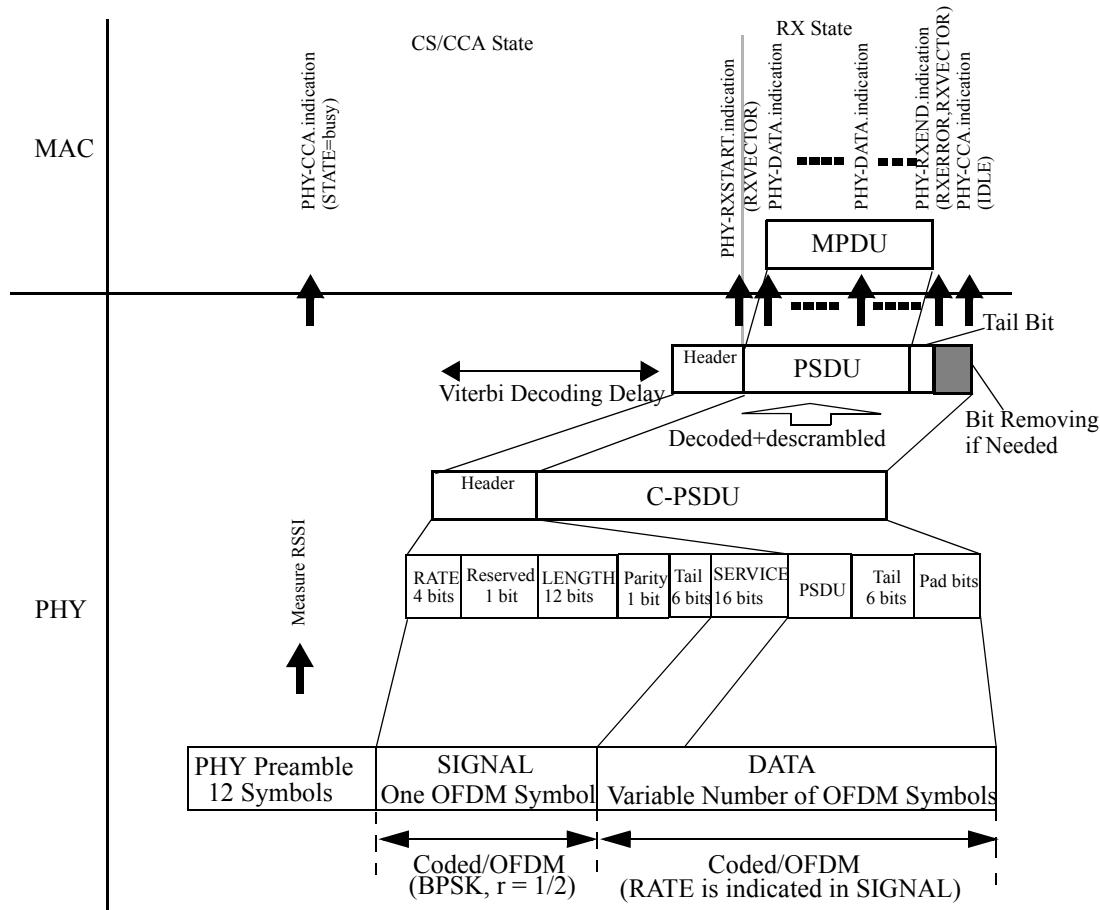

Figure 17-19—Receive PHY

Upon receiving the transmitted PHY preamble, the PHY measures the received signal strength level. This indicates activity to the MAC via **PHY-CCA.indication** primitive. A **PHY-CCA.indication(BUSY)** primitive shall be issued for reception of a signal prior to correct reception of the PPDU. The RSSI parameter reported to the MAC in the RXVECTOR.

After a **PHY-CCA.indication** primitive is issued, the PHY entity shall begin receiving the training symbols and searching for the SIGNAL in order to set the length of the data stream, the demodulation type, and the decoding rate.

If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a **PHY-RXSTART.indication(RXVECTOR)** primitive shall be issued. If **dot11TimingMsmtActivated** is true, the PHY shall do the following:

- Complete receiving the PHY header and verify the validity of the PHY Header.
- If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a **PHY-RXSTART.indication(RXVECTOR)** primitive shall be issued and **RX_START_OF_FRAME_OFFSET** parameter within the RXVECTOR shall be forwarded (see 17.2.3).

A VHT STA shall include the **CH_BANDWIDTH_IN_NON_HT** and **DYN_BANDWIDTH_IN_NON_HT** parameters in the RXVECTOR within the **PHY-RXSTART.indication(RXVECTOR)** primitive.

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the SIGNAL field, the SERVICE field, the PSDU length in octets, and the RSSI. Also, in this case, the CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted frame, as indicated by the LENGTH field.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The rate change indicated in the SIGNAL field shall be initiated from the SERVICE field data of the PHY header, as described in 17.3.2. The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet indicated by the PHY preamble LENGTH field, the receiver shall be returned to the RX IDLE state, as shown in Figure 17-19. A PHY-RXEND.indication(NoError) primitive shall be issued.

In the event that a change in the RSSI causes the status of the CCA to return to the IDLE state before the complete reception of the PSDU, as indicated by the PHY LENGTH field, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive and the PHY receiver shall return to the RX IDLE state. The CCA of the OFDM PHY shall indicate a busy medium for the intended duration of the transmitted packet.

If the indicated rate in the SIGNAL field is not receivable, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive and hold CCA busy for the calculated duration of the PPDU. If the PHY header is receivable, but the parity check of the PHY header is not valid, a PHY-RXSTART.indication primitive shall not be issued. The PHY shall indicate the error condition using a PHY-RXEND.indication(FormatViolation) primitive.

Any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

A typical state machine implementation of the receive PHY is given in Figure 17-20.

17.4 OFDM PLME

17.4.1 PLME SAP sublayer management primitives

Table 17-20 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

17.4.2 OFDM PHY MIB

All OFDM PHY MIB attributes are defined in Annex C, with specific values defined in Table 17-20. The column titled “Operational semantics” in Table 17-20 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

17.4.3 OFDM TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equation:

$$\text{TXTIME} = T_{\text{PREAMBLE}} + T_{\text{SIGNAL}} + T_{\text{SYM}} \times N_{\text{SYM}} \quad (17-29)$$

where

- T_{PREAMBLE} is defined in Table 17-5
- T_{SIGNAL} is defined in Table 17-5
- T_{SYM} is defined in Table 17-5
- N_{SYM} is given by Equation (17-11).

17.4.4 OFDM PHY characteristics

The static OFDM PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, are shown in Table 17-21. The definitions for these characteristics are given in 6.5.

Table 17-21—OFDM PHY characteristics

| Characteristics | Value (20 MHz channel spacing) | Value (10 MHz channel spacing) | Value (5 MHz channel spacing) |
|---------------------|---|---|---|
| aSlotTime | If dot11OperatingClassesReq uired is false, 9 μ s If dot11OperatingClassesReq uired is true, 9 μ s plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) | If dot11OperatingClassesReq uired is false, 13 μ s If dot11OperatingClassesReq uired is true, 13 μ s plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) | If dot11OperatingClassesReq uired is false, 21 μ s If dot11OperatingClassesReq uired is true, 21 μ s plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) |

18. Extended Rate PHY (ERP) specification

18.1 Overview

18.1.1 General

This clause specifies further rate extension of the PHY for the DSSS system of Clause 15 and the extensions of Clause 16. Hereinafter the PHY defined in this clause is known as the ERP. This PHY operates in the 2.4 GHz ISM band.

18.1.2 Introduction

The ERP builds on the payload data rates of 1 and 2 Mb/s, as described in Clause 15, that use DSSS modulation and builds on the payload data rates of 1, 2, 5.5, and 11 Mb/s, as described in Clause 16, that use DSSS and CCK. The ERP draws from Clause 17 to provide additional payload data rates of 6, 9, 12, 18, 24, 36, 48, and 54 Mb/s. Of these rates, transmission and reception capability for 1, 2, 5.5, 6, 11, 12, and 24 Mb/s data rates is mandatory.

18.1.3 Operational modes

The radio portion of all Clause 18 systems implements all mandatory modes of Clause 17 and Clause 16, except it uses the 2.4 GHz frequency band and channelization plan specified in 16.3.6. The ERP has the capability to decode Clause 15, Clause 16 and ERP PPDU. An ERP shall be capable of sending and receiving the short preamble that is (and remains) optional for Clause 16 PHYs.

The ERP has the capability to detect ERP and Clause 16 preambles whenever a CCA is requested. Because protection mechanisms are not required in all cases, the ERP CCA mechanisms for all preamble types shall be active at all times.

An ERP BSS is capable of operating in any combination of available ERP modes (Clause 18 PHYs) and NonERP modes (Clause 15 or Clause 16 PHYs). For example, a BSS could operate in an ERP-OFDM-only mode, a mixed mode of ERP-OFDM and ERP-DSSS/CCK, or a mixed mode of ERP-DSSS/CCK and NonERP. When options are enabled, combinations are also allowed.

The changes to other parts of this standard required to implement the ERP are summarized as follows:

- a) ERP-DSSS/CCK
 - 1) The PHY uses the capabilities of Clause 16 with the following exceptions:
 - i) Support of the short PPDU header format capability of 16.2.2.3 is mandatory.
 - ii) CCA (see 16.3.8.5) has a mechanism that detects all mandatory Clause 18 sync symbols.
 - iii) The maximum input signal level (see 16.3.8.3) is -20 dBm.
 - iv) Locking the transmit center frequency and the symbol clock frequency to the same reference oscillator is mandatory.
- b) ERP-OFDM
 - 1) The PHY uses the capabilities of Clause 17 with the following exceptions:
 - i) The frequency plan is in accordance with 16.3.6.2 and 16.3.6.3 instead of 17.3.8.4.
 - ii) CCA has a mechanism that detects all mandatory Clause 18 sync symbols.
 - iii) The frequency accuracy (see 17.3.9.5 and 17.3.9.6) is ±25 ppm.
 - iv) The maximum input signal level (see 17.3.10.5) is -20 dBm.

- v) The value of the slot time is found in Table 18-5.
- vi) SIFS is 10 μ s in accordance with 16.3.3. See 18.3.2.4 for more detail.

The 2.4 GHz ISM band is a shared medium, and coexistence with other devices such as Clause 15 and Clause 16 STAs is an important issue for maintaining high performance in Clause 18 (ERP) STAs. The ERP modulation (ERP-OFDM) has been designed to coexist with existing Clause 15 and Clause 16 STAs. This coexistence is achieved by several means, including virtual CS (RTS/CTS or CTS-to-self), CSMA/CA protocols, and MSDU fragmentation.

18.1.4 Scope

This clause specifies the ERP entity and the deviations from earlier clauses to accommodate it. It is organized by reference to the relevant earlier clauses to avoid excessive duplication.

The ERP consists of the following protocol functions:

- a) A function that defines a method for mapping the MPDUs into a framing format suitable for sending and receiving user data and management information between two or more STAs using the associated PHY system. The PHY exchanges PPDUs that contain PSDUs. The MAC uses the PHY service, so each MPDU corresponds to a PSDU that is carried in a PPDU.
- b) A function that defines the characteristics and method of transmitting and receiving data through a WM between two or more STAs; each using the ERP.

18.1.5 ERP functions

The ERP contains two functional entities: the PHY function and the layer management function.

The ERP service is provided to the MAC through the PHY service primitives described in Clause 8. Interoperability is addressed by use of the CS mechanism specified in 10.3.2.1 and the protection mechanism in 10.26. This mechanism allows NonERP STAs to know of ERP traffic that they cannot demodulate so that they may defer the medium to that traffic.

18.2 PHY-specific service parameter list

The architecture of the IEEE 802.11 MAC is intended to be PHY independent. Some PHY implementations require PHY-dependent MAC state machines running in the MAC sublayer in order to meet certain PHY requirements. The PHY-dependent MAC state machine resides in a sublayer defined as the MLME. In certain PHY implementations, the MLME may need to interact with the PLME as part of the normal PHY SAP primitives. These interactions are defined by the PLME parameter list currently defined in the PHY service primitives as TXVECTOR, TXSTATUS, and RXVECTOR. The list of these parameters and the values they may represent are defined in the specific PHY specifications for each PHY. This subclause addresses the TXVECTOR, TXSTATUS, and RXVECTOR for the ERP. The service parameters for TXVECTOR, TXSTATUS, and RXVECTOR shall follow 17.2.2, 17.2.4, and 17.2.3, respectively.

Several service primitives include a parameter vector. DATARATE and LENGTH are described in 8.3.4.4. The remaining parameters are considered to be management parameters and are specific to this PHY.

The parameters in Table 18-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request and PLME-TXTIME.request primitives.

Table 18-1—TXVECTOR parameters

| Parameter | Value |
|-----------------------------|--|
| DATARATE | The rate used to transmit the PSDU in Mb/s. Allowed value depends on value of MODULATION parameter: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 |
| LENGTH | The length of the PSDU in octets. Range: 1–4095 |
| PREAMBLE_TYPE | The preamble used for the transmission of the PPDU. Enumerated type for which the allowed value depends on value of MODULATION parameter: ERP-OFDM: null ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE |
| MODULATION | The modulation used for the transmission of this PSDU. Enumerated type: ERP-DSSS, ERP-CCK, ERP-OFDM |
| SERVICE | The scrambler initialization vector. Null. |
| TXPWR_LEVEL_INDEX | The transmit power level index. The definition of these levels is up to the implementer. 1–8 |
| TIME_OF_DEPARTURE_REQUESTED | false, true. When true, the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port; when false, the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. |

The parameters in Table 18-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART confirm service primitive.

Table 18-2—TXSTATUS parameters

| Parameter | Value |
|-----------------------------|--|
| TIME_OF_DEPARTURE | 0 to $2^{32}-1$. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}-1$. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}-1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

The parameters in Table 18-3 are defined as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive. When implementations require the use of these vectors, some or all of these parameters may be used in the vectors.

Table 18-3—RXVECTOR parameters

| Parameter | Value |
|--------------------------|--|
| DATARATE | The rate at which the PSDU was received in Mb/s. Allowed value depends on value of MODULATION parameter: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 |
| LENGTH | The length of the PSDU in octets. Range: 1–4095 |
| PREAMBLE_TYPE | The preamble type detected during reception of the PPDU. Enumerated type for which the allowed value depends on value of MODULATION parameter: ERP-OFDM: null ERP-DSSS, ERP-CCK: SHORTPREAMBLE, LONGPREAMBLE. |
| MODULATION | The modulation used for the reception of this PSDU. Enumerated types: ERP-DSSS, ERP-CCK, ERP-OFDM |
| SERVICE | Null. |
| RSSI | The RSSI is a measure of the RF energy received by the ERP. The 8-bit value is in the range 0 to RSSI maximum as described in 17.2.3.3. |
| RCPI | The RCPI is a measure of the received channel power and is included when dot11RadioMeasurementActivated is true. The 8-bit RCPI value is described in 17.2.3.6 and 16.3.8.6. |
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}-1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. |

18.3 Extended Rate PHY sublayer

18.3.1 Introduction

Subclause 18.3 provides a PHY for the ERP. The convergence procedure specifies how PSDUs are converted to and from PPDUs at the transmitter and receiver. The PPDU is formed during data transmission by appending the PSDU to the Extended Rate PHY preamble and header. At the receiver, the PHY preamble and header are processed to aid in the demodulation and delivery of the PSDU.

18.3.2 PPDU format

18.3.2.1 General

An ERP STA shall support three different preamble and header formats. The first is the long preamble and header described in 18.3.2.2 (and based on 16.2.2.2 with redefinition of reserved bits defined therein). This PPDU provides interoperability with Clause 16 STAs when using the 1, 2, 5.5, and 11 Mb/s data rates. The second is the short preamble and header described in 18.3.2.3 (and based on 16.2.2.3 where it is optional).

The short preamble supports the rates 2, 5.5, and 11 Mb/s. The third is the ERP-OFDM preamble and header specified in 18.3.2.4 (and based on 17.3.2).

18.3.2.2 Long preamble PPDU format

Figure 16-1 of 16.2.2.2 shows the basic format for the long preamble PPDU. This preamble is appropriate for use with the 1, 2, 5.5, and 11 Mb/s (Clause 16) modes and is compatible with BSSs using these modes.

The SERVICE field is defined in 16.2.3.5. An ERP STA shall set the Locked clocks bit to 1, when transmitting at a data rate described in Clause 16.

18.3.2.3 Short preamble PPDU format

Figure 16-2 of 16.2.2.3 shows the basic format for the short preamble PPDU. For the ERP, support for this preamble is mandatory. The short preamble is appropriate for use with 2, 5.5, and 11 Mb/s modes. The bits of the Short PHY SERVICE field and RATE field are the same as for the Long PHY SERVICE field and RATE field and are defined in 18.3.2.2.

18.3.2.4 ERP-OFDM PPDU format

The format, preamble, and headers for the ERP-OFDM PPDU are described in 17.3.2 to 17.3.5. For the ERP-OFDM modes, the DATA field that contains the SERVICE field, the PSDU, the TAIL bits, and the PAD bits shall follow 17.3.5.

For ERP-OFDM modes, an ERP packet is followed by a period of no transmission with a duration of aSignalExtension called the *signal extension*. The purpose of this extension is to make the TXTIME calculation in 18.5.3 result in a transmission duration interval that includes an additional duration of aSignalExtension. The SIFS for Clause 17 packets is 16 µs, and the SIFS for Clause 16 packets is 10 µs. The longer SIFS in Clause 17 is to allow extra time for the convolutional decode process to finish. As Clause 18 packets use a SIFS of 10 µs, this extra aSignalExtension length extension causes the transmitter to compute the Duration field in the MAC header incorporating the aSignalDuration of “idle time” following each ERP-OFDM transmission, which causes the NAV value of Clause 16 STAs to be set correctly.

The “CS mechanism” described in 10.3.2.1 combines the NAV state and the STA’s transmitter status with physical CS to determine the busy/idle state of the medium. The time interval between frames is called the IFS. A STA shall determine that the medium is idle through the use of the CCA mechanism for the interval specified. The starting reference of slot boundaries is the end of the last symbol of the previous frame on the medium. For ERP-OFDM frames, this includes the length extension. For ERP-OFDM frames, a STA shall generate the PHY-RXEND.indication aSignalDuration after the end of the last symbol of the previous frame on the medium. This adjustment shall be performed by the STA based on local configuration information set using the PLME SAP.

18.3.3 PHY data modulation and rate change

18.3.3.1 Long and short preamble formats

The long and short PHY preamble and the long PHY header shall be transmitted using the 1 Mb/s DBPSK modulation. The short PHY header shall be transmitted using the 2 Mb/s modulation. The SIGNAL and SERVICE fields combined shall indicate the modulation and rate that shall be used to transmit the PSDU. The transmitter and receiver shall initiate the modulation and rate indicated by the SIGNAL and SERVICE fields, starting with the first octet of the PSDU. The PSDU transmission rate shall be set by the DATARATE parameter in the TXVECTOR, issued with the PHY-TXSTART.request primitive described in 16.3.5.

Four modulation formats are mandatory, 1 Mb/s and 2 Mb/s ERP-DSSS and 5.5 Mb/s and 11 Mb/s ERP-CCK, and they are specified in 16.3.6.4.

18.3.3.2 ERP-OFDM format

PHY modulation and rate change for the ERP-OFDM frame format follows 17.3.7.

18.3.4 CCA

The PHY shall provide the capability to perform a CCA and report the results of the assessment to the MAC. The CCA mechanism shall detect a “medium busy” condition for all supported preamble and header types. That is, the CCA mechanism shall detect that the medium is busy for the PPDUs specified in 17.3.2 and 16.2.2. The CCA mechanism performance requirements are given in 18.4.6.

The ERP shall provide the capability to perform CCA according to the following method:

CCA Mode (ED and CS): A combination of CS and energy above threshold. CCA shall have a mechanism for CS that detects all mandatory Clause 18 sync symbols. This CCA’s mode’s CS shall include both Barker code sync detection and OFDM sync symbol detection. CCA shall report busy at least while a PPDU is being received with energy above the ED threshold at the antenna.

The PHY shall indicate a busy channel by issuing a PHY-CCA.indication(BUSY) primitive and shall indicate a clear channel by issuing a PHY-CCA.indication(IDLE) primitive.

18.3.5 PHY receive procedure

This subclause describes the procedure used by receivers of the ERP. An ERP receiver shall be capable of receiving 1, 2, 5.5, and 11 Mb/s PPDUs using either the long or short preamble formats described in Clause 16 and shall be capable of receiving 6, 12, and 24 Mb/s using the modulation and preamble described in Clause 17. The PHY may also implement the ERP-OFDM modulations at rates of 9, 18, 36, 48, and 54 Mb/s. The receiver shall be capable of detecting the preamble type (ERP-OFDM, short preamble, or long preamble) and the modulation type. These values shall be reported in the RXVECTOR (see 18.2).

Upon the receipt of a PPDU, the receiver shall first distinguish between the ERP-OFDM preamble and the single carrier modulations (long or short preamble). In the case where the preamble is an ERP-OFDM preamble, the PHY receive procedure shall follow the procedure described in 17.3.12. Otherwise, the receiver shall then distinguish between the long preamble and short preamble as specified in 16.2.2. The receiver shall then demodulate the SERVICE field to determine the modulation type as specified in 18.3.2.2 or 18.3.2.3. For short preamble and long preamble using ERP-DSSS or ERP-CCK, the receiver shall then follow the receive procedure described in 16.2.6.

18.4 ERP operating specifications (general)

18.4.1 Introduction

Subclauses 18.4.2 to 18.4.7 provide general specifications for the ERP sublayers. These specifications are based on 17.3.8 except where noted.

18.4.2 Regulatory requirements

All systems shall comply with the appropriate regulatory requirements for operation in the 2.4 GHz band.

18.4.3 Operating channel frequencies

The ERP shall operate in the frequency ranges specified in 16.3.6.3, as allocated by regulatory bodies in the United States, Europe, and Japan. The channel numbering and the number of operating channels shall follow Table 16-6 of 16.3.6.3.

18.4.4 Transmit and receive in-band and out-of-band spurious emissions

The ERP shall comply with in-band and out-of-band spurious emissions as set by the appropriate regulatory bodies for the 2.4 GHz band.

18.4.5 SIFS

The ERP shall use a SIFS of 10 μ s.

18.4.6 CCA performance

The CCA shall indicate true if there is no CCA “medium busy” indication. The CCA parameters are subject to the following criteria:

- a) When the start of a valid ERP-OFDM signal or valid ERP-DSSS/CCK sync symbols at a receive level greater than or equal to -82 dBm at the receiver antenna connector are present at the start of the PHY slot, the receiver’s CCA indicator shall report the channel busy with probability CCA_Detect_Probability within aCCATime. CCA_Detect_Probability is the probability that the CCA does respond correctly to a valid signal and shall be at least 99% for the long slot time and at least 90% for the short slot time. The values for the other parameters are found in Table 18-5. Note that the CCA Detect Probability and the power level are performance requirements.
- b) In the event that a correct PHY header is received, the ERP shall hold the CCA signal inactive (channel busy) for the full duration, as indicated by the PHY LENGTH field. Should a loss of CS occur in the middle of reception, the CCA shall indicate a busy medium for the intended duration of the transmitted PPDU.
- c) CCA shall report a busy medium upon detection of any energy above -62 dBm.

18.4.7 PHY transmit specifications

18.4.7.1 General

The PHY transmit specifications shall follow 17.3.9 with the exception of the transmit power level (17.3.9.2), the transmit center frequency tolerance (17.3.9.5), the symbol clock frequency tolerance (17.3.9.6), and the time of departure accuracy (17.3.9.9). Regulatory requirements may have an effect on the combination of maximum transmit power and spectral mask if the resulting signals violate restricted band emission limits.

18.4.7.2 Transmit power levels

The maximum transmit power level shall meet the requirements of the local regulatory body.

18.4.7.3 Transmit spectral mask

The transmit spectral mask for the ERP-OFDM modes shall follow 17.3.9.3 and is shown in Figure 17-13 therein. The transmit spectral mask for the ERP-DSSS modes shall follow 16.3.7.4 and is shown in Figure 16-10 therein.

18.4.7.4 Transmit center frequency tolerance

The transmit center frequency tolerance shall be ± 25 ppm maximum. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked).

18.4.7.5 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 25 ppm maximum. The transmit center frequency and symbol clock frequency shall be derived from the same reference oscillator (locked oscillators). This means that the error in ppm for the carrier and the symbol timing shall be the same.

18.4.7.6 Time of Departure accuracy

The time of departure specifications shall follow 17.3.9.9 for PPDUs transmitted using ERP-OFDM format and 16.3.7.10 for PPDUs transmitted using ERP-DSSS/CCK.

18.4.8 PHY receive specifications

18.4.8.1 General

Subclause 18.4.8 describes the receive specifications for the PHY sublayer. The receive specification for the ERP-OFDM modes shall follow 17.3.10 with the exception of the receiver maximum input level (17.3.10.5) and the adjacent channel rejection (17.3.10.3). The receive specifications for the ERP-DSSS modes shall follow 16.3.8 with the exception of the receiver maximum input level (16.3.8.3).

18.4.8.2 Receiver minimum input level sensitivity

The PER of the ERP-OFDM modes shall be less than 10% at a PSDU length of 1000 octets for the input levels of Table 17-18 of 17.3.10. Input levels are specific for each data rate and are measured at the antenna connector. A noise figure of 10 dB and an implementation loss of 5 dB are assumed. The PER of the ERP-DSSS modes shall be as specified in 16.3.8.2.

18.4.8.3 Adjacent channel rejection

Adjacent channels at 2.4 GHz are defined to be at ± 25 MHz spacing. The adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 17-18 of 17.3.10 and raising the power of the interfering signal until 10% PER is caused for a PSDU length of 1000 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The interfering signal in the adjacent channel shall be a signal compliant with the ERP, unsynchronized with the signal in the channel under test. In an ERP the corresponding rejection shall be no less than specified in Table 17-18 of 17.3.10.

The alternative adjacent channel rejection of Table 17-18 shall not be required for the ERP.

The adjacent channel rejection of the ERP-DSSS modes shall follow 16.3.8.4.

18.4.8.4 Receive maximum input level capability

The PER shall be less than 10% at a PSDU length of 1000 octets for an input level of -20 dBm measured at the antenna connector for any supported modulation signal or data rate (i.e., 1, 2, 5.5, 6, 9, 11, 12, 18, 22, 24, 33, 36, 48, 54 Mb/s).

18.5 ERP PLME

18.5.1 PLME SAP

Table 18-4 lists the additional MIB attributes that may be accessed by the PHY entities and the intralayer of higher LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

18.5.2 MIB

HR/DSSS PHY MIB attributes are defined in Annex C with additions from this supplement and with specific values defined in Table 18-4.

Table 18-4—MIB attribute default values/ranges

| Managed object | Default value/range | Operational semantics |

18.5.3 TXTIME

18.5.3.1 General

The value of TXTIME is calculated for each modulation type based on parameters in the TXVECTOR. For the 1, 2, 5.5, and 11 Mb/s modes with DSSS and CCK modulation formats, the value shall be calculated as described in 16.3.4.

18.5.3.2 ERP-OFDM TXTIME calculations

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated using the ERP-OFDM TXTIME calculation as shown in Equation (18-1).

$$\text{TXTIME} = T_{\text{PREAMBLE}} + T_{\text{SIGNAL}} + T_{\text{SYM}} \times \left\lceil \frac{16 + 8 \times \text{LENGTH} + 6}{N_{\text{DBPS}}} \right\rceil + T_{\text{SE}} \quad (18-1)$$

where

- $T_{PREAMBLE}$, T_{SIGNAL} , and T_{SYM} are defined in Table 17-5 in 17.3.2.4
- N_{DBPS} is the number of data bits per symbol and is derived from the DATARATE parameter in Table 17-4 in 17.3.2.3
- T_{SE} is aSignalExtension

18.5.4 ERP characteristics

The ERP characteristics in Table 18-5 shall be used for the ERP for the purposes of MAC timing calculations.

Table 18-5—ERP characteristics

| Characteristic | Value |
|---------------------|---|
| aSlotTime | If dot11OperatingClassesRequired is false: Long = 20 μ s Short = 9 μ s If dot11OperatingClassesRequired is true: Long = 20 μ s plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) Short = 9 μ s plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) |
| aSIFSTime | 10 μ s |
| aSignalExtension | 6 μ s |
| aCCATime | Implementation dependent, see 10.3.7. |
| aRxPHYStartDelay | 20 μ s for ERP-OFDM, 192 μ s for ERP-DSSS/CCK with long preamble, and 96 μ s for ERP-DSSS/CCK with short preamble |
| aRxTxTurnaroundTime | Implementation dependent, see 10.3.7. |
| aTxPHYDelay | Implementation dependent, see 10.3.7. |
| aRxPHYDelay | Implementation dependent, see 10.3.7. |
| aRxTxSwitchTime | Implementation dependent, see 10.3.7. |
| aTxRampOnTime | Implementation dependent, see 10.3.7. |
| aAirPropagationTime | As indicated by the coverage class (see 10.21.5). |
| aMACProcessingDelay | Implementation dependent, see 10.3.7. |
| aPreambleLength | 16 μ s for ERP-OFDM, 144 μ s for ERP-DSSS/CCK with long preamble, 72 μ s for ERP-DSSS/CCK with short preamble |
| aPHYHeaderLength | 4 μ s for ERP-OFDM, 48 μ s for ERP-DSSS/CCK with long preamble, 24 μ s for ERP-DSSS/CCK with short preamble |
| aPSDUMaxLength | 4095 octets |
| aCWmin(0) | 31 |
| aCWmin(1) | 15 |
| ACWmin | The set aCWmin() |
| aCWmax | 1023 |

The long slot time indicated in Table 18-5 shall be used unless the BSS consists only of ERP STAs that support the Short Slot Time option. STAs indicate support for a short slot time by setting the Short Slot Time subfield to 1 when transmitting Association Request and Reassociation Request frames. If the BSS consists of only ERP STAs that support the Short Slot Time option, an optional short slot time may be used. APs indicate usage of the short slot time indicated in Table 18-5 by setting the Short Slot Time subfield to 1 in all Beacon, Probe Response, Association Response, and Reassociation Response frame transmissions as described in 9.4.1.4. A STA shall use short slot if the BSS indicates short slot.

19. High-throughput (HT) PHY specification

19.1 Introduction

19.1.1 Introduction to the HT PHY

Clause 19 specifies the PHY entity for a high-throughput (HT) orthogonal frequency division multiplexing (OFDM) system.

In addition to the requirements found in Clause 19, an HT STA shall be capable of transmitting and receiving frames that are compliant with the mandatory PHY specifications defined as follows:

- In Clause 17 when the HT STA is operating in a 20 MHz channel width in the 5 GHz band
- In Clause 16 and Clause 18 when the HT STA is operating in a 20 MHz channel width in the 2.4 GHz band

The HT PHY is based on the OFDM PHY defined in Clause 17, with extensibility up to four spatial streams, operating in 20 MHz bandwidth. Additionally, transmission using one to four spatial streams is defined for operation in 40 MHz bandwidth. These features are capable of supporting data rates up to 600 Mb/s (four spatial streams, 40 MHz bandwidth).

The HT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), or 64-QAM. Forward error correction (FEC) coding (convolutional coding) is used with a coding rate of 1/2, 2/3, 3/4, or 5/6. LDPC codes are added as an optional feature.

Other optional features at both transmit and receive sides are 400 ns (short) guard interval (GI), transmit beamforming, HT-greenfield format, and STBC.

The maximum HT PSDU length is 65 535 octets.

19.1.2 Scope

The services provided to the MAC by the HT PHY consist of the following protocol functions:

- a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.
- b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of HT PHY and Clause 15, Clause 17, Clause 16, or Clause 18 PHYs.

19.1.3 HT PHY functions

19.1.3.1 General

The HT PHY contains two functional entities: the PHY and the layer management function (i.e., the PLME). Both of these functions are described in detail in 19.3 and 19.4.

The HT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8.

19.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

19.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

19.1.4 PPDU formats

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1. The effect of the CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format is described in 19.2.4.

The FORMAT parameter determines the overall structure of the PPDU as follows:

- *Non-HT format (NON_HT)*: Packets of this format are structured according to the Clause 17 (OFDM) or Clause 18 (ERP) specification. Support for non-HT format is mandatory.
- *HT-mixed format (HT_MF)*: Packets of this format contain a preamble compatible with Clause 17 and Clause 18 receivers. The non-HT-STF (L-STF), the non-HT-LTF (L-LTF), and the non-HT SIGNAL field (L-SIG) are defined so they can be decoded by non-HT Clause 17 and Clause 18 STAs. The rest of the packet cannot be decoded by Clause 17 or Clause 18 STAs. Support for HT-mixed format is mandatory.
- *HT-greenfield format (HT_GF)*: HT packets of this format do not contain a non-HT compatible part. Support for HT-greenfield format is optional. An HT STA that does not support the reception of an HT-greenfield format packet shall be able to detect that an HT-greenfield format packet is an HT transmission (as opposed to a non-HT transmission). In this case, the receiver shall decode the HT-SIG and determine whether the HT-SIG cyclic redundancy check (CRC) passes.

19.2 HT PHY service interface

19.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, TXSTATUS, RXVECTOR, and PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Status of the transmission is reported from PHY to MAC by parameters within TXSTATUS. Using the RXVECTOR, the PHY informs the MAC of the received packet parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

This interface is an extension of the generic PHY service interface defined in 8.3.4.

19.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 19-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 19-1—TXVECTOR and RXVECTOR parameters

| Parameter | Condition | Value | See NOTE 1 | |
|-------------------|------------------|---|------------|----------|
| | | | TXVECTOR | RXVECTOR |
| FORMAT | | Determines the format of the PPDU. Enumerated type: NON_HT indicates Clause 15, Clause 17, Clause 16, or Clause 18 PPDU formats or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format. | Y | Y |
| NON_HT_MODULATION | FORMAT is NON_HT | Enumerated type: ERP-DSSS ERP-CCK ERP-OFDM OFDM NON_HT_DUP_OFDM | Y | Y |
| | Otherwise | Not present | | |
| L_LENGTH | FORMAT is NON_HT | Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY. | Y | Y |
| | FORMAT is HT_MF | Indicates the value in the Length field of the L-SIG in the range 1 to 4095. This use is defined in 10.26.4. This parameter may be used for the protection of more than one PPDU as described in 10.26.5. | Y | Y |
| | FORMAT is HT_GF | Not present | N | N |
| L_DATARATE | FORMAT is NON_HT | Indicates the rate used to transmit the PSDU in megabits per second. Allowed values depend on the value of the NON_HT_MODULATION parameter as follows: ERP-DSSS: 1 and 2 ERP-CCK: 5.5 and 11 ERP-OFDM, NON_HT_DUP_OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 OFDM: 6, 9, 12, 18, 24, 36, 48, and 54 | Y | Y |
| | FORMAT is HT_MF | Indicates the data rate value that is in the L-SIG. This use is defined in 10.26.4. | Y | Y |
| | FORMAT is HT_GF | Not present | N | N |
| LSIGVALID | FORMAT is HT_MF | true if L-SIG Parity is valid false if L-SIG Parity is not valid | N | Y |
| | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | See NOTE 1 | |
|---------------|---|---|------------|----------|
| | | | TXVECTOR | RXVECTOR |
| SERVICE | FORMAT is NON_HT and NON_HT_MODULATION is one of <ul style="list-style-type: none">— ERP-OFDM— OFDM | Scrambler initialization, null | Y | N |
| | FORMAT is HT_MF or HT_GF | Scrambler initialization, null | Y | N |
| | Otherwise | Not present | N | N |
| RSSI | TXPWR_LEVEL_INDEX | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to 8. This parameter is used to indicate which of the available TxPowerLevel attributes defined in the MIB shall be used for the current transmission. | Y | N |
| PREAMBLE_TYPE | | The allowed values for the RSSI parameter are in the range 0 to RSSI maximum. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. In HT-mixed format, the reported RSSI shall be measured during the reception of the HT-LTFs. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |
| MCS | FORMAT is NON_HT and NON_HT_MODULATION is one of <ul style="list-style-type: none">— ERP-DSSS— ERP-CCK | Enumerated type: SHORTPREAMBLE LONGPREAMBLE | Y | Y |
| | Otherwise | Not present | N | N |
| REC_MCS | FORMAT is HT_MF or HT_GF | Selects the modulation and coding scheme used in the transmission of the packet. The value used in each MCS is the index defined in 19.5. Integer: range 0 to 76. Values of 77 to 127 are reserved. The interpretation of the MCS index is defined in 19.5. | Y | Y |
| | Otherwise | Not present | N | N |
| | FORMAT is HT_MF or HT_GF | Indicates the MCS that the STA's receiver recommends. | N | O |
| | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | See NOTE 1 | |
|--------------|--------------------------|--|------------|----------|
| | | | TXVECTOR | RXVECTOR |
| CH_BANDWIDTH | FORMAT is HT_MF or HT_GF | Indicates whether the packet is transmitted using 40 MHz or 20 MHz channel width. Enumerated type: HT_CBW20 for 20 MHz and 40 MHz upper and 40 MHz lower modes HT_CBW40 for 40 MHz | Y | Y |
| | FORMAT is NON_HT | Enumerated type: NON_HT_CBW40 for non-HT duplicate format NON_HT_CBW20 for all other non-HT formats | Y | Y |
| CH_OFFSET | | Indicates which portion of the channel is used for transmission. Refer to Table 19-2 for valid combinations of CH_OFFSET and CH_BANDWIDTH. Enumerated type: CH_OFF_20 indicates the use of a 20 MHz channel (that is not part of a 40 MHz channel). CH_OFF_40 indicates the entire 40 MHz channel. CH_OFF_20U indicates the upper 20 MHz of the 40 MHz channel CH_OFF_20L indicates the lower 20 MHz of the 40 MHz channel. | Y | N |
| LENGTH | FORMAT is HT_MF or HT_GF | Indicates the length of an HT PSDU in the range 0 to 65 535 octets. A value of 0 indicates a NDP that contains no data symbols after the HT preamble (see 19.3.9). | Y | Y |
| | Otherwise | Not present | N | N |
| SMOOTHING | FORMAT is HT_MF or HT_GF | Indicates whether frequency domain smoothing is recommended as part of channel estimation. (See NOTE 2.) Enumerated type: SMOOTHING_REC indicates that smoothing is recommended. SMOOTHING_NOT_REC indicates that smoothing is not recommended. | Y | Y |
| | Otherwise | Not present | N | N |
| SOUNDING | FORMAT is HT_MF or HT_GF | Indicates whether this packet is a sounding packet. Enumerated type: SOUNDING indicates this is a sounding packet. NOT_SOUNDING indicates this is not a sounding packet. | Y | Y |
| | Otherwise | Not present | N | N |
| AGGREGATION | FORMAT is HT_MF or HT_GF | Indicates whether the PSDU contains an A-MPDU. Enumerated type: AGGREGATED indicates this PSDU has A-MPDU aggregation. NOT_AGGREGATED indicates this PSDU does not have A-MPDU aggregation. | Y | Y |
| | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | |
|--------------|--------------------------|---|----------|---|
| | | | RXVECTOR | |
| STBC | FORMAT is HT_MF or HT_GF | Indicates the difference between the number of space-time streams (N_{STS}) and the number of spatial streams (N_{SS}) indicated by the MCS as follows: 0 indicates no STBC ($N_{STS} = N_{SS}$). 1 indicates $N_{STS} - N_{SS} = 1$. 2 indicates $N_{STS} - N_{SS} = 2$. Value of 3 is reserved. | Y | Y |
| | Otherwise | Not present | N | N |
| FEC_CODING | FORMAT is HT_MF or HT_GF | Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code. | Y | Y |
| | Otherwise | Not present | N | N |
| GI_TYPE | FORMAT is HT_MF or HT_GF | Indicates whether a short guard interval is used in the transmission of the packet. Enumerated type: LONG_GI indicates short GI is not used in the packet. SHORT_GI indicates short GI is used in the packet. | Y | Y |
| | Otherwise | Not present | N | N |
| NUM_EXTEN_SS | FORMAT is HT_MF or HT_GF | Indicates the number of extension spatial streams that are sounded during the extension part of the HT training in the range 0 to 3. | Y | Y |
| | Otherwise | Not present | N | N |
| ANTENNA_SET | FORMAT is HT_MF or HT_GF | Indicates which antennas of the available antennas are used in the transmission. The length of the field is 8 bits. A 1 in bit position n , relative to the LSB, indicates that antenna n is used. At most 4 bits out of 8 may be set to 1. This field is present only if ASEL is applied. | O | N |
| | Otherwise | Not present | N | N |
| N_TX | FORMAT is HT_MF or HT_GF | The N_TX parameter indicates the number of transmit chains. | Y | N |
| | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|--------------------|---|---|------------|----------|
| | | | See NOTE 1 | |
| EXPANSION_MAT | EXPANSION_MAT_TYPE is COMPRESSED_SV | Contains a set of compressed beamforming feedback matrices as defined in 19.3.12.3.6. The number of elements depends on the number of spatial streams and the number of transmit chains. | Y | N |
| | EXPANSION_MAT_TYPE is NON_COMPRESSED_SV | Contains a set of noncompressed beamforming feedback matrices as defined in 19.3.12.3.5. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix. | Y | N |
| | EXPANSION_MAT_TYPE is CSI_MATRICES | Contains a set of CSI matrices as defined in 19.3.12.3.2. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix. | Y | N |
| | Otherwise | Not present | N | N |
| EXPANSION_MAT_TYPE | EXPANSION_MAT is present | Enumerated type: COMPRESSED_SV indicates that EXPANSION_MAT is a set of compressed beamforming feedback matrices. NON_COMPRESSED_SV indicates that EXPANSION_MAT is a set of noncompressed beamforming feedback matrices. CSI_MATRICES indicates that EXPANSION_MAT is a set of channel state matrices. | Y | N |
| | Otherwise | Not present | N | N |
| CHAN_MAT | CHAN_MAT_TYPE is COMPRESSED_SV | Contains a set of compressed beamforming feedback matrices as defined in 19.3.12.3.6 based on the channel measured during the training symbols of the received PPDU. The number of elements depends on the number of spatial streams and the number of transmit chains. | N | Y |
| | CHAN_MAT_TYPE is NON_COMPRESSED_SV | Contains a set of noncompressed beamforming feedback matrices as defined in 19.3.12.3.5 based on the channel measured during the training symbols of the received PPDU. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix. | N | Y |
| | CHAN_MAT_TYPE is CSI_MATRICES | Contains a set of CSI matrices as defined in 19.3.12.3.2 based on the channel measured during the training symbols of the received PPDU. The number of complex elements is $N_{ST} \times N_r \times N_c$ where N_{ST} is the total number of subcarriers, N_c is the number of columns, and N_r is the number of rows in each matrix. | N | Y |
| | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | See NOTE 1 | |
|---------------|---|---|------------|----------|
| | | | TXVECTOR | RXVECTOR |
| CHAN_MAT_TYPE | FORMAT is HT_MF or HT_GF | Enumerated type: COMPRESSED_SV indicates that CHAN_MAT is a set of compressed beamforming vector matrices. NON_COMPRESSED_SV indicates that CHAN_MAT is a set of noncompressed beamforming vector matrices. CSI_MATRICES indicates that CHAN_MAT is a set of channel state matrices. | N | Y |
| | Otherwise | Not present | N | N |
| RCPI | | Is a measure of the received RF power averaged over all of the receive chains in the data portion of a received frame. Refer to 19.3.19.6 for the definition of RCPI. | N | Y |
| | CHAN_MAT_TYPE is CSI_MATRICES | Is a measure of the received SNR per chain. SNR indications of 8 bits are supported. SNR shall be the decibel representation of linearly averaged values over the tones represented in each receive chain as described in 9.4.1.28 | N | Y |
| SNR | CHAN_MAT_TYPE is COMPRESSED_SV or NON_COMPRESSED_SV | Is a measure of the received SNR per stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.29 and 9.4.1.30 | N | Y |
| | FORMAT is HT_MF or HT_GF Or FORMAT is NON_HT and NON_HT_MODULATION is NON_HT_DUP_OFDM | Indicates whether signal extension needs to be applied at the end of transmission. Boolean values: true indicates no signal extension is present. false indicates signal extension may be present depending on other TXVECTOR parameters (see 19.2.2). | Y | N |
| NO_SIG_EXTN | Otherwise | Not present | N | N |

Table 19-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | See NOTE 1 | |
|--|-----------|---|------------|----------|
| | | | TXVECTOR | RXVECTOR |
| TIME_OF_DEPARTURE_REQUESTED | | Enumerated type: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. | O | N |
| RX_START_OF_FRAME_OFFSET | | 0 to $2^{32}-1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | O |
| NOTE 1—In the “TXVECTOR” and “RXVECTOR” columns, the following apply: Y = Present; N = Not present; O = Optional. NOTE 2—Setting the smoothing bit is defined in 19.3.11.11.2. | | | | |

19.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for an HT PHY contains a SECONDARY_CHANNEL_OFFSET parameter, which takes one of the following values:

- SECONDARY_CHANNEL_NONE if no secondary channel is present; in this case the PHY shall set dot11CurrentSecondaryChannel to 0.
- SECONDARY_CHANNEL_ABOVE if the secondary channel is above the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel + 4.

- SECONDARY_CHANNEL_BELOW if the secondary channel is below the primary channel; in this case the PHY shall set dot11CurrentSecondaryChannel to dot11CurrentPrimaryChannel – 4.

19.2.4 Effect of CH_BANDWIDTH, CH_OFFSET, and MCS parameters on PPDU format

The structure of the PPDU transmitted by an HT STA is determined by the TXVECTOR FORMAT, CH_BANDWIDTH, CH_OFFSET, and MCS parameters as defined in Table 19-1. The effect of the FORMAT parameter is described in 19.1.4.

The operation of the PHY in the frequency domain is determined by the FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters. Table 19-2 shows the valid combinations of FORMAT, CH_BANDWIDTH, and CH_OFFSET and the corresponding PPDU format. Other combinations are reserved.

Table 19-2—Interpretation of FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters

| FORMAT | CH_BANDWIDTH | CH_OFFSET |
|-----------------|--|---|
| HF_MF, HF_GF | HT_CBW20 | <p>CH_OFF_20: 20 MHz HT format—The STA has a 20 MHz operating channel width and transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth.</p> <p>CH_OFF_20U: 40 MHz HT upper format—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the upper 20 MHz of a 40 MHz channel.</p> <p>CH_OFF_20L: 40 MHz HT lower format—The STA transmits an HT-mixed or HT-greenfield format PPDU of 20 MHz bandwidth in the lower 20 MHz of a 40 MHz channel.</p> |
| HT_MF, HT_GF | HT_CBW40 | CH_OFF_40: 40 MHz HT format—The STA transmits an HT-mixed or HT-greenfield format PPDU of 40 MHz bandwidth. |
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANN EL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANN EL_NONE | CH_OFF_20: 20 MHz non-HT format—The STA has a 20 MHz operating channel width and transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU. |
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANN EL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANN EL_BELOW | CH_OFF_20U: 40 MHz non-HT upper format—The STA transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU, in the upper 20 MHz of a 40 MHz channel. |

Table 19-2—Interpretation of FORMAT, CH_BANDWIDTH, and CH_OFFSET parameters (continued)

| FORMAT | CH_BANDWIDTH | CH_OFFSET |
|--------|--|---|
| NON_HT | NON_HT_CBW20 and the SECONDARY_CHANN EL_OFFSET parameter of the PHYCONFIG_VECTOR is SECONDARY_CHANN EL_ABOVE | CH_OFF_20L: 40 MHz non-HT lower format—The STA transmits an ERP-DSSS, ERP-CCK, ERP-OFDM, or OFDM format PPDU, in the lower 20 MHz of a 40 MHz channel. |
| NON_HT | NON_HT_CBW40 | CH_OFF_40: Non-HT duplicate format—The STA transmits an ERP-OFDM or OFDM format PPDU in each of the 20 MHz channels of a 40 MHz channel. The upper channel (higher frequency) is rotated by +90° relative to the lower channel. See 19.3.11.12. |

NOTE—Support of 20 MHz non-HT format and 20 MHz HT format with one and two spatial streams is mandatory at APs. Support of 20 MHz non-HT format and 20 MHz HT format with one spatial stream is mandatory at non-AP STAs.

19.2.5 Support for NON_HT formats

When the FORMAT parameter is equal to NON_HT, the behavior of the HT PHY is defined in other clauses as shown in Table 19-3, dependent on the operational band. In this case, the PHY-TXSTART.request primitive is handled by mapping the TXVECTOR parameters as defined in Table 19-3 and following the operation as defined in the referenced clause. Likewise the PHY-RXSTART.indication primitive emitted when a non-HT PPDU is received is defined in the referenced clauses, with mapping of RXVECTOR parameters as defined in Table 19-3.

Table 19-3—Mapping of the HT PHY parameters for NON_HT operation

| HT PHY parameter | 2.4 GHz operation defined by Clause 15 | 2.4 GHz operation defined by Clause 16 | 2.4 GHz operation defined by Clause 18 | 5.0 GHz operation defined by Clause 17 |

Non-HT format PPDUs structured according to Clause 15, Clause 17, Clause 16, or Clause 18 are transmitted

- Within the limits of the transmit spectrum mask specified in the respective clauses, or
- As non-HT duplicate PPDUs within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1, or
- As 20 MHz format non-HT PPDUs, within the limits of the 40 MHz transmit spectrum mask defined in 19.3.18.1, in the upper (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) or lower (CH_BANDWIDTH of value NON_HT_CBW20 and CH_OFFSET of value CH_OFF_20U) 20 MHz of the 40 MHz channel

Non-HT PPDUs transmitted using the 40 MHz transmit spectrum mask are referred to as *40 MHz mask non-HT PPDUs*. Refer to 11.16.9 for CCA sensing rules for transmission of 40 MHz mask non-HT PPDUs.

19.2.6 TXSTATUS parameters

The parameters listed in Table 19-4 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) service primitive.

Table 19-4—TXSTATUS parameter

| Parameter | Value |
|-----------------------------|--|
| TIME_OF_DEPARTURE | 0 to $2^{32}-1$. The locally measured time when the first frame energy is sent by the transmitting port, in units equal to 1/ TIME_OF_DEPARTURE_ClockRate. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}-1$. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}-1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

19.3 HT PHY

19.3.1 Introduction

Subclause 19.3 provides a procedure in which PSDUs are converted to and from PPDUs. During transmission, the PSDU is processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in demodulation and delivery of the PSDU.

Two preamble formats are defined. For HT-mixed format operation, the preamble has a non-HT portion and an HT portion. The non-HT portion of the HT-mixed format preamble enables detection of the PPDUs and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 and/or Clause 18. The non-HT portion of the HT-mixed format preamble also consists of the SIGNAL field defined in Clause 17 and is thus decodable by STAs compliant with Clause 17 and Clause 18 as well as HT STAs.

The HT portion of the HT-mixed format preamble enables estimation of the MIMO channel to support demodulation of the HT data by HT STAs. The HT portion of the HT-mixed format preamble also includes the HT-SIG field, which supports HT operation. The SERVICE field is prepended to the PSDU.

For HT-greenfield operation, compatibility with Clause 17 and Clause 18 STAs is not required. Therefore, the non-HT portions of the preamble are not included in the HT-greenfield format preamble.

19.3.2 PPDU format

Two formats are defined for the PPDU: HT-mixed format and HT-greenfield format. These two formats are called *HT formats*. Figure 19-1 shows the non-HT format⁴⁸ and the HT formats. There is also an MCS 32 format (specified in 19.3.11.11.5) used for MCS 32 that provides the lowest rate in a 40 MHz channel. In

⁴⁸ The non-HT format is shown related to the terminology of this subclause. The non-HT PPDU format is defined in 17.3.3 and 17.3.2.

addition to the HT formats, there is a non-HT duplicate format (specified in 19.3.11.12) that duplicates the 20 MHz non-HT packet in two 20 MHz halves of a 40 MHz channel.

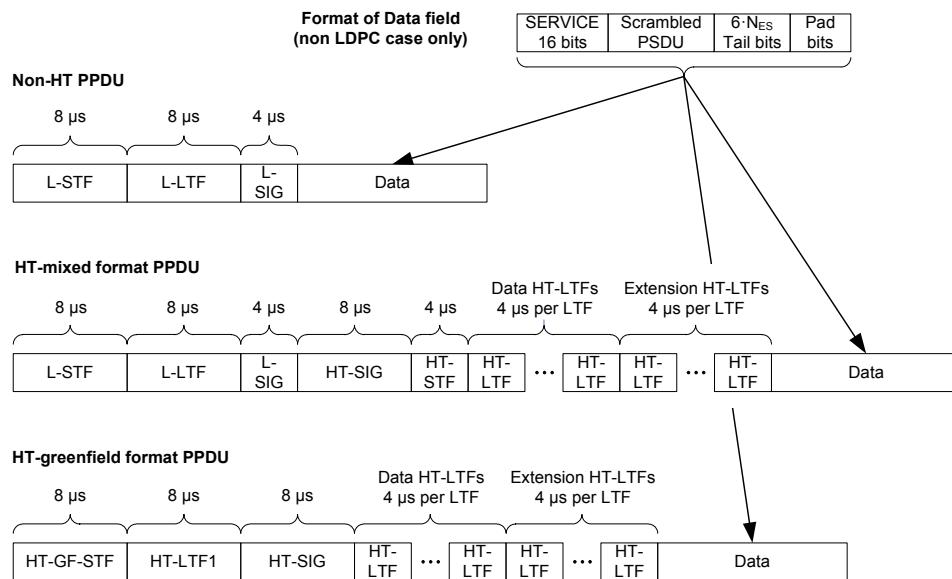

Figure 19-1—PPDU format

The elements of the PPDU are summarized in Table 19-5.

Table 19-5—Elements of the HT PPDU

| Element | Description |
|-----------|---|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| HT-SIG | HT SIGNAL field |
| HT-STF | HT Short Training field |
| HT-GF-STF | HT-Greenfield Short Training field |
| HT-LTF1 | First HT Long Training field (Data) |
| HT-LTFs | Additional HT Long Training fields (Data and Extension) |
| Data | The Data field includes the PSDU |

The HT-SIG, HT-STF, HT-GF-STF, HT-LTF1, and HT-LTFs exist only in HT packets. In non-HT packets only the L-STF, L-LTF, L-SIG, and Data fields exist.

In both HT-mixed format and HT-greenfield format frames, there are two types of HT-LTFs: Data HT-LTFs (HT-DLTFs) and Extension HT-LTFs (HT-ELTFs). HT-DLTFs are always included in HT PPDU to provide the necessary reference for the receiver to form a channel estimate that allows it to demodulate the data

portion of the frame. The number of HT-DLTFs, $N_{HT-DLTF}$, may be 1, 2, or 4 and is determined by the number of space-time streams being transmitted in the frame (see Table 19-13). HT-ELTFs provide additional reference in sounding PPDU so that the receiver can form an estimate of additional dimensions of the channel beyond those that are used by the data portion of the frame. The number of HT-ELTFs, $N_{HT-ELTF}$, may be 0, 1, 2, or 4 (see Table 19-14). PHY preambles in which HT-DLTFs are followed by HT-ELTFs are referred to as *staggered pREAMbles*. The HT-mixed format and HT-greenfield format frames shown in Figure 19-1 both contain staggered pREAMbles for illustrative purposes.

Transmissions of frames with TXVECTOR parameter NO_SIG_EXTN equal to false are followed by a period of no transmission for a duration of aSignalExtension. See 10.3.8.

A Signal Extension shall be present in a transmitted PPDU, based on the parameters of the TXVECTOR, when the NO_SIG_EXTN parameter is equal to false and either of the following is true:

- The FORMAT parameter is equal to HT_MF or HT_GF.
- The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A Signal Extension shall be assumed to be present (for the purpose of timing of PHY-RXEND.indication and PHY-CCA.indication primitives, as described below and in 19.3.21) in a received PPDU when either of the following is true, based on the determined parameter values of the RXVECTOR:

- The FORMAT parameter is equal to HT_MF or HT_GF.
- The FORMAT parameter is equal to NON_HT, and the NON_HT_MODULATION parameter is equal to ERP-OFDM, or NON_HT_DUP_OFDM.

A PPDU containing a Signal Extension is called a *signal extended PPDU*. When transmitting a signal extended PPDU, the PHY-TXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU. When receiving a signal extended PPDU, the PHY-RXEND.indication primitive shall be emitted a period of aSignalExtension after the end of the last symbol of the PPDU.

19.3.3 Transmitter block diagram

HT-mixed format and HT-greenfield format transmissions can be generated using a transmitter consisting of the following blocks:

- a) *Scrambler* scrambles the data to reduce the probability of long sequences of 0s or 1s; see 19.3.11.3.
- b) *Encoder parser*, if BCC encoding is to be used, demultiplexes the scrambled bits among N_{ES} (number of BCC encoders for the Data field) BCC encoders, in a round robin manner.
- c) *FEC encoders* encode the data to enable error correction. An FEC encoder may include a binary convolutional encoder followed by a puncturing device, or it may include an LDPC encoder.
- d) *Stream parser* divides the outputs of the encoders into blocks that are sent to different interleaver and mapping devices. The sequence of the bits sent to an interleaver is called a *spatial stream*.
- e) *Interleaver* interleaves the bits of each spatial stream (changes order of bits) to prevent long sequences of adjacent noisy bits from entering the BCC decoder. Interleaving is applied only when BCC encoding is used.
- f) *Constellation mapper* maps the sequence of bits in each spatial stream to constellation points (complex numbers).
- g) *STBC encoder* spreads constellation points from N_{SS} spatial streams into N_{STS} space-time streams using a space-time block code. STBC is used only when $N_{SS} < N_{STS}$; see 19.3.11.9.2.

- h) *Spatial mapper* maps space-time streams to transmit chains. This may include one of the following:
 - 1) *Direct mapping*: Constellation points from each space-time stream are mapped directly onto the transmit chains (one-to-one mapping).
 - 2) *Spatial expansion*: Vectors of constellation points from all of the space-time streams are expanded via matrix multiplication to produce the input to all of the transmit chains.
 - 3) *Beamforming*: Similar to spatial expansion, each vector of constellation points from all of the space-time streams is multiplied by a matrix of steering vectors to produce the input to the transmit chains.
- i) *Inverse discrete Fourier transform (IDFT)* converts a block of constellation points to a time domain block.
- j) *Cyclic shift (CSD) insertion* is where the insertion of the cyclic shifts prevents unintentional beamforming. CSD insertion may occur before or after the IDFT. There are three cyclic shift types as follows:
 - 1) A cyclic shift specified per transmitter chain with the values defined in Table 19-9 (a possible implementation is shown in Figure 19-2).
 - 2) A cyclic shift specified per space-time stream with the values defined in Table 19-10 (a possible implementation is shown in Figure 19-3).
 - 3) A cyclic shift $M_{CSD}(k)$ that may be applied as a part of the spatial mapper; see 19.3.11.11.2.
- k) *GI insertion* prepends to the symbol a circular extension of itself.
- l) *Windowing* optionally smooths the edges of each symbol to increase spectral decay.

Figure 19-2 and Figure 19-3 show example transmitter block diagrams. In particular, Figure 19-2 shows the transmitter blocks used to generate the HT-SIG of the HT-mixed format PPDU. These transmitter blocks are also used to generate the non-HT portion of the HT-mixed format PPDU, except that the BCC encoder and interleaver are not used when generating the L-STF and L-LTFs. Figure 19-3 shows the transmitter blocks used to generate the Data field of the HT-mixed format and HT-greenfield format PPDUs. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the HT-STF, HT-GF-STF, and HT-LTFs. The HT-greenfield format SIGNAL field is generated using the transmitter blocks shown in Figure 19-2, augmented by additional CSD and spatial mapping blocks.

19.3.4 Overview of the PPDU encoding process

The encoding process is composed of the steps described below. The following overview is intended to facilitate an understanding of the details of the convergence procedure:

- a) Determine the number of transmit chains, N_{TX} , from the N_TX field of the TXVECTOR. Produce the PHY preamble training fields for each of the N_{TX} transmit chains based on the FORMAT, NUM_EXTEN_SS, CH_BANDWIDTH, and MCS parameters of the TXVECTOR. The format and relative placement of the PHY preamble training fields vary depending on the frame format being used, as indicated by these parameters. Apply cyclic shifts. Determine spatial mapping to be used for HT-STF and HT-LTFs in HT-mixed format frame and HT-GF-STF and HT-LTFs in HT-greenfield format frame from the EXPANSION_MAT parameter of the TXVECTOR. Refer to 19.3.9 for details.
- b) Construct the PHY preamble SIGNAL fields from the appropriate fields of the TXVECTOR by adding tail bits, applying convolutional coding, formatting into one or more OFDM symbols, applying cyclic shifts, applying spatial processing, calculating an inverse Fourier transform for each OFDM symbol and transmit chain, and prepending a cyclic prefix or GI to each OFDM symbol in each transmit chain. The number and placement of the PHY preamble SIGNAL fields depend on the frame format being used. Refer to 19.3.9.3.5, 19.3.9.4.3, and 19.3.9.5.4.

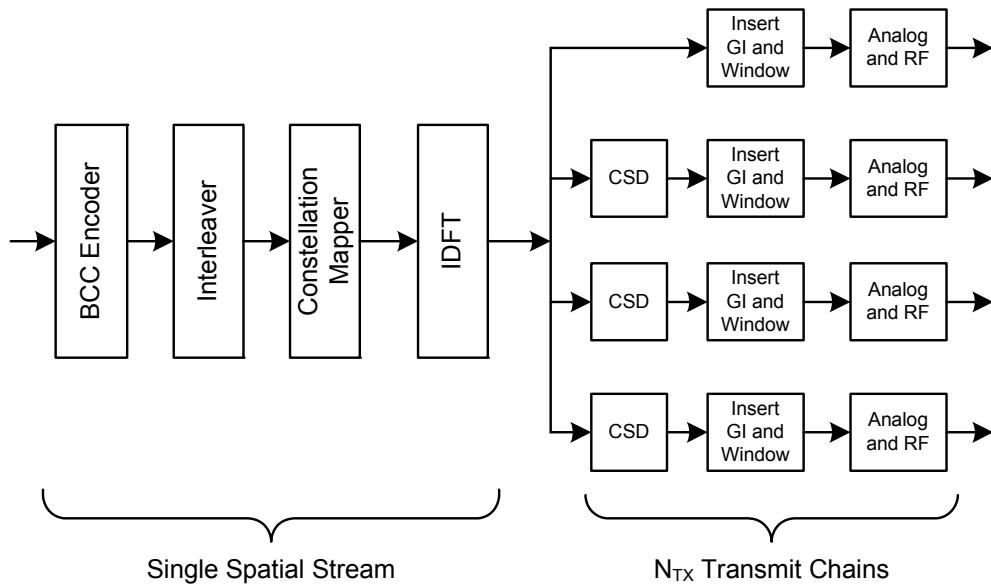

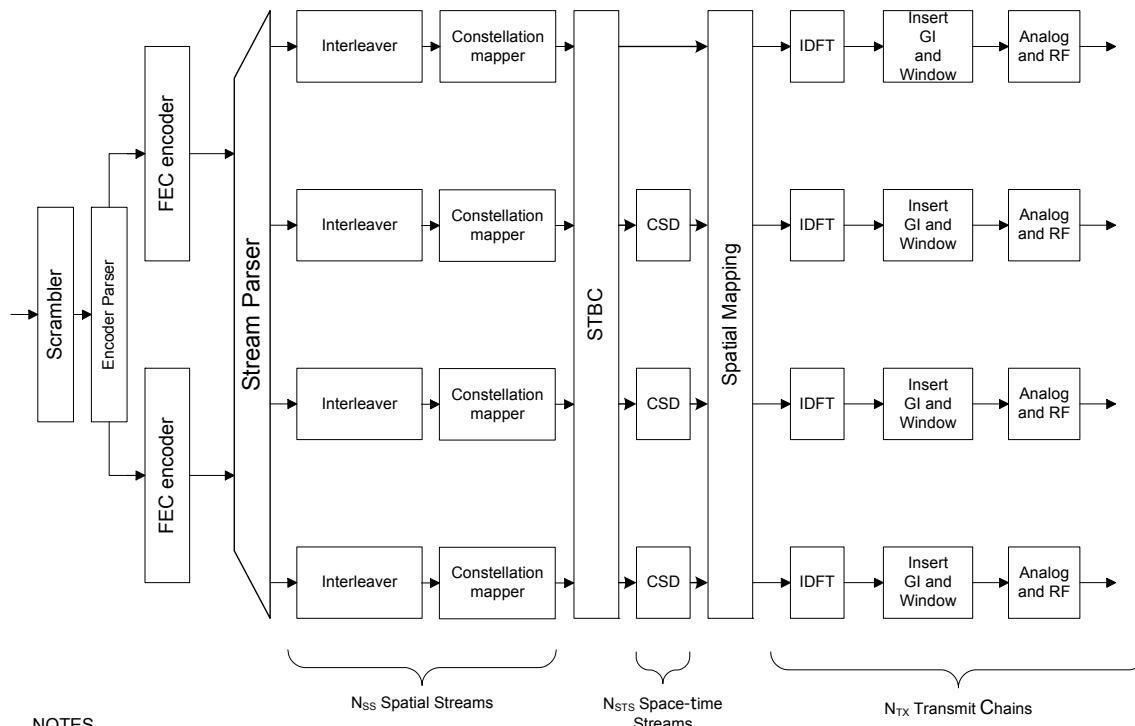

Figure 19-2—Transmitter block diagram 1

NOTES

- There might be 1 or 2 FEC encoders when BCC encoding is used.
- The stream parser might have 1, 2, 3 or 4 outputs.
- When LDPC encoding is used, the interleavers are not used
- When STBC is used, the STBC block has more outputs than inputs.
- When spatial mapping is used, there might be more transmit chains than space-time streams.
- The number of inputs to the spatial mapper might be 1, 2, 3, or 4.

Figure 19-3—Transmitter block diagram 2

- c) Concatenate the PHY preamble training and SIGNAL fields for each transmit chain one field after another, in the appropriate order, as described in 19.3.2 and 19.3.7.
- d) Use the MCS and CH_BANDWIDTH parameters of the TXVECTOR to determine the number of data bits per OFDM symbol (N_{DBPS}), the coding rate (R), the number of coded bits in each OFDM subcarrier (N_{BPSC}), and the number of coded bits per OFDM symbol (N_{CBPS}). Determine the number of encoding streams (N_{ES}) from the MCS, CH_BANDWIDTH, and FEC_CODING parameters of the TXVECTOR. Refer to 19.3.11.4 for details.
- e) Append the PSDU to the SERVICE field (see 19.3.11.2). If BCC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, tail bits are appended to the PSDU. If a single BCC encoder is used (i.e., when the value of N_{ES} is 1), the bit string is extended by 6 zero bits. If two BCC encoders are used (i.e., when the value of N_{ES} is 2), the bit string is extended by 12 zero bits. The number of symbols, N_{SYM} , is calculated according to Equation (19-32), and if necessary, the bit string is further extended with zero bits so that the resulting length is a multiple of $N_{SYM} \times N_{DBPS}$, as described in 19.3.11. If LDPC encoding is to be used, as indicated by the FEC_CODING parameter of the TXVECTOR, the resulting bit string is padded, if needed, by repeating coded bits rather than using zero bits, as given in the encoding procedure of 19.3.11.7.5. The number of resulting symbols is given by Equation (19-41), and the number of repeated coded bits used for padding is given by Equation (19-42). The resulting bit string constitutes the DATA part of the packet.
- f) Initiate the scrambler with a pseudorandom nonzero seed, generate a scrambling sequence, and exclusive-OR (XOR) it with the string of data bits, as described in 17.3.5.5.
- g) If BCC encoding is to be used, replace the scrambled zero bits that served as tail bits (6 bits if the value of N_{ES} is 1, or 12 bits if the value of N_{ES} is 2) following the data with the same number of nonscrambled zero bits, as described in 17.3.5.3. (These bits return the convolutional encoder to the zero state.)
- h) If BCC encoding is to be used and the value of N_{ES} is 2, divide the scrambled data bits between two BCC encoders by sending alternating bits to the two different encoders, as described in 19.3.11.5.
- i) If BCC encoding is to be used, encode the extended, scrambled data string with a rate 1/2 convolutional encoder (see 17.3.5.6). Omit (puncture) some of the encoder output string (chosen according to puncturing pattern) to reach the coding rate, R , corresponding to the TXVECTOR parameters MCS or L_DATARATE. Refer to 19.3.11.6 for details. If LDPC encoding is to be used, encode the scrambled data stream according to 19.3.11.7.5.
- j) Parse the coded bit stream that results from the BCC encoding or LDPC encoding into N_{SS} spatial streams, where the value of N_{SS} is determined from the MCS parameter of the TXVECTOR. See 19.3.11.8.2 for details.
- k) Divide each of the N_{SS} encoded and parsed spatial streams of bits into groups of $N_{CBPSS}(i)$ bits. If BCC encoding is to be used, within each spatial stream and group, perform an interleaving (reordering) of the bits according to a rule corresponding to $N_{BPSCS}(i)$, where i is the index of the spatial stream. Refer to 19.3.6 for details.
- l) For each of the N_{SS} encoded, parsed, and interleaved spatial streams, divide the resulting coded and interleaved data string into groups of $N_{BPSCS}(i)$ bits, where i is the index of the spatial stream. For each of the bit groups, convert the bit group into a complex number according to the modulation encoding tables. Refer to 17.3.5.8 for details.

- m) Divide the complex number string for each of the resulting N_{SS} spatial streams into groups of N_{SD} complex numbers, where the value of N_{SD} is determined from the CH_OFFSET parameter of TXVECTOR and the CH_BANDWIDTH parameter of TXVECTOR. Each such group is associated with one OFDM symbol in one spatial stream. In each group, the complex numbers are indexed 0 to $N_{SD} - 1$, and these indices have an associated one-to-one correspondence with subcarrier indices via the mapping function $M'(k)$ as described in 19.3.11.11, 19.3.11.11.3, 19.3.11.11.4, 19.3.11.11.5, and 19.3.11.12.
- n) If STBC is to be applied, as indicated by the STBC parameter in the TXVECTOR, operate on the complex number associated with each data subcarrier in sequential pairs of OFDM symbols as described in 19.3.11.9.2 to generate N_{STS} OFDM symbols for every N_{SS} OFDM symbols associated with the N_{SS} spatial streams. If STBC is not to be used, the number of space-time streams is the same as the number of spatial streams, and the sequences of OFDM symbols in each space-time stream are composed of the sequences of OFDM symbols in the corresponding spatial stream. In each group of N_{SD} resulting complex numbers in each space-time stream, the complex numbers indexed 0 to $N_{SD} - 1$ are mapped onto OFDM subcarriers via the mapping function $M'(k)$ as described in 19.3.11.11, 19.3.11.11.3, 19.3.11.11.4, 19.3.11.11.5, and 19.3.11.12.
- o) Determine whether 20 MHz or 40 MHz operation is to be used from the CH_BANDWIDTH parameter of the TXVECTOR. Specifically, when CH_BANDWIDTH is HT_CBW20 or NON_HT_CBW20, 20 MHz operation is to be used. When CH_BANDWIDTH is HT_CBW40 or NON_HT_CBW40, 40 MHz operation is to be used. For 20 MHz operation (with the exception of non-HT formats), insert four subcarriers as pilots into positions -21, -7, 7, and 21. The total number of the subcarriers, N_{ST} , is 56. For 40 MHz operation (with the exception of MCS 32 and non-HT duplicate format), insert six subcarriers as pilots into positions -53, -25, -11, 11, 25, and 53, resulting in a total of $N_{ST} = 114$ subcarriers. See 19.3.11.11.5 for pilot locations when using MCS 32 and 19.3.11.12 for pilot locations when using non-HT duplicate format. The pilots are modulated using a pseudorandom cover sequence. Refer to 19.3.11.10 for details. For 40 MHz operation, apply a +90° phase shift to the complex value in each OFDM subcarrier with an index greater than 0, as described in 19.3.11.11.4, 19.3.11.11.5, and 19.3.11.12.
- p) Map each of the complex numbers in each of the N_{ST} subcarriers in each of the OFDM symbols in each of the N_{STS} space-time streams to the N_{TX} transmit chain inputs. For direct-mapped operation, $N_{TX} = N_{STS}$, and there is a one-to-one correspondence between space-time streams and transmit chains. In this case, the OFDM symbols associated with each space-time stream are also associated with the corresponding transmit chain. Otherwise, a spatial mapping matrix associated with each OFDM subcarrier, as indicated by the EXPANSION_MAT parameter of the TXVECTOR, is used to perform a linear transformation on the vector of N_{STS} complex numbers associated with each subcarrier in each OFDM symbol. This spatial mapping matrix maps the vector of N_{STS} complex numbers in each subcarrier into a vector of N_{TX} complex numbers in each subcarrier. The sequence of N_{ST} complex numbers associated with each transmit chain (where each of the N_{ST} complex numbers is taken from the same position in the N_{TX} vector of complex numbers across the N_{ST} subcarriers associated with an OFDM symbol) constitutes an OFDM symbol associated with the corresponding transmit chain. For details, see 19.3.11.11. Spatial mapping matrices may include cyclic shifts, as described in 19.3.11.11.2.
- q) If the CH_BANDWIDTH and CH_OFFSET parameters of the TXVECTOR indicate that upper or lower 20 MHz are to be used in 40 MHz, move the complex numbers associated with subcarriers -28 to 28 in each transmit chain to carriers 4 to 60 in the upper channel or -60 to -4 in the lower

channel. Note that this shifts the signal in frequency from the center of the 40 MHz channel to +10 MHz or -10 MHz offset from the center of the 40 MHz channel. The complex numbers in the other subcarriers are set to 0.

- r) For each group of N_{ST} subcarriers and each of the N_{TX} transmit chains, convert the subcarriers to time domain using IDFT. Prepend to the Fourier-transformed waveform a circular extension of itself, thus forming a GI, and truncate the resulting periodic waveform to a single OFDM symbol length by applying time domain windowing. Determine the length of the GI according to the GI_TYPE parameter of the TXVECTOR. Refer to 19.3.11.11 and 19.3.11.12 for details. When beamforming is not used, it is sometimes possible to implement the cyclic shifts in the time domain.
- s) Append the OFDM symbols associated with each transmit chain one after another, starting after the final field of the PHY preamble. Refer to 19.3.2 and 19.3.7 for details.
- t) Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 19.3.7 for details. The transmit chains are connected to antenna elements according to ANTENNA_SET of the TXVECTOR if ASEL is applied.

19.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation, coding, and number of spatial channels. It is a compact representation that is carried in the HT-SIG. Rate-dependent parameters for the full set of MCSs are shown in Table 19-27 through Table 19-41 (in 19.5). These tables give rate-dependent parameters for MCSs with indices 0 to 76. MCSs with indices 0 to 7 and 32 have a single spatial stream; MCSs with indices 8 to 31 have multiple spatial streams using equal modulation (EQM) on all of the streams; MCSs with indices 33 to 76 have multiple spatial streams using unequal modulation (UEQM) on the spatial streams. MCS indices 77 to 127 are reserved.

Table 19-27 through Table 19-30 show rate-dependent parameters for EQM MCSs for one, two, three, and four streams for 20 MHz operation. Table 19-31 through Table 19-34 show rate-dependent parameters for EQM MCSs in one, two, three, and four streams for 40 MHz operation. The same EQM MCSs are used for 20 MHz and 40 MHz operation. Table 19-35 shows rate-dependent parameters for the 40 MHz, 6 Mb/s MCS 32 format.

The remaining tables, Table 19-36 to Table 19-41, show rate-dependent parameters for the MCSs with UEQM of the spatial streams for use with $N_{SS} > 1$.

UEQM MCSs are detailed in the following tables:

- Table 19-36 through Table 19-38 are for 20 MHz operation.
- Table 19-39 through Table 19-41 are for 40 MHz operation.

An HT STA shall support all equal modulation (EQM) rates for one spatial stream (MCSs 0 to 7) using a 20 MHz channel width. An HT AP that is not a VHT AP shall support all EQM rates for two spatial streams (MCSs 8 to 15) using a 20 MHz channel width. All other MCSs and modes are optional, specifically including transmit and receive support of 400 ns GI, operation in 40 MHz, and support of MCSs with indices 16 to 76.

19.3.6 Timing-related parameters

Table 19-6 defines the timing-related parameters.

Table 19-6—Timing-related constants

| Parameter | TXVECTOR CH_BANDWIDTH | | | |
|---|--|-----------------------------------|-----------------------------|--------------------------------|
| | NON_HT_CBW20 | HT_CBW_20 | HT_CBW40 or NON_HT_CBW40 | |
| | | | HT format | MCS 32 and non-HT duplicate |
| N_{SD} : Number of complex data numbers | 48 | 52 | 108 | 48 |
| N_{SP} : Number of pilot values | 4 | 4 | 6 | 4 |
| N_{ST} : Total number of subcarriers See NOTE 1 | 52 | 56 | 114 | 104 |
| N_{SI} : Highest data subcarrier index | 26 | 28 | 58 | 58 |
| Δ_f : Subcarrier frequency spacing | 312.5 kHz (20 MHz/64) | 312.5 kHz | 312.5 kHz (40 MHz/128) | |
| T_{DFT} : IDFT/DFT period | 3.2 μ s | 3.2 μ s | 3.2 μ s | |
| T_{GI} : Guard interval duration | 0.8 μ s = $T_{DFT}/4$ | 0.8 μ s | 0.8 μ s | |
| T_{GII} : Double guard interval | 1.6 μ s | 1.6 μ s | 1.6 μ s | |
| T_{GIS} : Short guard interval duration | N/A | 0.4 μ s = $T_{DFT}/8$ | 0.4 μ s See NOTE 2 | |
| T_{L-STF} : Non-HT short training sequence duration | 8 μ s = $10 \times T_{DFT}/4$ | 8 μ s | 8 μ s | |
| $T_{HT-GF-STF}$: HT-greenfield short training field duration | N/A | 8 μ s = $10 \times T_{DFT}/4$ | 8 μ s See NOTE 2 | |
| T_{L-LTF} : Non-HT long training field duration | 8 μ s = $2 \times T_{DFT} + T_{GII}$ | 8 μ s | 8 μ s | |
| T_{SYM} : Symbol interval | 4 μ s = $T_{DFT} + T_{GI}$ | 4 μ s | 4 μ s | |
| T_{SYMS} : Short GI symbol interval | N/A | 3.6 μ s = $T_{DFT} + T_{GIS}$ | 3.6 μ s See NOTE 2 | |
| T_{L-SIG} : Non-HT SIGNAL field duration | 4 μ s = T_{SYM} | 4 μ s | 4 μ s | |
| T_{HT-SIG} : HT SIGNAL field duration | N/A | 8 μ s = $2T_{SYM}$ | 8 μ s See NOTE 2 | |
| T_{HT-STF} : HT short training field duration | N/A | 4 μ s | 4 μ s See NOTE 2 | |

Table 19-6—Timing-related constants (continued)

| Parameter | TXVECTOR CH_BANDWIDTH | | | |
|--|-----------------------|---|---|--------------------------------|
| | NON_HT_CBW20 | HT_CBW_20 | HT_CBW40 or NON_HT_CBW40 | |
| | | | HT format | MCS 32 and non-HT duplicate |
| $T_{HT-LTF1}$: First HT long training field duration | N/A | 4 μ s in HT-mixed format, 8 μ s in HT-greenfield format | 4 μ s in HT-mixed format, 8 μ s in HT-greenfield format See NOTE 2 | |
| $T_{HT-LTFs}$: Second, and subsequent, HT long training fields duration | N/A | 4 μ s | 4 μ s See NOTE 2 | |
| NOTE 1— $N_{ST} = N_{SD} + N_{SP}$ except in the cases of MCS 32 and non-HT duplicate, where the number of data subcarriers differs from the number of complex data numbers, and the number of pilot subcarriers differs from the number of pilot values. In those cases, data numbers and pilot values are replicated in upper and lower 20 MHz portions of 40 MHz signal to make a total of 104 subcarriers. | | | | |
| NOTE 2—Not applicable in non-HT formats. | | | | |
| NOTE 3—N/A = Not applicable. | | | | |

Table 19-7 defines parameters used frequently in Clause 19.

Table 19-7—Frequently used parameters

| Symbol | Explanation |
|----------------|--|
| N_{CBPS} | Number of coded bits per symbol |
| $N_{CBPSS}(i)$ | Number of coded bits per symbol per the i -th spatial stream |
| N_{DBPS} | Number of data bits per symbol |
| N_{BPSC} | Number of coded bits per single carrier |
| $N_{BPSCS}(i)$ | Number of coded bits per single carrier for spatial stream i |
| N_{RX} | Number of receive chains |
| N_{STS} | Number of space-time streams |
| N_{SS} | Number of spatial streams |
| N_{ESS} | Number of extension spatial streams |
| N_{TX} | Number of transmit chains |
| N_{ES} | Number of BCC encoders for the Data field |
| N_{HT-LTF} | Number of HT Long Training fields (see 19.3.9.4.6) |
| $N_{HT-DLTF}$ | Number of Data HT Long Training fields |
| $N_{HT-ELTF}$ | Number of Extension HT Long Training fields |
| R | Coding rate |

19.3.7 Mathematical description of signals

For the description of the convention on mathematical description of signals, see 17.3.2.5.

In the case of either a 20 MHz non-HT format (TXVECTOR parameter FORMAT equal to NON_HT, MODULATION parameter equal to one of {ERP-OFDM, OFDM}) transmission or a 20 MHz HT format (TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, CH_BANDWIDTH equal to HT_CBW_20) transmission, the channel is divided into 64 subcarriers. In the 20 MHz non-HT format, the signal is transmitted on subcarriers -26 to -1 and 1 to 26, with 0 being the center (dc) carrier. In the 20 MHz HT format, the signal is transmitted on subcarriers -28 to -1 and 1 to 28.

In the case of the 40 MHz HT format, a 40 MHz channel is used. The channel is divided into 128 subcarriers. The signal is transmitted on subcarriers -58 to -2 and 2 to 58.

In the case of 40 MHz HT upper format or 40 MHz HT lower format, the upper or lower 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers -60 to -4 in the case of a 40 MHz HT lower format transmission and on subcarriers 4 to 60 in the case of a 40 MHz HT upper format transmission.

In the case of the MCS 32 and non-HT duplicate formats, the same data are transmitted over two adjacent 20 MHz channels. In this case, the 40 MHz channel is divided into 128 subcarriers, and the data are transmitted on subcarriers -58 to -6 and 6 to 58.

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (19-1).

$$r_{RF}(t) = \operatorname{Re}\{r(t)\exp(j2\pi f_c t)\} \quad (19-1)$$

where

f_c is the center frequency of the carrier

The transmitted RF signal is derived by modulating the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 19-4.

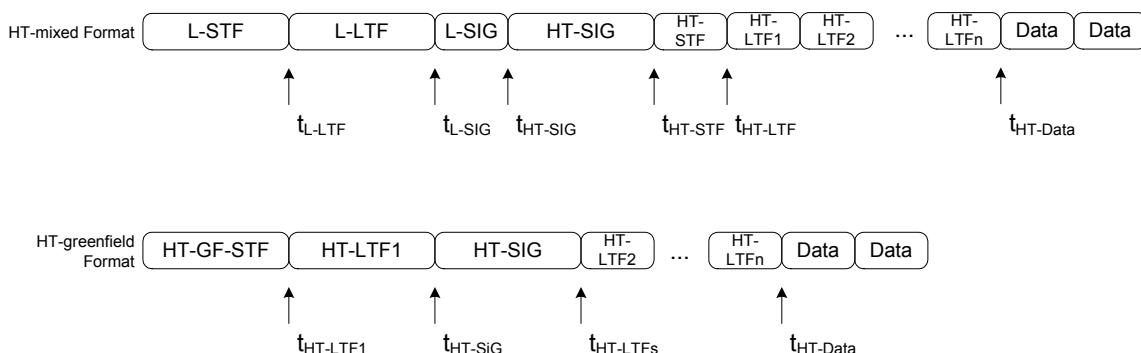

Figure 19-4—Timing boundaries for PPDU fields

The time offset, t_{Field} , determines the starting time of the corresponding field.

In HT-mixed format, the signal transmitted on transmit chain i_{TX} shall be as shown in Equation (19-2).

$$r_{PPDU}^{(i_{TX})}(t) = r_{L-STF}^{(i_{TX})}(t) + r_{L-LTF}^{(i_{TX})}(t - t_{L-LTF}) \quad (19-2)$$

$$\begin{aligned} &+ r_{L-SIG}^{(i_{TX})}(t - t_{L-SIG}) + r_{HT-SIG}^{(i_{TX})}(t - t_{HT-SIG}) + r_{HT-STF}^{(i_{TX})}(t - t_{HT-STF}) \\ &+ \sum_{i_{LTF}=1}^{N_{HTLTF}} r_{HT-LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT-LTF} - (i_{LTF} - 1)T_{HT-LTFs}) + r_{HT-DATA}^{(i_{TX})}(t - t_{HT-DATA}) \end{aligned}$$

where

$$\begin{aligned} t_{L-LTF} &= T_{L-STF} \\ t_{L-SIG} &= t_{L-LTF} + T_{L-LTF} \\ t_{HT-SIG} &= t_{L-SIG} + T_{L-SIG} \\ t_{HT-STF} &= t_{HT-SIG} + T_{HT-SIG} \\ t_{HT-LTF} &= t_{HT-STF} + T_{HT-STF} \\ t_{HT-Data} &= t_{HT-LTF} + N_{HT-LTF} \cdot T_{HT-LTFs} \end{aligned}$$

In the case of HT-greenfield format, the transmitted signal on transmit chain i_{TX} shall be as shown in Equation (19-3).

$$\begin{aligned} r_{PPDU}^{(i_{TX})}(t) &= r_{HT-GF-STF}^{(i_{TX})}(t) + r_{HT-LTF1}^{(i_{TX})}(t - t_{HT-LTF1}) \\ &+ r_{HT-SIG}^{(i_{TX})}(t - t_{HT-SIG}) \\ &+ \sum_{i_{LTF}=2}^{N_{HTLTF}} r_{HT-LTF}^{(i_{TX}, i_{LTF})}(t - t_{HT-LTFs} - (i_{LTF} - 2)T_{HT-LTFs}) \\ &+ r_{HT-DATA}^{(i_{TX})}(t - t_{HT-DATA}) \quad (19-3) \end{aligned}$$

where

$$\begin{aligned} t_{HT-LTF1} &= T_{HT-GF-STF} \\ t_{HT-SIG} &= t_{HT-LTF1} + T_{HT-LTF1} \\ t_{HT-LTFs} &= t_{HT-SIG} + T_{HT-SIG} \\ t_{HT-Data} &= t_{HT-LTFs} + (N_{HT-LTF} - 1) \cdot T_{HT-LTFs} \end{aligned}$$

Each baseband waveform, $r_{\text{Field}}^{(i_{TX})}(t)$, is defined via the discrete Fourier transform (DFT) per OFDM symbol as shown in Equation (19-4).

$$r_{\text{Field}}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{Field}}^{\text{Tone}} \cdot N_{TX}}} w_{\text{T}_{\text{Field}}}(t) \sum_k Y_k X_k^{(i_{TX})} \exp(j2\pi k \Delta_F t) \quad (19-4)$$

This general representation holds for all fields. A suggested definition of the windowing function, $w_{T_{Field}}(t)$, is given in 17.3.2.5. The frequency domain symbols $X_k^{(i_{TX})}$ represent the output of any spatial processing in subcarrier k for transmit chain i_{TX} required for the field.

The function Υ_k is used to represent a rotation of the upper tones in a 40 MHz channel as shown in Equation (19-5) and Equation (19-6).

$$\Upsilon_k = \begin{cases} 1, k \leq 0, \text{ in a 40 MHz channel} \\ j, k > 0, \text{ in a 40 MHz channel} \end{cases} \quad (19-5)$$

$$\Upsilon_k = 1, \text{ in a 20 MHz channel} \quad (19-6)$$

The $1/\sqrt{N_{Field}^{\text{Tone}} \cdot N_{TX}}$ scale factor in Equation (19-4) causes the total power of the time domain signal as summed over all transmit chains to be either 1 or lower than 1 when required. Table 19-8 summarizes the various values of N_{Field}^{Tone} .

Table 19-8—Value of tone scaling factor N_{Field}^{Tone}

| Field | N_{Field}^{Tone} , see NOTE 1 | |
|------------------|--|---------------------|
| | 20 MHz | 40 MHz |
| L-STF | 12 | 24 |
| HT-GF-STF | 12 | 24 |
| L-LTF | 52 | 104 |
| L-SIG | 52 | 104 |
| HT-SIG | 52/56, see NOTE 2 | 104/114, see NOTE 2 |
| HT-STF | 12 | 24 |
| HT-LTF | 56 | 114 |
| HT-DATA | 56 | 114 |
| MCS 32 | — | 104 |
| Non-HT Duplicate | — | 104 |

NOTE 1—The numbers in the table refer only to the value of N_{Field}^{Tone} as it appears in Equation (19-4) and in subsequent specification of various fields. This value might be different from the actual number of tones being transmitted.

NOTE 2—The values 56 and 114 are for HT-greenfield format; the values 52 and 104 are for HT-mixed format.

19.3.8 Transmission in the upper/lower 20 MHz of a 40 MHz channel

When transmitting in the upper/lower 20 MHz portion of a 40 MHz channel, the mathematical definition of transmission shall follow that of a 20 MHz channel with f_c in Equation (19-1) replaced by $f_c \pm 10 \text{ MHz}$.

This rule applies to 20 MHz HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L) and to 20 MHz non-HT transmission in the upper/lower 20 MHz of a 40 MHz channel (TXVECTOR primitive CH_BANDWIDTH equal to NON_HT_CBW20 and CH_OFFSET primitive equal to CH_OFF_20U or CH_OFF_20L).

19.3.9 HT preamble

19.3.9.1 Introduction

The HT pREAMbles are defined in HT-mixed format and in HT-greenfield format to carry the required information to operate in a system with multiple transmit and multiple receive antennas.

In the HT-mixed format, to provide compatibility with non-HT STAs, specific non-HT fields are defined so that they can be received by non-HT STAs compliant with Clause 17 or Clause 18 followed by the fields specific to HT STAs.

In the HT-greenfield format, all of the non-HT fields are omitted. The specific HT fields used are as follows:

- One HT-GF-STF for automatic gain control convergence, timing acquisition, and coarse frequency acquisition,
- One or several HT-LTFs, provided as a way for the receiver to estimate the channel between each spatial mapper input and receive chain. The first HT-LTFs (HT-DLTFs) are necessary for demodulation of the HT-Data portion of the PPDU and are followed, for sounding packets only, by optional HT-LTFs (HT-ELTFs) to sound extra spatial dimensions of the MIMO channel,
- HT-SIG, which provides all the information required to interpret the HT packet format.

In the case of multiple transmit chains, the HT pREAMbles use cyclic shift techniques to prevent unintentional beamforming.

19.3.9.2 HT-mixed format preamble

In HT-mixed format frames, the pREAMble has fields that support compatibility with Clause 17 and Clause 18 STAs and fields that support HT operation. The non-HT portion of the HT-mixed format pREAMble enables detection of the PPDU and acquisition of carrier frequency and timing by both HT STAs and STAs that are compliant with Clause 17 or Clause 18. The non-HT portion of the HT-mixed format pREAMble contains the SIGNAL field (L-SIG) defined in Clause 17 and is thus decodable by STAs compliant with Clause 17 and Clause 18 as well as HT STAs.

The HT portion of the HT-mixed format pREAMble enables estimation of the MIMO channel to support demodulation of the data portion of the frame by HT STAs. The HT portion of the HT-mixed format pREAMble also contains the HT-SIG field that supports HT operation.

19.3.9.3 Non-HT portion of the HT-mixed format pREAMble

19.3.9.3.1 Introduction

The transmission of the non-HT training fields and the L-SIG as part of an HT-mixed format packet is described in 19.3.9.3.2 through 19.3.9.3.5.

19.3.9.3.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the non-HT fields in the HT-mixed format pREAMble and the HT-SIG in the HT-mixed format pREAMble.

Cyclic shifts are used to prevent unintentional beamforming when the same signal or scalar multiples of one signal are transmitted through different spatial streams or transmit chains. A cyclic shift of duration T_{CS} on a signal $s(t)$ on interval $0 \leq t \leq T$ is defined as follows, where T is defined as T_{DFT} as referenced in Table 19-6.

With $T_{CS} \leq 0$, replace $s(t)$ with $s(t - T_{CS})$ when $0 \leq t < T + T_{CS}$ and with $s(t - T_{CS} - T)$ when $T + T_{CS} \leq t \leq T$. The cyclic-shifted signal is defined as shown in Equation (19-7).

$$s_{CS}(t; T_{CS})|_{T_{CS} < 0} = \begin{cases} s(t - T_{CS}) & 0 \leq t < T + T_{CS} \\ s(t - T_{CS} - T) & T + T_{CS} \leq t \leq T \end{cases} \quad (19-7)$$

The cyclic shift is applied to each OFDM symbol in the packet separately. Table 19-9 specifies the values for the cyclic shifts that are applied in the L-STF (in an HT-mixed format packet), the L-LTF, and L-SIG. It also applies to the HT-SIG in an HT-mixed format packet.

Table 19-9—Cyclic shift for non-HT portion of packet

| $T_{CS}^{i_{TX}}$ values for non-HT portion of packet | | | | |
|---|--|--|--|--|
| Number of transmit chains | Cyclic shift for transmit chain 1 (ns) | Cyclic shift for transmit chain 2 (ns) | Cyclic shift for transmit chain 3 (ns) | Cyclic shift for transmit chain 4 (ns) |
| 1 | 0 | — | — | — |
| 2 | 0 | -200 | — | — |
| 3 | 0 | -100 | -200 | — |
| 4 | 0 | -50 | -100 | -150 |

With more than four transmit chains, each cyclic shift on the additional transmit chains shall be between -200 ns and 0 ns inclusive.

19.3.9.3.3 L-STF definition

The L-STF is identical to the Clause 17 short training symbol. The non-HT short training OFDM symbol in the 20 MHz channel width is shown in Equation (19-8).

$$S_{-26,26} = \sqrt{1/2} \{0, 0, 1+j, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\} \quad (19-8)$$

The normalization factor $\sqrt{1/2}$ is the QPSK normalization.

The non-HT short training OFDM symbol in a 40 MHz channel width is given by Equation (19-9), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (see Equation (19-10)).

$$S_{-58,58} = \sqrt{1/2} \{ 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, 0, 0, \\ 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ 0, 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, \} \quad (19-9)$$

In HT-mixed format, the L-STF on transmit chain i_{TX} shall be as shown in Equation (19-10).

$$r_{L-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-STF}^{Tone}}} w_{T_{L-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} Y_k S_k \exp(j2\pi k \Delta_F(t - T_{CS}^{i_{TX}})) \quad (19-10)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values from Table 19-9
 Υ_k is defined in Equation (19-5) and Equation (19-6)

The L-STF has a period of $0.8 \mu\text{s}$. The entire STF includes ten such periods, with a total duration of $T_{L\text{-STF}} = 8 \mu\text{s}$.

19.3.9.3.4 L-LTF definition

The non-HT long training OFDM symbol is identical to the Clause 17 long training OFDM symbol. In the 20 MHz channel width, the long training OFDM symbol is given by Equation (19-11).

$$L_{-26,26} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 0, \\ 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, 1\} \quad (19-11)$$

The non-HT long training OFDM symbol in a 40 MHz channel width is given by Equation (19-12), after rotating the tones in the upper subchannel (subcarriers 6–58) by +90° (see Equation (19-13)).

The subcarriers at ± 32 in 40 MHz, which are the dc subcarriers for the non-HT 20 MHz transmission, are both nulled in the L-LTF. Such an arrangement allows proper synchronization of a 20 MHz non-HT STA.

The L-LTF waveform shall be as shown in Equation (19-13).

$$r_{L-LTF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-LTF}^{Tone}}} w_{T_{L-LTF}}(t) \sum_{k=-N_{sp}}^{N_{SR}} \Upsilon_k L_k \exp(j2\pi k \Delta_F(t - T_{GI2} - T_{CS}^{i_{TX}})) \quad (19-13)$$

where

T_{GI2} is 1.6 μ s

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and takes values specified in Table 19-9

Υ_k is defined in Equation (19-5) and Equation (19-6)

The entire LTF includes two 3.2 μs IDFT/DFT periods and an additional 1.6 μs double GI. The entire LTF is modulated with the L-LTF waveform.

19.3.9.3.5 L-SIG definition

The L-SIG is used to communicate rate and length information. The structure of the L-SIG is shown in Figure 19-5.

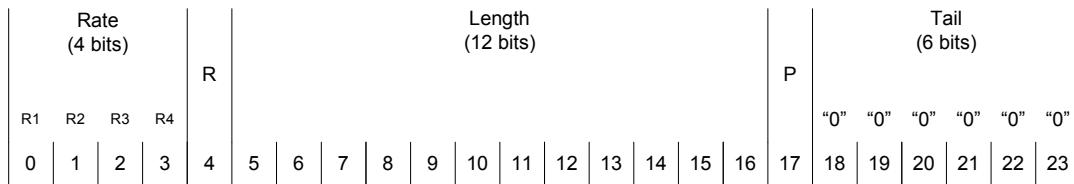

Figure 19-5—L-SIG structure

The value in the Rate field is obtained from the L_DATARATE field of the TXVECTOR. The value in the Length field is obtained from the L_LENGTH field of the TXVECTOR. The Length field is transmitted LSB first.

The reserved bit shall be set to 0.

The parity field has the even parity of bits 0–16.

The L-SIG shall be encoded, interleaved and mapped, and it shall have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.9. The stream of 48 complex numbers generated by the steps described in 17.3.5.7 is denoted by $d_k, k = 0 \dots 47$. The time domain waveform of the L-SIG in 20 MHz transmission shall be as given by Equation (19-14).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{TX}})) \quad (19-14)$$

In a 40 MHz transmission the time domain waveform of the L-SIG shall be as given by Equation (19-15).

$$r_{L-SIG}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{TX} \cdot N_{L-SIG}^{Tone}}} w_{T_{SYM}}(t) \sum_{k=-26}^{26} (D_k + p_0 P_k) \cdot (\exp(j2\pi(k-32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}})) + j \exp(j2\pi(k+32)\Delta_F(t - T_{GI} - T_{CS}^{i_{TX}}))) \quad (19-15)$$

where

$$D_k = \begin{cases} 0, & k = 0, \pm 7, \pm 21 \\ d_{M^r(k)}, & \text{otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 26, & -26 \leq k \leq -22 \\ k + 25, & -20 \leq k \leq -8 \\ k + 24, & -6 \leq k \leq -1 \\ k + 23, & 1 \leq k \leq 6 \\ k + 22, & 8 \leq k \leq 20 \\ k + 21, & 22 \leq k \leq 26 \end{cases}$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

N_{L-SIG}^{Tone} has the value given in Table 19-8

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 for HT-mixed format PPDUs

NOTE— D_k exists for $-N_{SR} \leq k \leq N_{SR}$ and takes the values from d_k that exists for $0 \leq k \leq N_{SD} - 1$. $M^r(k)$ is a “reverse” function of the function $M(k)$ defined in 17.3.5.10.

19.3.9.4 HT portion of HT-mixed format preamble

19.3.9.4.1 Introduction

When an HT-mixed format preamble is transmitted, the HT preamble consists of the HT-STF, the HT-LTFs, and the HT-SIG.

19.3.9.4.2 Cyclic shift definition

The cyclic shift values defined in this subclause apply to the HT-STF and HT-LTFs of the HT-mixed format preamble. The cyclic shift values defined in 19.3.9.3.2 apply to the HT-SIG in an HT-mixed format preamble.

Throughout the HT portion of an HT-mixed format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted in different space-time streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shifts to be used during the HT portion of the HT-mixed format preamble (with the exception of the HT_SIG) and the data portion of the frame are specified in Table 19-10.

Table 19-10—Cyclic shift values of HT portion of packet

| $T_{CS}^{i_{STS}}$ values for HT portion of packet | | | | |
|--|---|---|---|---|
| Number of space-time streams | Cyclic shift for space-time stream 1 (ns) | Cyclic shift for space-time stream 2 (ns) | Cyclic shift for space-time stream 3 (ns) | Cyclic shift for space-time stream 4 (ns) |
| 1 | 0 | — | — | — |
| 2 | 0 | -400 | — | — |
| 3 | 0 | -400 | -200 | — |
| 4 | 0 | -400 | -200 | -600 |

19.3.9.4.3 HT-SIG definition

The HT-SIG is used to carry information required to interpret the HT packet formats. The fields of the HT-SIG are described in Table 19-11.

Table 19-11—HT-SIG fields

| Field | Number of bits | Explanation and coding |
|--|----------------|--|
| Modulation and Coding Scheme | 7 | Index into the MCS table. See NOTE 1. |
| CBW 20/40 | 1 | Set to 0 for 20 MHz or 40 MHz upper/lower. Set to 1 for 40 MHz. |
| HT Length | 16 | The number of octets of data in the PSDU in the range 0 to 65 535. See NOTE 1 and NOTE 2. |
| Smoothing | 1 | Set to 1 indicates that channel estimate smoothing is recommended. Set to 0 indicates that only per-carrier independent (unsmoothed) channel estimate is recommended. See 19.3.11.11.2. |
| Not Sounding | 1 | Set to 0 indicates that PPDU is a sounding PPDU. Set to 1 indicates that the PPDU is not a sounding PPDU. |
| Reserved | 1 | Set to 1. |
| Aggregation | 1 | Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0. |
| STBC | 2 | Set to a nonzero number, to indicate the difference between the number of space-time streams (N_{STS}) and the number of spatial streams (N_{SS}) indicated by the MCS. Set to 00 to indicate no STBC ($N_{STS} = N_{SS}$). See NOTE 1. |
| FEC Coding | 1 | Set to 1 for LDPC. Set to 0 for BCC. |
| Short GI | 1 | Set to 1 to indicate that the short GI is used after the HT training. Set to 0 otherwise. |
| Number of Extension Spatial Streams | 2 | Indicates the number of extension spatial streams (N_{ESS}). Set to 0 for no extension spatial stream. Set to 1 for 1 extension spatial stream. Set to 2 for 2 extension spatial streams. Set to 3 for 3 extension spatial streams. See NOTE 1. |
| CRC | 8 | CRC of bits 0–23 in HT-SIG ₁ and bits 0–9 in HT-SIG ₂ . See 19.3.9.4.4. The first bit to be transmitted is bit C7 as explained in 19.3.9.4.4. |
| Tail Bits | 6 | Used to terminate the trellis of the convolution coder. Set to 0. |
| NOTE 1—Integer fields are transmitted in unsigned binary format, LSB first. | | |
| NOTE 2—A value of 0 in the HT Length field indicates a PPDU that does not include a data field, i.e., NDP. NDP transmissions are used for sounding purposes only (see 10.34.2). The packet ends after the last HT-LTF or the HT-SIG. | | |

The structure of the HT-SIG₁ and HT-SIG₂ fields is defined in Figure 19-6.

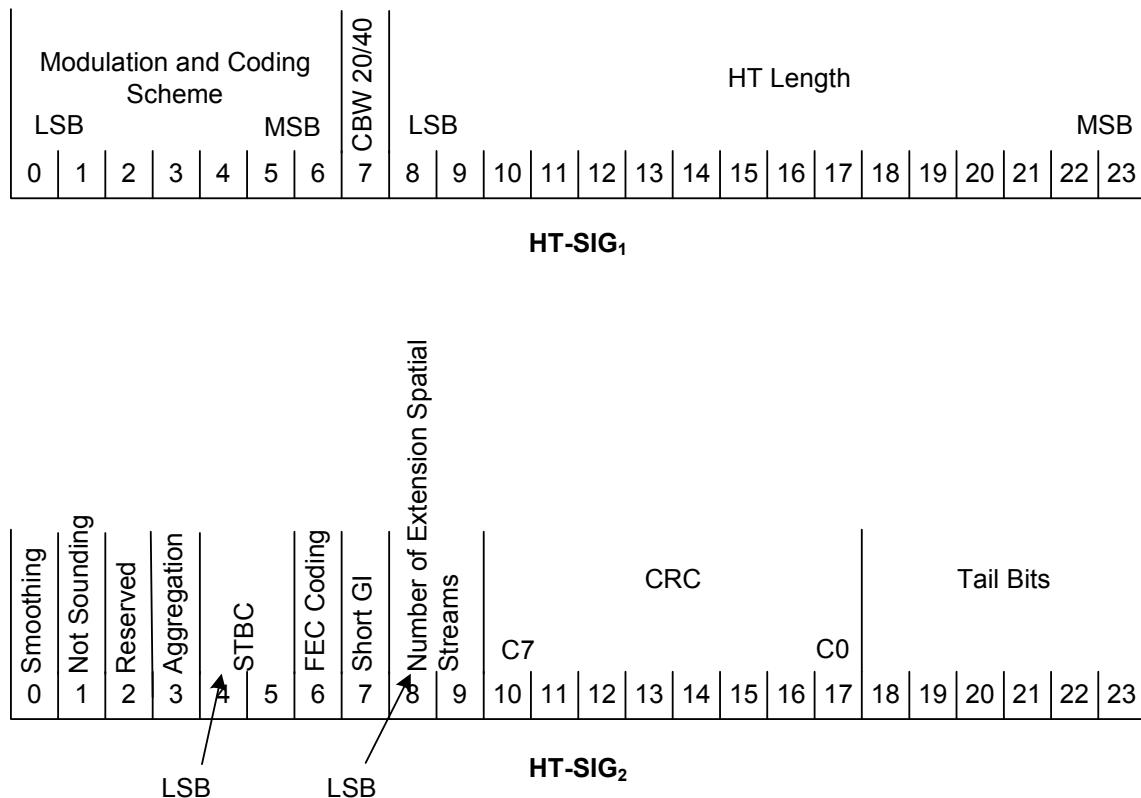

Figure 19-6—Format of HT-SIG₁ and HT-SIG₂

The HT-SIG is composed of two parts, HT-SIG₁ and HT-SIG₂, each containing 24 bits, as shown in Figure 19-6. All of the fields in the HT-SIG are transmitted LSB first, and HT-SIG₁ is transmitted before HT-SIG₂.

The HT-SIG parts shall be encoded at R = 1/2, interleaved, and mapped to a BPSK constellation, and they have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The BPSK constellation is rotated by 90° relative to the L-SIG in order to accommodate detection of the start of the HT-SIG. The stream of 96 complex numbers generated by these steps is divided into two groups of 48 complex numbers: $d_{k,n}$ $0 \leq k \leq 47$, $n = 0, 1$. The time domain waveform for the HT-SIG in an HT-mixed format packet in a 20 MHz transmission shall be as shown in Equation (19-16).

$$\begin{aligned}
 r_{HT-SIG}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^1 w_{T_{SYM}}(t - nT_{SYM}) \\
 & \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k) \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}}))
 \end{aligned} \tag{19-16}$$

In a 40 MHz transmission the time domain waveform shall be as shown in Equation (19-17).

$$\begin{aligned}
 r_{HT-SIG}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{TX} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^1 w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-26}^{26} (jD_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}^{i_{TX}})) \\
 & + j\exp(j2\pi(k+32)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}^{i_{TX}})))
 \end{aligned} \tag{19-17}$$

where

$$D_{k,n} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M'(k),n}, \text{ otherwise} \end{cases}$$

$M'(k)$ is defined in 19.3.9.3

P_k and p_n are defined in 17.3.5.10

N_{HT-SIG}^{Tone} has the value given in Table 19-8

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} and is defined by Table 19-9 for HT-mixed format PPDUs.

NOTE—This definition results in a quadrature binary phase shift keying (QBPSK) modulation in which the constellation of the data tones is rotated by 90° relative to the L-SIG in HT-mixed format PPDUs and relative to the first HT-LTF in HT-greenfield format PPDUs (see Figure 19-7). In HT-mixed format PPDUs, the HT-SIG is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble. This is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

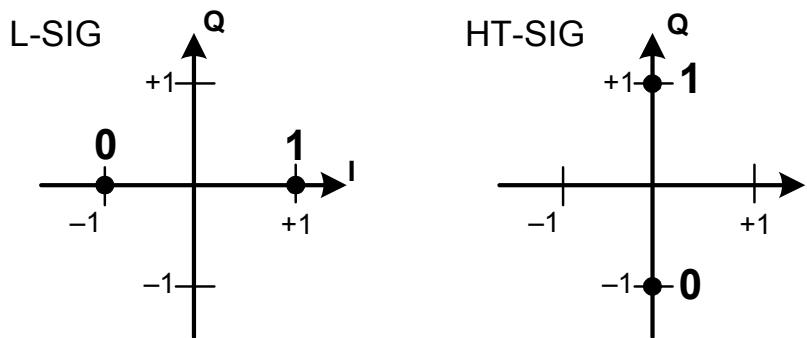

Figure 19-7—Data tone constellations in an HT-mixed format PPDU

19.3.9.4.4 CRC calculation for HT-SIG

The CRC protects bits 0–33 of the HT-SIG (bits 0–23 of HT-SIG₁ and bits 0–9 of HT-SIG₂). The value of the CRC field shall be the 1s complement of

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (19-18)$$

where

$M(D) = m_0D^{33} + m_1D^{32} + \dots + m_{32}D + m_{33}$ is the HT-SIG represented as a polynomial

where

m_0 is bit 0 of HT-SIG₁

m_{33} is bit 9 of HT-SIG₂

$I(D) = \sum_{i=26}^{33} D^i$ are initialization values that are added modulo 2 to the first 8 bits of HT-SIG₁

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$crc(D) = c_0D^7 + c_1D^6 + \dots + c_6D + c_7$

The CRC field is transmitted with c_7 first.

Figure 19-8 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, C7 first, through an inverter.

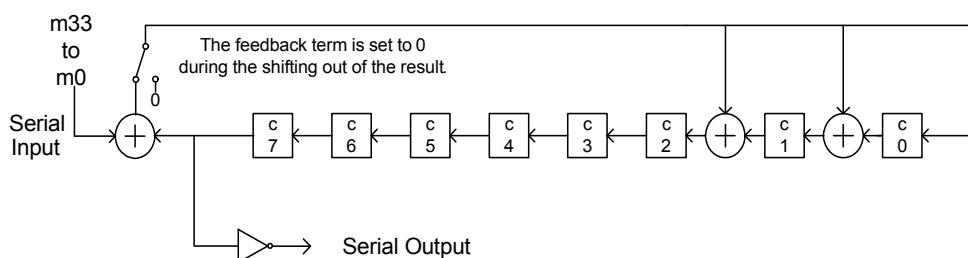

Figure 19-8—HT-SIG CRC calculation

As an example, if bits $\{m_0 \dots m_{33}\}$ are given by $\{1\ 1\ 1\ 1\ 0\ 0\ 0\ 1\ 0\ 0\ 1\ 0\ 0\ 1\ 1\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 1\ 1\ 1\ 0\ 0\ 0\ 0\ 0\ 0\}$, the output bits $\{B_7 \dots B_0\}$, where B_7 is output first, are $\{1\ 0\ 1\ 0\ 1\ 0\ 0\ 0\}$.

19.3.9.4.5 HT-STF definition

The purpose of the HT-STF is to improve automatic gain control estimation in a MIMO system. The duration of the HT-STF is 4 μ s. In a 20 MHz transmission, the frequency sequence used to construct the HT-STF is identical to L-STF. In a 40 MHz transmission, the HT-STF is constructed from the 20 MHz version by duplicating and frequency shifting and by rotating the upper subcarriers by 90°. The frequency sequences are shown in Equation (19-19) and Equation (19-20).

For 20 MHz:

$$HTS_{-28,28} = \sqrt{1/2} \quad (19-19)$$

$$\{0, 0, 0, 0, 1+j, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ 0, 0, 0, 0, -1-j, 0, 0, -1-j, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0\}$$

For 40 MHz:

$$HTS_{-58,58} = \sqrt{1/2} \quad (19-20)$$

$$\{0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, \\ 0, 0, 0, 0, -1-j, 0, 0, -1-j, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 0, 0, \\ 0, 0, 0, 0, 0, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, \\ 0, 0, 0, 0, 0, 0, -1-j, 0, 0, 0, -1-j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0, 0, 1+j, 0, 0\}$$

The time domain representation of the transmission in transmit chain i_{TX} shall be as shown in Equation (19-21).

$$r_{HT-STF}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-STF}^{Tone}}} w_{T_{HT-STF}}(t) \quad (19-21)$$

$$\sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [\mathcal{Q}_k]_{i_{TX}, i_{STS}} \Upsilon_k HTS_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}}))$$

where

$T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream i_{STS} and takes the values given in Table 19-10

\mathcal{Q}_k is defined in 19.3.11.11.2

Υ_k is defined in Equation (19-5) and Equation (19-6)

19.3.9.4.6 HT-LTF definition

The HT-LTF provides a means for the receiver to estimate the MIMO channel between the set of QAM mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. If the transmitter is providing training for exactly the space-time streams (spatial mapper inputs) used for the transmission of the PSDU, the number of training symbols, N_{LTF} , is equal to the number of space-time streams, N_{STS} , except that for three space-time streams, four training symbols are required. If the transmitter is providing training for more space-time streams (spatial mapper inputs) than the number used for the transmission of the PSDU, the number of training symbols is greater than the number of space-time streams. This latter case happens in a sounding PPDU.

The HT-LTF portion has one or two parts. The first part consists of one, two, or four HT-LTFs that are necessary for demodulation of the HT-Data portion of the PPDU. These HT-LTFs are referred to as *HT-DLTFs*. The optional second part consists of zero, one, two, or four HT-LTFs that may be used to sound extra spatial dimensions of the MIMO channel that are not utilized by the HT-Data portion of the PPDU. These HT-LTFs are referred to as *HT-ELTFs*. If a receiver has not advertised its ability to receive HT-ELTFs, it shall either issue a `PHY-RXEND.indication(UnsupportedRate)` primitive upon reception of a frame that includes HT-ELTFs or decode that frame. (When an HT packet includes one or more HT-ELTFs, it is

optional for a receiver that has not advertised its capability to receive HT-ELTFs to decode the data portion of the PPDU.)

The number of HT-DLTFs is denoted $N_{HT-DLTF}$. The number of HT-ELTFs is denoted $N_{HT-ELTF}$. The total number of HT-LTFs is shown in Equation (19-22).

$$N_{HT-LTF} = N_{HT-DLTF} + N_{HT-ELTF} \quad (19-22)$$

N_{HT-LTF} shall not exceed 5. Table 19-12 shows the determination of the number of space-time streams from the MCS and STBC fields in the HT-SIG. Table 19-13 shows the number of HT-DLTFs as a function of the number of space-time streams (N_{STS}). Table 19-14 shows the number of HT-ELTFs as a function of the number of extension spatial streams (N_{ESS}). N_{STS} plus N_{ESS} is less than or equal to 4. In the case where N_{STS} equals 3, N_{ESS} cannot exceed one; if N_{ESS} equals one in this case then N_{LTF} equals 5.

Table 19-12—Determining the number of space-time streams

| Number of Spatial Streams (from MCS) N_{SS} | STBC field | Number of space-time streams N_{STS} |
|--|------------|--|
| 1 | 0 | 1 |
| 1 | 1 | 2 |
| 2 | 0 | 2 |
| 2 | 1 | 3 |
| 2 | 2 | 4 |
| 3 | 0 | 3 |
| 3 | 1 | 4 |
| 4 | 0 | 4 |

Table 19-13—Number of HT-DLTFs required for data space-time streams

| N_{STS} | N_{HTDLTF} |
|-----------|--------------|
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |
| 4 | 4 |

Table 19-14—Number of HT-ELTFs required for extension spatial streams

| N_{ESS} | $N_{HT-ELTF}$ |
|-----------|---------------|
| 0 | 0 |
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |

The HT-LTF sequence shown in Equation (19-23) is transmitted in the case of 20 MHz operation.

$$HT-LTF_{28,28} = \{1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, 0, \\ 1, -1, -1, 1, 1, -1, 1, -1, 1, -1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1, -1, -1\} \quad (19-23)$$

NOTE—This sequence is an extension of the L-LTF where the four extra subcarriers are filled with +1 for negative frequencies and -1 for positive frequencies.

In 40 MHz transmissions, including MCS 32 format frames, the sequence to be transmitted is shown in Equation (19-24).

NOTE—This sequence is also constructed by extending the L-LTF in the following way: first, the L-LTF is duplicated and shifted as explained in 19.3.9.3.4 for the non-HT duplicate format; then the missing subcarriers [-32, -5, -4, -3, -2, 2, 3, 4, 5, 32] are filled with the values [1, -1, -1, -1, 1, -1, 1, 1, -1, 1], respectively.

This sequence, occupying 114 tones, is used even if the data portion is transmitted with MCS 32 format, which uses 104 tones.

NOTE—This sequence uses 114 tones when MCS 32 format is used to retain consistency with other 40 MHz formats and to facilitate channel estimation for beamforming and link adaptation.

In an HT-mixed format preamble, each HT-LTF consists of a single occurrence of the sequence plus a GI insertion and has a duration of 4 μ s. In case of multiple space-time streams, cyclic shift is invoked as specified in Table 19-10.

The generation of HT-DLTs is shown in Figure 19-9. The generation of HT-ELTs is shown in Figure 19-10. In these figures, and in the following text, the following notational conventions are used:

- $[X]_{m,n}$ indicates the element in row m and column n of matrix X
 - $[X]_N$ indicates a matrix consisting of the first N columns of matrix X
 - $[X]_{M:N}$ indicates a matrix consisting of columns M to N of matrix X

where

$$M \leq N$$

X is either Q_k or P_{HT-LTF}

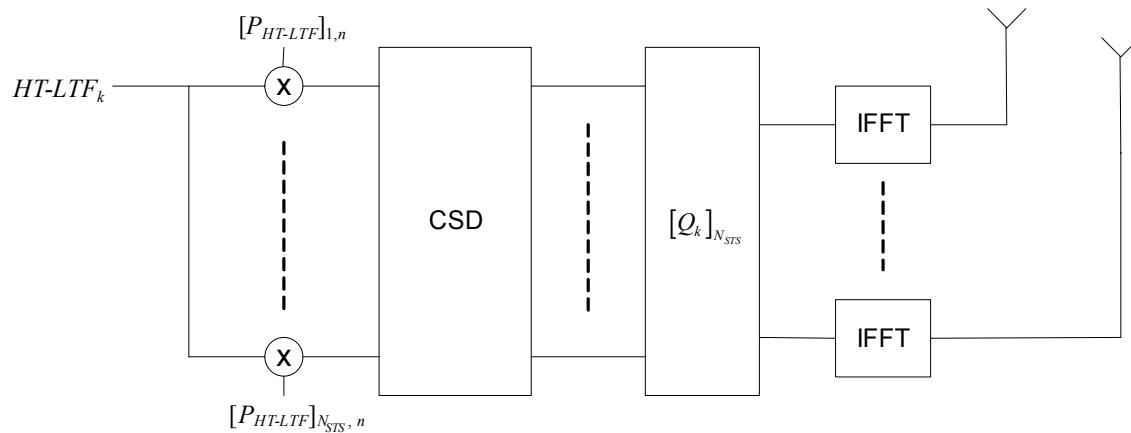

Figure 19-9—Generation of HT-DLTFs

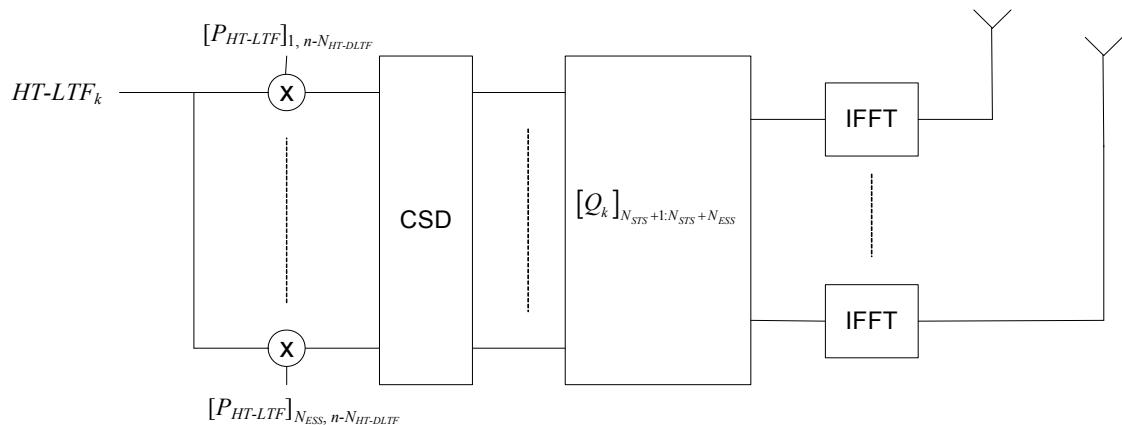

Figure 19-10—Generation of HT-ELTFs

The mapping between space-time streams and transmit chains is defined by the columns of an antenna map matrix Q_k for subcarrier k . The first N_{STS} columns define the space-time streams used for data transmission, and the next N_{ESS} columns (up to $N_{TX} - N_{STS}$ columns) define the extension spatial streams. Thus, for the purpose of defining HT-LTFs, Q_k is an $N_{TX} \times (N_{STS} + N_{ESS})$ dimension matrix. Columns $1 \dots N_{STS}$ of Q_k are excited by the HT-DLTFs, and columns $N_{STS} + 1 \dots N_{STS} + N_{ESS}$ are excited by the HT-ELTFs, where $N_{STS} + N_{ESS} \leq N_{TX}$ is the total number of spatial streams being probed by the HT-LTFs.

Possible forms of Q_k and other limitations on Q_k are specified in 19.3.11.11.2. P_{HT-LTF} is defined in Equation (19-27).

The time domain representation of the waveform transmitted on transmit chain i_{TX} during HT-DLTF n , where $1 \leq n \leq N_{HT-DLTF}$, shall be as shown in Equation (19-25).

$$r_{HT-LTF}^{n, i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTFs}}(t) \\ \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT-LTF}]_{i_{STS}, n} Y_k HT-LTF_k \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{STS}}))$$
(19-25)

For the HT-ELTFs ($N_{HT-DLTF} < n \leq N_{HT-LTF}$), it shall be as shown in Equation (19-26).

$$r_{HT-LTF}^{n, i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-LTF}^{Tone} \cdot N_{ESS}}} w_{T_{HT-LTFs}}(t) \\ \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{ESS}=1}^{N_{ESS}} ([Q_k]_{i_{TX}, N_{STS} + i_{ESS}} [P_{HT-LTF}]_{i_{ESS}, n - N_{HTDLTF}} Y_k HT-LTF_k \\ \cdot \exp(j2\pi k \Delta_F (t - T_{GI} - T_{CS}^{i_{ESS}})))$$
(19-26)

where

- $T_{CS}^{i_{STS}}$ cyclic shift values are given in Table 19-10
- $T_{CS}^{i_{ESS}}$ cyclic shift values are given in Table 19-10 with $i_{ESS} = i_{STS}$
- Q_k is defined in 19.3.11.11.2
- Y_k is defined in Equation (19-5) and Equation (19-6)
- P_{HT-LTF} the HT-LTF mapping matrix, is given by Equation (19-27)

$$P_{HT-LTF} = \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix}$$
(19-27)

19.3.9.5 HT-greenfield format preamble

19.3.9.5.1 General

For HT-greenfield operation, compatibility with Clause 17 and Clause 18 STAs is not required. Therefore, the portions of the preamble that are compatible with Clause 17 and Clause 18 STAs are not included. The result is a shorter and more efficient PHY frame format that includes a STF, LTF(s), and an HT-SIG.

19.3.9.5.2 Cyclic shift definition for HT-greenfield format preamble

Throughout the HT-greenfield format preamble, cyclic shift is applied to prevent beamforming when similar signals are transmitted on different spatial streams. The same cyclic shift is applied to these streams during the transmission of the data portion of the frame. The values of the cyclic shift to be used during the HT-greenfield format preamble, as well as the data portion of the HT-greenfield format frame, are specified in Table 19-10.

19.3.9.5.3 HT-GF-STF definition

The HT-GF-STF is placed at the beginning of an HT-greenfield format frame. The time domain waveform for the HT-GF-STF on transmit chain i_{TX} shall be as shown in Equation (19-28).

$$r_{HT-GF-STF}^{(i_{TX})}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-GF-STF}^{Tone}}} w_{T_{HT-GF-STF}}(t) \\ \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT-LTF}]_{i_{STS}, 1} \Upsilon_k S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19-28)$$

where

- $T_{CS}^{i_{STS}}$ represents the cyclic shift for the space-time stream i_{STS} and takes values from Table 19-10
- Q_k is defined in 19.3.11.11.2
- P_{HT-LTF} is defined in Equation (19-27)
- S_k is defined in non-HT-STF (L-STF), Equation (19-8) for 20 MHz operation and Equation (19-9) for 40 MHz operation
- Υ_k is defined in Equation (19-5) and Equation (19-6)

The waveform defined by Equation (19-28) has a period of 0.8 μs, and the HT-GF-STF includes ten such periods, with a total duration of $T_{HT-GF-STF} = 8 \mu s$.

19.3.9.5.4 HT-greenfield format HT-SIG

The content and format of the HT-SIG of an HT-greenfield format frame is identical to the HT-SIG in an HT-mixed format frame, as described in 19.3.9.4.3. The placement of the HT-SIG in an HT-greenfield format frame is shown in Figure 19-1. In HT-greenfield format frames, the HT-SIG is transmitted with the same cyclic shifts and the same spatial mapping as the preceding portions of the preamble. This use of the same cyclic shifts and spatial mapping is done to accommodate the estimation of channel parameters needed to robustly demodulate and decode the information contained in the HT-SIG.

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 20 MHz operation shall be as shown in Equation (19-29).

$$\begin{aligned}
 r_{HT-SIG}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^1 w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-26}^{26} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT-LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \\
 & \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}}))
 \end{aligned} \tag{19-29}$$

where

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

P_{HT-LTF} is defined in Equation (19-27)

The time domain waveform for the HT-SIG on transmit chain i_{TX} with 40 MHz operation shall be as shown in Equation (19-30).

$$\begin{aligned}
 r_{HT-SIG}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{STS} \cdot N_{HT-SIG}^{Tone}}} \sum_{n=0}^1 w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-32}^{26} \sum_{i_{STS}=1}^{N_{STS}} [P_{HT-LTF}]_{i_{STS}, 1} (jD_{k,n} + p_n P_k) \\
 & \cdot ([Q_{k-32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k-32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})) \\
 & + j[Q_{k+32}]_{i_{TX}, i_{STS}} \exp(j2\pi(k+32)\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))
 \end{aligned} \tag{19-30}$$

where

p_n and P_k are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

$T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10

Q_k is defined in 19.3.11.11.2

P_{HT-LTF} is defined in Equation (19-27)

19.3.9.5.5 HT-greenfield format LTF

The format of the LTF portion of the preamble in an HT-greenfield format frame is similar to that of the HT-LTF in an HT-mixed format frame, as described in 19.3.9.4.6, with the difference that the first HT-LTF (HT-LTF1) is twice as long (8 µs) as the other HT-LTFs. The time domain waveform for the long training symbol on transmit chain i_{TX} for the first HT-LTF in an HT-greenfield format frame shall be as shown in Equation (19-31).

$$r_{HT-LTF}^{1, i_{TX}}(t) = \frac{1}{\sqrt{N_{STS} \cdot N_{HT-LTF}^{Tone}}} w_{T_{HT-LTF1}}(t) \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [Q_k]_{i_{TX}, i_{STS}} [P_{HT-LTF}]_{i_{STS}, 1} Y_k HT-LTF(k) \exp(j2\pi k \Delta_F (t - T_{GI2} - T_{CS}^{i_{STS}})) \quad (19-31)$$

where

- $T_{CS}^{i_{STS}}$ represents the cyclic shift for space-time stream i_{STS} and takes values from Table 19-10
- Q_k is defined in 19.3.11.11.2
- P_{HT-LTF} is defined in Equation (19-27)

The first HT-LTF (HT-LTF1) consists of two periods of the long training symbol, preceded by a double-length (1.6 µs) cyclic prefix. The placement of the first and subsequent HT-LTFs in an HT-greenfield format frame is shown in Figure 19-1.

19.3.10 Transmission of NON_HT format PPDU with more than one transmit chain

When an HT device transmits a NON_HT format PPDU with the MODULATION parameter equal to OFDM or ERP-OFDM using more than one transmit chain, it shall apply the cyclic shifts defined in Table 19-9 to the transmission in each chain.

19.3.11 Data field

19.3.11.1 General

When BCC encoding is used, the Data field consists of the 16-bit SERVICE field, the PSDU, either six or twelve tail bits, depending on whether one or two encoding streams are represented, and pad bits. When LDPC encoding is used, the Data field consists of the 16-bit SERVICE field and the PSDU, processed by the procedure in 19.3.11.7.5.

The number of OFDM symbols in the data field when BCC encoding is used is computed as shown in Equation (19-32).

$$N_{SYM} = m_{STBC} \left\lceil \frac{8 \cdot length + 16 + 6 \cdot N_{ES}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (19-32)$$

where

- m_{STBC} is 2 if STBC is used and 1 otherwise (making sure that the number of symbols is even when STBC is used)
- $length$ is the value of the HT Length field in the HT-SIG field defined in Table 19-11
- N_{DBPS} takes the values defined in Table 19-27 through Table 19-41

The number of “zero” pad bits is thus $N_{SYM} \times N_{DBPS} - 8 \times length - 16 - 6 \times N_{ES}$. The number of symbols in the data field when LDPC encoding is used is described in 19.3.11.7.

For LDPC encoding, the number of encoded data bits, N_{avbits} , is given by Equation (19-39); the number of OFDM symbols, N_{SYM} , is given by Equation (19-41); and the number of repeated encoded bits for padding, N_{rep} , is given by Equation (19-42), in 19.3.11.7.5.

19.3.11.2 SERVICE field

The SERVICE field is used for scrambler initialization. The SERVICE field is composed of 16 bits, all set to 0 before scrambling. In non-HT PPDUs, the SERVICE field is the same as in 17.3.5.2. In HT PPDUs, the SERVICE field is composed of 16 zero bits, scrambled by the scrambler, as defined in 19.3.11.3.

19.3.11.3 Scrambler

The data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters `CH_BANDWIDTH_IN_NON_HT` and `DYN_BANDWIDTH_IN_NON_HT` shall not be present; therefore, the initial state of the scrambler shall be set to a pseudorandom nonzero seed.

19.3.11.4 Coding

The Data field shall be encoded using either the BCC defined in 17.3.5.6 or the LDPC code defined in 19.3.11.7. The encoder is selected by the FEC coding field in the HT-SIG, as described in 19.3.9.4.3. A single FEC encoder is always used when LDPC coding is used. When the BCC FEC encoder is used, a single encoder is used, except that two encoders are used when the selected MCS has a PHY rate greater than 300 Mb/s (see 19.5). To determine whether to use one or two BCC FEC encoders, the rate is calculated based on the use of an 800 ns GI. The operation of the BCC FEC is described in 19.3.11.6. The operation of the LDPC coder is described in 19.3.11.7.

Support for the reception of BCC-encoded Data field frames is mandatory.

19.3.11.5 Encoder parsing operation for two BCC FEC encoders

If two BCC encoders are used, the scrambled data bits are divided between the encoders by sending alternating bits to different encoders. Bit with index i sent to the encoder j , denoted $x_i^{(j)}$, is shown in Equation (19-33).

$$x_i^{(j)} = b_{N_{ES} \cdot i + j} \quad ; \quad 0 \leq j \leq N_{ES} - 1 \quad (19-33)$$

Following the parsing operation, 6 scrambled “zero” bits following the end of the message bits in each BCC input sequence are replaced by unscrambled “zero” bits, as described in 17.3.5.3.

The replaced bits are shown in Equation (19-34).

$$x_i^{(j)} : \quad 0 \leq j \leq N_{ES} - 1 \quad ; \quad \frac{\text{length} \cdot 8 + 16}{N_{ES}} \leq i \leq \frac{\text{length} \cdot 8 + 16}{N_{ES}} + 5 \quad (19-34)$$

19.3.11.6 Binary convolutional coding and puncturing

When BCC encoding is used, the encoder parser output sequences $\{x_i^0\}$, and $\{x_i^1\}$ where applicable, are each encoded by the rate 1/2 convolutional encoder defined in 17.3.5.6. After encoding, the encoded data shall be punctured by the method defined in 17.3.5.7 to achieve the rate selected by the MCS.

If rate 5/6 coding is selected, the puncturing scheme is defined in Figure 19-11.

Figure 19-11—Puncturing at rate 5/6

19.3.11.7 LDPC codes

19.3.11.7.1 Introduction

HT LDPC codes are described in 19.3.11.7.2 through 19.3.11.7.6. These codes are optionally used in the HT system as a high-performance error correcting code instead of the convolutional code (19.3.11.6). The LDPC encoder shall use the rate-dependent parameters in Table 19-27 through Table 19-41, with the exception of the N_{ES} parameter.

Support for LDPC codes is optional.

19.3.11.7.2 LDPC coding rates and codeword block lengths

The supported coding rates, information block lengths, and codeword block lengths are described in Table 19-15.

Table 19-15—LDPC parameters

| Coding rate (R) | LDPC information block length (bits) | LDPC codeword block length (bits) |
|-----------------|--------------------------------------|-----------------------------------|
| 1/2 | 972 | 1944 |
| 1/2 | 648 | 1296 |
| 1/2 | 324 | 648 |
| 2/3 | 1296 | 1944 |
| 2/3 | 864 | 1296 |
| 2/3 | 432 | 648 |
| 3/4 | 1458 | 1944 |
| 3/4 | 972 | 1296 |
| 3/4 | 486 | 648 |
| 5/6 | 1620 | 1944 |
| 5/6 | 1080 | 1296 |
| 5/6 | 540 | 648 |

19.3.11.7.3 LDPC encoder

For each of the three available codeword block lengths, the LDPC encoder supports rate 1/2, rate 2/3, rate 3/4, and rate 5/6 encoding. The LDPC encoder is systematic, i.e., it encodes an information block, $\mathbf{c}=(i_0, i_1, \dots, i_{(k-1)})$, of size k , into a codeword, \mathbf{c} , of size n , $\mathbf{c}=(i_0, i_1, \dots, i_{(k-1)}, p_0, p_1, \dots, p_{(n-k-1)})$, by adding $n-k$ parity bits obtained so that $\mathbf{H} \times \mathbf{c}^T = \mathbf{0}$, where \mathbf{H} is an $(n-k) \times n$ parity-check matrix. The selection of the codeword block length (n) is achieved via the LDPC PPDU encoding process described in 19.3.11.7.5.

19.3.11.7.4 Parity-check matrices

Each of the parity-check matrices is partitioned into square subblocks (submatrices) of size $Z \times Z$. These submatrices are either cyclic-permutations of the identity matrix or null submatrices.

The cyclic-permutation matrix P_i is obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. Figure 19-12 illustrates examples (for a subblock size of 8×8) of cyclic-permutation matrices P_i .

Table F-1 displays the “matrix prototypes” of parity-check matrices for all four coding rates at block length $n=648$ bits. The integer i denotes the cyclic-permutation matrix P_i , as illustrated in Figure 19-12. Vacant entries of the table denote null (zero) submatrices.

$$P_0 = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}, P_1 = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}, P_5 = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \end{bmatrix}$$

Figure 19-12—Examples of cyclic-permutation matrices with Z=8

Table F-2 displays the matrix prototypes of parity-check matrices for block length $n=1296$ bits, in the same fashion.

Table F-3 displays the matrix prototypes of parity-check matrices for block length $n=1944$ bits, in the same fashion.

19.3.11.7.5 LDPC PPDU encoding process

To encode an LDPC PPDU, step a) through step g) shall be performed in sequence:

- a) Compute the number of available bits, N_{avbits} , in the minimum number of OFDM symbols in which the Data field of the packet may fit.

$$N_{pld} = \text{length} \times 8 + 16 \quad (19-35)$$

$$N_{avbits} = N_{CBPS} \times m_{STBC} \times \left\lceil \frac{N_{pld}}{N_{CBPS} \times R \times m_{STBC}} \right\rceil \quad (19-36)$$

where

m_{STBC}

is 2 if STBC is used and 1 otherwise

length

is the value of the HT Length field in the HT-SIG field defined in Table 19-11

N_{pld}

is the number of bits in the PSDU and SERVICE field

- b) Compute the integer number of LDPC codewords to be transmitted, N_{CW} , and the length of the codewords to be used, L_{LDPC} from Table 19-16.

Table 19-16—PPDU encoding parameters

| Range of N_{avbits} (bits) | Number of LDPC codewords (N_{CW}) | LDPC codeword length L_{LDPC} (bits) |
|-------------------------------|---------------------------------------|---|
| $N_{avbits} \leq 648$ | 1 | 1296, if $N_{avbits} \geq N_{pld} + 912 \times (1-R)$ 648, otherwise |
| $648 < N_{avbits} \leq 1296$ | 1 | 1944, if $N_{avbits} \geq N_{pld} + 1464 \times (1-R)$ 1296, otherwise |
| $1296 < N_{avbits} \leq 1944$ | 1 | 1944 |

Table 19-16—PPDU encoding parameters (continued)

| Range of N_{avbits} (bits) | Number of LDPC codewords (N_{CW}) | LDPC codeword length L_{LDPC} (bits) |
|-------------------------------|---|---|
| $1944 < N_{avbits} \leq 2592$ | 2 | 1944, if $N_{avbits} \geq N_{pld} + 2916 \times (1-R)$ 1296, otherwise |
| $2592 < N_{avbits}$ | $\left\lceil \frac{N_{pld}}{1944 \cdot R} \right\rceil$ | 1944 |

- c) Compute the number of shortening bits, N_{shrt} , to be padded to the N_{pld} data bits before encoding, as shown in Equation (19-37).

$$N_{shrt} = \max(0, (N_{CW} \times L_{LDPC} \times R) - N_{pld}) \quad (19-37)$$

When $N_{shrt} = 0$, shortening is not performed. (Note that N_{shrt} is inherently restricted to be non-negative due to the codeword length and count selection of 19-16). When $N_{shrt} > 0$, shortening bits shall be equally distributed over all N_{CW} codewords with the first $N_{shrt} \bmod N_{CW}$ codewords shortened 1 bit more than the remaining codewords. Define $N_{spcw} = \lfloor N_{shrt}/N_{CW} \rfloor$. Then, when $N_{shrt} > 0$, the shortening is performed by setting information bits $i_{k-N_{spcw}-1}, \dots, i_{k-1}$ to 0 in the first $N_{shrt} \bmod N_{CW}$ codewords and setting information bits $i_{k-N_{spcw}}, \dots, i_{k-1}$ to 0 in the remaining codewords. For all values of N_{shrt} , encode each of the N_{CW} codewords using the LDPC encoding technique described in 19.3.11.7.2 through 19.3.11.7.4. When $N_{shrt} > 0$, the shortened bits shall be discarded after encoding.

- d) Compute the number of bits to be punctured, N_{punc} , from the codewords after encoding, as shown in Equation (19-38).

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19-38)$$

If $\left((N_{punc} > 0.1 \times N_{CW} \times L_{LDPC} \times (1-R)) \text{ AND } \left(N_{shrt} < 1.2 \times N_{punc} \times \frac{R}{1-R} \right) \right)$ is true OR if

$(N_{punc} > 0.3 \times N_{CW} \times L_{LDPC} \times (1-R))$ is true, increment N_{avbits} and recompute N_{punc} by the following two equations once:

$$N_{avbits} = N_{avbits} + N_{CBPS} \times m_{STBC} \quad (19-39)$$

$$N_{punc} = \max(0, (N_{CW} \times L_{LDPC}) - N_{avbits} - N_{shrt}) \quad (19-40)$$

The punctured bits shall be equally distributed over all N_{CW} codewords with the first $N_{punc} \bmod N_{CW}$ codewords punctured 1 bit more than the remaining codewords. Define $N_{ppcw} = \lfloor N_{punc}/N_{CW} \rfloor$. When $N_{ppcw} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \dots, p_{n-k-1}$ of the first $N_{punc} \bmod N_{CW}$ codewords and discarding parity bits $(p_{n-k-N_{ppcw}}, \dots, p_{n-k-1})$ of the remaining codewords after encoding. The number of OFDM symbols to be transmitted in the PPDU is computed as shown in Equation (19-41).

$$N_{SYM} = N_{avbits} / N_{CBPS} \quad (19-41)$$

- e) Compute the number of coded bits to be repeated, N_{rep} , as shown in Equation (19-42).

$$N_{rep} = \max(0, N_{avbits} - N_{CW} \times L_{LDPC} \times (1 - R) - N_{pld}) \quad (19-42)$$

The number of coded bits to be repeated shall be equally distributed over all N_{CW} codewords with one more bit repeated for the first $N_{rep} \bmod N_{CW}$ codewords than for the remaining codewords.

NOTE—When puncturing occurs, the coded bits are not repeated, and vice versa.

The coded bits to be repeated for any codeword shall be copied only from that codeword itself, starting from information bit i_0 and continuing sequentially through the information bits and, when necessary, into the parity bits, until the required number of repeated bits is obtained for that codeword. Note that these repeated bits are copied from the codeword after the shortening bits have been removed. If for a codeword the required number of repeated bits are not obtained in this manner (i.e., repeating the codeword once), the procedure is repeated until the required number is achieved. These repeated bits are then concatenated to the codeword after the parity bits in their same order. This process is illustrated in Figure 19-13. In this figure, the outlined arrows indicate the encoding procedure steps, while the solid arrows indicate the direction of puncturing and padding with repeated bits.

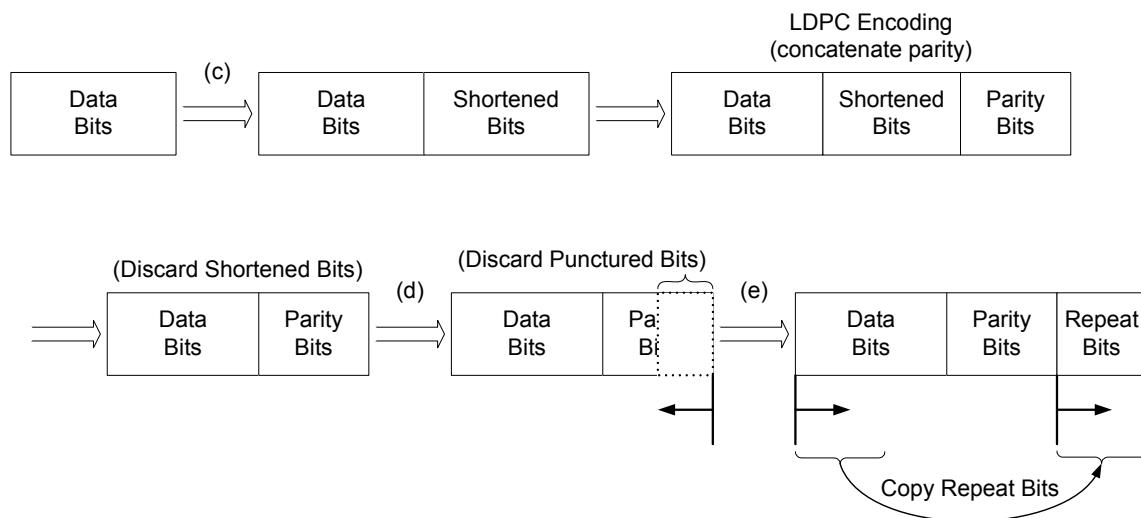

Figure 19-13—LDPC PPDU encoding padding and puncturing of a single codeword

- f) For each of the N_{CW} codewords, process the data using the number of shortening bits per codeword as computed in step c) for encoding, and puncture or repeat bits per codeword as computed per step d) and step e), as illustrated in Figure 19-13.
- g) Aggregate all codewords and parse as defined in 19.3.11.7.6.

19.3.11.7.6 LDPC parser

The succession of LDPC codewords that result from the encoding process of 19.3.11.7.5 shall be converted into a bitstream in sequential fashion. Within each codeword, bit i_0 is ordered first. The parsing of this encoded data stream into spatial streams shall follow exactly the parsing rules defined for the BCC encoder, as defined in 19.3.11.8.1. However, the frequency interleave of 19.3.11.8.3 is bypassed.

19.3.11.8 Data interleaver

19.3.11.8.1 Overview

After coding and puncturing, the data bit streams at the output of the FEC encoders are rearranged into blocks of $N_{CBPSS}(i_{SS})$ bits, where $i_{SS} = 1, 2, \dots, N_{SS}$ is the spatial stream index. This operation is referred to as *stream parsing* and is described in 19.3.11.8.2. If BCC encoding was used, each of these blocks is then interleaved by an interleaver that is a modification of the Clause 17 interleaver.

19.3.11.8.2 Stream parser

The number of bits assigned to a single axis (real or imaginary) in a constellation point in spatial stream i_{SS} is denoted by Equation (19-43).

$$s(i_{SS}) = \max\left\{1, \frac{N_{BPSCS}(i_{SS})}{2}\right\} \quad (19-43)$$

The sum of these over all streams is $S = \sum_{i_{SS}=1}^{N_{SS}} s(i_{SS})$.

NOTE—If equal MCS is used for all spatial streams, this sum becomes $N_{SS} \cdot s$, where s is the number of bits for an axis common to all streams.

Consecutive blocks of $s(i_{SS})$ bits are assigned to different spatial streams in a round robin fashion.

If two encoders are present, the output of each encoder is used alternately for each round robin cycle, i.e., at the beginning S bits from the output of first encoder are fed into all spatial streams, and then S bits from the output of second encoder are used, and so on.

Input k to spatial stream i_{SS} shall be $y_i^{(j)}$, which is output bit i of the encoder j ,

where

$$j = \left\lfloor \frac{k}{s(i_{SS})} \right\rfloor \bmod N_{ES} \quad (19-44)$$

$$i = \sum_{i'=1}^{i_{SS}-1} s(i') + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s(i_{SS})} \right\rfloor + k \bmod s(i_{SS}) \quad (19-45)$$

$$1 \leq i_{SS} \leq N_{SS}$$

For $i_{SS} = 1$, the first term in Equation (19-45) has a value of 0.

19.3.11.8.3 Frequency interleaver

MCS 32 interleaving shall be as defined in 17.3.5.7. Interleaving for all other MCSs is defined in this subclause.

The bits at the output of the stream parser are divided into blocks of $N_{CBPSS}(i_{SS})$, $i_{SS} = 1, 2, \dots, N_{SS}$ bits; and if BCC encoding was used, each block shall be interleaved by an interleaver based on the Clause 17 interleaver. This interleaver, which is based on entering the data in rows and reading them out in columns, has a different number of columns and rows depending on whether a 20 MHz channel or a 40 MHz channel is used. Table 19-17 defines the interleaver parameters. If LDPC encoding was used, no frequency interleaving is performed; hence the parsed streams are immediately mapped to symbols as defined in 19.3.11.9.

Table 19-17—Number of rows and columns in the interleaver

| Parameter | 20 MHz | 40 MHz |
|-----------|------------------------------|------------------------------|
| N_{COL} | 13 | 18 |
| N_{ROW} | $4 \times N_{BPSCS}(i_{SS})$ | $6 \times N_{BPSCS}(i_{SS})$ |
| N_{ROT} | 11 | 29 |

If more than one spatial stream exists after the operations based on the Clause 17 interleaver have been applied, a third operation called *frequency rotation* shall be applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT} .

The interleaving is defined using three permutations. The first permutation is defined by the rule shown in Equation (19-46).

$$i = N_{ROW} \times (k \bmod N_{COL}) + \lfloor k/N_{COL} \rfloor, \quad k = 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1 \quad (19-46)$$

The second permutation is defined by the rule shown in Equation (19-47).

$$\begin{aligned} j &= s(i_{SS}) \times \lfloor i/s(i_{SS}) \rfloor + (i + N_{CBPSS}(i_{SS}) - \lfloor N_{COL} \times i/N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \\ i &= 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1 \end{aligned} \quad (19-47)$$

The value of $s(i_{SS})$ is determined by the number of coded bits per subcarrier as shown in Equation (19-48).

$$s(i_{SS}) = \max(N_{BPSCS}(i_{SS})/2, 1) \quad (19-48)$$

If more than one spatial stream exists, a frequency rotation is applied to the output of the second permutation as shown in Equation (19-49).

$$\begin{aligned} r &= \left(j - \left(((i_{SS}-1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS}-1}{3} \right\rfloor \right) \times N_{ROT} \times N_{BPSCS}(i_{SS}) \right) \bmod N_{CBPSS}(i_{SS}); \\ j &= 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1 \end{aligned} \quad (19-49)$$

where

$i_{SS} = 1, 2, \dots, N_{SS}$ is the index of the spatial stream on which this interleaver is operating

The deinterleaver uses the following operations to perform the inverse rotation. The index of the bit in the received block (per spatial stream) is denoted by r . The first permutation reverses the third (frequency rotation) permutation of the interleaver as shown in Equation (19-50).

$$j = \left(r + \left(((i_{SS} - 1) \times 2) \bmod 3 + 3 \times \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right) \times N_{ROT} \times N_{BPSCS}(i_{SS}) \right) \bmod N_{CBPSS}(i_{SS}); \quad (19-50)$$

$$r = 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1$$

The second permutation reverses the second permutation in the interleaver as shown in Equation (19-51).

$$i = s(i_{SS}) \times \lfloor j/s(i_{SS}) \rfloor + (j + \lfloor N_{COL} \times j/N_{CBPSS}(i_{SS}) \rfloor) \bmod s(i_{SS}); \quad (19-51)$$

$$j = 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1$$

where $s(i_{SS})$ is defined in Equation (19-48).

The third permutation reverses the first permutation of the interleaver as shown in Equation (19-52).

$$k = N_{COL} \times i - (N_{CBPSS}(i_{SS}) - 1) \times \lfloor i/N_{ROW} \rfloor \quad i = 0, 1, \dots, N_{CBPSS}(i_{SS}) - 1 \quad (19-52)$$

19.3.11.9 Constellation mapping

19.3.11.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8.

The streams of complex numbers are denoted as shown in Equation (19-53).

$$d_{k,l,n}, 0 \leq k \leq N_{SD} - 1; 1 \leq l \leq N_{SS}; 0 \leq n \leq N_{SYM} - 1 \quad (19-53)$$

19.3.11.9.2 Space-time block coding (STBC)

This subclause defines a set of optional robust transmission formats that are applicable only when N_{STS} is greater than N_{SS} . In this case, N_{SS} spatial streams are mapped to N_{STS} space-time streams, which are mapped to N_{TX} transmit chains. These formats are based on STBC. When the use of STBC is indicated in the STBC field of the HT-SIG, a symbol operation shall occur between the constellation mapper and the spatial mapper (see Figure 19-3) as defined in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k,i,n}; k = 0 \dots N_{SD} - 1; i = 1 \dots N_{SS}; n = 0 \dots N_{SYM} - 1$, generated by the constellation mapper, is the input of the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k,i,n}; k = 0 \dots N_{SD} - 1; i = 1 \dots N_{STS}; n = 0 \dots N_{SYM} - 1$. For given values of k and i , STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k,i,2m}$ depends on $d_{k,i,2m}$ and $d_{k,i,2m+1}$, and $\tilde{d}_{k,i,2m+1}$ also depends on $d_{k,i,2m}$ and $d_{k,i,2m+1}$, as defined in Table 19-18.

If STBC is not applied, $\tilde{d}_{k,i,n} = d_{k,i,n}$ and $N_{SS} = N_{STS}$.

NOTE 1—The specific STBC schemes for single spatial streams ($N_{SS} = 1$) with $N_{TX} \geq 3$ are not detailed in this subclause since they are covered through the use of spatial expansion as detailed in 19.3.11.12.

NOTE 2—STBC is applied only for the HT-SIG MCS field values specified in Table 19-18 and is not used with MCS 32.

Table 19-18—Constellation mapper output to spatial mapper input for STBC

| N_{STS} | HT-SIG MCS field (bits 0–6 in HT-SIG ₁) | N_{SS} | HT-SIG STBC field (bits 4–5 in HT-SIG ₂) | i_{STS} | $\tilde{d}_{k, i, 2m}$ | $\tilde{d}_{k, i, 2m+1}$ |
|-----------|---|----------|--|-----------|------------------------|--------------------------|
| 2 | 0–7 | 1 | 1 | 1 | $d_{k, 1, 2m}$ | $d_{k, 1, 2m+1}$ |
| | | | | 2 | $-d_{k, 1, 2m+1}^*$ | $d_{k, 1, 2m}^*$ |
| 3 | 8–15, 33–38 | 2 | 1 | 1 | $d_{k, 1, 2m}$ | $d_{k, 1, 2m+1}$ |
| | | | | 2 | $-d_{k, 1, 2m+1}^*$ | $d_{k, 1, 2m}^*$ |
| | | | | 3 | $d_{k, 2, 2m}$ | $d_{k, 2, 2m+1}$ |
| 4 | 8–15 | 2 | 2 | 1 | $d_{k, 1, 2m}$ | $d_{k, 1, 2m+1}$ |
| | | | | 2 | $-d_{k, 1, 2m+1}^*$ | $d_{k, 1, 2m}^*$ |
| | | | | 3 | $d_{k, 2, 2m}$ | $d_{k, 2, 2m+1}$ |
| | | | | 4 | $-d_{k, 2, 2m+1}^*$ | $d_{k, 2, 2m}^*$ |
| 4 | 16–23, 39, 41, 43, 46, 48, 50 | 3 | 1 | 1 | $d_{k, 1, 2m}$ | $d_{k, 1, 2m+1}$ |
| | | | | 2 | $-d_{k, 1, 2m+1}^*$ | $d_{k, 1, 2m}^*$ |
| | | | | 3 | $d_{k, 2, 2m}$ | $d_{k, 2, 2m+1}$ |
| | | | | 4 | $d_{k, 3, 2m}$ | $d_{k, 3, 2m+1}$ |

19.3.11.10 Pilot subcarriers

In a 20 MHz transmission four pilot tones shall be inserted in the same subcarriers used in Clause 17, i.e., in subcarriers -21 , -7 , 7 , and 21 . The pilot sequence for the n^{th} symbols and i_{STS}^{th} space-time stream shall be as shown in Equation (19-54).

$$\begin{aligned} {}_{(i_{STS}, n)}^{-28,28} = & \left\{ 0, 0, 0, 0, 0, 0, 0, \Psi_{i_{STS}, n \bmod 4}^{(N_{STS})}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi_{i_{STS}, (n+1) \bmod 4}^{(N_{STS})}, 0, 0, 0, 0, 0, 0, 0, \right. \\ & \left. 0, 0, 0, 0, 0, 0, \Psi_{i_{STS}, (n+2) \bmod 4}^{(N_{STS})}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, \Psi_{i_{STS}, (n+3) \bmod 4}^{(N_{STS})}, 0, 0, 0, 0, 0, 0, 0 \right\} \end{aligned} \quad (19-54)$$

In a 40 MHz transmission (excluding MCS 32; see 19.3.11.11.5), pilot signals shall be inserted in subcarriers $-53, -25, -11, 11, 25$, and 53 . The pilot sequence for symbol n and space-time stream i_{STS} shall be as shown in Equation (19-55).

where the patterns $\Psi_{i_{STS}, n}^{(N_{STS})}$ are defined in Table 19-19 and Table 19-20.

NOTE—For each space-time stream, there is a different pilot pattern, and the pilot patterns are cyclically rotated over symbols.

The basic patterns are also different according to the total number of space-time streams for the packet.

Table 19-19—Pilot values for 20 MHz transmission

| N_{STS} | i_{STS} | $\Psi_{i_{STS}, 0}^{(N_{STS})}$ | $\Psi_{i_{STS}, 1}^{(N_{STS})}$ | $\Psi_{i_{STS}, 2}^{(N_{STS})}$ | $\Psi_{i_{STS}, 3}^{(N_{STS})}$ |
|-----------|-----------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|

19.3.11.11 OFDM modulation

19.3.11.11.1 General

The time domain signal is composed from the stream of complex numbers as shown in Equation (19-56)

$$\tilde{d}_{k, l, n}, 0 \leq k \leq N_{SD} - 1; 1 \leq l \leq N_{STS}; 0 \leq n \leq N_{SYM} - 1 \quad (19-56)$$

and from the pilot signals. In a 40 MHz transmission, the upper subcarriers are rotated 90° relative to the lower subcarriers.

19.3.11.11.2 Spatial mapping

The transmitter may choose to rotate and/or scale the constellation mapper output vector (or the space-time block coder output, if applicable). This rotation and/or scaling is useful in the following cases:

- When there are more transmit chains than space-time streams, $N_{STS} < N_{TX}$
- As part of (an optional) sounding packet
- As part of (an optional) calibration procedure
- When the packet is transmitted using one of the (optional) beamforming techniques

If the data to be transmitted on subcarrier k on space-time stream i_{STS} are $X_k^{(i_{STS})}$, the transmitted data on the transmit chain i_{TX} shall be as shown in Equation (19-57).

$$r_{Field}^{(i_{TX})} = \frac{1}{\sqrt{N_{STS} \cdot N_{Field}}} w_{T_{Field}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} [\mathcal{Q}_k]_{i_{TX}, i_{STS}} X_k^{(i_{STS})} \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{STS}})) \quad (19-57)$$

where

$[\mathcal{Q}_k]_{i_{TX}, i_{STS}}$ is the element in row i_{TX} and column i_{STS} in a matrix \mathcal{Q}_k with N_{TX} rows and N_{STS} columns;

\mathcal{Q}_k may be frequency dependent

$Field$ is any field, as defined in 19.3.7, excluding L-STF, L-LTF, L-SIG, and HT-SIG in HT_MF format PPDU

Below are examples of spatial mapping matrices that might be used. There exist many other alternatives; implementation is not restricted to the spatial mapping matrices shown. The examples are:

- a) *Direct mapping:* Q_k is a diagonal matrix of unit magnitude complex values that takes one of two forms:
 - 1) $Q_k = \mathbf{I}$, the identity matrix
 - 2) A CSD matrix in which the diagonal elements represent cyclic shifts in the time domain:
 $[Q_k]_{i,i} = \exp(-j2\pi k \Delta_F \tau_{CS}^i)$, where $\tau_{CS}^i, i = 1, \dots, N_{TX}$ represents the CSD applied.
- b) *Indirect mapping:* Q_k may be the product of a CSD matrix and a unitary matrix such as the Hadamard matrix or the Fourier matrix.
- c) *Spatial expansion:* Q_k is the product of a CSD matrix and a square matrix formed of orthogonal columns. As an illustration:
 - 1) The spatial expansion may be performed by duplicating some of the N_{STS} streams to form the N_{TX} streams, with each stream being scaled by the normalization factor $\sqrt{N_{STS}/N_{TX}}$. The spatial expansion may be performed by using, for instance, one of the following matrices, denoted D , left-multiplied by a CSD matrix, denoted $M_{CSD}(k)$, and/or possibly multiplied by any unitary matrix. The resulting spatial mapping matrix is then $Q_k = M_{CSD}(k) \cdot D$, where D may take on one of the following values:
 - i) $N_{TX}=2, N_{STS}=1, D = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 1 \end{bmatrix}^T$
 - ii) $N_{TX}=3, N_{STS}=1, D = \frac{1}{\sqrt{3}} \begin{bmatrix} 1 & 1 & 1 \end{bmatrix}^T$
 - iii) $N_{TX}=4, N_{STS}=1, D = \frac{1}{2} \begin{bmatrix} 1 & 1 & 1 & 1 \end{bmatrix}^T$
 - iv) $N_{TX}=3, N_{STS}=2, D = \frac{\sqrt{2}}{\sqrt{3}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$
 - v) $N_{TX}=4, N_{STS}=2, D = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 1 & 0 \\ 0 & 1 \end{bmatrix}$
 - vi) $N_{TX}=4, N_{STS}=3, D = \frac{\sqrt{3}}{2} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix}$
 - 2) Different spatial expansion over subcarriers should be used in HT-mixed format only and with the smoothing bit equal to 0:
 - i) $N_{TX}=2, N_{STS}=1, [Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \end{bmatrix}^T$ or $[Q_k]_{N_{STS}} = \begin{bmatrix} 0 & 1 \end{bmatrix}^T$
 - ii) $N_{TX}=3, N_{STS}=2, [Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$ or $\begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix}$

$$\text{iii) } N_{TX}=4, N_{STS}=2, [Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix}, \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{bmatrix} \text{ or } \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}$$

$$\text{iv) } N_{TX}=4, N_{STS}=3, [Q_k]_{N_{STS}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \text{ or } \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

- d) *Beamforming steering matrix:* Q_k is any matrix that improves the reception in the receiver based on some knowledge of the channel between the transmitter and the receiver. With transmit beamforming with explicit feedback, the steering matrix Q_k is determined using either H_{eff} for CSI feedback or V_k for noncompressed and compressed matrices feedback from the STA to which the beamformed packet is addressed.

When there are fewer space-time streams than transmit chains, the first N_{STS} columns of the matrices above that are square might be used.

The same matrix Q_k shall be applied to subcarrier k during all parts of the packet in HT-greenfield format and all parts of the packet following and including the HT-STF field in an HT-mixed format packet. This operation is transparent to the receiver.

If at least 95% of the sum of the energy from all impulse responses of the time domain channels between all space-time streams and all transmit chain inputs, induced by the CSD added according to Table 19-10 and the frequency-dependence in the matrix Q_k , is contained within 800 ns, the smoothing bit should be set to 1. Otherwise, it shall be set to 0.

The CSD of Table 19-10 shall be applied at the input of the spatial mapper.

For the identity matrix direct mapping, the smoothing bit should be set to 1.

If no spatial mapping is applied, the matrix Q_k is equal to the identity matrix and $N_{STS} = N_{TX}$.

Sounding PPDUs using spatial expansion shall use an orthonormal column matrix Q_k . When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

19.3.11.11.3 Transmission in 20 MHz HT format

For 20 MHz HT transmissions, the signal from transmit chain i_{TX} , $1 \leq i_{TX} \leq N_{TX}$ shall be as shown in Equation (19-58).

$$\begin{aligned}
 r_{HT-DATA}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{STS} \cdot N_{HT-DATA}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} ([Q_k]_{i_{TX}, i_{STS}} (\tilde{D}_{k, i_{STS}, n} + p_{n+z} P_{(i_{STS}, n)}^k) \\
 & \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))
 \end{aligned} \tag{19-58}$$

where

$$\begin{aligned}
 z & \text{ is 3 in an HT-mixed format packet and 2 in an HT-greenfield format packet} \\
 p_n & \text{ is defined in 17.3.5.10} \\
 \tilde{D}_{k, i_{STS}, n} & = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ \tilde{d}_{M^r(k), i_{STS}, n}, \text{ otherwise} \end{cases} \\
 M^r(k) & = \begin{cases} k + 28, -28 \leq k \leq -22 \\ k + 27, -20 \leq k \leq -8 \\ k + 26, -6 \leq k \leq -1 \\ k + 25, 1 \leq k \leq 6 \\ k + 24, 8 \leq k \leq 20 \\ k + 23, 22 \leq k \leq 28 \end{cases} \\
 P_{(i_{STS}, n)}^k & \text{ is defined in Equation (19-54)}
 \end{aligned}$$

19.3.11.11.4 Transmission in 40 MHz HT format

For 40 MHz HT transmissions, the signal from transmit chain i_{TX} shall be as shown in Equation (19-59).

$$\begin{aligned}
 r_{HT-DATA}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{STS} \cdot N_{HT-DATA}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{i_{STS}=1}^{N_{STS}} ([Q_k]_{i_{TX}, i_{STS}} (\tilde{D}_{k, i_{STS}, n} + p_{n+z} P_{(i_{STS}, n)}^k) \Upsilon_k \\
 & \cdot \exp(j2\pi k \Delta_F (t - nT_{SYM} - T_{GI} - T_{CS}^{i_{STS}})))
 \end{aligned} \tag{19-59}$$

where

$$\begin{aligned}
 z & \text{ is 3 in an HT-mixed format packet and 2 in an HT-greenfield format packet} \\
 p_n & \text{ is defined in 17.3.5.10}
 \end{aligned}$$

$$\tilde{D}_{k, i_{STS}, n} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M^r(k), i_{STS}, n}, \text{ otherwise} \end{cases}$$

$$M^r(k) = \begin{cases} k + 58, -58 \leq k \leq -54 \\ k + 57, -52 \leq k \leq -26 \\ k + 56, -24 \leq k \leq -12 \\ k + 55, -10 \leq k \leq -2 \\ k + 52, 2 \leq k \leq 10 \\ k + 51, 12 \leq k \leq 24 \\ k + 50, 26 \leq k \leq 52 \\ k + 49, 54 \leq k \leq 58 \end{cases}$$

$P_{(i_{STS}, n)}^k$ is defined in Equation (19-55)

NOTE—The 90° rotation that is applied to the upper part of the 40 MHz channel is applied in the same way to the HT-STF, HT-LTF, and HT-SIG. The rotation applies to both pilots and the data in the upper part of the 40 MHz channel.

19.3.11.11.5 Transmission in MCS 32 format

MCS 32 format provides the lowest transmission rate in 40 MHz. It is used only for one spatial stream and only with BPSK modulation and rate 1/2 coding.

In the MCS 32 format, the signal shall be as shown in Equation (19-60).

$$r_{HT-DATA}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{HT-Duplicate}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t-nT_{SYM}) \cdot \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,n} + p_{n+z}P_k)([Q_{k-32}]_{i_{TX},1} \exp(j2\pi(k-32)\Delta_F(t-nT_{SYM}-T_{GI})) + j[Q_{k+32}]_{i_{TX},1} \exp(j2\pi(k+32)\Delta_F(t-nT_{SYM}-T_{GI}))) \quad (19-60)$$

where

z is defined in 19.3.11.11.3

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in 19.3.9.4.3

N_{SR} has the value defined for non-HT 20 MHz transmission

$[Q_k]_{i_{TX},1}$ is an element from a vector of length N_{TX} , which may be frequency dependent

$N_{HT-Duplicate}^{Tone}$ is defined in Table 19-8

The rules of spatial expansion CSD limitation, as specified in 19.3.11.11.2, shall apply to $[Q_k]_{i_{TX},1}$.

19.3.11.11.6 Transmission with a short GI

Short GI is used in the data field of the packet when the Short GI field in the HT-SIG is equal to 1. When it is used, the same formula for the formation of the signal shall be used as in 19.3.11.11.3, 19.3.11.11.4, and 19.3.11.11.5, with T_{GI} replaced by T_{GIS} and T_{SYM} replaced by T_{SYMS} .

NOTE—Short GI is not used in HT-greenfield format with one spatial stream, in which case the HT-SIG is immediately followed by data. It is very difficult to parse the HT-SIG in time to demodulate these data with the correct GI length if the GI length is not known in advance.

19.3.11.12 Non-HT duplicate transmission

Non-HT duplicate transmission is used to transmit to Clause 17 STAs, Clause 18 STAs, and Clause 19 STAs that may be present in either the upper or lower halves of the 40 MHz channel. The L-STF, L-LTF, and L-SIG shall be transmitted in the same way as in the HT 40 MHz transmission. The HT-SIG, HT-STF, and HT-LTF are not transmitted. Data transmission shall be as defined in Equation (19-61).

$$\begin{aligned}
 r_{LEG-DUP}^{i_{TX}}(t) = & \frac{1}{\sqrt{N_{Non-HT\,Duplicate}^{Tone}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t-nT_{SYM}) \\
 & \cdot \sum_{k=-26}^{26} (D_{k,n} + p_{n+1}P_k)(\exp(j2\pi(k-32)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}^{i_{TX}})) \\
 & + j\exp(j2\pi(k+32)\Delta_F(t-nT_{SYM}-T_{GI}-T_{CS}^{i_{TX}})))
 \end{aligned} \tag{19-61}$$

where

- P_k and p_n are defined in 17.3.5.10
- $D_{k,n}$ is defined in 19.3.9.4.3
- $T_{CS}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in Table 19-9
- $N_{Non-HT\,Duplicate}^{Tone}$ is defined in Table 19-8

19.3.12 Beamforming

19.3.12.1 General

Beamforming is a technique in which the beamformer utilizes the knowledge of the MIMO channel to generate a steering matrix \mathcal{Q}_k that improves reception in the beamformee.

The equivalent complex baseband MIMO channel model is one in which, when a vector $\mathbf{x}_k = [x_1, x_2, \dots, x_{N_{Tx}}]^T$ is transmitted in subcarrier k , the received vector $\mathbf{y}_k = [y_1, y_2, \dots, y_{N_{Rx}}]^T$ is modeled as shown in Equation (19-62).

$$\mathbf{y}_k = H_k \mathbf{x}_k + \mathbf{n} \tag{19-62}$$

where

- H_k is channel matrix of dimensions $N_{RX} \times N_{TX}$
- \mathbf{n} is white (spatially and temporally) Gaussian noise as illustrated in Figure 19-14

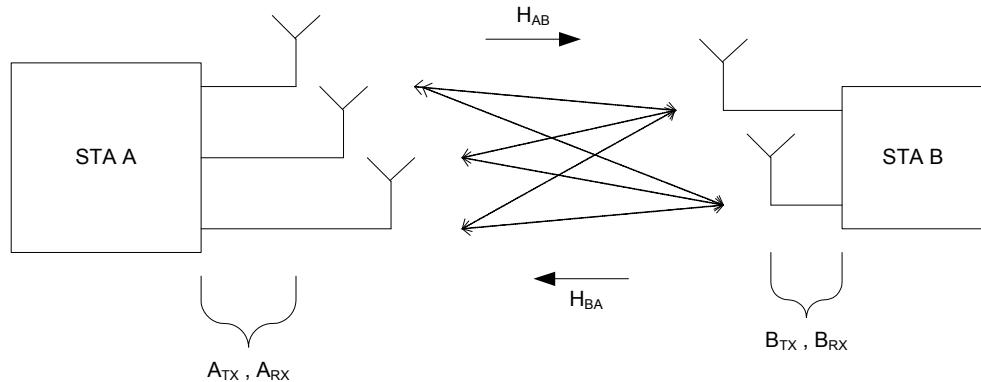

Figure 19-14—Beamforming MIMO channel model (3x2 example)

When beamforming is used, the beamformer replaces \mathbf{x}_k , which in this case has $N_{STS} \leq N_{TX}$ elements, with $Q_k \mathbf{x}_k$, where Q_k has N_{TX} rows and N_{STS} columns, so that the received vector is as shown in Equation (19-63).

$$\mathbf{y}_k = H_k Q_k \mathbf{x}_k + \mathbf{n} \quad (19-63)$$

The beamforming steering matrix that is computed (or updated) from a new channel measurement replaces the existing Q_k for the next beamformed data transmission. There are several methods of beamforming, differing in the way the beamformer acquires the knowledge of the channel matrices H_k and on whether the beamformer generates Q_k or the beamformee provides feedback information for the beamformer to generate Q_k .

19.3.12.2 Implicit feedback beamforming

Implicit feedback beamforming is a technique that relies on reciprocity in the time division duplex channel to estimate the channel over which a device is transmitting based on the MIMO reference that is received from the device to which it plans to transmit. This technique allows the transmitting device to calculate a set of transmit steering matrices, Q_k , one for each subcarrier, which are intended to optimize the performance of the link.

Referring to Figure 19-14, beamforming transmissions from STA A to STA B using implicit techniques are enabled when STA B sends STA A a sounding PPDU, the reception of which allows STA A to form an estimate of the MIMO channel from STA B to STA A, for all subcarriers. In a TDD channel in which the forward and reverse channels are reciprocal, the channel from STA A to STA B in subcarrier k is the matrix transpose of the channel from STA B to STA A in subcarrier k to within a complex scaling factor, i.e., $H_{AB,k} = \rho [H_{BA,k}]^T$. Here $H_{AB,k}$ is the MIMO channel matrix from STA A to STA B at subcarrier k , and

$H_{BA,k}$ is the channel matrix from STA B to STA A at subcarrier k . STA A uses this relationship to compute transmit steering matrices that are suitable for transmitting to STA B over $H_{AB,k}$.

NOTE—In order for the recipient of the sounding to compute steering matrices when steered or unsteered sounding is used, the steering matrices need to have the property $(H_k Q_k)(H_k Q_k)^H = H_k H_k^H$, where X^H indicates the conjugate transpose of the matrix X .

While the over-the-air channel between the antenna(s) at one STA and the antenna(s) at a second STA is reciprocal, the observed baseband-to-baseband channel used for communication might not be, as it includes the transmit and receive chains of the STAs. Differences in the amplitude and phase characteristics of the transmit and receive chains associated with individual antennas degrade the reciprocity of the over-the-air channel and cause degradation of performance of implicit beamforming techniques. The over-the-air calibration procedure described in 10.32.2.4 may be used to restore reciprocity. The procedure provides the means for calculating a set of correction matrices that can be applied at the transmit side of a STA to correct the amplitude and phase differences between the transmit and receive chains in the STA. If this correction is done at least at the STA that serves as the beamformer, there is sufficient reciprocity for implicit feedback in the baseband-to-baseband response of the forward link and reverse channel.

Figure 19-15 illustrates the observed baseband-to-baseband channel, including reciprocity correction. Spatial mapping matrices $Q_{A,k}$ and $Q_{B,k}$ are assumed to be identity matrices here for simplicity of illustration.

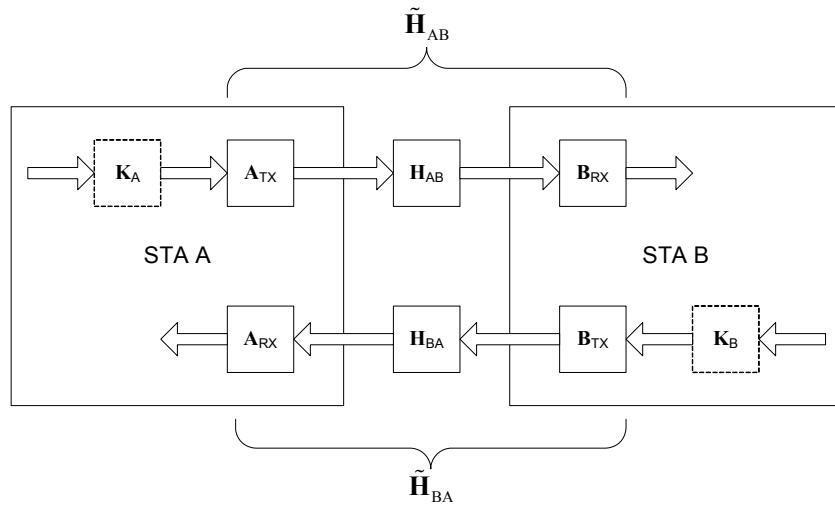

Figure 19-15—Baseband-to-baseband channel

NOTE—Spatial mapping matrix for sounding PPDUs are specified in 19.3.13.3.

The amplitude and phase responses of the transmit and receive chains can be expressed as diagonal matrices with complex valued diagonal entries, of the form $A_{TX,k}$ and $A_{RX,k}$ at STA A. The relationship between the baseband-to-baseband channel, $\tilde{H}_{AB,k}$, and the over-the-air channel, $H_{AB,k}$, is shown in Equation (19-64).

$$\tilde{H}_{AB,k} = B_{RX,k} H_{AB,k} A_{TX,k} \quad (19-64)$$

Similarly, the relationship between $\tilde{H}_{BA,k}$ and $H_{BA,k}$ is shown in Equation (19-65).

$$\tilde{H}_{BA,k} = A_{RX,k} H_{BA,k} B_{TX,k} \quad (19-65)$$

As an example, consider the case where calibration is performed at both STA A and STA B. The objective is to compute correction matrices, $K_{A,k}$ and $K_{B,k}$, that restore reciprocity so that Equation (19-66) is true.

$$\tilde{H}_{AB,k} K_{A,k} = \rho [\tilde{H}_{BA,k} K_{B,k}]^T \quad (19-66)$$

The correction matrices are diagonal matrices with complex valued diagonal entries. The reciprocity condition in Equation (19-66) is enforced when Equation (19-67) and Equation (19-68) are true.

$$K_{A,k} = \alpha_{A,k} [A_{TX,k}]^{-1} A_{RX,k} \quad (19-67)$$

and

$$K_{B,k} = \alpha_{B,k} [B_{TX,k}]^{-1} B_{RX,k} \quad (19-68)$$

where $\alpha_{A,k}$ and $\alpha_{B,k}$ are complex valued scaling factors.

Using these expressions for the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-69).

$$\hat{H}_{AB,k} = \tilde{H}_{AB,k} K_{A,k} = \alpha_{A,k} B_{RX,k} H_{AB,k} A_{RX,k} \quad (19-69)$$

If both sides apply the correction matrices, the calibrated baseband-to-baseband channel between STA A and STA B is expressed as shown in Equation (19-70).

$$\hat{H}_{BA,k} = \alpha_{B,k} A_{RX,k} H_{BA,k} B_{RX,k} = \frac{\alpha_{B,k}}{\alpha_{A,k}} [\hat{H}_{AB,k}]^T \quad (19-70)$$

Focusing on STA A, the procedure for estimating $K_{A,k}$ is as follows:

- a) STA A sends STA B a sounding PPDU, the reception of which allows STA B to estimate the channel matrices $\tilde{H}_{AB,k}$.
- b) STA B sends STA A a sounding PPDU, the reception of which allows STA A to estimate the channel matrices $\tilde{H}_{BA,k}$.
- c) STA B sends the quantized estimates of $\tilde{H}_{AB,k}$ to STA A.
- d) STA A uses its local estimates of $\tilde{H}_{BA,k}$ and the quantized estimates of $\tilde{H}_{AB,k}$ received from STA B to compute the correction matrices $K_{A,k}$.

NOTE—When a nonidentity matrix is used for $Q_{A,k}$, STA A is responsible for accounting for the spatial mapping in its local channel estimate as well as in the quantized CSI fed back since the channel feedback received in step c) is actually $\tilde{H}_{AB,k} Q_{A,k}$ and not $\tilde{H}_{AB,k}$. Furthermore, since $Q_{B,k}$ is defined in 19.3.13.3, additional steps might be taken in STA A to remove the effect of $Q_{B,k}$ when computing the correction matrix $K_{A,k}$.

Steps a) and b) occur over a short time interval to so the channel changes as little as possible between measurements. A similar procedure is used to estimate $K_{B,k}$ at STA B. The details of the computation of the correction matrices is implementation specific and beyond the scope of this standard.

19.3.12.3 Explicit feedback beamforming

19.3.12.3.1 General

In explicit beamforming, in order for STA A to transmit a beamformed packet to STA B, STA B measures the channel matrices and sends STA A either the effective channel, $H_{eff,k}$, or the beamforming feedback matrix, V_k , for STA A to determine a steering matrix, $Q_{steer,k} = Q_k V_k$, with V_k found from $H_k Q_k$, where Q_k is the orthonormal spatial mapping matrix that was used to transmit the sounding packet that elicited the V_k feedback. The effective channel, $H_{eff,k} = H_k Q_k$, is the product of the spatial mapping matrix used on transmit with the channel matrix. When new steering matrix $Q_{steer,k}$ is found, $Q_{steer,k}$ may replace Q_k for the next beamformed data transmission.

NOTE— $Q_{steer,k}$ is a mathematical term to update a new steering matrix for Q_k in the next beamformed data transmission.

19.3.12.3.2 CSI matrices feedback

In CSI matrices feedback, the beamformer receives the quantized MIMO channel matrix, H_{eff} , from the beamformee. The beamformer then may use this matrix to compute a set of transmit steering matrices, Q_k . The CSI matrix, H_{eff} , shall be determined from the transmitter spatial mapper input to the receiver FFT outputs. The beamformee shall remove the CSD in Table 19-10 from the measured channel matrix.

The matrices $H_{eff}(k)$, where k is the subcarrier index, are encoded so that applying the procedure in 19.3.12.3.3 optimally reconstructs the matrix.

19.3.12.3.3 CSI matrices feedback decoding procedure

The received, quantized matrix $H_{eff}^q(k)$ (of a specific subcarrier, k) shall be decoded as follows:

- a) The real and imaginary parts of each element of the matrix, $H_{eff(m,l)}^{q(R)}(k)$ and $H_{eff(m,l)}^{q(I)}(k)$, are decoded as a pair of 2s complement numbers to create the complex element, where $1 \leq m \leq N_r$ and $1 \leq l \leq N_c$.
- b) Each element in the matrix of subcarrier k is then scaled using the value in the carrier matrix amplitude field (3 bits), $M_H(k)$, interpreted as a positive integer, in decibels, as follows:
 - 1) Calculate the linear value as defined in Equation (19-71).
 - 2) Calculate decoded values of the real and imaginary parts of the matrix element as defined in Equation (19-72) and Equation (19-73).

$$r(k) = 10^{M_H(k)/20} \quad (19-71)$$

$$\operatorname{Re}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H_{eff(m,l)}^{q(R)}(k)}{r(k)} \quad (19-72)$$

$$\operatorname{Im}\{\tilde{H}_{eff(m,l)}(k)\} = \frac{H_{eff(m,l)}^{q(I)}(k)}{r(k)} \quad (19-73)$$

19.3.12.3.4 Example of CSI matrices feedback encoding

The following is an example of an encoding process:

- a) The maximums of the real and imaginary parts of each element of the matrix in each subcarrier are found, as defined by Equation (19-74).

$$m_H(k) = \max \left\{ \max \left\{ \left| \operatorname{Re}(H_{eff(m,l)}(k)) \right|_{m=1, l=1}^{m=N_r, l=N_c}, \left| \operatorname{Im}(H_{eff(m,l)}(k)) \right|_{m=1, l=1}^{m=N_r, l=N_c} \right\} \right\} \quad (19-74)$$

- b) The scaling ratio is calculated and quantized to 3 bits as defined by Equation (19-75). A linear scaler is given by Equation (19-76).

$$M_H(k) = \min \left\{ 7, \left\lfloor 20 \log_{10} \left(\frac{\max \{ m_H(z) \}_{z=-N_{SR}}^{z=N_{SR}}}{m_H(k)} \right) \right\rfloor \right\} \quad (19-75)$$

where

$$M_H^{\text{lin}}(k) = \frac{\max \{ m_H(z) \}_{z=-N_{SR}}^{z=N_{SR}}}{10^{M_H(k)/20}} \quad (19-76)$$

- c) The real and imaginary parts of each element in the matrix $H_{eff(m,l)}(k)$ are quantized to N_b bits in 2s complement encoding as defined by Equation (19-77) and Equation (19-78).

$$H_{eff(m,l)}^{q(R)}(k) = \left\lfloor \frac{\operatorname{Re}\{ H_{eff(m,l)}(k) \}}{M_H^{\text{lin}}(k)} (2^{N_b-1} - 1) + 0.5 \right\rfloor \quad (19-77)$$

$$H_{eff(m,l)}^{q(I)}(k) = \left\lfloor \frac{\operatorname{Im}\{ H_{eff(m,l)}(k) \}}{M_H^{\text{lin}}(k)} (2^{N_b-1} - 1) + 0.5 \right\rfloor \quad (19-78)$$

Each matrix is encoded using $3 + 2 \times N_b \times N_r \times N_c$ bits, where N_r and N_c are the number of rows and columns, respectively, in the channel matrix estimate computed by the receiving station and where N_b may have the value of 4, 5, 6, or 8 bits.

19.3.12.3.5 Noncompressed beamforming feedback matrix

In noncompressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are sent to the beamformer in the order of real and imaginary components per tone as specified in 9.4.1.29. The beamformer might use these matrices to determine the steering matrices, Q_k .

The beamformee shall encode the matrices $V(k)$ so a beamformer applying the procedure below optimally reconstructs the matrix.

The received matrix $V^q(k)$ (of a specific subcarrier k) shall be decoded as follows:

- a) The real and imaginary parts of each element of the matrix, $V_{m,l}^{q,R}$ and $V_{m,l}^{q,I}$, shall be decoded as a pair of 2s complement numbers to create the complex element, where $1 \leq m \leq N_r$ and $1 \leq l \leq N_c$.
- b) The dimensions of the beamforming feedback matrices are $N_r \times N_c$, where N_r and N_c are the number of rows and columns, respectively, in the beamforming feedback matrix computed by the receiving station. Each matrix is encoded using $2 \times N_b \times N_r \times N_c$ bits. N_b may have the value of 2, 4, 6, or 8 bits.
- c) Columns $1 \dots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \dots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5. A transmitter shall not reorder the columns of the beamforming feedback matrices.

19.3.12.3.6 Compressed beamforming feedback matrix

In compressed beamforming feedback matrix, the beamformee shall remove the space-time stream CSD in Table 19-10 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrices, $V(k)$, found by the beamformee are compressed in the form of angles, which are sent to the beamformer. The beamformer might use these angles to decompress the matrices and determine the steering matrices Q_k .

The matrix V per tone shall be compressed as follows: The $N_r \times N_c$ beamforming feedback orthonormal column matrix V found by the beamformee shall be represented as shown in Equation (19-79). When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix.

$$V = \left[\prod_{i=1}^{\min(N_c, N_r-1)} \left[D_i \begin{pmatrix} 1_{i-1} & e^{j\phi_{i,i}} & \dots & e^{j\phi_{N_r-1,i}} & 1 \end{pmatrix} \prod_{l=i+1}^{N_r} G_{li}^T(\psi_{li}) \right] \tilde{I}_{N_r \times N_c} \right] \quad (19-79)$$

The matrix $D_i \begin{pmatrix} 1_{i-1} & e^{j\phi_{i,i}} & \dots & e^{j\phi_{N_r-1,i}} & 1 \end{pmatrix}$ is an $N_r \times N_r$ diagonal matrix, where 1_{i-1} represents a sequence of 1s with length of $i-1$, as shown in Equation (19-80).

$$D \begin{pmatrix} 1_{i-1} & e^{j\phi_{i,i}} & \dots & e^{j\phi_{N_r-1,i}} & 1 \end{pmatrix} = \begin{bmatrix} I_{i-1} & 0 & \dots & \dots & 0 \\ 0 & e^{j\phi_{i,i}} & 0 & \dots & 0 \\ \vdots & 0 & \ddots & 0 & 0 \\ \vdots & \vdots & 0 & e^{j\phi_{N_r-1,i}} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \quad (19-80)$$

The matrix $G_{li}(\psi)$ is an $N_r \times N_r$ Givens rotation matrix as shown in Equation (19-81).

$$G_{li}(\psi) = \begin{bmatrix} I_{i-1} & 0 & 0 & 0 & 0 \\ 0 & \cos(\psi) & 0 & \sin(\psi) & 0 \\ 0 & 0 & I_{l-i-1} & 0 & 0 \\ 0 & -\sin(\psi) & 0 & \cos(\psi) & 0 \\ 0 & 0 & 0 & 0 & I_{N_r-l} \end{bmatrix} \quad (19-81)$$

where each I_m is an $m \times m$ identity matrix, and $\cos(\psi)$ and $\sin(\psi)$ are located at row l and column i . $\tilde{I}_{N_r \times N_c}$ is an identity matrix padded with 0s to fill the additional rows or columns when $N_r \neq N_c$.

For example, a 4×2 V matrix has the representation shown in Equation (19-82).

$$V = \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & e^{j\phi_{21}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{31}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} \cos\psi_{41} & 0 & 0 & \sin\psi_{41} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{41} & 0 & 0 & \cos\psi_{41} \end{bmatrix}^T \\ \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{32}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{42} & 0 & \sin\psi_{42} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{42} & 0 & \cos\psi_{42} \end{bmatrix}^T \times \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \quad (19-82)$$

The procedure for finding a compressed V matrix is described as follows:

A $N_r \times N_c$ beamforming feedback orthonormal column matrix V is column-wise phase invariant because the steering matrix needs a reference in phase per each column. When the number of rows and columns is equal, the orthonormal column matrix becomes a unitary matrix. In other words, V is equivalent to $\tilde{V}\tilde{D}$,

where \tilde{D} is a column-wise phase shift matrix such as $\tilde{D} = \text{diag}(e^{j\theta_1}, e^{j\theta_2}, \dots, e^{j\theta_{N_r}})$. When the beamformee estimates the channel, it may find \tilde{V} for the beamforming feedback matrix for the beamformer, but it should send $\tilde{V}\tilde{D}$ back to the beamformer, where $V = \tilde{V}\tilde{D}$. The angle, θ_i , in \tilde{D} is found to make the last row of $\tilde{V}\tilde{D}$ to be non-negative real numbers.

The angles $\phi_{1,1} \dots \phi_{N_r-1,1}$ in the diagonal matrix $D_1(e^{j\phi_{11}} \dots e^{j\phi_{N_r-1,1}} 1)^*$ shall satisfy the constraint that all elements in the first column of D_1^*V are non-negative real numbers. Now, the first column of $(G_{N_r,1} \dots G_{31}G_{21}D_1^*) \times V$ can be $[1 \ 0 \ \dots \ 0]^T$ by the Givens rotations G_{11} such as shown in Equation (19-83).

$$\begin{bmatrix} \cos\psi_{N_r,1} & 0 & 0 & \sin\psi_{N_r,1} \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -\sin\psi_{N_r,1} & 0 & 0 & \cos\psi_{N_r,1} \end{bmatrix} \dots \begin{bmatrix} \cos\psi_{31} & 0 & \sin\psi_{31} & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\psi_{31} & 0 & \cos\psi_{31} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos\psi_{21} & \sin\psi_{21} & 0 & 0 \\ -\sin\psi_{21} & \cos\psi_{21} & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} e^{j\phi_{11}} & 0 & 0 & 0 \\ 0 & \ddots & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,1}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \ddots & & \\ 0 & 0 & V_2 & \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (19-83)$$

For a new $(N_r-1) \times (N_c-1)$ submatrix V_2 , this process is applied in the same way. Then, the angles

$\phi_{2,2} \dots \phi_{N_r-1,2}$ in the diagonal matrix $D_2(1 \ e^{j\phi_{22}} \dots e^{j\phi_{N_r-1,2}} 1)^*$ shall satisfy the constraint that all

elements in the second column of $D_2^* \times \text{diag}(1, V_2)$ are non-negative real numbers. Now, the first two columns of $(G_{N_r,2} \dots G_{32} D_2^*)(G_{N_r,1} \dots G_{31} G_{21} D_1^*) \times V$ can be $\tilde{I}_{N_r \times 2}$ by the Givens rotations G_{l2} such as shown in Equation (19-84).

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{N_r,2} & 0 & \sin\psi_{N_r,2} \\ 0 & 0 & 1 & 0 \\ 0 & -\sin\psi_{N_r,2} & 0 & \cos\psi_{N_r,2} \end{bmatrix} \dots \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\psi_{32} & \sin\psi_{32} & 0 \\ 0 & -\sin\psi_{32} & \cos\psi_{32} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & e^{j\phi_{22}} & 0 & 0 \\ 0 & 0 & e^{j\phi_{N_r-1,2}} & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}^* \times G_{N_r,1} \dots G_{31} G_{21} D_1^* \times V = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & V_3 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad (19-84)$$

This process continues until the first N_c columns of the right side matrix become $\tilde{I}_{N_r \times N_c}$. When $N_c < N_r$, this process does not need to continue because V_{N_c+1} is nulled out by $\tilde{I}_{N_r \times N_c}$. Then, by multiplying the complex conjugate transpose of the products of the D_i and G_{li} matrices on the left, V can be expressed as shown in Equation (19-85).

$$V = D_1 G_{21}^T G_{31}^T \dots G_{N_r,1}^T \times D_2 G_{32}^T G_{42}^T \dots G_{N_r,2}^T \times \dots \times D_p G_{p+1,p}^T G_{p+2,p}^T \dots G_{N_r,p}^T \times \tilde{I}_{N_r \times N_c} \quad (19-85)$$

where $p = \min(N_c, N_r - 1)$, which can be written in short form as in Equation (19-79).

The angles found from the decomposition process above, e.g., the values of $\psi_{i,j}$ and $\phi_{k,l}$, are quantized as described in 9.6.12.8.

Columns $1 \dots N_c$ of the beamforming feedback matrix correspond to spatial streams $1 \dots N_c$, respectively. The mapping of spatial stream to modulation is defined in the MCS tables in 19.5. A transmitter shall not reorder the columns of the beamforming feedback matrices in determining steering matrices.

19.3.13 HT Preamble format for sounding PPDUs

19.3.13.1 General

The MIMO channel measurement takes place in every PPDUs as a result of transmitting the HT-LTFs as part of the PHY preamble. The number of HT-LTFs transmitted shall be determined by the number of space-time streams transmitted unless additional dimensions are optionally sounded using HT-ELTFs and these are transmitted using the same spatial transformation that is used for the Data field of the HT PPDUs. The use of the same spatial transformation enables the computation of the spatial equalization at the receiver.

When the number of space-time streams, N_{STS} , is less than the number of transmit antennas, or less than $\min(N_{TX}, N_{RX})$, sending only N_{STS} HT-LTFs does not allow the receiver to recover a full characterization of the MIMO channel, even though the resulting MIMO channel measurement is sufficient for receiving the Data field of the HT PPDUs.

However, it is often desirable to obtain as full a characterization of the channel as possible. This involves the transmission of a sufficient number of HT-LTFs to sound the full dimensionality of the channel, which is in some cases N_{TX} and in other cases $\min(N_{TX}, N_{RX})$. These cases of MIMO channel measurement are referred to as *MIMO channel sounding*. A sounding packet may be used to sound available channel dimensions. A sounding PPDUs is identified by setting the Not Sounding field in the HT-SIG to 0. A sounding PPDUs may have any allowed number of HT-LTFs satisfying $N_{HT-LTF} \geq N_{STS}$. In general, if the

Not Sounding field in the HT-SIG is equal to 0 and $N_{HT-LTF} > N_{STS}$, HT-ELTFs are used, except where $N_{SS} = 3$ and $N_{HT-LTF} = 4$ or in an NDP.

19.3.13.2 Sounding with a NDP

A STA may sound the channel using a NDP (indicated by the HT Length field in the HT-SIG equal to 0) with the Not Sounding field equal to 0. The number of LTFs is the number implied by the MCS, which shall indicate two or more spatial streams. The last HT-LTF of an NDP shall not be followed by a Data field (see Figure 19-16).

It is optional for a STA to process an NDP.

Figure 19-16—Example of an NDP used for sounding

19.3.13.3 Sounding PPDUs for calibration

In the case of a bidirectional calibration exchange, two STAs exchange sounding PPDUs, the exchange of which enables the receiving STA to compute an estimate of the MIMO channel matrix H_k for each subcarrier k . In general, in an exchange of calibration messages, the number of spatial streams is less than the number of transmit antennas. In such cases, HT-ELTFs are used. In the case of sounding PPDUs for calibration, the antenna mapping matrix shall be as shown in Equation (19-86).

$$Q_k = C_{CSD}(k)P_{CAL} \quad (19-86)$$

where

$C_{CSD}(k)$ is a diagonal cyclic shift matrix in which the diagonal elements carry frequency domain representation of the cyclic shifts given in Table 19-9

P_{CAL} is one of the following unitary matrices:

For $N_{TX} = 1$, $P_{CAL} = 1$

$$\text{For } N_{TX} = 2, P_{CAL} = \frac{\sqrt{2}}{2} \begin{bmatrix} 1 & -1 \\ 1 & 1 \end{bmatrix}$$

$$\text{For } N_{TX} = 3, P_{CAL} = \frac{\sqrt{3}}{3} \begin{bmatrix} 1 & 1 & 1 \\ 1 & e^{-j2\pi/3} & e^{-j4\pi/3} \\ 1 & e^{-j4\pi/3} & e^{-j2\pi/3} \end{bmatrix}$$

$$\text{For } N_{TX} = 4, P_{CAL} = \frac{1}{2} \begin{bmatrix} 1 & -1 & 1 & 1 \\ 1 & 1 & -1 & 1 \\ 1 & 1 & 1 & -1 \\ -1 & 1 & 1 & 1 \end{bmatrix}$$

19.3.13.4 Sounding PPDU for channel quality assessment

In response to the reception of an MRQ, sent by STA A to STA B, the responding STA B returns to the requesting STA A an MCS selection that STA B determines to be a suitable MCS for STA A to use in subsequent transmissions to STA B. In determining the MCS, STA B performs a channel quality assessment, which entails using whatever information STA B has about the channel, such as an estimate of the MIMO channel derived from the sounding PPDU that carries the MRQ. To enable this calculation, the MRQ is sent in conjunction with a sounding PPDU.

The STA sending the MRQ (STA A) determines how many HT-LTFs to send, and whether to use HT-ELTFs or an NDP, based on the Transmit Beamforming Capabilities field, number of space-time streams used in the PPDU carrying the MRQ, the number of transmit chains it is using (N_{TX}), whether the transmit and receive STAs support STBC, and in some cases, the number of receive chains at the responding STA (N_{RX}).

The maximum number of available space-time streams is set by the number of transmit and receive chains and the STBC capabilities of the transmitter and receiver, as is shown in Table 19-21. While the number of receive chains is not communicated in a capabilities indicator, the maximum number of space-time streams supported may be inferred from the MCS capabilities and the STBC capabilities of the receiving STA. When the number of receive chains is known at the transmitter, the number of HT-LTFs sent to obtain a full channel quality assessment is determined according to the maximum number of space-time streams indicated in Table 19-21. The number of HT-LTFs to use in conjunction with the indicated number of space-time streams is determined according to 19.3.9.4.6.

Table 19-21—Maximum available space-time streams

| N_{TX} | N_{RX} | $N_{STS, \max}$ without STBC | $N_{STS, \max}$ with STBC |
|----------|----------|---------------------------------|------------------------------|
| 1 | 1 | 1 | N/A |
| 2 | 1 | 1 | 2 |
| 3 | 1 | 1 | 2 |
| 3 | 2 | 2 | 3 |
| 4 | 1 | 1 | 2 |
| 4 | 2 | 2 | 4 |

If the requesting STA A sends an MRQ in a PPDU that uses fewer space-time streams in the data portion than the maximum number of space-time streams possible given the number of antennas at STA A and the responding STA B, the channel quality assessment made by STA B may be based on the HT-DLTFs alone. In this case, the MFB is limited to MCSs using the number of streams used in the Data field of the HT PPDU, or fewer. To determine whether an MCS should be chosen that uses more spatial streams than the PPDU containing the MRQ, it is necessary for the requesting STA A to either use HT-ELTFs (i.e., send the MRQ in a staggered sounding PPDU) or use an NDP (i.e., send the MRQ in conjunction with an NDP).

The sounding PPDU may have nonidentity spatial mapping matrix Q_k . For different receiving STAs, Q_k may vary.

19.3.14 Regulatory requirements

Wireless LANs (WLANS) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

19.3.15 Channel numbering and channelization

19.3.15.1 General

The STA may operate in the 5 GHz band and/or 2.4 GHz band. When using 20 MHz channels, it uses channels defined in 17.3.8.4 (5 GHz band) or 16.3.6 (2.4 GHz band). When using 40 MHz channels, it can operate in the channels defined in 19.3.15.2 and 19.3.15.3.

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

19.3.15.2 Channel allocation in the 2.4 GHz Band

Channel center frequencies are defined at every integer multiple of 5 MHz in the 2.4 GHz band. The relationship between center frequency and channel number is given by Equation (19-87).

$$\text{Channel center frequency} = 2407 + 5 \times n_{ch} (\text{MHz}) \quad (19-87)$$

where

$$n_{ch} = 1, 2, \dots, 13$$

19.3.15.3 Channel allocation in the 5 GHz band

Channel center frequencies are defined at every integer multiple of 5 MHz above 5 GHz. The relationship between center frequency and channel number is given in Equation (19-88).

$$\text{Channel center frequency} = \text{Channel starting frequency} + 5 \times n_{ch} (\text{MHz}) \quad (19-88)$$

where

$$n_{ch} = 1, \dots, 200$$

Channel starting frequency is defined as $\text{dot11ChannelStartingFactor} \times 500 \text{ kHz}$ or is defined as 5.000 GHz for systems where $\text{dot11OperatingClassesRequired}$ is false or not defined. A channel center frequency of 5.000 GHz shall be indicated by $\text{dot11ChannelStartingFactor} = 8000$ and $n_{ch} = 200$.

19.3.15.4 40 MHz channelization

The set of valid operating channel numbers by regulatory domain is defined in Annex E.

The 40 MHz channels are specified by two fields: (*Nprimary_ch*, *Secondary*). The first field represents the channel number of the primary channel, and the second field indicates whether the secondary channel is above or below the primary channel (1 indicates above, -1 indicates below). The secondary channel number shall be $N_{primary_ch} + Secondary \times 4$.

For example, a 40 MHz channel consisting of 40 MHz channel number 36 and Secondary 1 specifies the primary channel is 36 and the secondary channel is 40.

19.3.16 Slot time

The slot time shall follow 17.3.8.6 for 5 GHz bands and 18.5.4 for 2.4 GHz bands.

The slot time for 40 MHz channel spacing shall be the same as that for 20 MHz channel spacing.

19.3.17 Transmit and receive impedance at the antenna connector

The impedance at the transmit and receive antenna connector(s) for each transmit and receive antenna shall follow 17.3.8.7.

19.3.18 PHY transmit specification

19.3.18.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause, i.e., its emissions can be no higher at any frequency offset than the minimum of the values specified in the regulatory and default masks.

NOTE 2—The transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels by VHT STAs, see 21.3.17.4.2.

For the 2.4 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, -20 dBr at 11 MHz frequency offset, -28 dBr at 20 MHz frequency offset, and the maximum of -45 dBr and -53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-17. The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

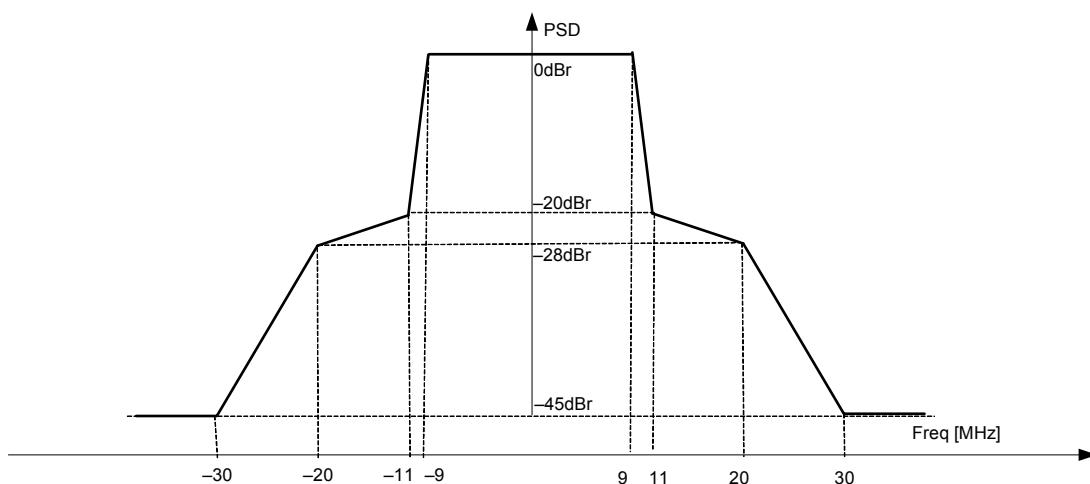

Figure 19-17—Transmit spectral mask for 20 MHz transmission in the 2.4 GHz band

For the 2.4 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, -20 dBr at 21 MHz frequency offset, -28 dBr at 40 MHz offset, and the maximum of -45 dBr and -56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-18.

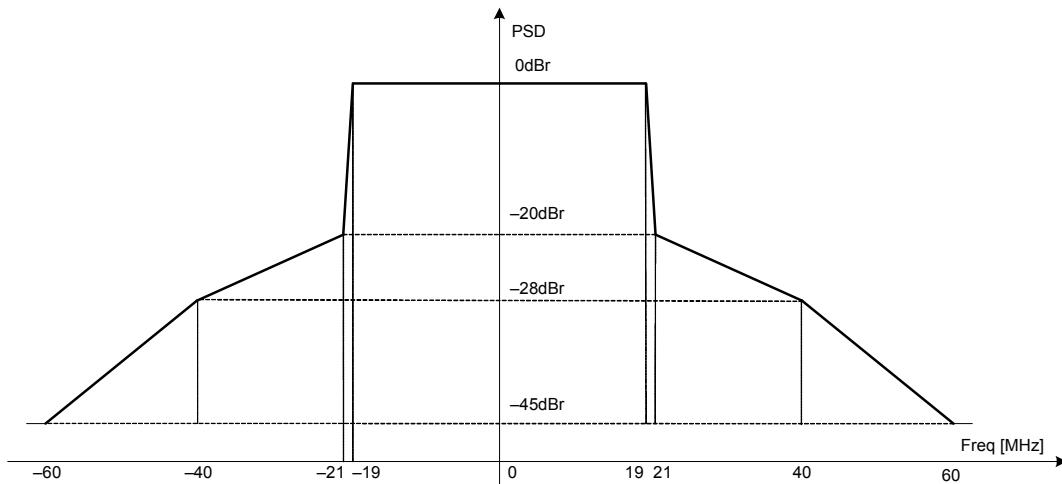

Figure 19-18—Transmit spectral mask for a 40 MHz channel in the 2.4 GHz band

For the 5 GHz band, when transmitting in a 20 MHz channel, the transmitted spectrum shall have a 0 dBr (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 18 MHz, -20 dBr at 11 MHz frequency offset, -28 dBr at 20 MHz frequency offset, and the maximum of -40 dBr and -53 dBm/MHz at 30 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-19. The measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

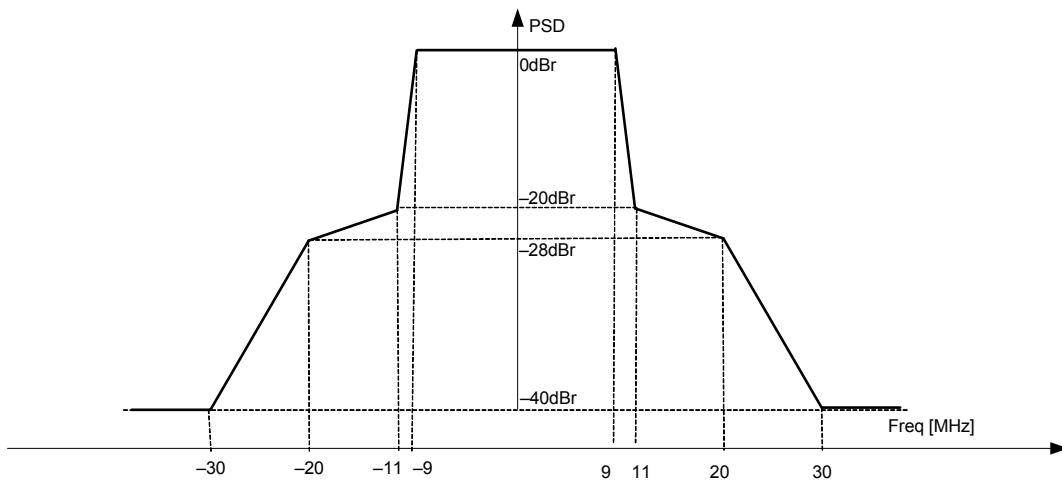

Figure 19-19—Transmit spectral mask for 20 MHz transmission in the 5 GHz band

For the 5 GHz band, when transmitting in a 40 MHz channel, the transmitted spectrum shall have a 0 dBr bandwidth not exceeding 38 MHz, -20 dBr at 21 MHz frequency offset, -28 dBr at 40 MHz offset, and the maximum of -40 dBr and -56 dBm/MHz at 60 MHz frequency offset and above. The transmitted spectral density of the transmitted signal shall fall within the spectral mask, as shown in Figure 19-20.

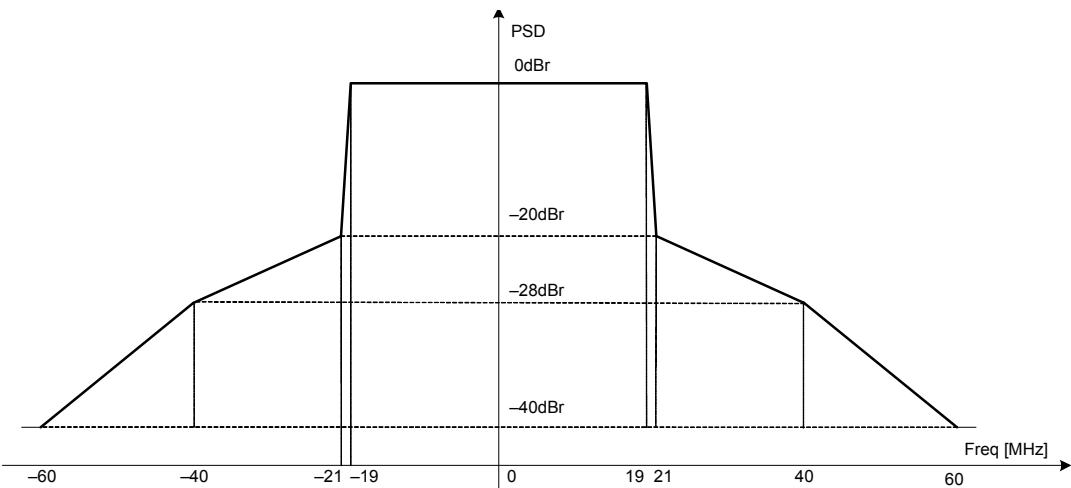

Figure 19-20—Transmit spectral mask for a 40 MHz channel in the 5 GHz band

Transmission with CH_OFF_20U, CH_OFF_20L, or CH_OFF_40 shall comply with the same mask that is used for the 40 MHz channel.

19.3.18.2 Spectral flatness

In a 20 MHz channel and in corresponding 20 MHz transmission in a 40 MHz channel, the average energy of the constellations in each of the subcarriers with indices -16 to -1 and $+1$ to $+16$ shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices -28 to -17 and $+17$ to $+28$ shall deviate no more than $+4/-6$ dB from the average energy of subcarriers with indices -16 to -1 and $+1$ to $+16$.

In a 40 MHz transmission (excluding PPDUs in MCS 32 format and non-HT duplicate format), the average energy of the constellations in each of the subcarriers with indices -42 to -2 and $+2$ to $+42$ shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices -43 to -58 and $+43$ to $+58$ shall deviate no more than $+4/-6$ dB from the average energy of subcarriers with indices -42 to -2 and $+2$ to $+42$.

In MCS 32 format and non-HT duplicate format, the average energy of the constellations in each of the subcarriers with indices -42 to -33 , -31 to -6 , $+6$ to $+31$, and $+33$ to $+42$ shall deviate no more than ± 4 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices -43 to -58 and $+43$ to $+58$ shall deviate no more than $+4/-6$ dB from the average energy of subcarriers with indices -42 to -33 , -31 to -6 , $+6$ to $+31$, and $+33$ to $+42$.

The tests for the spectral flatness requirements may be performed with spatial mapping $Q_k = \mathbf{I}$ (see 19.3.11.11.2).

19.3.18.3 Transmit power

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

19.3.18.4 Transmit center frequency tolerance

The transmitter center frequency tolerance shall be ± 20 ppm maximum for the 5 GHz band and ± 25 ppm maximum for the 2.4 GHz band. The different transmit chain center frequencies (LO) and each transmit chain symbol clock frequency shall all be derived from the same reference oscillator.

19.3.18.5 Packet alignment

If no signal extension is required (see 19.3.2), the receiver shall emit a PHY-CCA.indication(IDLE) primitive (see 8.3.5.12) at the 4 μ s boundary following the reception of the last symbol of the packet. If a signal extension is required, the receiver shall emit a PHY-CCA.indication(IDLE) primitive a duration of aSignalExtension after the 4 μ s boundary following the reception of the last symbol of the packet. This situation is illustrated for an HT-greenfield format packet using short GI in Figure 19-21.

If no signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8) at the 4 μ s boundary following the trailing boundary of the last symbol of the packet on the WM. If a signal extension is required, the transmitter shall emit a PHY-TXEND.confirm primitive (see 8.3.5.8) a duration of aSignalExtension after the 4 μ s boundary following the trailing boundary of the last symbol of the packet on the WM. This situation is illustrated in Figure 19-21.

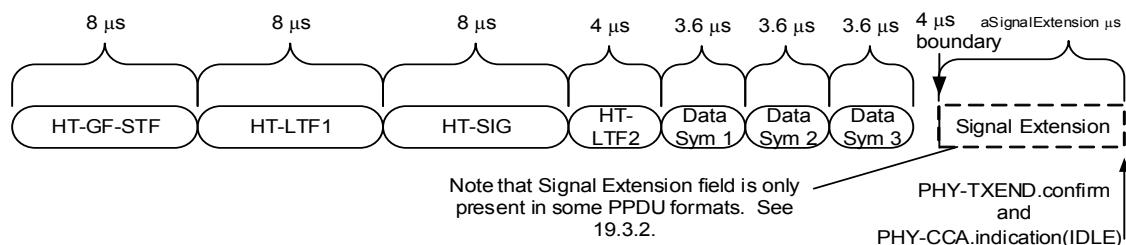

Figure 19-21—Packet alignment example (HT-greenfield format packet with short GI)

19.3.18.6 Symbol clock frequency tolerance

The symbol clock frequency tolerance shall be ± 20 ppm maximum for 5 GHz bands and ± 25 ppm for 2.4 GHz bands. The transmit center frequency and the symbol clock frequency for all transmit antennas shall be derived from the same reference oscillator.

19.3.18.7 Modulation accuracy

19.3.18.7.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 19.3.18.7.2 and 19.3.18.7.3. The test method is described in 19.3.18.7.4.

19.3.18.7.2 Transmit center frequency leakage

For VHT STAs the requirements on transmitter center frequency leakage are defined in 21.3.17.4.2; otherwise, the requirements are defined in this subclause.

The transmitter center frequency leakage shall follow 17.3.9.7.2 for all transmissions in a 20 MHz channel width. For transmissions in a 40 MHz channel width, the center frequency leakage shall not exceed -20 dB relative to overall transmitted power, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. For upper or lower 20 MHz transmissions in a 40 MHz channel, the center frequency leakage

(center of a 40 MHz channel) shall not exceed -17 dB relative to overall transmitted power, or, equivalently, 0 dB relative to the average energy of the rest of the subcarriers. The transmit center frequency leakage is specified per antenna.

19.3.18.7.3 Transmitter constellation error

The relative constellation frame-averaged RMS error, calculated first by averaging over subcarriers, OFDM frames, and spatial streams, shall not exceed a data-rate-dependent value according to Table 19-22. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ with EQM MCSs shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The same requirement applies both to 20 MHz channels and 40 MHz channels.

Table 19-22—Allowed relative constellation error versus constellation size and coding rate

| Modulation | Coding rate | Relative constellation error (dB) |
|------------|-------------|-----------------------------------|
| BPSK | 1/2 | -5 |
| QPSK | 1/2 | -10 |
| QPSK | 3/4 | -13 |
| 16-QAM | 1/2 | -16 |
| 16-QAM | 3/4 | -19 |
| 64-QAM | 2/3 | -22 |
| 64-QAM | 3/4 | -25 |
| 64-QAM | 5/6 | -27 |

19.3.18.7.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a streams of complex samples at 40 Msample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, and analog-to-digital quantization noise. Each transmit chain is connected directly through a cable to the setup input port. A possible embodiment of such a setup is converting the signals to a low intermediate frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope, and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

- Detect the start of frame.
- Detect the transition from short sequences to channel estimation sequences, and establish fine timing (with one sample resolution).
- Estimate the coarse and fine frequency offsets.
- Derotate the frame according to estimated frequency offset.
- Estimate the complex channel response coefficients for each of the subcarriers and each of the transmit chains.

- f) For each of the data OFDM symbols, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers in all spatial streams, derotate the subcarrier values according to estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, multiply the vector by a zero-forcing equalization matrix generated from the channel estimated during the channel estimation phase.
- g) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
- h) Compute the average of the RMS of all errors in a frame. It is given by Equation (19-89).

$$Error_{RMS} = \frac{\sum_{i_f=1}^{N_f} \sqrt{\left[\sum_{i_s=1}^{N_{SYM}} \left[\sum_{i_{ss}=1}^{N_{SS}} \left(\sum_{i_{sc}=1}^{N_{ST}} ((I(i_f, i_s, i_{ss}, i_{sc}) - I_0(i_f, i_s, i_{ss}, i_{sc}))^2 + (Q(i_f, i_s, i_{ss}, i_{sc}) - Q_0(i_f, i_s, i_{ss}, i_{sc}))^2 \right) \right] \right]} }{N_{SYM} \times N_{SS} \times N_{ST} \times P_0} \quad (19-89)$$

where

N_f is the number of frames for the measurement

$I_0(i_f, i_s, i_{ss}, i_{sc})$, $Q_0(i_f, i_s, i_{ss}, i_{sc})$ denotes the ideal symbol point in the complex plane in subcarrier i_{sc} , spatial stream i_{ss} , and OFDM symbol i_s of frame i_f

$I(i_f, i_s, i_{ss}, i_{sc})$, $Q(i_f, i_s, i_{ss}, i_{sc})$ denotes the observed symbol point in the complex plane in subcarrier i_{sc} , spatial stream i_{ss} , and OFDM symbol i_s of frame i_f

P_0 is the average power of the constellation

The vector error on a phase plane is shown in Figure 17-16.

The test shall be performed over at least 20 frames (N_f), and the average of the RMS shall be taken. The frames under test shall be at least 16 OFDM symbols long. Random data shall be used for the symbols.

19.3.18.8 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

- MULTICHANNEL_SAMPLING_RATE is:

$$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW20}$$

$$40 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{40 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to HT_CBW40}$$

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across $f_H - f_L \geq 50 \text{ MHz}$

- FIRST_TRANSITION_FIELD is L-STF (for HT-mixed format) or HT-GF-STF (for HT-greenfield format)
- SECOND_TRANSITION_FIELD is L-LTF (for HT-mixed format) or HT-GF-LTF1 (for HT-greenfield format)

- TRAINING_FIELD is L-LTF (for HT-mixed format) or HT-LTF1 (for HT-greenfield format) windowed in a manner which should approximate the windowing described in 17.3.2.5 with $T_{TR} = 100$ ns.
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW20) or 80 ns (for a CH_BANDWIDTH parameter equal to HT_CBW40).

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

19.3.19 HT PHY receiver specification

19.3.19.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 19-23 or less. The minimum input levels are measured at the antenna connectors and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized device under test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the device under test. The test in this subclause and the minimum sensitivity levels specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

Table 19-23—Receiver minimum input level sensitivity

| Modulation | Rate (R) | Adjacent channel rejection (dB) | Nonadjacent channel rejection (dB) | Minimum sensitivity (20 MHz channel spacing) (dBm) | Minimum sensitivity (40 MHz channel spacing) (dBm) |
|------------|----------|---------------------------------|------------------------------------|--|--|
| BPSK | 1/2 | 16 | 32 | -82 | -79 |
| QPSK | 1/2 | 13 | 29 | -79 | -76 |
| QPSK | 3/4 | 11 | 27 | -77 | -74 |
| 16-QAM | 1/2 | 8 | 24 | -74 | -71 |
| 16-QAM | 3/4 | 4 | 20 | -70 | -67 |
| 64-QAM | 2/3 | 0 | 16 | -66 | -63 |
| 64-QAM | 3/4 | -1 | 15 | -65 | -62 |
| 64-QAM | 5/6 | -2 | 14 | -64 | -61 |

19.3.19.2 Adjacent channel rejection

For all transmissions in a 20 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 20 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 20 MHz when operating in the 5 GHz band, and the adjacent channel center frequencies shall be separated by 25 MHz when operating in the 2.4 GHz band.

For all transmissions in a 40 MHz channel width, the adjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 40 MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The adjacent channel center frequencies shall be separated by 40 MHz.

The interfering signal in the adjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23. The interference signal shall have a minimum duty cycle of 50%.

The test in this subclause and the adjacent channel rejection levels specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.3 Nonadjacent channel rejection

For all transmissions in a 20 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 20 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 40 MHz or more.

For all transmissions in a 40 MHz channel width in the 5 GHz band, the nonadjacent channel rejection shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 19-23 and raising the power of an interfering signal of 40 MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel center frequencies shall be separated by 80 MHz or more.

The interfering signal in the nonadjacent channel shall be a signal compliant with the HT PHY, unsynchronized with the signal in the channel under test. The corresponding rejection shall be no less than specified in Table 19-23. The interference signal shall have a minimum duty cycle of 50%. The nonadjacent channel rejection for transmissions in a 20 MHz or 40 MHz channel width is applicable only to 5 GHz band.

The test in this subclause and the nonadjacent channel rejection level specified in Table 19-23 apply only to non-STBC modes, MCSs 0–31, 800 ns GI, and BCC.

19.3.19.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm in the 5 GHz band and –20 dBm in the 2.4 GHz band, measured at each antenna for any baseband modulation.

19.3.19.5 CCA sensitivity

19.3.19.5.1 CCA-Energy Detect (CCA-ED)

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given

in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel and dot11OFDMEDThreshold for the secondary 20 MHz channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 19.3.19.5.2, 19.3.19.5.3, and 19.3.19.5.4 is a mandatory energy detection requirement on all Clause 19 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

19.3.19.5.2 CCA sensitivity for non-HT PPDUs

CCA sensitivity requirements for non-HT PPDUs in the primary channel are described in 17.3.10.6 and 18.4.6.

19.3.19.5.3 CCA sensitivity in 20 MHz

For an HT STA with the operating channel width equal to 20 MHz, the start of a valid 20 MHz HT signal at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of -82 dBm shall cause the PHY to set PHY-CCA.indication(BUSY) with a probability $> 90\%$ within $4 \mu s$. The receiver shall indicate a channel busy condition for any signal 20 dB or more above the minimum modulation and coding rate sensitivity ($-82 + 20 = -62$ dBm) in the 20 MHz channel.

An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a channel busy condition (PHY-CCA.indication(BUSY)) for any valid HT_GF signal in the 20 MHz channel at a receive level greater than or equal to -72 dBm.

19.3.19.5.4 CCA sensitivity in 40 MHz

This subclause describes the CCA sensitivity requirements for an HT STA with the operating channel width equal to 40 MHz.

The receiver of a 20/40 MHz STA with the operating channel width equal to 40 MHz shall provide CCA on both the primary and secondary channels.

When the secondary channel is idle, the start of a valid 20 MHz HT signal in the primary channel at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of -82 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary}) primitive with a probability $> 90\%$ within $4 \mu s$. The start of a valid 40 MHz HT signal that occupies both the primary and secondary channels at a receive level greater than or equal to the minimum modulation and coding rate sensitivity of -79 dBm shall cause the PHY to generate a PHY-CCA.indication(BUSY, {primary, secondary}) primitive for both the primary and secondary channels with a probability per channel $> 90\%$ within $4 \mu s$.

An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a {primary} channel busy condition (PHY-CCA.indication(BUSY, {primary}) primitive) for any valid HT_GF signal in the primary channel at a receive level greater than or equal to -72 dBm when the secondary channel is idle. An HT STA that does not support the reception of HT_GF format PPDUs shall indicate a {primary, secondary} channel busy condition (PHY-CCA.indication(BUSY, {primary, secondary}) primitive) for any valid 40 MHz HT_GF signal in both the primary and secondary channels at a receive level greater than or equal to -69 dBm.

The receiver shall indicate a {primary} channel busy condition for any signal at or above -62 dBm in the 20 MHz primary channel. This level is 20 dB above the minimum modulation and coding rate sensitivity for

a 20 MHz PPDU. When the primary channel is idle, the receiver indicate a {secondary} channel busy condition for any signal at or above –62 dBm in the 20 MHz secondary channel. The receiver shall indicate a {primary, secondary} channel busy condition for any signal present in both the primary and secondary channels that is at or above –62 dBm in the primary channel and at or above –62 dBm in the secondary channel.

19.3.19.6 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel. This parameter shall be a measure by the PHY of the received RF power in the channel measured over the data portion of the received frame. The received power shall be the average of the power in all active receive chains.

The RCPI encoding is defined in 15.4.6.6.

RCPI shall equal the received RF power within an accuracy of ± 5 dB (95% confidence interval) within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1.

19.3.19.7 Reduced interframe space (RIFS)

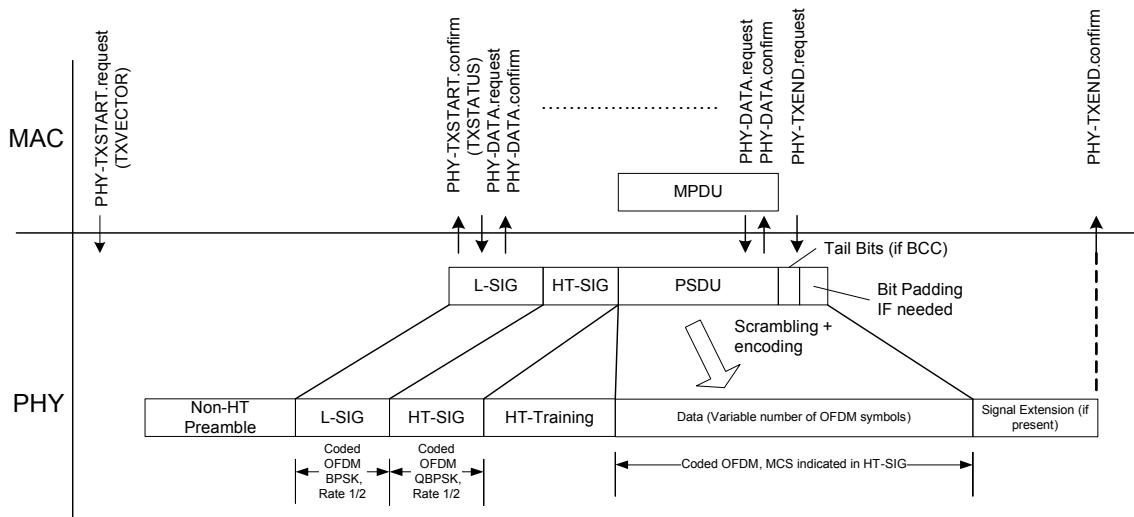

The receiver shall be able to decode a packet that was transmitted with a RIFS separation from the previous packet.

19.3.20 PHY transmit procedure

There are three options for the transmit PHY procedure. The first two options, for which typical transmit procedures are shown in Figure 19-22 and Figure 19-23, are selected if the FORMAT field of the PHY-TXSTART.request(TXVECTOR) primitive is equal to HT_MF or HT_GF, respectively. These transmit procedures do not describe the operation of optional features, such as LDPC or STBC. The third option is to follow the transmit procedure in Clause 17 or Clause 18 if the FORMAT field is equal to NON_HT. Additionally, if the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates OFDM, follow the transmit procedure in Clause 17. If the FORMAT field is equal to NON_HT, CH_BANDWIDTH indicates NON_HT_CBW20, and NON_HT_MODULATION indicates other than OFDM, follow the transmit procedure in Clause 18. And furthermore, if the FORMAT field is equal to NON_HT and CH_BANDWIDTH indicates NON_HT_CBW40, follow the transmit procedure in Clause 17, except that the signal in Clause 17 is generated simultaneously on each of the upper and lower 20 MHz channels that constitute the 40 MHz channel as defined in 19.3.8 and 19.3.11.12. In all these options, in order to transmit data, the PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 19.4. Other transmit parameters, such as MCS coding types and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 19.2.2.

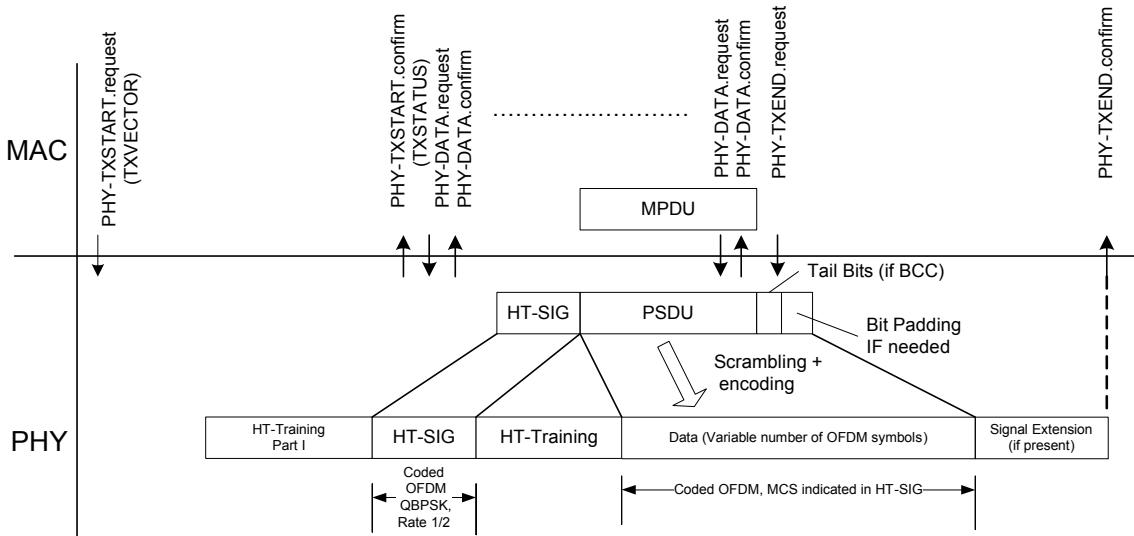

A clear channel shall be indicated by issuing a PHY-CCA.indication(IDLE) primitive. Note that under some circumstances, the MAC uses the latest value of the PHY-CCA.indication primitive before issuing the PHY-TXSTART.request primitive. Transmission of the PPDU shall be initiated after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 19-1.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC

Figure 19-22—PHY transmit procedure (HT-mixed format PPDU)

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 19-23—PHY transmit procedure (HT-greenfield format PPDU)

The data shall then be exchanged between the MAC and the PHY through a series of PHY-DATA.request(DATA) primitives issued by the MAC and PHY-DATA.confirm primitives issued by the PHY. Once PHY preamble transmission is started, the PHY entity shall immediately initiate data scrambling and data encoding. The encoding method shall be based on the FEC_CODING, CH_BANDWIDTH, and

MCS parameter of the TXVECTOR. A modulation rate change, if any, shall be initiated starting with the SERVICE field data, as described in 19.3.2.

The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The SERVICE field and PSDU are encoded by the encoder selected by the FEC_CODING, CH_BANDWIDTH, and MCS parameters of the TXVECTOR as described in 19.3.3. Transmission can be prematurely terminated by the MAC through the primitive PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive. Normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number supplied in the LENGTH field.

The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY. If the length of the coded PSDU is not an integer multiple of the OFDM symbol length, bits shall be stuffed to make the coded PSDU length an integer multiple of the OFDM symbol length.

The GI shall be inserted in every OFDM symbol as a countermeasure against delay spread.

In some PPDU formats (as defined in 19.3.2), a signal extension is present. When no signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of last symbol of the PPDU. When a signal extension is present, the PHY-TXEND.confirm primitive is generated at the end of the signal extension.

A typical state machine implementation of the transmit PHY is provided in Figure 19-24. Requests (.request) and confirmations (.confirm) are issued once per state as shown. This state machine does not describe the operation of optional features, such as LDPC or STBC.

19.3.21 PHY receive procedure

Typical PHY receive procedures are shown in Figure 19-25 and Figure 19-26. The receive procedures correspond to HT-mixed format and HT-greenfield format, respectively. A typical state machine implementation of the receive PHY is given in Figure 19-27. These receive procedures and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a non-HT PPDU format, refer to the receive procedure and state machine in Clause 17 or Clause 18. Further, through station management (via the PLME), the PHY is set to the appropriate frequency, as specified in 19.4. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble, the PHY measures a receive signal strength. This indicates activity to the MAC via the PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive shall also be issued as an initial indication of reception of a signal. The channel-list parameter of the PHY-CCA.indication primitive is determined as follows:

- It is absent when the operating channel width is 20 MHz.
- It is set to {primary} when the operating channel width is 40 MHz and the signal is present only in the primary channel.
- It is set to {secondary} when the operating channel width is 40 MHz and the signal is present only in the secondary channel.
- It is set to {primary, secondary} when the operating channel width is 40 MHz and the signal is present in both the primary and secondary channels.

The RSSI parameter is reported to the MAC in the RXVECTOR.

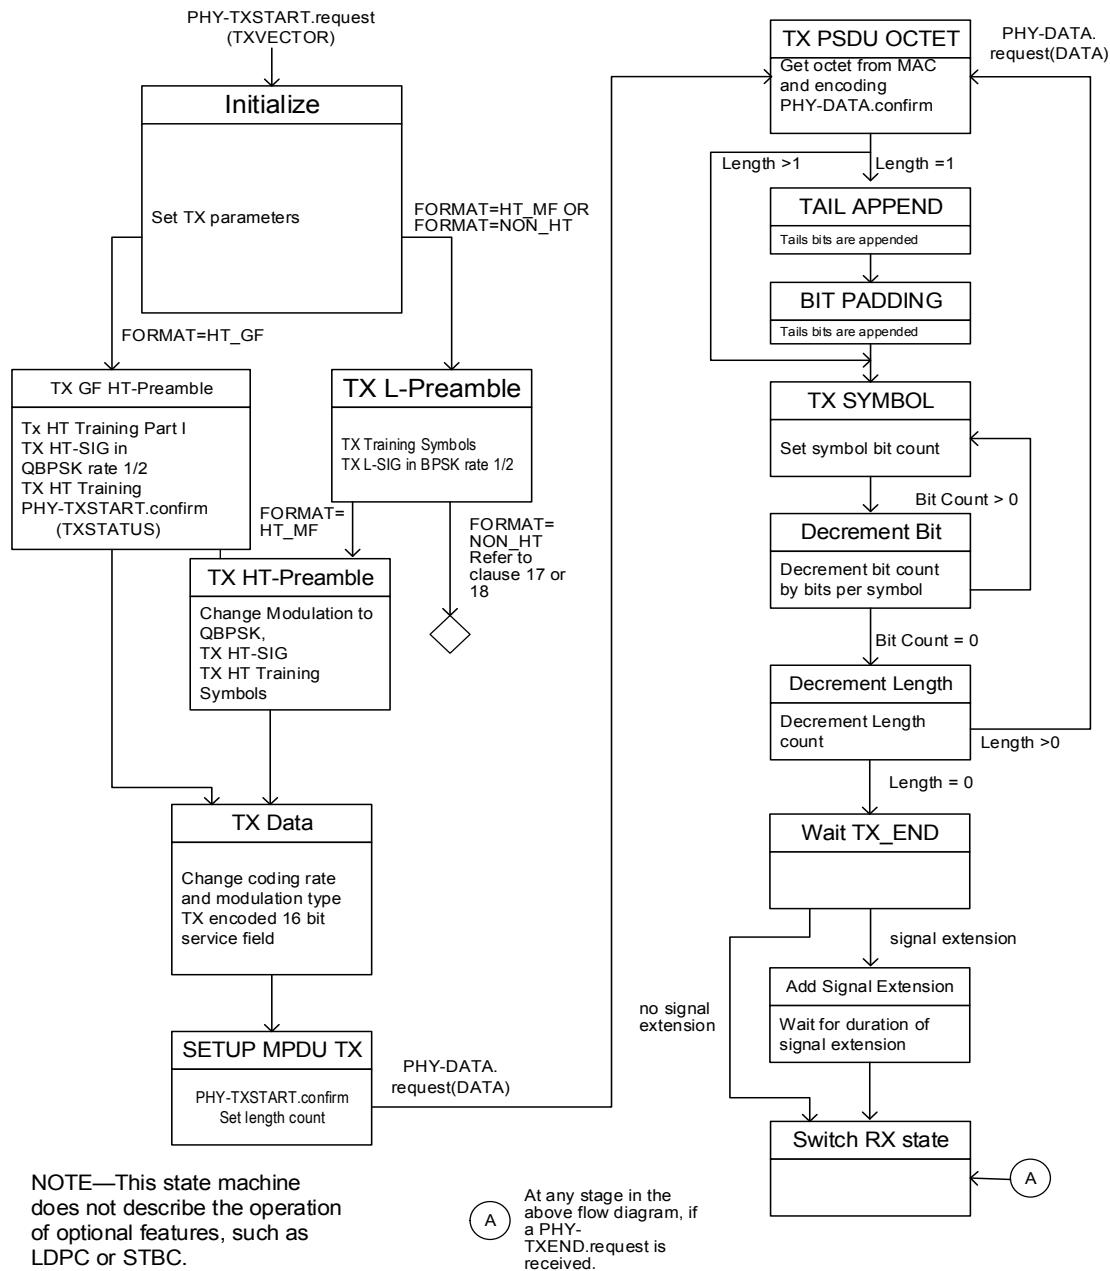

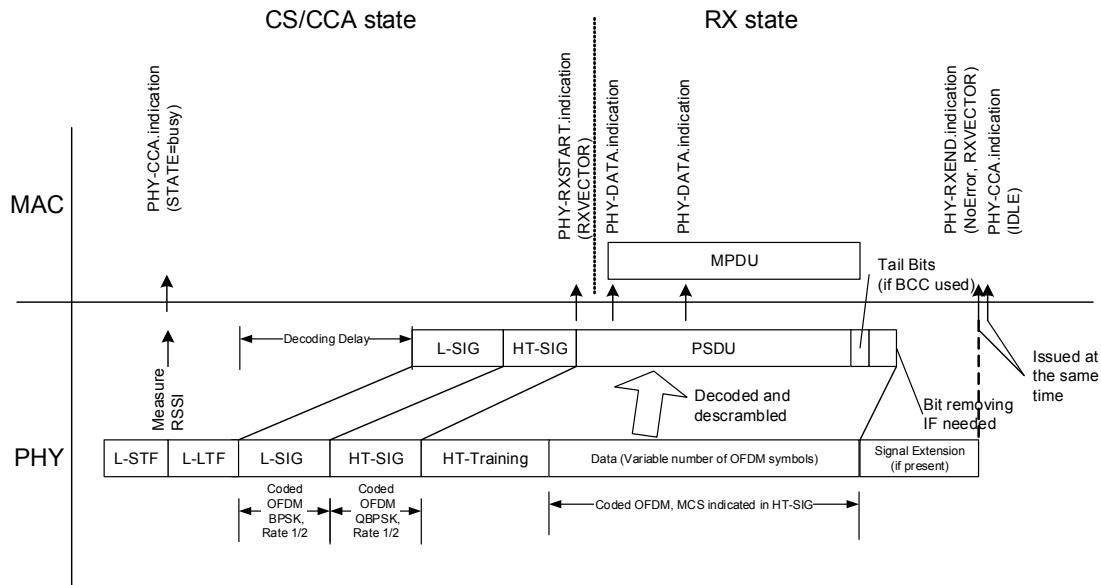

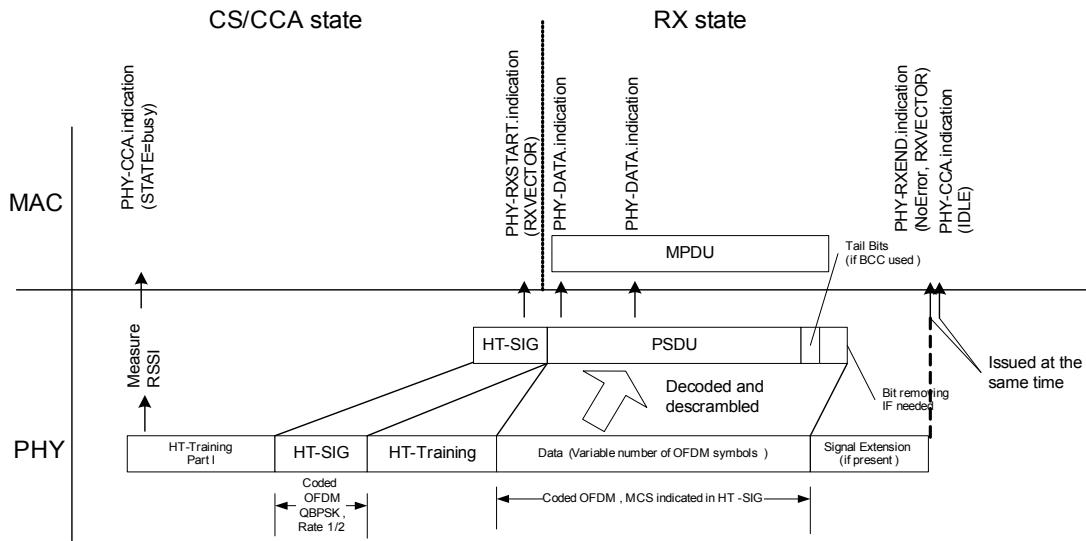

Figure 19-24—PHY transmit state machine

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 19-25—PHY receive procedure for HT-mixed format PPDU format

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC.

Figure 19-26—PHY receive procedure for HT-greenfield format PPDU

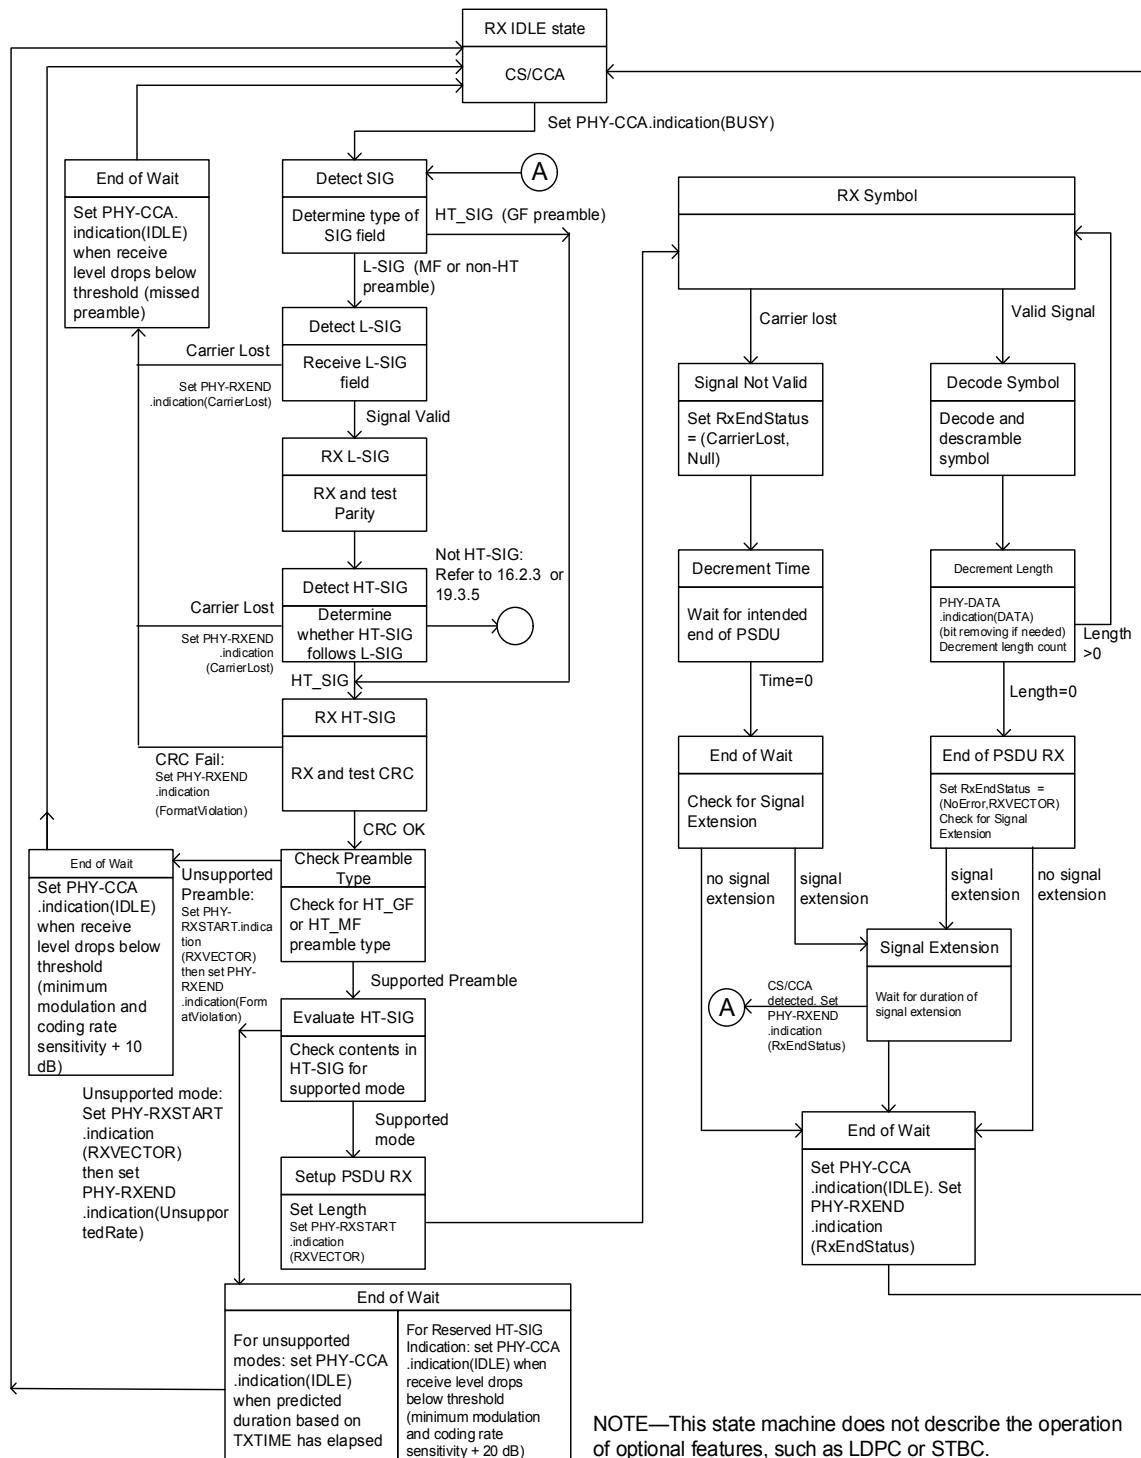

Figure 19-27—PHY receive state machine

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for SIGNAL and HT-SIG in order to set the length of the data stream, the demodulation type, code type, and the decoding rate. If signal loss occurs before validating L-SIG and/or HT-SIG, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5. If the check of the HT-SIG CRC is not valid, a PHY-RXSTART.indication primitive is not issued. The PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. The HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (for a missed preamble) specified in 19.3.19.5.

If the PHY preamble reception is successful and a valid HT-SIG CRC is indicated:

- Upon reception of an HT-mixed format preamble, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3, for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth list item below.
- Upon reception of a GF preamble by an HT STA that does not support GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until either the predicted duration of the packet from the contents of the HT-SIG field, as defined by TXTIME in 19.4.3, except Reserved HT-SIG Indication, elapses or until the received level drops below the receiver minimum sensitivity level of BPSK, R=1/2 in Table 19-23 + 10 dB (−72 dBm for 20 MHz, −69 dBm for 40 MHz). Reserved HT-SIG Indication is defined in the fourth list item below.
- Upon reception of a GF preamble by an HT STA that supports GF, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive for the predicted duration of the transmitted frame, as defined by TXTIME in 19.4.3, for all supported and unsupported modes except Reserved HT-SIG Indication. Reserved HT-SIG Indication is defined in the fourth list item below.
- If the HT-SIG indicates a Reserved HT-SIG Indication, the HT PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below the CCA sensitivity level (minimum modulation and coding rate sensitivity + 20 dB) specified in 19.3.19.5. Reserved HT-SIG Indication is defined as an HT-SIG with MCS field in the range 77–127 or Reserved field = 0 or STBC field = 3 and any other HT-SIG field bit combinations that do not correspond to modes of PHY operation defined in Clause 19.

Subsequent to an indication of a valid HT-SIG CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. If dot11TimingMsmtActivated is true, the PHY shall do the following:

- Complete receiving the PHY header and verify the validity of the PHY Header.
- If the PHY header reception is successful (and the SIGNAL field is completely recognizable and supported), a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 19.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 19-1. Upon reception of a GF preamble by an HT STA that does not support GF, the FORMAT field of RXVECTOR is equal to HT_GF, the remaining fields may be empty, and the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(FormatViolation) primitive. If the HT-SIG indicates an unsupported mode or Reserved HT-SIG Indication, the PHY shall indicate the error condition by issuing a PHY-RXEND.indication(UnsupportedRate) primitive.

Following training and SIGNAL fields, the coded PSDU (which comprises the coded PHY SERVICE field and scrambled and coded PSDU) shall be received. If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a

PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU, if no signal extension is present (as defined in 19.3.2), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. The number of PSDU octets is indicated in the HT Length field of the HT-SIG. The PHY shall proceed with PSDU reception. After the reception of the final bit of the last PSDU octet and possible tail and padding bits, the receiver shall be returned to the RX IDLE state if no signal extension is present (as defined in 19.3.2), as shown in Figure 19-27. Otherwise, the receiver waits for the duration of the signal extension before returning to the RX IDLE state. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

While in the Signal Extension state, if the receiver detects a CS/CCA event, it issues an RXEND.indication primitive (with the RXERROR parameter set to NoError or CarrierLost, depending on whether a carrier lost event occurred during the reception of the PPDU), leaves the Signal Extension state, and enters the Detect SIG state. This sequence occurs when signal-extended PPDUs are transmitted while separated by a RIFS.

If the binary convolutional code is used, any data received after the indicated data length are considered pad bits (to fill out an OFDM symbol) and should be discarded.

19.4 HT PLME

19.4.1 PLME SAP sublayer management primitives

Table 19-24 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.2 and 6.5.4.

19.4.2 PHY MIB

HT PHY MIB attributes are defined in Annex C with specific values defined in Table 19-24. The “Operational semantics” column in Table 19-24 contains two types: static and dynamic.

- Static MIB attributes are fixed and cannot be modified for a given PHY implementation.
- Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute. When MAX-ACCESS is equal to read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is equal to read-write, the MIB attribute may be read and written by management entities.

19.4.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive or calculated for the PHY receive procedure shall be calculated for HT-mixed format according to the Equation (19-90) and Equation (19-91) for short and long GI, respectively, and for HT-greenfield format according to Equation (19-92) and Equation (19-93) for short and long, respectively:

$$\begin{aligned}
 \text{TXTIME} = & T_{LEG_PREAMBLE} + T_{L_SIG} + T_{HT_PREAMBLE} + T_{HT_SIG} \\
 & + T_{SYM} \times \left\lceil \frac{T_{SYMS} \times N_{SYM}}{T_{SYM}} \right\rceil + SignalExtension
 \end{aligned} \tag{19-90}$$

$$\begin{aligned} \text{TXTIME} = & T_{\text{LEG_PREAMBLE}} + T_{L\text{-SIG}} + T_{HT\text{-PREAMBLE}} + T_{HT\text{-SIG}} \\ & + T_{\text{SYM}} \times N_{\text{SYM}} + \text{SignalExtension} \end{aligned} \quad (19-91)$$

$$\text{TXTIME} = T_{GF\text{-HT_PREAMBLE}} + T_{HT\text{-SIG}} + T_{\text{SYMS}} \times N_{\text{SYM}} + \text{SignalExtension} \quad (19-92)$$

$$\text{TXTIME} = T_{GF\text{-HT_PREAMBLE}} + T_{HT\text{-SIG}} + T_{\text{SYM}} \times N_{\text{SYM}} + \text{SignalExtension} \quad (19-93)$$

where

- $T_{\text{LEG_PREAMBLE}} = T_{L\text{-STF}} + T_{L\text{-LTF}}$ is the duration of the non-HT preamble
- $T_{HT\text{-PREAMBLE}}$ is the duration of the HT preamble in HT-mixed format, given by $T_{HT\text{-STF}} + T_{HT\text{-LTF1}} + (N_{HT\text{-LTF}} - 1)T_{HT\text{-LTF}s}$
- $T_{GF\text{-HT_PREAMBLE}}$ is the duration of the preamble in HT-greenfield format, given by $T_{HT\text{-GF_STF}} + T_{HT\text{-LTF1}} + (N_{HT\text{-LTF}} - 1)T_{HT\text{-LTF}s}$
- $T_{\text{SYM}}, T_{\text{SYMS}}, T_{HT\text{-SIG}}, T_{L\text{-STF}}, T_{HT\text{-STF}}, T_{HT\text{-GF_STF}}, T_{L\text{-LTF}}, T_{HT\text{-LTF1}}$ and $T_{HT\text{-LTF}s}$ are defined in Table 19-6
- SignalExtension is 0 μs when TXVECTOR parameter NO_SIG_EXTN is true and is a SignalExtension as defined in Table 19-25 when TXVECTOR parameter NO_SIG_EXTN is false
- $N_{HT\text{-LTF}}$ is defined in Equation (19-22)
- N_{SYM} is defined in Equation (19-32) for BCC and Equation (19-41) for LDPC

For non-HT modes of operation, refer to Clause 17 and Clause 18 for TXTIME calculations, except that frames transmitted with a value of NON_HT_DUP_OFDM for the TXVECTOR parameter NON_HT_MODULATION shall use Equation (18-1) for TXTIME calculation.

19.4.4 HT PHY

The static HT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25. The definitions for these characteristics are given in 6.5.4

Table 19-25—HT PHY characteristics

| Characteristics | Value |
|-----------------|---|
| aRIFSTime | 2 μs |
| aSlotTime | <p>When operating in the 2.4 GHz band: If dot11OperatingClassesRequired is false, long = 20 μs If dot11OperatingClassesRequired is true, long = 20 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79)</p> <p>If dot11OperatingClassesRequired is false, short = 9 μs If dot11OperatingClassesRequired is true, short = 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79)</p> <p>When operating in the 5 GHz band: If dot11OperatingClassesRequired is false, 9 μs If dot11OperatingClassesRequired is true, 9 μs plus any coverage-class-dependent aAirPropagationTime (see Table 9-79)</p> |

Table 19-25—HT PHY characteristics (continued)

| Characteristics | Value |
|-----------------------------|---|
| aSIFSTime | 10 µs when operating in the 2.4 GHz band 16 µs when operating in the 5 GHz bands |
| aSignalExtension | 0 µs when operating in the 5 GHz band 6 µs when operating in the 2.4 GHz band |
| aCCATime | Implementation dependent, see 10.3.7. |
| aRxPHYStartDelay | 28 µs for HT-mixed format, 24 µs for HT-greenfield format |
| aRxTxTurnaroundTime | Implementation dependent, see 10.3.7. |
| aTxPHYDelay | Implementation dependent, see 10.3.7. |
| aRxPHYDelay | Implementation dependent, see 10.3.7. |
| aRxTxSwitchTime | Implementation dependent, see 10.3.7. |
| aTxRampOnTime | Implementation dependent, see 10.3.7. |
| aAirPropagationTime | As indicated by the coverage class (see 10.21.5). |
| aMACProcessingDelay | Implementation dependent, see 10.3.7. |
| aPreambleLength | 16 µs |
| aSTFOneLength | 8 µs |
| aSTFTwoLength | 4 µs |
| aLTFOneLength | 8 µs |
| aLTFTwoLength | 4 µs |
| aPHYHeaderLength | 4 µs for HT-mixed format, N/A for HT-greenfield format |
| aPHYSigTwoLength | 8 µs |
| aPHYServiceLength | 16 bits |
| aPHYConvolutionalTailLength | 6 bits |
| aPSDUMaxLength | 65 535 octets |
| aPPDUMaxTime | 10 ms |
| aIUStime | 8 µs |
| aDTT2UTTTtime | 32 µs |
| aCWmin | 15 |
| aCWmax | 1023 |
| aMaxCSIMatricesReportDelay | 250 ms |

For non-HT modes of operation, refer to Clause 17 and Clause 18 for PHY characteristics.

19.5 Parameters for HT MCSs

Table 19-26 defines the symbols used in the rate-dependent parameter tables.

Table 19-26—Symbols used in MCS parameter tables

| Symbol | Explanation |
|---------------------|--|
| N_{SS} | Number of spatial streams |
| R | Coding rate |
| N_{BPSC} | Number of coded bits per single carrier (total across spatial streams) |
| $N_{BPSCS}(i_{SS})$ | Number of coded bits per single carrier for each spatial stream, $i_{SS} = 1, \dots, N_{SS}$ |
| N_{SD} | Number of complex data numbers per spatial stream per OFDM symbol |
| N_{SP} | Number of pilot values per OFDM symbol |
| N_{CBPS} | Number of coded bits per OFDM symbol |
| N_{DBPS} | Number of data bits per OFDM symbol |
| N_{ES} | Number of BCC encoders for the DATA field |
| N_{TBPS} | Total bits per subcarrier |

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

The rate-dependent parameters for mandatory 20 MHz, $N_{SS} = 1$ MCSs with $N_{ES} = 1$ shall be as shown in Table 19-27.

Table 19-27—MCS parameters for mandatory 20 MHz, $N_{SS} = 1$, $N_{ES} = 1$

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|--|------------|-----|---------------------|----------|----------|------------|------------|------------------|----------------------|
| | | | | | | | | 800 ns GI | 400 ns GI (see NOTE) |
| 0 | BPSK | 1/2 | 1 | 52 | 4 | 52 | 26 | 6.5 | 7.2 |
| 1 | QPSK | 1/2 | 2 | 52 | 4 | 104 | 52 | 13.0 | 14.4 |
| 2 | QPSK | 3/4 | 2 | 52 | 4 | 104 | 78 | 19.5 | 21.7 |
| 3 | 16-QAM | 1/2 | 4 | 52 | 4 | 208 | 104 | 26.0 | 28.9 |
| 4 | 16-QAM | 3/4 | 4 | 52 | 4 | 208 | 156 | 39.0 | 43.3 |
| 5 | 64-QAM | 2/3 | 6 | 52 | 4 | 312 | 208 | 52.0 | 57.8 |
| 6 | 64-QAM | 3/4 | 6 | 52 | 4 | 312 | 234 | 58.5 | 65.0 |
| 7 | 64-QAM | 5/6 | 6 | 52 | 4 | 312 | 260 | 65.0 | 72.2 |
| NOTE—Support of 400 ns GI is optional on transmit and receive. | | | | | | | | | |

The rate-dependent parameters for optional 20 MHz, $N_{SS} = 2$ MCSs with $N_{ES} = 1$ and EQM of the spatial streams shall be as shown in Table 19-28.

Table 19-28—MCS parameters for optional 20 MHz, $N_{SS} = 2$, $N_{ES} = 1$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|------------------|-----------|
| | | | | | | | | 800 ns GI | 400 ns GI |
| 8 | BPSK | 1/2 | 1 | 52 | 4 | 104 | 52 | 13.0 | 14.4 |
| 9 | QPSK | 1/2 | 2 | 52 | 4 | 208 | 104 | 26.0 | 28.9 |
| 10 | QPSK | 3/4 | 2 | 52 | 4 | 208 | 156 | 39.0 | 43.3 |
| 11 | 16-QAM | 1/2 | 4 | 52 | 4 | 416 | 208 | 52.0 | 57.8 |
| 12 | 16-QAM | 3/4 | 4 | 52 | 4 | 416 | 312 | 78.0 | 86.7 |
| 13 | 64-QAM | 2/3 | 6 | 52 | 4 | 624 | 416 | 104.0 | 115.6 |
| 14 | 64-QAM | 3/4 | 6 | 52 | 4 | 624 | 468 | 117.0 | 130.0 |
| 15 | 64-QAM | 5/6 | 6 | 52 | 4 | 624 | 520 | 130.0 | 144.4 |

The rate-dependent parameters for optional 20 MHz, $N_{SS} = 3$ MCSs with $N_{ES} = 1$ and EQM of the spatial streams shall be as shown in Table 19-29.

Table 19-29—MCS parameters for optional 20 MHz, $N_{SS} = 3$, $N_{ES} = 1$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|------------------|-----------|
| | | | | | | | | 800 ns GI | 400 ns GI |
| 16 | BPSK | 1/2 | 1 | 52 | 4 | 156 | 78 | 19.5 | 21.7 |
| 17 | QPSK | 1/2 | 2 | 52 | 4 | 312 | 156 | 39.0 | 43.3 |
| 18 | QPSK | 3/4 | 2 | 52 | 4 | 312 | 234 | 58.5 | 65.0 |
| 19 | 16-QAM | 1/2 | 4 | 52 | 4 | 624 | 312 | 78.0 | 86.7 |
| 20 | 16-QAM | 3/4 | 4 | 52 | 4 | 624 | 468 | 117.0 | 130.0 |
| 21 | 64-QAM | 2/3 | 6 | 52 | 4 | 936 | 624 | 156.0 | 173.3 |
| 22 | 64-QAM | 3/4 | 6 | 52 | 4 | 936 | 702 | 175.5 | 195.0 |
| 23 | 64-QAM | 5/6 | 6 | 52 | 4 | 936 | 780 | 195.0 | 216.7 |

The rate-dependent parameters for optional 20 MHz, $N_{SS} = 4$ MCSs with $N_{ES} = 1$ and EQM of the spatial streams shall be as shown in Table 19-30.

Table 19-30—MCS parameters for optional 20 MHz, $N_{SS} = 4$, $N_{ES} = 1$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|------------------|-----------|
| | | | | | | | | 800 ns GI | 400 ns GI |
| 24 | BPSK | 1/2 | 1 | 52 | 4 | 208 | 104 | 26.0 | 28.9 |
| 25 | QPSK | 1/2 | 2 | 52 | 4 | 416 | 208 | 52.0 | 57.8 |
| 26 | QPSK | 3/4 | 2 | 52 | 4 | 416 | 312 | 78.0 | 86.7 |
| 27 | 16-QAM | 1/2 | 4 | 52 | 4 | 832 | 416 | 104.0 | 115.6 |
| 28 | 16-QAM | 3/4 | 4 | 52 | 4 | 832 | 624 | 156.0 | 173.3 |
| 29 | 64-QAM | 2/3 | 6 | 52 | 4 | 1248 | 832 | 208.0 | 231.1 |
| 30 | 64-QAM | 3/4 | 6 | 52 | 4 | 1248 | 936 | 234.0 | 260.0 |
| 31 | 64-QAM | 5/6 | 6 | 52 | 4 | 1248 | 1040 | 260.0 | 288.9 |

The rate-dependent parameters for optional 40 MHz, $N_{SS} = 1$ MCSs with $N_{ES} = 1$ shall be as shown in Table 19-31.

Table 19-31—MCS parameters for optional 40 MHz, $N_{SS} = 1$, $N_{ES} = 1$

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|------------------|-----------|
| | | | | | | | | 800 ns GI | 400 ns GI |
| 0 | BPSK | 1/2 | 1 | 108 | 6 | 108 | 54 | 13.5 | 15.0 |
| 1 | QPSK | 1/2 | 2 | 108 | 6 | 216 | 108 | 27.0 | 30.0 |
| 2 | QPSK | 3/4 | 2 | 108 | 6 | 216 | 162 | 40.5 | 45.0 |
| 3 | 16-QAM | 1/2 | 4 | 108 | 6 | 432 | 216 | 54.0 | 60.0 |
| 4 | 16-QAM | 3/4 | 4 | 108 | 6 | 432 | 324 | 81.0 | 90.0 |
| 5 | 64-QAM | 2/3 | 6 | 108 | 6 | 648 | 432 | 108.0 | 120.0 |
| 6 | 64-QAM | 3/4 | 6 | 108 | 6 | 648 | 486 | 121.5 | 135.0 |
| 7 | 64-QAM | 5/6 | 6 | 108 | 6 | 648 | 540 | 135.0 | 150.0 |

The rate-dependent parameters for optional 40 MHz, $N_{SS} = 2$ MCSs with $N_{ES} = 1$ and EQM of the spatial streams shall be as shown in Table 19-32.

Table 19-32—MCS parameters for optional 40 MHz, $N_{SS} = 2$, $N_{ES} = 1$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|------------------|-----------|
| | | | | | | | | 800 ns GI | 400 ns GI |
| 8 | BPSK | 1/2 | 1 | 108 | 6 | 216 | 108 | 27.0 | 30.0 |
| 9 | QPSK | 1/2 | 2 | 108 | 6 | 432 | 216 | 54.0 | 60.0 |
| 10 | QPSK | 3/4 | 2 | 108 | 6 | 432 | 324 | 81.0 | 90.0 |
| 11 | 16-QAM | 1/2 | 4 | 108 | 6 | 864 | 432 | 108.0 | 120.0 |
| 12 | 16-QAM | 3/4 | 4 | 108 | 6 | 864 | 648 | 162.0 | 180.0 |
| 13 | 64-QAM | 2/3 | 6 | 108 | 6 | 1296 | 864 | 216.0 | 240.0 |
| 14 | 64-QAM | 3/4 | 6 | 108 | 6 | 1296 | 972 | 243.0 | 270.0 |
| 15 | 64-QAM | 5/6 | 6 | 108 | 6 | 1296 | 1080 | 270.0 | 300.0 |

The rate-dependent parameters for optional 40 MHz, $N_{SS} = 3$ MCSs, with EQM of the spatial streams shall be as shown in Table 19-33.

Table 19-33—MCS parameters for optional 40 MHz, $N_{SS} = 3$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | N_{ES} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|----------|------------------|-----------|
| | | | | | | | | | 800 ns GI | 400 ns GI |
| 16 | BPSK | 1/2 | 1 | 108 | 6 | 324 | 162 | 1 | 40.5 | 45.0 |
| 17 | QPSK | 1/2 | 2 | 108 | 6 | 648 | 324 | 1 | 81.0 | 90.0 |
| 18 | QPSK | 3/4 | 2 | 108 | 6 | 648 | 486 | 1 | 121.5 | 135.0 |
| 19 | 16-QAM | 1/2 | 4 | 108 | 6 | 1296 | 648 | 1 | 162.0 | 180.0 |
| 20 | 16-QAM | 3/4 | 4 | 108 | 6 | 1296 | 972 | 1 | 243.0 | 270.0 |
| 21 | 64-QAM | 2/3 | 6 | 108 | 6 | 1944 | 1296 | 2 | 324.0 | 360.0 |
| 22 | 64-QAM | 3/4 | 6 | 108 | 6 | 1944 | 1458 | 2 | 364.5 | 405.0 |
| 23 | 64-QAM | 5/6 | 6 | 108 | 6 | 1944 | 1620 | 2 | 405.0 | 450.0 |

The rate-dependent parameters for optional 40 MHz, $N_{SS} = 4$ MCSs, with EQM of the spatial streams shall be as shown in Table 19-34.

Table 19-34—MCS parameters for optional 40 MHz, $N_{SS} = 4$, EQM

| MCS Index | Modulation | R | $N_{BPSCS}(i_{SS})$ | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | N_{ES} | Data rate (Mb/s) | |
|-----------|------------|-----|---------------------|----------|----------|------------|------------|----------|------------------|-----------|
| | | | | | | | | | 800 ns GI | 400 ns GI |
| 24 | BPSK | 1/2 | 1 | 108 | 6 | 432 | 216 | 1 | 54.0 | 60.0 |
| 25 | QPSK | 1/2 | 2 | 108 | 6 | 864 | 432 | 1 | 108.0 | 120.0 |

20. Directional multi-gigabit (DMG) PHY specification

20.1 DMG PHY introduction

20.1.1 Scope

The DMG PHY supports three modulation methods:

- A control modulation using MCS 0 (the DMG control mode; see 20.4)
- A single carrier (SC) modulation using MCS 1 to MCS 12, MCS 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6 (the DMG SC mode; see 20.6) and MCS 25 to MCS 31 (the DMG low-power SC mode; see 20.7)
- An OFDM modulation using MCS 13 to MCS 24 (the DMG OFDM mode; see 20.5)

All DMG modulation methods share a similar preamble (see 20.3.6).

The services provided to the MAC by the DMG PHY consist of the following protocol functions:

- a) A function that defines a method of mapping the PHY service data units (PSDU) into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.
- b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the DMG MCSs, these STAs support a mixture of DMG SC mode, DMG OFDM mode, DMG low-power SC mode, and DMG control mode.

20.1.2 DMG PHY functions

The DMG PHY contains two functional entities: the PHY and the layer management function (PLME). Each of these functions is described in detail in 20.3 to 20.12. The DMG PHY service is provided to the MAC through the PHY service primitives defined in Clause 8.

20.1.2.1 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

20.1.2.2 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation. The service of a layer or sublayer is the set of capabilities that it offers to a user in the next higher layer (or sublayer). Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

20.2 DMG PHY service interface

20.2.1 Introduction

The PHY interfaces to the MAC through the TXVECTOR, RXVECTOR, and the PHYCONFIG_VECTOR. Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received packet parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

This interface is an extension of the generic PHY service interface defined in 8.3.4.

20.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 20-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 20-1—TXVECTOR and RXVECTOR parameters

| Parameter | Value | TXVECTOR | RXVECTOR |
|-------------|--|----------|----------|
| MCS | <p>The MCS parameter is an enumerated type that indicates the modulation and coding scheme used in the transmission of the packet. Values are integers in the range 0 to 31 and the values 9.1, 12.1, 12.2, 12.3, 12.4, 12.5 and 12.6.</p> <ul style="list-style-type: none"> — An MCS value of 0 indicates the use of DMG control mode. — MCS values of 1 to 12 and 9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6 indicate use of single carrier modulations. The value is an index to Table 20-19. — MCS values of 13 to 24 indicates use of OFDM modulations. The value is an index to Table 20-14. — MCS values of 25 to 31 indicate use of DMG low-power SC mode. The value is an index to Table 20-23. | Y | Y |
| LENGTH | Indicates the number of octets in the PSDU in the range 1 to 262 143. | Y | Y |
| ADD-PPDU | <p>Enumerated Type:</p> <ul style="list-style-type: none"> — ADD-PPDU indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. — NO-ADD-PPDU indicates no additional PPDU follows this PPDU. | Y | Y |
| PACKET-TYPE | <p>Enumerated Type:</p> <ul style="list-style-type: none"> — TRN-R-PACKET indicates either a packet whose data part is followed by one or more TRN subfields, or a packet that is requesting TRN subfields to be appended to a future response packet. — TRN-T-PACKET indicates a packet whose data part is followed by one or more TRN subfields. The transmitter may change AWV configuration at the beginning of each TRN subfield. <p>This parameter is reserved if TRN-LEN is 0.</p> | Y | Y |
| TRN-LEN | TRN-LEN indicates the length of the training field. Values are in the range 0–16 (see 20.10.2.2.3). | Y | Y |
| AGGREGATION | <p>Indicates whether the PSDU contains an A-MPDU.</p> <p>Enumerated Type:</p> <ul style="list-style-type: none"> — AGGREGATED indicates this is a PSDU with A-MPDU aggregation. — NOT_AGGREGATED indicates this is a PSDU without A-MPDU aggregation. | Y | Y |

Table 20-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Value | TXVECTOR | RXVECTOR |
|-----------------------------|--|----------|----------|
| RSSI | The allowed values for the RSSI parameter are in the range 0 through RSSI maximum. This parameter is a measure by the PHY of the power observed at the input of the antennas plus the antenna gain, or equivalent antenna gain for a phased-array antenna, used to receive the current PPDU. RSSI shall be measured during the reception of the PHY preamble. RSSI is intended to be used in a relative manner, and it shall be a monotonically increasing function of the received power. | N | Y |
| SNR | This parameter indicates the SNR measured during the reception of a DMG control mode packet. Values are –13 dB to 50.75 dB in 0.25 dB steps. | N | Y |
| RCPI | Is a measure of the received RF power measured over the preamble of a received frame. Refer to 20.3.10 for the definition of RCPI. | N | Y |
| ANT_CONFIG | Indicates which antenna configuration(s) is to be used throughout the transmission of the packet, and when to switch between configurations. Values are implementation dependent. | Y | N |
| CHAN_MEASUREMENT | Channel as measured during the reception of TRN subfields. Each measurement includes 63 complex numbers. | N | Y |
| TIME_OF_DEPARTURE_REQUESTED | Enumerated type: — true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first frame energy is sent by the transmitting port. — false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. | O | N |
| RX_START_OF_FRAME_OFFSET | 0 to $2^{32}-1$. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | See NOTE |
| DTP_TYPE | Enumerated: — STATIC indicating static tone paring (see 20.5.3.2.4.6.2). — DYNAMIC indicating dynamic tone pairing (see 20.5.3.2.4.6.3). | Y | Y |
| DTP_INDICATOR | An update to the DTP tone map is indicated by changing the value of this parameter from 0 to 1 or from 1 to 0 (see 10.40) | Y | Y |
| BEAM_TRACKING_REQUEST | This parameter indicates whether beam tracking is requested. Enumerated type: Beam tracking requested or Beam tracking not requested | Y | Y |

Table 20-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Value | TXVECTOR | RXVECTOR |
|---|---|----------|----------|
| LAST_RSSI | <p>In the TXVECTOR, LAST_RSSI indicates the received power level of the last packet with a valid PHY header that was received a SIFS before transmission of the current packet; otherwise, it is 0 (10.3.2.3.3).</p> <p>In the RXVECTOR, LAST_RSSI indicates the value of the LAST_RSSI field from the PCLP header of the received packet. Valid values are integers in the range 0 to 15:</p> <ul style="list-style-type: none"> — Values of 2 to 14 represent power levels ($-71 + \text{value} \times 2$) dBm. — A value of 15 represents power greater than or equal to -42 dBm. — A value of 1 represents power less than or equal to -68 dBm. — A value of 0 indicates that the previous packet was not received a SIFS before the current transmission. | Y | Y |
| Turnaround | Set to 1 or 0 as specified in 10.3.2.3.3. | Y | Y |
| NOTE— “Y” if dot11TimingMsmtActivated is true, otherwise “N”. | | | |

20.2.3 TXSTATUS parameters

The parameters listed in Table 20-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) primitive.

Table 20-2—TXSTATUS parameters

| Parameter | Value |
|-----------------------------|--|
| TIME_OF_DEPARTURE | When the first frame energy is sent by the transmitting port, in units equal to $1/\text{TIME_OF_DEPARTURE_ClockRate}$. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TIME_OF_DEPARTURE_ClockRate | 0 to $2^{16}-1$. The clock rate, in units of MHz, is used to generate the TIME_OF_DEPARTURE value. This parameter is present only if TIME_OF_DEPARTURE_REQUESTED is true in the corresponding request. |
| TX_START_OF_FRAME_OFFSET | 0 to $2^{32}-1$. An estimate of the offset (in 10 nanosecond units) from the point in time at which the start of the preamble corresponding to the frame was transmitted at the transmit antenna connector to the point in time at which this primitive is issued to the MAC. |

20.3 Common parameters

20.3.1 Channelization

The DMG PHY operates in the channels defined in Annex E and shall support at least channel number 2.

The channel center frequency is defined as:

$$\text{Channel center frequency} = \text{Channel starting frequency} + \text{Channel spacing} \times \text{Channel number}$$

where channel starting frequency, channel spacing and channel number are as defined in Annex E.

20.3.2 Transmit mask

The transmitted spectrum shall adhere to the transmit spectrum mask shown in the Figure 20-1. The transmit spectrum shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth not exceeding 1.88 GHz, -17 dB_r at a 1.2 GHz offset, -22 dB_r at a 2.7 GHz offset and -30 dB_r at a 3.06 GHz offset and above, inside the channels allowed for the regulatory domain in which the device is transmitting. The measurement shall be made using a 1 MHz resolution bandwidth and a 300 kHz video bandwidth.

The transmit mask shall be measured on data packets longer than 10 μ s without training fields.

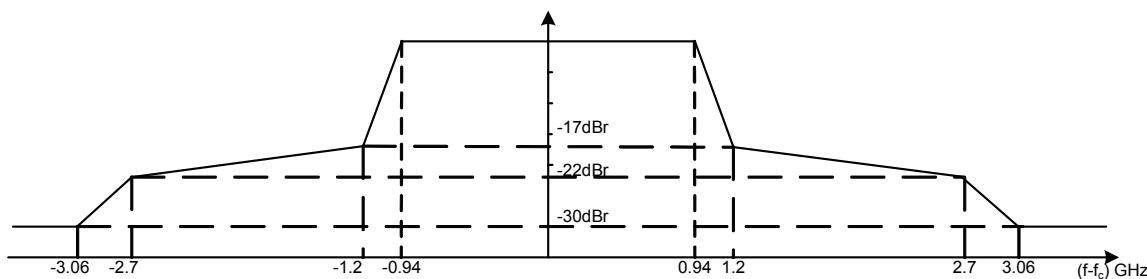

Figure 20-1—Transmit mask

20.3.3 Common requirements

20.3.3.1 Introduction

This subclause describes the common requirement from all four DMG modes: control, SC, OFDM, and low-power SC.

In all of the modes, all defined fields are transmitted bit 0 first in time.

20.3.3.2 Center frequency tolerance

20.3.3.2.1 General

The transmitter center frequency tolerance shall be ± 20 ppm maximum.

20.3.3.2.2 Center frequency convergence

The transmitter center frequency shall converge to within 1 ppm of its final value within 0.9 μ s from the start of the packet.

20.3.3.3 Symbol clock tolerance

The symbol clock frequency tolerance shall be ± 20 ppm maximum.

The transmit center frequency and the symbol clock frequency shall be derived from the same reference oscillator.

20.3.3.4 Transmit center frequency leakage

The transmitter center frequency leakage shall not exceed –23 dB relative to the overall transmitted power or, equivalently, in OFDM (MCS 13–24), +2.5 dB relative to the average power of a subcarrier, measured over a subcarrier spacing bandwidth.

20.3.3.5 Transmit rampup and rampdown

The transmit power-on ramp is defined as the time it takes for a transmitter to rise from less than 10% to greater than 90% of the average power to be transmitted in the frame.

The transmit power-on ramp shall be less than 10 ns.

The transmit power-down ramp is defined as the time it takes the transmitter to fall from greater than 90% to less than 10% of the maximum power to be transmitted in the frame.

The transmit power-down ramp shall be less than 10 ns.

20.3.3.6 Antenna setting

Antenna setting shall remain constant for the transmission of the entire packet except for the case of transmission of BRP-TX packets (see 20.10.2.2). During the transmission of BRP-TX packets, it shall remain constant for the transmission of the STF, CE field, and Data field.

20.3.3.7 Maximum input requirement

The receiver maximum input level is the maximum power level at the receive antenna(s) of the incoming signal, in dBm, present at the input of the receiver antenna for which the error rate criterion (defined in 20.3.3.8) is met. A receiver shall have a receiver maximum input level at the receive antenna(s) of at least 10 microwatts/cm² for each of the modulation formats that the receiver supports.

20.3.3.8 Receive sensitivity

For MCS 0, the PER shall be less than 5% for a PSDU length of 256 octets with the MCS dependent input levels listed in Table 20-3 defined at the antenna connector(s). For the other MCSSs, the PER shall be less than 1% for a PSDU length of 4096 octets with the MCS dependent input levels listed in Table 20-3 defined at the antenna connector(s).

NOTE—For RF power measurements performed over the air, the input level shall be corrected to compensate for the antenna gain in the implementation. The gain of the antenna is the maximum estimated gain by the manufacturer. In the case of the phased-array antenna, the gain of the phased-array antenna is the maximum sum of estimated element gain minus 3 dB implementation loss.

Table 20-3 assumes 5 dB implementation loss and 10 dB noise factor (Noise Figure).

Table 20-3—Receiver sensitivity

| MCS | Receive sensitivity (dBm) |
|-----|---------------------------|
| 0 | –78 |
| 1 | –68 |
| 2 | –66 |
| 3 | –65 |

20.3.4 Timing-related parameters

Table 20-4 defines timing-related parameters.

Table 20-4—Timing-related parameters

| Parameter | Value |
|---|--|
| N_{SD} : Number of data subcarriers | 336 |
| N_{SP} : Number of pilot subcarriers | 16 |
| N_{DC} : Number of DC subcarriers | 3 |
| N_{ST} : Total Number of subcarriers | 355 |
| N_{SR} : Number of subcarriers occupying half of the overall BW | 177 |
| N_{GI} | 64 |
| N_{SPB} | 448 |
| Δ_F : subcarrier frequency spacing | 5.156 25 MHz (2640 MHz / 512) |
| F_s : OFDM sample rate | 2640 MHz |
| F_c : SC chip rate | 1760 MHz = $\frac{2}{3} F_s$ |
| T_s : OFDM Sample Time | 0.38 ns = $1 / F_s$ |
| T_c : SC Chip Time | 0.57 ns = $1 / F_c$ |
| T_{DFT} : OFDM IDFT/DFT period | 0.194 μ s |
| T_{GI} : guard interval duration | 48.4 ns = $T_{DFT}/4$ |
| T_{seq} | 72.7 ns = $128 \times T_c$ |
| T_{STF} : Detection sequence duration | 1236 ns = $17 \times T_{seq}$ |
| T_{CE} : Channel Estimation sequence duration | 655 ns = $9 \times T_{seq}$ |
| T_{SYM} : Symbol Interval | 0.242 μ s = $T_{DFT} + T_{GI}$ |
| T_{HEADER} : Header Duration | 0.242 μ s = T_{SYM} (OFDM) 0.582 μ s = $2 \times 512 \times T_c$ (SC and low-power SC) |
| F_{CCP} : control mode chip rate | 1760 MHz |
| T_{CCP} : control mode chip time | 0.57 ns = $1 / F_{CCP}$ |
| T_{STF-CP} : control mode short training field duration | 3.636 μ s = $50 \times T_{seq}$ |
| T_{CE-CP} : control mode channel estimation field duration | 655 ns = $9 \times T_{seq}$ |
| T_{Data} | $N_{SYM} \times T_{SYM}$ (OFDM) $(N_{BLKS} \times 512 + 64) \times T_c$ (SC) NOTE— N_{SYM} is defined in 20.5.3.2.3.3 and N_{BLKS} is defined in 20.6.3.2.3.3. |

Table 20-5 defines parameters used frequently in Clause 20.

Table 20-5—Frequently used parameters

| Symbol | Explanation |
|------------|---|
| N_{CBPS} | Number of coded bits per symbol |
| N_{DBPS} | Number of data bits per symbol |
| N_{BPSC} | Number of coded bits per single carrier |
| R | Code rate |

20.3.5 Mathematical conventions in the signal description

20.3.5.1 General

The transmitted signal is described in complex base-band signal notation. The actual transmitted signal is related to the complex baseband signal $r(t)$ by the following relation:

$$r_{RF}(t) = \operatorname{Re}\{r(t)\exp(j2\pi f_c t)\}$$

where

f_c is the center frequency of the carrier

The transmitted RF signal is generated by modulating the complex baseband signal, which consists of several fields. The fields and the timing boundaries for the various fields are shown in Figure 20-2.

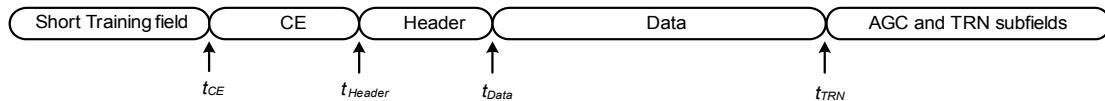

Figure 20-2—Packet structure

The time offset, t_{Field} , determines the starting time of the corresponding field.

$$r_{PPDU}(t) = r_{STF}(t) + r_{CE}(t - t_{CE}) + r_{Header}(t - t_{Header}) + r_{Data}(t - t_{Data}) + r_{TRN}(t - t_{TRN})$$

where

$$t_{CE} = T_{STF}$$

$$t_{Header} = t_{CE} + T_{CE}$$

$$t_{Data} = t_{Header} + T_{Header}$$

$$t_{TRN} = t_{Data} + T_{Data}$$

Each OFDM base band waveform $r_{Field}(nT_S)$, for the fields above, is defined via the discrete inverse Fourier transform as:

$$r_{Field}(nT_S) = w_{T_{Field}}(nT_S) \sum_k X_k \exp(j2\pi k \Delta_F (nT_S - T_{GI}))$$

where

X_k is the complex constellation point to be transmitted on subcarrier k

n is the discrete time index

The window $w_{T_{Field}}(nT_S)$ is user defined and is used to smooth the transition between fields.

The base band waveform for fields defined by time domain sequences or for single carrier transmission is

$$r_{Field}(nT_C) = x(n)$$

where

$x(n)$ is the constellation point n

Conversion from the sampled digital domain to the continuous time domain is beyond the scope of this document. Filtering for pulse shaping such as in GMSK is beyond the scope of this standard.

20.3.5.2 Windowing function

The windowing function $w_{T_{Field}}(nT_S)$ is used to smooth the transition between adjacent fields in the PPDU where OFDM modulation is employed. See Figure 20-3. No windowing is applied to preamble fields or to SC modulated fields.

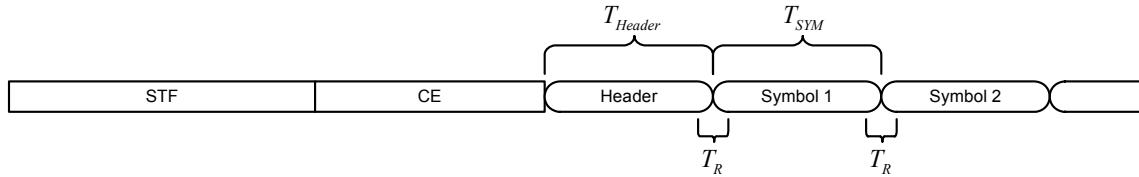

Figure 20-3—Illustration of windowing function

An example of a windowing function is given by

$$w_T(t) = \begin{cases} \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} + \frac{t}{T_R}\right)\right) & -\frac{T_R}{2} < t \leq \frac{T_R}{2} \\ 1 & \frac{T_R}{2} < t \leq T - \frac{T_R}{2} \\ \sin^2\left(\frac{\pi}{2}\left(\frac{1}{2} - \frac{t-T}{T_R}\right)\right) & T - \frac{T_R}{2} < t \leq T + \frac{T_R}{2} \end{cases}$$

The transition region creates an overlap (with length T_R) between adjacent fields. The field wave form $r_{Field}(nT_S)$ is extended cyclically to fill the part of the transition region in which it is undefined. If the transition region vanishes (i.e., $T_R=0$), the windowing function degenerates to a rectangular window. The choice of windowing function is implementation dependent, as long as transmit EVM and transmit mask requirements are met.

20.3.6 Common preamble

20.3.6.1 General

The preamble is the part of the PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of modulation (SC or OFDM) and channel estimation. The format of the preamble is common to both OFDM packets and SC packets and consists of a Short Training field followed by a Channel Estimation field. The content of the Short Training field is the same between SC and OFDM packets (see 20.3.6.2), but the content of the Channel Estimation field is not the same between such packets (see 20.3.6.3). Figure 20-4 illustrates the SC packet preamble, and Figure 20-5 illustrates the OFDM packet preamble.

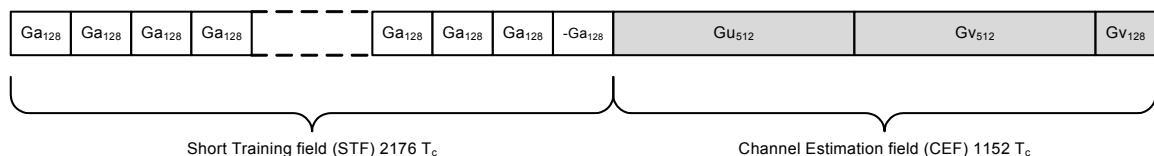

Figure 20-4—SC preamble

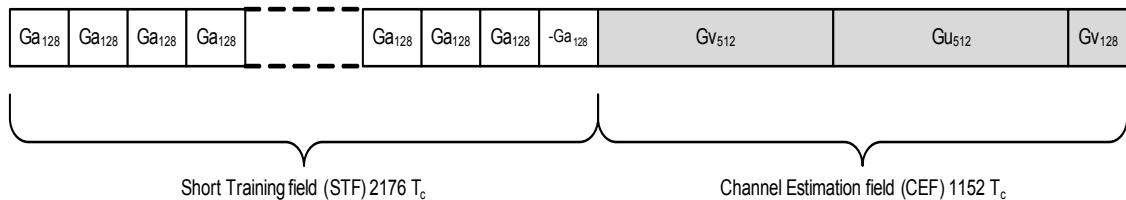

Figure 20-5—OFDM preamble

20.3.6.2 Short Training field

The Short Training field is composed of 16 repetitions of sequences $Ga_{128}(n)$ of length 128 defined in 20.11, followed by a single repetition of $-Ga_{128}(n)$.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} (Ga_{128}(n \bmod 128))\exp(j\pi\frac{n}{2}) & n = 0, 1, \dots, 16 \times 128 - 1 \\ (-Ga_{128}(n \bmod 128))\exp(j\pi\frac{n}{2}) & n = 16 \times 128, \dots, 17 \times 128 - 1 \end{cases}$$

where

mod is the modulus operation

20.3.6.3 Channel Estimation field

The Channel Estimation field is used for channel estimation, as well as indication of which modulation is going to be used for the packet. The Channel Estimation field is composed of a concatenation of two sequences $Gu_{512}(n)$ and $Gv_{512}(n)$, where the last 128 samples of $Gu_{512}(n)$ and $Gv_{512}(n)$ are equal to the last 128 samples used in the Short Training field. They are followed by a 128 samples sequence $Gv_{128}(n)$ equal to the first 128 samples of both $Gv_{512}(n)$ and $Gu_{512}(n)$.

The Gu_{512} and Gv_{512} sequences are defined as

$$G_{u_{512}} = \begin{bmatrix} -Gb_{128} & -Ga_{128} & Gb_{128} & -Ga_{128} \end{bmatrix}$$

$$G_{v_{512}} = \begin{bmatrix} -Gb_{128} & Ga_{128} & -Gb_{128} & -Ga_{128} \end{bmatrix}$$

where

Ga_{128} and Gb_{128} are as defined in 20.11

When the data field of the packet is modulated using single carrier, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 20-6. When the data field of the packet is modulated using OFDM, the Gu_{512} and Gv_{512} fields are concatenated in the order illustrated in Figure 20-7.

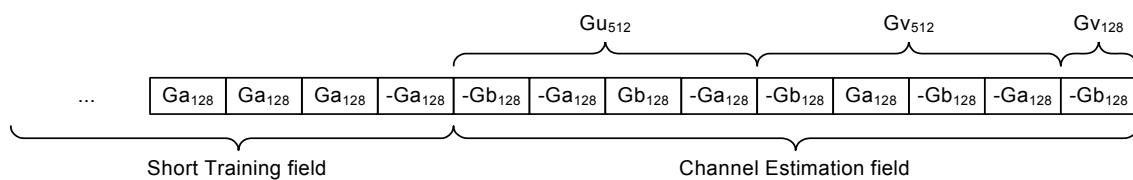

Figure 20-6—Channel Estimation field for SC packets

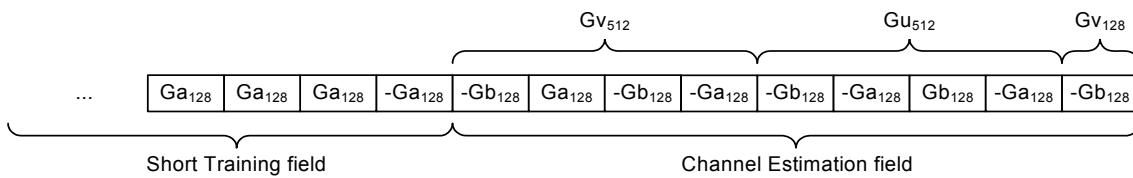

Figure 20-7—Channel Estimation field for OFDM packets

The waveform for the channel estimation sequence is

$$r_{CE_{SC}}(nT_c) = (Gu_{512}(n) + Gv_{512}(n - 512) + Gv_{128}(n - 1024))\exp(j\pi\frac{n}{2}), n = 0, 1, \dots, 1151$$

$$r_{CE_{OFDM}}(nT_c) = (Gv_{512}(n) + Gu_{512}(n - 512) + Gv_{128}(n - 1024))\exp(j\pi\frac{n}{2}), n = 0, 1, \dots, 1151$$

Note that sequences $Gu_{512}(n)$ and $Gv_{512}(n)$ are defined for $0 \leq n \leq 511$. For other values of n , $Gu_{512}(n)$ and $Gv_{512}(n)$ are set to 0.

20.3.6.4 Transmission of the preamble and BRP fields in an OFDM packet

20.3.6.4.1 General

The preamble sequence defined in the above subclauses and the BRP fields defined in 20.10.2.2.5, 20.10.2.2.6, and 20.10.2.2.7 are specified at the SC chip rate (T_c). For transmission in the OFDM (nominal) sample rate, the signal is resampled with a 3/2 rate change. The resampling is done by upsampling by a factor of 3, filtering by the filter h_{Filt} defined in 20.3.6.4.2, and downsampling by a factor of 2 (see equation below). The resampling is performed using a specific filter h_{Filt} since the OFDM receiver needs to know this filter to correct for its response during channel estimation. To define the transmission of the preamble when the packet is an OFDM packet, the preamble waveform is defined below.

Let $r_{preamble}(nT_c) = r_{STF}(nT_c) + r_{CE}(nT_c - t_{ce})$, where r_{CE} is $r_{CE_{SC}}$ or $r_{CE_{OFDM}}$ as appropriate.

Then:

$$r_{preamble}^{OFDM(2)}\left(n \frac{T_s}{2}\right) = \begin{cases} r_{preamble}\left(n \frac{T_c}{3}\right) & n = 0, 3, 6, \dots \\ 0 & otherwise \end{cases}$$

$$\tilde{r}_{preamble}^{OFDM(2)}\left(n \frac{T_s}{2}\right) = \sum_{K=0}^{K-1} r_{preamble}^{OFDM(2)}\left((n-K) \frac{T_s}{2}\right) h_{Filt}(k), n = 0, 1, \dots$$

$$\tilde{r}_{preamble}^{OFDM}\left(n T_s\right) = r_{preamble}^{OFDM(2)}\left(2n \frac{T_s}{2} - \frac{K-1}{2} \frac{T_s}{2}\right), n = 0, 1, \dots$$

where

K is the length of the filter defined in 20.3.6.4.2

$\tilde{r}_{preamble}^{OFDM(2)}(n) = 0$, for $n < 0$

20.3.6.4.2 h_{Filt} definition

The filter h_{Filt} is defined by the following coefficients (from h_0 to h_{70}):

$[-1, 0, 1, 1, -2, -3, 0, 5, 5, -3, -9, -4, 10, 14, -1, -20, -16, 14, 33, 9, -35, -42, 11, 64, 40, -50, -96, -15, 120, 126, -62, -256,$
 $-148, 360, 985, 1267, 985, 360, -148, -256, -62, 126, 120, -15, -96, -50, 40, 64, 11, -42, -35, 9, 33, 14, -16, -20, -1, 14, 10,$
 $-4, -9, -3, 5, 5, 0, -3, -2, 1, 1, 0, -1]$. Normalized to have a norm of $\sqrt{3}$ so that $h_{Filt}(k) = \frac{\sqrt{3} \times h_k}{\sqrt{\sum_{l=0}^{70} h_l^2}}$.

20.3.7 HCS calculation for headers of DMG control mode, DMG OFDM mode, and DMG SC mode

The header check sequence (HCS) is a CRC of the header bits. The header is considered to be a stream of bits B_0, \dots, B_{M-1} . The CRC is based on CRC 16-CCITT. The value of the CRC field is the 1s complement of

$$CRC(D) = (M(D) \oplus I(D))D^{16} \bmod G(D)$$

where

$M(D) = B_0 D^{M-1} + B_1 D^{M-2} + \dots + B_{M-1}$ is the header bits represented as polynomial (over the binary field) where B_0 is bit 0 of the header and B_{M-1} is bit $M-1$ of the header

$I(D) = \sum_{k=M-16}^{M-1} D^k$ is an initialization polynomial added to the first 16 bits of the header (setting the shift register bits to 1)

$G(D) = D^{16} + D^{12} + D^5 + 1$ is the CRC generating polynomial

$$CRC(D) = x_0 D^{15} + x_1 D^{14} + \dots + x_{14} D + x_{15}$$

The CRC field is transmitted with x_{15} first.

For a block diagram and an example of how to calculate the CRC, see 15.3.3.7.

20.3.8 Common LDPC parity matrices

20.3.8.1 General

Four Low-Density Parity-Check (LDPC) codes are specified, each of a different rate but with a common codeword size of 672 bits.

Each of the parity-check matrices \mathbf{H} is partitioned into square submatrices of size $Z \times Z$. The submatrices are either cyclic-permutations of the identity matrix, or null submatrices with all zero entries.

A location with integer i denotes the cyclic-permutation submatrix P_i obtained from the $Z \times Z$ identity matrix by cyclically shifting the columns to the right by i elements. The matrix P_0 is the $Z \times Z$ identity matrix. An empty location denotes a null submatrix of size $Z \times Z$.

Examples with $Z = 4$:

$$P_0 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad P_1 = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \quad P_3 = \begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

20.3.9 Scrambler

The header and data fields following the scrambler initialization field (including data padding bits) shall be scrambled by XORing each bit in turn with a length 127 periodic sequence generated by the polynomial $S(x) = x^7 + x^4 + 1$. The PHY header bits, with the exception of the first seven bits for SC and OFDM and the first five bits for control mode, are placed one after the other, bit 7 first (bit 5 first for DMG control mode). The octets of the PSDU and the pad bits shall be placed into a bit stream with bit 0 (LSB) of each octet first and bit 7 of each octet (MSB) last. The generation of the sequence and the XOR operation are defined in Figure 20-8.

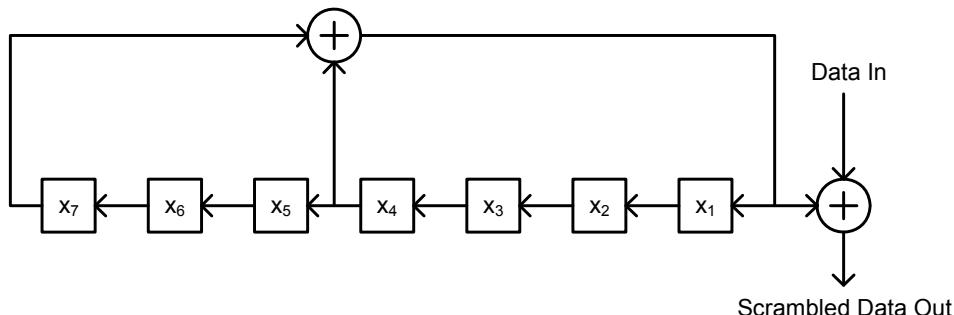

Figure 20-8—Data scrambler

For each PPDU, the transmitter shall select a nonzero seed value for the scrambler (bits x_1 through x_7). The seed value should be selected in a pseudorandom fashion. The seed value is sent in the Scrambler Initialization field of the PHY header. Each data bit in the data field of the PPDU is then XORed with the scrambler output ($x_4 \oplus x_7$) and then the scrambler content is shifted once.

20.3.10 Received channel power indicator (RCPI) measurement

The RCPI is a measure of the received RF power in the selected channel as measured at the DMG Antenna output. This parameter shall be measured by the PHY of the received RF power in the channel measured over the preamble of the received frame.

The RCPI encoding is defined in 15.4.6.6.

RCPI shall equal the received RF power with an accuracy of ± 5 dB with 95% confidence interval within the specified dynamic range of the receiver. The received RF power shall be determined assuming a receiver noise equivalent bandwidth equal to the channel width multiplied by 1.1. The relative error between RF power measurements made within a 1 second interval should be less than ± 1 dB.

20.4 DMG control mode

20.4.1 Introduction

Transmission and reception of control mode PPDU is mandatory. DMG control mode uses the same chip rate as the DMG SC mode. DMG control mode is transmitted when the TXVECTOR indicates MCS 0.

The modulation and coding scheme for the DMG control mode is shown in Table 20-10.

Table 20-10—DMG control mode modulation and coding scheme

| MCS index | Modulation | Code rate | Data rate |
|-----------|------------|------------------|------------------------|
| 0 | DBPSK | 1/2 ^a | 27.5 Mb/s ^a |

^aCode rate and data rate might be lower due to codeword shortening.

20.4.2 PPDU format

The DMG control mode PPDU is composed of the Preamble, Header, Data field, and possibly AGC and TRN subfields. This is shown in Figure 20-9.

Figure 20-9—DMG control mode PPDU format

20.4.3 Transmission

20.4.3.1 Preamble

20.4.3.1.1 General

The preamble is the part of the DMG control mode PPDU that is used for packet detection, AGC, frequency offset estimation, synchronization, indication of frame type and channel estimation.

The preamble is composed of two parts as shown in Figure 20-10: the Short Training field and the Channel Estimation field.

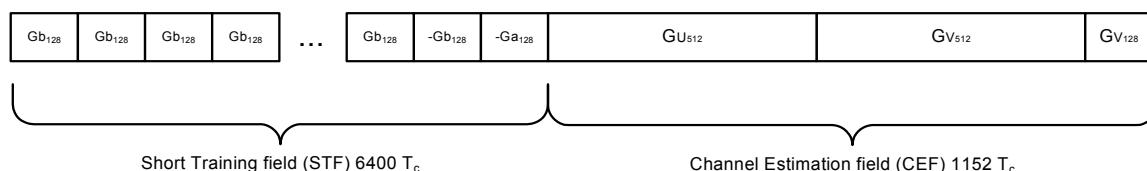

Figure 20-10—DMG control mode preamble

20.4.3.1.2 Short Training field

The Short Training field is composed of 48 repetitions of the sequence $Gb_{128}(n)$ of length 128, followed by a single $-Gb_{128}(n)$ sequence (for synchronization) and then a single $-Ga_{128}(n)$ sequence. The sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined in 20.11.

The waveform for the Short Training field is

$$r_{STF}(nT_c) = \begin{cases} Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 0, 1, \dots, 48 \times 128 - 1 \\ -Gb_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 48 \times 128, \dots, 49 \times 128 - 1 \\ -Ga_{128}(n \bmod 128)\exp\left(j\pi\frac{n}{2}\right) & n = 49 \times 128, \dots, 50 \times 128 - 1 \end{cases}$$

where mod is the modulus operation. Note that sequences $Ga_{128}(n)$ and $Gb_{128}(n)$ are defined for $0 \leq n \leq 127$. For other n they are set to 0.

20.4.3.1.3 Channel Estimation field

The Channel Estimation field is the same as the Channel Estimation field of the DMG SC mode, as defined in Figure 20-6 of 20.3.6.3.

20.4.3.2 Header

20.4.3.2.1 General

In the DMG control mode, the preamble is followed by the header block. The header consists of several fields that define the details of the PPDU to be transmitted.

The header fields are described in Table 20-11.

Table 20-11—DMG control mode header fields

| Field name | Number of bits | Starting bit | Description |
|-------------------------------------|----------------|--------------|--|
| Differential encoder initialization | 1 | 0 | Used to initialize the differential encoding. |
| Scrambler Initialization | 4 | 1 | Bits X1–X4 of the initial scrambler state. |
| Length | 10 | 5 | Number of data octets in the PSDU. Range 14–1023. |
| Packet Type | 1 | 15 | As defined in Table 20-17. |
| Training Length | 5 | 16 | Length of the training field. The use of this field is defined in 20.10.2.2.3. |

Table 20-11—DMG control mode header fields (continued)

| Field name | Number of bits | Starting bit | Description |
|---------------|----------------|--------------|---|
| Turnaround | 1 | 21 | As defined in Table 20-1. |
| Reserved bits | 2 | 22 | |
| HCS | 16 | 24 | Header Check sequence. Calculation of the header check sequence is defined in 20.3.7. |

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

20.4.3.2.2 Generation of HCS bits

The header check sequence (HCS) is calculated over bits 0-23 and uses CRC 16-CCITT as described in 20.3.7.

20.4.3.2.3 Header encoding and modulation

The header bits followed by the HCS bits are prepended to the data field bits and passed into the data field encoder per 20.4.3.3. The minimal payload length is 14 octets.

20.4.3.3 Data field

20.4.3.3.1 General

The Data field consists of the payload data of the PSDU. The PSDU is scrambled, encoded, modulated and spread as described in the following subclauses.

20.4.3.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9. Bits x1, x2, x3, x4 of the scrambler shift register are initialized using the bits in the scrambler initialization bits from the header, bits x5, x6, x7 are set to 1. The header is scrambled starting from bit 5. The scrambling of the data field continues the scrambling of the header with no reset.

20.4.3.3.3 Encoder

The DMG control mode header and data is encoded using an effective LDPC code rate less than or equal to 1/2, generated from the data PHY rate 3/4 LDPC parity check matrix, with shortening. The following steps are used for the encoding:

- 1) $L_{CWD} = 168$ is the maximal number of data bits in each LDPC codeword. $L_{HDR}=5$ is the length of the header (including HCS) in octets. $L_{FDCW}=6$ is the length of the additional data in the first LDPC codeword in octets.
- 2) The total (header and additional data) number of bits in the first LDPC codeword is $L_{DPFCW} = (L_{HDR} + L_{FDCW}) \times 8 = 88$.

- 3) The number of LDPC codewords is $N_{CW} = 1 + \left\lceil \frac{(Length - 6) \times 8}{L_{CWD}} \right\rceil$.
- 4) The number of bits in the second and any subsequent LDPC codeword (if present), except the last, is $L_{DPCW} = \left\lceil \frac{(Length - 6) \times 8}{N_{CW} - 1} \right\rceil$.
- 5) The number of bits in the last LDPC codeword is $L_{DPLCW} = (Length - 6) \times 8 - (N_{CW} - 2) \times L_{DPCW}$.

NOTE—For example, if $Length = 128$, then $N_{CW} = 1 + \left\lceil \frac{(128 - 6) \times 8}{L_{CWD}} \right\rceil = 7$, $L_{DPCW} = 163$, and

$L_{DPLCW} = 161$. In the first LDPC block, the 88 bits of L_{DPFCW} consist of 40 header+HCS bits along with 48 bits of the data.

20.4.3.3.4 Modulation

The scrambled and coded bit stream is converted into a stream of complex constellation points using differential binary phase shift keying (DBPSK) as follows.

The encoded bit stream $[c_0, c_1, c_2, c_3, c_4, \dots]$ is converted to the nondifferential stream $s(k) = 2c_k - 1$. The differential sequence is created by setting $d(k) = s(k) \times d(k - 1)$. For the differential encoding purposes $d(-1)$ is defined to be 1. $s(0)$ is the first bit of the encoded header bits.

20.4.3.3.5 Spreading

The constellation points are spread using the sequence $Ga_{32}(n)$, which is defined in 20.11.

The waveform for the modulated and spread data field is

$$r_{DATA}(nT_c) = \left(Ga_{32}(n \bmod 32) \cdot d\left(\left\lfloor \frac{n}{32} \right\rfloor\right) \exp\left(j\pi\frac{n}{2}\right) \right), n = 0, 1, 2, \dots$$

where $d(k)$ is the modulated constellation point k .

20.4.4 Performance requirements

20.4.4.1 Transmit requirements

20.4.4.1.1 Introduction

Transmitter performance requirements of the DMG control mode are defined in 20.4.4.1.2.

20.4.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc. The instrumentation shall perform carrier lock, symbol timing recovery, and amplitude adjustment while making the measurements. The instrumentation shall incorporate a rake receiver or equalizer to minimize error resulting from multipath. If used, the equalizer

shall be trained using information in the preamble (STF and/or CEF). For the DMG control mode EVM, the signal is first de-spread using G_{32} . The EVM is then calculated on the resulting symbols according to the formula below:

$$EVM = 20\log_{10}\left(\sqrt{\left(\frac{1}{N_s P_{avg}} \sum_{i=1}^{N_s} [(I_i - I_i^*)^2 + (Q_i - Q_i^*)^2]\right)}\right)$$

where

- N_S is the number of symbols to be measured
- N_S should be greater than 511
- P_{avg} is the average power of the constellation
- (I_i, Q_i) is the complex coordinates of the measured symbol i
- (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The EVM shall not exceed a data-rate dependent value according to Table 20-12.

Table 20-12—DMG control mode EVM requirements

| MCS index | Description | EVM value [dB] |
|-----------|-----------------------------|----------------|
| 0 | DMG control mode modulation | -6 |

20.4.4.2 Receive requirements

20.4.4.2.1 Introduction

Subclause 20.4.4.2 describes the performance requirement from the DMG control mode receiver.

20.4.4.2.2 CCA

The start of a valid DMG control mode transmission at a receive level greater than -68dBm shall cause CCA to indicate busy with a probability > 90% within 3 μ s.

20.5 DMG OFDM mode

20.5.1 Introduction

Transmission and reception of DMG OFDM mode PPDU is optional. The use of the DMG OFDM mode is obsolete. Consequently, this option may be removed in a later revision of the standard.

20.5.2 PPDU format

An OFDM frame is composed of the Short Training field (STF), the channel estimation field (CE), the Header, OFDM symbols and optional training fields (see 20.10.2.2.2), as shown in Figure 20-11.

Figure 20-11—OFDM frame format

20.5.3 Transmission

20.5.3.1 Header

20.5.3.1.1 General

In the DMG OFDM mode, the preamble is followed by the PHY header. The PHY header consists of several fields that define the details of the PPDU being transmitted. The encoding and modulation of the header is described in 20.5.3.1.4.

The header fields are described in Table 20-13.

Table 20-13—DMG OFDM mode header fields

| Field name | Number of bits | Start bit | Description |
|--------------------------|----------------|-----------|--|
| Scrambler Initialization | 7 | 0 | Bits X1–X7 of the initial scrambler state. |
| MCS | 5 | 7 | Index into the Modulation and Coding Scheme table. |
| Length | 18 | 12 | Number of data octets in the PSDU. Range 1–262 143. |
| Additional PPDU | 1 | 30 | Contains a copy of the parameter ADD-PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU. |
| Packet Type | 1 | 31 | See the definition in Table 20-17. |
| Training Length | 5 | 32 | <p>Corresponds to the TXVECTOR parameter TRN-LEN.</p> <p>If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.10.2.2.3. A value of 0 indicates that no training field is present in this PPDU.</p> <p>If the Beam Tracking Request field is 1 and the Packet Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the Packet Type field is 0, the Training Length field indicates the length of the training field requested for receive training.</p> |

Table 20-13—DMG OFDM mode header fields (continued)

| Field name | Number of bits | Start bit | Description |
|-----------------------|----------------|-----------|---|
| Aggregation | 1 | 37 | Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0. |
| Beam Tracking Request | 1 | 38 | Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST. Set to 1 to indicate the need for beam tracking (10.38.7); otherwise, set to 0. The Beam Tracking Request field is reserved when the Training Length field is 0. |
| Tone Pairing Type | 1 | 39 | Set to 0 to indicate Static Tone Pairing (20.5.3.2.4.6.2); Set to 1 to indicate Dynamic Tone Pairing (20.5.3.2.4.6.3). Only valid if MCS field value is in the range 13 to 17; otherwise reserved. |
| DTP Indicator | 1 | 40 | Bit flip used to indicate DTP update. Only valid when the Tone Pairing Type field is 1 and the MCS field value is in the range 13 to 17; otherwise reserved. |
| Last RSSI | 4 | 41 | Contains a copy of the parameter LAST_RSSI from the TXVECTOR. The value is an unsigned integer: — Values of 2 to 14 represent power levels $(-71 + \text{value} \times 2)$ dBm. — A value of 15 represents a power greater than or equal to -42 dBm. — A value of 1 represents a power less than or equal to -68 dBm. Value of 0 indicates that the previous packet was not received a SIFS before the current transmission. |
| Turnaround | 1 | 45 | As defined in Table 20-1. |
| Reserved | 2 | 46 | |
| HCS | 16 | 48 | Header check sequence. Definition of this field calculation is in 20.5.3.1.3. |

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

20.5.3.1.2 Modulation and coding scheme

The modulation and coding scheme (MCS) field specifies the modulation and code rate used in the PPDU. The modulation and coding schemes for OFDM modulations are defined in Table 20-14.

A device that supports OFDM shall support MCSs 13-17 for both transmit and receive.

Table 20-14—DMG OFDM mode modulation and coding schemes

| MCS index | Modulation | Code rate | N _{BPSC} | N _{CBPS} | N _{DBPS} | Data rate (Mb/s) |
|-----------|------------|-----------|-------------------|-------------------|-------------------|------------------|
| 13 | SQPSK | 1/2 | 1 | 336 | 168 | 693.00 |
| 14 | SQPSK | 5/8 | 1 | 336 | 210 | 866.25 |
| 15 | QPSK | 1/2 | 2 | 672 | 336 | 1386.00 |
| 16 | QPSK | 5/8 | 2 | 672 | 420 | 1732.50 |
| 17 | QPSK | 3/4 | 2 | 672 | 504 | 2079.00 |
| 18 | 16-QAM | 1/2 | 4 | 1344 | 672 | 2772.00 |
| 19 | 16-QAM | 5/8 | 4 | 1344 | 840 | 3465.00 |
| 20 | 16-QAM | 3/4 | 4 | 1344 | 1008 | 4158.00 |
| 21 | 16-QAM | 13/16 | 4 | 1344 | 1092 | 4504.50 |
| 22 | 64-QAM | 5/8 | 6 | 2016 | 1260 | 5197.50 |
| 23 | 64-QAM | 3/4 | 6 | 2016 | 1512 | 6237.00 |
| 24 | 64-QAM | 13/16 | 6 | 2016 | 1638 | 6756.75 |

20.5.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7.

20.5.3.1.4 Header encoding and modulation

The header is encoded using a single OFDM symbol. The bits are scrambled and encoded as follows:

- 1) The 64 header bits (B_1, B_2, \dots, B_{LH}), where $LH = 64$, are scrambled as described in 20.3.9, starting from the eighth bit, to create $\mathbf{q}=(q_1,q_2,\dots,q_{LH})$.
- 2) The sequence \mathbf{q} is padded with 440 zeros to obtain a total of 504 bits, $(q_1,q_2,\dots,q_{LH},0_{LH+1},0_{LH+2},\dots,0_{504})$, which are then encoded using the rate 3/4 LDPC code as described in 20.5.3.2.3.3. 168 parity bits, p_1,p_2,\dots,p_{168} , are generated.
- 3) A sequence \mathbf{c}_1 is generated as $(q_1,q_2,\dots,q_{LH},p_9,p_{10},\dots,p_{168})$.
- 4) A sequence \mathbf{c}_2 is generated as $(q_1,q_2,\dots,q_{LH},p_1,p_2,\dots,p_{84}, p_{93},p_{94},\dots,p_{168})$ XORed with a one-time pad sequence generated using the scrambler defined in 20.3.9, with the shift register initialized to all 1s.
- 5) A sequence \mathbf{c}_3 is generated as $(q_1,q_2,\dots,q_{LH},p_1,p_2,\dots,p_{160})$ XORed with the continuation of the one-time pad sequence generated in step 4).
- 6) The sequences $\mathbf{c}_1, \mathbf{c}_2$ and \mathbf{c}_3 are concatenated to form the 672-bit sequence $\mathbf{c}=(c_1,c_2,c_3,\dots,c_{672})=(\mathbf{c}_1, \mathbf{c}_2, \mathbf{c}_3)$.

- 7) The 672-bit sequence, \mathbf{c} , is then mapped as QPSK as described in 20.5.3.2.4.3, pilots are inserted as described in 20.5.3.2.5 and the resulting sequence $d_0, d_1, \dots, d_{SD-1}$ is modulated as an OFDM symbol as follows:

$$r_{Header}(qT_s) = \frac{1}{\sqrt{N_{Tones}}} w_{T_{SYM}}(qT_s) \sum_{k = -N_{SR}}^{N_{SR}} (D_k + p_1 P_k) \exp(j2\pi k \Delta_F (qT_s - T_{GI}))$$

where p_1 and P_k are defined in 20.5.3.2.5 and D_k is defined in 20.5.3.2.6.

20.5.3.2 Data field

20.5.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.5.3.2.3.

20.5.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9. The scrambling of the data field continues the scrambling of the header with no reset.

20.5.3.2.3 Encoding

20.5.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. LDPC is a block code. Each block of bits (B_1, B_2, \dots, B_k) is concatenated with a block of parity bits $(p_1, p_2, \dots, p_{n-k})$ to create a codeword $\mathbf{c} = (B_1, B_2, \dots, B_k, p_1, p_2, \dots, p_{n-k})$ such that $\mathbf{H}\mathbf{c}^T = \mathbf{0}$. \mathbf{H} is an $(n-k) \times n$ parity check matrix. The block size n is 672 bits. The code rate, R , is equal to k/n . The set of code rates is defined in Table 20-15. The parity check matrices are defined in 20.5.3.2.3.2. The encoding process is defined in 20.5.3.2.3.3.

Table 20-15—LDPC code rates

| Code rate | Codeword size | Number of data bits |
|-----------|---------------|---------------------|
| 1/2 | 672 | 336 |
| 5/8 | 672 | 420 |
| 3/4 | 672 | 504 |
| 13/16 | 672 | 546 |

20.5.3.2.3.2 Parity check matrices

See 20.3.8.

20.5.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps including determining the number of padding bits, padding with zeros and the coding of every word.

- 1) First the total number of padding bits N_{PAD} is calculated, using the number of LDPC codeword N_{CW} and the number of OFDM symbols N_{SYM} :

$$N_{CW} = \left\lceil \frac{\text{Length} \times 8}{L_{CW} \times R} \right\rceil$$

$$N_{SYM} = \left\lceil \frac{N_{CW} \times L_{CW}}{N_{CBPS}} \right\rceil$$

If BRP packet and $N_{SYM} < \text{aBRPminOFDMblocks}$; $N_{SYM} = \text{aBRPminOFDMblocks}$

$$N_{PAD} = R \times N_{SYM} \times N_{CBPS} - \text{Length} \times 8$$

$$\text{Recalculate } N_{CW} = N_{SYM} \cdot \frac{N_{CBPS}}{L_{CW}}$$

where $L_{CW}=672$ is the LDPC codeword length, Length is the length of the PSDU defined in the header field, R is the code rate and N_{CBPS} is the number of code bits per symbol as defined in the MCS table.

- 2) The PSDU is concatenated with N_{PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU.
- 3) The output stream of the scrambler is broken into blocks of $L_{CWD}=R \times L_{CW}$ bits such as the m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \dots, b_{L_{CWD}}^{(m)})$.
- 4) To each data word, $n-k=L_{CW}R \times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \dots, p_{n-k}^{(m)})$ are added to create the codeword $c^{(m)} = (b_1^{(m)}, b_2^{(m)}, \dots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \dots, p_{n-k}^{(m)})$ such that $\mathbf{H}c^{(m)\top} = 0$.
- 5) The codewords are the concatenated one after the other to create the coded bits stream $(c_1, c_2, \dots, c_{N_{SYM} \times N_{CBPS}})$.

20.5.3.2.4 Modulation mapping

20.5.3.2.4.1 General

The coded bits are mapped to complex constellation points for the modulation specified in the MCS as described in the following subclauses.

20.5.3.2.4.2 SQPSK modulation

In SQPSK (Spread QPSK) modulation, the input stream is broken into groups of N_{CBPS} bits –

$(c_0^{(q)}, c_1^{(q)}, \dots, c_{N_{CBPS}-1}^{(q)})$. Each pair of bits $(c_{2k}^{(q)}, c_{2k+1}^{(q)})$, $k = 0, 1, \dots, \frac{N_{CBPS}}{2} - 1$ is converted into a

complex constellation point $a_k^{(q)} = \frac{1}{\sqrt{2}}((2c_{2k}^{(q)} - 1) + j(2c_{2k+1}^{(q)} - 1))$. This generates the constellation points

for half the OFDM subcarriers. For the other subcarriers, $d_{P(k)}^{(q)} = \text{conj}(d_k^{(q)})$ for $k = 0, 1, \dots, \frac{N_{CBPS}}{2} - 1$

where the indices $P(k)$, in the range $N_{CBPS}/2$ to $N_{CBPS} - 1$, are as defined in 20.5.3.2.4.6.

20.5.3.2.4.3 QPSK modulation

- a) The input stream is broken into groups of N_{CBPS} bits – $(c_0^{(q)}, c_1^{(q)}, \dots, c_{N_{CBPS}-1}^{(q)})$. Each group of four bits $(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)})$ is converted into two complex constellation points $x_{2k}^{(q)} = \frac{1}{\sqrt{2}}((2c_{4k}^{(q)} - 1) + j(2c_{4k+2}^{(q)} - 1))$, $x_{2k+1}^{(q)} = \frac{1}{\sqrt{2}}((2c_{4k+1}^{(q)} - 1) + j(2c_{4k+3}^{(q)} - 1))$. The block $\left(x_0^{(q)}, x_1^{(q)}, \dots, x_{\frac{N_{CBPS}}{2}-1}^{(q)}\right)$ is created.
- b) Each pair of constellation points $(x_{2k}^{(q)}, x_{2k+1}^{(q)}), k = 0, 1, \dots, \frac{N_{SD}}{2} - 1$ is converted into $[d_k^{(q)}, d_{P(k)}^{(q)}] = Q[x_{2k}^{(q)}, x_{2k+1}^{(q)}]$ where the matrix $Q = \frac{1}{\sqrt{5}} \begin{bmatrix} 1 & 2 \\ -2 & 1 \end{bmatrix}$ and the indices $P(k)$, in the range $N_{SD}/2$ to $N_{SD} - 1$, are as defined in 20.5.3.2.4.6.
- c) The output is the stream of blocks $(d_0^{(q)}, d_1^{(q)}, \dots, d_{N_{SD}-1}^{(q)}), q = 1, \dots, N_{SYM}$.

20.5.3.2.4.4 16-QAM modulation

The input stream is broken into groups of N_{CBPS} bits $(c_0^{(q)}, c_1^{(q)}, \dots, c_{N_{CBPS}-1}^{(q)})$. Each group of eight bits

$(c_{4k}^{(q)}, c_{4k+1}^{(q)}, c_{4k+2}^{(q)}, c_{4k+3}^{(q)}, c_{4k+2N_{SD}}^{(q)}, c_{4k+1+2N_{SD}}^{(q)}, c_{4k+2+2N_{SD}}^{(q)}, c_{4k+3+2N_{SD}}^{(q)}), k = 0, 1, 2, \dots, \frac{N_{SD}}{2} - 1$ is

converted into two complex constellation points $(x_{2k}^{(q)}, x_{2k+1}^{(q)})$ such that

$$\begin{aligned} x_{2k}^{(q)} &= \frac{1}{\sqrt{10}} \{ [(4c_{4k}^{(q)} - 2) - (2c_{4k}^{(q)} - 1)(2c_{4k+1}^{(q)} - 1)] \\ &\quad + j[(4c_{4k+2}^{(q)} - 2) - (2c_{4k+2}^{(q)} - 1)(2c_{4k+3}^{(q)} - 1)] \} \end{aligned}$$

and

$$\begin{aligned} x_{2k+1}^{(q)} &= \frac{1}{\sqrt{10}} \{ [(4c_{4k+2N_{SD}}^{(q)} - 2) - (2c_{4k+2N_{SD}}^{(q)} - 1)(2c_{4k+1+2N_{SD}}^{(q)} - 1)] \\ &\quad + j[(4c_{4k+2+2N_{SD}}^{(q)} - 2) - (2c_{4k+2+2N_{SD}}^{(q)} - 1)(2c_{4k+3+2N_{SD}}^{(q)} - 1)] \} \end{aligned}$$

The output is the stream of blocks $(x_0^{(q)}, x_1^{(q)}, \dots, x_{N_{SD}-1}^{(q)}), q = 0, 1, \dots, N_{SYM}-1$.

20.5.3.2.4.5 64-QAM modulation

The input stream is broken into groups of N_{CBPS} bits $(c_0^{(q)}, c_1^{(q)}, \dots, c_{N_{CBPS}-1}^{(q)})$. The constellation point for the k 'th subcarrier in the q 'th symbol is

$$d_k^{(q)} = \frac{1}{\sqrt{42}}((8c_{6m}^{(q)} - 4) - (2c_{6m}^{(q)} - 1)(4c_{6m+1}^{(q)} - 2) + (2c_{6m}^{(q)} - 1)(2c_{6m+1}^{(q)} - 1)(2c_{6m+2}^{(q)} - 1)) \\ + j\left(\frac{1}{\sqrt{42}}((8c_{6m+3}^{(q)} - 4) - (2c_{6m+3}^{(q)} - 1)(4c_{6m+4}^{(q)} - 2) + (2c_{6m+3}^{(q)} - 1)(2c_{6m+4}^{(q)} - 1)(2c_{6m+5}^{(q)} - 1))\right)$$

$$m = 112(k \bmod 3) + \left\lfloor \frac{k}{3} \right\rfloor, k = 0, 1, \dots, N_{SD}-1$$

NOTE—This mapping provides interleaving between three LDPC codewords on a subcarrier basis.

The mapping is shown in Figure 20-12.

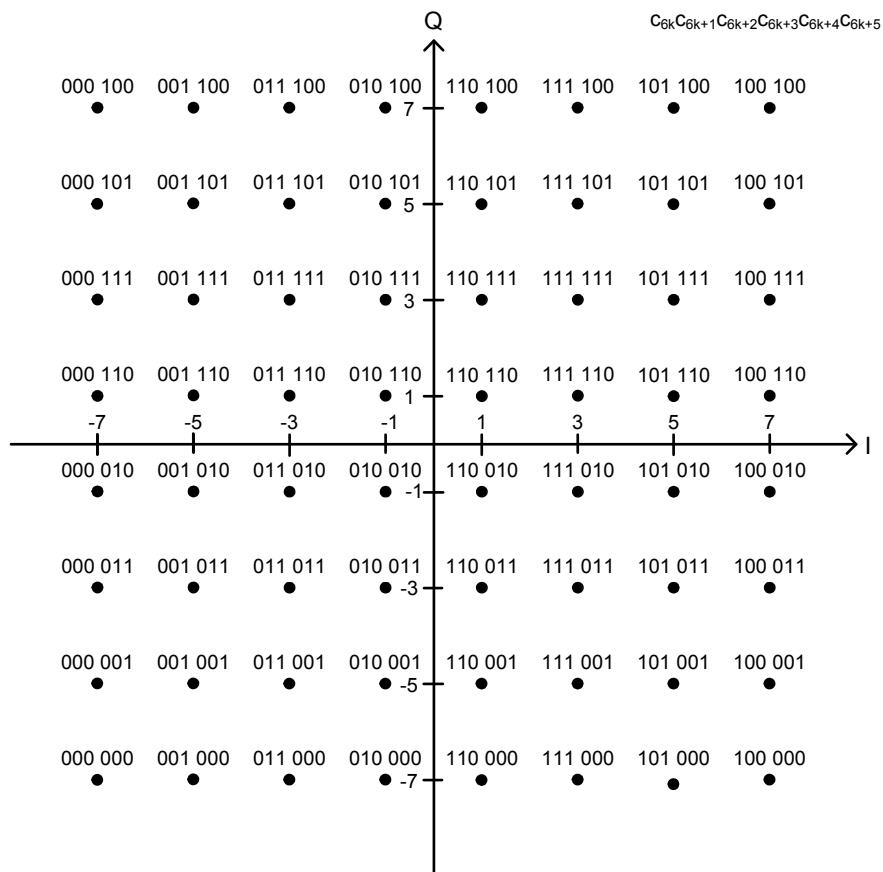

Figure 20-12—64-QAM modulation mapping

20.5.3.2.4.6 Tone pairing for SQPSK and QPSK

20.5.3.2.4.6.1 General

When SQPSK or QPSK modulations are employed in OFDM, bit sequences are mapped to pairs of symbols $(d_k^{(q)}, d_{P(k)}^{(q)})$ where k is in the range $0 \leq k \leq \frac{N_{SD}}{2} - 1$ and $P(k)$ is in the range $\frac{N_{SD}}{2} \leq P(k) \leq N_{SD} - 1$ in order to exploit frequency diversity. The indices k and $P(k)$ determine which pair of OFDM subcarriers each pair of symbols are carried on.

All DMG modes shall support Static Tone Pairing (STP) where a constant mapping between k and $P(k)$ is employed. The PHY header is always encoded using STP.

A STA may employ Dynamic Tone Pairing (DTP) where the mapping between k and $P(k)$ are determined by the receiving STA and fed back to the transmitting STA. A STA may use DTP when transmitting to a DTP-capable STA, from which it has received DTP feedback.

20.5.3.2.4.6.2 Static tone pairing (STP)

When applied to the payload, STP is indicated by the value 0 in the Tone Pairing Type field in the PHY header. STP is always applied to the PHY header.

When STP is applied, the QPSK or SQPSK symbol-pair indices k and $P(k)$ are such that

$$P(k) = k + \frac{N_{SD}}{2} \text{ for } k = 0, 1, 2, \dots, \frac{N_{SD}}{2} - 1$$

20.5.3.2.4.6.3 Dynamic tone pairing (DTP)

When applied, DTP is indicated by the value 1 in the Tone Pairing Type field in the PHY header. DTP can be applied only to the payload of a PPDU employing MCS 13-17.

When DTP is applied, the SQPSK symbol-pair indices, k and $P(k)$, are such that

$$P(k) = \text{ToneIndexOffset}\left(\left\lfloor \frac{k}{N_{TPG}} \right\rfloor\right) + \text{mod}(k, N_{TPG}) \text{ for } k = 0, 1, 2, \dots, \frac{N_{SD}}{2} - 1$$

where

N_{TPG} denotes the number of tones per group

$\text{ToneIndexOffset}(l)$ denotes the starting index of the l -th group of tone pairs, for $l = 0, 1, 2, \dots, \frac{N_{SD}}{N_{TPG}} - 1$

The values of N_{TPG} and $\text{ToneIndexOffset}(l)$ for $l = 0, 1, 2, \dots, \frac{N_{SD}}{N_{TPG}} - 1$ are derived from the DTP Report element (9.4.2.146) included in the last received DTP Report frame (9.6.20.9).

The number of tone-pairs per group, N_{TPG} , is derived as

$$N_{TPG} = \frac{N_{SD}}{2N_G}$$

where

N_G is the number of DTP groups, which is equal to 42

The tone index offsets, $\text{ToneIndexOffset}(l)$, are derived as

$$\text{ToneIndexOffset}(l) = N_{TPG} \times \text{GroupPairIndex}(l) + \frac{N_{SD}}{2}$$

where

$\text{GroupPairIndex}(l)$ is the value of the GroupPairIndex(l) subfield of the DTP Report element

20.5.3.2.5 Pilot sequence

Pilot tones are inserted at tones $-150, -130, -110, -90, -70, -50, -30, -10, 10, 30, 50, 70, 90, 110, 130, 150$. The values of the pilots at these tones is $[-1, 1, -1, 1, 1, -1, -1, -1, -1, 1, 1, 1, -1, 1, 1]$, respectively. The pilot sequence P is created by creating a sequence of zeros corresponding to tones $-N_{SR}$ to N_{SR} . The pilots are then inserted at the corresponding tones with the values specified above.

At OFDM symbol n the pilot sequence is multiplied by the value $2 \times p_n - 1$, where p_n is the value generated by the shift register defined in 20.5.3.2.2 if x_1, x_2, \dots, x_7 are all set to 1 at the first OFDM symbol.

20.5.3.2.6 OFDM modulation

The stream of complex constellation points d_k is broken into groups of N_{SD} points $d_{m,n}$ where $m=1,2,\dots,N_{SD}$ and $n=1,2,\dots,N_{SYM}$. The baseband signal for the data phase is

$$r_{DATA}(qT_s) = \frac{1}{\sqrt{N_{Tones}}} \sum_{n=1}^{N_{SYM}} w_{T_{SYM}}(qT_s - (n-1)T_{SYM}) \sum_{k=-N_{SR}}^{N_{SR}} (D_{k,n} + p_{n+1}P_k) \exp(j2\pi k \Delta_F (qT_s - (n-1)T_{SYM} - T_{GI}))$$

where

p_n, P are defined in 20.5.3.2.5

$N_{Tones} = N_{ST} - N_{DC}$ is the number of active subcarriers

$$D_{k,n} = \begin{cases} 0 & k = 0, \pm 1, \pm 10, \pm 30, \pm 50, \pm 70, \pm 90, \pm 110, \pm 130, \pm 150 \\ d_{M(k),n} & \text{Otherwise} \end{cases}$$

$$M(k) = \begin{cases} k + 178 & -177 \leq k \leq -151 \\ k + 177 & -149 \leq k \leq -131 \\ k + 176 & -129 \leq k \leq -111 \\ k + 175 & -109 \leq k \leq -91 \\ k + 174 & -89 \leq k \leq -71 \\ k + 173 & -69 \leq k \leq -51 \\ k + 172 & -49 \leq k \leq -31 \\ k + 171 & -29 \leq k \leq -11 \\ k + 170 & -9 \leq k \leq -2 \\ k + 167 & 2 \leq k \leq 9 \\ k + 166 & 11 \leq k \leq 29 \\ k + 165 & 31 \leq k \leq 49 \\ k + 164 & 51 \leq k \leq 69 \\ k + 163 & 71 \leq k \leq 89 \\ k + 162 & 91 \leq k \leq 109 \\ k + 161 & 111 \leq k \leq 129 \\ k + 160 & 131 \leq k \leq 149 \\ k + 159 & 151 \leq k \leq 177 \end{cases}$$

The header symbol uses p_n with $n = 1$.

20.5.4 Performance requirements

20.5.4.1 Transmit requirements

20.5.4.1.1 Introduction

This subclause describes the performance requirement from the DMG OFDM mode transmitter.

20.5.4.1.2 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or an equivalent procedure:

- a) Start of frame shall be detected.
- b) Transition from short sequences to channel estimation sequences shall be detected, and fine timing (with one sample resolution) shall be established.
- c) Frequency offsets shall be estimated and corrected.
- d) The frame shall be de-rotated according to estimated frequency offset.
- e) The complex channel response coefficients shall be estimated for each of the subcarriers using information contained in the preamble (STF and/or CEF).

- f) For each of the OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to estimated phase, and divide each subcarrier value with a complex estimated channel response coefficient.
- g) For subcarrier, compute the Euclidean distance to the ideal location for the symbol, or pilot.
- h) Compute the RMS average of all errors in a packet. It is given by

$$EVM = 20 \log_{10} \left(\frac{1}{N_f} \sum_{i=1}^{N_f} \sqrt{\frac{\sum_{j=1}^{N_{SYM}} \sum_{k \in K} [(I(i,j,k) - I^*(i,j,k))^2 + (Q(i,j,k) - Q^*(i,j,k))^2]}{(N_{ST} - N_{DC}) N_{SYM} P_0}} \right)$$

where

- N_f is the number of frames
- i is the frame index
- k is the carrier index
- K is the set of pilot and data subcarriers {1,2, ..., ($N_{SR} - 1$), ($N_{SR} + N_{DC}$), ($N_{SR} + N_{DC} + 1$), ..., N_{ST} }
- j is the symbol index
- N_{SYM} is the number of symbols
- N_{ST} is the total number of subcarriers
- I^*, Q^* is the ideal constellation point for I and Q, respectively
- P_0 is the average power of the constellation (I^*, Q^*) computed over the i^{th} frame

The measurements shall occur only on the OFDM symbols, the measurement shall be performed on at least 10 frames with 16 symbols at least in each of them. Random data shall be used.

The EVM RMS error shall not exceed an MCS dependent value as found in Table 20-16.

Table 20-16—DMG OFDM mode EVM requirements

| MCS index | Modulation | Coding rate | EVM value [dB] |
|-----------|------------|-------------|----------------|
| 13 | SQPSK | 1/2 | -7 |
| 14 | SQPSK | 5/8 | -9 |
| 15 | QPSK | 1/2 | -10 |
| 16 | QPSK | 5/8 | -11 |
| 17 | QPSK | 3/4 | -13 |
| 18 | 16-QAM | 1/2 | -15 |
| 19 | 16-QAM | 5/8 | -17 |
| 20 | 16-QAM | 3/4 | -19 |
| 21 | 16-QAM | 13/16 | -20 |

Table 20-16—DMG OFDM mode EVM requirements (continued)

| MCS index | Modulation | Coding rate | EVM value [dB] |
|-----------|------------|-------------|----------------|
| 22 | 64-QAM | 5/8 | -22 |
| 23 | 64-QAM | 3/4 | -24 |
| 24 | 64-QAM | 13/16 | -26 |

20.5.4.1.3 Tx flatness

When using the DMG OFDM mode and only while transmitting OFDM symbols, the average energy of the OFDM Symbols constellations in each of the subcarriers with indices -146 to -2 and +2 to +145 shall deviate no more than ± 2 dB from their average energy. The average energy of the constellations in each of the subcarriers with indices -147 to -177 and +147 to +177 shall deviate no more than +2/-4 dB from the average energy of subcarriers with indices -177 to -2 and +2 to +177.

20.5.4.1.4 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

- MULTICHANNEL_SAMPLING_RATE is 2640×10^6 sample/s
- FIRST_TRANSITION_FIELD is Short Training field
- SECOND_TRANSITION_FIELD is Channel Estimation field
- TRAINING_FIELD is Channel Estimation field
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

20.5.4.2 Receive requirements

20.5.4.2.1 Introduction

Subclause 20.5.4.2 describes the performance requirement for an OFDM receiver.

20.5.4.2.2 CCA

The start of a valid DMG OFDM mode or DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (-68 dBm) shall cause CCA to indicate busy with a probability >90% within 1 μ s.

20.6 DMG SC mode

20.6.1 Introduction

Transmission and reception of DMG SC mode PPDUs is mandatory for selected MCSs.

20.6.2 PPDU format

A SC frame is composed of the Short Training field (STF), the channel estimation field (CE), the Header, SC blocks and optional training fields, as shown in Figure 20-13.

Figure 20-13—SC frame format

20.6.3 Transmission

20.6.3.1 Header

20.6.3.1.1 General

In the DMG SC mode, the preamble is followed by the header. The header consists of several fields that define the details of the PPDU to be transmitted. The encoding and modulation of the header is described in 20.6.3.1.4.

The header fields are described in Table 20-17.

Table 20-17—DMG SC mode header fields

| Field name | Number of bits | Start bit | Description |
|--------------------------|----------------|-----------|--|
| Scrambler Initialization | 7 | 0 | Bits X1–X7 of the initial scrambler state. |
| Base MCS | 5 | 7 | Modulation and Coding Scheme (see Table 20-19) |
| Length | 18 | 12 | If the Extended SC MCS Indication field is 0, indicates the number of data octets in the PSDU; range 1–262 143. If the Extended SC MCS Indication field is 1, the Length field value is set to $\text{Base_Length1} - \lfloor (\text{Base_Length2} - N)/4 \rfloor$, where N is the number of data octets in the PSDU, and Base_Length1 and Base_Length2 are computed according to Table 20-18. The number of data octets in the PSDU shall not exceed 262 143. |
| Additional PPDU | 1 | 30 | Contains a copy of the parameter ADD-PPDU from the TXVECTOR. A value of 1 indicates that this PPDU is immediately followed by another PPDU with no IFS or preamble on the subsequent PPDU. A value of 0 indicates that no additional PPDU follows this PPDU. |
| Packet Type | 1 | 31 | Corresponds to the TXVECTOR parameter PACKET-TYPE. <ul style="list-style-type: none"> — Packet Type = 0 (BRP-RX packet, see 20.10.2.2.3), indicates either a PPDU whose data part is followed by one or more TRN subfields (when the Beam Tracking Request field is 0 or in DMG control mode), or a PPDU that contains a request for TRN subfields to be appended to a future response PPDU (when the Beam Tracking Request field is 1). — Packet Type = 1 (BRP-TX packet, see 20.10.2.2.3), indicates a PPDU whose data part is followed by one or more TRN subfields. The transmitter may change AWV at the beginning of each TRN subfield. <p>The field is reserved when the Training Length field is 0.</p> |

Table 20-17—DMG SC mode header fields (continued)

| Field name | Number of bits | Start bit | Description |
|----------------------------|----------------|-----------|--|
| Training Length | 5 | 32 | <p>Corresponds to the TXVECTOR parameter TRN-LEN.</p> <p>If the Beam Tracking Request field is 0, the Training Length field indicates the length of the training field. The use of this field is defined in 20.10.2.2.3. A value of 0 indicates that no training field is present in this PPDU.</p> <p>If the Beam Tracking Request field is 1 and the Packet Type field is 1, the Training Length field indicates the length of the training field appended to this PPDU. If the Packet Type field is 0, the Training Length field indicates the length of the training field requested for receive training.</p> |
| Aggregation | 1 | 37 | Set to 1 to indicate that the PPDU in the data portion of the packet contains an A-MPDU; otherwise, set to 0. |
| Beam Tracking Request | 1 | 38 | <p>Corresponds to the TXVECTOR parameter BEAM_TRACKING_REQUEST.</p> <p>Set to 1 to indicate the need for beam tracking (10.38.7); otherwise, set to 0.</p> <p>The Beam Tracking Request field is reserved when the Training Length field is 0.</p> |
| Last RSSI | 4 | 39 | <p>Contains a copy of the parameter LAST_RSSI from the TXVECTOR.</p> <p>The value is an unsigned integer:</p> <p>Values 2 to 14 represent power levels $(-71 + \text{value} \times 2)$ dBm.</p> <p>A value of 15 represents a power greater than or equal to -42 dBm.</p> <p>A value of 1 represents a power less than or equal to -68 dBm.</p> <p>A value of 0 indicates that the previous packet was not received a SIFS before the current transmission.</p> |
| Turnaround | 1 | 43 | As defined in Table 20-1. |
| Extended SC MCS Indication | 1 | 44 | <p>The Extended SC MCS Indication field combined with the Base MCS field indicates the MCS.</p> <p>The Extended SC MCS Indication field indicates whether the Length field shall be calculated according to Table 20-18.</p> |
| Reserved | 3 | 45 | |
| HCS | 16 | 48 | Header check sequence |

All of the numeric fields are encoded in unsigned binary, least significant bit first.

Reserved bits are set to 0 by the transmitter and shall be ignored by the receiver.

If the Additional PPDU field is equal to 1, the Training Length field shall be set to 0.

When the MCS belongs to the set {9.1, 12.1, 12.2, 12.3, 12.4, 12.5, 12.6}, bits (X7, X6) of the initial scrambler state are set to $(\text{Base_Length}_2 - N) \bmod 4$, where N is the number of data octets in the PSDU, and Base_Length_2 is computed according to Table 20-18. Bits (X1–X5) are selected in a pseudorandom fashion making sure that at least one bit in X1–X7 is nonzero.

X1–X7 are sent in the Scrambler Initialization field, as defined in 20.6.3.1.4, and 20.6.3.2.2.

Table 20-18—Parameters for computing Length field value in SC header when Extended SC MCS Indication field is set to 1

| MCS | <i>Base_Length1</i> (See NOTES 1 and 2) | <i>Base_Length2</i> (See NOTES 1 and 3) |
|---|--|---|
| 9.1 | $\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 42$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{39} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.1 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 52.5 \right\rfloor$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.2 | $\left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 63$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 112}{39} \right\rfloor \times 68.25 \right\rfloor$ |
| 12.3 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 4}{3} \right\rfloor \times 68.25 \right\rfloor$ | $N_{BLKS} \times 210$ |
| 12.4 | $\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 42$ | $N_{BLKS} \times 252$ |
| 12.5 | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 52.5 \right\rfloor$ | $N_{BLKS} \times 273$ |
| 12.6 | $\left\lfloor \frac{N_{BLKS} \times 8}{3} \right\rfloor \times 63$ | $\left\lfloor \left\lfloor \frac{N_{BLKS} \times 56}{13} \right\rfloor \times 68.25 \right\rfloor$ |
| <p>NOTE 1—N_{BLKS} is the number of symbol blocks defined in 20.6.3.2.3.3.</p> <p>NOTE 2—<i>Base_Length1</i> is the maximum Length value such that the packet with the base MCS specified in SC header has the given N_{BLKS}.</p> <p>NOTE 3—<i>Base_Length2</i> is the maximum number of data octets in PSDU such that the packet with the extended MCS has the given N_{BLKS}.</p> | | |

20.6.3.1.2 Modulation and coding scheme

The modulation and coding scheme defines the modulation and code rate that is used in the PPDU. The modulation and coding schemes for SC are defined in Table 20-19.

Table 20-19—DMG SC mode modulation and coding schemes

| MCS | Base MCS field | Extended SC MCS Indication field | Modulation | N _{CBPS} | Repetition | Code rate | Data rate (Mb/s) |
|-----|----------------|----------------------------------|---------------|-------------------|------------|-----------|------------------|
| 1 | 1 | 0 | $\pi/2$ -BPSK | 1 | 2 | 1/2 | 385 |
| 2 | 2 | 0 | $\pi/2$ -BPSK | 1 | 1 | 1/2 | 770 |
| 3 | 3 | 0 | $\pi/2$ -BPSK | 1 | 1 | 5/8 | 962.5 |

Table 20-19—DMG SC mode modulation and coding schemes (continued)

| MCS | Base MCS field | Extended SC MCS Indication field | Modulation | N _{CBPS} | Repetition | Code rate | Data rate (Mb/s) |
|------|----------------|----------------------------------|-----------------|-------------------|------------|-----------|------------------|
| 4 | 4 | 0 | $\pi/2$ -BPSK | 1 | 1 | 3/4 | 1155 |
| 5 | 5 | 0 | $\pi/2$ -BPSK | 1 | 1 | 13/16 | 1251.25 |
| 6 | 6 | 0 | $\pi/2$ -QPSK | 2 | 1 | 1/2 | 1540 |
| 7 | 7 | 0 | $\pi/2$ -QPSK | 2 | 1 | 5/8 | 1925 |
| 8 | 8 | 0 | $\pi/2$ -QPSK | 2 | 1 | 3/4 | 2310 |
| 9 | 9 | 0 | $\pi/2$ -QPSK | 2 | 1 | 13/16 | 2502.5 |
| 9.1 | 6 | 1 | $\pi/2$ -QPSK | 2 | 1 | 7/8 | 2695 |
| 10 | 10 | 0 | $\pi/2$ -16-QAM | 4 | 1 | 1/2 | 3080 |
| 11 | 11 | 0 | $\pi/2$ -16-QAM | 4 | 1 | 5/8 | 3850 |
| 12 | 12 | 0 | $\pi/2$ -16-QAM | 4 | 1 | 3/4 | 4620 |
| 12.1 | 7 | 1 | $\pi/2$ -16-QAM | 4 | 1 | 13/16 | 5005 |
| 12.2 | 8 | 1 | $\pi/2$ -16-QAM | 4 | 1 | 7/8 | 5390 |
| 12.3 | 9 | 1 | $\pi/2$ -64-QAM | 6 | 1 | 5/8 | 5775 |
| 12.4 | 10 | 1 | $\pi/2$ -64-QAM | 6 | 1 | 3/4 | 6390 |
| 12.5 | 11 | 1 | $\pi/2$ -64-QAM | 6 | 1 | 13/16 | 7507.5 |
| 12.6 | 12 | 1 | $\pi/2$ -64-QAM | 6 | 1 | 7/8 | 8085 |

Transmit and receive support for MCS 4 and below is mandatory. Other MCSs are optional.

20.6.3.1.3 Generation of the HCS bits

Calculation of the HCS for bits 0–47 of the header is defined in 20.3.7.

20.6.3.1.4 Header encoding and modulation

The header is encoded using a two SC block of N_{SPB} symbols with N_{GI} guard symbols. The bits are scrambled and encoded as follows:

- 1) The input header bits (B₁, B₂, ..., B_{LH}), where LH = 64, are scrambled as described in 20.3.9, starting from the eighth bit. to create $\mathbf{d}_{1s} = (q_1, q_2, \dots, q_{LH})$
- 2) The LDPC codeword $\mathbf{c} = (q_1, q_2, \dots, q_{LH}, 0_1, 0_2, \dots, 0_{504-LH}, p_1, p_2, \dots, p_{168})$ is created by concatenating 504-LH zeros to the LH bits of \mathbf{d}_{1s} and then generating the parity bits p₁, p₂, ..., p₁₆₈ such that $\mathbf{H}\mathbf{c}^T = \mathbf{0}$, where \mathbf{H} is the parity check matrix for the rate 3/4 LDPC code specified in 20.6.3.2.3.2.
- 3) Remove bits LH+1 to 504 and bits 665 to 672 of the codeword \mathbf{c} to create the sequence $\mathbf{cs1} = (q_1, q_2, \dots, q_{LH}, p_1, p_2, \dots, p_{160})$.
- 4) Remove bits LH+1 to 504 and bits 657 to 664 of the codeword \mathbf{c} to create the sequence $\mathbf{cs2} = (q_1, q_2, \dots, q_{LH}, p_1, p_2, \dots, p_{152}, p_{161}, p_{162}, \dots, p_{168})$ and then XOR with a PN sequence that is generated

from the LFSR used for data scramblings defined in 20.3.9. The LFSR is initialized to the all 1s vector.

- 5) **cs1** and **cs2** are concatenated to form the sequence (**cs1**, **cs2**). The resulting 448 bits are then mapped as $\pi/2$ -BPSK as described in 20.6.3.2.4.2. The N_{GI} guard symbols are then prepended to the resulting N_{CBPB} symbols as described in 20.6.3.2.5.

The same resulting N_{CBPB} symbols are multiplied by -1 and repeated, and then prepended with N_{GI} guard symbols as described in 20.6.3.2.5. The resulting sequence is then appended after the sequence created in step 5).

20.6.3.2 Data field

20.6.3.2.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses. The amount of padding is defined in 20.6.3.2.3.

20.6.3.2.2 Scrambler

The operation of the scrambler is defined in 20.3.9. The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler.

20.6.3.2.3 Encoding

20.6.3.2.3.1 General

The data are encoded by a systematic LDPC encoder. The LDPC is a block code. Each block of information bits (B_1, B_2, \dots, B_k) is concatenated with a block of parity bits (p_1, p_2, \dots, p_{n-k}) to create a codeword $c = (B_1, B_2, \dots, B_k, p_1, p_2, \dots, p_{n-k})$ such that $\mathbf{H}c^T = \mathbf{0}$, where \mathbf{H} is the $(n-k) \times n$ parity check matrix. The block size n is 672 bits. The code rate, R , is equal to k/n . The set of code rates is defined in Table 20-20. The parity check matrices are defined in 20.6.3.2.3.2. The encoding process is defined in 20.6.3.2.3.3.

Table 20-20—LDPC code rates

| Code rate | Codeword size | Number of data bits |
|-----------|---------------|---------------------|
| 1/2 | 672 | 336 |
| 5/8 | 672 | 420 |
| 3/4 | 672 | 504 |
| 13/16 | 672 | 546 |
| 7/8 | 624 | 546 |

20.6.3.2.3.2 Parity check matrices

See 20.3.8.

20.6.3.2.3.3 LDPC encoding process

The LDPC encoding process is composed of several steps that includes deciding the number of shortening/repetition bits in every codeword, the shortening itself, the coding of each word and then any repetition of bits.

- a) First the total number of data pad bits N_{DATA_PAD} is calculated, using the number of LDPC codewords N_{CW} :

$$N_{CW} = \left\lceil \frac{\frac{Length \cdot 8}{L_{CW} \cdot R}}{\rho} \right\rceil$$

if BRP packet and $N_{CW} < N_{CWmin}$; $N_{CW} = N_{CWmin}$

$$N_{DATA_PAD} = N_{CW} \cdot \frac{L_{CW}}{\rho} \cdot R - Length \cdot 8$$

where

- L_{CW} is the LDPC codeword length, which is 624 for code rate $R=7/8$, 672 for all other code rates
- $Length$ is the length of the PSDU defined in the header field (in octets)
- ρ is the repetition factor (1 or 2)
- R is the code rate
- N_{CWmin} is defined for BRP packets in Table 20-24.

The scrambled PSDU is concatenated with N_{DATA_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

- b) The procedure for converting the scrambled PSDU data to LDPC codewords depends on the repetition factor.
 - 1) If $\rho = 1$ and the code rate is not $7/8$,
 - i) The output stream of the scrambler is broken into blocks of $L_{CWD} = L_{CW} \times R$ bits such that the m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \dots, b_{L_{CWD}}^{(m)})$, $m \leq N_{CW}$.
 - ii) To each data word, $n-k=L_{CW}R \times L_{CW}$ parity bits $(p_1^{(m)}, p_2^{(m)}, \dots, p_{n-k}^{(m)})$ are added to create the codeword $\mathbf{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \dots, b_{L_{CWD}}^{(m)}, p_1^{(m)}, \dots, p_{n-k}^{(m)})$ such that $\mathbf{H}\mathbf{c}^{(m)\top} = \mathbf{0}$
 - 2) If $\rho = 1$ and the code rate is $7/8$, 48 bits are punctured from the parity bits of the rate $13/16$ parity bits:
 - i) The output stream of the scrambler is broken into blocks of 546 bits such that the m^{th} data word is $(b_1^{(m)}, b_2^{(m)}, \dots, b_{546}^{(m)})$, $m \leq N_{CW}$.
 - ii) To each data word, 126 parity bits $(p_1^{(m)}, p_2^{(m)}, \dots, p_{126}^{(m)})$ are added to create the code word $\tilde{\mathbf{c}}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \dots, b_{546}^{(m)}, p_1^{(m)}, \dots, p_{126}^{(m)})$ such that $\mathbf{H}\tilde{\mathbf{c}}^{(m)\top} = \mathbf{0}$. The code word $\mathbf{c}^{(m)}$ is generated from $\tilde{\mathbf{c}}^{(m)}$ by removing the first 48 parity bits so that $\mathbf{c}^{(m)} = (b_1^{(m)}, b_2^{(m)}, \dots, b_{546}^{(m)}, p_{49}^{(m)}, p_{50}^{(m)}, \dots, p_{126}^{(m)})$

- 3) If $\rho = 2$,
 - i) The data bits in each codeword $(b_1, b_2, \dots, b_{L_Z})$ where $L_Z = L_{CW}/2\rho$ are concatenated with $L_{CW}/2\rho$ zeros to produce a sequence of length of $2L_Z$ $(b_1, b_2, \dots, b_{L_Z}, 0_1, 0_2, \dots, 0_{L_Z})$.
 - ii) The LDPC codeword $\mathbf{c} = (b_1, b_2, \dots, b_{L_Z}, 0_1, 0_2, \dots, 0_{L_Z}, p_1, p_2, \dots, p_{336})$ is created by generating the parity bits p_1, p_2, \dots, p_{336} such that $\mathbf{H}\mathbf{c}^T = \mathbf{0}$, where \mathbf{H} is the parity matrix for rate 1/2 LDPC coding specified in 20.3.8.
 - iii) Replace bits $L_Z + 1$ to 336 of the codeword \mathbf{c} with bits from the sequence b_1, b_2, \dots, b_{L_Z} XORed by a PN sequence that is generated from the LFSR used for data scrambling as defined in 20.3.9. The LFSR is initialized to the all 1s vector and reinitialized to the same vector after every codeword.
- c) The codewords are then concatenated one after the other to create the coded bits stream $(c_1, c_2, \dots, c_{L_{CW} \cdot N_{CW}})$.
- d) The number of symbol blocks, N_{BLKS} , and the number of symbol block padding bits, N_{BLK_PAD} , are calculated:

$$N_{BLKS} = \left\lceil \frac{N_{CW} \cdot L_{CW}}{N_{CBPB}} \right\rceil$$

$$N_{BLK_PAD} = N_{BLKS} \cdot N_{CBPB} - N_{CW} \cdot L_{CW}$$

where N_{CBPB} is the number of coded bits per symbol block, per Table 20-21 in 20.6.3.2.5.

- e) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled using the continuation of the scrambler sequence that scrambled the PSDU input bits.

20.6.3.2.4 Modulation mapping

20.6.3.2.4.1 General

The coded and padded bit stream is converted into a stream of complex constellation points according to the modulation specified in the MCS table.

20.6.3.2.4.2 $\pi/2$ -BPSK modulation

In $\pi/2$ -BPSK modulation, the input bit stream is mapped according to the following equation: $\tilde{s}_k = 2 \cdot c_k - 1$, where c_k is the k^{th} input coded (or scrambled pad) bit. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for BPSK is depicted in Figure 20-14.

NOTE—With appropriate choice of transmit filtering, $\pi/2$ -BPSK is equivalent to a precoded pulse-shaped MSK (e.g., GMSK). The precoder is simply $b_{out,k} = b_{in,k} \oplus b_{in,k-1}$, $k = 0, 1, \dots$, where $b_{in,k}$ is the scrambled input stream, $b_{in,-1}$ is 0, $b_{out,k}$ is the input to the (G)MSK modulator.

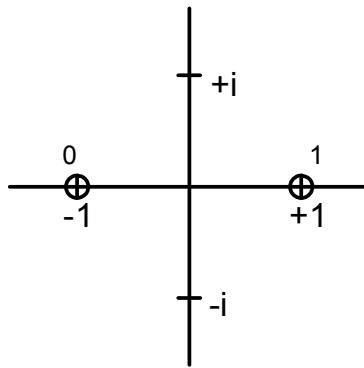

Figure 20-14—BPSK constellation bit encoding

20.6.3.2.4.3 $\pi/2$ -QPSK modulation

In $\pi/2$ -QPSK modulation, the input bit stream is grouped into sets of 2 bits and mapped according to the

following equation: $\tilde{s}_k = \frac{1}{\sqrt{2}}((2c_{2k}-1) + j(2c_{2k+1}-1)) \exp\left(-j\frac{\pi}{4}\right)$, where k is the output symbol index,

$k = 0, 1, \dots$. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j\pi k/2}$. The constellation bit encoding for QPSK is depicted in Figure 20-15.

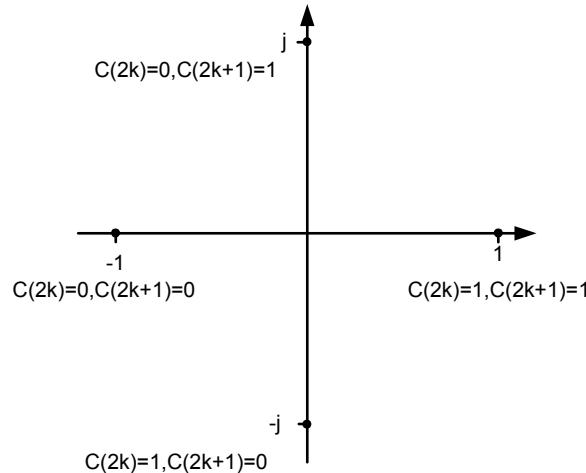

Figure 20-15—QPSK constellation bit encoding

20.6.3.2.4.4 $\pi/2$ -16-QAM modulation

In $\pi/2$ -16-QAM modulation, the input bit stream is grouped into sets of 4 bits and mapped according to the following equation:

$$\tilde{s}_k = \frac{1}{\sqrt{10}} \{(4c_{4k}-2) - (2c_{4k}-1)(2c_{4k+1}-1) + j(4c_{4k+2}-2) - j(2c_{4k+2}-1)(2c_{4k+3}-1)\}$$

where k is the output symbol index, $k = 0, 1, \dots$. Each output symbol is then rotated according to the following equation: $s_k = \tilde{s}_k \cdot e^{j \cdot \pi \cdot k/2}$. The constellation bit encoding for 16-QAM is depicted in Figure 20-16.

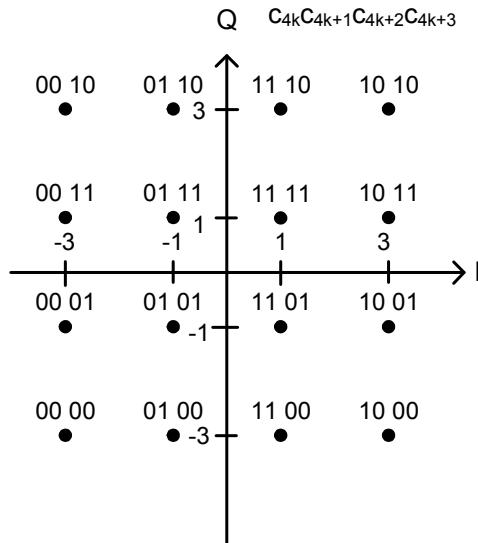

Figure 20-16—16-QAM constellation bit encoding

20.6.3.2.4.5 $\pi/2$ -64-QAM modulation

In $\pi/2$ -64-QAM modulation, the input bit stream is grouped in sets of 6 bits and mapped according to the following equation:

$$\begin{aligned}\tilde{s}_k = & \\ & \frac{1}{\sqrt{42}}((8c_{6k}-4)-(2c_{6k}-1)(4c_{6k+1}-2)+(2c_{6k}-1)(2c_{6k+1}-1)(2c_{6k+2}-1))+ \\ & \frac{j}{\sqrt{42}}((8c_{6k+3}-4)-(2c_{6k+3}-1)(4c_{6k+4}-2)+(2c_{6k+3}-1)(2c_{6k+4}-1)(2c_{6k+5}-1))\end{aligned}$$

where k is the output symbol index, $k=0,1, \dots$. Each output symbol is then rotated according to the following equation $s_k = \tilde{s}_k \cdot e^{\frac{j\pi k}{2}}$. The constellation bit encoding for 64-QAM is depicted in Figure 20-17.

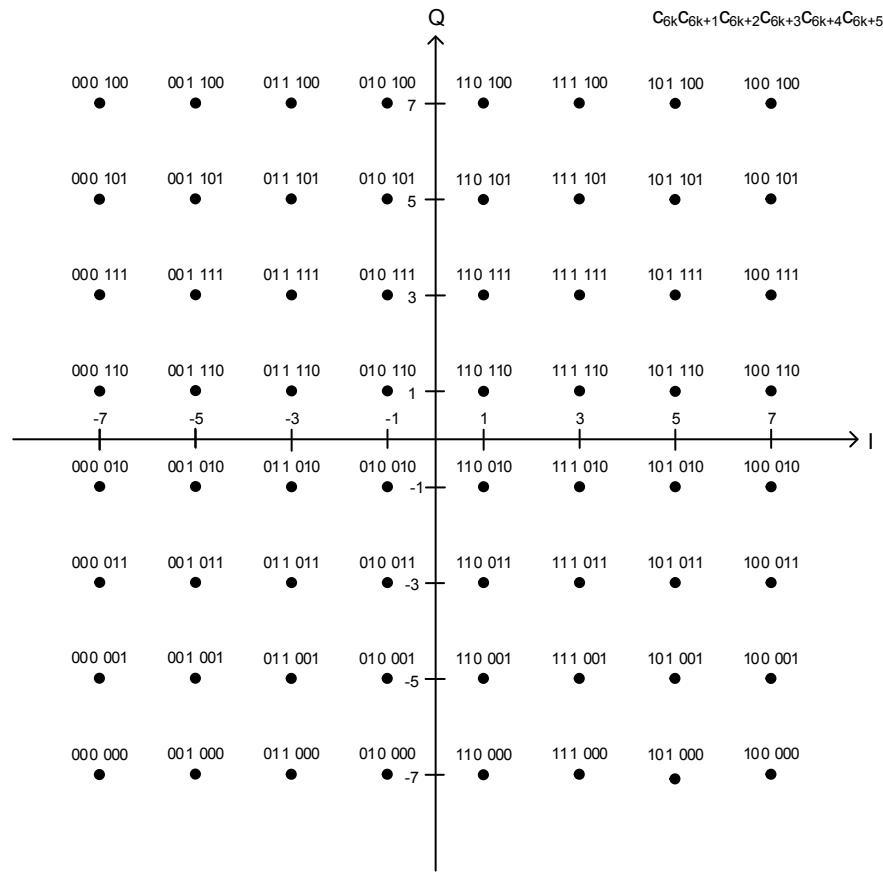

Figure 20-17—64-QAM constellation bit encoding

20.6.3.2.5 Symbol blocking and guard insertion

Each group of N_{CBPB} bits is prepended by $\pi/2$ -BPSK symbols generated by the 64 point Golay sequence Ga_{64} defined in 20.11. N_{CBPB} values are shown in Table 20-21. The starting index for the first symbol for $\pi/2$ rotation is 0.

Table 20-21—Values of N_{CBPB}

| Symbol mapping | N_{CBPB} |
|-----------------|------------|
| $\pi/2$ -BPSK | 448 |
| $\pi/2$ -QPSK | 896 |
| $\pi/2$ -16-QAM | 1792 |
| $\pi/2$ -64-QAM | 2688 |

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by the same Golay sequence guard interval. See Figure 20-18. If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by the same Golay sequence guard interval.

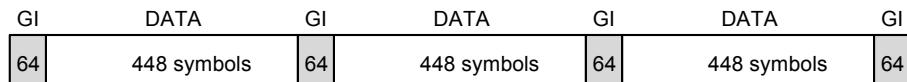

Figure 20-18—Block transmission

20.6.4 Performance requirements

20.6.4.1 Transmit requirements

20.6.4.1.1 Transmit EVM

The transmit EVM accuracy test shall be performed by instrumentation capable of converting the transmitted signal into a stream of complex samples, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc.

The instrumentation shall perform carrier lock, symbol timing recovery and amplitude adjustment and equalization while making the measurements. The equalizer shall be trained using information in the SC preamble (STF and/or CEF). For the DMG SC mode EVM, measuring N_s samples at the sample rate, the measured symbols should not contain the first and the last hundred symbols of a given packet (ramp up/down). The EVM is calculated according to the formula below:

$$EVM = 20 \log_{10} \left(\sqrt{\frac{1}{N_s P_{avg}} \sum_{i=1}^{N_s} [(I_i - I_i^* - I_0)^2 + (Q_i - Q_i^* - Q_0)^2]} \right)$$

where N_s is the number of samples to be measured and N_s shall be 1000, P_{avg} is the average power of the constellation, (I_i, Q_i) is the complex coordinates of the measured symbol i , (I_i^*, Q_i^*) is the complex coordinates of the ideal constellation point for the measured symbol i , and (I_0, Q_0) is the complex DC term chosen to minimize EVM.

The test equipment should use a root-raised cosine filter with roll-off factor of 0.25 for the pulse shaping filter when conducting EVM measurement.

The transmit pulse shaping used is left to the implementer.

The relative constellation error (EVM) shall not exceed an MCS dependent value according to Table 20-22.

Table 20-22—DMG SC mode EVM requirements

| MCS | Modulation | Coding rate | EVM value [dB] |
|-----|---------------------|---------------------|----------------|
| 1 | $\pi/2\text{-BPSK}$ | 1/2 with repetition | -6 |
| 2 | $\pi/2\text{-BPSK}$ | 1/2 | -7 |
| 3 | $\pi/2\text{-BPSK}$ | 5/8 | -9 |
| 4 | $\pi/2\text{-BPSK}$ | 3/4 | -10 |
| 5 | $\pi/2\text{-BPSK}$ | 13/16 | -12 |

Table 20-22—DMG SC mode EVM requirements (continued)

| MCS | Modulation | Coding rate | EVM value [dB] |
|------|-----------------|-------------|----------------|
| 6 | $\pi/2$ -QPSK | 1/2 | -11 |
| 7 | $\pi/2$ -QPSK | 5/8 | -12 |
| 8 | $\pi/2$ -QPSK | 3/4 | -13 |
| 9 | $\pi/2$ -QPSK | 13/16 | -15 |
| 9.1 | $\pi/2$ -QPSK | 7/8 | -16 |
| 10 | $\pi/2$ -16-QAM | 1/2 | -19 |
| 11 | $\pi/2$ -16-QAM | 5/8 | -20 |
| 12 | $\pi/2$ -16-QAM | 3/4 | -21 |
| 12.1 | $\pi/2$ -16-QAM | 13/16 | -22 |
| 12.2 | $\pi/2$ -16-QAM | 7/8 | -23 |
| 12.3 | $\pi/2$ -64-QAM | 5/8 | -26 |
| 12.4 | $\pi/2$ -64-QAM | 3/4 | -27 |
| 12.5 | $\pi/2$ -64-QAM | 13/16 | -29 |
| 12.6 | $\pi/2$ -64-QAM | 7/8 | -31 |

20.6.4.1.2 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

- MULTICHANNEL_SAMPLING_RATE is 1760×10^6 sample/s
- FIRST_TRANSITION_FIELD is Short Training field
- SECOND_TRANSITION_FIELD is Channel Estimation field
- TRAINING_FIELD is Channel Estimation field
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

20.6.4.2 Receive requirements

20.6.4.2.1 Introduction

This subclause describes the receiver requirements of the DMG SC mode.

20.6.4.2.2 CCA

The start of a valid DMG SC mode transmission at a receive level greater than the minimum sensitivity for MCS 1 (-68 dBm) shall cause CCA to indicate busy with a probability > 90% within 1 μ s. The receiver shall hold the carrier sense signal busy for any signal 20 dB above the minimum sensitivity for MCS 1.

20.7 DMG low-power SC mode

20.7.1 Introduction

The DMG low-power SC mode is an optional SC mode that can provide lower processing power requirements for DMG transceivers.

20.7.2 Transmission

20.7.2.1 Preamble

The DMG low-power SC mode uses the same preamble as the DMG SC mode.

20.7.2.2 Header

20.7.2.2.1 General

The DMG low-power SC mode header fields are the same fields as in the DMG SC mode (see Table 20-17 in 20.6.3.1).

The DMG low-power SC mode modulation and coding schemes are listed in Table 20-23.

Table 20-23—DMG low-power SC mode modulation and coding schemes

| MCS | Modulation | Effective code rate | Coding scheme | N_{CPB} | Rate (Mb/s) |
|-----|---------------|---------------------|------------------------------|-----------|-------------|
| 25 | $\pi/2$ -BPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 626 |
| 26 | $\pi/2$ -BPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 834 |
| 27 | $\pi/2$ -BPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 1112 |
| 28 | $\pi/2$ -QPSK | 13/28 | RS(224,208)+Block-Code(16,8) | 392 | 1251 |
| 29 | $\pi/2$ -QPSK | 13/21 | RS(224,208)+Block-Code(12,8) | 392 | 1668 |
| 30 | $\pi/2$ -QPSK | 52/63 | RS(224,208)+SPC(9,8) | 392 | 2224 |
| 31 | $\pi/2$ -QPSK | 13/14 | RS(224,208)+Block-Code(8,8) | 392 | 2503 |

20.7.2.2.2 Header encoding and modulation

The DMG low-power SC mode header is encoded and modulated as defined in 20.6.3.1.4.

20.7.2.3 Data field

20.7.2.3.1 General

The data field consists of the payload data of the PSDU and possible padding. The data are padded with zeros, scrambled, encoded and modulated as described in the following subclauses.

20.7.2.3.2 Scrambler

The operation of the scrambler is defined in 20.3.9. The scrambling of the PSDU continues the scrambling of the header with no reset of the scrambler. The padding bits are also scrambled.

20.7.2.3.3 Encoding

20.7.2.3.3.1 General

Data is encoded using an outer RS(224,208) block code and a short inner code. The inner code is a (16,8) block code for MCSs 25 and 28, a (12,8) block code for MCSs 26 and 29, and a (9,8) single parity check (SPC) block code for MCSs 27 and 30 and the identity block-code for MCS 31. The encoding is further detailed in the following steps:

- 1) First, the number of block padding bits is calculated:
 - a) The total number of Reed Solomon codewords is $N_{RS} = \lceil (Length)/208 \rceil$ and the total number of RS encoded symbols is given by $Length + N_{RS} \times 16$;
 - b) After Reed Solomon encoding, the data is encoded with a short block code ($N,8$) where N can take one of the following values 8, 9, 12, or 16 depending on the MCS as shown in Table 20-23. Therefore:
 - i) The total number of encoded bits is $N_{EB} = N \times (Length + N_{RS} \times 16)$;
 - ii) The total number of 512 (in length) blocks (each containing 392 data symbols) is $N_{BLKS} = \lceil N_{EB}/(N_{CBPS} \times 392) \rceil$. If BRP packet and $N_{BLKS} < N_{BLKS_MIN}$; $N_{BLKS} = N_{BLKS_MIN}$, where $N_{BLKS_MIN} = 18$. The total number of zero block padding bits is $N_{BLK_PAD} = N_{BLKS} \times N_{CBPS} \times 392 - N_{EB}$.
- 2) The data is broken into blocks of length 208×8 bits (except for possibly the last block).
- 3) Each block is encoded using the RS(224,208) block code as described in 20.7.2.3.2, except perhaps the last block, which is encoded by a shortened version of the code (i.e., if the last block length is K, the shortened block code is RS(16+K,K)).
- 4) The Reed Solomon encoded data stream is further encoded using the block code($N,8$) as described in 20.7.2.3.3.
- 5) The coded bit stream is concatenated with N_{BLK_PAD} zeros. They are scrambled with the continuation of the scrambler sequence that scrambled the PSDU input bits.
- 6) Each set of 7 octets is interleaved using a uniform interleaver of 7 rows and 8 columns. The 7 octets are written row wise and read column wise, i.e., the index i of a bit after interleaving is related to the index k of a bit before interleaving by the following rule:

$$i = 8 \times (k \bmod 7) + \lfloor k/7 \rfloor, k = 0, 1, \dots, 55$$
- 7) The resulting bit stream is modulated and then blocked as described in 20.7.2.3.4 and 20.7.2.3.5.

20.7.2.3.3.2 RS encoding

The RS block code is based on the polynomial

$$g(x) = \prod_{k=1}^{16} (x + a^k)$$

where $a = 0x02$ is a root of the primitive polynomial $p(x) = 1 + x^2 + x^3 + x^4 + x^8$. We assume that an octet $b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7$ (b_0 is the LSB) represented by the polynomial

$$M = b_7x^7 + b_6x^6 + b_5x^5 + b_4x^4 + b_3x^3 + b_2x^2 + b_1x + b_0.$$

The RS is a systematic block code. Given a block of octets $\mathbf{m} = (m_{M-1}, m_{M-2}, \dots, m_0)$, the additional

parity octets $\mathbf{r} = (r_{15}, r_{14}, \dots, r_0)$ are calculated by setting $r = x^{16}\mathbf{m}(x) \bmod g(x)$, where $\mathbf{r}(x) = \sum_{k=0}^{15} r_k x^k$

and $\mathbf{m}(x) = \sum_{k=0}^{M-1} m_k x^k$ and where the calculation is performed over $GF(2^8)$. The parity octets \mathbf{r} are appended to the uncoded block \mathbf{m} to generate the encoded RS block $m_{M-1}, m_{M-2}, \dots, m_0, r_{15}, r_{14}, \dots, r_0$.

20.7.2.3.3.3 (N,8) Block-coding

Every octet $\mathbf{b}_{1 \times 8} = [b_0 b_1 b_2 b_3 b_4 b_5 b_6 b_7]$ is encoded into an N -bit codeword $\mathbf{c}_{1 \times N} = \left[\begin{array}{c} \mathbf{b}_{1 \times 8} \\ \mathbf{p}_{1 \times (N-8)} \end{array} \right]$ such that $\mathbf{c}_{1 \times N} = \mathbf{b}_{1 \times 8} \mathbf{G}_{8 \times N}$, where the generator matrix $\mathbf{G}_{8 \times N}$ is given by the following expressions for $N = 8, 9, 12$, and 16, respectively:

$\mathbf{G}_{8 \times 8}$ is the identity matrix.

$$\mathbf{G}_{8 \times 9} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \end{bmatrix}$$

$$\mathbf{G}_{8 \times 12} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 1 & 1 \end{bmatrix}$$

$$\mathbf{G}_{8 \times 16} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 0 & 1 & 0 & 1 & 0 & 0 \end{bmatrix}$$

20.7.2.3.4 Modulation

The same $\pi/2$ -BPSK described in 20.6.3.2.4.2 and $\pi/2$ -QPSK described in 20.6.3.2.4.2 are used in the DMG low-power SC mode.

20.7.2.3.5 Blocking

The blocking for the low-power SC is illustrated in Figure 20-19. The data is partitioned into blocks of length 512 wherein each 512-block is constructed from 8 subblocks. Each subblock is of length 64. The first subblock is a G_{64} , which is the $\pi/2$ -BPSK symbols sequence generated by the 64 point Golay sequence Ga_{64} defined in 20.11. The starting index for the first symbol $\pi/2$ rotation is 0, and subblocks 2 to 8 are constructed in the same way, i.e., a data portion of 56 symbols followed by a guard interval of 8 symbols. Note that each 512-block carries 392 symbols of data and 120 symbols of guard.

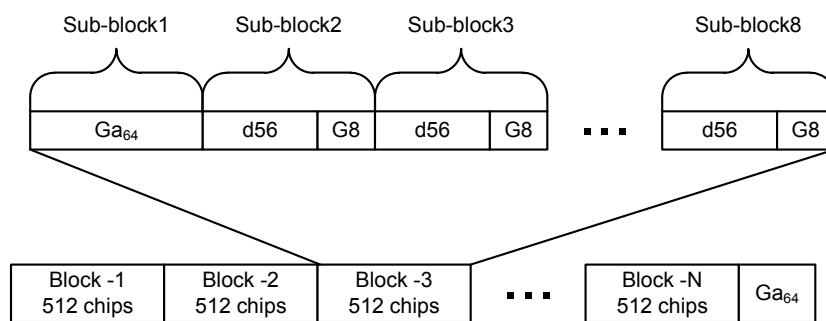

Figure 20-19—Blocking for DMG low-power SC mode

If the Additional PPDU field within the PHY header is equal to 0, the final block transmitted is followed by Ga_{64} . If the Additional PPDU field within the PHY header is equal to 1, the final block transmitted of the last PPDU in an A-PPDU is followed by Ga_{64} .

The G_8 guard interval is a copy of the last 8 samples of Ga_{64} .

NOTE—A STA might estimate the channel impulse response from the CEF, and decides whether to equalize using the 512-block or the short 64-subblock. For example, if the channel impulse response energy is almost concentrated in 8 taps, a 64-equalizer can be used; otherwise, a 512-equalizer is used.

20.8 PHY transmit procedure

The PHY transmit procedure is shown in Figure 20-20. In order to transmit data, a PHY-TXSTART.request primitive shall be enabled so that the PHY entity shall be in the transmit state. Further, the PHY shall be set to operate at the appropriate frequency through station management via the PLME, as specified in 20.12. Other transmit parameters, such as MCS and transmit power, are set via the PHY SAP with the PHY-TXSTART.request(TXVECTOR) primitive, as described in 20.2.2.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

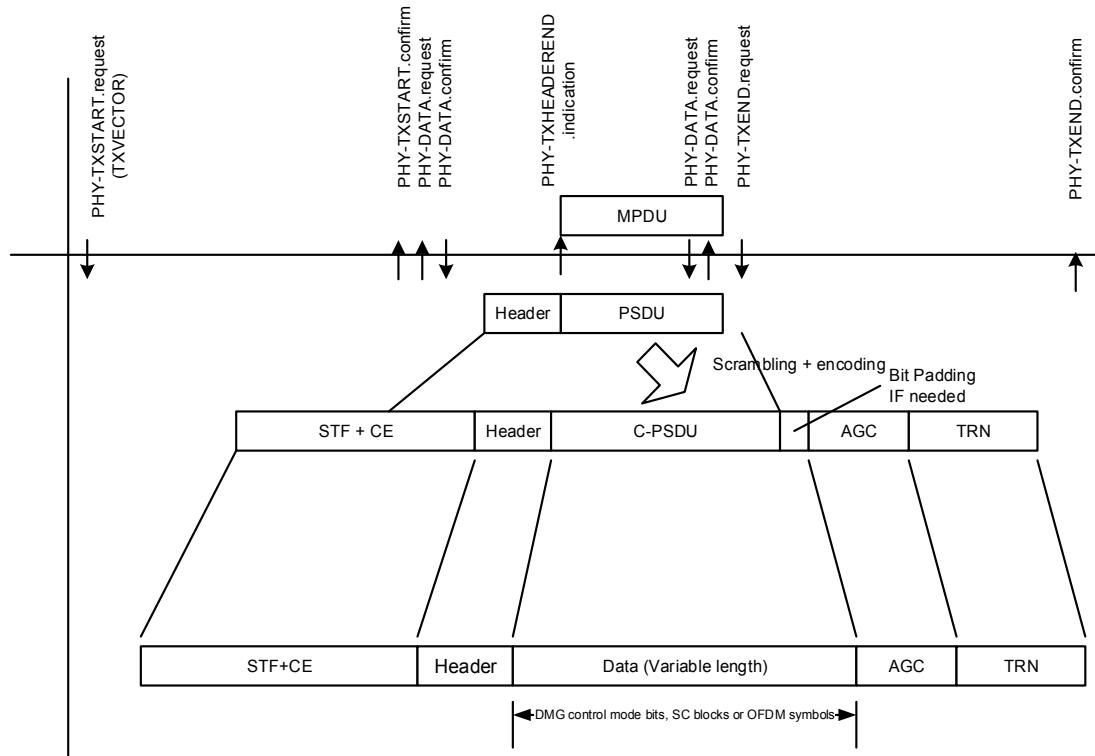

Figure 20-20—PHY transmit procedure

The preamble format (control, SC, or OFDM mode) depend on the MCS in the PHY-TXSTART.request. The PHY shall calculate the length of the packet according the MCS and the length specified in the PHY-TXSTART.request primitive, adding padding bits if necessary.

The PHY continues with the encoding and transmission of the header according to the parameters of the PHY-TXSTART.request(TXVECTOR) primitive. The PHY proceeds with PSDU transmission through a series of data octet transfers from the MAC. The data are encoded as described in 20.4.3.2.3, 20.5.3.2.3, and 20.6.3.2.3. The encoded data are then modulated as described in 20.4, 20.5, 20.6, and 20.7, depending on the MCS requested in the PHY-TXSTART.request primitive. Transmission can be prematurely terminated by the MAC through the PHY-TXEND.request primitive. PHY-TXSTART shall be disabled by receiving a PHY-TXEND.request primitive.

Transmission of the PSDU is completed with the transmission of the last bits of the (encoded) PSDU. If no TRN-T/R fields are specified in the PHY-TXSTART.request primitive, the PHY shall issue a PHY-TXEND.confirm primitive after the transmission of the last bits. If TRN units are requested in the PHY-TXSTART.request primitive, the transmission continues with the transmission of AGC subfields and TRN units. The PHY issues the PHY-TXEND.confirm primitive to the MAC after the transmission of the last TRN unit. The packet transmission shall be completed, and the PHY entity shall enter the receive state (i.e., PHY-TXSTART shall be disabled). Each PHY-TXEND.request primitive is acknowledged with a PHY-TXEND.confirm primitive from the PHY.

A typical transmit state machine is shown in Figure 20-21.

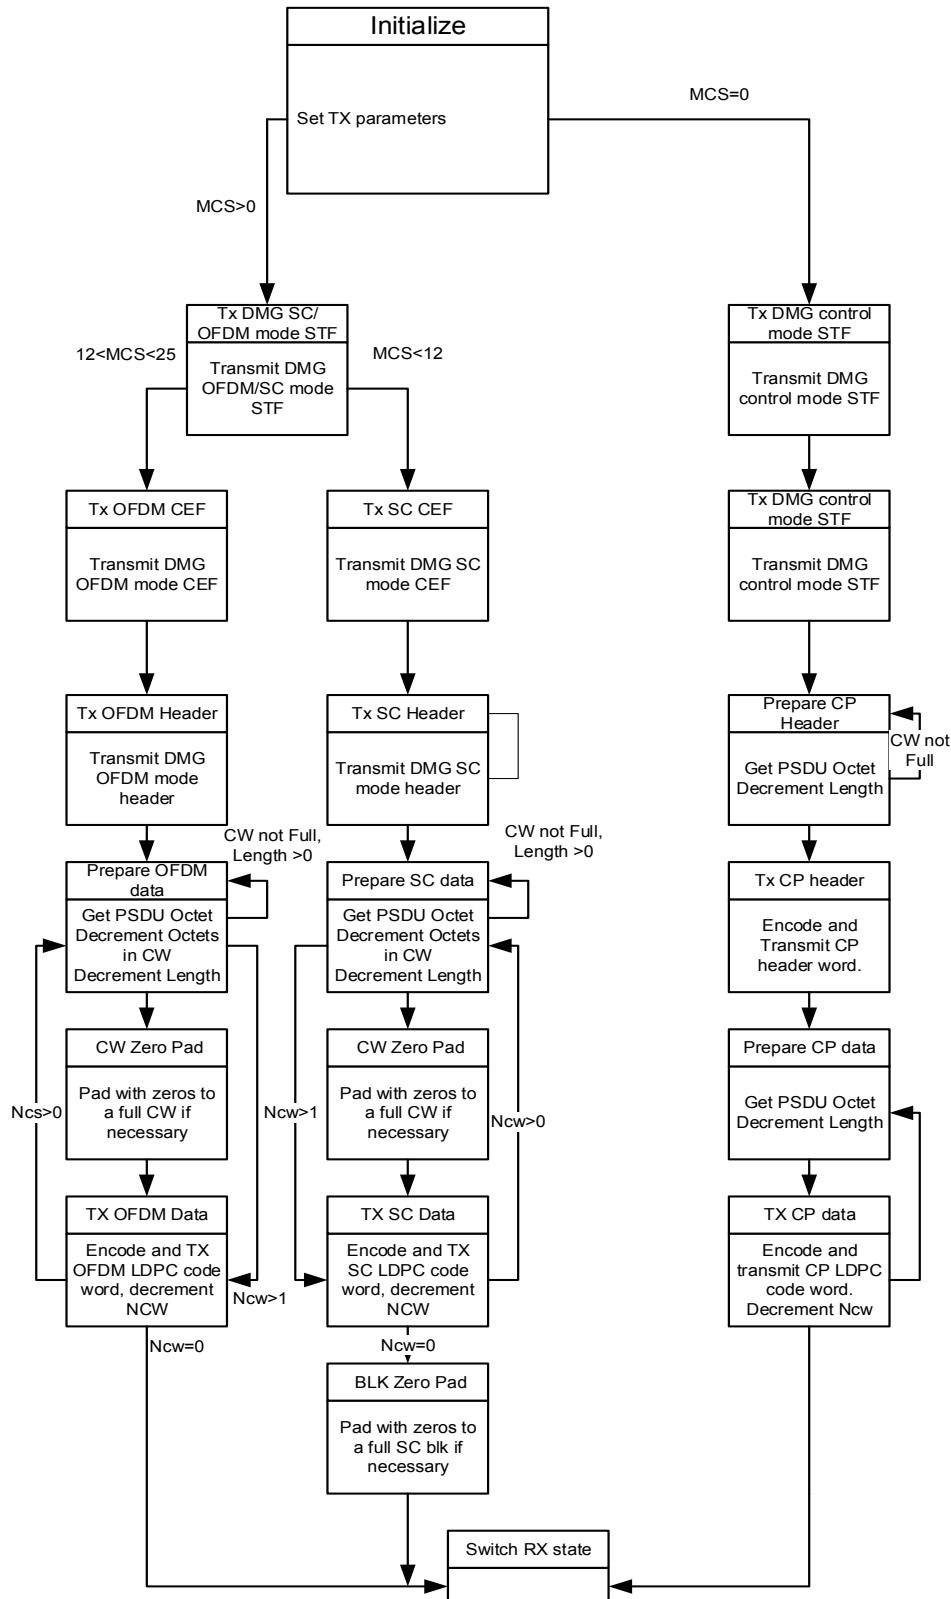

Figure 20-21—Typical Tx state machine (Training Length = 0 is assumed; some optional features such as DMG SC low-power mode are not shown)

20.9 PHY receive procedure

A typical PHY receive procedure is shown in Figure 20-22.

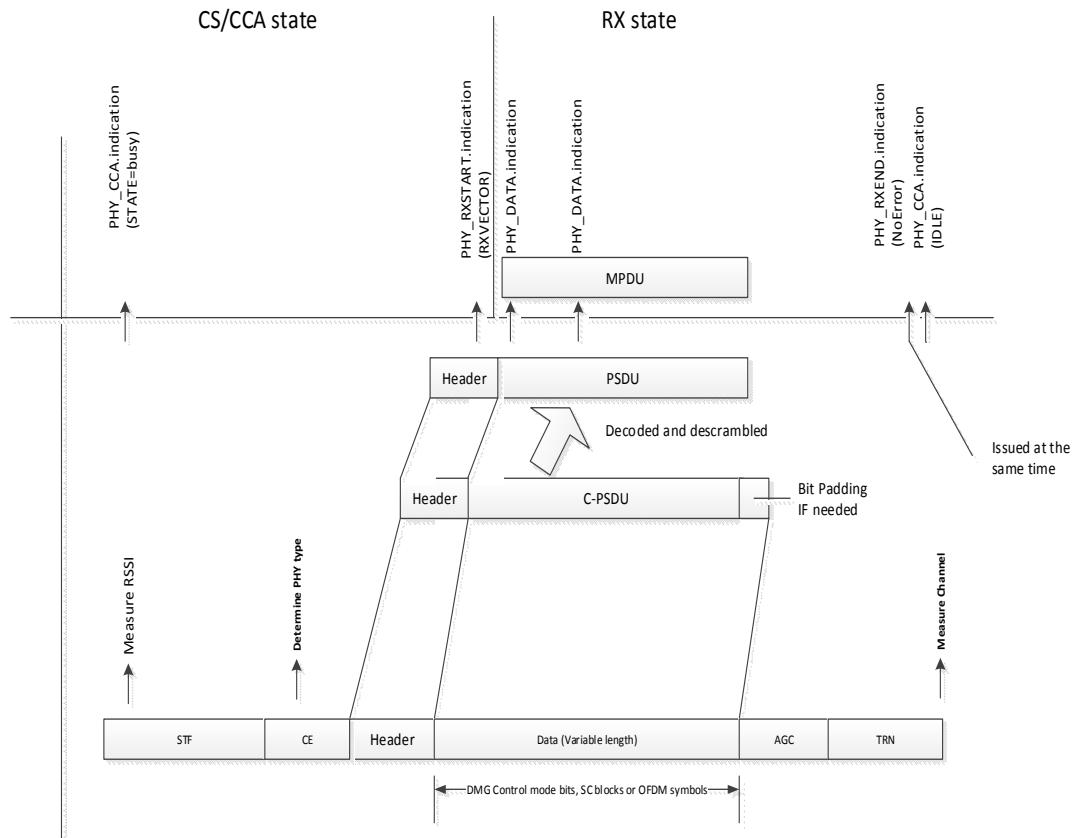

Figure 20-22—PHY receive procedure

Upon receiving the STF, the PHY measures signal strength. This activity is indicated by the PHY to the MAC by issuing a PHY-CCA.indication(BUSY) primitive.

After the PHY-CCA.indication(BUSY) primitive is issued, the PHY entity shall search for the CE field and begin receiving the CE field. The PHY demodulates the header according to the PHY type determined the reception of the CE field. If the CE field indicated a SC mode, the receiver is capable of receiving low-power SC mode, and dot11LowPowerSCPHYActivated is true, then the PHY shall attempt to demodulate both a SC header and an SC low-power header. The PHY shall decode the header and determine the MCS, length and other parameters needed for the demodulation of the packet.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

At the end of the data portion of a packet that has the Training Length field in the PHY header equal to 0, the PHY shall issue a PHY-RXEND.indication(No_Error) primitive to the MAC. If the Training Length field in the PHY header is greater than 0, the PHY shall continue to receive these training fields after the data

portion of the packet and measure the channel. After the end of the training fields, the PHY shall generate a PHY-CCA.indication(IDLE) primitive and the PHY-RXEND.indication(NoError) primitive.

In the case of signal loss before the decoding of the header or in the case of an invalid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the received level drops below a value that is 20 dB higher than the receive sensitivity of MCS 1. In the case of signal loss after decoding of a valid header, the PHY shall not generate a PHY-CCA.indication(IDLE) primitive until the expected end of the packet, including AGC and TRN fields.

A typical receive state machine is shown in Figure 20-23.

20.10 Beamforming

20.10.1 Beamforming concept

Beamforming enables a pair of STAs to train their transmit and receive antennas for subsequent communication. A beamformed link is established following the successful completion of BF training, which is described in 10.38.

DMG STAs use a quasi-omni antenna pattern. The antenna gain of the main beam of a quasi-omni antenna pattern shall be at most 15 dB lower than the antenna gain in the main beam for a directional pattern.

20.10.2 Beamforming frame format

20.10.2.1 Sector-level sweep

PPDUs transmitted during transmit sector sweep are DMG control mode PPDUs. PPDUs transmitted during receive sector sweep are DMG control mode or DMG SC mode PPDUs.

20.10.2.2 Beam refinement

20.10.2.2.1 General

Beam refinement is a process where a STA can improve its antenna configuration (or antenna weight vectors) both for transmission and reception. If the SLS beamforming training did not include an RSS, as in the case where both devices have more than one transmit sector per antenna, beam refinement can serve as the first receive antenna configuration training. The procedure of beam refinement is described in 10.38.6.4.

In the beam refinement procedure, BRP packets are used to train the receiver and transmitter antenna. There are two types of BRP packets: BRP-RX packets and BRP-TX packets:

- BRP-RX packets are packets that have TRN training subfields appended to them. These packets enable receiver antenna weight vector training.
- BRP-TX packets are packets that have TRN training subfields appended to them. The transmitting STA may change antenna configuration at the beginning of each subfield. The receiving STA performs measurements on these subfields and sends feedback to the STA that transmits the BRP-TX packet.

20.10.2.2.2 BRP packet structure

The TRN-LEN parameter in the TVXVECTOR or RXVECTOR of a BRP packet shall be greater than zero. If the PACKET-TYPE parameter in the RXVECTOR or TXVECTOR is equal to TRN-R-PACKET, then the BEAM_TRACKING_REQUEST parameter in the corresponding RXVECTOR or TXVECTOR shall be set to Beam Tracking Not Requested.

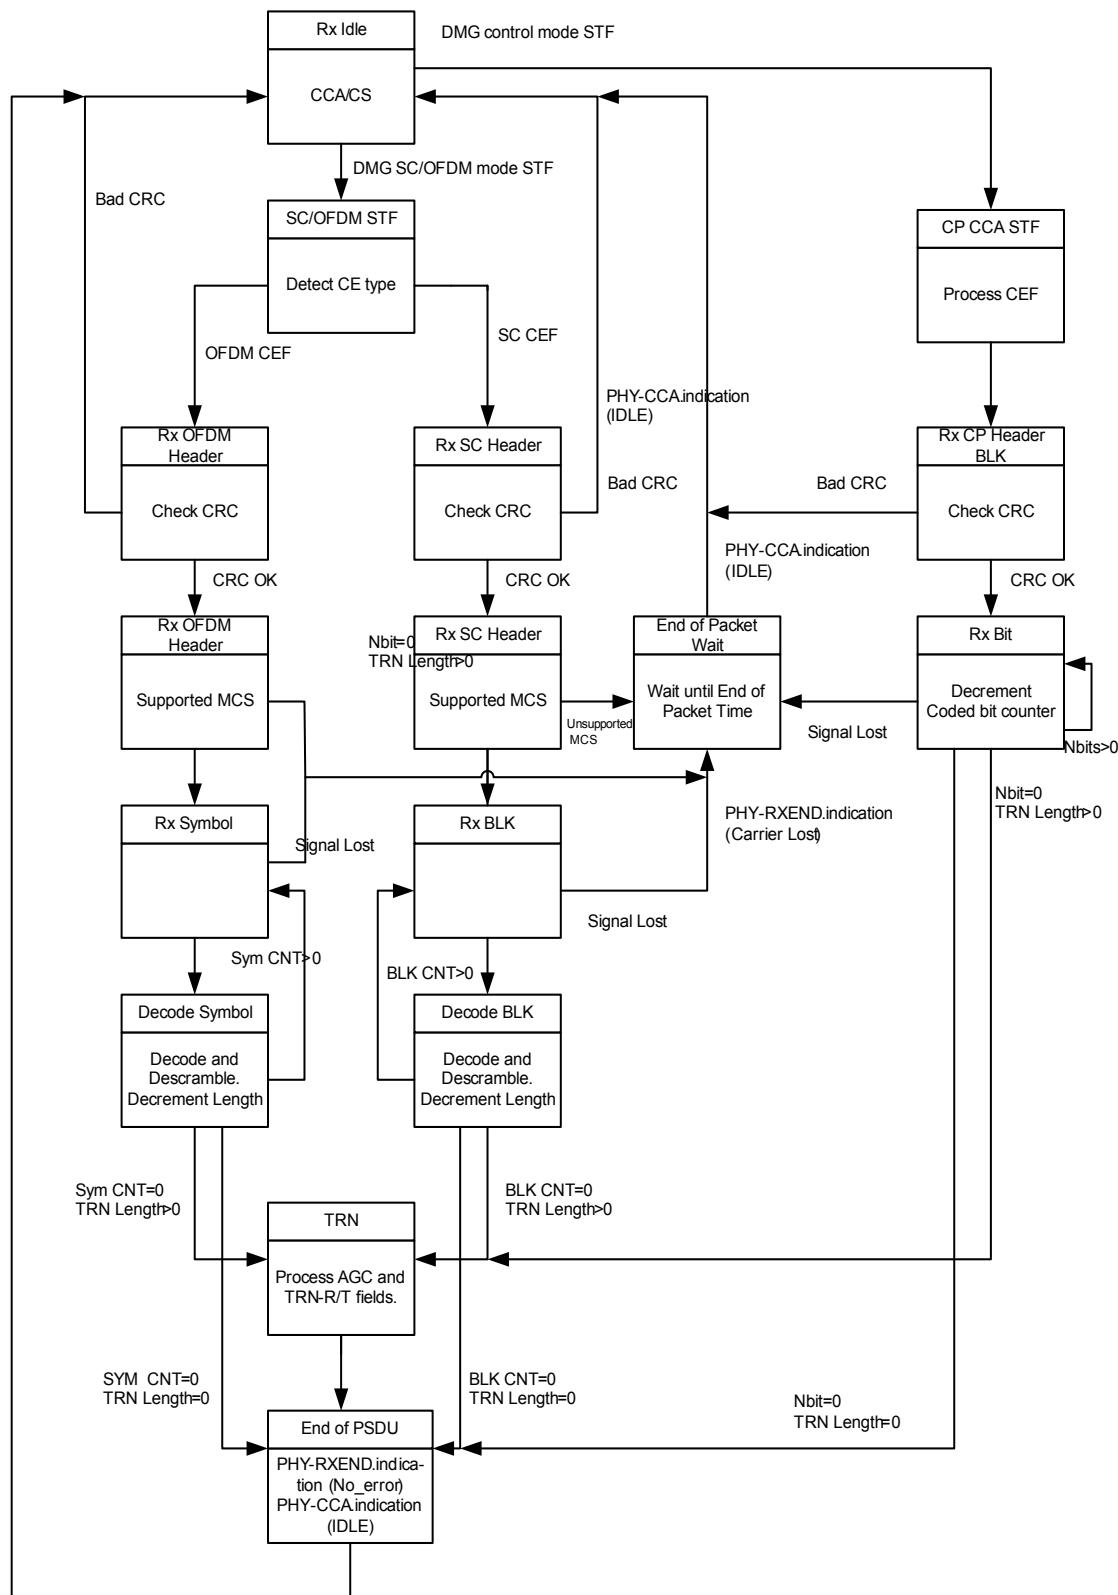

Figure 20-23—Typical Rx state machine
 (some optional features such as DMG low-power SC mode are not shown)

Each BRP packet is composed of an STF, a CE field, and a data field followed by a training field containing an AGC training field and a TRN field. This is shown in Figure 20-24.

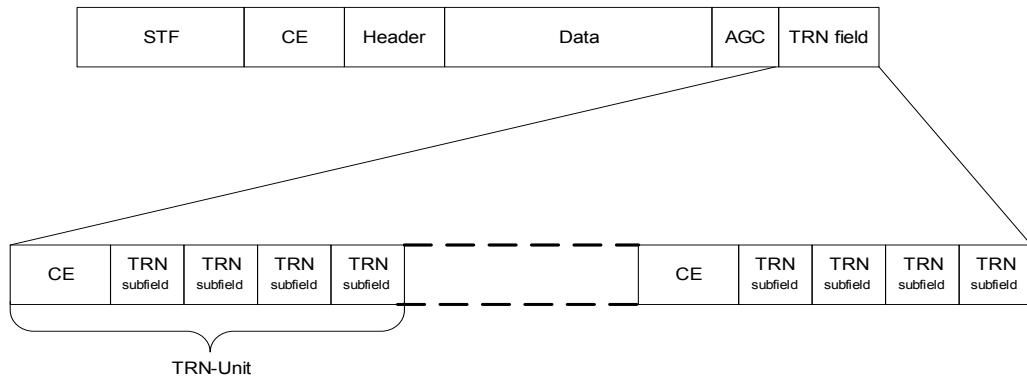

Figure 20-24—BRP packet structure

20.10.2.2.3 BRP packet header fields

The Packet Type and Training Length fields present within the SC mode header, control mode header, LP SC mode header, and OFDM mode header are used to indicate that a packet is BRP packet and the length of the training fields, respectively.

A value of 0 in the Packet Type field and a value of 0 in the Beam Tracking Request field indicate a BRP-RX packet.

A value of 1 in the Packet Type field indicates a BRP-TX packet.

A value of N in the Training Length field indicates $4 \times N$ AGC subfields and that the TRN-R/T field has N TRN-Units.

The value N in the Training Length field of a BRP-RX packet is equal to the value of the L-RX field requested by the intended receiver of the BRP-RX packet at a previously received BRP Request field (see 9.5.4).

20.10.2.2.4 BRP packet duration

The minimum duration of the data field of a BRP packet when sent in an SC mode is $aBRPminSCblocks$ SC blocks (see 20.6.3.2.5) and, if needed, the data field of the packet shall be extended by extra zero padding to generate the required number of SC blocks. Table 20-24 contains the values of N_{CWmin} for each MCS necessary to compute the padding described in 20.6.3.2.3.3.

The minimum duration of the data field of a BRP packet when sent in an DMG OFDM mode is $aBRPminOFDMblocks$ OFDM blocks and, if needed, the data field of the packet shall be extended by extra zero padding to generate the required number of OFDM symbols.

The minimum duration of the data field of a BRP packet when sent with the low-power SC mode is N_{BLKS_MIN} low-power SC blocks (see 20.7.2.3.3).

Table 20-24—Zero filling for DMG SC mode BRP packets

| MCS index | Modulation | N_{CBPS} | Repetition | Code rate | Data rate (Mb/s) | N_{CWmin} |
|-----------|-----------------|------------|------------|-----------|------------------|-------------|
| 1 | $\pi/2$ -BPSK | 1 | 2 | 1/2 | 385 | 12 |
| 2 | $\pi/2$ -BPSK | 1 | 1 | 1/2 | 770 | 12 |
| 3 | $\pi/2$ -BPSK | 1 | 1 | 5/8 | 962.5 | 12 |
| 4 | $\pi/2$ -BPSK | 1 | 1 | 3/4 | 1155 | 12 |
| 5 | $\pi/2$ -BPSK | 1 | 1 | 13/16 | 1251.25 | 12 |
| 6 | $\pi/2$ -QPSK | 2 | 1 | 1/2 | 1540 | 23 |
| 7 | $\pi/2$ -QPSK | 2 | 1 | 5/8 | 1925 | 23 |
| 8 | $\pi/2$ -QPSK | 2 | 1 | 3/4 | 2310 | 23 |
| 9 | $\pi/2$ -QPSK | 2 | 1 | 13/16 | 2502.5 | 23 |
| 9.1 | $\pi/2$ -QPSK | 2 | 1 | 7/8 | 2695 | 25 |
| 10 | $\pi/2$ -16-QAM | 4 | 1 | 1/2 | 3080 | 46 |
| 11 | $\pi/2$ -16-QAM | 4 | 1 | 5/8 | 3850 | 46 |
| 12 | $\pi/2$ -16-QAM | 4 | 1 | 3/4 | 4620 | 46 |
| 12.1 | $\pi/2$ -16-QAM | 4 | 1 | 13/16 | 5005 | 46 |
| 12.2 | $\pi/2$ -16-QAM | 4 | 1 | 7/8 | 5390 | 49 |
| 12.3 | $\pi/2$ -64-QAM | 6 | 1 | 5/8 | 5775 | 69 |
| 12.4 | $\pi/2$ -64-QAM | 6 | 1 | 3/4 | 6930 | 69 |
| 12.5 | $\pi/2$ -64-QAM | 6 | 1 | 13/16 | 7507.5 | 69 |
| 12.6 | $\pi/2$ -64-QAM | 6 | 1 | 7/8 | 8085 | 74 |

20.10.2.2.5 AGC field

The beam refinement AGC fields are composed of $4N$ repetitions of the sequence $[Ga_{64} Ga_{64} Ga_{64} Ga_{64} Ga_{64}]$ when the packet is transmitted using the OFDM or SC mode and $[Gb_{64} Gb_{64} Gb_{64} Gb_{64} Gb_{64}]$ when the packet is transmitted using the control mode. The sequences Ga_{64} and Gb_{64} are defined in 20.11. The sequences are transmitted using rotated $\pi/2$ -BPSK modulation. Any transmit signal transients that occur due to this TX AWV configuration change shall completely settle by the end of the first Ga_{64} or Gb_{64} subsequence.

In a BRP-TX packet, the transmitter may change the TX AWV configuration at the beginning of each AGC subfield. The set of AWVs used for the AGC subfields should be the same as that used for the TRN-T subfields. In a BRP-RX packet, the transmitter shall use the same TX AWV as in the preamble and data fields of the packet.

20.10.2.2.6 TRN field

The TRN field enable transmitter and receiver AWV training. The TRN field has the form shown in Figure 20-25.

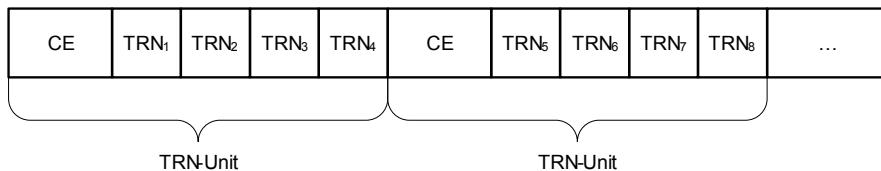

Figure 20-25—TRN field definition

The TRN field is composed of N TRN-Units. Each TRN-Unit is composed of a CE subfield and 4 TRN subfields. Each subfield CE matches the Channel Estimation field defined in 20.3.6.3. The $4N$ subfields TRN_1 through TRN_{4N} each consist of the sequence $[\text{Ga}_{128} \text{--Gb}_{128} \text{ Ga}_{128} \text{ Gb}_{128} \text{ Ga}_{128}]$. The sequences Ga_{128} and Gb_{128} are defined in Table 20-25 and Table 20-26, respectively, in 20.11. The sequences are transmitted using rotated $\pi/2$ -BPSK modulation.

In a BRP-RX packet, all of the TRN and CE subfields are transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX packet, the CE subfield shall be transmitted using the same AWV as the preamble and data field of the packet. In a BRP-TX packet, the transmitter may change AWV at the beginning of each TRN subfield. Any transmit signal transients that occur due to TX AWV configuration changes at the beginning of TRN subfields shall settle by the end of the first 64 samples of the subfield.

20.10.2.2.7 Channel measurement

The good autocorrelation properties of the Golay sequence enable reconstructing part of the impulse response of the channel between the transmitter and the receiver. The receiver should find the tap with largest amplitude in the channel during the CE field of the BRP-RX. It selects thereafter the set of taps that is measured around the tap with the largest amplitude, according to `dot11ChanMeasFBCKNtaps`. It can select a contiguous set of taps or select a noncontiguous set of taps, and include the tap delays subfield as part of the subfield measurement. It then measures the phase and amplitude of the corresponding channel taps in each of the TRN-T field repetition (except for those using the CE AWV configuration). The beam refinement feedback subfield $k-1$ is the relative amplitude and phase of this tap in the k^{th} repetition compared to this tap in the first TRN-T subfield.

20.10.2.2.8 BRP resampling in an OFDM packet

The BRP AGC, CE, and Tn/Rn fields are specified at the SC chip rate (T_c). When appended to an OFDM packet, the signal is resampled as defined in 20.3.3.2.

20.11 Golay sequences

The following Golay sequences are used in the preamble, in the single carrier guard interval and in beam refinement TRN-R/T and AGC fields: $Ga_{128}(n)$, $Gb_{128}(n)$, $Ga_{64}(n)$, $Gb_{64}(n)$, $Ga_{32}(n)$, $Gb_{32}(n)$. These are 3 pairs of complementary sequences. The subscript denotes the length of the sequences. These sequences are generated using the following recursive procedure:

$$\begin{aligned}A_0(n) &= \delta(n) \\B_0(n) &= \delta(n) \\A_k(n) &= W_k A_{k-1}(n) + B_{k-1}(n - D_k) \\B_k(n) &= W_k B_{k-1}(n) - B_{k-1}(n - D_k)\end{aligned}$$

Note that $A_k(n), B_k(n)$ are zero for $n < 0$ and for $n \geq 2^k$.

$Ga_{128}(n)=A_7(128-n)$, $Gb_{128}(n)=B_7(128-n)$ when the procedure uses $D_k = [1\ 8\ 2\ 4\ 16\ 32\ 64]$ ($k=1,2,\dots,7$) and $W_k = [-1\ -1\ -1\ -1\ +1\ -1\ -1]$.

$Ga_{64}(n)=A_6(64-n)$, $Gb_{64}(n)=B_6(64-n)$ when the procedure uses $D_k = [2\ 1\ 4\ 8\ 16\ 32]$ and $W_k = [1\ 1\ -1\ -1\ 1\ -1]$.

$Ga_{32}(n)=A_5(32-n)$, $Gb_{32}(n)=B_5(32-n)$ when the procedure uses $D_k = [1\ 4\ 8\ 2\ 16]$ and $W_k = [-1\ 1\ -1\ 1\ -1]$.

The sequences are defined in Table 20-25, Table 20-26, Table 20-27, Table 20-28, Table 20-29, and Table 20-30. The sequences in the tables are normative, the description above is informative.

20.12 DMG PLME

20.12.1 PLME SAP sublayer management primitives

Table 20-31 lists the MIB attributes that may be accessed by the PHY entities and the intra-layer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

20.12.2 DMG PHY MIB

All DMG PHY MIB attributes are defined in Annex C, with specific values defined in Table 20-31. The column titled “Operational semantics” in Table 20-31 contains two types: static and dynamic. Static MIB attributes are fixed and cannot be modified for a given PHY implementation. Dynamic MIB attributes can be modified by some management entity.

Table 20-31—DMG PHY MIB attribute default values

| Managed object | Default value/range | Operational semantics |
|-------------------------------|---------------------|-----------------------|
| dot11PHYOperationTable | | |
| dot11PHYtype | DMG | Static |
| dot11PHYDMGTable | | |
| dot11LowPowerSCPHYImplemented | Boolean | Static |
| dot11LowPowerSCPHYActivated | Boolean | Dynamic |

20.12.3 TXTIME calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated according to the following equations.

For the DMG OFDM mode and for the DMG SC mode (N_{TRN} is Training Length field defined in the header – see, for example, Table 20-13):

$$\begin{aligned}
 & \text{TXTIME} \\
 &= \begin{cases} T_{STF} + T_{CE} + T_{header} + T_{Data} & N_{TRN} = 0 \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, (\alpha \times \beta + \gamma) \times T_C\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and SC} \\ T_{STF} + T_{CE} + T_{header} + \max\{T_{Data}, \delta \times T_{SYM}\} + N_{TRN} \times T_{TRN-Unit} & N_{TRN} > 0 \text{ and OFDM} \end{cases}
 \end{aligned}$$

where

$$\begin{aligned}
 \alpha &= \text{aBRPminSCblocks} \\
 \beta &= \text{aSCBlockSize} \\
 \gamma &= \text{aSCGILength} \\
 \delta &= \text{aBRPminOFDMblocks} \\
 T_{TRN-Unit} &= \text{aBRPTRNBlock} \times T_C
 \end{aligned}$$

For the DMG control mode:

$$T_{XTIME} = T_{STF-CP} + T_{CE-CP} + (11 \times 8 + (Length - 6) \times 8 + N_{CW} \times 168) \times T_C \times 32 + N_{TRN} \times T_{TRN-Unit}$$

where N_{CW} calculation is defined in 20.4.3.3.

20.12.4 DMG PHY

The static DMG PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 20-32. The definitions for these characteristics are given in 6.5.4.

Table 20-32—DMG PHY characteristics

| PHY parameter | Value |
|---------------------------|--|
| aRIFSTime | 1 μ s |
| aSIFSTime | 3 μ s |
| aRxPHYDelay | Implementation dependent, see 10.3.7. |
| aRxTxTurnaroundTime | Implementation dependent, see 10.3.7. |
| aCCATime | Implementation dependent, see 10.3.7. |
| aRxTxSwitchTime | Implementation dependent, see 10.3.7. |
| aRxPHYStartDelay | DMG control mode: 10 μ s; DMG SC and SC low-power modes: 3.6 μ s; DMG OFDM mode: 3.3 μ s |
| aMACProcessingDelay | Implementation dependent, see 10.3.7. |
| aTxPHYDelay | Implementation dependent, see 10.3.7. |
| aTxRampOnTime | Implementation dependent, see 10.3.7. |
| aDataPreambleLength | 1891 ns |
| aControlPHYPreambleLength | 4291 ns |
| aSBIFSTime | 1 μ s |
| aSBIFSAccuracy | 0.03 μ s |
| aAirPropagationTime | 100 ns |
| aDMGDetectionThres | -48 dBm |
| aBRPIFS | 40 μ s |
| aSlotTime | 5 μ s |
| aCWmin | 15 |
| aCWmax | 1023 |
| aBRPminSCblocks | 18 |
| aBRPminOFDMblocks | 20 |
| aBRPTRNBlock | 4992 |

Table 20-32—DMG PHY characteristics (continued)

| PHY parameter | Value |
|----------------|----------------|
| aSCGILength | 64 |
| aSCBlockSize | 512 |
| aPPDUMaxTime | 2 ms |
| aPSDUMaxLength | 262 143 octets |

21. Very high throughput (VHT) PHY specification

21.1 Introduction

21.1.1 Introduction to the VHT PHY

Clause 21 specifies the PHY entity for a very high throughput (VHT) orthogonal frequency division multiplexing (OFDM) system.

In addition to the requirements in Clause 21, a VHT STA shall be capable of transmitting and receiving PPDUs that are compliant with the mandatory PHY specifications defined in Clause 19.

The VHT PHY is based on the HT PHY defined in Clause 19, which in turn is based on the OFDM PHY defined in Clause 17. The VHT PHY extends the maximum number of space-time streams supported to eight and provides support for downlink multi-user (MU) transmissions. A downlink MU transmission supports up to four users with up to four space-time streams per user with the total number of space-time streams not exceeding eight.

NOTE—MU transmission is different from VHT SU group addressed transmission.

The VHT PHY provides support for 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous channel widths and support for 80+80 MHz noncontiguous channel width.

The VHT PHY data subcarriers are modulated using binary phase shift keying (BPSK), quadrature phase shift keying (QPSK), 16-quadrature amplitude modulation (16-QAM), 64-QAM, and 256-QAM. Forward error correction (FEC) coding (convolutional or LDPC coding) is used with coding rates of 1/2, 2/3, 3/4, and 5/6.

A VHT STA shall support the following features:

- Non-HT and non-HT duplicate formats (transmit and receive) for all channel widths supported by the VHT STA
- HT-mixed format (transmit and receive)
- VHT format (transmit and receive)
- 20 MHz, 40 MHz, and 80 MHz channel widths
- Single spatial stream VHT-MCSs 0 to 7 (transmit and receive) in all supported channel widths
- Binary convolutional coding

A VHT STA may support the following features:

- HT-greenfield format (transmit and receive)
- 2 or more spatial streams (transmit and receive)
- 400 ns short guard interval (transmit and receive)
- Beamforming sounding (by sending a VHT NDP)
- Responding to transmit beamforming sounding (by providing compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)
- Support for 160 MHz channel width
- Support for 80+80 MHz channel width
- VHT-MCSs 8 and 9 (transmit and receive)

21.1.2 Scope

The services provided to the MAC by the VHT PHY consist of the following protocol functions:

- a) A function that defines a method of mapping the PSDUs into a framing format (PPDU) suitable for sending and receiving PSDUs between two or more STAs.
- b) A function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. Depending on the PPDU format, these STAs support a mixture of VHT, Clause 19 and Clause 17 PHYs.

21.1.3 VHT PHY functions

21.1.3.1 General

The VHT PHY contains two functional entities: the PHY function and the physical layer management function (i.e., the PLME). Both of these functions are described in detail in 21.3 and 21.4.

The VHT PHY service is provided to the MAC through the PHY service primitives defined in Clause 8. The VHT PHY service interface is described in 21.2.

21.1.3.2 PHY management entity (PLME)

The PLME performs management of the local PHY functions in conjunction with the MLME.

21.1.3.3 Service specification method

The models represented by figures and state diagrams are intended to be illustrations of the functions provided. It is important to distinguish between a model and a real implementation. The models are optimized for simplicity and clarity of presentation, but do not necessarily reflect any particular implementation.

The service of a layer is the set of capabilities that it offers to a user in the next higher layer. Abstract services are specified here by describing the service primitives and parameters that characterize each service. This definition is independent of any particular implementation.

21.1.4 PPDU formats

The structure of the PPDU transmitted by a VHT STA is determined by the TXVECTOR parameters as defined in Table 21-1.

In a VHT STA the FORMAT parameter determines the overall structure of the PPDU and can take one of the following values:

- Non-HT format (NON_HT), based on Clause 17 and including non-HT duplicate format.
- HT-mixed format (HT_MF) as specified in Clause 19.
- HT-greenfield format (HT_GF) as specified in Clause 19.
- VHT format (VHT). PPDUs of this format contain a preamble compatible with Clause 17 and Clause 19 STAs. The non-VHT portion of the VHT format preamble (the parts of VHT preamble preceding the VHT-SIG-A field) is defined so that it can be decoded by these STAs.

NOTE—Required support for these formats is defined in 11.40, 19.1.1, and 21.1.1.

A VHT PPDU can be further categorized as a VHT SU PPDU or a VHT MU PPDU. A VHT PPDU using a group ID value of 0 or 63 is a VHT SU PPDU and either carries only one PSDU or no PSDU. A VHT PPDU

using a group ID value in the range 1 to 62 is a VHT MU PPDU and carries one or more PSDUs to one or more users.

21.2 VHT PHY service interface

21.2.1 Introduction

The PHY provides an interface to the MAC through an extension of the generic PHY service interface defined in 8.3.4. The interface includes TXVECTOR, RXVECTOR, and PHYCONFIG_VECTOR.

Using the TXVECTOR, the MAC supplies the PHY with per-PPDU transmit parameters. Using the RXVECTOR, the PHY informs the MAC of the received PPDU parameters. Using the PHYCONFIG_VECTOR, the MAC configures the PHY for operation, independent of frame transmission or reception.

21.2.2 TXVECTOR and RXVECTOR parameters

The parameters in Table 21-1 are defined as part of the TXVECTOR parameter list in the PHY-TXSTART.request primitive and/or as part of the RXVECTOR parameter list in the PHY-RXSTART.indication primitive.

Table 21-1—TXVECTOR and RXVECTOR parameters

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------------|------------------|--|----------|----------|
| FORMAT | | Determines the format of the PPDU. Enumerated type: NON_HT indicates Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) or non-HT duplicate PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. HT_MF indicates HT-mixed format. HT_GF indicates HT-greenfield format. VHT indicates VHT format. | Y | Y |
| NON_HT_MODULATION | FORMAT is NON_HT | In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: OFDM indicates Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) format NON_HT_DUP_OFDM indicates non-HT duplicate format | Y | Y |
| | Otherwise | Not present | N | N |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|--------------|---------------|---|----------|----------|
| L_LENGTH | FORMAT is VHT | Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (21-24) using the TXTIME value defined by Equation (21-109) and Equation (21-110), which in turn depend on other parameters including the TXVECTOR parameter APEP_LENGTH. | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| L_DATARATE | FORMAT is VHT | Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6. | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| LSIGVALID | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| SERVICE | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| SMOOTHING | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| AGGREGATION | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| NUM_EXTEN_SS | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|--------------------|---|--|----------|----------|
| ANTENNA_SET | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| N_TX | FORMAT is VHT | Indicates the number of transmit chains. | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| EXPANSION_MAT_TYPE | FORMAT is VHT and EXPANSION_MAT is present. | Set to COMPRESSED_SV | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| EXPANSION_MAT | FORMAT is VHT | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of a previous VHT NDP PPDU. | M U | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| CHAN_MAT_TYPE | FORMAT is VHT and PSDU_LENGTH equals 0 | Set to COMPRESSED_SV | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than 0 | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| CHAN_MAT | FORMAT is VHT and PSDU_LENGTH equals 0 | Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of the received VHT NDP PPDU. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than 0 | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------|---------------|--|----------|----------|
| DELTASNR | FORMAT is VHT | Contains an array of delta SNR values as defined in 9.4.1.51 based on the channel measured during the training symbols of the received VHT NDP PPDU. NOTE—In the RXVECTOR this parameter is present only for VHT NDP PPDUs for MU sounding. | M U | Y |
| | Otherwise | Not present | N | N |
| RCPI | | See corresponding entry in Table 19-1 | | |
| | | | | |
| SNR | FORMAT is VHT | Contains an array of received SNR measurements for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.49 | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| NO_SIG_EXTN | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| FEC_CODING | FORMAT is VHT | Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code. | M U | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| STBC | FORMAT is VHT | Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). This parameter is 0 for a VHT MU PPDU. | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| GI_TYPE | FORMAT is VHT | Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU. | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------------|-------------------------------|---|----------|----------|
| TXPWR_LEVEL_INDEX | FORMAT is VHT | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to numberOfOctets(dot11TxPowerLevelExtended)/2. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission. | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| RSSI | FORMAT is VHT | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of the VHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power. | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| MCS | FORMAT is VHT | Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9 | M U | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| REC_MCS | FORMAT is HT_MF, HT_GF or VHT | Indicates the MCS that the STA's receiver recommends. | N | O |
| | Otherwise | Not present | N | N |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------------------|--------------------------|---|----------|----------|
| CH_BANDWIDTH | FORMAT is HT_MF or HT_GF | See corresponding entry in Table 19-1 | | |
| | FORMAT is VHT | Indicates the channel width of the transmitted PPDU: Enumerated type: CBW20 for 20 MHz CBW40 for 40 MHz CBW80 for 80 MHz CBW160 for 160 MHz CBW80+80 for 80+80 MHz | Y | Y |
| | FORMAT is NON_HT | In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: CBW40, CBW80, CBW160, or CBW80+80 if NON_HT_MODULATION equals NON_HT_DUP_OFDM CBW20 if NON_HT_MODULATION equals OFDM NOTE—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth. | Y | Y |
| DYN_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| | Otherwise | Not present | N | N |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|------------------------|---|---|----------|----------|
| CH_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: CBW20, CBW40, CBW80, CBW160, CBW80+80 NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the currently received MPDU (e.g., RTS) or the previous MPDU in an exchange (e.g., the RTS preceding a CTS). | O | Y |
| | Otherwise | Not present | N | N |
| LENGTH | FORMAT is VHT | Not present | N | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| AEP_LENGTH | FORMAT is VHT | If equal to 0, indicates a VHT NDP PPDU for both RXVECTOR and TXVECTOR. If greater than 0 in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.13.2) carried in the PSDU. If greater than 0 in the RXVECTOR, this parameter is the value obtained from the VHT-SIG-B Length field multiplied by 4. | M U | O |
| | Otherwise | Not present | N | N |
| PSDU_LENGTH | FORMAT is VHT | Indicates the number of octets in the VHT PSDU in the range 0 to aPSDUMaxLength octets (see Table 21-29). A value of 0 indicates a VHT NDP PPDU. | N | Y |
| | Otherwise | Not present | N | N |
| USER_POSITION | FORMAT is VHT and $1 \leq \text{GROUP_ID} \leq 62$ | Index for user in MU transmission. Integer: range 0-3. NOTE—The entries in the USER_POSITION array are in ascending order. | M U | O |
| | Otherwise | Not present | N | N |
| NUM_STS | FORMAT is VHT | Indicates the number of space-time streams. Integer: range 1-8 for SU, 1-4 per user in the TXVECTOR and 0-4 in the RXVECTOR for MU. NUM_STS summed over all users is in the range 1 to 8. | M U | Y |
| | Otherwise | Not present | N | N |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---------------------|---------------------------------------|--|----------|----------|
| GROUP_ID | FORMAT is VHT | Indicates the group ID. Integer: range 0-63 (see Table 21-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU. | Y | Y |
| | Otherwise | Not present | N | N |
| PARTIAL_AID | FORMAT is VHT and GROUP_ID is 0 or 63 | Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20). Integer: range 0-511. | Y | Y |
| | Otherwise | Not present | N | N |
| NUM_USERS | FORMAT is VHT | Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4. | Y | N |
| | Otherwise | Not present | N | N |
| BEAMFORMED | FORMAT is VHT and GROUP_ID is 0 or 63 | Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is set to 1, frequency domain smoothing as part of channel estimation is not recommended. | Y | O |
| | Otherwise | Not present | N | N |
| TXOP_PS_NOT_ALLOWED | FORMAT is VHT | Indicates whether a VHT AP allows non-AP VHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the VHT AP allows non-AP VHT STAs to enter doze state during a TXOP. 1 indicates that the VHT AP does not allow non-AP VHT STAs to enter doze state during a TXOP. | Y | Y |
| | Otherwise | Not present | N | N |

Table 21-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-----------------------------|----------------------------------|--|----------|----------|
| TIME_OF_DEPARTURE_REQUESTED | | See corresponding entry in Table 19-1 | | |
| RX_START_OF_FRAME_OFFSET | dot11TimingMsmtActivated is true | 0 to $2^{32}-1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | Y |
| | Otherwise | Not present | N | N |

NOTE—In the “TXVECTOR” and “RXVECTOR” columns, the following apply:
 Y = Present;
 N = Not present;
 O = Optional;
 MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU.
 Parameters specified to be present per user are conceptually supplied as an array of values indexed by u , where u takes values 0 to NUM_USERS-1.

21.2.3 PHYCONFIG_VECTOR parameters

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains an OPERATING_CHANNEL parameter, which identifies the operating or primary channel. The PHY shall set dot11CurrentPrimaryChannel to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CHANNEL_WIDTH parameter, which identifies the operating channel width and takes one of the values 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz. The PHY shall set dot11CurrentChannelWidth to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_0 parameter, which identifies the center frequency of the channel (or of segment 0 if the CHANNEL_WIDTH parameter indicates 80+80 MHz) and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex0 to the value of this parameter.

The PHYCONFIG_VECTOR carried in a PHY-CONFIG.request primitive for a VHT PHY contains a CENTER_FREQUENCY_SEGMENT_1 parameter, which takes the value 0 if the CHANNEL_WIDTH parameter does not indicate 80+80 MHz, and otherwise identifies the center frequency of segment 1 and takes a value between 1 and 200. The PHY shall set dot11CurrentChannelCenterFrequencyIndex1 to the value of this parameter.

21.2.4 Effects of CH_BANDWIDTH parameter on PPDU format

Table 21-2 shows the valid combinations of the FORMAT, NON_HT_MODULATION, and CH_BANDWIDTH parameters and the corresponding PPDU format and value of CH_OFFSET (if applicable). Other combinations are reserved.

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters

| FORMAT | NON_HT_MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|----------------|-------------------|---|------------|--|
| VHT | N/A | CBW20 | N/A | The STA transmits a VHT PPDU (when FORMAT is VHT) of 20 MHz bandwidth. If the BSS bandwidth is wider than 20 MHz, then the transmission shall use the primary 20 MHz channel. |
| VHT | N/A | CBW40 | N/A | The STA transmits a VHT PPDU (when FORMAT is VHT) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. |
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} < f_{P20, idx}$ | CH_OFF_20U | The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel. |
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR > 20 MHz and $f_{S20, idx} > f_{P20, idx}$ | CH_OFF_20L | The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. The transmission shall use the primary 20 MHz channel. |
| HT_MF or HT_GF | N/A | HT_CBW20 and CHANNEL_WIDTH in PHYCONFIG_VECTOR = 20 MHz | CH_OFF_20 | The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 20 MHz bandwidth. |

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters (continued)

| FORMAT | NON_HT_MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|----------------|-------------------|--------------|-----------|--|
| HT_MF or HT_GF | N/A | HT_CBW40 | CH_OFF_40 | The STA transmits an HT-mixed PPDU (when FORMAT is HT_MF) or HT-greenfield PPDU (when FORMAT is HT_GF) of 40 MHz bandwidth. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. |
| VHT | N/A | CBW80 | | The STA transmits a VHT PPDU of 80 MHz bandwidth. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. |
| VHT | N/A | CBW160 | | The STA transmits a VHT PPDU of 160 MHz bandwidth. |
| VHT | N/A | CBW80+80 | | The STA transmits a VHT PPDU of 80+80 MHz bandwidth. |
| NON_HT | OFDM | CBW20 | | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to OFDM using the primary 20 MHz channel as defined in Clause 17. |
| NON_HT | NON_HT_DUP_OFDM | CBW40 | | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent 20 MHz channels as defined in 21.3.10.12. If the BSS bandwidth is wider than 40 MHz, then the transmission shall use the primary 40 MHz channel. The one 20 MHz channel higher in frequency is rotated +90° relative to the 20 MHz channel lowest in frequency as defined in Equation (21-15). |
| NON_HT | NON_HT_DUP_OFDM | CBW80 | | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent 20 MHz channels as defined in 21.3.10.12. If the BSS bandwidth is 160 MHz or 80+80 MHz, then the transmission shall use the primary 80 MHz channel. The three 20 MHz channels higher in frequency are rotated +180° relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16). |

Table 21-2—Interpretation of FORMAT, NON_HT_MODULATION, CH_BANDWIDTH, and CH_OFFSET parameters (continued)

| FORMAT | NON_HT_MODULATION | CH_BANDWIDTH | CH_OFFSET | PPDU format |
|--------|-------------------|--------------|-----------|---|
| NON_HT | NON_HT_DUP_OFDM | CBW160 | | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using eight adjacent 20 MHz channels as defined in 21.3.10.12. The second, third, fourth, sixth, seventh, and eighth 20 MHz channels in the order of increasing frequency are rotated +180° relative to the 20 MHz channel lowest in frequency as defined in Equation (21-17). |
| NON_HT | NON_HT_DUP_OFDM | CBW80+80 | | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of four adjacent 20 MHz channels as defined in 21.3.10.12. In each frequency segment, the three 20 MHz channels higher in frequency are rotated +180° relative to the 20 MHz channel lowest in frequency as defined in Equation (21-16). |

21.2.5 Support for NON_HT and HT formats

21.2.5.1 General

A VHT STA logically contains Clause 17, Clause 19, and Clause 21 PHYs. The MAC interfaces to the PHYs via the Clause 21 PHY service interface, which in turn interacts with the Clause 17 and Clause 19 PHY service interfaces as shown in Figure 21-1, Figure 21-2, and Figure 21-3.

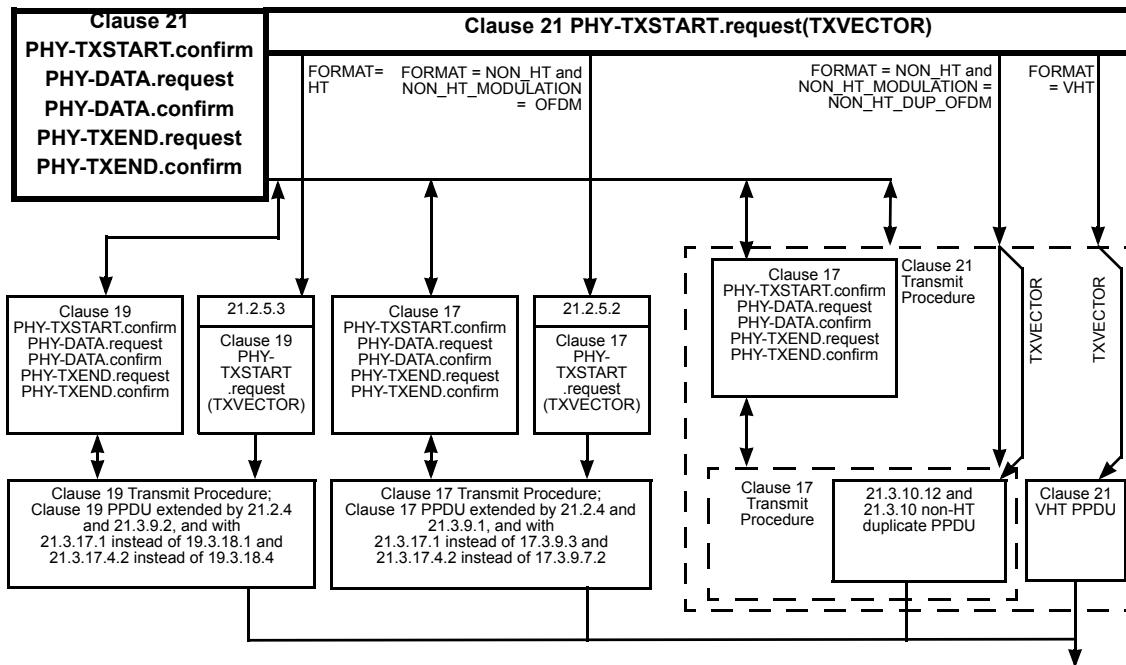

Figure 21-1—PHY interaction on transmit for various PPDU formats

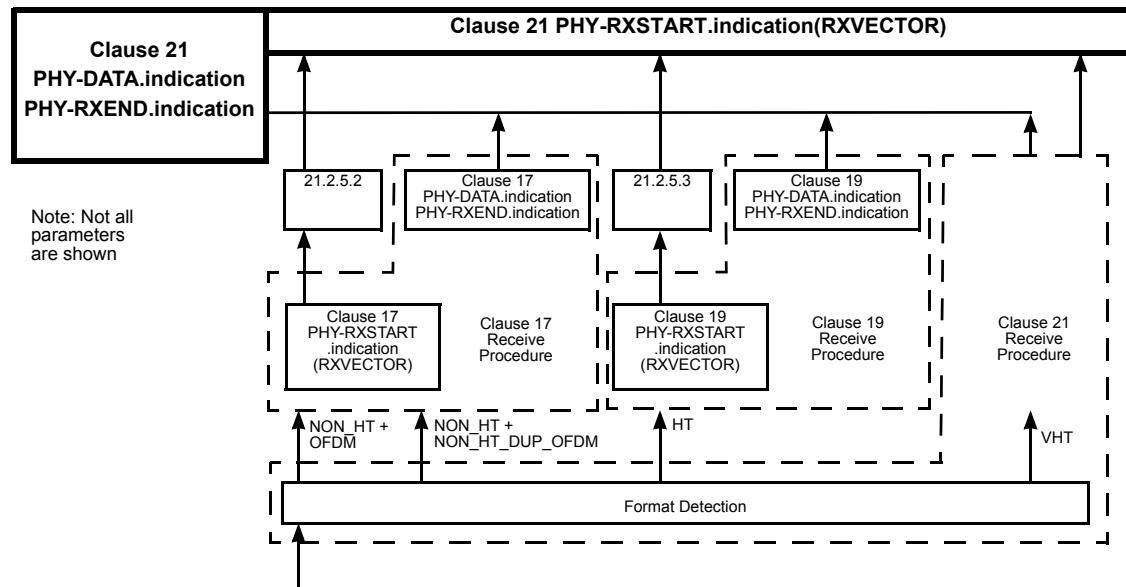

Figure 21-2—PHY interaction on receive for various PPDU formats

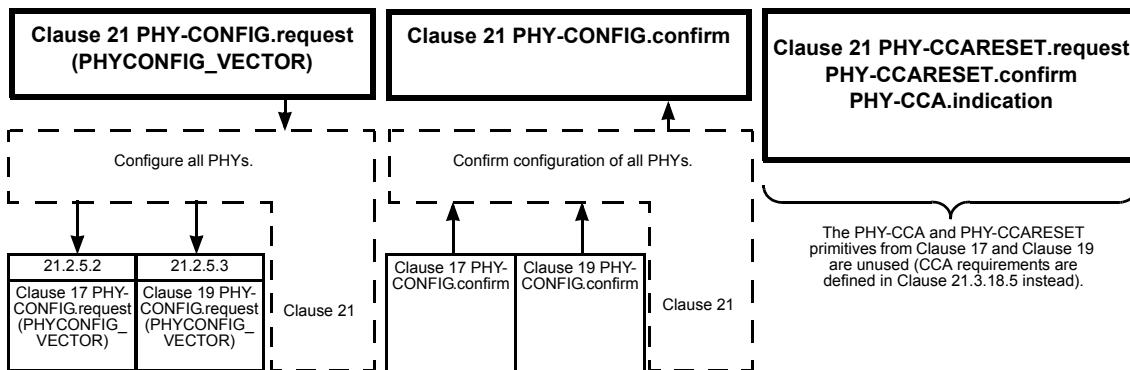

Figure 21-3—PHY-CONFIG and CCA interaction with Clause 17, Clause 19, and Clause 21 PHYs

21.2.5.2 Support for NON_HT format when NON_HT_MODULATION is OFDM

When a **PHY-TXSTART.request(TXVECTOR)** primitive with the **FORMAT** parameter equal to **NON_HT** and the **NON_HT_MODULATION** parameter equal to **OFDM** is issued, the behavior of the VHT PHY is defined in Clause 17 with additional requirements described in the following subclauses:

- 21.3.9.1
- 21.3.17.1 instead of 17.3.9.3
- 21.3.17.4.2 instead of 17.3.9.7.2

where the Clause 21 TXVECTOR parameters in Table 21-1 are mapped to Clause 17 TXVECTOR parameters in Table 17-1 according to Table 21-3.

NOTE—When the **FORMAT** parameter is set to **NON_HT** and the **NON_HT_MODULATION** parameter is set to **NON_HT_DUP_OFDM** in a **PHY-TXSTART.request(TXVECTOR)** primitive, the behavior of the VHT PHY is defined in Clause 21.

When the VHT PHY receives a Clause 21 **PHY-CONFIG.request(PHYCONFIG_VECTOR)** primitive, the VHT PHY shall, for the purposes of OFDM PPDU transmission and reception, behave as if it were a Clause 17 PHY that had received a **PHY-CONFIG.request(PHYCONFIG_VECTOR)** primitive but with the **CHANNEL_WIDTH**, **CENTER_FREQUENCY_SEGMENT_0**, and **CENTER_FREQUENCY_SEGMENT_1** parameters discarded from **PHYCONFIG_VECTOR**.

As defined in 21.3.20, once a PPDU is received and detected as a **NON_HT** PPDU, the behavior of the VHT PHY is defined in Clause 17. The RXVECTOR parameters from the Clause 17 **PHY-RXSTART.indication** primitive are mapped to the Clause 21 RXVECTOR parameters as defined in Table 21-3. VHT PHY parameters not listed in the table are not present.

Table 21-3—Mapping of VHT PHY parameters for NON_HT operation

| VHT PHY Parameter | 5 GHz operation defined by Clause 17 | Parameter List |
|-------------------|--------------------------------------|-------------------|
| L_LENGTH | LENGTH | TXVECTOR/RXVECTOR |
| L_DATARATE | DATARATE | TXVECTOR/RXVECTOR |
| TXPWR_LEVEL_INDEX | TXPWR_LEVEL_INDEX | TXVECTOR |

Table 21-3—Mapping of VHT PHY parameters for NON_HT operation (continued)

| VHT PHY Parameter | 5 GHz operation defined by Clause 17 | Parameter List |
|----------------------------|--------------------------------------|-------------------|
| RSSI | RSSI | RXVECTOR |
| SERVICE | SERVICE | TXVECTOR/RXVECTOR |
| RCPI | RCPI | RXVECTOR |
| CH_BANDWIDTH_IN_NON_HT | CH_BANDWIDTH_IN_NON_HT | TXVECTOR/RXVECTOR |
| DYN_BANDWIDTH_IN_NON_HT | DYN_BANDWIDTH_IN_NON_HT | TXVECTOR/RXVECTOR |
| OPERATING_CHANNEL | OPERATING_CHANNEL | PHYCONFIG_VECTOR |
| CHANNEL_WIDTH | discarded | PHYCONFIG_VECTOR |
| CENTER_FREQUENCY_SEGMENT_0 | discarded | PHYCONFIG_VECTOR |
| CENTER_FREQUENCY_SEGMENT_1 | discarded | PHYCONFIG_VECTOR |

21.2.5.3 Support for HT formats

When a PHY-TXSTART.request(TXVECTOR) primitive is received with the TXVECTOR parameter FORMAT equal to HT_MF or HT_GF, the behavior of the PHY is defined by Clause 19 with additional requirements defined in the following subclauses:

- 21.3.9.2
- 21.3.17.1 instead of 19.3.18.1
- 21.3.17.4.2 instead of 19.3.18.4

The Clause 21 TXVECTOR parameters in Table 21-1 are mapped directly to Clause 19 TXVECTOR parameters in Table 19-1 and the Clause 19 PHY-TXSTART.request(TXVECTOR) primitive is issued. The PHY shall use a value of CH_OFFSET in the Clause 19 TXVECTOR that is consistent with Table 21-2.

When the VHT PHY receives a Clause 21 PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive, the VHT PHY shall, for the purposes of HT PPDU transmission and reception, behave as if it were a Clause 19 PHY that had received PHY-CONFIG.request(PHYCONFIG_VECTOR) primitive but with the CHANNEL_WIDTH, CENTER_FREQUENCY_SEGMENT_0, and CENTER_FREQUENCY_SEGMENT_1 parameters discarded from the PHYCONFIG_VECTOR and the SECONDARY_CHANNEL_OFFSET parameter set to SECONDARY_CHANNEL_NONE if dot11CurrentChannelWidth indicates 20 MHz, to SECONDARY_CHANNEL_ABOVE if $f_{P20, idx} < f_{S20, idx}$, or to SECONDARY_CHANNEL_BELOW otherwise.

As defined in 21.3.20, once a PPDU is received and detected as an HT PPDU, the behavior of the VHT PHY is defined in Clause 19. The RXVECTOR parameters in Table 19-1 from the Clause 19 PHY-RXSTART.indication primitive are mapped directly to the RXVECTOR parameters in Table 21-1 and a Clause 21 PHY-RXSTART.indication primitive is issued.

21.2.6 TXSTATUS parameters

The parameters listed in Table 20-2 are defined as part of the TXSTATUS parameter list in the PHY-TXSTART.confirm(TXSTATUS) primitive.

21.3 VHT PHY

21.3.1 Introduction

This subclause provides the procedure by which PSDUs are converted to and from transmissions on the wireless medium.

During transmission, a PSDU (in the SU case) or one or more PSDUs (in the MU case) are processed (i.e., scrambled and coded) and appended to the PHY preamble to create the PPDU. At the receiver, the PHY preamble is processed to aid in the detection, demodulation, and delivery of the PSDU.

Pre-VHT modulated fields refer to the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields, while VHT modulated fields refer to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields (see Figure 21-17).

21.3.2 VHT PPDU format

A single PPDU format is defined for this PHY: the VHT PPDU format. Figure 21-4 shows the VHT PPDU format.

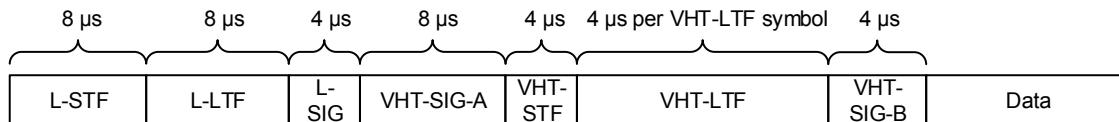

Figure 21-4—VHT PPDU format

The fields of the VHT PPDU format are summarized in Table 21-4.

Table 21-4—Fields of the VHT PPDU

| Field | Description |
|-----------|-------------------------------------|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| VHT-SIG-A | VHT Signal A field |
| VHT-STF | VHT Short Training field |
| VHT-LTF | VHT Long Training field |
| VHT-SIG-B | VHT Signal B field |
| Data | The Data field carrying the PSDU(s) |

The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields exist only in VHT PPDUs. In a VHT NDP the Data field is not present. The number of symbols in the VHT-LTF field, N_{VHTLTF} , can be either 1, 2, 4, 6, or 8 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU (see Table 21-13).

21.3.3 Transmitter block diagram

The generation of each field in a VHT PPDU uses many of the following blocks:

- a) PHY padding
- b) Scrambler
- c) BCC encoder parser
- d) FEC (BCC or LDPC) encoders
- e) Stream parser
- f) Segment parser (for 160 MHz and 80+80 MHz transmissions)
- g) BCC interleaver
- h) Constellation mapper
- i) Pilot insertion
- j) Replicate over multiple 20 MHz (if BW > 20 MHz)
- k) Multiply by 1st column of P_{VHTLF}
- l) LDPC tone mapper
- m) Segment deparser
- n) Space time block code (STBC) encoder
- o) Cyclic shift diversity (CSD) per STS insertion
- p) Spatial mapper
- q) Inverse discrete Fourier transform (IDFT)
- r) Cyclic shift diversity (CSD) per chain insertion
- s) Guard interval (GI) insertion
- t) Windowing

Figure 21-5 to Figure 21-16 show example transmitter block diagrams. The actual structure of the transmitter is implementation dependent. In particular, Figure 21-5 shows the transmit process for the L-SIG and VHT-SIG-A fields of a VHT PPDU using one frequency segment. These transmit blocks are also used to generate L-STF and L-LTF fields, except that the BCC encoder and interleaver are not used for these fields.

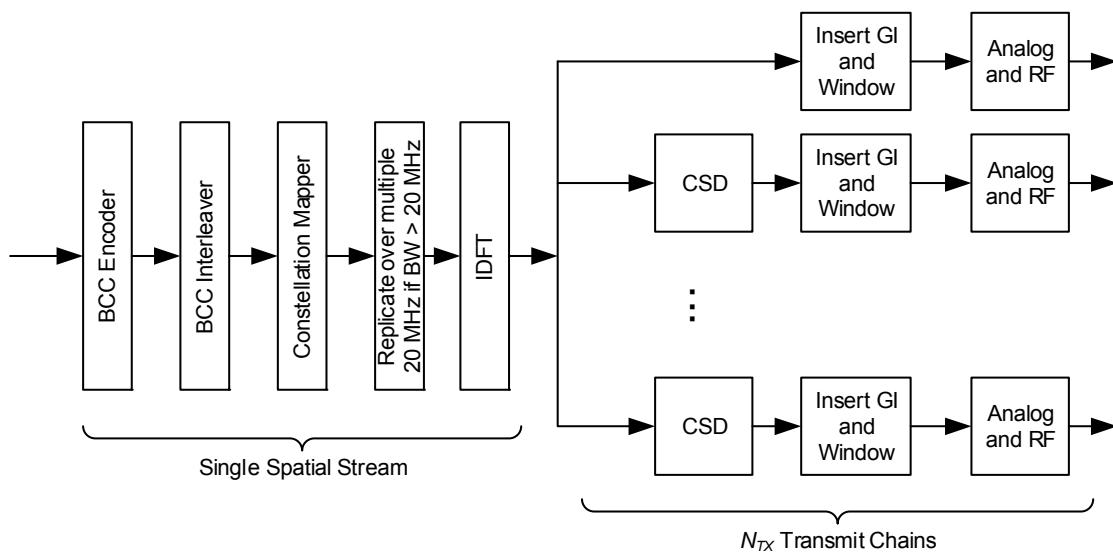

Figure 21-5—Transmitter block diagram for the L-SIG and VHT-SIG-A fields

Figure 21-6 and Figure 21-7 show the transmit process for generating the VHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU, respectively, in 20 MHz, 40 MHz, and 80 MHz channel widths. Figure 21-8 and Figure 21-9 show the transmit process for generating the VHT_SIG-B field of a 160 MHz and 80+80 MHz VHT SU PPDU, respectively.

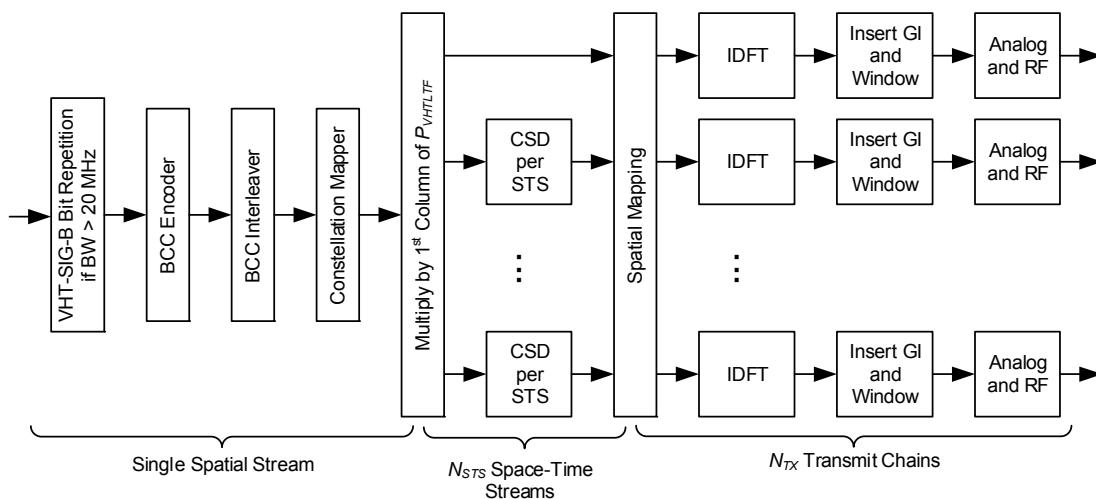

Figure 21-6—Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU

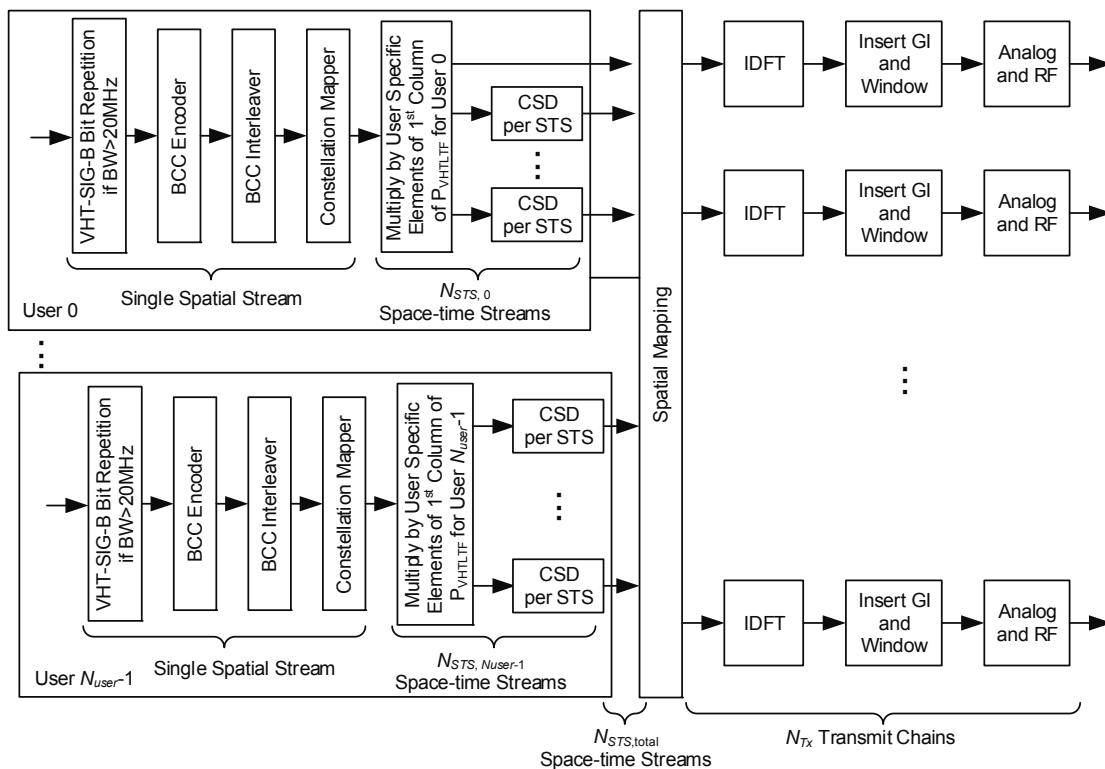

Figure 21-7—Transmitter block diagram for the VHT-SIG-B field of a 20 MHz, 40 MHz, and 80 MHz VHT MU PPDU

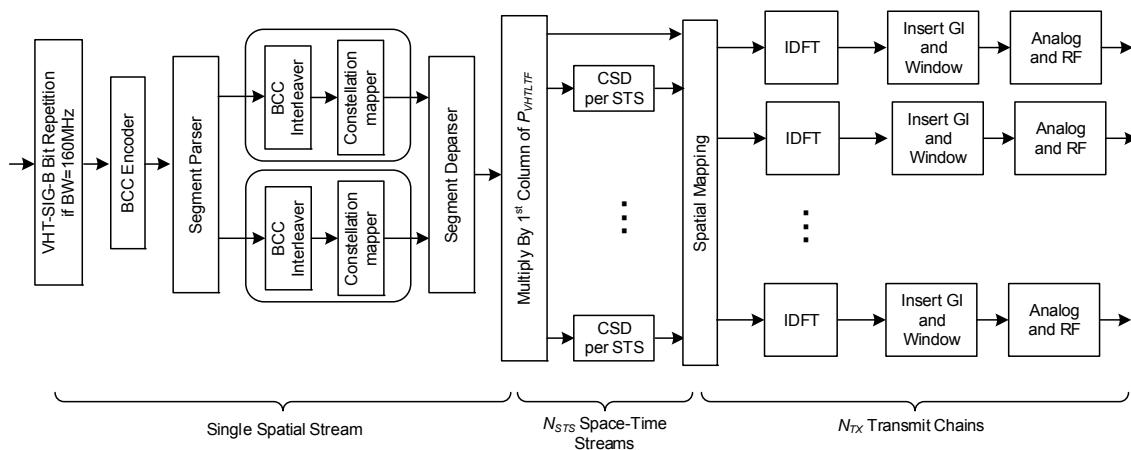

Figure 21-8—Transmitter block diagram for the VHT-SIG-B field of a 160 MHz VHT SU PPDU

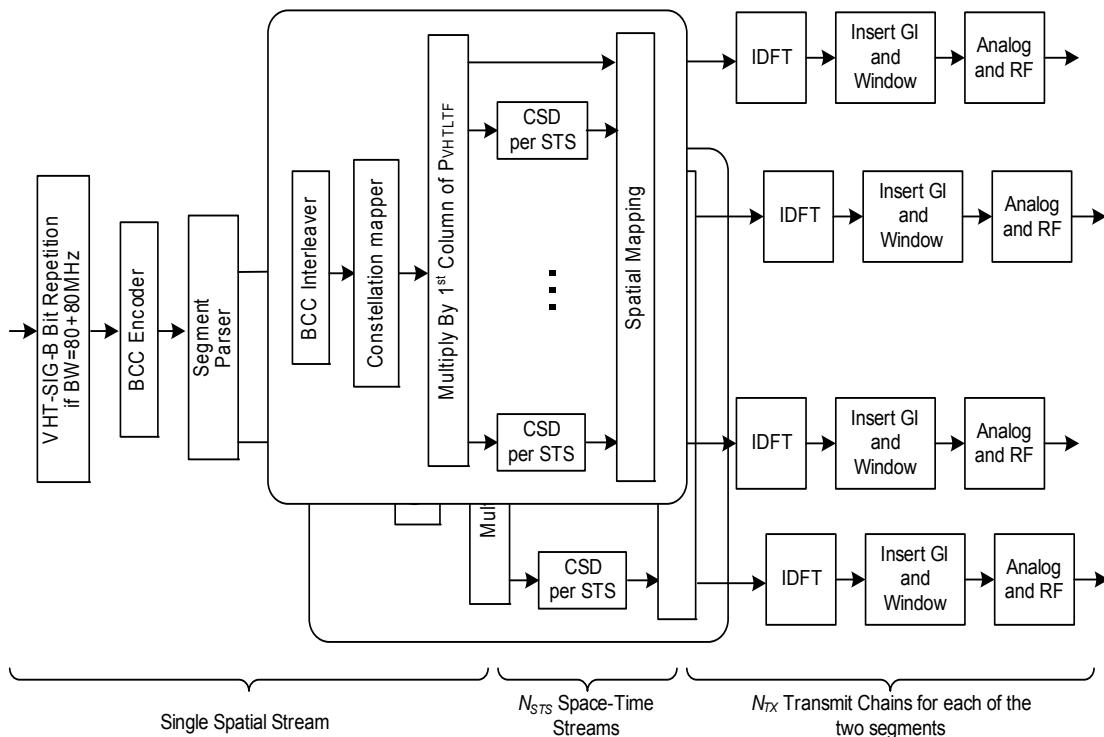

Figure 21-9—Transmitter block diagram for the VHT-SIG-B field of an 80+80 MHz VHT SU PPDU

Figure 21-10 shows the transmitter blocks used to generate the Data field of a 20 MHz, 40 MHz, and 80 MHz VHT SU PPDU with BCC encoding. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-LTF fields. This is illustrated in Figure 21-21. A subset of these transmitter blocks consisting of the constellation mapper and CSD blocks, as well as the blocks to the right of, and including, the spatial mapping block, are also used to generate the VHT-STF field but without the multiplication by $A_{VHT-LTF}^k$ (defined in Equation (21-40)).

21.3.4 Overview of the PPDU encoding process

21.3.4.1 General

This subclause provides an overview of the VHT PPDU encoding process.

21.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 21.3.8.2.2 with the following highlights:

- Determine the CH_BANDWIDTH from the TXVECTOR.
- Sequence generation: Generate the L-STF sequence over the CH_BANDWIDTH as described in 21.3.8.2.2.
- Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- IDFT: Compute the inverse discrete Fourier transform.
- CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.
- Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

- g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in 21.3.8.2.3 with the following highlights:

- a) Determine the CH_BANDWIDTH from the TXVECTOR.
- b) Sequence generation: Generate the L-LTF sequence over the CH_BANDWIDTH as described in 21.3.8.2.3.
- c) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- d) IDFT: Compute the inverse discrete Fourier transform.
- e) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.
- f) Insert GI and apply windowing: Prepend a GI ($2 \times \text{LONG_GI}$) and apply windowing as described in 21.3.7.4.
- g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 21.3.8.2.4 with the following highlights:

- a) In a VHT PPDU set the RATE subfield in the SIGNAL field to 6 Mb/s. Set the Length, Parity, and Tail bits in the SIGNAL field as described in 21.3.8.2.4.
- b) BCC encoder: Encode the SIGNAL field by a convolutional encoder at the rate of R=1/2 as described in 21.3.10.5.3.
- c) BCC interleaver: Interleave as described in 21.3.10.8.
- d) Constellation Mapper: BPSK modulate as described in 21.3.10.9.
- e) Pilot insertion: Insert pilots as described in 21.3.10.11.
- f) Duplication and phase rotation: Duplicate the L-SIG field over each 20 MHz of the CH_BANDWIDTH. Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- g) IDFT: Compute the inverse discrete Fourier transform.
- h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.
- i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
- j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.5 Construction of VHT-SIG-A

The VHT-SIG-A field consists of two symbols, VHT-SIG-A1 and VHT-SIG-A2, as defined in 21.3.8.3.3 and is constructed as follows:

- a) Obtain the CH_BANDWIDTH, STBC, GROUP_ID, PARTIAL_AID (SU only), NUM_STS, GI_TYPE, FEC_CODING, MCS (SU only), BEAMFORMED (SU only), NUM_USERS, and TXOP_PS_NOT_ALLOWED from the TXVECTOR. Add the reserved bits, append the calculated CRC, then append the N_{tail} tail bits as shown in 21.3.8.3.3. This results in 48 uncoded bits.

- b) BCC encoder: Encode the data by a convolutional encoder at the rate of R=1/2 as described in 17.3.5.6.
- c) BCC interleaver: Interleave as described in 17.3.5.7.
- d) Constellation mapper: BPSK modulate the first 48 interleaved bits as described in 17.3.5.8 to form the first symbol of VHT-SIG-A. BPSK modulate the second 48 interleaved bits and rotate by 90° counter-clockwise relative to the first symbol to form the second symbol of VHT-SIG-A.
- e) Pilot insertion: Insert pilots as described in 117.3.5.9.
- f) Duplication and phase rotation: Duplicate VHT-SIG-A1 and VHT-SIG-A2 over each 20 MHz of the CH_BANDWIDTH. Apply the appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- g) IDFT: Compute the inverse discrete Fourier transform.
- h) CSD: Apply CSD for each transmit chain and frequency segment as described in 21.3.8.2.1.
- i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
- j) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.6 Construction of VHT-STF

The VHT-STF field is defined in 21.3.8.3.4 and is constructed as follows:

- a) Sequence generation: Generate the VHT-STF in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.4.
- b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- c) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.
- d) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.
- e) IDFT: Compute the inverse discrete Fourier transform.
- f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
- g) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.7 Construction of VHT-LTF

The VHT-LTF field is defined in 21.3.8.3.5 and constructed as follows:

- a) Sequence generation: Generate the VHT-LTF sequence in the frequency domain over the bandwidth indicated by CH_BANDWIDTH as described in 21.3.8.3.5.
- b) Phase rotation: Apply appropriate phase rotation for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- c) $A_{VHT-LTF}$ matrix mapping: Apply the $P_{VHT-LTF}$ matrix to the data tones of the VHT-LTF sequence and apply the $R_{VHT-LTF}$ matrix to the pilot tones as described in 21.3.8.3.5.
- d) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.
- e) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.
- f) IDFT: Compute the inverse discrete Fourier transform.
- g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.

- h) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.8 Construction of VHT-SIG-B

The VHT-SIG-B field is constructed per-user as follows:

- a) Obtain the VHT-MCS (for MU only) and APEP_LENGTH from the TXVECTOR.
- b) VHT-SIG-B bits: Set the VHT-MCS (for MU only) and VHT-SIG-B Length field as described in 21.3.8.3.6. Add the reserved bits (for SU only) and N_{tail} bits of tail. In an NDP set VHT-SIG-B to the fixed bit pattern for the bandwidth used as described in 21.3.8.3.6.
- c) VHT-SIG-B Bit Repetition: Repeat the VHT-SIG-B bits as a function of CH_BANDWIDTH as defined in 21.3.8.3.6.
- d) BCC encoder: Encode the VHT-SIG-B field using BCC at rate R=1/2 as described in 17.3.5.6.
- e) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of the BCC encoder into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDU transmissions.
- f) BCC interleaver: Interleave as described in 21.3.10.8.
- g) Constellation mapper: Map to a BPSK constellation as defined in 17.3.5.8.
- h) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDU transmissions.
- i) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.
- j) $P_{VHT-LTF}$ matrix mapping: Apply the mapping of the 1st column of the $P_{VHT-LTF}$ matrix to the data subcarriers as described in 21.3.8.3.6. The total number of data and pilot subcarriers is the same as in the Data field.
- k) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.
- l) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.
- m) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- n) IDFT: Compute the inverse discrete Fourier transform.
- o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as described in 21.3.7.4.
- p) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.9 Construction of the Data field in a VHT SU PPDU

21.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as follows:

- a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 and append the PSDU to the SERVICE field.
- b) PHY padding: Append the PHY pad bits and tail bits to the PSDU.
- c) Scrambler: Scramble the PHY padded data.
- d) BCC encoder: Divide the scrambled bits between the encoders by sending bits to different encoders in a round robin manner. The number of encoders is determined by rate-dependent parameters described in 21.5. BCC encode as described in 21.3.10.5.2 and 21.3.10.5.3.

- e) Stream parser: Rearrange the output of the BCC encoders into blocks as described in 21.3.10.6.
- f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDUs transmissions.
- g) BCC interleaver: Interleave as described in 21.3.10.8.
- h) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM, or 256-QAM constellation points as described in 21.3.10.9.
- i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDUs transmissions.
- j) STBC: Apply STBC as described in 21.3.10.9.4.
- k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.
- l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.
- m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.
- n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.
- p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.
- q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as follows:

- a) Insert the CRC calculated for VHT-SIG-B in the SERVICE field as described in 21.3.10.2 and append the PSDU to the SERVICE field.
- b) PHY padding: Append the PHY pad bits to the PSDU. There are no tail bits.
- c) Scrambler: Scramble the PHY padded data.
- d) LDPC encoder: The scrambled bits are encoded using the LDPC code with the APEP_LENGTH in the TXVECTOR as described in 21.3.10.5.4.
- e) Stream parser: The output of the LDPC encoder is rearranged into blocks as described in 21.3.10.6.
- f) Segment parser (if needed): In a 160 MHz or 80+80 MHz transmission, divide the output bits of each stream parser into two frequency subblocks as described in 21.3.10.7. This block is bypassed for 20 MHz, 40 MHz, and 80 MHz VHT PPDUs transmissions.
- g) Constellation mapper: Map to BPSK, QPSK, 16-QAM, 64-QAM or 256-QAM constellation points as described in 21.3.10.9.
- h) LDPC tone mapper: The LDPC tone mapping shall be performed on all LDPC encoded streams as described in 21.3.10.9.2.
- i) Segment deparser (if needed): In a 160 MHz transmission, merge the two frequency subblocks into one frequency segment as described in 21.3.10.9.3. This block is bypassed for 20 MHz, 40 MHz, 80 MHz, and 80+80 MHz VHT PPDUs transmissions.
- j) STBC: Apply STBC as described in 21.3.10.9.4.
- k) Pilot insertion: Insert pilots following the steps described in 21.3.10.10.
- l) CSD: Apply CSD for each space-time stream and frequency segment as described in 21.3.8.3.2.

- m) Spatial mapping: Apply the Q matrix as described in 21.3.10.11.1.
- n) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- o) IDFT: In an 80+80 MHz transmission, map each frequency subblock to a separate IDFT. Compute the inverse discrete Fourier transform.
- p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.
- q) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.4.10 Construction of the Data field in a VHT MU PPDU

21.3.4.10.1 General

In an MU transmission, the PPDU encoding process is performed independently on a per-user basis up to the input of the Spatial Mapping block, except that CSD is performed with a knowledge of the space time stream starting index for that user. All user data is combined and mapped to the transmit chains in the Spatial Mapping block.

21.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using steps a) to k) in 21.3.4.9.1, then applying CSD for a VHT MU PPDU (as described in 21.3.8.3.2).

21.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using steps a) to k) in 21.3.4.9.2, then applying CSD as for a VHT MU PPDU (as described in 22.3.8.3.2).

21.3.4.10.4 Combining to form a VHT MU PPDU

The per-user data is combined as follows:

- a) Spatial Mapping: The Q matrix is applied as described in 21.3.10.11.1. The combining of all user data is done in this block.
- b) Phase rotation: Apply the appropriate phase rotations for each 20 MHz subchannel as described in 21.3.7.4 and 21.3.7.5.
- c) IDFT: Compute the inverse discrete Fourier transform.
- d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as described in 21.3.7.4.
- e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 21.3.7.4 and 21.3.8 for details.

21.3.5 VHT modulation and coding scheme (VHT-MCS)

The VHT-MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the VHT-SIG-A field for VHT SU PPDUs and in the VHT-SIG-B field for VHT MU PPDUs. Rate-dependent parameters for the full set of VHT-MCSs are shown in Table 21-30 to Table 21-61 (in 21.5). These tables give rate-dependent parameters for VHT-MCSs with indices 0 to 9, with number of spatial streams from 1 to 8 and bandwidth options of 20 MHz, 40 MHz,

80 MHz, and either 160 MHz or 80+80 MHz. Equal modulation (EQM) is applied to all streams for a particular user.

21.3.6 Timing-related parameters

Refer to Table 19-6 for timing-related parameters for non-VHT formats.

Table 21-5 defines the timing-related parameters for VHT format.

Table 21-5—Timing-related constants

| Parameter | CBW20 | CBW40 | CBW80 | CBW80+80 | CBW160 | Description |
|-----------------|--|-------|-------|----------|--------|--|
| N_{SD} | 52 | 108 | 234 | 234 | 468 | Number of complex data numbers per frequency segment |
| N_{SP} | 4 | 6 | 8 | 8 | 16 | Number of pilot values per frequency segment |
| N_{ST} | 56 | 114 | 242 | 242 | 484 | Total number of subcarriers per frequency segment. See NOTE. |
| N_{SR} | 28 | 58 | 122 | 122 | 250 | Highest data subcarrier index per frequency segment |
| N_{Seg} | 1 | 1 | 1 | 2 | 1 | Number of frequency segments |
| Δ_F | 312.5 kHz | | | | | Subcarrier frequency spacing |
| T_{DFT} | 3.2 μ s | | | | | IDFT/DFT period |
| T_{GI} | 0.8 μ s = $T_{DFT}/4$ | | | | | Guard interval duration |
| T_{GI2} | 1.6 μ s | | | | | Double guard interval |
| T_{GIS} | 0.4 μ s = $T_{DFT}/8$ | | | | | Short guard interval duration |
| T_{SYML} | 4 μ s = $T_{DFT} + T_{GI} = 1.25 \times T_{DFT}$ | | | | | Long GI symbol interval |
| T_{SYMS} | 3.6 μ s = $T_{DFT} + T_{GIS} = 1.125 \times T_{DFT}$ | | | | | Short GI symbol interval |
| T_{SYM} | T_{SYML} or T_{SYMS} depending on the GI used (see Table 21-8) | | | | | Symbol interval |
| T_{L-STF} | 8 μ s = 10 x $T_{DFT}/4$ | | | | | Non-HT Short Training field duration |
| T_{L-LTF} | 8 μ s = 2 x $T_{DFT} + T_{GI2}$ | | | | | Non-HT Long Training field duration |
| T_{L-SIG} | 4 μ s = T_{SYML} | | | | | Non-HT SIGNAL field duration |
| $T_{VHT-SIG-A}$ | 8 μ s = 2 T_{SYML} | | | | | VHT Signal A field duration |

Table 21-5—Timing-related constants (continued)

| Parameter | CBW20 | CBW40 | CBW80 | CBW80+80 | CBW160 | Description |
|----------------------------------|----------------------|-------|-------|----------|--------|-------------------------------------|
| $T_{VHT-STF}$ | $4 \mu s = T_{SYML}$ | | | | | VHT Short Training field duration |
| $T_{VHT-LTF}$ | $4 \mu s = T_{SYML}$ | | | | | Duration of each VHT-LTF symbol |
| $T_{VHT-SIG-B}$ | $4 \mu s = T_{SYML}$ | | | | | VHT Signal B field duration |
| $N_{service}$ | 16 | | | | | Number of bits in the SERVICE field |
| N_{tail} | 6 | | | | | Number of tail bits per BCC encoder |
| NOTE— $N_{ST} = N_{SD} + N_{SP}$ | | | | | | |

Table 21-6 defines parameters used frequently in Clause 21.

Table 21-6—Frequently used parameters

| Symbol | Explanation |
|----------------------------|---|
| $N_{CBPS}, N_{CBPS,u}$ | Number of coded bits per symbol for user u , $u = 0, \dots, N_{user}-1$. For a VHT SU PPDU, $N_{CBPS} = N_{CBPS,0}$ For a VHT MU PPDU, N_{CBPS} is undefined |
| $N_{CBPSS}, N_{CBPSS,u}$ | Number of coded bits per symbol per spatial stream. For the VHT-SIG-B field, N_{CBPSS} is common for all users. $N_{CBPSS} = \begin{cases} N_{SD}, & \text{for a 20 MHz, 40 MHz, 80 MHz, and 160 MHz PPDU} \\ 2N_{SD}, & \text{for an 80+80 MHz PPDU} \end{cases}$ for all users. For the Data field, $N_{CBPSS,u}$ equals the number of coded bits per symbol per spatial stream for user u , $u = 0, \dots, N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{CBPSS} = N_{CBPSS,0}$ For the Data field of a VHT MU PPDU, N_{CBPSS} is undefined |
| $N_{CBPSSI}, N_{CBPSSI,u}$ | Number of coded bits per symbol per spatial stream per BCC interleaver block. For a VHT SU PPDU, $N_{CBPSSI} = \begin{cases} N_{CBPSS}, & \text{for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS}}{2}, & \text{for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU for user u , $u = 0, \dots, N_{user}-1$ $N_{CBPSSI,u} = \begin{cases} N_{CBPSS,u}, & \text{for a 20 MHz, 40 MHz, or 80 MHz PPDU} \\ \frac{N_{CBPSS,u}}{2}, & \text{for a 160 MHz or 80+80 MHz PPDU} \end{cases}$ For a VHT MU PPDU, N_{CBPSSI} is undefined. |

Table 21-6—Frequently used parameters (continued)

| Symbol | Explanation |
|--------------------------|--|
| $N_{DBPS}, N_{DBPS,u}$ | Number of data bits per symbol for user u , $u = 0, \dots, N_{user}-1$. For a VHT SU PPDU, $N_{DBPS} = N_{DBPS,0}$ For a VHT MU PPDU, N_{DBPS} is undefined |
| $N_{BPSCS}, N_{BPSCS,u}$ | Number of coded bits per subcarrier per spatial stream for user u , $u = 0, \dots, N_{user}-1$. For a VHT SU PPDU, $N_{BPSCS} = N_{BPSCS,0}$ For a VHT MU PPDU, N_{BPSCS} is undefined |
| N_{RX} | Number of receive chains |
| N_{user} | For pre-VHT modulated fields, $N_{user} = 1$. For VHT modulated fields, N_{user} represents the number of users in the transmission (equal to the TXVECTOR parameter NUM_USERS). |
| $N_{STS}, N_{STS,u}$ | For pre-VHT modulated fields, $N_{STS,u} = 1$ (see NOTE). For VHT modulated fields, $N_{STS,u}$ is the number of space-time streams for user u , $u = 0, \dots, N_{user}-1$. For a VHT SU PPDU, $N_{STS} = N_{STS,0}$. For a VHT MU PPDU, N_{STS} is undefined. |
| $N_{STS,total}$ | For VHT modulated fields, $N_{STS,total}$ is the total number of space-time streams in a PPDU. $N_{STS,total} = \sum_{u=0}^{N_{user}-1} N_{STS,u}$ For pre-VHT modulated fields, $N_{STS,total}$ is undefined. Note that $N_{STS,total} = N_{STS}$ for a VHT SU PPDU. |
| $N_{SS}, N_{SS,u}$ | Number of spatial streams. For the VHT-SIG-B field, $N_{SS} = 1$ for each user. For the Data field, $N_{SS,u}$ is the number of spatial streams for user u , $u = 0, \dots, N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{SS} = N_{SS,0}$. For the Data field of a VHT MU PPDU, N_{SS} is undefined. |
| N_{TX} | Number of transmit chains |
| $N_{ES}, N_{ES,u}$ | The number of BCC encoders. For the VHT-SIG-B field, $N_{ES} = 1$ for each user. For a Data field encoded using BCC, $N_{ES,u}$ is the number of BCC encoders for user u , $u = 0, \dots, N_{user}-1$. For the Data field encoded using LDPC, $N_{ES} = 1$ for a VHT SU PPDU and $N_{ES,u} = 1$ for a VHT MU PPDU for user u , $u = 0, \dots, N_{user}-1$. For the Data field of a VHT SU PPDU, $N_{ES} = N_{ES,0}$. For the Data field of a VHT MU PPDU, N_{ES} is undefined. |
| $N_{VHT-LTF}$ | Number of VHT-LTF symbols (see 21.3.8.3.5) |

Table 21-6—Frequently used parameters (continued)

| Symbol | Explanation |
|---|--|
| R, R_u | R_u is the coding rate for user u , $u = 0, \dots, N_{user}-1$. For a VHT SU PPDU, $R = R_0$ For a VHT MU PPDU, R is undefined |
| M_u | For pre-VHT modulated fields, $M_u = 0$. For VHT modulated fields, $M_0 = 0$ for $u = 0$ and $M_u = \sum_{u'=0}^{u-1} N_{STS, u'}$ for $u = 1, \dots, N_{user}-1$. |
| NOTE—For pre-VHT modulated fields, u is 0 only since $N_{user} = 1$. | |

21.3.7 Mathematical description of signals

21.3.7.1 Notation

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5. In addition, the following notational conventions are used in Clause 21:

$[Q]_{m, n}$ indicates the element in row m and column n of matrix Q , where $1 \leq m \leq N_{row}$ and $1 \leq n \leq N_{col}$

N_{row} and N_{col} are the number of rows and columns, respectively, of the matrix Q

$[Q]_{M:N}$ indicates a matrix consisting of columns M to N of matrix Q

21.3.7.2 Subcarrier indices in use

For description on subcarrier indices over which the signal is transmitted for non-HT and HT PPDUs, see 19.3.7.

For a 20 MHz VHT PPDU transmission, the 20 MHz is divided into 64 subcarriers. The signal is transmitted on subcarriers -28 to -1 and 1 to 28, with 0 being the center (DC) subcarrier.

For a 40 MHz VHT PPDU transmission, the 40 MHz is divided into 128 subcarriers. The signal is transmitted on subcarriers -58 to -2 and 2 to 58.

For an 80 MHz VHT PPDU transmission, the 80 MHz is divided into 256 subcarriers. The signal is transmitted on subcarriers -122 to -2 and 2 to 122.

For a 160 MHz VHT PPDU transmission, the 160 MHz is divided into 512 subcarriers. The signal is transmitted on subcarriers -250 to -130, -126 to -6, 6 to 126, and 130 to 250.

For an 80+80 MHz VHT PPDU transmission, each 80 MHz frequency segment is divided into 256 subcarriers. In each frequency segment, the signal is transmitted on subcarriers -122 to -2 and 2 to 122.

21.3.7.3 Channel frequencies

Let

$$f_{c, \text{idx}0} = \text{dot11CurrentChannelCenterFrequencyIndex0} \quad (21-1)$$

$$f_{c, \text{idx}1} = \text{dot11CurrentChannelCenterFrequencyIndex1} \quad (21-2)$$

$$f_{P20, \text{idx}} = \text{dot11CurrentPrimaryChannel} \quad (21-3)$$

$$f_{\text{CH, start}} = \text{dot11ChannelStartingFactor} \times 500 \text{ kHz} \quad (21-4)$$

where

`dot11CurrentChannelCenterFrequencyIndex0`, `dot11CurrentChannelCenterFrequencyIndex1`, and `dot11CurrentPrimaryChannel` are defined in Table 21-22.

When `dot11CurrentChannelWidth` (see Table 21-22) is 20 MHz, $f_{P20, \text{idx}} = f_{c, \text{idx}0}$. For `dot11CurrentChannelWidth` greater than 20 MHz, $f_{P20, \text{idx}}$ and $f_{c, \text{idx}0}$ shall have the relationship specified in Equation (21-5).

$$f_{P20, \text{idx}} = f_{c, \text{idx}0} - 4 \cdot \left(\frac{N_{20\text{MHz}}}{2} - n_{P20} \right) + 2 \quad (21-5)$$

where

$$N_{20\text{MHz}} = \begin{cases} 2, & \text{if } \text{dot11CurrentChannelWidth} \text{ indicates 40 MHz} \\ 4, & \text{if } \text{dot11CurrentChannelWidth} \text{ indicates 80 MHz and 80+80 MHz} \\ 8, & \text{if } \text{dot11CurrentChannelWidth} \text{ indicates 160 MHz} \end{cases}$$

n_{P20} is an integer with possible range $0 \leq n_{P20} \leq N_{20\text{MHz}} - 1$

When `dot11CurrentChannelWidth` is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz,

- The primary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{P20, \text{idx}}$ MHz.
- The secondary 20 MHz channel is the channel with 20 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S20, \text{idx}}$, where $f_{S20, \text{idx}}$ is given in Equation (21-6).

$$f_{S20, \text{idx}} = \begin{cases} f_{P20, \text{idx}} + 4, & \text{if } n_{P20} \text{ is even} \\ f_{P20, \text{idx}} - 4, & \text{if } n_{P20} \text{ is odd} \end{cases} \quad (21-6)$$

When `dot11CurrentChannelWidth` is 80 MHz, 160 MHz, or 80+80 MHz,

- The primary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{P40, \text{idx}}$ MHz, where $f_{P40, \text{idx}}$ is given in Equation (21-7).
- The secondary 40 MHz channel is the channel with 40 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S40, \text{idx}}$ MHz, where $f_{S40, \text{idx}}$ is given in Equation (21-8).

$$f_{P40, \text{idx}} = f_{c, \text{idx}0} - 8 \cdot \left(\frac{N_{20\text{MHz}}}{4} - n_{P40} \right) + 4 \quad (21-7)$$

$$f_{S40, \text{idx}} = \begin{cases} f_{P40, \text{idx}} + 8, & \text{if } n_{P40} \text{ is even} \\ f_{P40, \text{idx}} - 8, & \text{if } n_{P40} \text{ is odd} \end{cases} \quad (21-8)$$

where $n_{P40} = \lfloor n_{P20}/2 \rfloor$

When dot11CurrentChannelWidth is 160 MHz,

- The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{P80, \text{idx}}$ MHz, where $f_{P80, \text{idx}}$ is given in Equation (21-9).
- The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S80, \text{idx}}$ MHz where $f_{S80, \text{idx}}$ is given in Equation (21-10).

$$f_{P80, \text{idx}} = f_{c, \text{idx}0} - 16 \cdot \left(\frac{N_{20\text{MHz}}}{8} - n_{P80} \right) + 8 \quad (21-9)$$

$$f_{S80, \text{idx}} = \begin{cases} f_{P80, \text{idx}} + 16, & \text{if } n_{P80} \text{ is even} \\ f_{P80, \text{idx}} - 16, & \text{if } n_{P80} \text{ is odd} \end{cases} \quad (21-10)$$

where $n_{P80} = \lfloor n_{P20}/4 \rfloor$.

When dot11CurrentChannelWidth is 80+80 MHz,

- The primary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{P80, \text{idx}}$ MHz, where $f_{P80, \text{idx}} = f_{c, \text{idx}0}$.
- The secondary 80 MHz channel is the channel with 80 MHz bandwidth centered at $f_{\text{CH, start}} + 5 \times f_{S80, \text{idx}}$ MHz where $f_{S80, \text{idx}} = f_{c, \text{idx}1}$.

21.3.7.4 Transmitted signal

The transmitted signal is described in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11).

$$r_{RF}^{(i_{\text{Seg}}, i_{TX})}(t) = \text{Re} \left\{ \frac{1}{\sqrt{N_{\text{Seg}}}} r_{\text{PPDU}}^{(i_{\text{Seg}}, i_{TX})}(t) \exp(j2\pi f_c^{(i_{\text{Seg}})} t) \right\}, \quad (21-11)$$

$$i_{\text{Seg}} = 0, \dots, N_{\text{Seg}} - 1; \quad i_{TX} = 1, \dots, N_{TX}$$

where

N_{Seg} represents the number of frequency segments in the transmit signal, as defined in Table 21-5;

$r_{\text{PPDU}}^{(i_{\text{Seg}}, i_{TX})}(t)$ represents the complex baseband signal of frequency segment i_{Seg} and transmit chain i_{TX} ;

$f_c^{(i_{\text{Seg}})}$ represents the center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg} . Table 21-7 shows $f_c^{(i_{\text{Seg}})}$ as a function of the channel starting frequency and dot11CurrentChannelWidth (see Table 21-22) where $f_{P20, \text{idx}}$, $f_{P40, \text{idx}}$, and $f_{P80, \text{idx}}$ are given in Equation (21-4), Equation (21-5), Equation (21-7), and Equation (21-9), respectively.

NOTE—Transmitted signals might have different impairments such as phase offset or phase noise between the two frequency segments, which is not shown in Equation (21-11) for simplicity. See 21.3.17.3.

Table 21-7—Center frequency of the portion of the PPDU transmitted in frequency segment i_{Seg}

| dot11CurrentChannelWidth | CH_BANDWIDTH | $f_c^{(i_{\text{Seg}})} = f_{\text{CH, start}} + 5 \times f_{(i_{\text{Seg}})}$ | |
|--------------------------|--------------|---|--|
| | | $f_{(0)}$ | $f_{(1)}$ |
| 20 MHz | CBW20 | $f_{c, \text{idx}0}$ | — |
| 40 MHz | CBW20 | $f_{P20, \text{idx}}$ | — |
| | CBW40 | $f_{c, \text{idx}0}$ | — |
| 80 MHz | CBW20 | $f_{P20, \text{idx}}$ | — |
| | CBW40 | $f_{P40, \text{idx}}$ | — |
| | CBW80 | $f_{c, \text{idx}0}$ | — |
| 160 MHz | CBW20 | $f_{P20, \text{idx}}$ | — |
| | CBW40 | $f_{P40, \text{idx}}$ | — |
| | CBW80 | $f_{P80, \text{idx}}$ | — |
| | CBW160 | $f_{c, \text{idx}0}$ | — |
| 80+80 MHz | CBW20 | $f_{P20, \text{idx}}$ | — |
| | CBW40 | $f_{P40, \text{idx}}$ | — |
| | CBW80 | $f_{P80, \text{idx}}$ | — |
| | CBW80+80 | $\min(f_{c, \text{idx}0}, f_{c, \text{idx}1})$ | $\max(f_{c, \text{idx}0}, f_{c, \text{idx}1})$ |

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The timing boundaries for the various fields are shown in Figure 21-17 where N_{VHTLTF} is the number of VHT-LTF symbols and is defined in Table 21-13.

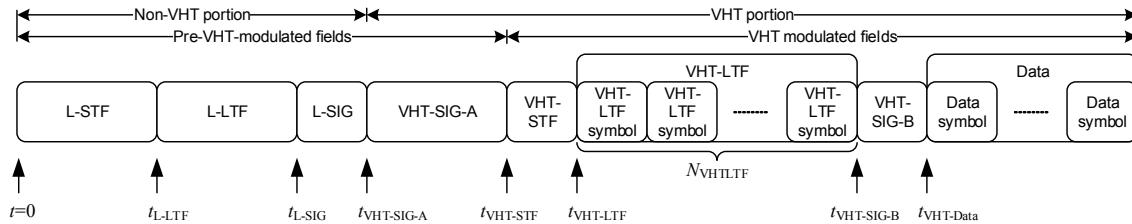

Figure 21-17—Timing boundaries for VHT PPDU fields

The time offset, t_{Field} , determines the starting time of the corresponding field relative to the start of L-STF ($t = 0$).

The signal transmitted on frequency segment i_{Seg} and transmit chain i_{TX} shall be as shown in Equation (21-12).

$$\begin{aligned} r_{PPDU}^{(i_{Seg}, i_{TX})}(t) &= r_{L-STF}^{(i_{Seg}, i_{TX})}(t) + r_{L-LTF}^{(i_{Seg}, i_{TX})}(t - t_{L-LTF}) \\ &+ r_{L-SIG}^{(i_{Seg}, i_{TX})}(t - t_{L-SIG}) + r_{VHT-SIG-A}^{(i_{Seg}, i_{TX})}(t - t_{VHT-SIG-A}) \\ &+ r_{VHT-STF}^{(i_{Seg}, i_{TX})}(t - t_{VHT-STF}) + r_{VHT-LTF}^{(i_{Seg}, i_{TX})}(t - t_{VHT-LTF}) \\ &+ r_{VHT-SIG-B}^{(i_{Seg}, i_{TX})}(t - t_{VHT-SIG-B}) + r_{VHT-Data}^{(i_{Seg}, i_{TX})}(t - t_{VHT-Data}) \end{aligned} \quad (21-12)$$

where

$$0 \leq i_{Seg} \leq N_{Seg} - 1$$

$$1 \leq i_{TX} \leq N_{TX}$$

$$t_{L-LTF} = T_{L-STF}$$

$$t_{L-SIG} = t_{L-LTF} + T_{L-LTF}$$

$$t_{VHT-SIG-A} = t_{L-SIG} + T_{L-SIG}$$

$$t_{VHT-STF} = t_{VHT-SIG-A} + T_{VHT-SIG-A}$$

$$t_{VHT-LTF} = t_{VHT-STF} + T_{VHT-STF}$$

$$t_{VHT-SIG-B} = t_{VHT-LTF} + N_{VHT-LTF} T_{VHT-LTF}$$

$$t_{VHT-Data} = t_{VHT-SIG-B} + T_{VHT-SIG-B}$$

Each field, $r_{Field}^{(i_{Seg}, i_{TX})}(t)$, is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13).

$$r_{Subfield}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{Field}^{\text{Tone}} N_{\text{Norm}}}} w_{T_{\text{Subfield}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{user}-1} \sum_{m=1}^{N_{STS,u}} \left[Q_k^{(i_{Seg})} \right]_{i_{TX}, (M_u + m)} Y_{k, BW} X_{k, u}^{(i_{Seg}, m)} \quad (21-13)$$

$$\exp(j2\pi k \Delta_F (t - T_{GI, Field} - T_{CS, VHT}(M_u + m)))$$

This general representation holds for all subfields. The total power of the time domain VHT modulated field signals summed over all transmit chains should not exceed the total power of the time domain pre-VHT modulated field signals summed over all transmit chains. For notational simplicity, the parameter BW is omitted from some bandwidth dependent terms.

In Equation (21-13) the following notions are used:

N_{Field}^{Tone} Table 21-8 summarizes the various values of N_{Field}^{Tone} as a function of bandwidth per frequency segment.

Table 21-8—Tone scaling factor and guard interval duration values for PHY fields

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of bandwidth per frequency segment | | | | Guard interval duration |
|--------------------------------------|---|--------|--------|---------|---------------------------------------|
| | 20 MHz | 40 MHz | 80 MHz | 160 MHz | |
| L-STF | 12 | 24 | 48 | 96 | - |
| L-LTF | 52 | 104 | 208 | 416 | T_{GI2} |
| L-SIG | 52 | 104 | 208 | 416 | T_{GI} |
| VHT-SIG-A | 52 | 104 | 208 | 416 | T_{GI} |
| VHT-STF | 12 | 24 | 48 | 96 | - |
| VHT-LTF | 56 | 114 | 242 | 484 | T_{GI} |
| VHT-SIG-B | 56 | 114 | 242 | 484 | T_{GI} |
| VHT-Data | 56 | 114 | 242 | 484 | T_{GI} or T_{GIS} (see NOTE 2) |
| NON_HT_DUP_OFDM-Data (see NOTE 1) | - | 104 | 208 | 416 | T_{GI} |

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2— T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

N_{Norm} For pre-VHT modulated fields, $N_{\text{Norm}} = N_{TX}$. For VHT modulated fields, $N_{\text{Norm}} = N_{STS,\text{total}}$ where $N_{STS,\text{total}}$ is given in Table 21-6.

$w_{T_{\text{Subfield}}}(t)$ is a windowing function. An example function, $w_{T_{\text{Subfield}}}(t)$, is given in 17.3.2.5. T_{Subfield} is T_{L-STF} for L-STF, T_{L-LTF} for L-LTF, T_{L-SIG} for L-SIG, T_{SYML} for VHT-SIG-A, $T_{VHT-STF}$ for VHT-STF, $T_{VHT-LTF}$ for VHT-LTF and $T_{VHT-SIG-B}$ for VHT-SIG-B. T_{Subfield} is T_{SYM} for VHT-Data, that is T_{SYML} when not using the short guard interval (Short GI field of VHT-SIG-A is 0) and T_{SYMS} when using the short guard interval (Short GI field of VHT-SIG-A is 1).

$Q_k^{(i_{\text{seg}})}$ is the spatial mapping matrix for the subcarrier k in frequency segment i_{seg} . For pre-VHT modulated fields, $Q_k^{(i_{\text{seg}})}$ is a column vector with N_{TX} elements with element i_{TX} being $\exp(-j2\pi k \Delta_F T_{CS}^{i_{TX}})$, where $T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} whose values are given in Table 21-10. For VHT modulated fields, $Q_k^{(i_{\text{seg}})}$ is a matrix with N_{TX} rows and $N_{STS,\text{total}}$ columns.

$\Upsilon_{k,\text{BW}}$ is defined in 21.3.7.5

Δ_F is the subcarrier frequency spacing given in Table 21-5.

$X_{k,u}^{(i_{\text{seg}},m)}$ is the frequency domain symbol in subcarrier k of user u for frequency segment i_{seg} of space-time stream m . Some of the $X_{k,u}^{(i_{\text{seg}},m)}$ within $-N_{SR} \leq k \leq N_{SR}$ have a value of 0. Examples of such cases include the DC tones, guard tones on each side of the transmit spectrum, as well as

the unmodulated tones of L-STF and VHT-STF fields. Note that the multiplication matrices $A_{VHT-LTF}^k$ and $P_{VHT-LTF}$ are included in the calculation of $X_{k,u}^{(i_{Seg},m)}$ for the VHT-LTF and VHT-SIG-B fields, respectively.

$T_{GI, Field}$ is the guard interval duration used for each OFDM symbol in the field. For L-STF and VHT-STF, $T_{GI, Field} = T_{GI}$ but it can be omitted from Equation (21-13) due to the periodic property of L-STF and VHT-STF over every 0.8 μ s. For the L-SIG, VHT-SIG-A, VHT-LTF, and VHT-SIG-B fields, $T_{GI, Field}$ is defined in the “Guard interval duration” column of Table 21-8.

$T_{CS, VHT}(l)$ For pre-VHT modulated fields, $T_{CS, VHT}(l) = 0$. For VHT modulated fields, $T_{CS, VHT}(l)$ represents the cyclic shift per space-time stream, whose value is defined in Table 21-11.

M_u is defined in Table 21-6.

21.3.7.5 Definition of tone rotation

The function $\Upsilon_{k,BW}$ is used to represent a rotation of the tones. BW in $\Upsilon_{k,BW}$ is determined by the TXVECTOR parameter CH_BANDWIDTH as defined in Table 21-9.

Table 21-9—CH_BANDWIDTH and $\Upsilon_{k,BW}$

| CH_BANDWIDTH | $\Upsilon_{k,BW}$ |
|--------------|---|
| CBW20 | $\Upsilon_{k,20}$ |
| CBW40 | $\Upsilon_{k,40}$ |
| CBW80 | $\Upsilon_{k,80}$ |
| CBW160 | $\Upsilon_{k,160}$ |
| CBW80+80 | $\Upsilon_{k,80}$ per frequency segment |

For a 20 MHz PPDU transmission,

$$\Upsilon_{k,20} = 1 \quad (21-14)$$

For a 40 MHz PPDU transmission,

$$\Upsilon_{k,40} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \quad (21-15)$$

For an 80 MHz PPDU transmission,

$$\Upsilon_{k,80} = \begin{cases} 1, & k < -64 \\ -1, & k \geq -64 \end{cases} \quad (21-16)$$

For an 80+80 MHz PPDU transmission, each 80 MHz frequency segment shall use the phase rotation for 80 MHz PPDU transmissions as defined in Equation (21-16).

For a 160 MHz PPDU transmission,

$$Y_{k,160} = \begin{cases} 1, & k < -192 \\ -1, & -192 \leq k < 0 \\ 1, & 0 \leq k < 64 \\ -1, & 64 \leq k \end{cases} \quad (21-17)$$

21.3.8 VHT preamble

21.3.8.1 Introduction

A VHT preamble is defined to carry the required information to operate in either single user or multi-user mode. To maintain compatibility with non-VHT STAs, specific non-VHT fields are defined that can be received by non-VHT STAs compliant with Clause 17 or Clause 19. The non-VHT fields are followed by VHT fields specific to VHT STAs.

21.3.8.2 Non-VHT portion of VHT format preamble

21.3.8.2.1 Cyclic shift for pre-VHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} are defined in Table 21-10.

Table 21-10—Cyclic shift values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU

| T _{CS} ^{i_{TX}} values for L-STF, L-LTF, L-SIG, and VHT-SIG-A fields of the PPDU | | | | | | | | | |
|--|--|------|------|------|------|------|-----|------|------------------------------|
| Total number of transmit chains (N _{TX}) per frequency segment | Cyclic shift for transmit chain i _{TX} (in units of ns) | | | | | | | | |
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | >8 |
| 1 | 0 | — | — | — | — | — | — | — | — |
| 2 | 0 | -200 | — | — | — | — | — | — | — |
| 3 | 0 | -100 | -200 | — | — | — | — | — | — |
| 4 | 0 | -50 | -100 | -150 | — | — | — | — | — |
| 5 | 0 | -175 | -25 | -50 | -75 | — | — | — | — |
| 6 | 0 | -200 | -25 | -150 | -175 | -125 | — | — | — |
| 7 | 0 | -200 | -150 | -25 | -175 | -75 | -50 | — | — |
| 8 | 0 | -175 | -150 | -125 | -25 | -100 | -50 | -200 | — |
| >8 | 0 | -175 | -150 | -125 | -25 | -100 | -50 | -200 | Between -200 and 0 inclusive |

21.3.8.2.2 L-STF definition

The L-STF field for a 20 MHz or 40 MHz transmission is defined by Equation (19-8) and Equation (19-9), respectively, in 19.3.9.3.3. For 80 MHz, the L-STF field is defined by Equation (21-18). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$S_{-122, 122} = \{S_{-58, 58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-58, 58}\} \quad (21-18)$$

where

$S_{-58, 58}$ is defined in Equation (19-9)

For 160 MHz, the L-STF is defined by Equation (21-19).

$$S_{-250, 250} = \{S_{-122, 122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, S_{-122, 122}\} \quad (21-19)$$

where

$S_{-122, 122}$ is defined in Equation (21-18)

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-STF pattern for the 80 MHz ($S_{-122, 122}$) defined in Equation (21-18).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-20).

$$r_{L-STF}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{L-STF}^{\text{Tone}} N_{TX}}} w_{T_{L-STF}}(t) \sum_{k=-N_{SR}}^{N_{SR}} \Upsilon_{k, \text{BW}} S_k \exp(j2\pi k \Delta_F (t - T_{CS}^{i_{TX}})) \quad (21-20)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmit chain i_{TX} with a value given in Table 21-10

$\Upsilon_{k, \text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

N_{L-STF}^{Tone} has the value given in Table 21-8

21.3.8.2.3 L-LTF definition

For a 20 MHz or 40 MHz transmission, the L-LTF pattern in the VHT preamble is defined by Equation (19-11) and Equation (19-12) in 19.3.9.3.4, respectively. For an 80 MHz transmission, the L-LTF pattern is defined by Equation (21-21). Note that these equations do not include the phase rotation per 20 MHz subchannel.

$$L_{-122, 122} = \{L_{-58, 58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-58, 58}\} \quad (21-21)$$

where

$L_{-58, 58}$ is defined in Equation (19-12)

For a 160 MHz transmission, the L-LTF is defined by Equation (21-22). Note that this equation does not include the phase rotations per 20 MHz subchannel.

$$L_{-250, 250} = \{L_{-122, 122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, L_{-122, 122}\} \quad (21-22)$$

where

$L_{-122, 122}$ is given by Equation (21-21)

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the L-LTF pattern for the 80 MHz L-LTF pattern ($L_{-122, 122}$) defined in Equation (21-21).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as defined in Equation (21-23).

$$r_{\text{L-LTF}}^{(i_{Seg}, i_{TX})}(t) = \frac{1}{\sqrt{N_{\text{L-LTF}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-LTF}}}(t) \sum_{k=-N_{SR}}^{N_{SR}} Y_{k, \text{BW}} L_k \exp(j2\pi k \Delta_F (t - T_{\text{GI2}} - T_{CS}^{i_{TX}})) \quad (21-23)$$

where

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

$Y_{k, \text{BW}}$ is defined by Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$N_{\text{L-LTF}}^{\text{Tone}}$ has the value given in Table 21-8

21.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In a VHT PPDU, the RATE field shall be set to the value representing 6 Mb/s in the 20 MHz channel spacing column of Table 17-6. In a non-HT duplicate PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (21-24).

$$\text{Length} = \frac{\text{TXTIME} - 20}{4} \times 3 - 3 \quad (21-24)$$

where

TXTIME (in μs) is defined in 21.4.3

The LSB of the binary expression of the Length value shall be mapped to B5. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The Reserved (R) field shall be set to 0.

The Parity (P) field has the even parity of bits 0-16.

The SIGNAL TAIL field shall be set to 0.

The L-SIG field shall be encoded, interleaved, and mapped following the steps described in 17.3.5.6, 17.3.5.7, and 17.3.5.8. The stream of 48 complex numbers generated by these steps is denoted by

d_k , $k = 0, \dots, 47$. Pilots shall be inserted as described in 17.3.5.9. The time domain waveform of the L-SIG field shall be as given by Equation (21-25).

$$r_{\text{L-SIG}}^{(i_{\text{Seg}}, i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{L-SIG}}^{\text{Tone}} N_{\text{TX}}}} w_{T_{\text{L-SIG}}}(t) \cdot \sum_{i_{\text{BW}}=0}^{N_{\text{20MHz}}-1} \sum_{k=-26}^{26} \left(\Upsilon_{(k - K_{\text{Shift}}(i_{\text{BW}})), \text{BW}}(D_{k, 20} + p_0 P_k) \cdot \exp(j2\pi(k - K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - T_{GI} - T_{CS}^{i_{\text{TX}}})) \right) \quad (21-25)$$

where

N_{20MHz} is defined in 21.3.7.3

$K_{\text{Shift}}(i) = (N_{\text{20MHz}} - 1 - 2i) \cdot 32$

$$D_{k, 20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k)}, \text{otherwise} \end{cases} \quad (21-26)$$

$$M_{20}^r(k) = \begin{cases} k + 26, -26 \leq k \leq -22 \\ k + 25, -20 \leq k \leq -8 \\ k + 24, -6 \leq k \leq -1 \\ k + 23, 1 \leq k \leq 6 \\ k + 22, 8 \leq k \leq 20 \\ k + 21, 22 \leq k \leq 26 \end{cases} \quad (21-27)$$

P_k is defined in 17.3.5.10

p_0 is the first pilot value in the sequence defined in 17.3.5.10

$N_{\text{L-SIG}}^{\text{Tone}}$ has the value given in Table 21-8

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$T_{CS}^{i_{\text{TX}}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

NOTE— $M_{20}^r(k)$ is a “reverse” function of the function $M(k)$ defined in 17.3.5.10.

21.3.8.3 VHT portion of VHT format preamble

21.3.8.3.1 Introduction

The VHT portion of the VHT format preamble consists of the VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields.

21.3.8.3.2 Cyclic shift for VHT modulated fields

The cyclic shift values defined in this subclause apply to the VHT-STF, VHT-LTF, VHT-SIG-B, and Data fields of the VHT PPDU. The cyclic shift values defined in 21.3.8.2.1 apply to VHT-SIG-A field in the VHT format preamble.

Throughout the VHT modulated fields of the preamble, cyclic shifts are applied to prevent unintended beamforming when correlated signals are transmitted in multiple space-time streams. The same cyclic shift is also applied to these streams during the transmission of the Data field of the VHT PPDU. The cyclic shift value $T_{CS,VHT}(n)$ for the VHT modulated fields for space-time stream n out of $N_{STS,total}$ total space-time streams is shown in Table 21-11.

Table 21-11—Cyclic shift values for the VHT modulated fields of a PPDU

| Total number of space-time streams ($N_{STS,total}$) | Cyclic shift for space-time stream n (ns) | | | | | | | |
|--|---|------|------|------|------|------|------|------|
| | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 1 | 0 | – | – | – | – | – | – | – |
| 2 | 0 | -400 | – | – | – | – | – | – |
| 3 | 0 | -400 | -200 | – | – | – | – | – |
| 4 | 0 | -400 | -200 | -600 | – | – | – | – |
| 5 | 0 | -400 | -200 | -600 | -350 | – | – | – |
| 6 | 0 | -400 | -200 | -600 | -350 | -650 | – | – |
| 7 | 0 | -400 | -200 | -600 | -350 | -650 | -100 | – |
| 8 | 0 | -400 | -200 | -600 | -350 | -650 | -100 | -750 |

In a VHT MU PPDU, the cyclic shifts are applied sequentially across the space-time streams as follows: the cyclic shift of the space-time stream number m of user u is given by $T_{CS,VHT}(M_u + m)$ of the row corresponding to $N_{STS,total}$ in Table 21-11.

21.3.8.3.3 VHT-SIG-A definition

The VHT-SIG-A field carries information required to interpret VHT PPDUs. The structure of the VHT-SIG-A field for the first part (VHT-SIG-A1) is shown in Figure 21-18 and for the second part (VHT-SIG-A2) is shown in Figure 21-19.

| | B0 | B1 | B2 | B3 | B4 | B9 | B10 | B12 | B13 | B15 | B16 | B18 | B19 | B21 | B22 | B23 |

Figure 21-19—VHT-SIG-A2 structure

NOTE—Integer fields are represented in unsigned binary format with the least significant bit in the lowest numbered bit position.

The VHT-SIG-A field contains the fields listed in Table 21-12. The mapping of the fields is also described in Table 21-12. Note that the mapping of the STBC field, the NSTS/Partial AID field, the SU/MU[0] Coding field, the SU VHT-MCS/MU[1-3] Coding field, and the Beamformed field is different for VHT SU and MU PPDUs.

The VHT-SIG-A field is composed of two parts, VHT-SIG-A1 and VHT-SIG-A2, each containing 24 data bits, as shown in Table 21-12. VHT-SIG-A1 is transmitted before VHT-SIG-A2. The VHT-SIG-A symbols shall be BCC encoded at rate, $R = 1/2$, be interleaved, be mapped to a BPSK constellation, and have pilots inserted following the steps described in 17.3.5.6, 17.3.5.7, 17.3.5.8, and 17.3.5.9, respectively. The first and second half of the stream of 96 complex numbers generated by these steps (before pilot insertion) is divided into two groups of 48 complex numbers $d_{k,n}$, $k = 0 \dots 47$, where $n = 0, 1$, respectively. The first 48 complex numbers form the first symbol of VHT-SIG-A and the second 48 complex numbers form the second symbol of VHT-SIG-A after rotating by 90° counter-clockwise relative to the first symbol. The first symbol of VHT-SIG-A, which does not have the 90° rotation, is used to differentiate VHT PPDUs from HT PPDUs, while the second symbol of VHT-SIG-A, which has the 90° rotation, is used to differentiate VHT PPDUs from non-HT PPDUs.

Table 21-12—Fields in the VHT-SIG-A field

| Two parts of VHT-SIG-A | Bit | Field | Number of bits | Description |
|-------------------------------|------------|----------------------|-----------------------|--|
| VHT-SIG-A1 | B0-B1 | BW | 2 | Set to 0 for 20 MHz, 1 for 40 MHz, 2 for 80 MHz, and 3 for 160 MHz and 80+80 MHz |
| | B2 | Reserved | 1 | Reserved. Set to 1. |
| | B3 | STBC | 1 | For a VHT SU PPDU: Set to 1 if space time block coding (see 21.3.10.9.4) is used and set to 0 otherwise. For a VHT MU PPDU: Set to 0. |
| | B4-B9 | Group ID | 6 | Set to the value of the TXVECTOR parameter GROUP_ID. A value of 0 or 63 indicates a VHT SU PPDU; otherwise, indicates a VHT MU PPDU. |
| | B10-B21 | NSTS/Partial AID | 12 | For a VHT MU PPDU: NSTS is divided into 4 user positions of 3 bits each. User position p , where $0 \leq p \leq 3$, uses bits $B(10 + 3p)$ to $B(12 + 3p)$. The number of space-time streams for user u are indicated at user position $p = \text{USER_POSITION}[u]$ where $u = 0, 1, \dots, \text{NUM_USERS} - 1$ and the notation $A[b]$ denotes the value of array A at index b . Zero space-time streams are indicated at positions not listed in the <code>USER_POSITION</code> array. Each user position is set as follows: Set to 0 for 0 space-time streams Set to 1 for 1 space-time stream Set to 2 for 2 space-time streams Set to 3 for 3 space-time streams Set to 4 for 4 space-time streams Values 5-7 are reserved For a VHT SU PPDU: B10-B12 Set to 0 for 1 space-time stream Set to 1 for 2 space-time streams Set to 2 for 3 space-time streams Set to 3 for 4 space-time streams Set to 4 for 5 space-time streams Set to 5 for 6 space-time streams Set to 6 for 7 space-time streams Set to 7 for 8 space-time streams B13-B21 Partial AID: Set to the value of the TXVECTOR parameter PARTIAL_AID. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20). |
| | B22 | TXOP_PS_NOT_ALLO_WED | 1 | Set to 0 by VHT AP if it allows non-AP VHT STAs in TXOP power save mode to enter doze state during a TXOP. Set to 1 otherwise. The bit is reserved and set to 1 in VHT PPDUs transmitted by a non-AP VHT STA. |
| | B23 | Reserved | 1 | Set to 1 |

Table 21-12—Fields in the VHT-SIG-A field (continued)

| Two parts of VHT-SIG-A | Bit | Field | Number of bits | Description |
|------------------------|---------|---|----------------|--|
| VHT-SIG-A2 | B0 | Short GI | 1 | Set to 0 if short guard interval is not used in the Data field. Set to 1 if short guard interval is used in the Data field. |
| | B1 | Short GI N_{SYM} Disambiguation | 1 | Set to 1 if short guard interval is used and $N_{SYM} \bmod 10 = 9$; otherwise, set to 0. N_{SYM} is defined in 21.4.3. |
| | B2 | SU/MU[0] Coding | 1 | For a VHT SU PPDU, B2 is set to 0 for BCC, 1 for LDPC. For a VHT MU PPDU, if the MU[0] NSTS field is nonzero, then B2 indicates the coding used for user u with $USER_POSITION[u] = 0$; set to 0 for BCC and 1 for LDPC. If the MU[0] NSTS field is 0, then this field is reserved and set to 1. |
| | B3 | LDPC Extra OFDM Symbol | 1 | Set to 1 if the LDPC PPDU encoding process (if an SU PPDU), or at least one LDPC user's PPDU encoding process (if a VHT MU PPDU), results in an extra OFDM symbol (or symbols) as described in 21.3.10.5.4 and 21.3.10.5.5. Set to 0 otherwise. |
| | B4-B7 | SU VHT-MCS/MU[1-3] Coding | 4 | For a VHT SU PPDU: VHT-MCS index For a VHT MU PPDU: If the MU[1] NSTS field is nonzero, then B4 indicates coding for user u with $USER_POSITION[u] = 1$: set to 0 for BCC, 1 for LDPC. If the MU[1] NSTS field is 0, then B4 is reserved and set to 1. If the MU[2] NSTS field is nonzero, then B5 indicates coding for user u with $USER_POSITION[u] = 2$: set to 0 for BCC, 1 for LDPC. If the MU[2] NSTS field is 0, then B5 is reserved and set to 1. If the MU[3] NSTS field is nonzero, then B6 indicates coding for user u with $USER_POSITION[u] = 3$: set to 0 for BCC, 1 for LDPC. If the MU[3] NSTS field is 0, then B6 is reserved and set to 1. B7 is reserved and set to 1 |
| | B8 | Beamformed | 1 | For a VHT SU PPDU: Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission, set to 0 otherwise. For a VHT MU PPDU: Reserved and set to 1 NOTE—If equal to 1 smoothing is not recommended. |
| | B9 | Reserved | 1 | Reserved and set to 1 |
| | B10-B17 | CRC | 8 | CRC calculated as in 19.3.9.4.4 with c7 in B10. Bits 0-23 of HT-SIG1 and bits 0-9 of HT-SIG2 are replaced by bits 0-23 of VHT-SIG-A1 and bits 0-9 of VHT-SIG-A2, respectively. |
| | B18-B23 | Tail | 6 | Used to terminate the trellis of the convolutional decoder. Set to 0. |

The time domain waveform for the VHT-SIG-A field in a VHT PPDU shall be as specified in Equation (21-28).

$$r_{\text{VHT-SIG-A}}^{(i_{\text{Seg}}, i_{\text{TX}})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-A}}^{\text{Tone}} N_{\text{TX}}}} \sum_{n=0}^1 w_{T_{\text{SYML}}}(t - n T_{\text{SYML}}) \cdot \quad (21-28)$$

$$\sum_{i_{\text{BW}}=0}^{N_{\text{20MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{\text{BW}})), \text{BW}}(j^n D_{k,n, \text{BW}} + p_{n+1} P_k) \cdot \exp(j2\pi(k-K_{\text{Shift}}(i_{\text{BW}}))\Delta_F(t - n T_{\text{SYML}} - T_{\text{GI}} - T_{\text{CS}}^{i_{\text{TX}}})) \right)$$

where

N_{20MHz} and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4

$$D_{k,n,20} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}^r(k), n}, \text{ otherwise} \end{cases}$$

$M_{20}^r(k)$ is defined in Equation (21-27)

P_k and p_n are defined in 17.3.5.10

$N_{\text{VHT-SIG-A}}^{\text{Tone}}$ has the value given in Table 21-8

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$T_{\text{CS}}^{i_{\text{TX}}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

NOTE—This definition results in a QPSK modulation on the second symbol of VHT-SIG-A where the constellation of the data tones is rotated by 90° counter-clockwise relative to the first symbol of VHT-SIG-A and relative to the non-HT signal field in VHT PPDU (Figure 21-20). In VHT PPDU, the VHT-SIG-A is transmitted with the same number of subcarriers and the same cyclic shifts as the preceding non-HT portion of the preamble.

For an 80+80 MHz transmission, each frequency segment shall use the time domain waveform for 80 MHz transmissions.

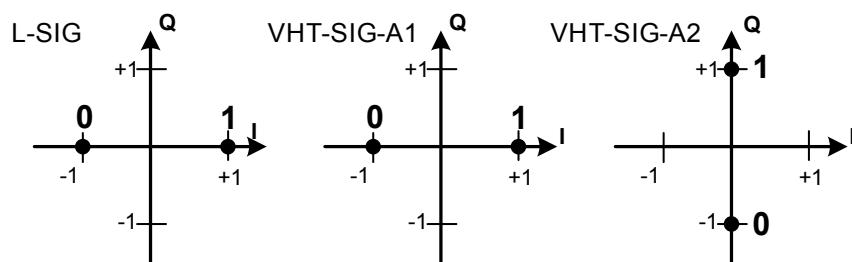

Figure 21-20—Data tone constellation in the VHT PPDU pre-VHT modulated fields

21.3.8.3.4 VHT-STF definition

The main purpose of the VHT-STF field is to improve automatic gain control estimation in a MIMO transmission. The duration of the VHT-STF field is $T_{VHT-STF}$ regardless of the Short GI field setting in VHT-SIG-A. The frequency domain sequence used to construct the VHT-STF field in a 20 MHz transmission is identical to the HT-STF field. In a 40 MHz and an 80 MHz transmission, the VHT-STF field is constructed from the 20 MHz version by frequency shifting a duplicate of it to each 20 MHz subchannel and applying appropriate phase rotations per 20 MHz subchannel.

For a 20 MHz transmission, the frequency domain sequence is given by Equation (21-29).

$$VHTS_{-28, 28} = HTS_{-28, 28} \quad (21-29)$$

where

$HTS_{-28, 28}$ is defined in Equation (19-19)

For a 40 MHz transmission, the frequency domain sequence is given by Equation (21-30).

$$VHTS_{-58, 58} = HTS_{-58, 58} \quad (21-30)$$

where

$HTS_{-58, 58}$ is defined in Equation (19-20)

For an 80 MHz transmission, the frequency domain sequence is given by Equation (21-31).

$$VHTS_{-122, 122} = \{VHTS_{-58, 58}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-58, 58}\} \quad (21-31)$$

where

$VHTS_{-58, 58}$ is given by Equation (21-30)

For a 160 MHz transmission, the frequency domain sequence is given by Equation (21-32).

$$VHTS_{-250, 250} = \{VHTS_{-122, 122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHTS_{-122, 122}\} \quad (21-32)$$

where

$VHTS_{-122, 122}$ is given by Equation (21-31)

NOTE—Equation (21-29), Equation (21-30), Equation (21-31), and Equation (21-32) do not show the phase rotation per 20 MHz subchannel.

For an 80+80 MHz transmission, each 80 MHz frequency segment shall use the VHT-STF pattern for the 80 MHz ($VHTS_{-122, 122}$) defined in Equation (21-31).

The time domain representation of the signal on frequency segment i_{Seg} and transmit chain i_{TX} shall be as specified in Equation (21-33).

$$r_{\text{VHT-STF}}^{(i_{\text{Seg}}, i_{\text{Tx}})}(t) = \frac{1}{\sqrt{N_{\text{VHT-STF}}^{\text{Tone}} N_{\text{STS, total}}}} w_{T_{\text{VHT-STF}}}(t) \quad (21-33)$$

$$\cdot \sum_{k=-N_{\text{SR}}}^{N_{\text{SR}}} \sum_{u=0}^{N_{\text{user}}-1} \sum_{m=1}^{N_{\text{STS},u}} \left(\left[Q_k^{(i_{\text{Seg}})} \right]_{i_{\text{Tx}}, (M_u + m)} \Upsilon_{k, \text{BW}} VHTS_k \right) \\ \cdot \exp(j2\pi k \Delta_F (t - T_{\text{CS,VHT}}(M_u + m)))$$

where

$N_{\text{VHT-STF}}^{\text{Tone}}$ has the value given in Table 21-8

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11

$Q_k^{(i_{\text{Seg}})}$ is defined in 21.3.10.11.1

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

21.3.8.3.5 VHT-LTF definition

The VHT Long Training field (VHT-LTF) field provides a means for the receiver to estimate the MIMO channel between the set of constellation mapper outputs (or, if STBC is applied, the STBC encoder outputs) and the receive chains. The transmitter provides training for $N_{\text{STS, total}}$ space-time streams (spatial mapper inputs) used for the transmission of the PSDU(s). For each tone, the MIMO channel that can be estimated is an $N_{\text{RX}} \times N_{\text{STS, total}}$ matrix. A VHT transmission has a preamble that contains VHT-LTF symbols, where the data tones of each VHT-LTF symbol are multiplied by entries belonging to a matrix $P_{\text{VHT-LTF}}$, to enable channel estimation at the receiver. The pilot tones of each VHT-LTF symbol are multiplied by the entries of a matrix $R_{\text{VHT-LTF}}$ defined in the following text. The multiplication of the pilot tones in the VHT-LTF symbol by the $R_{\text{VHT-LTF}}$ matrix instead of the $P_{\text{VHT-LTF}}$ matrix allows receivers to track phase and frequency offset during MIMO channel estimation using the VHT-LTF. The number of VHT-LTF symbols, $N_{\text{VHT-LTF}}$, is a function of the total number of space-time streams $N_{\text{STS, total}}$ as shown in Table 21-13. As a result the VHT-LTF field consists of one, two, four, six or eight symbols.

Table 21-13—Number of VHT-LTFs required for different numbers of space-time streams

| $N_{\text{STS, total}}$ | N_{VHTLTF} |
|-------------------------|---------------------|
| 1 | 1 |
| 2 | 2 |
| 3 | 4 |
| 4 | 4 |
| 5 | 6 |
| 6 | 6 |
| 7 | 8 |
| 8 | 8 |

Let LTF_{left} and LTF_{right} be the sequences defined in Equation (21-34) and Equation (21-35), respectively.

$$LTF_{left} = \{1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1, 1, -1, -1, 1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21-34)$$

$$LTF_{right} = \{1, -1, -1, 1, 1, -1, 1, -1, -1, -1, -1, 1, 1, -1, -1, 1, -1, 1, -1, 1, 1, 1, 1\} \quad (21-35)$$

NOTE— LTF_{left} is identical to the leftmost 26 elements of Equation (17-8), and LTF_{right} is identical to the rightmost 26 elements of Equation (17-8).

In a 20 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-36).

$$\begin{aligned} VHT-LTF_{-28, 28} &= \{1, 1, LTF_{left}, 0, LTF_{right}, -1, -1\} \\ &= HT-LTF_{-28, 28} \end{aligned} \quad (21-36)$$

where

$HT-LTF_{-28, 28}$ is defined in Equation (19-23)

In a 40 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-37).

$$\begin{aligned} VHT-LTF_{-58, 58} &= \{LTF_{left}, 1, LTF_{right}, -1, -1, -1, 1, 0, 0, 0, -1, 1, 1, -1, LTF_{left}, 1, LTF_{right}\} \\ &= HT-LTF_{-58, 58} \end{aligned} \quad (21-37)$$

where

$HT-LTF_{-58, 58}$ is defined in Equation (19-24)

In an 80 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-38).

$$\begin{aligned} VHT-LTF_{-122, 122} &= \{LTF_{left}, 1, LTF_{right}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{left}, 1, LTF_{right}, \\ &\quad 1, -1, 1, -1, 0, 0, 0, 1, -1, -1, 1, \\ &\quad LTF_{left}, 1, LTF_{right}, -1, -1, -1, 1, 1, -1, 1, -1, 1, 1, -1, LTF_{left}, 1, LTF_{right}\} \end{aligned} \quad (21-38)$$

In a 160 MHz transmission, the VHT-LTF sequence transmitted is given by Equation (21-39).

$$VHT-LTF_{-250, 250} = \{VHT-LTF_{-122, 122}, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, VHT-LTF_{-122, 122}\} \quad (21-39)$$

where

$VHT-LTF_{-122, 122}$ is given in Equation (21-38)

NOTE—Equation (21-36), Equation (21-37), Equation (21-38), and Equation (21-39) do not show the phase rotation per 20 MHz subchannel.

For a 80+80 MHz transmission, each 80 MHz frequency segment shall use the 80 MHz VHT-LTF sequence, $VHT-LTF_{-122, 122}$, defined in Equation (21-38).

The generation of the time domain VHT-LTF symbols per frequency segment is shown in Figure 21-21 where $A_{VHT-LTF}^k$ is given in Equation (21-40).

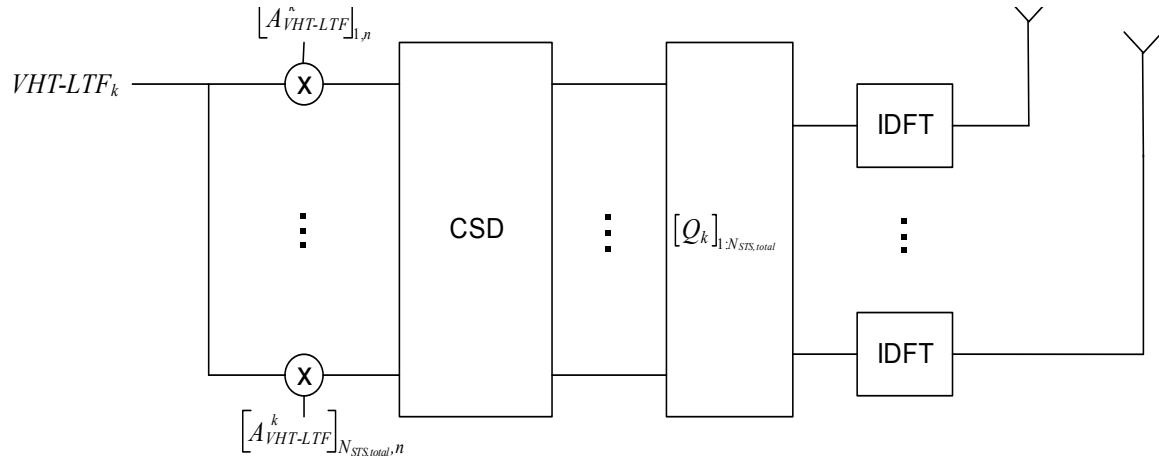

Figure 21-21—Generation of VHT-LTF symbols per frequency segment

$$A_{VHT-LTF}^k = \begin{cases} R_{VHT-LTF}, & \text{if } k \in K_{\text{Pilot}} \\ P_{VHT-LTF}, & \text{otherwise} \end{cases} \quad (21-40)$$

where

- K_{Pilot} is the set of subcarrier indices for the pilot tones.
- For a 20 MHz transmission, $K_{\text{Pilot}} = \{\pm 7, \pm 21\}$.
- For a 40 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 25, \pm 53\}$.
- For an 80 MHz transmission, $K_{\text{Pilot}} = \{\pm 11, \pm 39, \pm 75, \pm 103\}$.
- For a 160 MHz transmission, $K_{\text{Pilot}} = \{\pm 25, \pm 53, \pm 89, \pm 117, \pm 139, \pm 167, \pm 203, \pm 231\}$.
- For an 80+80 MHz transmission, K_{Pilot} for each 80 MHz frequency segment is identical to K_{Pilot} for an 80 MHz transmission.

$R_{VHT-LTF}$ is a $N_{VHT-LTF} \times N_{VHT-LTF}$ matrix whose elements are defined in Equation (21-41).

$$[R_{VHT-LTF}]_{m,n} = [P_{VHT-LTF}]_{1,n}, \quad 1 \leq m, n \leq N_{VHT-LTF} \quad (21-41)$$

$P_{VHT-LTF}$ is defined in Equation (21-42)

The time domain representation of the waveform transmitted on frequency segment i_{Seg} of transmit chain i_{TX} shall be as described by Equation (21-42).

$$r_{\text{VHT-LTF}}^{(i_{\text{seg}}, i_{\text{Tx}})}(t) = \frac{1}{\sqrt{N_{\text{VHT-LTF}}^{\text{Tone}} N_{\text{STS, total}}}} \sum_{n=0}^{N_{\text{VHT-LTF}} - 1} w_{T_{\text{VHT-LTF}}}(t - n T_{\text{VHT-LTF}}) \\ \cdot \sum_{k=-N_{\text{SR}}}^{N_{\text{SR}}} \sum_{u=0}^{N_{\text{user}} - 1} \sum_{m=1}^{N_{\text{STS}, u}} \left(\left[Q_k^{(i_{\text{seg}})} \right]_{i_{\text{Tx}}, (M_u + m)} \Upsilon_{k, \text{BW}} \left[A_{\text{VHT-LTF}}^k \right]_{(M_u + m), (n+1)} V_{\text{HT-LTF}}^k \right. \\ \left. \cdot \exp(j2\pi k \Delta_F (t - n T_{\text{VHT-LTF}} - T_{\text{GI}} - T_{\text{CS,VHT}}(M_u + m))) \right) \quad (21-42)$$

where

$N_{\text{VHT-LTF}}^{\text{Tone}}$ has the value given in Table 21-8

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11

$Q_k^{(i_{\text{seg}})}$ is defined in 21.3.10.11.1

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$A_{\text{VHT-LTF}}^k$ is defined in Equation (21-40)

$$P_{\text{VHT-LTF}} = \begin{cases} P_{4 \times 4}, N_{\text{STS, total}} \leq 4 \\ P_{6 \times 6}, N_{\text{STS, total}} = 5, 6 \\ P_{8 \times 8}, N_{\text{STS, total}} = 7, 8 \end{cases} \quad (21-43)$$

where

$P_{4 \times 4}$ is defined in Equation (19-27)

The VHT-LTF mapping matrix for six VHT-LTF symbols, $P_{6 \times 6}$, is defined in Equation (21-44).

$$P_{6 \times 6} = \begin{bmatrix} 1 & -1 & 1 & 1 & 1 & -1 \\ 1 & -w^1 & w^2 & w^3 & w^4 & -w^5 \\ 1 & -w^2 & w^4 & w^6 & w^8 & -w^{10} \\ 1 & -w^3 & w^6 & w^9 & w^{12} & -w^{15} \\ 1 & -w^4 & w^8 & w^{12} & w^{16} & -w^{20} \\ 1 & -w^5 & w^{10} & w^{15} & w^{20} & -w^{25} \end{bmatrix} \quad (21-44)$$

where

$$w = \exp(-j2\pi/6)$$

The VHT-LTF mapping matrix for eight VHT-LTF symbols, $P_{8 \times 8}$, is defined in Equation (21-45).

$$P_{8 \times 8} = \begin{bmatrix} P_{4 \times 4} & P_{4 \times 4} \\ P_{4 \times 4} & -P_{4 \times 4} \end{bmatrix} \quad (21-45)$$

where

$P_{4 \times 4}$ is defined in Equation (19-27)

As defined in Table 21-5, the duration of each VHT-LTF symbol is $T_{VHT-LTF}$ regardless of the Short GI field setting in VHT-SIG-A.

21.3.8.3.6 VHT-SIG-B definition

The VHT-SIG-B field is one symbol and contains 26 bits in a 20 MHz PPDU, 27 bits in a 40 MHz PPDU, and 29 bits in 80 MHz, 160 MHz, and 80+80 MHz PPDU for each user. The fields in the VHT-SIG-B field are listed in Table 21-14. For fields consisting of multiple bits, the LSB of the value occupies the lowest numbered bit of the field. For example, for an MU transmission using VHT-MCS 5 (0101 in binary) in 20 MHz bandwidth, the VHT-SIG-B field bits are set as follows: B16=1, B17=0, B18=1, and B19=0.

Table 21-14—Fields in the VHT-SIG-B field

| Field | VHT MU PPDU Allocation (bits) | | | VHT SU PPDU Allocation (bits) | | | Description |
|------------------|-------------------------------|----------------|----------------------------------|-------------------------------|----------------|----------------------------------|--|
| | 20 MHz | 40 MHz | 80 MHz, 160 MHz, 80+80 MHz | 20 MHz | 40 MHz | 80 MHz, 160 MHz, 80+80 MHz | |
| VHT-SIG-B Length | B0-B15 (16) | B0-B16 (17) | B0-B18 (19) | B0-B16 (17) | B0-B18 (19) | B0-B20 (21) | Length of A-MPDU pre-EOF padding in units of four octets |
| VHT-MCS | B16-B19 (4) | B17-B20 (4) | B19-B22 (4) | N/A | N/A | N/A | |
| Reserved | N/A | N/A | N/A | B17-B19 (3) | B19-B20 (2) | B21-B22 (2) | All 1s |
| Tail | B20-B25 (6) | B21-B26 (6) | B23-B28 (6) | B20-B25 (6) | B21-B26 (6) | B23-B28 (6) | All 0s |
| Total # bits | 26 | 27 | 29 | 26 | 27 | 29 | |

NOTE—Due to the limitations in the maximum A-MPDU length, B19-20 are always 0 for an 80 MHz, 160 MHz, and 80+80 MHz VHT SU PPDU.

The VHT-SIG-B Length field for user u shall be set using Equation (21-46).

$$\text{VHT-SIG-B Length (for user } u \text{ in units of 4 octets)} = \left\lceil \frac{\text{APEP_LENGTH}_u}{4} \right\rceil \quad (21-46)$$

where

APEP_LENGTH_u is the TXVECTOR parameter APEP_LENGTH for user u (in octets)

The VHT-SIG-B bits for an NDP transmission in various channel widths shall be set as defined in Table 21-15.

Table 21-15—VHT-SIG-B bits (before Tail field) in NDP for various channel widths

| Channel Width | B0 | B1 | B2 | B3 | B4 | B5 | B6 | B7 | B8 | B9 | B10 | B11 | B12 | B13 | B14 | B15 | B16 | B17 | B18 | B19 | B20 | B21 | B22 |
|--|----|----|----|----|----|----|----|----|----|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 20 MHz | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | — | — | — |
| 40 MHz | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | - | - |
| 80 MHz, 160 MHz, or 80+80 MHz | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |

For a 40 MHz transmission, the VHT-SIG-B bits are repeated twice. For an 80 MHz transmission, the VHT-SIG-B bits are repeated four times and a pad bit appended that is set to 0. For a 160 MHz and 80+80 MHz transmission, the VHT-SIG-B bits are first repeated four times and a pad bit appended that is set to 0 as in the 80 MHz transmission. Then, the resulting 117 bits are repeated again to fill the 234 available bits. The repetition of the VHT-SIG-B bits for various channel width PPDUs is shown in Figure 21-22.

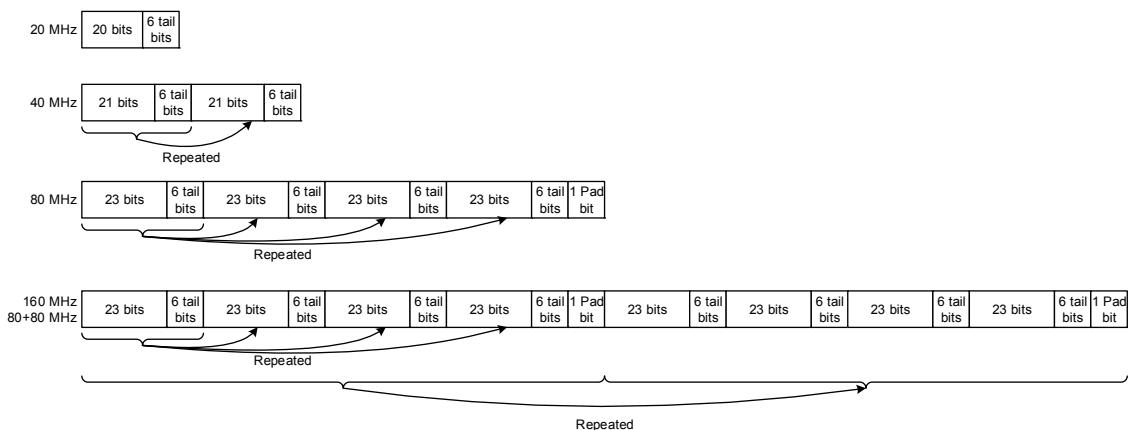

Figure 21-22—VHT-SIG-B bits in 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz transmissions

For each user u , the VHT-SIG-B field shall be BCC encoded at rate $R = 1/2$ as defined in 17.3.5.6, be segment parsed as defined in 21.3.10.7, be interleaved as defined in 21.3.10.8, be mapped to a BPSK constellation as defined in 17.3.5.8, be segment deparsed as defined in 21.3.10.9.3, and have pilots inserted following the steps described in 21.3.10.10. The VHT-SIG-B field constellation points are mapped to $N_{STS,u}$ space-time streams by the user-specific elements of the first column of the $P_{VHT-LTF}$ matrix, which is defined in clause 21.3.8.3.5. The total number of data subcarriers and pilot subcarriers are the same as in the Data field. The space-time streams per each frequency segment are input into the CSD block, which is defined in Table 21-11 and follow the same transmission flow as the Data field from there on. The duration of the VHT-SIG-B field is $T_{VHT-SIG-B}$, regardless of the value of the TXVECTOR parameter GI_TYPE. The time domain waveform for the VHT-SIG-B field in a VHT PPDU is specified by Equation (21-47).

$$r_{\text{VHT-SIG-B}}^{(i_{\text{Seg}}, i_{\text{Tx}})}(t) = \frac{1}{\sqrt{N_{\text{VHT-SIG-B}}^{\text{Tone}} N_{\text{STS, total}}}} w_{T_{\text{VHT-SIG-B}}}(t) \\ \cdot \sum_{k=-N_{SR}}^{N_{SR}} \sum_{u=0}^{N_{\text{user}}-1} \sum_{m=1}^{N_{\text{STS, u}}} \left[Q_k^{(i_{\text{Seg}})} \right]_{i_{\text{Tx}}(M_u+m)} \Upsilon_{k, \text{BW}} \left(\left[P_{\text{VHT-LTF}} \right]_{(M_u+m), 1} D_{k, \text{BW}}^{(i_{\text{Seg}}, u)} + p_3 P_0^k \right) \\ \cdot \exp(j2\pi k \Delta_F (t - T_{\text{GI}} - T_{\text{CS, VHT}}(M_u+m))) \quad (21-47)$$

where

$N_{\text{VHT-SIG-B}}^{\text{Tone}}$ has the value given in Table 21-8

$T_{\text{CS, VHT}}(n)$ is given in Table 21-11

$Q_k^{(i_{\text{Seg}})}$ is defined in 21.3.10.11.1

p_n is defined in 17.3.5.10

P_n^k is defined in 21.3.10.10

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$P_{\text{VHT-LTF}}$ is given in Equation (21-43)

Let $d_k^{(i_{\text{Seg}}, u)}$ be the stream of complex numbers generated for VHT-SIG-B for user u at subcarrier k (logical index, starting with 0) on frequency segment i_{Seg} (prior to multiplication by $P_{\text{VHT-LTF}}$). For a 20 MHz VHT transmission,

$$D_{k, 20}^{(i_{\text{Seg}}, u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ d_{M_{20}(k)}^{(i_{\text{Seg}}, u)}, \text{otherwise} \end{cases} \quad (21-48)$$

$$M_{20}(k) = \begin{cases} k + 28, -28 \leq k \leq -22 \\ k + 27, -20 \leq k \leq -8 \\ k + 26, -6 \leq k \leq -1 \\ k + 25, 1 \leq k \leq 6 \\ k + 24, 8 \leq k \leq 20 \\ k + 23, 22 \leq k \leq 28 \end{cases} \quad (21-49)$$

For a 40 MHz VHT transmission,

$$D_{k, 40}^{(i_{\text{Seg}}, u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ d_{M_{40}(k)}^{(i_{\text{Seg}}, u)}, \text{otherwise} \end{cases} \quad (21-50)$$

$$M_{40}^r(k) = \begin{cases} k + 58, & -58 \leq k \leq -54 \\ k + 57, & -52 \leq k \leq -26 \\ k + 56, & -24 \leq k \leq -12 \\ k + 55, & -10 \leq k \leq -2 \\ k + 52, & 2 \leq k \leq 10 \\ k + 51, & 12 \leq k \leq 24 \\ k + 50, & 26 \leq k \leq 52 \\ k + 49, & 54 \leq k \leq 58 \end{cases} \quad (21-51)$$

For an 80 MHz VHT transmission,

$$D_{k, 80}^{(i_{\text{seg}}, u)} = \begin{cases} 0, & k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ d_{M_{80}^r(k)}^{(i_{\text{seg}}, u)}, & \text{otherwise} \end{cases} \quad (21-52)$$

$$M_{80}^r(k) = \begin{cases} k + 122, & -122 \leq k \leq -104 \\ k + 121, & -102 \leq k \leq -76 \\ k + 120, & -74 \leq k \leq -40 \\ k + 119, & -38 \leq k \leq -12 \\ k + 118, & -10 \leq k \leq -2 \\ k + 115, & 2 \leq k \leq 10 \\ k + 114, & 12 \leq k \leq 38 \\ k + 113, & 40 \leq k \leq 74 \\ k + 112, & 76 \leq k \leq 102 \\ k + 111, & 104 \leq k \leq 122 \end{cases} \quad (21-53)$$

For a 160 MHz VHT transmission,

$$D_{k, 160}^{(i_{\text{seg}}, u)} = \begin{cases} 0, & k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ d_{M_{160}^r(k)}^{(i_{\text{seg}}, u)}, & \text{otherwise} \end{cases} \quad (21-54)$$

$$M_{160}^r(k) = \begin{cases} k + 250, & -250 \leq k \leq -232 \\ k + 249, & -230 \leq k \leq -204 \\ k + 248, & -202 \leq k \leq -168 \\ k + 247, & -166 \leq k \leq -140 \\ k + 246, & -138 \leq k \leq -130 \\ k + 243, & -126 \leq k \leq -118 \\ k + 242, & -116 \leq k \leq -90 \\ k + 241, & -88 \leq k \leq -54 \\ k + 240, & -52 \leq k \leq -26 \\ k + 239, & -24 \leq k \leq -6 \\ k + 228, & 6 \leq k \leq 24 \\ k + 227, & 26 \leq k \leq 52 \\ k + 226, & 54 \leq k \leq 88 \\ k + 225, & 90 \leq k \leq 116 \\ k + 224, & 118 \leq k \leq 126 \\ k + 221, & 130 \leq k \leq 138 \\ k + 220, & 140 \leq k \leq 166 \\ k + 219, & 168 \leq k \leq 202 \\ k + 218, & 204 \leq k \leq 230 \\ k + 217, & 232 \leq k \leq 250 \end{cases} \quad (21-55)$$

For an 80+80 MHz VHT transmission, each frequency segment shall follow the 80 MHz VHT transmission format as specified in Equation (21-52) and Equation (21-53).

21.3.9 Transmission of NON_HT and HT PPDUs with multiple transmit chains

21.3.9.1 Transmission of 20 MHz NON_HT PPDUs with more than one transmit chain

A VHT STA that transmits a NON_HT PPDU shall apply the cyclic shifts defined in Table 21-10 to the preamble and Data field.

21.3.9.2 Transmission of HT PPDUs with more than four transmit chains

A VHT STA that transmits an HT PPDU with FORMAT equal to HT_MF shall apply the cyclic shifts defined in Table 21-10 for the non-HT portion of the PPDU, including the HT-SIG field.

21.3.10 Data field

21.3.10.1 General

The number of OFDM symbols in the Data field is determined by the Length field in L-SIG (see Equation (21-24)), the preamble duration and the setting of the Short GI field in VHT-SIG-A (see 21.3.8.3.3).

When BCC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, the PHY pad bits, and the tail bits ($N_{tail}N_{ES}$ bits for SU and $N_{tail}N_{ES,u}$ bits for each user u in MU). When LDPC encoding is used, the Data field shall consist of the SERVICE field, the PSDU, and the PHY pad bits. No tail bits are present when LDPC encoding is used.

The padding flow is as follows. The MAC delivers a PSDU that fills the available octets in the Data field of the PPDU for each user u . The PHY determines the number of pad bits to add and appends them to the PSDU. The number of pad bits added will always be 0 to 7 per user. When user u of a VHT MU PPDU uses BCC encoding, the number of pad bits is calculated using Equation (21-56). In the case of SU ignore u in Equation (21-56).

$$N_{PAD,u} = N_{SYM}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} - N_{tail}N_{ES,u} \quad (21-56)$$

where

PSDU_LENGTH_u is defined in 21.4.3

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU

For an SU PPDU, if LDPC encoding is used then the PHY padding bits are calculated using Equation (21-57).

$$N_{PAD} = N_{SYM,init}N_{DBPS} - 8 \cdot \text{PSDU_LENGTH} - N_{service} \quad (21-57)$$

where

PSDU_LENGTH is defined in 21.4.3

$N_{SYM,init}$ is given by Equation (21-62)

For a VHT MU PPDU, if LDPC encoding is used for user u then the PHY padding bits are calculated using Equation (21-58).

$$N_{PAD,u} = N_{SYM_max_init}N_{DBPS,u} - 8 \cdot \text{PSDU_LENGTH}_u - N_{service} \quad (21-58)$$

where

PSDU_LENGTH_u is defined in 21.4.3

$N_{SYM_max_init}$ is given by Equation (21-65)

The Data field of the VHT PPDU contains data for one or more users. For a VHT MU PPDU, the data processing, from scrambling to constellation mapping shall happen on a per-user basis. In the following subclauses, this process is described from a single user's point of view.

21.3.10.2 SERVICE field

The SERVICE field is as shown in Table 21-16.

Table 21-16—SERVICE field

| Bits | Field | Description |
|--------|--------------------------|---|
| B0-B6 | Scrambler Initialization | Set to 0 |
| B7 | Reserved | Set to 0 |
| B8-B15 | CRC | CRC calculated over VHT-SIG-B (excluding tail bits) |

21.3.10.3 CRC calculation for VHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23.

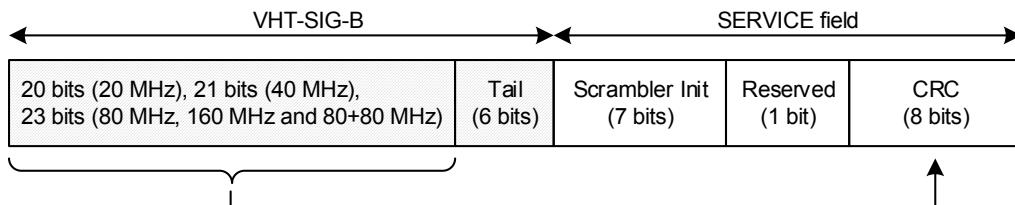

Figure 21-23—VHT-SIG-B and SERVICE field relationship

The value of the CRC field shall be the 1s complement of Equation (21-59).

$$crc(D) = (M(D) \oplus I(D))D^8 \bmod G(D) \quad (21-59)$$

where

$$M(D) = m_0 D^{N-1} + m_1 D^{N-2} + \dots + m_{N-2} D + m_{N-1}$$

N is the number of bits over which the CRC is generated; 20 for 20 MHz, 21 for 40 MHz, and 23 for 80 MHz/160 MHz/80+80 MHz

m_i is bit i of VHT-SIG-B

$$I(D) = \sum_{i=N-8}^{N-1} D^i \text{ are initialized values that are added modulo 2 to the first 8 bits of VHT-SIG-B}$$

$G(D) = D^8 + D^2 + D + 1$ is the CRC generating polynomial

$$crc(D) = c_0 D^7 + c_1 D^6 + \dots + c_6 D + c_7$$

Figure 19-8 shows the operation of the CRC. First, the shift register is reset to all 1s. The bits are then passed through the XOR operation at the input. When the last bit has entered, the output is generated by shifting the bits out of the shift register, c_7 first, through an inverter.

As an example, if bits $\{m_0, \dots, m_{22}\}$ are given by $\{1\ 0\ 0\ 1\ 1\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 0\ 1\ 1\}$, the CRC bits $\{c_7, \dots, c_0\}$ are $\{0\ 0\ 0\ 1\ 1\ 1\ 0\ 0\}$.

The CRC field is transmitted with c_7 first. Hence, c_7 is mapped to B8 of the SERVICE field, c_6 is mapped to B9, ..., and c_0 is mapped to B15 of the SERVICE field.

21.3.10.4 Scrambler

The SERVICE, PSDU, and PHY pad parts of the Data field shall be scrambled by the scrambler defined in 17.3.5.5. The Clause 17 TXVECTOR parameters CH_BANDWIDTH_IN_NON_HT and DYN_BANDWIDTH_IN_NON_HT are not present; therefore, the initial state of the scrambler is set to a pseudorandom nonzero seed. Different users in a VHT MU PPDU may use different pseudorandom nonzero seeds.

21.3.10.5 Coding

21.3.10.5.1 General

The Data field shall be encoded using either the binary convolutional code (BCC) defined in 21.3.10.5.2 and 21.3.10.5.3 or the low density parity check (LDPC) code defined in 21.3.10.5.4. The encoder is selected by the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding, or MU[3] Coding fields in VHT-SIG-A, as defined in 21.3.8.3.3. When BCC FEC encoding is used, the number of encoders is determined by rate-dependent parameters as defined in 21.5. The operation of the BCC FEC is described in 21.3.10.5.2 and 21.3.10.5.3. The operation of the LDPC coder is described in 21.3.10.5.4. Support for the reception of a BCC encoded Data field is mandatory.

21.3.10.5.2 BCC encoder parsing operation

If multiple encoders are used, the scrambled SERVICE, PSDU, and PHY pad bits are divided between the encoders by sending bits to different encoders in a round robin manner. Bit i to encoder j of user u , denoted $x_{i,u}^{(j)}$, is as specified in Equation (21-60).

$$x_{i,u}^{(j)} = \begin{cases} b_{N_{ES,u}+j,u}; & 0 \leq i < N_{SYM} \frac{N_{DBPS,u}}{N_{ES,u}} - N_{tail}, \quad 0 \leq j \leq N_{ES,u} - 1 \\ 0; & N_{SYM} \frac{N_{DBPS,u}}{N_{ES,u}} - N_{tail} \leq i < N_{SYM} \frac{N_{DBPS,u}}{N_{ES,u}}, \quad 0 \leq j \leq N_{ES,u} - 1 \end{cases} \quad (21-60)$$

where

$b_{k,u}$ is bit k of the scrambled SERVICE, PSDU, and pad bits of user u

N_{SYM} is the number of symbols in the Data field and is given by Equation (21-111) for a VHT SU PPDU and by Equation (21-67) for a VHT MU PPDU

NOTE—Tail bits with value 0 are being appended to each BCC encoder parser output sequence in Equation (21-60).

21.3.10.5.3 Binary convolutional coding and puncturing

The BCC encoder parser output sequences of user u $\{x_{i,u}^{(j)}\}$, $0 \leq i < N_{SYM} N_{DBPS,u} / N_{ES,u}$, $0 \leq j \leq N_{ES,u} - 1$ each of which is separately encoded by a rate $R = 1/2$ convolutional encoder defined in 17.3.5.6. After encoding, the encoded data is punctured by the method defined in 17.3.5.6 (except for rate 5/6), to achieve the rate selected by the modulation and coding scheme. In the case that rate 5/6 coding is selected, the puncturing scheme will be the same as described in 19.3.11.6.

21.3.10.5.4 LDPC coding

For a VHT SU PPDU using LDPC coding to encode the Data field, the LDPC code and encoding process described in 19.3.11.7 shall be used with the following modifications. First, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits are encoded. Thus, N_{pld} for VHT PPDUs shall be computed using Equation (21-61) instead of Equation (19-35).

$$N_{pld} = N_{SYM, init} N_{DBPS} \quad (21-61)$$

where

$N_{SYM, init}$ is given by Equation (21-62)

$$N_{SYM, init} = m_{STBC} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{service}}{m_{STBC} \cdot N_{DBPS}} \right\rceil \quad (21-62)$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

APEP_LENGTH is the TXVECTOR parameter APEP_LENGTH

Following the calculation of N_{pld} , N_{avbits} shall be computed using Equation (21-63) instead of Equation (19-36).

$$N_{avbits} = N_{SYM, init} N_{CBPS} \quad (21-63)$$

In addition, if N_{SYM} computed in Equation (19-41) in step d) of 19.3.11.7.5 is greater than $N_{SYM, init}$, then the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A shall be set to 0.

LDPC codes used in VHT MU PPDUs shall also follow the definitions in 19.3.11.7. Refer to 21.3.10.5.5 for a description of the LDPC encoding process for VHT MU PPDUs.

21.3.10.5.5 Encoding process for VHT MU PPDUs

For a VHT MU PPDU, first compute the initial number of OFDM symbols for each user using Equation (21-64).

$$N_{SYM_init, u} = \begin{cases} \left\lceil \frac{8 \cdot \text{APEP_LENGTH}_u + N_{service} + N_{tail} \cdot N_{ES, u}}{N_{DBPS, u}} \right\rceil & \text{when user } u \text{ uses BCC} \\ \left\lceil \frac{8 \cdot \text{APEP_LENGTH}_u + N_{service}}{N_{DBPS, u}} \right\rceil & \text{when user } u \text{ uses LDPC} \end{cases} \quad (21-64)$$

where

APEP_LENGTH_u is the TXVECTOR parameter APEP_LENGTH for user u

Based on the above equation, compute the largest initial number of symbols over all users using Equation (21-65).

$$N_{SYM_max_init} = \max \{ N_{SYM_init, u} \}_{u=0}^{N_{user}-1} \quad (21-65)$$

Then, for each user u that uses LDPC in the VHT MU PPDU, the final number of symbols in the Data field ($N_{SYM, u}$) shall be computed as follows. First, perform step a) in 19.3.11.7.5 with the exception that N_{pld} is computed using Equation (21-66) instead of Equation (19-35).

$$N_{pld} = N_{SYM_max_init} N_{DBPS, u} \quad (21-66)$$

Then, perform steps b) through d) in 19.3.11.7.5 with N_{CBPS} and R replaced with $N_{CBPS, u}$ and R_u , respectively. $N_{SYM, u}$ for user u shall then be equal to the value of N_{SYM} obtained at the end of step d) using Equation (19-41).

The purpose of going through steps a) to d) in 19.3.11.7.5 in the above paragraph is to compute $N_{SYM,u}$. Thus, at this stage $N_{SYM,u}$ for each user may be calculated without actually encoding the data using LDPC.

For BCC users, $N_{SYM,u} = N_{SYM_init,u}$.

Then, compute the number of symbols in the Data field using Equation (21-67).

$$N_{SYM} = \max \{N_{SYM,u}\}_{u=0}^{N_{user}-1} \quad (21-67)$$

When constructing the Data field for user u encoded using LDPC code, the MAC follows the padding procedure described in 10.13.6 and delivers a PSDU that contains $PSDU_LENGTH_u$ octets (see 21.4.3). The PHY follows the padding procedure described in 21.3.10.1 to fill $N_{SYM_max_init}$ symbols, where $N_{SYM_max_init}$ is defined in Equation (21-65). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the LDPC encoding process specified in 19.3.11.7.5 with the following modifications. First, N_{pld} shall be computed using Equation (21-66) instead of Equation (19-35). Also, replace N_{CBPS} and R with $N_{CBPS,u}$ and R_u , respectively. Next, step d) in 19.3.11.7.5 is replaced with step d) below:

- d) If N_{SYM} computed in Equation (21-67) is equal to $N_{SYM_max_init}$, then the number of bits to be punctured, N_{punc} , from the codewords after encoding is computed as shown in Equation (19-38).

If N_{SYM} computed in Equation (21-67) is greater than $N_{SYM_max_init}$, then the number of bits to be punctured, N_{punc} , from the codewords after encoding is computed using Equation (19-39) and Equation (20-40). Note also that N_{avbits} has now been updated in Equation (19-39) in this case.

The punctured bits shall be equally distributed over all N_{CW} codewords with the first $\text{rem}(N_{punc}, N_{CW})$ codewords punctured 1 bit more than the remaining codewords. Define $N_{ppcw} = \lfloor N_{punc}/N_{CW} \rfloor$. When $N_{ppcw} > 0$, the puncturing is performed by discarding parity bits $p_{n-k-N_{ppcw}-1}, \dots, p_{n-k-1}$ of the first $\text{rem}(N_{punc}, N_{CW})$ codewords and discarding parity bits $p_{n-k-N_{ppcw}}, \dots, p_{n-k-1}$ of the remaining codewords after encoding.

When constructing the Data field for users encoded using BCC, the MAC follows the padding procedure described in 10.13.6 and delivers a PSDU that contains $PSDU_LENGTH_u$ octets. The PHY follows the padding procedure described in 21.3.10.1 to fill up N_{SYM} symbols computed in Equation (21-67). Then, for each user, all bits in the Data field including the scrambled SERVICE, PSDU, and pad bits shall be encoded using the BCC encoding process specified in 21.3.10.5.2 and 21.3.10.5.3. Note that this process results in the BCC tail bits being placed at the very end of the PPDU.

In addition, if N_{SYM} computed in Equation (21-67) is greater than $N_{SYM_max_init}$ computed in Equation (21-65), then the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 1. Otherwise, the LDPC Extra OFDM Symbol field of VHT-SIG-A2 shall be set to 0.

21.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in this subclause.

The description is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

The number of bits assigned to a single axis (real or imaginary) of a constellation point in a spatial stream is denoted by Equation (21-68).

$$s = \max \left\{ 1, \frac{N_{BPSCS}}{2} \right\} \quad (21-68)$$

The sum of these over all streams is $S = N_{SS} \cdot s$

Consecutive blocks of s bits are assigned to different spatial streams in a round robin fashion.

Let

$$N_{Block} = \left\lfloor \frac{N_{CBPS}}{N_{ES} \cdot S} \right\rfloor \quad (21-69)$$

and

$$M = \frac{N_{CBPS} - N_{Block} \cdot N_{ES} \cdot S}{s \cdot N_{ES}} \quad (21-70)$$

For the first $N_{Block} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, S bits from the output of first encoder are divided among all spatial streams, s bits per stream. Then, S bits from the output of next encoder are used, and so on. If N_{CBPS} is greater than $N_{Block} \cdot N_{ES} \cdot S$, then for the last $N_{CBPS} - N_{Block} \cdot N_{ES} \cdot S$ bits of each OFDM symbol, $M \cdot s$ bits from the output of the first encoder are fed into spatial streams 1 through M (s bits per spatial stream), and then $M \cdot s$ bits from the output of the next encoder are used for spatial stream $M+1$ through $[(2M-1) \bmod N_{SS}] + 1$, and so on, where $z \bmod t$ is the remainder resulting from the division of integer z by integer t .

The following equations are an equivalent description to the above procedure. Bit i at the output of encoder j is assigned to input bit k of spatial stream i_{SS} where

$$j = \begin{cases} \left\lfloor \frac{k}{s} \right\rfloor \bmod N_{ES}, & k = 0, 1, \dots, N_{Block} \cdot N_{ES} \cdot s - 1 \\ \left\lfloor \frac{L}{M} \right\rfloor, & k = N_{Block} \cdot N_{ES} \cdot s, \dots, N_{CBPSS} - 1 \end{cases} \quad (21-71)$$

and

$$i = \begin{cases} (i_{SS} - 1)s + S \cdot \left\lfloor \frac{k}{N_{ES} \cdot s} \right\rfloor + k \bmod s, & k = 0, 1, \dots, N_{Block} \cdot N_{ES} \cdot s - 1 \\ (L \bmod M) \cdot s + N_{Block} \cdot S + k \bmod s, & k = N_{Block} \cdot N_{ES} \cdot s, \dots, N_{CBPSS} - 1 \end{cases} \quad (21-72)$$

where

$$i_{SS} = 1, 2, \dots, N_{SS}$$

$$i = 0, 1, \dots, N_{CBPS}/N_{ES} - 1$$

$$j = 0, 1, \dots, N_{ES} - 1$$

$$k = 0, 1, \dots, N_{CBPSS} - 1$$

$$L = \left\lfloor \frac{k'}{s} \right\rfloor N_{SS} + (i_{SS} - 1)$$

$$k' = k - N_{Block} \cdot N_{ES} \cdot s$$

NOTE— N_{CBPS} is greater than $N_{Block} \cdot N_{ES} \cdot S$ in only the following cases:

- 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 5
- 160 MHz and 80+80 MHz, $N_{SS} = 5$, VHT-MCS = 6
- 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 5
- 160 MHz and 80+80 MHz, $N_{SS} = 7$, VHT-MCS = 6

21.3.10.7 Segment parser

The description in this subclause is given in terms of an SU transmission. For MU transmissions, the rearrangements are carried out in the same way per user.

For a 160 MHz or an 80+80 MHz transmission, the output bits of each stream parser are first divided into blocks of N_{CBPSS} bits ($N_{CBPSS,u}$ bits in the case of an MU transmission). Then, each block is further divided into two frequency subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-73).

$$y_{k,l} = x_{2s \cdot N_{ES} \left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod(s \cdot N_{ES})}, \quad k = 0, 1, \dots, \frac{N_{CBPSS}}{2} - 1 \quad (21-73)$$

where

x_m is the m th bit of a block of N_{CBPSS} bits, $m = 0$ to $N_{CBPSS} - 1$

l is the frequency subblock index, $l = 0, 1$

$y_{k,l}$ is bit k of the frequency subblock l

s is defined in Equation (21-68)

If N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, then apply the segment parsing method described in Equation (21-73) for $\lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor$ sets of $2s \cdot N_{ES}$ segment parser input bits. At this point, each stream parser output has $2s \cdot N_{res}$ ($N_{res} = \frac{N_{CBPSS} \bmod(2s \cdot N_{ES})}{2s} < N_{ES}$, integer) residue bits. Then, the residue bits are divided into subsets of s bits, with each subset being assigned to different subblock ($l = 0, 1$) in a round robin fashion. The first s bits are assigned to the subblock with index $l = 0$. Repeat N_{res} times (until all bits are distributed to the two subblocks). That is, if N_{CBPSS} is not divisible by $2s \cdot N_{ES}$, each block is further divided into two subblocks of $N_{CBPSS}/2$ bits as shown in Equation (21-74).

$$y_{k,l} = \begin{cases} x_{2s \cdot N_{ES} \left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + l \cdot s \cdot N_{ES} + k \bmod(s \cdot N_{ES})}, & k = 0, 1, \dots, \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES} - 1 \\ x_{2s \cdot N_{ES} \left\lfloor \frac{k}{s \cdot N_{ES}} \right\rfloor + 2s \cdot \left\lfloor \frac{k \bmod(s \cdot N_{ES})}{s} \right\rfloor + l \cdot s + k \bmod s}, & k = \lfloor N_{CBPSS}/(2s \cdot N_{ES}) \rfloor \cdot s \cdot N_{ES}, \dots, \frac{N_{CBPSS}}{2} - 1 \end{cases} \quad (21-74)$$

Segment parser is bypassed for a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, i.e., as specified in Equation (21-75).

$$y_{k,l} = x_k, \quad k = 0, 1, \dots, N_{CBPSS} - 1 \quad (21-75)$$

where

- l is the frequency subblock index. $l = 0$ for a 20, 40 or 80 MHz VHT PPDU transmission.
- $y_{k,l}$ is bit k of the frequency subblock l
- x_m is bit m of a block of N_{CBPSS} bits, $m = 0$ to $N_{CBPSS} - 1$

21.3.10.8 BCC interleaver

For ease of explanation, the operation of the interleaver is described for the SU case. For user u of an MU transmission, the interleaver operates in the same way on the output bits for the user from the stream parser by replacing N_{SS} , N_{CBPSS} , N_{CBPSSI} , and N_{BPSCS} with $N_{SS,u}$, $N_{CBPSS,u}$, $N_{CBPSSI,u}$, and $N_{BPSCS,u}$, respectively. That is, the operation of the interleaver is the same as if the transmission were an SU one, consisting of bits from only that user.

This subclause describes the interleaver used in the case of BCC encoding. The interleaver described in this subclause shall be bypassed in the case of LDPC encoding.

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the bits at the output of the stream parser are processed in groups of N_{CBPSS} bits. Each of these groups is divided into N_{SS} blocks of N_{CBPSS} bits, and each block shall be interleaved by an interleaver based on the Clause 17 interleaver. In a 160 MHz or an 80+80 MHz VHT PPDU transmission, each frequency subblock of $N_{CBPSS}/2$ output bits from the segment parser is interleaved by the interleaver for 80 MHz defined in this subclause. This interleaver, which is based on entering the data in rows, and reading it out in columns, has a different number of columns N_{COL} and rows N_{ROW} for different bandwidths. The values of N_{COL} and N_{ROW} are given in Table 21-17.

Table 21-17—Number of rows and columns in the interleaver

| Parameter | 20 MHz | 40 MHz | 80 MHz |
|-------------------------------|----------------------|----------------------|----------------------|
| N_{COL} | 13 | 18 | 26 |
| N_{ROW} | $4 \times N_{BPSCS}$ | $6 \times N_{BPSCS}$ | $9 \times N_{BPSCS}$ |
| N_{ROT} ($N_{SS} \leq 4$) | 11 | 29 | 58 |
| N_{ROT} ($N_{SS} > 4$) | 6 | 13 | 28 |

After the operations based on the Clause 17 interleaver have been applied and if more than one spatial stream exists, a third operation called *frequency rotation* is applied to the additional spatial streams. The parameter for the frequency rotation is N_{ROT} . The values of N_{ROT} are given in Table 21-17.

An additional parameter is the spatial stream index $i_{SS} = 1, 2, \dots, N_{SS}$. The output of the third operation is a function of the spatial stream index.

The interleaving is defined using three permutations. The first permutation is given by the rule shown in Equation (21-76).

$$i = N_{ROW}(k \bmod N_{COL}) + \left\lfloor \frac{k}{N_{COL}} \right\rfloor, k = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-76)$$

The second permutation is defined by the rule shown in Equation (21-77).

$$j = s \left\lfloor \frac{i}{s} \right\rfloor + \left(i + N_{CBPSSI} - \left\lfloor \frac{N_{COL} \cdot i}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad i = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-77)$$

where

s is defined in Equation (21-68)

If $2 \leq N_{SS} \leq 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-78).

$$r = \left\{ j - \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSP} \quad (21-78)$$

$$j = 0, 1, \dots, N_{CBPSSI} - 1$$

where

$i_{SS} = 1, 2, \dots, N_{SS}$ is the spatial stream index on which this interleaver is operating

If $N_{SS} > 4$, a frequency rotation is applied to the output of the second permutation as shown in Equation (21-79).

$$r = \{j - J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS}\} \bmod N_{CBPSSI}, j = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-79)$$

where

$i_{SS} = 1, 2, \dots, N_{SS}$ is the spatial stream index on which this interleaver is operating, and $J(i_{SS})$ is an integer as defined in Table 21-18.

Table 21-18— $J(i_{SS})$ values

| i_{SS} | $J(i_{SS})$ |
|----------|-------------|
| 1 | 0 |
| 2 | 5 |
| 3 | 2 |
| 4 | 7 |
| 5 | 3 |
| 6 | 6 |
| 7 | 1 |
| 8 | 4 |

The deinterleaver uses the following three operations to perform the inverse permutations. Let r denote the index of the bit in the received block (per spatial stream). The first operation reverses the third (frequency rotation) permutation of the interleaver. When $N_{SS} = 1$, this reversal is performed by $j = r$ ($r = 0, 1, \dots, N_{CBPSSI} - 1$). When $2 \leq N_{SS} \leq 4$, this reversal is performed by as shown in Equation (21-80).

$$j = \left\{ r + \left[(2(i_{SS} - 1)) \bmod 3 + 3 \left\lfloor \frac{i_{SS} - 1}{3} \right\rfloor \right] \cdot N_{ROT} \cdot N_{BPSCS} \right\} \bmod N_{CBPSSI}, \quad (21-80)$$

$$r = 0, 1, \dots, N_{CBPSSI} - 1$$

When $N_{SS} > 4$, this reversal is performed by Equation (21-81).

$$j = \{r + J(i_{SS}) \cdot N_{ROT} \cdot N_{BPSCS}\} \bmod N_{CBPSSI} \quad r = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-81)$$

where

$J(i_{SS})$ is defined in Table 21-18

The second operation defined by Equation (21-82) reverses the second permutation in the interleaver.

$$i = s \left\lfloor \frac{j}{s} \right\rfloor + \left(j + \left\lfloor \frac{N_{COL} \cdot j}{N_{CBPSSI}} \right\rfloor \right) \bmod s, \quad j = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-82)$$

where

s is defined in Equation (21-68)

The third operation defined in Equation (21-83) reverses the first permutation of the interleaver.

$$k = N_{COL} \cdot i - (N_{CBPSSI} - 1) \left\lfloor \frac{i}{N_{ROW}} \right\rfloor, \quad i = 0, 1, \dots, N_{CBPSSI} - 1 \quad (21-83)$$

21.3.10.9 Constellation mapping

21.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points for BPSK, QPSK, 16-QAM, and 64-QAM follows the rules defined in 17.3.5.8. For 256-QAM, the mapping is shown in Figure 21-24, Figure 21-25, Figure 21-26, and Figure 21-27.

The bit string convention in Figure 21-24, Figure 21-25, Figure 21-26, and Figure 21-27 follows the bit string convention outlined in 17.3.5.8.

The streams of complex numbers in frequency subblock l for user u are denoted

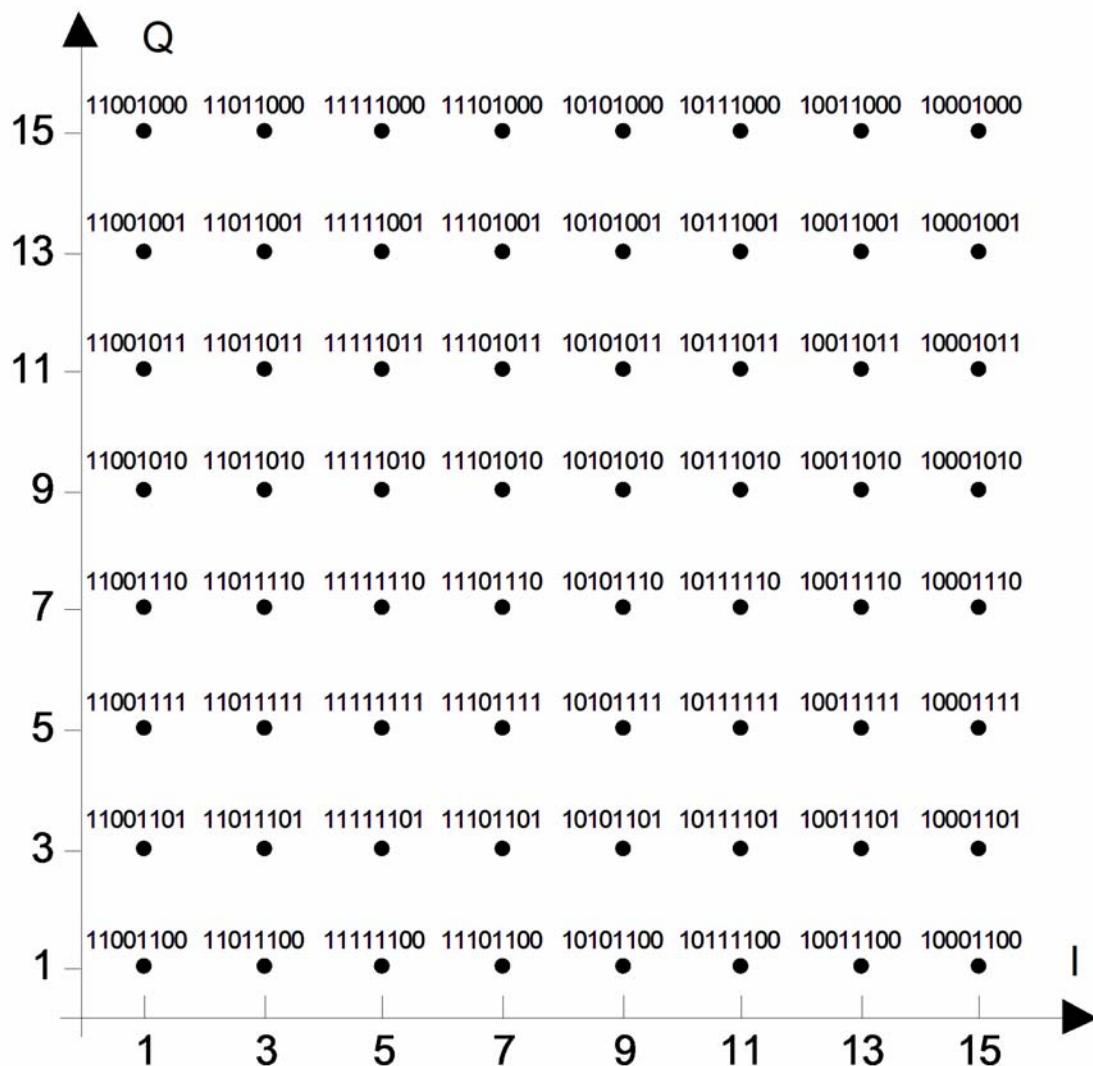

Figure 21-24—Constellation bit encoding for 256-QAM (1st quadrant)

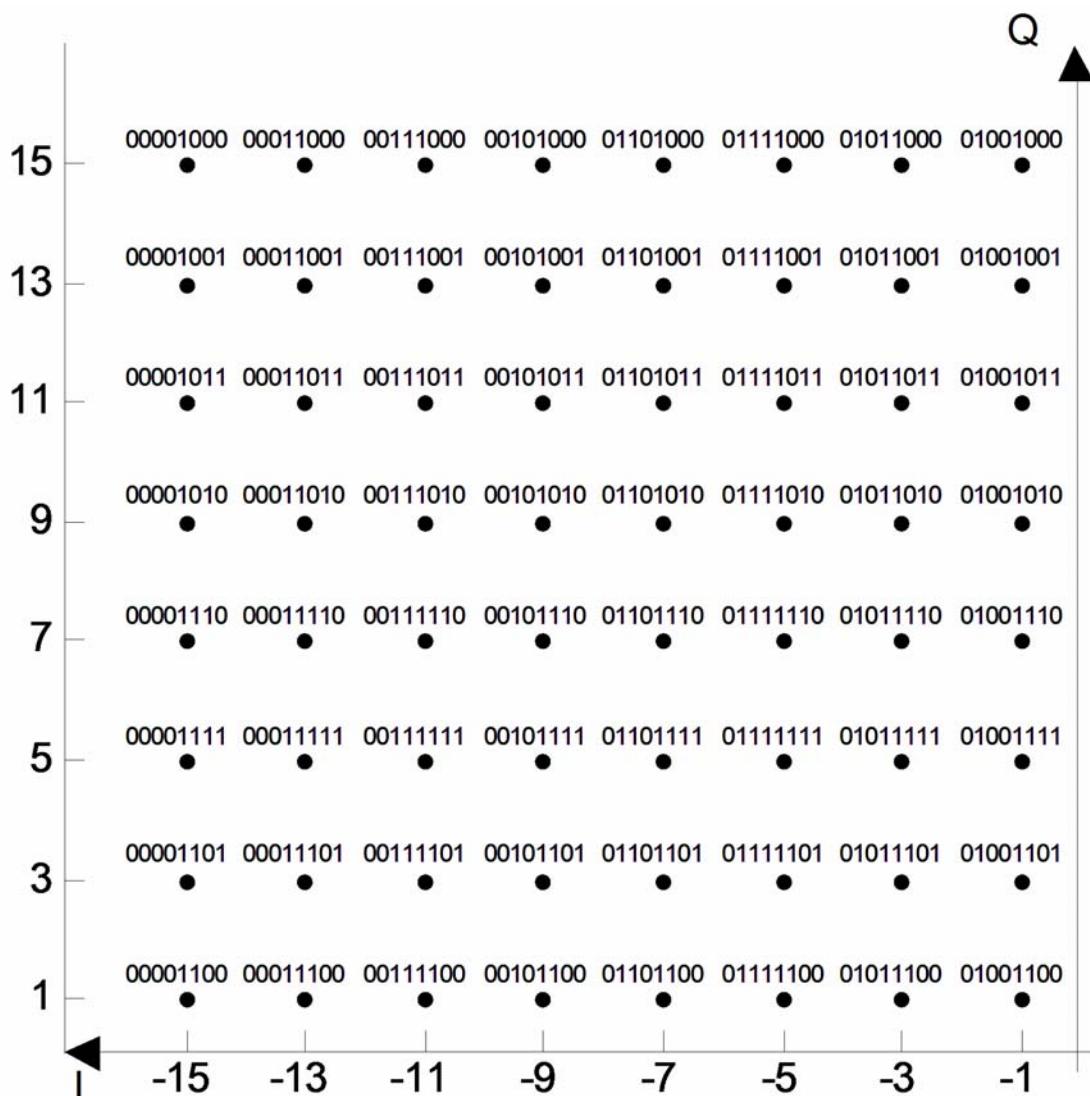

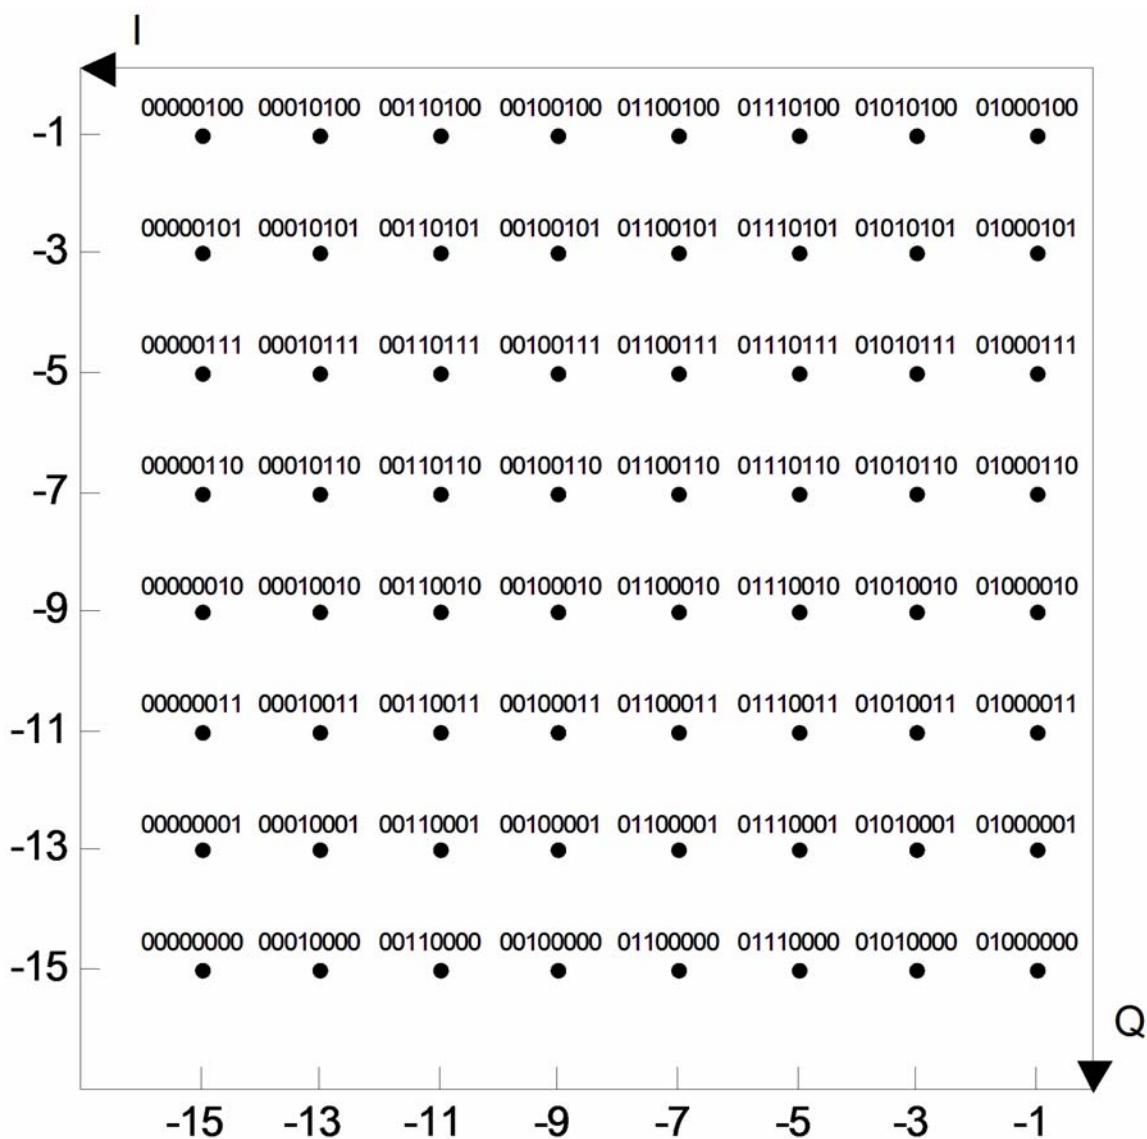

Figure 21-25—Constellation bit encoding for 256-QAM (2nd quadrant)

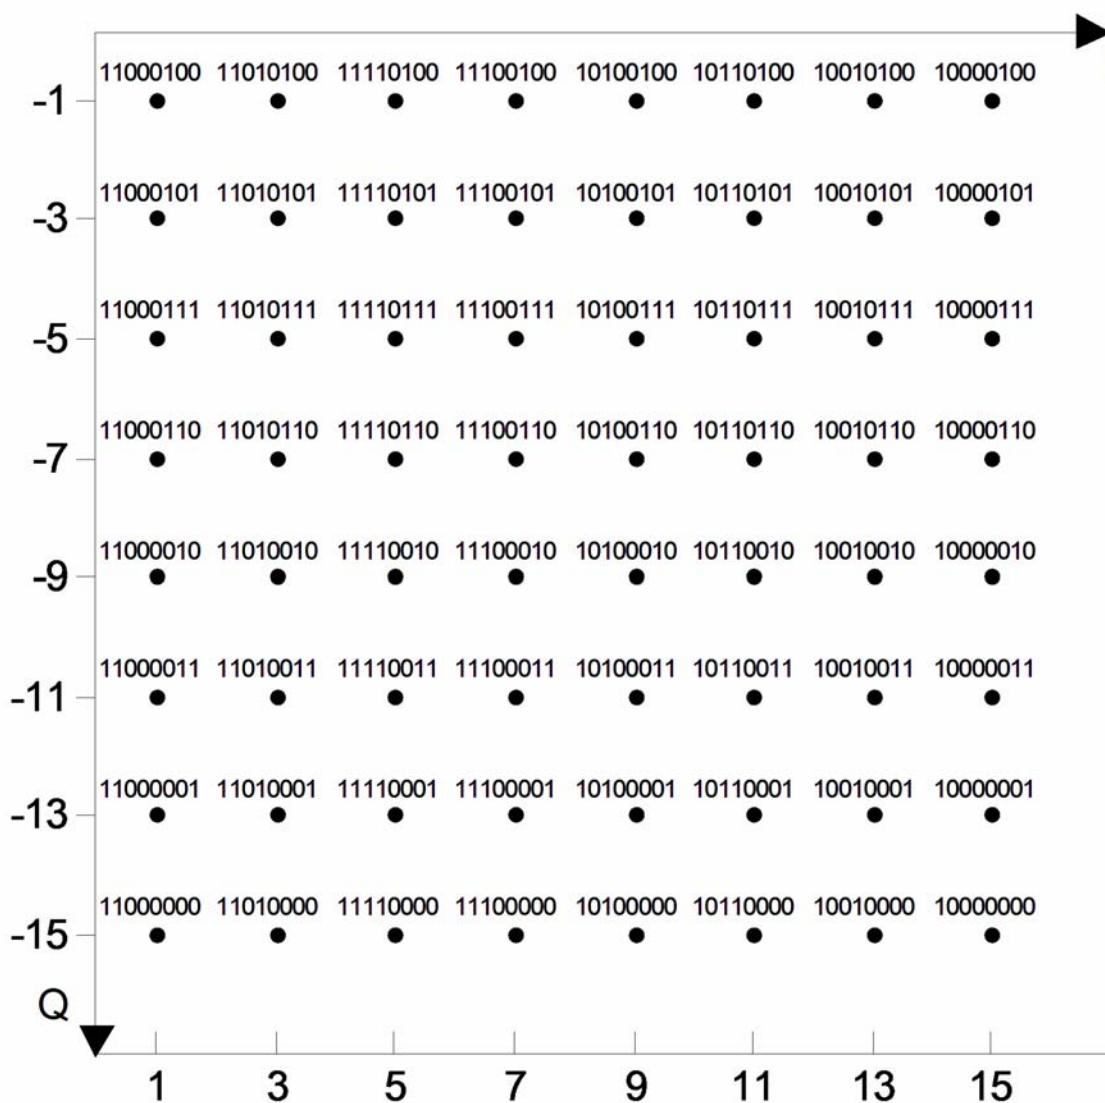

Figure 21-27—Constellation bit encoding for 256-QAM (4th quadrant)

$$d_{k, i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, } 80 \text{ MHz, and } 80+80 \text{ MHz}; \quad (21-84)$$

$$k = 0, 1, \dots, \frac{N_{SD}}{2} - 1 \text{ for } 160 \text{ MHz};$$

$$i = 1, \dots, N_{SS, u};$$

$$n = 0, 1, \dots, N_{SYM} - 1;$$

$$l = 0 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, and } 80 \text{ MHz;}$$

$$l = 0, 1 \text{ for } 160 \text{ MHz and } 80+80 \text{ MHz;}$$

$$u = 0, \dots, N_{user} - 1$$

The normalization factor, K_{MOD} , for 256-QAM is $1/\sqrt{170}$.

21.3.10.9.2 LDPC tone mapping

The LDPC tone mapping shall be performed on all LDPC encoded streams as described in this subclause and using an LDPC tone-mapping distance parameter D_{TM} . D_{TM} is constant for each bandwidth and its value for different bandwidths is given in Table 21-19. LDPC tone mapping shall not be performed on streams that are encoded using BCC.

Table 21-19—LDPC tone mapping distance for each bandwidth

| Parameter | 20 MHz | 40 MHz | 80 MHz | 160 MHz, 80+80 MHz |
|-----------|--------|--------|--------|-----------------------|
| D_{TM} | 4 | 6 | 9 | 9 |

For a VHT PPDU transmission, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers generated by the constellation mappers (see Equation (21-84)) to obtain

$$d''_{t(k), i, n, l, u} = d_{k, i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, } 80 \text{ MHz and } 80+80 \text{ MHz; } \quad (21-85)$$

$$k = 0, 1, \dots, \frac{N_{SD}}{2} - 1 \text{ for } 160 \text{ MHz;}$$

$$i = 1, \dots, N_{SS, u};$$

$$n = 0, 1, \dots, N_{SYM} - 1;$$

$$l = 0 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, and } 80 \text{ MHz;}$$

$$l = 0, 1 \text{ for } 160 \text{ MHz and } 80+80 \text{ MHz;}$$

$$u = 0, \dots, N_{user} - 1$$

where

$$t(k) = \begin{cases} D_{TM} \left(k \bmod \frac{N_{SD}}{D_{TM}} \right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor, & \text{for } 20 \text{ MHz, } 40 \text{ MHz, } 80 \text{ MHz, and } 80+80 \text{ MHz} \\ D_{TM} \left(k \bmod \frac{N_{SD}/2}{D_{TM}} \right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}/2} \right\rfloor, & \text{for } 160 \text{ MHz} \end{cases} \quad (21-86)$$

As a result of the LDPC tone mapping operation above, each two consecutively generated complex constellation numbers $d'_{k, i, n, l, u}$ and $d'_{k+1, i, n, l, u}$ will be transmitted on two data tones that are separated by at least $D_{TM} - 1$ other data tones. Note that the operation above is equivalent to block-interleaving the complex numbers $d'_{0, i, n, l, u}, \dots, d'_{N_{SD}-1, i, n, l, u}$ for each i, n , and u using a matrix with D_{TM} rows and N_{SD}/D_{TM} (for 20 MHz, 40 MHz, 80 MHz, or 80+80 MHz) or $\frac{N_{SD}}{2 \cdot D_{TM}}$ (for 160 MHz) columns, where $d'_{0, i, n, l, u}, \dots, d'_{N_{SD}-1, i, n, l, u}$ are written row-wise into the matrix, and $d''_{0, i, n, l, u}, \dots, d''_{N_{SD}-1, i, n, l, u}$ are read column-wise from the matrix.

NOTE—LDPC tone mapping is performed separately for the upper and lower 80 MHz segments of a 160 MHz of 80+80 MHz transmission as indicated by the frequency subblock index l in Equation (21-85) and Equation (21-86).

Since LDPC tone mapping is not performed on BCC-coded streams, for BCC-coded streams, the following applies:

$$d''_{k, i, n, l, u} = d'_{k, i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, } 80 \text{ MHz and } 80+80 \text{ MHz}; \quad (21-87)$$

$$k = 0, 1, \dots, \frac{N_{SD}}{2} - 1 \text{ for } 160 \text{ MHz};$$

$$i = 1, \dots, N_{SS, u};$$

$$n = 0, 1, \dots, N_{SYM} - 1;$$

$$l = 0 \text{ for } 20 \text{ MHz, } 40 \text{ MHz, and } 80 \text{ MHz};$$

$$l = 0, 1 \text{ for } 160 \text{ MHz and } 80+80 \text{ MHz};$$

$$u = 0, \dots, N_{user} - 1$$

21.3.10.9.3 Segment deparser

In a 160 MHz VHT PPDU transmission, the two frequency subblocks at the output of the LDPC tone mapper for LDPC or constellation mapper for BCC are combined into one frequency segment as shown in Equation (21-88).

$$d^{(i_{Seg})}_{k, l, n, u} = \begin{cases} d''_{k, i, n, 0, u}, & \text{if } 0 \leq k \leq \frac{N_{SD}}{2} - 1 \\ d''_{k - N_{SD}/2, i, n, 1, u}, & \text{if } \frac{N_{SD}}{2} \leq k \leq N_{SD} - 1 \end{cases}, \quad i_{Seg} = 0 \quad (21-88)$$

In a 20 MHz, 40 MHz, or 80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d_{k, i, n, u}^{(i_{\text{seg}})} = d''_{k, i, n, 0, u}, \quad 0 \leq k \leq N_{SD} - 1, \quad i_{\text{Seg}} = 0 \quad (21-89)$$

In an 80+80 MHz VHT PPDU transmission, the segment deparsing is not performed. Hence,

$$d_{k, i, n, u}^{(i_{\text{seg}})} = d''_{k, i, n, i_{\text{seg}}, u}, \quad 0 \leq k \leq N_{SD} - 1, \quad i_{\text{Seg}} = 0, 1 \quad (21-90)$$

NOTE—As per Table 21-7, $f_c^{(0)}$ (center frequency for frequency segment $i_{\text{Seg}}=0$) is always less than $f_c^{(1)}$ in case of 80+80 MHz VHT PPDU transmissions. Hence, $d''_{k, i, n, 0, u}$ (frequency subblock 0) is always transmitted in the frequency segment lower in frequency, while $d''_{k, i, n, 1, u}$ (frequency subblock 1) is always transmitted in the frequency segment higher in frequency.

21.3.10.9.4 Space-time block coding

This subclause defines a set of optional robust transmission techniques that are applicable only when using STBC coding for VHT SU PPDUs. In this case, $N_{SS,0}$ spatial streams are mapped to $N_{STS,0}$ space-time streams. These techniques are based on STBC. When the VHT-SIG-A STBC field is 1, a symbol operation shall occur between the constellation mapper and the spatial mapper as defined in this subclause. STBC shall not be applied in a VHT MU PPDU. Hence, the user subscript u is 0 in this subclause.

If STBC is applied, the stream of complex numbers, $d_{k, i, n, 0}^{(i_{\text{seg}})}$; $k = 0, \dots, N_{SD} - 1$; $i = 1, \dots, N_{SS,0}$; $n = 0, \dots, N_{SYM} - 1$, generated by the segment deparser, is the input to the STBC encoder, which produces as output the stream of complex numbers $\tilde{d}_{k, i_{STS}, n, 0}^{(i_{\text{seg}})}$; $k = 0, \dots, N_{SD} - 1$; $i_{STS} = 1, \dots, N_{STS,0}$; $n = 0, \dots, N_{SYM} - 1$. For given values of k and i , STBC processing operates on the complex modulation symbols in sequential pairs of OFDM symbols so that the value of $\tilde{d}_{k, 2i-1, 2m, 0}^{(i_{\text{seg}})}$ and $\tilde{d}_{k, 2i, 2m, 0}^{(i_{\text{seg}})}$ depend on $d_{k, i, 2m, 0}^{(i_{\text{seg}})}$ and $d_{k, i, 2m+1, 0}^{(i_{\text{seg}})}$. Also, $\tilde{d}_{k, 2i-1, 2m+1, 0}^{(i_{\text{seg}})}$ and $\tilde{d}_{k, 2i, 2m+1, 0}^{(i_{\text{seg}})}$ depend on $d_{k, i, 2m, 0}^{(i_{\text{seg}})}$ and $d_{k, i, 2m+1, 0}^{(i_{\text{seg}})}$. This is defined in Table 21-20. Note that the segment index i_{Seg} is omitted in Table 21-20 for simplicity.

Table 21-20—Constellation mapper output to spatial mapper input for STBC

| N_{STS} | N_{SS} | i_{STS} | $\tilde{d}_{k, i_{STS}, 2m, 0}^{(i_{\text{seg}})}$ | $\tilde{d}_{k, i_{STS}, 2m+1, 0}^{(i_{\text{seg}})}$ |
|-----------|----------|-----------|--|--|
| 2 | 1 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m+1, 0}$ |
| | | 2 | $-d_{k, 1, 2m+1, 0}$ | $d_{k, 1, 2m, 0}^*$ |
| 4 | 2 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m+1, 0}$ |
| | | 2 | $-d_{k, 1, 2m+1, 0}^*$ | $d_{k, 1, 2m, 0}^*$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m+1, 0}$ |
| | | 4 | $-d_{k, 2, 2m+1, 0}^*$ | $d_{k, 2, 2m, 0}^*$ |

Table 21-20—Constellation mapper output to spatial mapper input for STBC (continued)

| N_{STS} | N_{SS} | i_{STS} | $\tilde{d}_{k, i_{STS}, 2m, 0}$ | $\tilde{d}_{k, i_{STS}, 2m + 1, 0}$ |
|-----------|----------|-----------|---------------------------------|-------------------------------------|
| 6 | 3 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m + 1, 0}$ |
| | | 2 | $-d_{k, 1, 2m + 1, 0}^*$ | $d_{k, 1, 2m, 0}^*$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m + 1, 0}$ |
| | | 4 | $-d_{k, 2, 2m + 1, 0}^*$ | $d_{k, 2, 2m, 0}^*$ |
| | | 5 | $d_{k, 3, 2m, 0}$ | $d_{k, 3, 2m + 1, 0}$ |
| | | 6 | $-d_{k, 3, 2m + 1, 0}^*$ | $d_{k, 3, 2m, 0}^*$ |
| 8 | 4 | 1 | $d_{k, 1, 2m, 0}$ | $d_{k, 1, 2m + 1, 0}$ |
| | | 2 | $-d_{k, 1, 2m + 1, 0}^*$ | $d_{k, 1, 2m, 0}^*$ |
| | | 3 | $d_{k, 2, 2m, 0}$ | $d_{k, 2, 2m + 1, 0}$ |
| | | 4 | $-d_{k, 2, 2m + 1, 0}^*$ | $d_{k, 2, 2m, 0}^*$ |
| | | 5 | $d_{k, 3, 2m, 0}$ | $d_{k, 3, 2m + 1, 0}$ |
| | | 6 | $-d_{k, 3, 2m + 1, 0}^*$ | $d_{k, 3, 2m, 0}^*$ |
| | | 7 | $d_{k, 4, 2m, 0}$ | $d_{k, 4, 2m + 1, 0}$ |
| | | 8 | $-d_{k, 4, 2m + 1, 0}^*$ | $d_{k, 4, 2m, 0}^*$ |

If STBC is not applied, $\tilde{d}_{k, i, n, 0}^{(i_{Seg})} = d_{k, i, n, 0}^{(i_{Seg})}$ and $N_{STS, 0} = N_{SS, 0}$.

NOTE—When STBC is applied, an odd number of space-time streams is not allowed, and $N_{STS, 0} = 2N_{SS, 0}$.

21.3.10.10 Pilot subcarriers

In a 20 MHz transmission, four pilot tones shall be inserted in subcarriers $k \in \{-21, -7, 7, 21\}$. The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-91).

$$\begin{aligned} P_n^{\{-21, -7, 7, 21\}} &= \{\Psi_{1, n \bmod 4}^{(1)}, \Psi_{1, (n+1) \bmod 4}^{(1)}, \Psi_{1, (n+2) \bmod 4}^{(1)}, \Psi_{1, (n+3) \bmod 4}^{(1)}\} \\ P_n^k \notin \{-21, -7, 7, 21\} &= 0 \end{aligned} \quad (21-91)$$

where

$\Psi_{1, m}^{(1)}$ is given by the $N_{STS} = 1$ row of Table 19-19

In a 40 MHz transmission, six pilot tones shall be inserted in subcarriers $-53, -25, -11, 11, 25$, and 53 . The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-92).

$$\begin{aligned} P_n^{\{-53, -25, -11, 11, 25, 53\}} &= \{\Psi_{1,n}^{(1)}, \Psi_{1,(n+1)}^{(1)}, \dots, \Psi_{1,(n+5)}^{(1)}\} \\ P_n^k \notin \{-53, -25, -11, 11, 25, 53\} &= 0 \end{aligned} \quad (21-92)$$

where

$\Psi_{1,m}^{(1)}$ is given by the $N_{STS} = 1$ row of Table 19-20

In an 80 MHz transmission, eight pilot tones shall be inserted in subcarriers $-103, -75, -39, -11, 11, 39, 75$, and 103 . The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-93).

$$\begin{aligned} P_n^{\{-103, -75, -39, -11, 11, 39, 75, 103\}} &= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \dots, \Psi_{(n+7) \bmod 8}\} \\ P_n^k \notin \{-103, -75, -39, -11, 11, 39, 75, 103\} &= 0 \end{aligned} \quad (21-93)$$

where

Ψ_m is defined in Table 21-21

Table 21-21—Pilot values for 80 MHz transmission

| Ψ_0 | Ψ_1 | Ψ_2 | Ψ_3 | Ψ_4 | Ψ_5 | Ψ_6 | Ψ_7 |
|----------|----------|----------|----------|----------|----------|----------|----------|
| 1 | 1 | 1 | -1 | -1 | 1 | 1 | 1 |

In a 160 MHz transmission, the 80 MHz pilot mapping is replicated in the two 80 MHz subchannels of the 160 MHz transmission. Specifically, 16 pilot tones shall be inserted in subcarriers $-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203$, and 231 . The pilot mapping P_n^k for subcarrier k for symbol n shall be as specified in Equation (21-94).

$$\begin{aligned} P_n^{\{-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203, 231\}} &= \{\Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8}, \\ &\quad \Psi_{n \bmod 8}, \Psi_{(n+1) \bmod 8}, \Psi_{(n+2) \bmod 8}, \Psi_{(n+3) \bmod 8}, \Psi_{(n+4) \bmod 8}, \Psi_{(n+5) \bmod 8}, \Psi_{(n+6) \bmod 8}, \Psi_{(n+7) \bmod 8}\} \\ P_n^k \notin \{-231, -203, -167, -139, -117, -89, -53, -25, 25, 53, 89, 117, 139, 167, 203, 231\} &= 0 \end{aligned} \quad (21-94)$$

where

Ψ_m is given in Table 21-21

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz pilot tone allocation and values defined for 80 MHz transmission as specified in Equation (21-93) and Table 21-21.

The above pilot mapping shall be copied to all space-time streams before the space-time stream cyclic shifts are applied.

21.3.10.11 OFDM modulation

21.3.10.11.1 Transmission in VHT format

The time domain waveform of the Data field of a VHT PPDU from frequency segment i_{Seg} and transmit chain i_{TX} , $1 \leq i_{TX} \leq N_{TX}$ shall be as defined in Equation (21-95).

$$r_{\text{VHT-Data}}^{(i_{\text{Seg}}, i_{\text{Tx}})}(t) = \frac{1}{\sqrt{N_{\text{VHT-Data}}^{\text{Tone}} N_{\text{STS, total}}}} \sum_{n=0}^{N_{\text{SYM}}-1} w_{T_{\text{SYM}}}(t - n T_{\text{SYM}}) \\ \cdot \sum_{k=-N_{\text{SR}}}^{N_{\text{SR}}} \sum_{u=0}^{N_{\text{user}}-1} \sum_{m=1}^{N_{\text{STS}, u}} \left(\left[Q_k^{(i_{\text{Seg}})} \right]_{i_{\text{Tx}}, (M_u + m)} \Upsilon_{k, \text{BW}}(\tilde{D}_{k, m, n, \text{BW}}^{(i_{\text{Seg}}, u)} + p_{n+4} P_n^k) \right. \\ \left. \cdot \exp(j2\pi k \Delta_F(t - n T_{\text{SYM}} - T_{\text{GI, Data}} - T_{\text{CS,VHT}}(M_u + m))) \right) \quad (21-95)$$

where

p_n is defined in 17.3.5.10

P_n^k is defined in 21.3.10.10

$\Upsilon_{k, \text{BW}}$ is defined in Equation (21-14), Equation (21-15), Equation (21-16), and Equation (21-17)

$\tilde{D}_{k, m, n, \text{BW}}^{(i_{\text{Seg}}, u)}$ is the transmitted constellation for user u at subcarrier k , space-time stream m , and Data field OFDM symbol n and is defined in Equation (21-96) through Equation (21-99)

$N_{\text{VHT-Data}}^{\text{Tone}}$ has the value given in Table 21-8

$T_{\text{CS,VHT}}(n)$ is given in Table 21-11

$T_{\text{GI, Data}}$ is the guard interval duration. $T_{\text{GI, Data}} = T_{\text{GI}}$ when not using the short guard interval (Short GI field of VHT-SIG-A2 is 0) and $T_{\text{GI, Data}} = T_{\text{GIS}}$ when using the short guard interval (Short GI field of VHT-SIG-A2 is 1). T_{GI} and T_{GIS} are given in Table 21-5.

In a 20 MHz VHT transmission,

$$\tilde{D}_{k, m, n, 20}^{(i_{\text{Seg}}, u)} = \begin{cases} 0, k = 0, \pm 7, \pm 21 \\ \tilde{d}_{M_{20}^r(k), m, n, u}^{(i_{\text{Seg}})}, \text{ otherwise} \end{cases} \quad (21-96)$$

where

$M_{20}^r(k)$ is defined in Equation (21-49)

In a 40 MHz VHT transmission,

$$\tilde{D}_{k, m, n, 40}^{(i_{\text{Seg}}, u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 25, \pm 53 \\ \tilde{d}_{M_{40}^r(k), m, n, u}^{(i_{\text{Seg}})}, \text{ otherwise} \end{cases} \quad (21-97)$$

where

$M_{40}^r(k)$ is defined in Equation (21-51)

In an 80 MHz transmission,

$$\tilde{D}_{k, m, n, 80}^{(i_{\text{seg}}, u)} = \begin{cases} 0, k = 0, \pm 1, \pm 11, \pm 39, \pm 75, \pm 103 \\ \tilde{d}_{M_{80}(k), m, n, u}^{(i_{\text{seg}})}, \text{ otherwise} \end{cases} \quad (21-98)$$

where

$M_{80}^r(k)$ is defined in Equation (21-53)

In a 160 MHz transmission,

$$\tilde{D}_{k, m, n, 160}^{(i_{\text{seg}}, u)} = \begin{cases} 0, k = 0, \pm 1, \pm 2, \pm 3, \pm 4, \pm 5, \pm 25, \pm 53, \pm 89, \pm 117, \pm 127, \pm 128, \pm 129, \pm 139, \pm 167, \pm 203, \pm 231 \\ \tilde{d}_{M_{160}(k), m, n, u}^{(i_{\text{seg}})}, \text{ otherwise} \end{cases} \quad (21-99)$$

where

$M_{160}^r(k)$ is defined in Equation (21-55)

In an 80+80 MHz transmission, each frequency segment shall follow the 80 MHz VHT subcarrier mapping as specified in Equation (21-98) and Equation (21-53).

$Q_k^{(i_{\text{seg}})}$ is a spatial mapping/steering matrix with N_{TX} rows and $N_{STS,\text{total}}$ columns for subcarrier k in frequency segment i_{Seg} . $Q_k^{(i_{\text{seg}})}$ may be frequency dependent. Refer to the examples of Q_k listed in 19.3.11.11.2 for examples of $Q_k^{(i_{\text{seg}})}$ that could be used for VHT SU PPDUs. Note that implementations are not restricted to the spatial mapping matrix examples listed in 19.3.11.11.2 and the number of transmit chains N_{TX} could be greater than 4. For VHT SU PPDUs to which beamforming is applied, $Q_k^{(i_{\text{seg}})}$ is a beamforming steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. For VHT MU PPDUs, $Q_k^{(i_{\text{seg}})}$ is the DL-MU-MIMO steering matrix and is derived from the TXVECTOR parameter EXPANSION_MAT. The beamforming steering matrices and DL-MU-MIMO steering matrices are implementation specific.

21.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU is a non-HT duplicate. Non-HT duplicate transmission is used to transmit to non-HT OFDM STAs, HT STAs, or VHT STAs that may be present in a part of a 40 MHz, 80 MHz, or 160 MHz channel (see Table 21-2). The VHT-SIG-A, VHT-STF, VHT-LTF, and VHT-SIG-B fields are not transmitted. The L-STF, L-LTF, and L-SIG fields shall be transmitted in the same way as in the VHT transmission, with the exceptions for the Rate and Length fields which shall follow 17.3.4.

In a 40 MHz non-HT duplicate transmission, the Data field shall be as defined by Equation (19-61).

For 80 MHz and 160 MHz non-HT duplicate transmissions, the Data field shall be as defined by Equation (21-100).

$$r_{\text{non-HT}, BW}^{i_{TX}}(t) = \frac{1}{\sqrt{N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}}} \sum_{n=0}^{N_{SYM}-1} w_{T_{SYM}}(t - nT_{SYM}) \\ \cdot \sum_{i_{BW}=0}^{N_{20\text{MHz}}-1} \left(\sum_{k=-26}^{26} \Upsilon_{(k-K_{\text{Shift}}(i_{BW})), BW}(D_{k,n} + p_{n+1}P_k) \right. \\ \left. \cdot \exp(j2\pi(k-K_{\text{Shift}}(i_{BW}))\Delta_F(t - nT_{SYM} - T_{GI} - T_{CS}^{i_{TX}})) \right) \quad (21-100)$$

where

$N_{20\text{MHz}}$ and $K_{\text{Shift}}(i)$ are defined in 21.3.8.2.4

P_k and p_n are defined in 17.3.5.10

$D_{k,n}$ is defined in Equation (21-26)

$\Upsilon_{k, BW}$ is defined in Equation (21-16) and Equation (21-17)

$T_{CS}^{i_{TX}}$ represents the cyclic shift for transmitter chain i_{TX} with a value given in Table 21-10

$N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$ has the value given in Table 21-8

In an 80+80 MHz non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for an 80 MHz non-HT duplicate transmission in Equation (21-100).

21.3.11 SU-MIMO and DL-MU-MIMO Beamforming

21.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming are techniques used by a STA with multiple antennas (the beamformer) to steer signals using knowledge of the channel to improve throughput. With SU-MIMO beamforming all space-time streams in the transmitted signal are intended for reception at a single STA. With DL-MU-MIMO beamforming, disjoint subsets of the space-time streams are intended for reception at different STAs.

For SU-MIMO beamforming, the steering matrix Q_k can be determined from the beamforming feedback matrix V_k that is sent back to the beamformer by the beamformee using the compressed beamforming feedback matrix format as defined in 19.3.12.3.6. The feedback report format is described in 9.4.1.49.

For DL-MU-MIMO beamforming, the receive signal vector in subcarrier k at beamformee u , $\mathbf{y}_{k,u} = [y_{k,0}, y_{k,1}, \dots, y_{k,N_{RX_u}-1}]^T$, is shown in Equation (21-101), where $\mathbf{x}_k = [\mathbf{x}_{k,0}^T, \mathbf{x}_{k,1}^T, \dots, \mathbf{x}_{k,N_{user}-1}^T]^T$ denotes the transmit signal vector in subcarrier k for all N_{user} beamformees, with $\mathbf{x}_{k,u} = [x_{k,0}, x_{k,1}, \dots, x_{k,N_{STS,u}-1}]^T$ being the transmit signal for beamformee u .

$$\mathbf{y}_{k,u} = \mathbf{H}_{k,u} \times [Q_{k,0}, Q_{k,1}, \dots, Q_{k,N_{user}-1}] \times \mathbf{x}_k + \mathbf{n} \quad (21-101)$$

where

$\mathbf{H}_{k,u}$ is the channel matrix from the beamformer to beamformee u in subcarrier k with dimensions $N_{RX_u} \times N_{TX}$

- N_{RX_u} is the number of receive antennas at beamformee u
- $Q_{k,u}$ is a steering matrix for beamformee u in subcarrier k with dimensions $N_{TX} \times N_{STS_u}$
- N_{user} is the number of VHT MU PPDUs recipients (see Table 21-6)
- n is a vector of additive noise and may include interference

The DL-MU-MIMO steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \dots, Q_{k,N_{user}-1}]$ can be determined by the beamformer using the beamforming feedback matrices for subcarrier k from beamformee u , $V_{k,u}$, and SNR information for subcarrier k from beamformee u , $SNR_{k,u}$, where $u = 0, 1, \dots, N_{user} - 1$. The steering matrix that is computed (or updated) using new beamforming feedback matrices and new SNR information from some or all of participating beamformees might replace the existing steering matrix Q_k for the next DL-MU-MIMO data transmission. The beamformee group for the MU transmission is signaled using the Group ID field in VHT-SIG-A (see 21.3.8.3.3 and 21.3.11.4).

21.3.11.2 Beamforming Feedback Matrix V

Upon receipt of a VHT NDP sounding PPDU, the beamformee shall remove the space-time stream CSD in Table 21-11 from the measured channel before computing a set of matrices for feedback to the beamformer. The beamforming feedback matrix, $V_{k,u}$, found by the beamformee u for subcarrier k shall be compressed in the form of angles using the method described in 19.3.12.3.6. The angles, $\phi(k,u)$ and $\psi(k,u)$, are quantized according to Table 9-68. The number of bits for quantization is chosen by the beamformee, based on the indication from the beamformer as to whether the feedback is requested for SU-MIMO beamforming or DL-MU-MIMO beamforming. The compressed beamforming feedback using 19.3.12.3.6 is the only Clause 21 beamforming feedback format defined.

The beamformee shall generate the beamforming feedback matrices with the number of rows (N_r) equal to the N_{STS} of the NDP.

After receiving the angle information, $\phi(k,u)$ and $\psi(k,u)$, the beamformer reconstructs $V_{k,u}$ using Equation (19-79). For SU-MIMO beamforming, the beamformer can use this $V_{k,0}$ matrix to determine the steering matrix Q_k . For DL-MU-MIMO beamforming, the beamformer may calculate a steering matrix $Q_k = [Q_{k,0}, Q_{k,1}, \dots, Q_{k,N_{user}-1}]$ using $V_{k,u}$ and $SNR_{k,u}$ ($0 \leq u \leq N_{user} - 1$) in order to suppress crosstalk between participating beamformees. The method used by the beamformer to calculate the steering matrix Q_k is implementation specific.

The beamformee decides the tone grouping value to be used in the beamforming feedback matrix V . A beamformer shall support all tone grouping values and Codebook Information values.

21.3.11.3 Maximum Number of Total Spatial Streams in VHT MU PPDUs

An MU beamformee capable STA shall support reception of VHT MU PPDUs with the total number of space-time streams across the N_{user} users being less than or equal to the value indicated in the Maximum $N_{STS,total}$ subfield of the Supported VHT-MCS and NSS Set field of the VHT Capabilities element.

21.3.11.4 Group ID

A value in the Group ID field in VHT-SIG-A (see 21.3.8.3.3) in the range 1 to 62 indicates a VHT MU PPDU. Prior to transmitting a VHT MU PPDU, group assignments have been established by the AP for DL-MU-MIMO capable STAs using the Group ID Management frame as defined in 9.6.23.3.

After the PHY is configured using the PHYCONFIG_VECTOR parameter GROUP_ID_MANAGEMENT, the following lookup tables are populated:

- a) Group ID to Membership Status, denoted by MembershipStatusInGroupID[g] for $1 \leq g \leq 62$
- b) Group ID to User Position, denoted by UserPositionInGroupID[g] for $1 \leq g \leq 62$

When a STA receives a VHT MU PPDU where the Group ID field in VHT-SIG-A has the value k and where MembershipStatusInGroupID[k] is equal to 1, then the number of space-time streams for that STA is indicated in the MU[UserPositionInGroupID[k]] NSTS field in VHT-SIG-A. The space-time streams of different users are ordered in accordance to user position values, i.e., the space-time streams for the user in user position 0 come first, followed by the space-time streams for the user in position 1, followed by the space-time streams for the user in position 2, and followed by the space-time streams for the user in position 3.

A STA is also able to identify the space-time streams intended for other STAs that act as interference. VHT-LTF symbols in the VHT MU PPDU are used to measure the channel for the space-time streams intended for the STA and can also be used to measure the channel for the interfering space-time streams. To successfully demodulate the space-time streams intended for the STA, the STA may use the channel state information for all space-time streams to reduce the effect of interfering space-time streams.

If a STA finds that it is not a member of the group, or the STA is a member of the group but the corresponding MU NSTS field in VHT-SIG-A indicates that there are zero space-time streams for the STA in the PPDU, then the STA may elect to not process the remainder of the PPDU.

21.3.12 VHT preamble format for sounding PPDUs

NDP is the only VHT sounding format.

The format of a VHT NDP PPDU is shown in Figure 21-28.

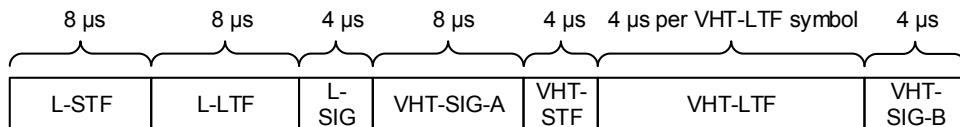

Figure 21-28—VHT NDP format

NOTE—The number of VHT-LTF symbols in the NDP is determined by the SU NSTS field in VHT-SIG-A.

The VHT NDP PPDU has the following properties:

- Uses the VHT PPDU format but without the Data field.
- Is a VHT SU PPDU as indicated by the VHT-SIG-A field.
- Has the data bits of the VHT-SIG-B field set to a fixed bit pattern (see 21.3.8.3.6).

21.3.13 Regulatory requirements

Wireless LANs (WLANS) implemented in accordance with this standard are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The PHY specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regulations are subject to revision or may be superseded. Requirements that are subject to local geographic regulations are annotated within the PHY specification. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Annex D for further information. Operation in

countries within defined regulatory domains might be subject to additional or alternative national regulations.

21.3.14 Channelization

A VHT channel is specified by the four PLME MIB fields specified in Table 21-22.

Table 21-22—Fields to specify VHT channels

| Field | Meaning |
|--|--|
| dot11CurrentChannelWidth | Channel width. Possible values represent 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channels. |
| dot11CurrentChannelCenterFrequencyIndex0 | For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, denotes the channel center frequency. For an 80+80 MHz channel, denotes the center frequency of the frequency segment 0, which is the frequency segment containing the primary channel. Valid range is 1 to 200. See Equation (21-102). |
| dot11CurrentChannelCenterFrequencyIndex1 | For an 80+80 MHz channel, denotes the center frequency of the frequency segment 1, which is the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (21-102). For a 20 MHz, 40 MHz, 80 MHz, or 160 MHz channel, set to 0. |
| dot11CurrentPrimaryChannel | Denotes the location of the primary 20 MHz channel. Valid range is 1 to 200. See Equation (21-103). |

Given dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1, the respective center frequency is given by Equation (21-102).

$$\begin{aligned} \text{Channel center frequency [MHz]} \\ = \text{Channel starting frequency} + 5 \times \text{dot11CurrentChannelCenterFrequencyIndex} \end{aligned} \quad (21-102)$$

where

Channel starting frequency is given by the operating class (Annex E)
 dot11CurrentChannelCenterFrequencyIndex is either dot11CurrentChannelCenterFrequencyIndex0 or dot11CurrentChannelCenterFrequencyIndex1

The center frequency of the primary 20 MHz channel is given by Equation (21-103).

$$\begin{aligned} \text{Primary 20 MHz channel center frequency [MHz]} \\ = \text{Channel starting frequency} + 5 \times \text{dot11CurrentPrimaryChannel} \end{aligned} \quad (21-103)$$

The channel starting frequency is defined as $\text{dot11ChannelStartingFactor} \times 500 \text{ kHz}$. If a channel center frequency is 5.000 GHz, it shall be indicated by $\text{dot11ChannelStartingFactor} = 8000$ and $\text{dot11CurrentPrimaryChannel} = 200$.

For an 80+80 MHz channel, any two channels that would each be allowed as 80 MHz channels and whose center frequencies are separated by greater than 80 MHz (difference between dot11CurrentChannelCenterFrequencyIndex0 and dot11CurrentChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 80 MHz) may be used.

For example, a channel specified by

```
channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 42
dot11CurrentPrimaryChannel = 36
```

is an 80 MHz channel with a center frequency of 5210 MHz and the primary 20 MHz channel centered at 5180 MHz.

A channel specified by

```
channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 160 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 50
dot11CurrentPrimaryChannel = 56
```

is a 160 MHz channel with a center frequency of 5250 MHz and the primary 20 MHz channel centered at 5280 MHz.

A channel specified by

```
channel starting frequency = 5000 MHz
dot11CurrentChannelWidth = 80+80 MHz
dot11CurrentChannelCenterFrequencyIndex0 = 155
dot11CurrentChannelCenterFrequencyIndex1 = 106
dot11CurrentPrimaryChannel = 161
```

is an 80+80 MHz channel in which frequency segment 0 has 80 MHz bandwidth and center frequency of 5775 MHz. Frequency segment 1 also has 80 MHz bandwidth and center frequency of 5530 MHz. The primary 20 MHz channel is centered at 5805 MHz.

21.3.15 Slot time

The slot time for the VHT PHY shall be 9 μ s for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz channel spacing.

21.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7.

21.3.17 VHT transmit specification

21.3.17.1 Transmit spectrum mask

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements and the mask defined in this subclause.

NOTE 2—Transmit spectral mask figures in this subclause are not drawn to scale.

NOTE 3—For rules regarding TX center frequency leakage levels, see 21.3.17.4.2. The spectral mask requirements in this subclause do not apply to the RF LO.

For a 20 MHz mask PPDU of non-HT, HT or VHT format, the interim transmit spectral mask shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth of 18 MHz, -20 dB_r at 11 MHz frequency offset, -28 dB_r at 20 MHz frequency offset, and -40 dB_r at 30 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 9 and 11 MHz, 11 and 20 MHz, and 20 and 30 MHz shall be linearly interpolated in dB domain from the requirements for 9 MHz, 11 MHz, 20 MHz, and 30 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the

interim transmit spectral mask and -53 dBm/MHz at any frequency offset. Figure 21-29 shows an example of the resulting overall spectral mask when the -40 dB spectrum level is above -53 dBm/MHz.

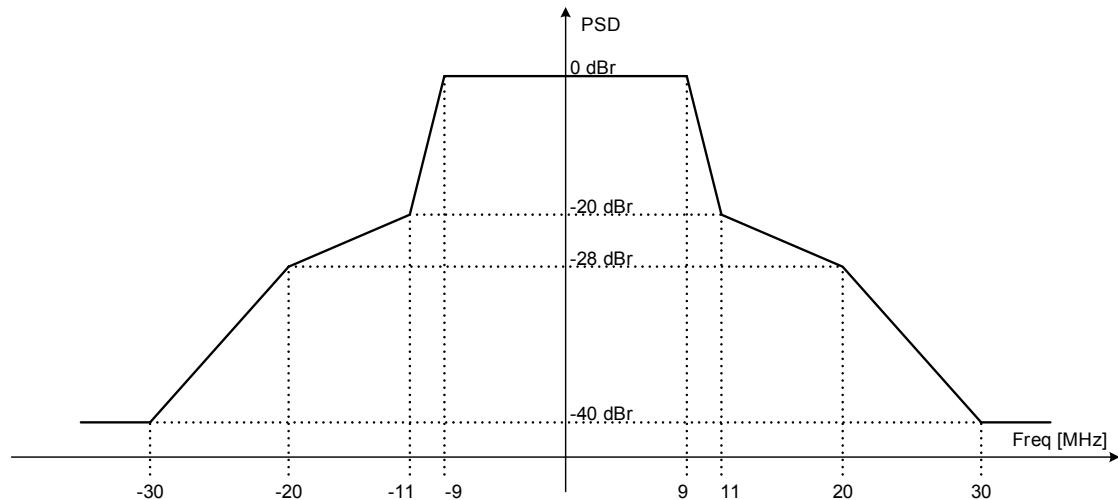

Figure 21-29—Example transmit spectral mask for 20 MHz mask PPDU

For a 40 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, -20 dB_r at 21 MHz frequency offset, -28 dB_r at 40 MHz frequency offset, and -40 dB_r at 60 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 19 and 21 MHz, 21 and 40 MHz, and 40 and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectral mask and -56 dBm/MHz at any frequency offset greater than 19 MHz. Figure 21-30 shows an example of the resulting overall spectral mask when the -40 dB spectrum level is above -56 dBm/MHz.

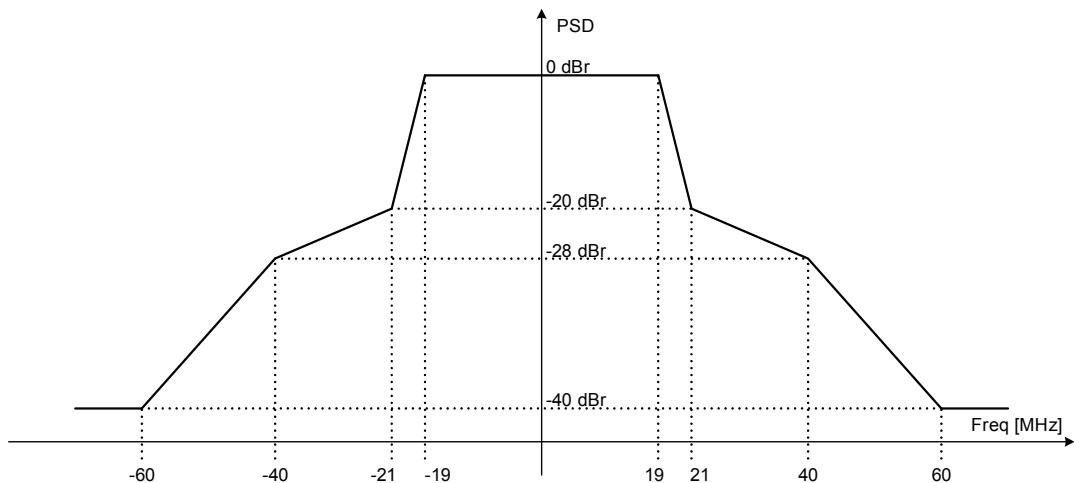

Figure 21-30—Example transmit spectral mask for 40 MHz mask PPDU

For an 80 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth of 78 MHz, -20 dB_r at 41 MHz frequency offset, -28 dB_r at 80 MHz frequency offset, and -40 dB_r at

120 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 39 and 41 MHz, 41 and 80 MHz, and 80 and 120 MHz shall be linearly interpolated in dB domain from the requirements for 39 MHz, 41 MHz, 80 MHz, and 120 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and -59 dBm/MHz at any frequency offset. Figure 21-31 shows an example of the resulting overall spectral mask when the -40 dB_r spectrum level is above -59 dBm/MHz.

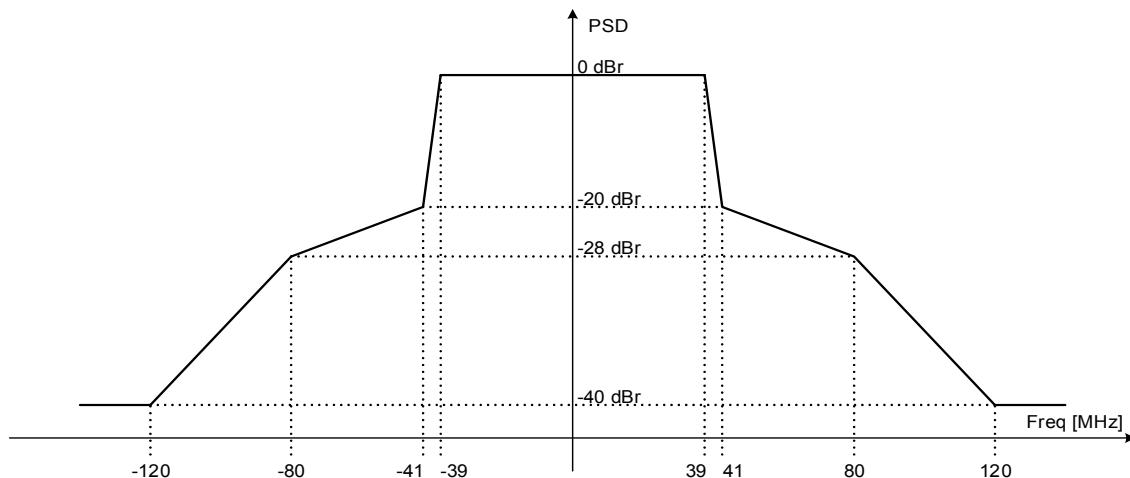

Figure 21-31—Example transmit spectral mask for 80 MHz mask PPDU

For a 160 MHz mask PPDU of non-HT, non-HT duplicate, HT or VHT format, the interim transmit spectral mask shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth of 158 MHz, -20 dB_r at 81 MHz frequency offset, -28 dB_r at 160 MHz frequency offset, and -40 dB_r at 240 MHz frequency offset and above. The interim transmit spectral mask for frequency offsets in between 79 and 81 MHz, 81 and 160 MHz, and 160 and 240 MHz shall be linearly interpolated in dB domain from the requirements for 79 MHz, 81 MHz, 160 MHz, and 240 MHz frequency offsets. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and -59 dBm/MHz at any frequency offset. Figure 21-32 shows an example of the resulting overall spectral mask when the -40 dB_r spectrum level is above -59 dBm/MHz.

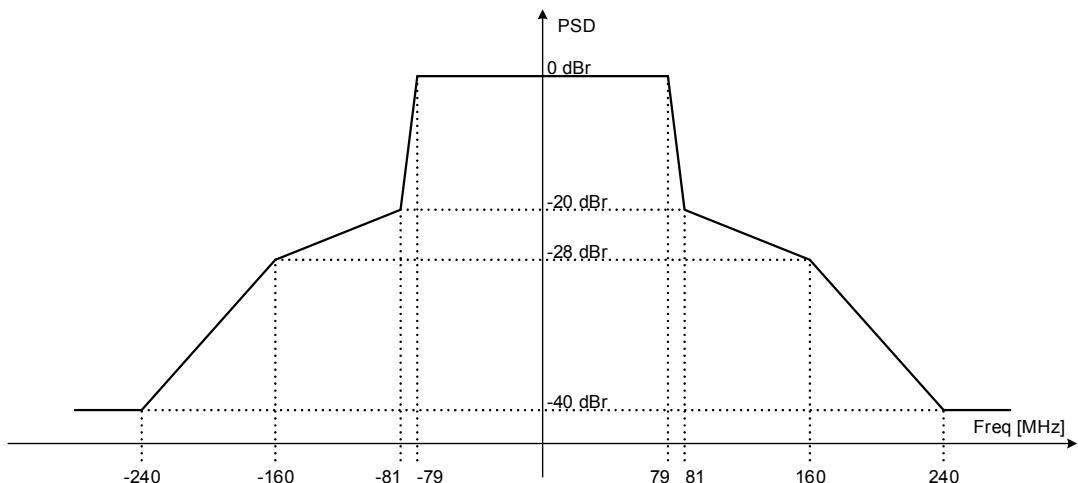

Figure 21-32—Example transmit spectral mask for 160 MHz mask PPDU

For an 80+80 MHz mask PPDU of non-HT duplicate or VHT format, the overall transmit spectral mask is constructed in the following manner. First, the 80 MHz interim spectral mask is placed on each of the two 80 MHz segments. Then, for each frequency at which both of the 80 MHz interim spectral masks have values greater than -40 dBr and less than -20 dBr, the sum of the two interim mask values (summed in linear domain) shall be taken as the overall spectral mask value. Next, for each frequency at which neither of the two 80 MHz interim masks have values greater than or equal to -20 dBr and less than or equal to 0 dBr, the higher value of the two interim masks shall be taken as the overall interim spectral value. Finally, for any frequency region where the mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the interim spectral mask value defined shall be used to define the interim spectral mask value. The transmit spectrum shall not exceed the maximum of the interim transmit spectrum mask and -59 dBm/MHz at any frequency offset. Figure 21-33 shows an example of a transmit spectral mask for a noncontiguous transmission using two 80 MHz channels where the center frequency of the two 80 MHz channels are separated by 160 MHz and the -40 dBr spectrum level is above -59 dBm/MHz.

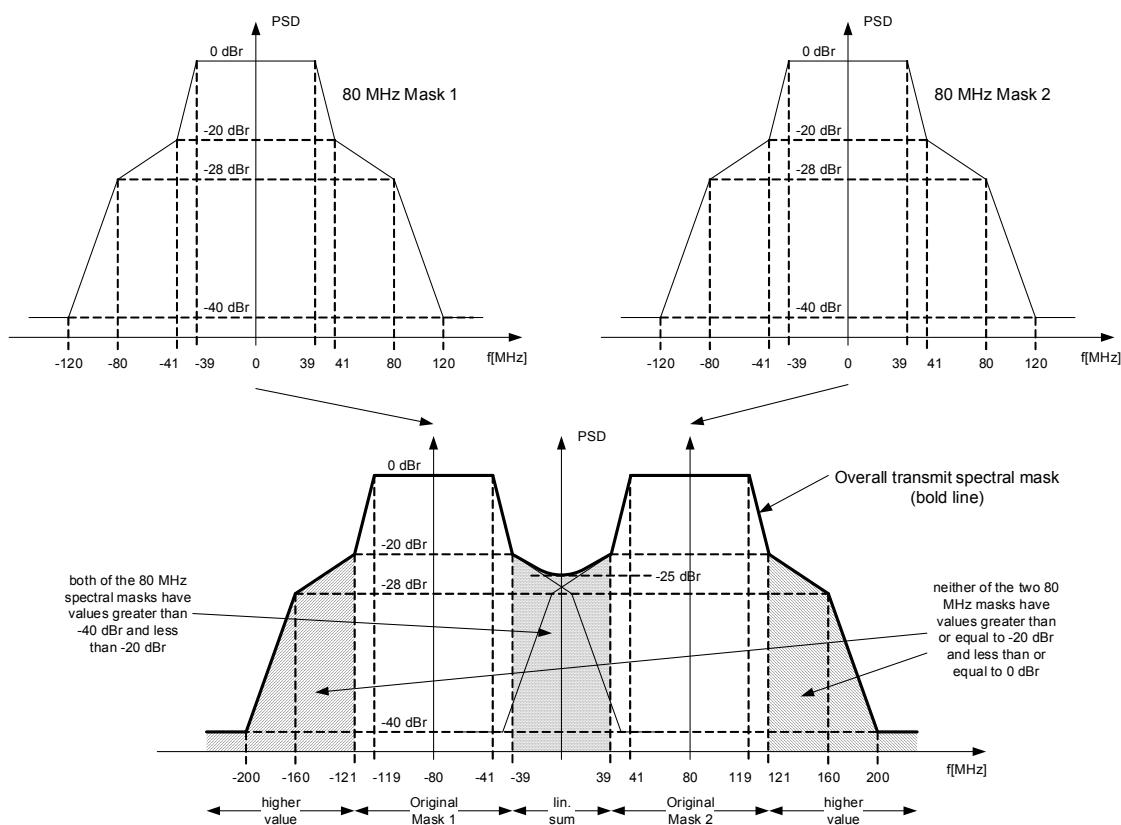

Figure 21-33—Example transmit spectral mask for 80+80 MHz mask PPDU

Different center frequency separation between the two 80 MHz frequency segments of the spectral mask as well as different peak levels of each 80 MHz frequency segment of the spectral mask are possible, in which case a similar procedure in determining the spectral mask as in Figure 21-33 is followed.

The transmit spectral mask for noncontiguous transmissions using two nonadjacent 80 MHz channels is applicable only in regulatory domains that allow for such transmissions.

Measurements shall be made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

21.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. Demodulate the PPDUs according to the following (or equivalent) procedure:

- a) Start of PPDU shall be detected.
- b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
- c) Coarse and fine frequency offsets shall be estimated.
- d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
- e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
- f) For each of the data OFDM symbols: transform the symbol into subcarrier received values.

The spectral flatness test shall be performed over at least 20 PPDUs. The PPDUs under test shall be at least 16 data OFDM symbols long.

Evaluate spectral flatness using the subcarrier received values or the magnitude of the channel estimation.

Let $E_{i,\text{avg}}$ denote the magnitude of the channel estimation on subcarrier i or the average constellation energy of a BPSK modulated subcarrier i in a VHT data symbol.

In a contiguous non-HT duplicate or VHT transmission having a bandwidth listed in Table 21-23, $E_{i,\text{avg}}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 21-23 from the average of $E_{i,\text{avg}}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\text{avg}}$ is done in the linear domain.

Table 21-23—Maximum transmit spectral flatness deviations

| Format | Bandwidth of transmission (MHz) | Averaging subcarrier indices (inclusive) | Tested subcarrier indices (inclusive) | Maximum deviation (dB) |
|--------|---------------------------------|--|--|------------------------|
| VHT | 20 | −16 to −1 and +1 to +16 | −16 to −1 and +1 to +16 | ±4 |
| | | | −28 to −17 and +17 to +28 | +4/−6 |
| | 40 | −42 to −2 and +2 to +42 | −42 to −2 and +2 to +42 | ±4 |
| | | | −58 to −43 and +43 to +58 | +4/−6 |
| | 80 | −84 to −2 and +2 to +84 | −84 to −2 and +2 to +84 | ±4 |
| | | | −122 to −85 and +85 to +122 | +4/−6 |
| | 160 | −172 to −130, −126 to −44, +44 to +126, and +130 to +172 | −172 to −130, −126 to −44, +44 to +126, and +130 to +172 | ±4 |
| | | | −250 to −173, −43 to −6, +6 to +43, and +173 to +250 | +4/−6 |

Table 21-23—Maximum transmit spectral flatness deviations (continued)

| Format | Bandwidth of transmission (MHz) | Averaging subcarrier indices (inclusive) | Tested subcarrier indices (inclusive) | Maximum deviation (dB) |
|---------------------|---------------------------------|--|--|------------------------|
| non-HT duplicate | 40 | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | –42 to –33, –31 to –6, +6 to +31, and +33 to +42 | ±4 |
| | | | –43 to –58 and +43 to +58 | +4/–6 |
| | 80 | –84 to –70, –58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84 | –84 to –70, –58 to –33, –31 to –6, +6 to +31, +33 to +58, +70 to +84 | ±4 |
| | | | –122 to –97, –95 to –85 and +85 to +95, +97 to +122 | +4/–6 |
| | 160 | –172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172 | –172 to –161, –159 to –134, –122 to –97, –95 to –70, –58 to –44, +44 to +58, +70 to +95, +97 to +122, +134 to +159, +161 to +172 | ±4 |
| | | | –250 to –225, –223 to –198, –186 to –173, –43 to –33, –31 to –6, +6 to +31, +33 to +43, +173 to +186, +198 to +223, +225 to +250 | +4/–6 |

In an 80+80 MHz transmission, each segment shall meet the spectral flatness requirement for an 80 MHz transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 21.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz transmissions.

21.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The symbol clock frequency and transmit center frequency tolerance shall be ±20 ppm maximum. The transmit center frequency and the symbol clock frequency for all transmit antennas and frequency segments shall be derived from the same reference oscillator. Transmit signals with TXVECTOR parameter CH_BANDWIDTH set to CBW160 or CBW80+80 may be generated using two separate RF LOs, one for each of the lower and upper 80 MHz frequency portions.

NOTE—The signal phase of the two 80 MHz frequency portions might not be correlated.

21.3.17.4 Modulation accuracy

21.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are described in 21.3.17.4.2 and 21.3.17.4.3. The test method is described in 21.3.17.4.4.

21.3.17.4.2 Transmit center frequency leakage

TX LO leakage shall meet the following requirements for all formats and bandwidths except 80+80 MHz where the RF LO falls outside both frequency segments:

- When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW 312.5 kHz shall not exceed the average power per-subcarrier of the transmitted PPDU, or equivalently, $(P - 10\log_{10}(N_{ST}))$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5.
- When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW 312.5 kHz shall not exceed the maximum of -32 dB relative to the total transmit power and -20 dBm, or equivalently $\max(P - 32, -20)$, where P is the transmit power per antenna in dBm, and N_{ST} is defined in Table 21-5.

For an 80+80 MHz transmission where the RF LO falls outside both frequency segments, the RF LO shall follow the spectral mask requirements as defined in 21.3.17.1.

The transmit center frequency leakage is specified per antenna.

21.3.17.4.3 Transmitter constellation error

The relative constellation RMS error, calculated by first averaging over subcarriers, frequency segments, VHT PPDUs, and spatial streams (see Equation (19-89)) shall not exceed a data-rate dependent value according to Table 21-24. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized testing instrumentation input ports. In the test, $N_{SS} = N_{STS}$ (no STBC) shall be used. Each output port of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation. The requirements apply to 20 MHz, 40 MHz, 80 MHz, and 160 MHz contiguous transmissions as well as 80+80 MHz noncontiguous transmissions.

Table 21-24—Allowed relative constellation error versus constellation size and coding rate

| Modulation | Coding rate | Relative constellation error (dB) |
|------------|-------------|-----------------------------------|
| BPSK | 1/2 | -5 |
| QPSK | 1/2 | -10 |
| QPSK | 3/4 | -13 |
| 16-QAM | 1/2 | -16 |
| 16-QAM | 3/4 | -19 |
| 64-QAM | 2/3 | -22 |
| 64-QAM | 3/4 | -25 |
| 64-QAM | 5/6 | -27 |
| 256-QAM | 3/4 | -30 |
| 256-QAM | 5/6 | -32 |

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to each 20 MHz subchannel.

21.3.17.4.4 Transmitter modulation accuracy (EVM) test

The transmit modulation accuracy test shall be performed by instrumentation capable of converting the transmitted signals into a stream of complex samples at sampling rate greater than or equal to the bandwidth of the signal being transmitted; except that

- For non-HT duplicate transmissions, each 20 MHz subchannel may be tested independently while all subchannels are being transmitted and
- For noncontiguous transmissions, each frequency segment may be tested independently while both segments are being transmitted.

In this case, transmit modulation accuracy of each segment shall meet the required value in Table 21-24 using only the subcarriers within the corresponding segment.

The instrument shall have sufficient accuracy in terms of I/Q arm amplitude and phase balance, DC offsets, phase noise, and analog to digital quantization noise. A possible embodiment of such a setup is converting the signals to a low IF frequency with a microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal shall be processed in a manner similar to an actual receiver, according to the following steps, or equivalent procedure:

- a) Start of PPDU shall be detected.
- b) Transition from L-STF to L-LTF shall be detected and fine timing shall be established.
- c) Coarse and fine frequency offsets shall be estimated.
- d) Symbols in a PPDU shall be derotated according to estimated frequency offset.
- e) For each VHT-LTF symbol, transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, and derotate the subcarrier values according to the estimated phase.
- f) Estimate the complex channel response coefficient for each of the subcarriers and each of the transmit streams.
- g) For each of the data OFDM symbols: transform the symbol into subcarrier received values, estimate the phase from the pilot subcarriers, derotate the subcarrier values according to the estimated phase, group the results from all of the receiver chains in each subcarrier to a vector, and multiply the vector by a zero-forcing equalization matrix generated from the estimated channel.
- h) For each data-carrying subcarrier in each spatial stream, find the closest constellation point and compute the Euclidean distance from it.
- i) Compute the average across PPDUs of the RMS of all errors per PPDU as given by Equation (19-89).

NOTE—In the case the transmit modulation accuracy test is performed simultaneously for the two frequency segments of the 80+80 MHz transmissions, N_{ST} in Equation (19-89) represents the total number of subcarriers of both 80 MHz frequency segments.

The test shall be performed over at least 20 PPDUs (N_f as defined in Equation (19-89)). The PPDUs under test shall be at least 16 data OFDM symbols long. Random data shall be used for the symbols.

21.3.17.5 Time of Departure accuracy

The Time of Departure accuracy test evaluates TIME_OF_DEPARTURE against aTxPHYTxStartRMS and aTxPHYTxStartRMS against TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH as defined in Annex P with the following test parameters:

- MULTICHANNEL_SAMPLING_RATE is:

$$20 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{20 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to CBW20}$$

$$40 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{40 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to CBW40}$$

$$80 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{80 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to CBW80}$$

$$160 \times 10^6 \left(1 + \left\lceil \frac{f_H - f_L}{160 \text{ MHz}} \right\rceil \right) \text{ sample/s, for a CH_BANDWIDTH parameter equal to CBW160}$$

or CBW80+80

where

f_H is the nominal center frequency in Hz of the highest channel in the channel set

f_L is the nominal center frequency in Hz of the lowest channel in the channel set, the channel set is the set of channels upon which frames providing measurements are transmitted, the channel set comprises channels uniformly spaced across

$$f_H - f_L \leq 50 \text{ MHz}$$

- FIRST_TRANSITION_FIELD is L-STF.
- SECOND_TRANSITION_FIELD is L-LTF.
- TRAINING_FIELD is L-LTF windowed in a manner which should approximate the windowing described in 17.3.2.5 with TTR = 100 ns.
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH is 80 ns.

NOTE—The indicated windowing applies to the time of departure accuracy test equipment, and not the transmitter or receiver.

21.3.18 VHT receiver specification

For tests in this subclause, the input levels are measured at the antenna connectors and are referenced as the average power per receive antenna. The number of spatial streams under test shall be equal to the number of utilized transmitting STA antenna (output) ports and also equal to the number of utilized Device Under Test input ports. Each output port of the transmitting STA shall be connected through a cable to one input port of the Device Under Test.

21.3.18.1 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 21-25. The test in this subclause and the minimum sensitivity levels specified in Table 21-25 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-25—Receiver minimum input level sensitivity

| Modulation | Rate (R) | Minimum sensitivity (20 MHz PPDU) (dBm) | Minimum sensitivity (40 MHz PPDU) (dBm) | Minimum sensitivity (80 MHz PPDU) (dBm) | Minimum sensitivity (160 MHz or 80+80 MHz PPDU) (dBm) |
|-------------------|-----------------|--|--|--|--|
| BPSK | 1/2 | -82 | -79 | -76 | -73 |
| QPSK | 1/2 | -79 | -76 | -73 | -70 |
| QPSK | 3/4 | -77 | -74 | -71 | -68 |
| 16-QAM | 1/2 | -74 | -71 | -68 | -65 |
| 16-QAM | 3/4 | -70 | -67 | -64 | -61 |
| 64-QAM | 2/3 | -66 | -63 | -60 | -57 |
| 64-QAM | 3/4 | -65 | -62 | -59 | -56 |
| 64-QAM | 5/6 | -64 | -61 | -58 | -55 |
| 256-QAM | 3/4 | -59 | -56 | -53 | -50 |
| 256-QAM | 5/6 | -57 | -54 | -51 | -48 |

21.3.18.2 Adjacent channel rejection

Adjacent channel rejection for W MHz channels (where W is 20, 40, 80 or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25 and raising the power of the interfering signal of W MHz bandwidth until 10% PER is caused for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding adjacent channel rejection. The center frequency of the adjacent channel shall be placed W MHz away from the center frequency of the desired signal.

Adjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed 80 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is 80 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the power difference between the interfering and desired signal. The smaller value between ΔP_1 and ΔP_2 is the corresponding adjacent channel rejection.

The interfering signal in the adjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the adjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

Table 21-26—Minimum required adjacent and nonadjacent channel rejection levels

| Modulation | Rate (R) | Adjacent channel rejection (dB) | | Nonadjacent channel rejection (dB) | |
|------------|----------|---------------------------------|----------------------|------------------------------------|----------------------|
| | | 20/40/80/ 160 MHz Channel | 80+80 MHz Channel | 20/40/80/ 160 MHz Channel | 80+80 MHz Channel |
| BPSK | 1/2 | 16 | 13 | 32 | 29 |
| QPSK | 1/2 | 13 | 10 | 29 | 26 |
| QPSK | 3/4 | 11 | 8 | 27 | 24 |
| 16-QAM | 1/2 | 8 | 5 | 24 | 21 |
| 16-QAM | 3/4 | 4 | 1 | 20 | 17 |
| 64-QAM | 2/3 | 0 | -3 | 16 | 13 |
| 64-QAM | 3/4 | -1 | -4 | 15 | 12 |
| 64-QAM | 5/6 | -2 | -5 | 14 | 11 |
| 256-QAM | 3/4 | -7 | -10 | 9 | 6 |
| 256-QAM | 5/6 | -9 | -12 | 7 | 4 |

The measurement of adjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.3 Nonadjacent channel rejection

Nonadjacent channel rejection for W MHz channels (where W is 20, 40, 80, or 160) shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25, and raising the power of the interfering signal of W MHz bandwidth until a 10% PER occurs for a PSDU length of 4096 octets. The difference in power between the signals in the interfering channel and the desired channel is the corresponding nonadjacent channel rejection. The nonadjacent channel rejection shall be met with any nonadjacent channels located at least $2 \times W$ MHz away from the center frequency of the desired signal.

Nonadjacent channel rejection for 80+80 MHz channels shall be measured by setting the desired signal's strength 3 dB above the rate-dependent sensitivity specified in Table 21-25. Then, an interfering signal of 80 MHz bandwidth is introduced, where the center frequency of the interfering signal is placed at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_1 be the power difference between the interfering and desired signal. Next, the interfering signal of 80 MHz bandwidth is moved to a frequency where the center frequency of the interfering signal is at least 160 MHz away from the center frequency of the frequency segment higher in frequency of the desired signal. The center frequency of the interfering signal shall also be at least 160 MHz away from the center frequency of the frequency segment lower in frequency of the desired signal. The power of the interfering signal is raised until 10% PER is caused for a PSDU length of 4096 octets. Let ΔP_2 be the difference in power between the signals in the interfering channel and the desired channel. The smaller value between ΔP_1 and ΔP_2 is the corresponding nonadjacent channel rejection.

The interfering signal in the nonadjacent channel shall be a signal compliant with the VHT PHY, unsynchronized with the signal in the channel under test, and shall have a minimum duty cycle of 50%. The corresponding rejection shall be no less than specified in Table 21-26.

The test in this subclause and the nonadjacent sensitivity levels specified in Table 21-26 apply only to non-STBC modes, 800 ns GI, BCC, and VHT PPDUs.

The measurement of nonadjacent channel rejection for 160 MHz operation in a regulatory domain is required only if such a frequency band plan is permitted in that regulatory domain.

21.3.18.4 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of –30 dBm, measured at each antenna for any baseband VHT modulation.

21.3.18.5 CCA sensitivity

21.3.18.5.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

21.3.18.5.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary 20 MHz channel, dot11OFDMEDThreshold for the secondary 20 MHz channel (if present), dot11OFDMEDThreshold + 3 dB for the secondary 40 MHz channel (if present), and dot11OFDMEDThreshold + 6 dB for the secondary 80 MHz channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 21.3.18.5.3 and 21.3.18.5.4 is a mandatory energy detect requirement on all Clause 21 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

21.3.18.5.3 CCA sensitivity for signals occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 21-27 is met in an otherwise idle 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary 20 MHz channel under the conditions listed in Table 21-27 within a period of aCCATime (see 21.4.4) and hold the CCA signal busy (PHY-CCA.indication(BUSY, channel-list) primitive) for the duration of the PPDU.

Table 21-27—Conditions for CCA BUSY on the primary 20 MHz

| Operating channel width | Conditions |
|---|---|
| 20 MHz, 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz | The start of a 20 MHz NON_HT PPDU in the primary 20 MHz channel as defined in 17.3.10.6. The start of an HT PPDU under the conditions defined in 19.3.19.5. The start of a 20 MHz VHT PPDU in the primary 20 MHz channel at or above -82 dBm. |
| 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz | The start of a 40 MHz non-HT duplicate or VHT PPDU in the primary 40 MHz channel at or above -79 dBm. The start of an HT PPDU under the conditions defined in 19.3.19.5. |
| 80 MHz, 160 MHz, or 80+80 MHz | The start of an 80 MHz non-HT duplicate or VHT PPDU in the primary 80 MHz channel at or above -76 dBm. |
| 160 MHz or 80+80 MHz | The start of a 160 MHz or 80+80 MHz non-HT duplicate or VHT PPDU at or above -73 dBm. |

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity ($-82 + 20 = -62$ dBm) in the primary 20 MHz channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY,{secondary}), PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

21.3.18.5.4 CCA sensitivity for signals not occupying the primary 20 MHz channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions are present in an otherwise idle 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

- Any signal within the secondary 20 MHz channel at or above a threshold of -62 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondary40}), PHY-CCA.indication(BUSY,{secondary80}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
- A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in the secondary 20 MHz channel at or above -72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary40}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) and PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions are present in an otherwise idle 80 MHz, 160 MHz, or 80+80 MHz operating channel width:

- Any signal within the secondary 40 MHz channel at or above a threshold of -59 dBm within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY, {secondary80}) primitive or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
- A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in the secondary 40 MHz channel at or above -72 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).
- A 20 MHz non-HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz sub-channel of the secondary 40 MHz channel at or above -72 dBm with >90% probability within a period aCCAMidTime.

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary80}) primitive if the conditions for PHY-CCA.indication(BUSY, {primary}), PHY-CCA.indication(BUSY, {secondary}), and PHY-CCA.indication(BUSY, {secondary40}) primitive are not present and one of the following conditions are present in an otherwise idle 160 MHz or 80+80 MHz operating channel width:

- Any signal within the secondary 80 MHz channel at or above -56 dBm.
- An 80 MHz non-HT duplicate or VHT PPDU detected in the secondary 80 MHz channel at or above -69 dBm with >90% probability within a period aCCAMidTime (see 21.4.4).
- A 40 MHz non-HT duplicate, HT_MF, HT_GF or VHT PPDU detected in any 40 MHz sub-channel of the secondary 80 MHz channel at or above -72 dBm with >90% probability within a period aCCAMidTime.
- A 20 MHz NON_HT, HT_MF, HT_GF or VHT PPDU detected in any 20 MHz sub-channel of the secondary 80 MHz channel at or above -72 dBm with >90% probability within a period aCCAMidTime.

21.3.18.6 RSSI

The RSSI parameter returned in the RXVECTOR shall be calculated during the reception of the VHT-LTFs and shall be a monotonically increasing function of the received power.

21.3.19 PHY transmit procedure

There are two paths for the transmit PHY procedure:

- The first path, for which typical transmit procedures are shown in Figure 21-34, is selected if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is VHT. These transmit procedures do not describe the operation of optional features, such as LDPC, STBC or MU.
- The second path is to follow the transmit procedure in Clause 17 if the FORMAT parameter of the PHY-TXSTART.request(TXVECTOR) primitive is NON_HT and the NON_HT_MODULATION parameter is set to NON_HT_DUP_OFDM except that the signal referred to in Clause 17 is instead generated simultaneously on each of the 20 MHz channels that are indicated by the CH_BANDWIDTH parameter as defined in 21.3.8 and 21.3.10.12.

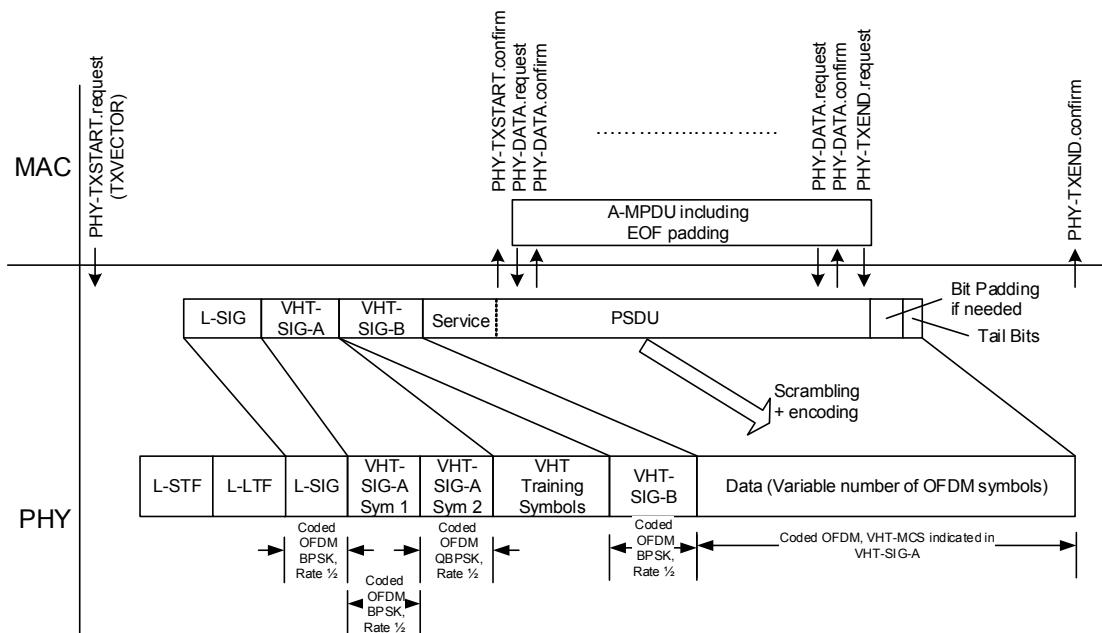

NOTE 1—For a VHT MU PPDU the A-MPDU is per user in the MAC sublayer and the VHT Training Symbols, VHT-SIG-B, and Data are per user in the PHY in Figure 21-34, with the number VHT Training Symbols depending on the total number of space-time streams across all users.

NOTE 2—The transmit procedure for NON_HT format where NON_HT_MODULATION is OFDM is specified in 21.2.5.2. The transmit procedure for HT_MF and HT_GF formats is specified in 21.2.5.3.

In both paths, in order to transmit data, the MAC generates a PHY-TXSTART.request primitive, which causes the PHY entity to enter the transmit state. Further, the PHY is set to operate at the appropriate frequency through station management via the PLME, as specified in 21.4. Other transmit parameters, such as VHT-MCS Coding types and transmit power, are set via the PHY SAP using the PHY-TXSTART.request(TXVECTOR) primitive, as described in 21.2.2. The remainder of the clause applies to the first path.

The PHY indicates the state of the primary channel and other channels (if any) via the PHY-CCA.indication primitive (see 21.3.18.5 and 8.3.5.12). Transmission of the PPDU shall be initiated by the PHY after receiving the PHY-TXSTART.request(TXVECTOR) primitive. The TXVECTOR elements for the PHY-TXSTART.request primitive are specified in Table 21-1.

Transmission of the PHY preamble may start if TIME_OF_DEPARTURE_REQUESTED is false, and shall start immediately if TIME_OF_DEPARTURE_REQUESTED is true, based on the parameters passed in the PHY-TXSTART.request primitive.

NOTE—This procedure does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-34—PHY transmit procedure for SU transmission

If all of the following conditions are met:

- If `dot11TODImplemented` and `dot11TODActivated` are true or if `dot11TimingMsmtActivated` is true,
- The TXVECTOR parameter `TIME_OF_DEPARTURE_REQUESTED` is true,

then the PHY shall issue a `PHY-TXSTART.confirm(TXSTATUS)` primitive to the MAC, forwarding the `TIME_OF_DEPARTURE` corresponding to the time when the first frame energy is sent by the transmitting port and `TIME_OF_DEPARTURE_ClockRate` parameter within the `TXSTATUS` vector. If `dot11TimingMsmtActivated` is true, then the PHY shall forward the value of `TX_START_OF_FRAME_OFFSET` in `TXSTATUS` vector.

After the PHY preamble transmission is started, the PHY entity immediately initiates data scrambling and data encoding. The encoding method for the Data field is based on the `FEC_CODING`, `CH_BANDWIDTH`, `NUM_STS`, `STBC`, `MCS`, and `NUM_USERS` parameter of the TXVECTOR, as described in 21.3.2.

The SERVICE field and PSDU are encoded as described in 21.3.3. The data shall be exchanged between the MAC and the PHY through a series of `PHY-DATA.request(DATA)` primitives issued by the MAC, and `PHY-DATA.confirm` primitives issued by the PHY. Zero to seven PHY padding bits are appended to the PSDU to make the number of bits in the coded PSDU an integer multiple of the number of coded bits per OFDM symbol.

Transmission can be prematurely terminated by the MAC through the `PHY-TXEND.request` primitive. PSDU transmission is terminated by receiving a `PHY-TXEND.request` primitive. Each `PHY-TXEND.request` primitive is acknowledged with a `PHY-TXEND.confirm` primitive from the PHY. In an SU transmission, normal termination occurs after the transmission of the final bit of the last PSDU octet, according to the number of OFDM symbols indicated by N_{SYM} (see 21.4.3).

In the PHY, the GI or short GI is inserted in every data OFDM symbol as a countermeasure against delay spread.

When the PPDU transmission is completed the PHY entity enters the receive state.

A typical state machine implementation of the transmit PHY for an SU transmission is provided in Figure 21-35. Request (.request) and confirmation (.confirm) primitives are issued once per state as shown. This state machine does not describe the operation of optional features, such as multi-user, LDPC or STBC.

21.3.20 PHY receive procedure

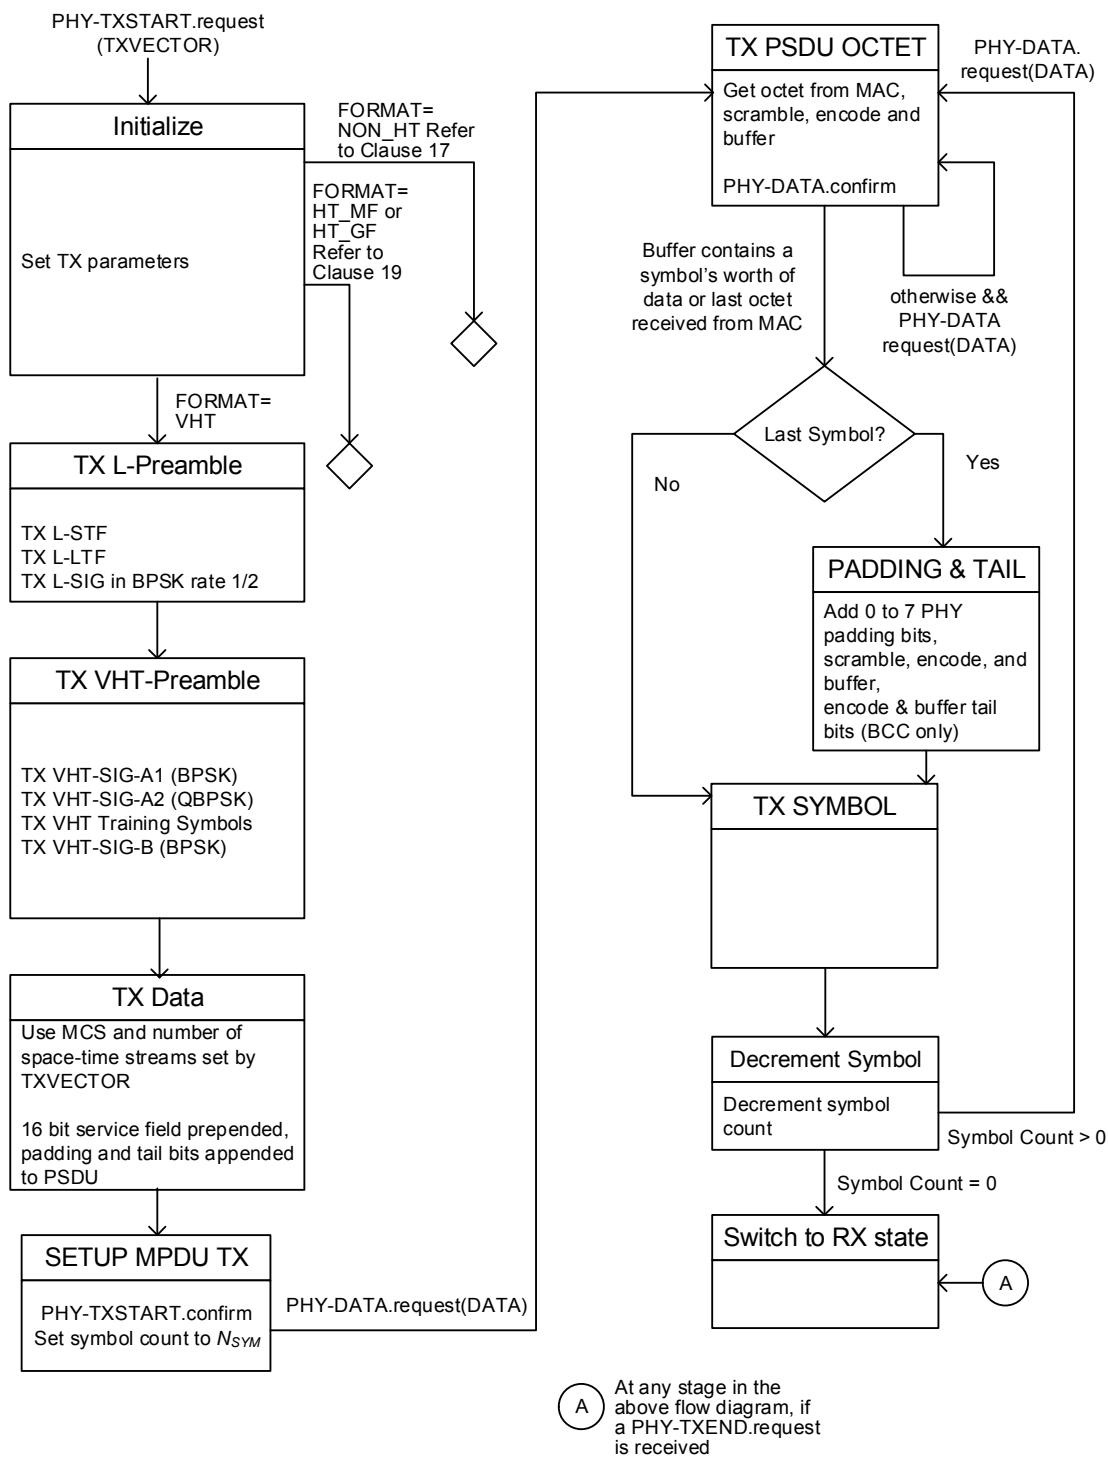

A typical PHY receive procedure is shown in Figure 21-36 for VHT format. A typical state machine implementation of the receive PHY is given in Figure 21-37. This receive procedure and state machine do not describe the operation of optional features, such as LDPC or STBC. If the detected format indicates a NON_HT PPDU, refer to the receive procedure and state machine in Clause 17. If the detected format indicates an HT PPDU format, refer to the receive procedure and state machine in Clause 19. Further, through station management (via the PLME) the PHY is set to the appropriate frequency, as specified in 21.4. The PHY has also been configured with group information (i.e., group membership and position in group) so that it can receive data intended for the STA. Other receive parameters, such as RSSI and indicated DATARATE, may be accessed via the PHY SAP.

Upon receiving the transmitted PHY preamble overlapping the primary 20 MHz channel, the PHY measures a receive signal strength. The PHY indicates this activity to the MAC by issuing a PHY-CCA.indication primitive. A PHY-CCA.indication(BUSY, channel-list) primitive is also issued as an initial indication of reception of a signal as specified in 21.3.18.5. The channel-list parameter of the PHY-CCA.indication primitive is absent when the operating channel width is 20 MHz. The channel-list parameter is present and includes the element primary when the operating channel width is 40 MHz, 80 MHz, 160 MHz, or 80+80 MHz.

The PHY shall not issue a PHY-RXSTART.indication primitive in response to a PPDU that does not overlap the primary 20 MHz channel.

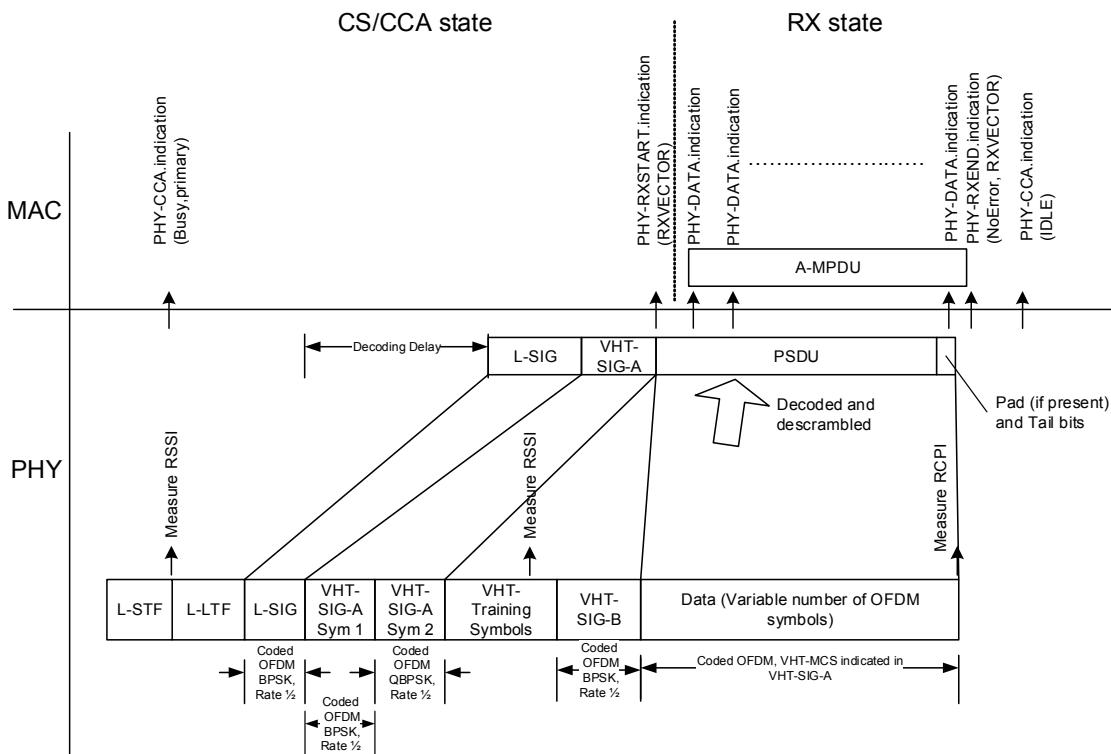

The PHY includes the most recently measured RSSI value in the PHY-RXSTART.indication(RXVECTOR) primitive issued to the MAC.

After the PHY-CCA.indication(BUSY, channel-list) primitive is issued, the PHY entity shall begin receiving the training symbols and searching for L-SIG in order to set the maximum duration of the data stream. If the check of the L-SIG parity bit is not valid, a PHY-RXSTART.indication primitive is not issued, and instead the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If a valid L-SIG parity bit is indicated, the VHT PHY shall maintain PHY-CCA.indication(BUSY, channel-list) primitive for the predicted duration of the transmitted PPDU, as defined by RXTIME in Equation (21-105), for all supported modes, unsupported modes, Reserved VHT-SIG-A Indication, invalid VHT-SIG-A CRC and invalid L-SIG Length field value. The L-SIG Length field value of a VHT PPDU is invalid if it is not divisible by 3. Reserved VHT-SIG-A Indication is defined as a VHT-SIG-A with Reserved bits equal to 0 or MU[u] NSTS fields ($u = 0, 1, 2, 3$) set to 5-7 or Short GI field set to 0 and Short GI NSYM Disambiguation field set to 1, or a combination of VHT-MCS and N_{STS} not included in 21.5 or any other VHT-SIG-A field bit combinations that do not correspond to modes of PHY operation defined in Clause 21. If the VHT-SIG-A indicates an unsupported mode, the PHY shall issue a PHY-RXEND.indication(UnsupportedRate) primitive. If the VHT-SIG-A indicates an invalid CRC or Reserved VHT-SIG-A Indication or if the L-SIG Length field is invalid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive.

NOTE—This state machine does not describe the operation of optional features, such as MU-MIMO, LDPC or STBC.

Figure 21-35—PHY transmit state machine for SU transmission

NOTE—This procedure does not describe the operation of optional features, such as LDPC or STBC. This procedure describes the case where VHT-SIG-A indicates a mode not requiring decoding of VHT-SIG-B.

Figure 21-36—PHY receive procedure for SU transmission

After receiving a valid L-SIG and VHT-SIG-A indicating a supported mode, the PHY entity shall begin receiving the VHT training symbols and VHT-SIG-B. If the received group ID in VHT-SIG-A has a value indicating a VHT SU PPDU (see 10.20), the PHY entity may choose not to decode VHT-SIG-B. If VHT-SIG-B is not decoded, subsequent to an indication of a valid VHT-SIG-A CRC, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued.

Subsequently, if dot11TimingMsmtActivated is true, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued and RX_START_OF_FRAME_OFFSET parameter within the RXVECTOR shall be forwarded (see 20.2.2).

NOTE—The RX_START_OF_FRAME_OFFSET value is used as described in 6.3.57 in order to estimate when the start of the preamble for the incoming frame was detected on the medium at the receive antenna connector.

The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If the Group ID field in VHT-SIG-A has a value indicating a VHT MU PPDU (see 10.20), the PHY, in a STA that is MU beamformee capable, shall decode VHT-SIG-B. If the VHT-SIG-B indicates an unsupported mode, the PHY shall issue the error condition PHY-RXEND.indication(UnsupportedRate) primitive.

If VHT-SIG-B was decoded the PHY may check the VHT-SIG-B CRC in the SERVICE field. If the VHT-SIG-B CRC in the SERVICE field is not checked a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

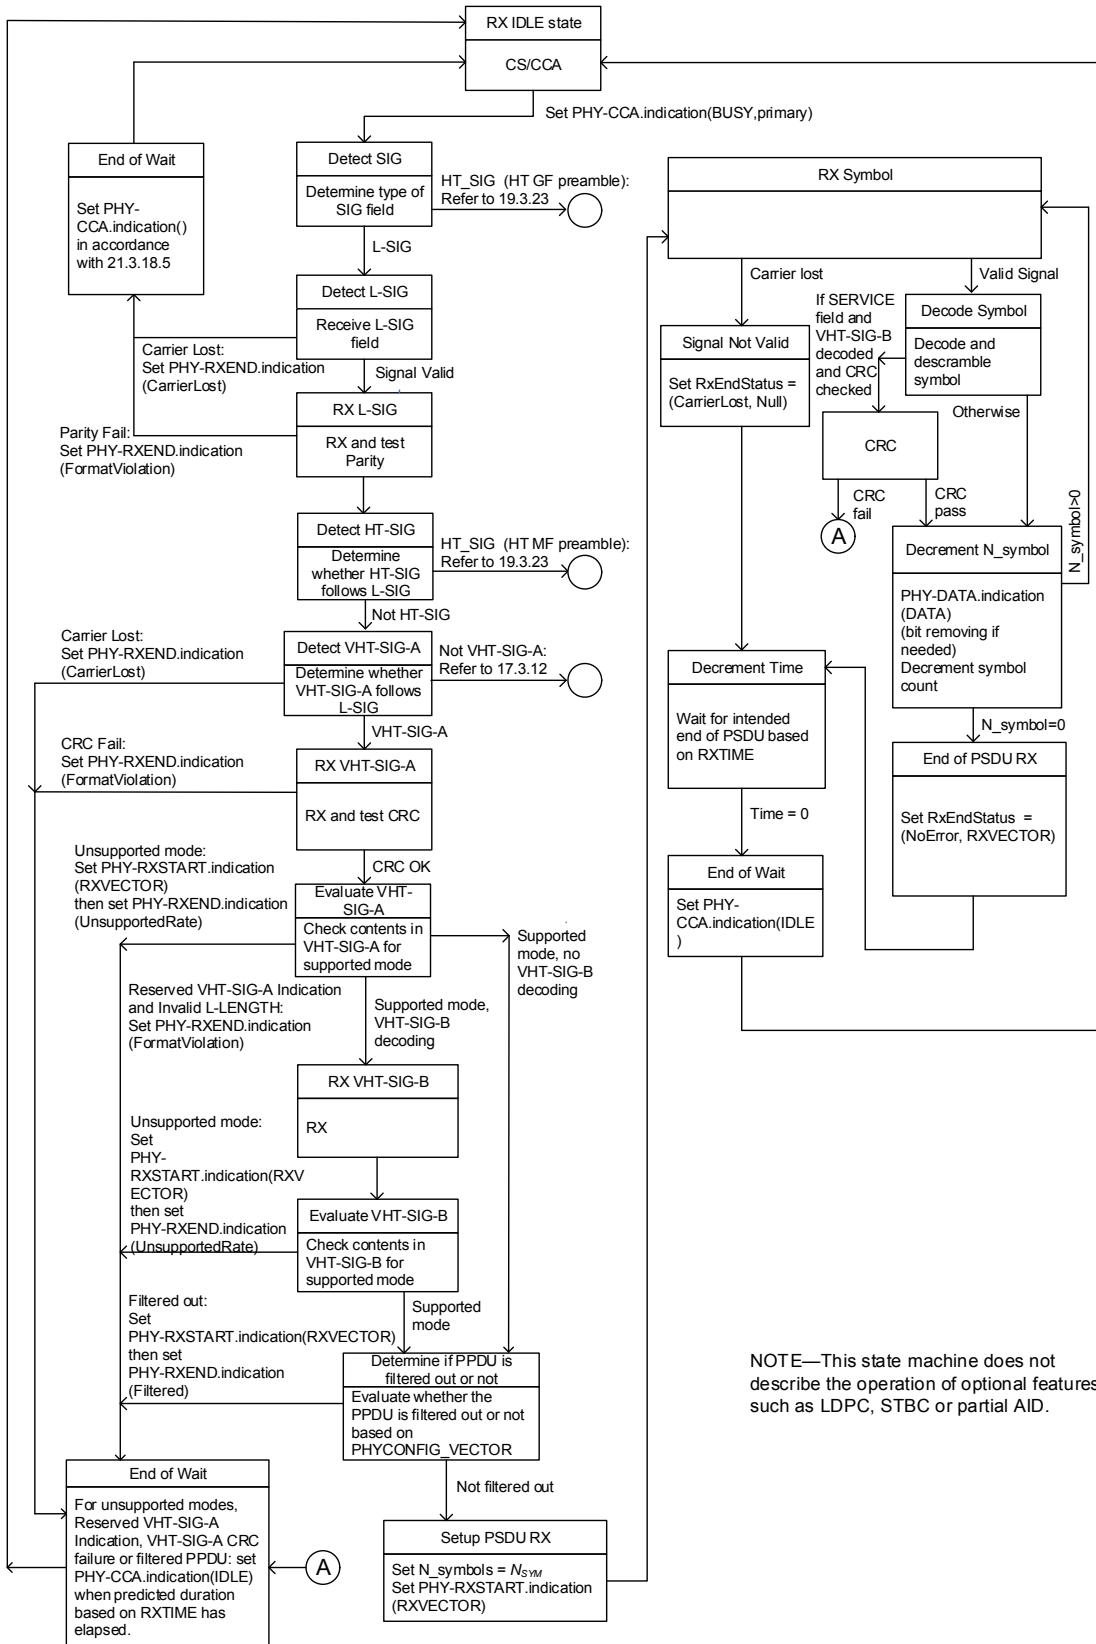

Figure 21-37—PHY receive state machine

The PHY optionally filters out the PPDU based on the GroupID, MU[0-3] NSTS and Partial AID fields of VHT-SIG-A and the contents of the PHYCONFIG_VECTOR as follows:

- The PHY shall not filter out the PPDU if one of the following is true:
 - ($g = 0$) and (l_{00} is true) and ($partialaid$ is included in PARTIAL_AID_LIST_GID00)
 - ($g = 63$) and (l_{63} is true) and ($partialaid$ is included in PARTIAL_AID_LIST_GID63)
 - ($1 \leq g \leq 62$) and (MembershipStatusInGroupID[g] = 1) and
 $(n_{STS}[\text{UserPositionInGroupID}[g]] > 0)$
- where
 - l_{NN} is the one of the LISTEN_TO_GIDNN parameters of the PHYCONFIG_VECTOR
 - MembershipStatusInGroupID[g] is the Membership Status Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
 - g is the value of the GroupID field of VHT-SIG-A
 - $n_{STS}[u]$ is the value of the MU[u] NSTS field of VHT-SIG-A
 - UserPositionInGroupID[g] is the User Position Array field of the GROUP_ID_MANAGEMENT parameter of the PHYCONFIG_VECTOR for group g
 - $partialaid$ is the value of the Partial AID field of VHT-SIG-A
- Otherwise, the PHY may filter out the PPDU.

If the PPDU is filtered out, the PHY shall issue a PHY-RXEND.indication(Filtered) primitive.

Following training and signal fields, the Data field shall be received. The number of symbols in the Data field is determined by Equation (21-104).

$$N_{SYM} = \begin{cases} N_{SYM} - 1, & \text{if Short GI} = 1 \text{ and Short GI NSYM Disambiguation} = 1 \\ N_{SYM}, & \text{otherwise} \end{cases} \quad (21-104)$$

where

$$N_{SYM} = \left\lfloor \frac{\text{RXTIME} - \left(\frac{T_{L-STF} + T_{L-LTF} + T_{L-SIG} + T_{VHT-SIG-A} + T_{VHT-STF} + N_{VHT-LTF}T_{VHT-LTF} + T_{VHT-SIG-B}}{T_{SYM}} \right)}{T_{SYM}} \right\rfloor$$

$$\text{RXTIME}(\mu s) = \left\lceil \frac{\text{LENGTH} + 3}{3} \right\rceil \cdot 4 + 20 \quad (21-105)$$

where LENGTH is the LENGTH field in L-SIG.

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using BCC encoding is calculated using Equation (21-106).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{SYM}N_{DBPS} - N_{service} - N_{tail} \cdot N_{ES}}{8} \right\rfloor \quad (21-106)$$

where

$$N_{SYM} \quad \text{is given by Equation (21-104)}$$

For a VHT SU PPDU, the SU/MU[0] Coding field of VHT-SIG-A2 indicates the type of coding. The PHY entity shall use an LDPC decoder to decode the C-PSDU if this bit is 1; otherwise, BCC decoding shall be used. For an MU transmission, the SU/MU[0] Coding, MU[1] Coding, MU[2] Coding and MU[3] Coding

fields of VHT-SIG-A2 indicate the type of coding for user u with $\text{USER_POSITION}[u] = 0, 1, 2$, and 3 , respectively. The PHY entity shall use an LDPC decoder to decode the C-PSDU for the respective user if its bit for its C-PSDU is 1 . BCC decoding shall be used otherwise. When an LDPC decoder is to be used, $N_{\text{SYM},\text{init}}$ is obtained from Equation (21-107).

$$N_{\text{SYM},\text{init}} = \begin{cases} N_{\text{SYM},\text{init}}, & \text{if LDPC Extra OFDM Symbol} = 0 \\ N_{\text{SYM},\text{init}} - 1, & \text{if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 0 \\ N_{\text{SYM},\text{init}} - 2, & \text{if LDPC Extra OFDM Symbol} = 1 \text{ and STBC} = 1 \end{cases} \quad (21-107)$$

where

LDPC Extra OFDM Symbol and STBC are fields in VHT-SIG-A (see Table 21-12)

The value of the PSDU_LENGTH parameter returned in the RXVECTOR using LDPC encoding is calculated using Equation (21-108).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{\text{SYM},\text{init}}N_{\text{DBPS}} - N_{\text{service}}}{8} \right\rfloor \quad (21-108)$$

where

$N_{\text{SYM},\text{init}}$ is given by Equation (21-107)

The value of the PSDU_LENGTH parameter returned in the RXVECTOR for an NDP is 0 .

If VHT-SIG-B is decoded and the VHT-SIG-B CRC in the SERVICE field is checked and not valid, the PHY shall issue the error condition PHY-RXEND.indication(FormatViolation) primitive. If the VHT-SIG-B field is decoded and the VHT-SIG-B CRC field is checked and valid, a PHY-RXSTART.indication(RXVECTOR) primitive shall be issued. The RXVECTOR associated with this primitive includes the parameters specified in Table 21-1.

If signal loss occurs during reception prior to completion of the PSDU reception, the error condition shall be reported to the MAC using a PHY-RXEND.indication(CarrierLost) primitive. After waiting for the intended end of the PSDU as determined by Equation (21-105), the PHY shall generate a PHY-CCA.indication(IDLE) primitive and return to RX IDLE state.

The received PSDU bits are assembled into octets, decoded, and presented to the MAC using a series of PHY-DATA.indication(DATA) primitive exchanges. Any final bits that cannot be assembled into a complete octet are considered pad bits and discarded. After the reception of the final bit of the last PSDU octet, and possible padding and tail bits, the receiver shall be returned to the RX IDLE state, as shown in Figure 21-37. A PHY-RXEND.indication(NoError) primitive shall be issued on entry to the RX IDLE state.

21.4 VHT PLME

21.4.1 PLME SAP sublayer management primitives

Table 21-28 lists the MIB attributes that may be accessed by the PHY entities and the intralayer of higher level LMEs. These attributes are accessed via the PLME-GET, PLME-SET, PLME-RESET, and PLME-CHARACTERISTICS primitives defined in 6.5.

Table 21-28—VHT PHY MIB attributes

21.4.2 PHY MIB

VHT PHY MIB attributes are defined in Annex C with specific values defined in Table 21-28. The “Operational semantics” column in Table 21-28 contains two types: static and dynamic.

- Static MIB attributes are fixed and cannot be modified for a given PHY implementation.
- Dynamic MIB attributes are interpreted according to the MAX-ACCESS field of the MIB attribute.

When MAX-ACCESS is read-only, the MIB attribute value may be updated by the PLME and read from the MIB attribute by management entities. When MAX-ACCESS is read-write, the MIB attribute may be read and written by management entities but shall not be updated by the PLME.

21.4.3 TXTIME and PSDU_LENGTH calculation

The value of the TXTIME parameter returned by the PLME-TXTIME.confirm primitive shall be calculated for a VHT PPDU using Equation (21-109) for short GI and Equation (21-110) for long GI.

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{\text{SYML}} \times \left\lceil \frac{T_{\text{SYMS}} \times N_{\text{SYM}}}{T_{\text{SYML}}} \right\rceil \quad (21-109)$$

$$\text{TXTIME} = T_{\text{LEG_PREAMBLE}} + T_{\text{L-SIG}} + T_{\text{VHT-SIG-A}} + T_{\text{VHT_PREAMBLE}} + T_{\text{VHT-SIG-B}} + T_{\text{SYML}} \times N_{\text{SYM}} \quad (21-110)$$

where

$$T_{\text{LEG_PREAMBLE}} = T_{\text{L-STF}} + T_{\text{L-LTF}}$$

$$T_{\text{VHT_PREAMBLE}} = T_{\text{VHT-STF}} + N_{\text{VHT-LTF}} T_{\text{VHT-LTF}}$$

T_{SYML} , T_{SYMS} , $T_{\text{VHT-SIG-A}}$, $T_{\text{VHT-SIG-B}}$, $T_{\text{L-STF}}$, $T_{\text{VHT-STF}}$, $T_{\text{L-LTF}}$, and $T_{\text{VHT-LTF}}$ are defined in Table 21-5

$N_{\text{VHT-LTF}}$ is defined in Table 21-13

For an NDP, there is no Data field and $N_{\text{SYM}} = 0$.

For a VHT SU PPDU using BCC encoding, the total number of data symbols in the Data field is given by Equation (21-111).

$$N_{\text{SYM}} = m_{\text{STBC}} \times \left\lceil \frac{8 \cdot \text{APEP_LENGTH} + N_{\text{service}} + N_{\text{tail}} \cdot N_{\text{ES}}}{m_{\text{STBC}} \cdot N_{\text{DBPS}}} \right\rceil \quad (21-111)$$

where

m_{STBC} is equal to 2 when STBC is used, and 1 otherwise

For a VHT SU PPDU using LDPC encoding, the total number of data symbols in the Data field, N_{SYM} , is given in 21.3.10.5.4 (computed using Equation (19-41) in step d) of 19.3.11.7.5).

For a VHT MU PPDU, the total number of data symbols in the Data field, N_{SYM} , is given by Equation (21-67).

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using BCC encoding is calculated using Equation (21-112).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{\text{SYM}} N_{\text{DBPS}} - N_{\text{service}} - N_{\text{tail}} \cdot N_{\text{ES}}}{8} \right\rfloor \quad (21-112)$$

where

N_{SYM} is given by Equation (21-111)

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for a VHT SU PPDU using LDPC encoding is calculated using Equation (21-113).

$$\text{PSDU_LENGTH} = \left\lfloor \frac{N_{\text{SYM}, \text{init}} N_{\text{DBPS}} - N_{\text{service}}}{8} \right\rfloor \quad (21-113)$$

where

$N_{\text{SYM}, \text{init}}$ is given by Equation (21-62)

The value of the PSDU_LENGTH parameter for user u returned in the PLME-TXTIME.confirm primitive and in the RXVECTOR for a VHT MU PPDU is calculated using Equation (21-114).

$$\text{PSDU_LENGTH}_u = \begin{cases} \left\lfloor \frac{N_{\text{SYM}} N_{\text{DBPS}, u} - N_{\text{service}} - N_{\text{tail}} \cdot N_{\text{ES}, u}}{8} \right\rfloor & \text{when BCC is used for user } u \\ \left\lfloor \frac{N_{\text{SYM_max_init}} N_{\text{DBPS}, u} - N_{\text{service}}}{8} \right\rfloor & \text{when LDPC is used for user } u \end{cases} \quad (21-114)$$

where

N_{SYM} is given by Equation (21-67),

$N_{\text{SYM_max_init}}$ is given by Equation (21-65),

The value of the PSDU_LENGTH parameter returned in the PLME-TXTIME.confirm primitive for an NDP is 0.

21.4.4 VHT PHY

The static VHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 unless otherwise listed in Table 21-29. The definitions for these characteristics are given in 6.5.

Table 21-29—VHT PHY characteristics

| Characteristics | Value |
|--|---|
| aCCAMidTime | 25 µs |
| aPPDUMaxTime | 5.484 ms |
| aPSDUMaxLength | 4 692 480 octets (see NOTE 1) |
| aRxPHYStartDelay | 36 + 4 × the maximum possible value for $N_{\text{VHT-LTF}}$ supported + 4 (see NOTE 2) |
| NOTE 1—This is the maximum length in octets for a VHT SU PPDU with a bandwidth of 160 MHz or 80+80 MHz, VHT-MCS 9, and 8 spatial streams, and limited by 1504 possible Short GI data symbols in aPPDUMaxTime. This is the maximum PSDU length a VHT PHY could support assuming no restrictions in MAC. See 10.3.2 and 9.2.4.7.1 for additional restrictions on the maximum number of octets the MAC could support. | |
| NOTE 2—This value arises from the time to the end of VHT-SIG-B (see Figure 21-4) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains. | |

21.5 Parameters for VHT-MCSs

The rate-dependent parameters for 20 MHz, 40 MHz, 80 MHz, 160 MHz, and 80+80 MHz $N_{SS} = 1, \dots, 8$ are given in Table 21-30 through Table 21-61. Support for 400 ns GI is optional in all cases. Support for VHT-MCS 8 and 9 (when valid) is optional in all cases. A VHT STA shall support single spatial stream VHT-MCSs within the range VHT-MCS 0 to VHT-MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Long GI Data Rate subfield values in the Supported VHT-MCS and NSS Set field may result in a reduced VHT-MCS range (cut-off) for $N_{SS} = 2, \dots, 8$. Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS} = 1$ is mandatory. Support for 20 MHz, 40 MHz, and 80 MHz with $N_{SS} = 2, \dots, 8$ is optional. Support for 160 MHz and 80+80 MHz with $N_{SS} = 1, \dots, 8$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks for each BCC encoder per OFDM symbol.

Table 21-30 to Table 21-33, Table 21-38 to Table 21-41, Table 21-46 to Table 21-49, and Table 21-54 to Table 21-57 define VHT-MCSs not only for SU transmission but also for user u of MU transmission. In the case of VHT-MCSs for MU transmission, the parameters, N_{SS} , R , N_{BPSCS} , N_{CBPS} , N_{DBPS} , and N_{ES} are replaced with $N_{SS,u}$, R_u , $N_{BPSCS,u}$, $N_{CBPS,u}$, $N_{DBPS,u}$, and $N_{ES,u}$ respectively. Note that the 400 ns GI rate values are rounded to 1 decimal place.

Table 21-30—VHT-MCSs for mandatory 20 MHz, $N_{SS} = 1$

| VHT-MCS Index | Modulation | R | N_{BPSCS} | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | N_{ES} | Data rate (Mb/s) | |
|--|------------|-----|-------------|----------|----------|------------|------------|----------|------------------|----------------------|
| | | | | | | | | | 800 ns GI | 400 ns GI (See NOTE) |
| 0 | BPSK | 1/2 | 1 | 52 | 4 | 52 | 26 | 1 | 6.5 | 7.2 |
| 1 | QPSK | 1/2 | 2 | 52 | 4 | 104 | 52 | 1 | 13.0 | 14.4 |
| 2 | QPSK | 3/4 | 2 | 52 | 4 | 104 | 78 | 1 | 19.5 | 21.7 |

22. Television very high throughput (TVHT) PHY specification

22.1 Introduction

22.1.1 Introduction to the TVHT PHY

Clause 22 specifies the PHY entity for a television very high throughput (TVHT) orthogonal frequency division multiplexing (OFDM) system.

Three basic channel units (BCUs) are defined as 6 MHz, 7 MHz, or 8 MHz, depending on the regulatory domain, and denoted in the rest of this clause as a BCU or TVHT_W. Many of the terms used in this clause refer to different bands, depending on the regulatory domain. These terms include

- TVHT_2W, which represents two contiguous BCUs (12 MHz, 14 MHz, or 16 MHz)
- TVHT_W+W, which represents two noncontiguous BCU (6+6 MHz, 7+7 MHz, or 8+8 MHz)
- TVHT_4W, which represents four contiguous BCUs (24 MHz, 28 MHz, or 32 MHz)
- TVHT_2W+2W, which represents two noncontiguous frequency segments, each of which is composed of two BCUs (12+12 MHz, 14+14 MHz, or 16+16 MHz)

The TVHT PHY is based on the VHT PHY as defined in 21.3, 21.4, 21.5, and on Clause 17.

All TVHT transmissions in one BCU shall use the VHT PHY parameters for 40 MHz channel defined in 21.3, 21.4, and 21.5 with a sampling clock change to fit into each of the BCU bandwidths and with the number of encoders (N_{ES}) always being 1 (for SU-MIMO and per user in MU-MIMO).

Table 22-8 describes the sampling clock for each of the BCUs and the basic PHY parameters for transmission over one BCU.

For all VHT PPDUs and non-HT PPDUs in TVWS band, timing-related parameters shall be used as defined in Table 22-5 and Table 22-8; frequently used parameters shall be used as defined in Table 22-6 and Table 22-9; phase rotation parameter $\Upsilon_{k, BW}$ shall be replaced by $\Upsilon_{k, M}$, which is defined in Table 22-12; and cyclic shift parameters shall be used as defined in 22.3.8.3.2.

As shown in Table 22-8, the design is based on defining 144 OFDM tones in the 6 MHz and 8 MHz channel units and using up to tone 58 on each side of the DC tone for data and pilots, exactly matching the VHT 40 MHz PHY parameters. The 7 MHz channel unit is split into 168 tones to maintain the same tone spacing and PHY design as used for 6 MHz channels (note the ratio of 168 to 144 is identical to the ratio of 7 to 6). The choice of 144 and not 128 was made to reduce the PHY channel BW from 6 MHz to 5 1/3 MHz in order to allow sharper filtering to achieve 55 dB ACLR.

The TVHT PHY defines the following transmission modes that incorporate transmission on one, two, or four BCUs:

- a) Mandatory transmission mode - one BCU (TVHT_MODE_1)
- b) Optional transmission modes - multi-BCUs
 - 1) Two contiguous BCUs (TVHT_MODE_2C)
 - 2) Two noncontiguous BCUs (TVHT_MODE_2N)
 - 3) Four contiguous BCUs (TVHT_MODE_4C)
 - 4) Two noncontiguous frequency segments, each of which comprises two contiguous BCUs (TVHT_MODE_4N)

The tone spacing, DFT duration, and other timing parameters remain unchanged for all optional modes compared with the definition in Table 22-8.

The number of occupied tones in each BCU of any optional mode is the same as the number defined in Table 22-8.

The location of the occupied tones in each BCU of any optional mode is shown in Table 22-9.

The DATA encoding process for multi-BCUs transmission is similar to one BCU transmission and is defined in 22.3.10.

A TVHT STA shall support the following features:

- TVHT_MODE_1 (one BCU)
- Single spatial stream MCSs 0 to 7 (transmit and receive)
- Binary convolutional coding
- Normal and short guard interval (transmit and receive)

A TVHT STA may support the following features:

- TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, or TVHT_MODE_4N (two or four BCUs)
- Two or more spatial streams (transmit and receive)
- Beamforming sounding (by sending a VHT NDP frame)
- Respond to transmit beamforming sounding (provide compressed beamforming feedback)
- STBC (transmit and receive)
- LDPC (transmit and receive)
- VHT MU PPDUs (transmit and receive)
- MCSs 8 and 9 (transmit and receive)

22.1.2 Scope

The services provided to the MAC by the TVHT PHY consist of a protocol function that defines the characteristics and method of transmitting and receiving data through a wireless medium between two or more STAs. These STAs support a TVHT PHY.

22.1.3 TVHT PHY functions

22.1.3.1 General

See 21.1.3.1 with “TVHT” replacing “VHT”.

22.1.3.2 PHY management entity (PLME)

See 21.1.3.2.

22.1.3.3 Service specification method

See 21.1.3.3 with “TVHT” replacing “VHT”.

22.1.4 PPDU formats

The structure of the PPDU transmitted by a TVHT STA is determined by the TXVECTOR parameters as defined in 22.2.2.

The FORMAT parameter determines the overall structure of the PPDU and includes the following:

- Non-HT format (NON_HT), based on Clause 17. Support for non-HT format is mandatory.
- VHT format (VHT). Support for TVHT_W VHT format is mandatory.

22.2 TVHT PHY service interface

22.2.1 Introduction

See 21.2.1.

22.2.2 TXVECTOR and RXVECTOR parameters

The TXVECTOR and RXVECTOR parameters are defined in Table 22-1.

The TXVECTOR parameter FORMAT shall be set to NON_HT or VHT. When the TXVECTOR parameter FORMAT equals NON_HT, then NON_HT_MODULATION shall be set to NON_HT_DUP_OFDM.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter L_DATARATE indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6 Mb/s, 9 Mb/s, 12 Mb/s, 18 Mb/s, 24 Mb/s, 36 Mb/s, 48 Mb/s, and 54 Mb/s divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels.

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU:

Enumerated type:

- TVHT_W for one BCUs
- TVHT_2W for two contiguous BCUs
- TVHT_W+W for two noncontiguous BCUs
- TVHT_4W for four contiguous BCUs
- TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs

Note that TVHT_W represents the broadcast channel bandwidth for the regulatory domain, e.g., TVHT_W is 6 MHz, 7 MHz, or 8 MHz. TVHT_2W represents two contiguous BCUs with the same regulatory domain, e.g., TVHT_2W is 12 MHz, 14 MHz, or 16 MHz.

When the TXVECTOR parameter FORMAT equals NON_HT, the TXVECTOR parameter CH_BANDWIDTH indicates the channel width of the transmitted PPDU on transmission and the estimated channel width of the received PPDU on reception:

Enumerated type:

- TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W

When the TXVECTOR parameter FORMAT equals VHT, the TXVECTOR parameter NUM_STS indicates the number of space-time streams: range 1 to 4 for SU, 1 to 3 per user for MU. NUM_STS summed over all

users shall be less than or equal to 4. The TXVECTOR parameter NUM_STS is not present when the TXVECTOR parameter FORMAT equals to NON_HT.

Table 22-1—TXVECTOR and RXVECTOR parameters

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|--------------------|---|---|----------|----------|
| FORMAT | | Determines the format of the PPDU. Enumerated type: NON_HT indicates non-HT duplicated PPDU format. In this case, the modulation is determined by the NON_HT_MODULATION parameter. VHT indicates VHT format. | Y | Y |
| NON_HT_MODULATION | FORMAT is NON_HT | In TXVECTOR, indicates the format type of the transmitted non-HT PPDU. In RXVECTOR, indicates the estimated format type of the received non-HT PPDU. Enumerated type: NON_HT_DUP_OFDM indicates non-HT duplicate format. | Y | Y |
| | Otherwise | Not present | N | N |
| L_LENGTH | FORMAT is NON_HT | Indicates the length of the PSDU in octets in the range 1 to 4095. This value is used by the PHY to determine the number of octet transfers that occur between the MAC and the PHY. | Y | Y |
| | FORMAT is VHT | Not present NOTE—The Length field of the L-SIG in VHT PPDUs is defined in Equation (22-9) using the scaling factor defined in 22.3.8.2.1. | N | N |
| L_DATARATE | FORMAT is NON_HT | Indicates the data rate used to transmit the PSDU in Mb/s. The allowed values are 6, 9, 12, 18, 24, 36, 48, and 54 divided by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz channels. | Y | Y |
| | FORMAT is VHT | Not present NOTE—The RATE field in the L-SIG field in a VHT PPDU is set to the value representing $6/X$ Mb/s in TVWS band “Modulation BPSK and Coding rate 1/2” row of Table 22-4. | N | N |
| N_TX | FORMAT is VHT | Indicates the number of transmit chains. | Y | N |
| | Otherwise | Not present | N | N |
| EXPANSION_MAT_TYPE | FORMAT is VHT and EXPANSION_MAT is present. | Set to COMPRESSED_SV | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |

Table 22-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---------------|--|--|----------|----------|
| EXPANSION_MAT | FORMAT is VHT | Contains a vector in the number of selected subcarriers containing feedback matrices as defined in 22.3.11.2 based on the channel measured during the training symbols of a previous VHT NDP PPDU. | M U | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| CHAN_MAT_TYPE | FORMAT is VHT and PSDU_LENGTH equals zero | Set to COMPRESSED_SV NOTE—This parameter is present only for TVHT NDP PPDUs. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than zero | Not present | | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| CHAN_MAT | FORMAT is VHT and PSDU_LENGTH equals zero | Contains a set of compressed beamforming feedback matrices as defined in 21.3.11.2 based on the channel measured during the training symbols of the received VHT NDP PPDU. | N | Y |
| | FORMAT is VHT and PSDU_LENGTH is greater than zero | Not present | | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| DELTA_SNR | FORMAT is VHT | Contains an array of delta SNR values as defined in 9.4.1.52 based on the channel measured during the training symbols of the received VHT NDP PPDU. NOTE—In the RXVECTOR this parameter is present only for VHT NDP PPDUs for MU sounding. | M U | Y |
| | Otherwise | Not present | | N |
| RCPI | | Is a measure of the received RF power averaged over all of the receive chains in the Data field of a received PPDU. Refer to 19.3.19.6 for the definition of RCPI. | N | Y |
| SNR | FORMAT is VHT | Contains an array of measures of the received SNR for each spatial stream. SNR indications of 8 bits are supported. SNR shall be the sum of the decibel values of SNR per tone divided by the number of tones represented in each stream as described in 9.4.1.50. | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| NO_SIG_EXTN | FORMAT is VHT | Not present | | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |

Table 22-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------------|---------------|--|----------|----------|
| FEC_CODING | FORMAT is HT | Indicates which FEC encoding is used. Enumerated type: BCC_CODING indicates binary convolutional code. LDPC_CODING indicates low-density parity check code. | M U | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| STBC | FORMAT is VHT | Indicates whether STBC is used. 0 indicates no STBC ($N_{STS}=N_{SS}$ in the Data field). 1 indicates STBC is used ($N_{STS}=2N_{SS}$ in the Data field). | Y | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| GI_TYPE | FORMAT is VHT | Indicates whether a short guard interval is used in the transmission of the Data field of the PPDU. Enumerated type: LONG_GI indicates short GI is not used in the Data field of the PPDU. SHORT_GI indicates short GI is used in the Data field of the PPDU. | Y | Y |
| | Otherwise | Not present | | |
| TXPWR_LEVEL_INDEX | FORMAT is VHT | The allowed values for the TXPWR_LEVEL_INDEX parameter are in the range 1 to numberOfOctets(dot11TxPowerLevelExtended)/2. This parameter is used to indicate which of the available transmit output power levels defined in dot11TxPowerLevelExtended shall be used for the current transmission. | Y | N |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| RSSI | FORMAT is VHT | The allowed values for the RSSI parameter are in the range 0 to 255. This parameter is a measure by the PHY of the power observed at the antennas used to receive the current PPDU measured during the reception of the TVHT-LTF field. RSSI is intended to be used in a relative manner, and it is a monotonically increasing function of the received power. | N | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| MCS | FORMAT is VHT | Indicates the modulation and coding scheme used in the transmission of the PPDU. Integer: range 0 to 9 | M U | Y |
| | Otherwise | See corresponding entry in Table 19-1 | | |
| REC_MCS | FORMAT is VHT | Indicates the MCS that the STA's receiver recommends. | N | O |
| | Otherwise | Not present | | |

Table 22-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-------------------------|------------------|---|----------|----------|
| CH_BANDWIDTH | FORMAT is VHT | Indicates the channel width of the transmitted PPDU: Enumerated type: TVHT_1W for one BCU TVHT_2W for two contiguous BCUs TVHT_W+W for two noncontiguous BCUs TVHT_4W for four contiguous BCUs TVHT_2W+2W for two noncontiguous frequency segments, each of which comprises two contiguous BCUs | Y | Y |
| | FORMAT is NON_HT | In TXVECTOR, indicates the channel width of the transmitted PPDU. In RXVECTOR, indicates the estimated channel width of the received PPDU. Enumerated type: TVHT_1W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W if NON_HT_MODULATION equals NON_HT_DUP_OFDM | Y | Y |
| DYN_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | In TXVECTOR, if present, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. In RXVECTOR, if valid, indicates whether the transmitter is capable of Static or Dynamic bandwidth operation. Enumerated type: Static if the transmitter is capable of Static bandwidth operation Dynamic if the transmitter is capable of Dynamic bandwidth operation NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| | Otherwise | Not present | N | N |
| CH_BANDWIDTH_IN_NON_HT | FORMAT is NON_HT | In TXVECTOR, if present, indicates the channel width of the transmitted PPDU, which is signaled via the scrambling sequence. In RXVECTOR, if valid, indicates the channel width of the received PPDU, which is signaled via the scrambling sequence. Enumerated type: TVHT_1W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. NOTE—In the RXVECTOR, the validity of this parameter is determined by the MAC based on the contents of the received MPDU. | O | Y |
| | Otherwise | Not present | N | N |
| AEP_P_LENGTH | FORMAT is VHT | If equal to 0, indicates a TVHT NDP PPDU for both RXVECTOR and TXVECTOR. If greater than zero, in the TXVECTOR, indicates the number of octets in the range 1 to 1 048 575 in the A-MPDU pre-EOF padding (see 10.13.2) carried in the PSDU. If greater than zero, in the RXVECTOR, is the value obtained from the VHT-SIG-B Length field multiplied by 4. | M U | O |
| | Otherwise | Not present | N | N |

Table 22-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|---------------|---|---|----------|----------|
| PSDU_LENGTH | FORMAT is VHT | Indicates the number of octets in the VHT PSDU in the range 0 to 1 065 600 octets. A value of 0 indicates a VHT NDP PPDU. | N | Y |
| | Otherwise | Not present | N | N |
| USER_POSITION | FORMAT is VHT and $1 \leq \text{GROUP_ID} \leq 62$ | Index for user in MU transmission. Integer: range 0 to 3. NOTE—The entries in the USER_POSITION array are in ascending order. | M U | O |
| | Otherwise | Not present | N | N |
| NUM_STS | FORMAT is VHT | Indicates the number of space-time streams. Integer: range 1 to 4 for SU, 1 to 3 per user in the TXVECTOR, and 0 to 4 in the RXVECTOR for MU. NUM_STS summed over all users is between 1 and 4. | M U | Y |
| | Otherwise | Not present | N | N |
| GROUP_ID | FORMAT is VHT | Indicates the group ID. Integer: range 0 to 63 (see Table 22-12) A value of 0 or 63 indicates a VHT SU PPDU. A value in the range 1 to 62 indicates a VHT MU PPDU. | Y | Y |
| | Otherwise | Not present | N | N |
| PARTIAL_AID | FORMAT is VHT and GROUP_ID is 0 or 63 | Provides an abbreviated indication of the intended recipient(s) of the PSDU (see 9.1710.20). Integer: range 0 to 511. | Y | Y |
| | Otherwise | Not present | N | N |
| NUM_USERS | FORMAT is VHT | Indicates the number of users with nonzero space-time streams. Integer: range 1 to 4. | Y | N |
| | Otherwise | Not present | N | N |
| BEAMFORMED | FORMAT is VHT and GROUP_ID is 0 or 63 | Set to 1 if a beamforming steering matrix is applied to the waveform in an SU transmission. Set to 0 otherwise. NOTE—When BEAMFORMED is set to 1, smoothing is not recommended. | Y | O |
| | Otherwise | Not present | N | N |

Table 22-1—TXVECTOR and RXVECTOR parameters (continued)

| Parameter | Condition | Value | TXVECTOR | RXVECTOR |
|-----------------------------|--|---|----------|----------|
| TXOP_PS_NOT_ALLOWED | FORMAT is VHT | Indicates whether a TVHT AP allows non-AP TVHT STAs in TXOP power save mode to enter doze state during the TXOP. 0 indicates that the TVHT AP allows non-AP TVHT STAs to enter doze state during a TXOP. 1 indicates that the TVHT AP does not allow non-AP TVHT STAs to enter doze state during a TXOP. | Y | Y |
| | Otherwise | Not present | N | N |
| TIME_OF_DEPARTURE_REQUESTED | | Boolean value: true indicates that the MAC entity requests that the PHY entity measures and reports time of departure parameters corresponding to the time when the first PPDU energy is sent by the transmitting port. false indicates that the MAC entity requests that the PHY entity neither measures nor reports time of departure parameters. | O | N |
| | dot11TimingMsmtActivated is true | 0 to $2^{32} - 1$. An estimate of the offset (in 10 ns units) from the point in time at which the start of the preamble corresponding to the incoming frame arrived at the receive antenna connector to the point in time at which this primitive is issued to the MAC. | N | Y |
| RX_START_OF_FRAME_OFFSET | Otherwise | Not present | N | N |
| | <p>NOTE 1—In the “TXVECTOR” and “RXVECTOR” columns, the following apply:</p> <p>Y = Present; N = Not present; O = Optional;</p> <p>MU indicates that the parameter is present once for a VHT SU PPDU and present per user for a VHT MU PPDU. Parameters specified to be present per user are conceptually supplied as an array of values indexed by u, where u takes values 0 to NUM_USERS – 1.</p> <p>NOTE 2—On reception, where valid, the CH_BANDWIDTH_IN_NON_HT parameter is likely to be a more reliable indication of subformat and channel width than the NON_HT_MODULATION and CH_BANDWIDTH parameters, since for non-HT or non-HT duplicate frames, CH_BANDWIDTH is a receiver estimate of the bandwidth, whereas CH_BANDWIDTH_IN_NON_HT is the signaled bandwidth.</p> | | | |

22.2.3 Effects of CH_BANDWIDTH parameter on PPDU format

Table 22-2 shows the PPDU format as a function of the CH_BANDWIDTH and FORMAT parameters.

Table 22-2—PPDU format as a function of CH_BANDWIDTH parameter

| FORMAT | CH_BANDWIDTH | PPDU format |
|--------|--------------|---|
| VHT | TVHT_W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_1. |
| VHT | TVHT_2W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2C. |
| VHT | TVHT_4W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4C. |
| VHT | TVHT_W+W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_2N. |
| VHT | TVHT_2W+2W | The STA transmits a VHT PPDU in TVWS bands (when FORMAT is VHT) with TVHT_MODE_4N. |
| NON_HT | TVHT_W | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using one TVHT_W channel as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_W, then the transmission shall use the primary TVHT_W channel. |
| NON_HT | TVHT_2W | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two adjacent TVHT_W channels as defined in 22.3.10.12. If the BSS bandwidth is wider than TVHT_2W, then the transmission shall use the primary TVHT_2W channel. |
| NON_HT | TVHT_4W | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using four adjacent TVHT_W channels as defined in 22.3.10.12. |
| NON_HT | TVHT_W+W | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of single TVHT_W channels as defined in 22.3.10.12. |
| NON_HT | TVHT_2W+2W | The STA transmits a NON_HT PPDU with NON_HT_MODULATION set to NON_HT_DUP_OFDM using two nonadjacent frequency segments, with each frequency segment consisting of two adjacent TVHT_W channels as defined in 22.3.10.12. |

22.2.4 Support for NON_HT and HT formats

Transmission of HT PPDUs is not supported in Clause 22. Except for Non-HT duplicate transmission defined in 22.3.10.12, transmission of NON_HT is not supported in Clause 22.

Non-HT duplicate transmission is based on Clause 17, unless otherwise stated in Clause 22.

Non-HT PPDU format is same as in Figure 17-1. Overview of the PPDU encoding process is defined in 17.3.2.2 except for following modifications:

Modulation-dependent parameters for Non-HT duplicate mode in TVWS band is defined in Table 22-3. Timing related parameters are defined in Table 22-5. t_{SIGNAL} in Equation (17-2) is equal to 16 multiplied by $X \mu\text{s}$, and t_{DATA} in Equation (17-2) is equal to 20 multiplied by $X \mu\text{s}$ where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

Table 22-3—Modulation-dependent parameters for Non-HT duplicate mode in TVWS band

| Modulation | Coding rate (R) | Coded bits per subcarrier (N_{BPSC}) | Coded bits per OFDM symbol (N_{CBPS}) | Data bits per OFDM symbol (N_{DBPS}) | Data rate (Mb/s) (TVWS band) |
|------------|---------------------|--|---|--|------------------------------|
| BPSK | 1/2 | 1 | 48 | 24 | $6/X$ (see NOTE) |
| BPSK | 3/4 | 1 | 48 | 36 | $9/X$ (see NOTE) |
| QPSK | 1/2 | 2 | 96 | 48 | $12/X$ (see NOTE) |
| QPSK | 3/4 | 2 | 96 | 72 | $18/X$ (see NOTE) |
| 16-QAM | 1/2 | 4 | 192 | 96 | $24/X$ (see NOTE) |
| 16-QAM | 3/4 | 4 | 192 | 144 | $36/X$ (see NOTE) |
| 64-QAM | 2/3 | 6 | 288 | 192 | $48/X$ (see NOTE) |
| 64-QAM | 3/4 | 6 | 288 | 216 | $54/X$ (see NOTE) |

NOTE—In TVWS band, X depends on regulatory domain, i.e., 7.5 for 6 MHz and 7 MHz unit channels and 5.625 for 8 MHz channels.

The timings for preamble are multiplied by X where X is 7.5 for 6 MHz and 7 MHz unit channels and X is 5.625 for 8 MHz channels.

Constructions of L-STF, L-LTF, and L-SIG are same as in 22.3.4.2, 22.3.4.3, and 22.3.4.4 except for the value field parameters in L-SIG.

Interpretation of the bits R1-R4 in the SIGNAL field is modified as in Table 22-4.

Table 22-4—RATE field in L-SIG

| R1-R4 | Modulation | Coding rate |
|-------|------------|-------------|
| 1101 | BPSK | 1/2 |
| 1111 | BPSK | 3/4 |
| 0101 | QPSK | 1/2 |
| 0111 | QPSK | 3/4 |
| 1001 | 16-QAM | 1/2 |
| 1011 | 16-QAM | 3/4 |
| 0001 | 64-QAM | 2/3 |
| 0011 | 64-QAM | 3/4 |

Table 22-5 and Table 22-6 define the timing-related parameters for Non-HT format and location of occupied tones.

Table 22-5—Timing-related constants in Non-HT PPDU

| Parameter | 6 MHz | 7 MHz | 8 MHz | Description |
|------------|---|---|---|--|
| N_{SD} | 96 | 96 | 96 | Number of complex data numbers per BCU |
| N_{SP} | 8 | 8 | 8 | Number of pilot values per BCU |
| N_{ST} | 104 | 104 | 104 | Total number of subcarriers per BCU |
| N_{SR} | 58 | 58 | 58 | Highest data subcarrier index per BCU |
| Δ_f | $\frac{6 \text{ MHz}}{144} = 41\frac{2}{3} \text{ kHz}$ | $\frac{7 \text{ MHz}}{168} = 41\frac{2}{3} \text{ kHz}$ | $\frac{8 \text{ MHz}}{144} = 55\frac{5}{9} \text{ kHz}$ | Subcarrier frequency spacing |
| T_{DFT} | 24 μs | 24 μs | 18 μs | IDFT/DFT period |
| T_{GI} | $6 \mu\text{s} = T_{DFT}/4$ | $6 \mu\text{s} = T_{DFT}/4$ | $4.5 \mu\text{s} = T_{DFT}/4$ | Guard interval duration |
| T_{GIS} | $3 \mu\text{s} = T_{DFT}/8$ | $3 \mu\text{s} = T_{DFT}/8$ | $2.25 \mu\text{s} = T_{DFT}/8$ | Short guard interval duration |

Other timing parameters are derived as in Table 17-5 using the definition of T_{FFT} in Table 22-5. Table 22-6 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Refer to Table 21-6 for parameters definition. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3 TVHT PHY sublayer

22.3.1 Introduction

See 21.3.1.

22.3.2 VHT PPDU format in TVWS bands

A single PPDU format is defined for this PHY: the VHT PPDU format in TVWS bands. Figure 22-1 shows the VHT PPDU format in TVWS bands, with the timing parameters (8 μs and 4 μs) in Figure 21-4 replaced by numbers from Table 22-8.

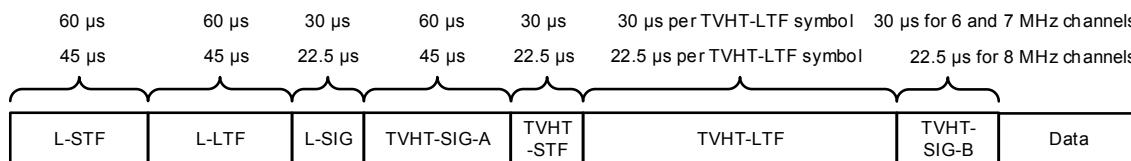

Figure 22-1—VHT PPDU format in TVWS bands

The fields of the VHT PPDU format in TVWS bands are summarized in Table 22-7.

Table 22-6—Tone location in Non-HT PPDU

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N | Description |
|------------------|---|---|--|---|--|--|
| N_{ST} | 104 | 104 | 104 | 104 | 104 | Total number of occupied subcarriers per BCU |
| N_{TT} | 104 | 208 | 208 | 416 | 416 | Total number of occupied subcarriers across all BCUs |
| Subcarrier index | -58 to -33, -31 to -6, +6 to +31, and +33 to +58 | -130 to -105, -103 to -78, -66 to -41, -39 to -14, +14 to +39, +41 to +66, +78 to +103, and +105 to +130 | -58 to -33, -31 to -6, +6 to +31, and +33 to +58 for each BCU | -274 to -249, -247 to -222, -210 to -185, -183 to -158, -130 to -105, -103 to -78, -66 to -41, -39 to -14, +14 to +39, +41 to +66, +78 to +103, +105 to +130, +158 to +183, +185 to +210, +222 to +247, and +249 to +274 | -130 to -105, -103 to -78, -66 to -41, -39 to -14, +14 to +39, +41 to +66, +78 to +103, and +105 to +130 for each BCU | Location of occupied subcarriers for 6 MHz and 8 MHz channel units |
| Subcarrier index | -58 to -33, -31 to -6, +6 to +31, and +33 to +58 | -142 to -117, -115 to -90, -78 to -53, -51 to -26, +26 to +51, +53 to +78, +90 to +115, and +117 to +142 | -58 to -33, -31 to -6, +6 to +31, and +33 to +58 for each BCU | -310 to -285, -283 to -258, -246 to -221, -219 to -194, -142 to -117, -115 to -90, -78 to -53, -51 to -26, +26 to +51, +53 to +78, +90 to +115, +117 to +142, +194 to +219, +221 to +246, +258 to +283, and +285 to +310 | -142 to -117, -115 to -90, -78 to -53, -51 to -26, +26 to +51, +53 to +78, +90 to +115, +117 to +142 for each BCU | Location of occupied subcarriers for 7 MHz |

The TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields exist only in VHT PPDU in TVWS bands. In a TVHT NDP, the Data field is not present. The number of symbols in the TVHT-LTF field, $N_{TVHLLTF}$, can be 1, 2, or 4 and is determined by the total number of space-time streams across all users being transmitted in the VHT PPDU in TVWS bands (see Table 21-13).

22.3.3 Transmitter block diagram

The transmit process for the L-SIG and TVHT-SIG-A fields of a VHT PPDU using one BCU is shown in Figure 21-5, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

Table 22-7—Fields of the VHT PPDU in TVWS bands

| Field | Description |
|------------|----------------------------------|
| L-STF | Non-HT Short Training field |
| L-LTF | Non-HT Long Training field |
| L-SIG | Non-HT SIGNAL field |
| TVHT-SIG-A | TVHT Signal A field |
| TVHT-STF | TVHT Short Training field |
| TVHT-LTF | TVHT Long Training field |
| TVHT-SIG-B | TVHT Signal B field |
| Data | The Data field includes the PSDU |

The transmit process for generating the TVHT-SIG-B field of a VHT SU PPDU and VHT MU PPDU using one frequency segment is shown in Figure 21-5 and Figure 21-7, respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth.

The transmit process for generating the Data field of a SU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encodings, using one BCU, is shown Figure 21-10 and Figure 21-11, respectively, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth. Single BCC encoder shall be assumed in Figure 21-10.

The transmit process for generating the Data field of a MU PPDU in TVHT_MODE_1, TVHT_MODE_2C, or TVHT_MODE_4C with BCC and LDPC encoding is shown in Figure 21-12, with “TVHT” replacing “VHT” and with bandwidth corrected according to TVHT bandwidth. In the case of BCC encoding, single BCC encoder shall be assumed in Figure 21-12.

Figure 22-2 and Figure 22-3 show the transmit process for generating the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC and LDPC encoding, respectively, where the subcarrier allocation block allocates the subcarriers for the two IDFTs in each transmit path by the subcarrier mapper as described in 22.3.10.11.

22.3.4 Overview of the PPDU encoding process

22.3.4.1 General

This subclause provides an overview of the VHT PPDU in TVWS bands encoding process.

22.3.4.2 Construction of L-STF

Construct the L-STF field as defined in 22.3.8.2.2 following the procedure in 21.3.4.2 reading “Clause 22” for references to “Clause 21” except the following:

- c) Duplication and phase rotation: Duplicate the L-STF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

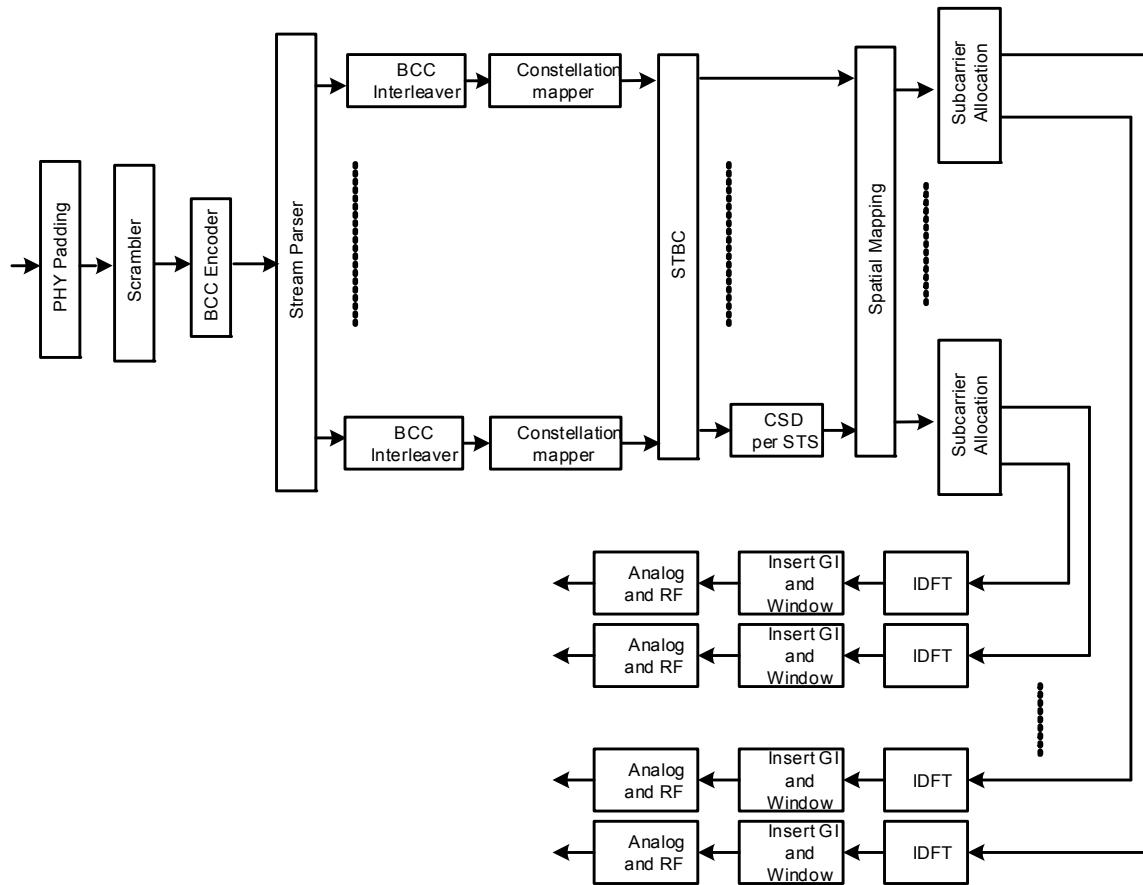

Figure 22-2—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with BCC encoding

22.3.4.3 Construction of the L-LTF

Construct the L-LTF field as defined in L-LTF definition following the procedure in 21.3.4.3 reading “Clause 22” for references to “Clause 21” except the following:

- c) Duplication and phase rotation: Duplicate the L-LTF over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

22.3.4.4 Construction of L-SIG

Construct the L-SIG field as the SIGNAL field defined by 22.3.8.2.4 following the procedure in 21.3.4.4 reading “Clause 22” for references to “Clause 21” except the following:

- a) For a VHT PPDU in TVWS bands, set the RATE subfield in the SIGNAL field R1-R4 to 1101. Set the Length, Parity, and Tail bits in the SIGNAL field as defined in 22.3.8.2.4. Add calculated one bit parity and N_{tail} bits into the L-SIG symbol.
- f) Duplication and phase rotation: Duplicate the L-SIG field over the BCUs of the CH_BANDWIDTH. Apply appropriate phase rotation as defined in 22.3.7.

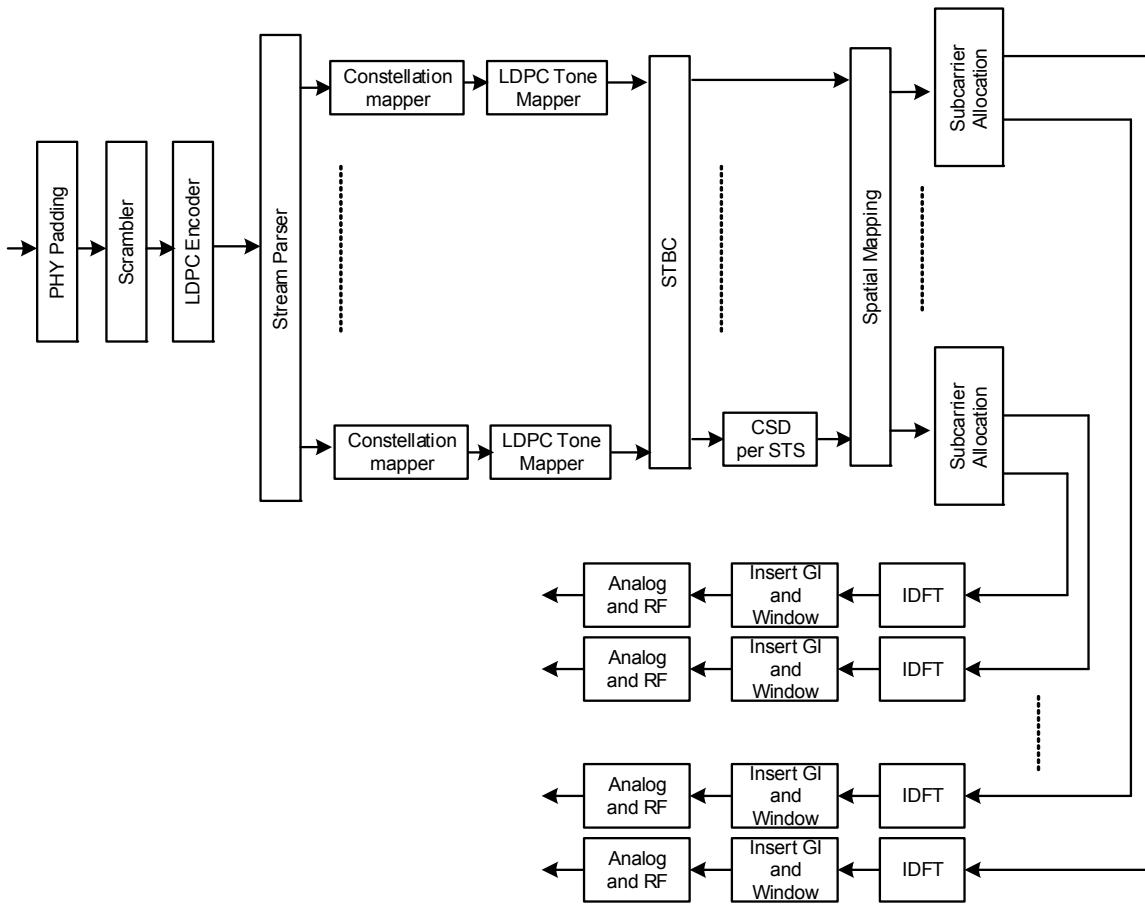

Figure 22-3—Transmitter block diagram for the Data field of a TVHT_MODE_2N or TVHT_MODE_4N SU PPDU with LDPC encoding

22.3.4.5 Construction of TVHT-SIG-A

The TVHT-SIG-A field consists of two symbols, TVHT-SIG-A1 and TVHT-SIG-A2, constructed as defined in 22.3.8.3.3 following the procedure in 21.3.4.5 reading “Clause 22” for references to “Clause 21” except the following:

- e) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.
- f) Duplication and phase rotation: Duplicate TVHT-SIG-A1 and TVHT-SIG-A2 over all of the BCUs of the CH_BANDWIDTH. Apply the appropriate phase rotation as defined in 22.3.7.
- i) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.6 Construction of TVHT-STF

Construct the TVHT-STF field for each BCU as defined in 22.3.8.3.4 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.6 reading “Clause 22” for references to “Clause 21” except the following:

- b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.
- f) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-STF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.4.

22.3.4.7 Construction of TVHT-LTF

Construct the TVHT-LTF field for each BCU as defined in 22.3.8.3.5 with channel bandwidth being 40 MHz, following the procedure in 21.3.4.7 reading “Clause 22” for references to “Clause 21” except the following:

- b) Phase rotation: Apply appropriate phase rotation as defined in 22.3.7.
- g) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-LTF subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.5.

22.3.4.8 Construction of TVHT-SIG-B

The TVHT-SIG-B field is constructed per-user for each BCU as defined in 21.3.4.8 with channel bandwidth being 40 MHz, reading “Clause 22” for references to “Clause 21” except the following:

- i) Pilot insertion: Insert pilots following the steps defined in 22.3.10.10.
- m) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.
- o) Insert GI and apply windowing: Prepend a GI (LONG_GI) and apply windowing as defined in 22.3.7.

In multiple BCU transmissions TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N, the TVHT-SIG-B subcarriers of one BCU are repeated in each BCU with an appropriate phase rotation factor being applied as described in 22.3.8.3.6.

22.3.4.9 Construction of the Data field in an SU PPDU

22.3.4.9.1 Using BCC

The construction of the Data field in a VHT SU PPDU with BCC encoding proceeds as defined in 21.3.4.9.1 reading “Clause 22” for references to “Clause 21” except the following:

- d) BCC encoder: Only one encoder is used.
- f) Segment parser is omitted.
- i) Segment deparser is omitted.
- l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.
- n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.
- o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.
- p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.9.2 Using LDPC

The construction of the Data field in a VHT SU PPDU with LDPC encoding proceeds as defined in 21.3.4.9.2 reading “Clause 22” for references to “Clause 21” except the following:

- f) Segment parser is omitted.
- i) Segment deparser is omitted.
- l) CSD: Apply CSD for each space-time stream and frequency segment as described in 22.3.8.3.2.
- n) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7. When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 21.3.10.11.1.
- o) IDFT: When in TVHT_MODE_2N or VHT_MODE_4N, allocate the subcarriers for the two IDFTs in each transmit path as described in 22.3.10.11.
- p) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.

22.3.4.10 Construction of the Data field in an MU PPDU

22.3.4.10.1 General

See 21.3.4.10.1.

22.3.4.10.2 Using BCC

A Data field with BCC encoding is constructed using the process defined in 22.3.4.9.1 before the spatial mapping block and repeated for each user that uses BCC encoding.

22.3.4.10.3 Using LDPC

A Data field with LDPC encoding is constructed using the process defined in 22.3.4.9.2 before the spatial mapping block and repeated for each user that uses LDPC encoding.

22.3.4.10.4 Combining to form an MU PPDU

The per-user data is combined as defined in 21.3.4.10.4 except the following:

- a) Spatial mapping: The Q matrix is applied as defined in 22.3.10.11. The combining of all user data is done in this block.
- b) Phase rotation: Apply the appropriate phase rotations as defined in 22.3.7.
- d) Insert GI and apply windowing: Prepend a GI (SHORT_GI or LONG_GI) and apply windowing as defined in 22.3.7.
- e) Analog and RF: Upconvert the resulting complex baseband waveform associated with each transmit chain to an RF signal according to the center frequency of the desired channel and transmit. Refer to 22.3.7 and 22.3.8 for details.

22.3.5 Modulation and coding scheme (MCS)

The MCS is a value that determines the modulation and coding used in the Data field of the PPDU. It is a compact representation that is carried in the TVHT-SIG-A field for SU PPDUs and in the TVHT-SIG-B field for MU PPDUs. Rate-dependent parameters for the full set of MCSs are shown in Table 22-26 to Table 22-37 (in 22.5). These tables give rate-dependent parameters for MCSs with indices 0 to 9, with number of spatial streams from 1 to 4 and bandwidth options of one, two, or four BCUs. Equal modulation (EQM) is applied to all streams for a particular user.

Table 22-26 to Table 22-29 show rate-dependent parameters for MCSs for one to four streams for one BCU operation. Table 22-30 to Table 22-33 show rate-dependent parameters for MCSs for one to four streams for dual BCU operation. Table 22-34 to Table 22-37 show rate-dependent parameters for MCSs for one to four streams for quad BCU operation.

22.3.6 Timing-related parameters

Table 22-8 and Table 22-9 define the timing-related parameters for VHT format and location of occupied tones in TVWS bands.

Table 22-8—Timing-related parameters

| Parameter | 6 MHz | 7 MHz | 8 MHz | Description |
|------------|---|---|---|--|
| N_{SD} | 108 | 108 | 108 | Number of complex data numbers per BCU |
| N_{SP} | 6 | 6 | 6 | Number of pilot values per BCU |
| N_{ST} | 114 | 114 | 114 | Total number of subcarriers per BCU |
| N_{SR} | 58 | 58 | 58 | Highest data subcarrier index per BCU |
| Δ_F | $\frac{6 \text{ MHz}}{144} = 41\frac{2}{3} \text{ kHz}$ | $\frac{7 \text{ MHz}}{168} = 41\frac{2}{3} \text{ kHz}$ | $\frac{8 \text{ MHz}}{144} = 55\frac{5}{9} \text{ kHz}$ | Subcarrier frequency spacing |
| T_{DFT} | 24 μs | 24 μs | 18 μs | IDFT/DFT period |
| T_{GI} | $6 \mu\text{s} = T_{DFT}/4$ | $6 \mu\text{s} = T_{DFT}/4$ | $4.5 \mu\text{s} = T_{DFT}/4$ | Guard interval duration |

The rest of the timing parameters are derived as in Table 21-5 using the definition of T_{DFT} in Table 22-8. Table 22-9 defines the number of occupied tones and their location in all transmission modes. Zero denotes the DC tone of any contiguous segment.

Table 22-9—Tone location

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N | Description |
|-----------|-------------|--------------|--------------|--------------|--------------|--|
| N_{ST} | 114 | 114 | 114 | 114 | 114 | Total number of occupied subcarriers per BCU |
| N_{TT} | 114 | 228 | 228 | 456 | 456 | Total number of occupied subcarriers across all BCUs |

Table 22-9—Tone location (continued)

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N | Description |
|------------------|-------------------------|--|--------------------------------------|--|---|--|
| Subcarrier index | -58 to -2 and +2 to +58 | -130 to -74, -70 to -14, +14 to +70, and +74 to +130 | -58 to -2 and +2 to +58 for each BCU | -274 to -218, -214 to -158, -130 to -74, -70 to -14, +14 to +70, +74 to +130, +158 to +214, and +218 to +274 | -130 to -74, -70 to -14, +14 to +70, and +74 to +130 for each BCU | Location of occupied subcarriers for 6 MHz and 8 MHz channel units |
| Subcarrier index | -58 to -2 and +2 to +58 | -142 to -86, -82 to -26, +26 to +82, and +86 to +142 | -58 to -2 and +2 to +58 for each BCU | -310 to -254, -250 to -194, -142 to -86, -82 to -26, +26 to +82, +86 to +142, +194 to +250, and +254 to +310 | -142 to -86, -82 to -26, +26 to +82, and +86 to +142 for each BCU | Location of occupied subcarriers for 7 MHz |

Refer to Table 21-6 for the frequency parameters. The definitions in the table are applicable to Clause 22 with the exception that in each transmission mode in Clause 22 $N_{CBPSSI} = N_{CBPSS}$ for SU and MU PPDUs.

22.3.7 Mathematical description of signals

For a description of the conventions used for the mathematical description of the signals, see 17.3.2.5.

For all VHT PPDU in TVWS bands transmission modes the signal is transmitted on subcarriers as defined in Table 22-9.

Let

$$\begin{aligned}
 f_{c, \text{idx}0} &= \text{dot11CurrentTVHTChannelCenterFrequencyIndex0} \text{ (see Table 22-17)} \\
 f_{c, \text{idx}1} &= \text{dot11CurrentTVHTChannelCenterFrequencyIndex1} \text{ (see Table 22-17)} \\
 f_{PW, \text{idx}} &= \text{dot11CurrentPrimaryChannel} \text{ (see Table 22-17), where TVHT_W refers to a BCU of} \\
 &\quad 6 \text{ MHz, 7 MHz, or 8 MHz} \\
 f_{CH, \text{start}} &= \text{Channel starting frequency given in the operation class (E.1)}
 \end{aligned}$$

When `dot11CurrentTVHTChannelWidth` is `TVHT_W`, `TVHT_2W`, `TVHT_W+W`, `TVHT_4W`, or `TVHT_2W+2W`, $f_{PW, \text{idx}}$ and $f_{c, \text{idx}1}$ shall have the relationship specified in Equation (22-1).

$$f_{PW, \text{idx}} = f_{c, \text{idx}0} + n_{PW} \tag{22-1}$$

where

$$N_{PW} = \begin{cases} 1 & \text{in } \text{TVHT_W} \text{ and } \text{TVHT_W+W} \\ 2 & \text{in } \text{TVHT_2W} \text{ and } \text{TVHT_2W+2W} \\ 4 & \text{in } \text{TVHT_4W} \end{cases}$$

n_{PW} is an integer with possible range $0 \leq n_{PW} \leq N_{PW} - 1$

When `dot11CurrentTVHTChannelWidth` is `TVHT_W`, `TVHT_2W`, `TVHT_W+W`, `TVHT_4W`, or `TVHT_2W+2W`,

- The primary `TVHT_W` channel is the channel with `TVHT_W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{PW, idx}$, where $f_{PW, idx}$ is given in Equation (22-1).

When `dot11CurrentTVHTChannelWidth` is `TVHT_2W`, `TVHT_4W`, or `TVHT_2W+2W`,

- The secondary `TVHT_W` channel is the channel with `TVHT_W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{SW, idx}$, where $f_{SW, idx}$ is given in Equation (22-2).

$$f_{SW, idx} = \begin{cases} f_{PW, idx} + 1, & \text{if } n_{PW} \text{ is even} \\ f_{PW, idx} - 1, & \text{if } n_{PW} \text{ is odd} \end{cases} \quad (22-2)$$

When `dot11CurrentTVHTChannelWidth` is `TVHT_W+W`,

- The secondary `TVHT_W` channel is the channel with `TVHT_W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{SW, idx}$, where $f_{SW, idx}$ is given in Equation (22-3).

$$f_{SW, idx} = f_{c, idx1} \quad (22-3)$$

When `dot11CurrentTVHTChannelWidth` is `TVHT_2W`, `TVHT_4W`, or `TVHT_2W+2W`,

- The primary `TVHT_2W` channel is the channel with `TVHT_2W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{P2W, idx} + 0.5 \times TVHT_W$ MHz, where $f_{P2W, idx}$ is given in Equation (22-4).
- The secondary `TVHT_2W` channel is the channel with `TVHT_2W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{S2W, idx} + 0.5 \times TVHT_W$ MHz, where $f_{S2W, idx}$ is given in Equation (22-5).

$$f_{P2W, idx} = f_{c, idx0} + 2 \times n_{P2W} \quad 0 \leq n_{P2W} \leq N_{P2W} - 1 \quad N_{P2W} = \begin{cases} 1 & \text{in } TVHT_2W \text{ and } TVHT_2W+2W \\ 2 & \text{in } TVHT_4W \end{cases} \quad (22-4)$$

When `dot11CurrentTVHTChannelWidth` is `TVHT_4W`,

- The secondary `TVHT_2W` channel is the channel with `TVHT_2W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{S2W, idx} + 0.5 \times TVHT_W$ MHz, where $f_{S2W, idx}$ is given in Equation (22-5).

$$f_{S2W, idx} = \begin{cases} f_{P2W, idx} + 2, & \text{if } n_{P2W} \text{ is even} \\ f_{P2W, idx} - 2, & \text{if } n_{P2W} \text{ is odd} \end{cases} \quad (22-5)$$

When `dot11CurrentTVHTChannelWidth` is `TVHT_2W+2W`,

- The secondary `TVHT_2W` channel is the channel with `TVHT_2W` bandwidth centered at $f_{CH, start} + TVHT_W \times f_{S2W, idx} + 0.5 \times TVHT_W$ MHz, where $f_{S2W, idx}$ is given in Equation (22-3).

The transmitted signal is defined in complex baseband signal notation. The actual transmitted signal is related to the complex baseband signal by the relation shown in Equation (21-11) in Clause 21.

$f_c^{(i_{seg})}$ represents the center frequency of the PPDU transmitted in frequency segment i_{seg} in each transmission mode in Clause 22.

Note that in `TVHT_MODE_2C` and `TVHT_MODE_4C`, the gap between the center frequencies of the adjacent segments is as shown in Table 22-9.

Table 22-10 shows $f_c^{(i_{\text{Seg}})}$ as a function of dot11CurrentTVHTChannelWidth.

Table 22-10—Center frequency of a PPDU transmitted in frequency segment i_{Seg}

| dot11CurrentTVHTChannelWidth | CH_BANDWIDTH | $f_c^{(i_{\text{Seg}})} = f_{\text{CH, start}} + \text{TVHT_W} \times f_{(i_{\text{Seg}})} + \text{Correction}$ | |
|------------------------------|--------------|--|---|
| | | $(f_{(0)}, \text{Correction})$ | $(f_{(1)}, \text{Correction})$ |
| TVHT_W | TVHT_W | $(f_{c, \text{idx0}}, 0)$ | — |
| TVHT_2W | TVHT_W | $(f_{\text{PW, idx}}, 0)$ | — |
| | TVHT_2W | $(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$ | — |
| TVHT_W+W | TVHT_W | $(f_{\text{PW, idx}}, 0)$ | |
| | TVHT_W+W | $(f_{c, \text{idx0}}, 0)$ | $(f_{c, \text{idx1}}, 0)$ |
| TVHT_4W | TVHT_W | $(f_{\text{PW, idx}}, 0)$ | — |
| | TVHT_2W | $(f_{\text{P2W, idx}}, 0.5 \times \text{TVHT_W})$ | — |
| | TVHT_4W | $(f_{c, \text{idx0}}, 1.5 \times \text{TVHT_W})$ | — |
| TVHT_2W+2W | TVHT_W | $(f_{c, \text{idx0}}, 0)$ | |
| | TVHT_2W | $(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$ | |
| | TVHT_2W+2W | $(f_{c, \text{idx0}}, 0.5 \times \text{TVHT_W})$ | $(f_{c, \text{idx1}}, 0.5 \times \text{TVHT_W})$ |

NOTE—Transmitted signals in TVHT_MODE_2N and TVHT_MODE_4N might have different impairments such as phase offset or phase noise between the two frequency segments in TVHT_MODE_2N or TVHT_MODE_4N, which is not shown in Equation (21-11) for simplicity. See 22.3.17.3.

The transmitted RF signal is derived by upconverting the complex baseband signal, which consists of several fields. The signal transmitted on frequency segment i_{Seg} of transmit chain i_{TX} is described by Equation (21-12) in 21.3.7. The timing boundaries for the various fields are shown in Figure 21-17.

Each field is defined as the summation of one or more subfields, where each subfield is defined to be an inverse discrete Fourier transform as specified in Equation (21-13) and where references to Table 21-5, Table 21-6, Table 21-8, Table 22-9, Table 21-10, and Table 21-11 are replaced by the corresponding descriptions in Clause 22 including Table 22-8, Table 22-9, Table 22-11, and Table 22-12.

Table 22-11 summarizes the various values of $N_{\text{Field}}^{\text{Tone}}$ as a function of number of BCUs (TVHT_MODE_1 has one BCU, TVHT_MODE_2C and TVHT_MODE_2N have two BCUs, and TVHT_MODE_4C and TVHT_MODE_4N have four BCUs).

Table 22-11—Tone scaling factor and guard interval duration values for PHY fields

| Field | $N_{\text{Field}}^{\text{Tone}}$ as a function of the number of BCUs | | | Guard interval duration |
|-----------------------------------|--|-----|------|------------------------------------|
| | One | Two | Four | |
| L-STF | 24 | 48 | 96 | — |
| L-LTF | 104 | 208 | 416 | T_{GI2} |
| L-SIG | 104 | 208 | 416 | T_{GI} |
| TVHT-SIG-A | 104 | 208 | 416 | T_{GI} |
| TVHT-STF | 24 | 48 | 96 | - |
| TVHT-LTF | 114 | 228 | 456 | T_{GI} |
| TVHT-SIG- | 114 | 228 | 456 | T_{GI} |
| VHT-Data | 114 | 228 | 484 | T_{GI} or T_{GIS} (see NOTE 2) |
| NON_HT_DUP_OFDM-Data (see NOTE 1) | 104 | 208 | 416 | T_{GI} |

NOTE 1—For notational convenience, NON_HT_DUP_OFDM-Data is used as a label for the Data field of a NON_HT PPDU with format type NON_HT_DUP_OFDM.

NOTE 2— T_{GI} denotes guard interval duration when TXVECTOR parameter GI_TYPE equals LONG_GI, T_{GIS} denotes short guard interval duration when TXVECTOR parameter GI_TYPE equals SHORT_GI.

In addition, the parameter $\Upsilon_{k, \text{BW}}$ in Equation (21-13) is replaced by $\Upsilon_{k, M}$ as defined in Table 22-12.

Table 22-12—Transmission mode and Gamma sub k, M

| Transmission mode | $\Upsilon_{k, M}$ |
|-------------------------------|---|
| TVHT_MODE_1, TVHT_MODE_2N | $\Upsilon_{k, 1}$ per segment |
| TVHT_MODE_2C, TVHT_MODE_4N | $\Upsilon_{k, 2}$ per two contiguous segments |
| TVHT_MODE_4C | $\Upsilon_{k, 4}$ |

For TVHT_MODE_1 and TVHT_MODE_2N PPDU transmission,

$$\Upsilon_{k, 1} = \begin{cases} 1, & k < 0 \\ j, & k \geq 0 \end{cases} \quad (22-6)$$

For TVHT_MODE_2C and TVHT_MODE_4N PPDU transmission,

$$\Upsilon_{k, 2} = \begin{cases} 1, & k < -72 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } k < -84 \text{ for } 7 \text{ MHz channels} \\ -1, & k \geq -72 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } k \geq -84 \text{ for } 7 \text{ MHz channels} \end{cases} \quad (22-7)$$

For TVHT_MODE_4C PPDU transmission,

$$\Upsilon_{k,4} = \begin{cases} 1, & k < -216 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } k < -252 \text{ for } 7 \text{ MHz channels} \\ -1, & -216 \leq k < 0 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } -252 \leq k < 0 \text{ for } 7 \text{ MHz channels} \\ 1, & 0 \leq k < 72 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } 0 \leq k < 84 \text{ for } 7 \text{ MHz channels} \\ -1, & k \geq 72 \text{ for } 6 \text{ MHz and } 8 \text{ MHz channels, } k \geq 84 \text{ for } 7 \text{ MHz channels} \end{cases} \quad (22-8)$$

22.3.8 TVHT preamble

22.3.8.1 Introduction

A TVHT preamble is defined to carry the required information to operate in either single user or multi-user mode.

22.3.8.2 Non-TVHT portion of TVHT format preamble

22.3.8.2.1 Cyclic shift definition for pre-TVHT modulated fields

The cyclic shift value $T_{CS}^{i_{TX}}$ for the L-STF, L-LTF, L-SIG, and TVHT-SIG-A fields of the PPDU for transmit chain i_{TX} out of a total of N_{TX} is defined in Table 21-10 with a scaling factor to account for the change in sampling clock frequency. The CSD delay values shall be multiplied by the corresponding correction values for the 6 MHz, 7 MHz, and 8 MHz channels, respectively.

The scaling factor for transmissions over 6 MHz and 7 MHz channels is 7.5.

The scaling factor for transmissions over 8 MHz channels is 5.625.

As an example, the CSD value for antenna-2 with 2-transmit antennas is -200 ns, and the corresponding CSD value for 6 MHz channels is $-1.5 \mu\text{s}$.

22.3.8.2.2 L-STF definition

The L-STF field for each BCU in any transmission mode is defined by Equation (19-9) in 19.3.9.3.3.

The time domain representation of the signal on BCU i_{Seg} in transmit chain i_{TX} is specified in Equation (21-20), where $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

22.3.8.2.3 L-LTF definition

The L-LTF field for each BCU in any transmission mode is defined by Equation (19-12) in 19.3.9.3.4.

Note that these equations do not include the phase rotations as defined in Table 22-12.

The time domain representation of the signal in transmit chain i_{TX} is specified in Equation (21-23), where $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.2.4 L-SIG definition

The L-SIG field is used to communicate data rate and length information. The structure of the L-SIG field is defined in Figure 17-5.

In a VHT PPDU, the RATE field shall be set to the value corresponding to 6 Mb/s in the 20 MHz channel spacing column of Table 17-6.

In a NON_HT_DUP PPDU, the RATE field is defined in 17.3.4.2 using the L_DATARATE parameter in the TXVECTOR.

The LENGTH field shall be set to the value given by Equation (22-9).

$$\text{LENGTH} = [(\text{TXTIME} - (20 \cdot \text{scaling factor})) / (4 \cdot \text{scaling factor})] \times 3 - 3 \quad (22-9)$$

where the scaling factor is defined in 22.3.8.2.1 and TXTIME is defined in 22.4.3. In a non-HT duplicate PPDU, the LENGTH field is defined in 17.3.4.3 using the L_LENGTH parameter in the TXVECTOR.

The time domain waveform of the L-SIG field in each BCU is specified in Equation (21-25) using $N_{20\text{MHz}} = 2$, where $\Upsilon_{k,\text{BW}}$ is replaced by $\Upsilon_{k,\text{M}}$ as defined in Table 22-12 and where the rest of the variables are specified in 22.3.7.

22.3.8.3 TVHT portion of TVHT format preamble

22.3.8.3.1 Introduction

The TVHT portion of the VHT format preamble consists of the TVHT-SIG-A, TVHT-STF, TVHT-LTF, and TVHT-SIG-B fields.

Notational conventions are specified in 21.3.8.3.1.

22.3.8.3.2 Cyclic shift for TVHT modulated fields

The definition, application, and CSD values are defined in 21.3.8.3.2 with scaling factors as defined in 22.3.8.2.1.

22.3.8.3.3 TVHT-SIG-A definition

The TVHT-SIG-A field carries information required to interpret VHT PPDU in TVWS bands and is defined in 21.3.8.3.3.

The time domain waveform of the TVHT-SIG-A field in each BCU is specified in Equation (21-28), where $N_{20\text{MHz}} = 2$ and where the rest of the variables are specified in 22.3.7.

Fields in the TVHT-SIG-A fields are the same as in Table 21-12 except for the description B0-B1 (BW) and B10-B21 in TVHT-SIG-A1. Description of B0-B1 is specified in Table 22-13

Table 22-13—B0-B1 (BW) in TVHT-SIG-A1

| B0-B1 | TVHT_MODE |
|-------|-------------------------------|
| 00 | Not used |
| 10 | TVHT_MODE_1 |
| 01 | TVHT_MODE_2C and TVHT_MODE_2N |
| 11 | TVHT_MODE_4C and TVHT_MODE_4N |

Description of B10-B21 (N_{STS} /Partial AID) is specified as follows:

For an MU PPDU:

- N_{STS} is divided into 4 user positions of 3 bits each. User position p , where $0 \leq p \leq 3$, uses bits $B(10+3p)$ - $B(12+3p)$. The number of space-time streams for user u is indicated at user position $p = \text{USER_POSITION}[u]$ where $u = 0, 1, \dots, \text{NUM_USER} - 1$ and where the notation $A[b]$ denotes the value of array A at index b . Zero space-time streams are indicated at positions not listed in the `USER_POSITION` array.
- Set to 0 for 0 space time streams
- Set to 1 for 1 space time stream
- Set to 2 for 2 space time streams
- Set to 3 for 3 space time streams
- Values 4 to 7 are reserved

For an SU PPDU:

B10-B12

- Set to 0 for 1 space time stream
- Set to 1 for 2 space time streams
- Set to 2 for 3 space time streams
- Set to 3 for 4 space time streams
- Values 4 to 7 are reserved

B13-B21

- Partial AID: Set to the value of the TXVECTOR parameter `PARTIAL_AID`. Partial AID provides an abbreviated indication of the intended recipient(s) of the PSDU (see 10.20).

22.3.8.3.4 TVHT-STF definition

The TVHT-STF field for each BCU in any transmission mode is defined by Equation (21-30) in 21.3.8.3.4.

The time domain waveform of the TVHT-STF field in each BCU is specified in Equation (21-33), where $\Upsilon_{k, \text{BW}}$ is replaced by $\Upsilon_{k, M}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.5 TVHT-LTF definition

The TVHT-LTF field is defined in 21.3.8.3.5.

The TVHT-LTF sequence transmitted for each BCU in any transmission mode is defined by Equation (21-37).

The time domain waveform of the TVHT-LTF field in each BCU is specified in Equation (21-42), where $\Upsilon_{k, \text{BW}}$ is replaced by $\Upsilon_{k, M}$ as defined in Table 22-12 and where N_{SR} is defined in Table 22-8.

22.3.8.3.6 TVHT-SIG-B definition

The TVHT-SIG-B field for each BCU in any transmission mode is as defined in 21.3.8.3.6 for 40 MHz bandwidth.

The 27 TVHT-SIG-B bits are first repeated twice, then BCC encoded, interleaved, and made into constellations as described by Figure 21-22 and the corresponding text in 21.3.8.3.6. If the channel bandwidth of the current PPDU is `TVHT_W`, then the IDFT is conducted as defined in 21.3.8.3.6.

The time domain waveform for the TVHT-SIG-B field in each BCU in a VHT PPDU is the same as Equation (21-47) with channel bandwidth being 40 MHz. If the channel bandwidth of the current PPDU is larger than TVHT_W, then the TVHT-SIG-B subcarriers as described above are repeated in each BCU, with appropriate phase rotation factors $\Upsilon_{k,M}$ being applied as shown in Table 22-12, before conducting IDFT.

22.3.9 Transmission of NON-HT and HT PPDUs with multiple antennas

A TVHT STA that transmits a NON-HT PPDU shall apply the cyclic shifts defined in 22.3.8.2.1 for L-STF, L-LTF, and L-SIG fields of the PPDU.

22.3.10 Data field

22.3.10.1 General

See 21.3.10.1, with “TVHT” replacing “VHT”.

22.3.10.2 SERVICE field

See 21.3.10.2, with “TVHT” replacing “VHT”.

22.3.10.3 CRC calculation for TVHT-SIG-B

The CRC calculation and insertion is illustrated in Figure 21-23.

The value of the CRC field shall be the 1s complement of Equation (21-59) with the values of N set to 21 for all Modes.

22.3.10.4 Scrambler

See 21.3.10.4 with “TVHT” replacing “VHT”.

22.3.10.5 Coding

See 21.3.10.5 with “TVHT” replacing “VHT”.

22.3.10.6 Stream parser

After coding and puncturing, the data bit streams at the output of the FEC encoders are processed in groups of N_{CBPS} bits. Each of these groups is rearranged into N_{SS} blocks of N_{CBPSS} bits ($N_{SS,u}$ blocks of $N_{CBPSS,u}$ bits in the case of an MU transmission). This operation is referred to as *stream parsing* and is described in 21.3.10.6.

22.3.10.7 Segment parser

The segment parser as described in 21.3.10.7 is not used in Clause 22. All modes of operation use a common interleaver in the case of BCC or use a common tone mapper in the case of LDPC.

22.3.10.8 BCC interleaver

The BCC interleaver and deinterleaver for one BCU (TVHT_MODE_1) is as defined in 21.3.10.8 for 40 MHz.

The BCC interleaver and deinterleaver for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuse the same formulas as described in 21.3.10.8 for 40 MHz with new values for N_{COL} , N_{ROW} , and N_{ROT} as defined in Table 22-14.

Table 22-14—Number of rows and columns in the interleaver

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C, TVHT_MODE_2N | TVHT_MODE_4C, TVHT_MODE_4N |
|-------------------------------|----------------------|-------------------------------|-------------------------------|
| N_{COL} | 18 | 27 | 48 |
| N_{ROW} | $6 \times N_{BPSCS}$ | $8 \times N_{BPSCS}$ | $9 \times N_{BPSCS}$ |
| N_{ROT} ($N_{SS} \leq 4$) | 29 | 46 | 78 |

22.3.10.9 Constellation mapping

22.3.10.9.1 General

The mapping between bits at the output of the interleaver and complex constellation points is as described in 21.3.10.9.1.

The streams of complex numbers in frequency subblock l for user u are denoted

$$d_{k, i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1; \quad i = 1, \dots, N_{SS, u}; \quad n = 0, 1, \dots, N_{SYM} - 1; \\ l = 0 \text{ for all transmission modes.}$$

22.3.10.9.2 LDPC tone mapping

The LDPC tone mapping for one BCU (TVHT_MODE_1) is as defined in 21.3.10.9.2 for 40 MHz.

The LDPC tone mapping for TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N reuses the same formulas as described in 21.3.10.9.2 for 40 MHz with values for D_{TM} as defined in Table 22-15.

Table 22-15—LDPC Tone Mapping Distance for each transmission mode

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C, TVHT_MODE_2N | TVHT_MODE_4C, TVHT_MODE_4N |
|-----------|-------------|-------------------------------|-------------------------------|
| D_{TM} | 6 | 8 | 9 |

For all Clause 22 transmission Modes, the LDPC tone mapping for LDPC-coded streams corresponding to user u is done by permuting the stream of complex numbers

$$d_{t(k), i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1; \quad i = 1, \dots, N_{SS, u}; \quad n = 0, 1, \dots, N_{SYM} - 1; \\ l = 0 \text{ for all transmission modes.}$$

generated by the constellation mappers, to obtain

$$d'_{t(k), i, n, l, u}; \quad k = 0, 1, \dots, N_{SD} - 1; \quad i = 1, \dots, N_{SS, u}; \quad n = 0, 1, \dots, N_{SYM} - 1; \\ l = 0 \text{ for all transmission modes.}$$

where

$$t(k) = D_{TM} \left(k \bmod \frac{N_{SD}}{D_{TM}} \right) + \left\lfloor \frac{k \cdot D_{TM}}{N_{SD}} \right\rfloor \quad \text{for all transmission modes}$$

22.3.10.9.3 Segment deparser

The segment deparser is not used in Clause 22 as no segment parser is used in Clause 22.

22.3.10.9.4 Space-time block coding

See 21.3.10.9.4 with “TVHT” replacing “VHT”.

22.3.10.10 Pilot subcarriers

For TVHT_MODE_1 transmission, six pilot tones shall be inserted in subcarriers -53, -25, -11, 11, 25, and 53. The pilots are generated as described in 21.3.10.10 for 40 MHz transmission.

When multiple BCUs are used (TVHT_MODE_2C, TVHT_MODE_2N, TVHT_MODE_4C, and TVHT_MODE_4N), each BCU shall use the same pilot tones, which are generated as described in 21.3.10.10 for 40 MHz transmission.

22.3.10.11 OFDM modulation transmission in VHT format

For TVHT transmissions, the signal from transmit chain i_{TX} , $1 \leq i_{TX} \leq N_{TX}$ shall be as specified in Equation (21-95), where $\Upsilon_{k, \text{BW}}$ is replaced by $\Upsilon_{k, M}$ as defined in Table 22-12 and where N_{SR} and Δ_F are defined in Table 22-8.

For TVHT_MODE_1 transmission, parameters shall be selected to be the same with 40 MHz VHT transmission as defined in 21.3.10.11.1.

For multi-segment transmissions TVHT_MODE_2C and TVHT_MODE_4C, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated to the IDFT block according to the subcarrier mapping as specified in Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier.

For multi-segment transmissions TVHT_MODE_2N and TVHT_MODE_4N, each frequency segment shall follow the waveform as described in Equation (21-95), and the data and pilot subcarriers are allocated by the subcarrier allocation block, as shown in Figure 22-2, to the two IDFT blocks according to the subcarrier mapping as specified in Equation (21-95) and Table 22-9 in consecutive order from the lowest subcarrier to the highest subcarrier in each of the two frequency segments, the lower half of the subcarriers are mapped to the IDFT corresponding to the lower frequency segment, and the upper half of the subcarriers are mapped to the IDFT corresponding to the upper frequency segment.

22.3.10.12 Non-HT duplicate transmission

When the TXVECTOR parameter FORMAT is NON_HT and the TXVECTOR parameter NON_HT_MODULATION is NON_HT_DUP_OFDM, the transmitted PPDU shall be a non-HT duplicate. Multiple BCUs non-HT duplicate transmission is used to transmit to TVHT STAs that may be present in a part of a channel.

For non-HT duplicate transmission, the Data field shall be as defined in 21.3.10.12, with “TVHT” replacing “VHT” and with references to “Clause 22” replacing references to “Clause 21”, using the parameter values

defined in Table 22-16. The Data field shall be as defined by Equation (21-100) with following modifications. $N_{20\text{MHz}}$ is defined in Table 22-16. $K_{\text{Shift}}(i)$ in Equation (21-100) is replaced by $K_{\text{Shift}}(i) = (N_{20\text{MHz}} - 1 - 2i) \cdot 32 + 8 \cdot \lfloor N_{20\text{MHz}}/4 \rfloor + 8 \cdot \lfloor N_{20\text{MHz}}/8 \rfloor - (16 \cdot \lfloor i/2 \rfloor)$.

$T_{CS}^{i_{TX}}$ represents the cyclic shift of the transmit chain i_{TX} and is defined in 22.3.8.2.1. $N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$ is defined in Table 22-16.

Table 22-16—Parameters for Non-HT duplicate transmissions

| Parameter | TVHT_MODE_1 | TVHT_MODE_2C | TVHT_MODE_2N | TVHT_MODE_4C | TVHT_MODE_4N |
|--|-------------|--------------|--------------|--------------|--------------|
| $N_{20\text{MHz}}$ | 2 | 4 | 2 | 8 | 4 |
| $N_{\text{NON_HT_DUP_OFDM-Data}}^{\text{Tone}}$ | 104 | 208 | 104 | 416 | 208 |

In addition, the parameter $\Upsilon_{k,BW}$ is replaced by $\Upsilon_{k,M}$ as defined in Table 22-12. For a noncontiguous TVHT_W+W or TVHT_2W+2W non-HT duplicate transmission, data transmission in each frequency segment shall be as defined for a TVHT_W or TVHT_2W non-HT duplicate transmission, respectively.

22.3.11 SU-MIMO and MU-MIMO Beamforming

22.3.11.1 General

SU-MIMO and DL-MU-MIMO beamforming in TVWS band is used as defined in 21.3.11.1 reading “Clause 22” for references to “Clause 21” except for feedback report format described in 9.4.1.50.

22.3.11.2 Beamforming Feedback Matrix V

Beamforming Feedback Matrix V is constructed as defined in 21.3.11.2 reading “Clause 22” for reference to “Clause 21” except for CSD values defined in 22.3.8.3.2.

22.3.11.3 Group ID

See 21.3.11.4 with “TVHT” replacing “VHT”.

22.3.12 TVHT preamble format for sounding PPDUs

The format of a VHT NDP PPDU in TVWS bands is constructed as defined Figure 22-1.

NOTE—The number of TVHT-LTF symbols in the NDP is determined by the SU N_{STS} field in TVHT-SIG-A.

The TVHT NDP PPDU has the following properties:

- Uses the TVHT PPDU format but without the Data field.
- Is a TVHT SU PPDU as indicated by the TVHT-SIG-A field.
- Has the data bits of the TVHT-SIG-B field set to a fixed bit pattern (see 22.3.8.3.6).

22.3.13 Regulatory requirements

See 21.3.13.

22.3.14 Channelization

A TVHT channel is specified by the four PLME MIB fields specified in Table 22-17.

Table 22-17—Fields to specify TVHT channels

| Field | Meaning |
|--|---|
| dot11CurrentTVHTChannelWidth | Channel width. Possible values represent TVHT_W, TVHT_2W, TVHT_W+W, TVHT_4W, TVHT_2W+2W. |
| dot11CurrentTVHTChannelCenterFrequencyIndex0 | In TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation denotes the center frequency of the lowest TV channel. In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that contains the primary channel. Valid range is 1 to 200. See Equation (22-10). |
| dot11CurrentTVHTChannelCenterFrequencyIndex1 | In TVHT_MODE_2N and TVHT_MODE_4N operation, denotes the center frequency of the lowest TV channel in the frequency segment that does not contain the primary channel. Valid range is 1 to 200. See Equation (22-10). Undefined for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C operation. |
| dot11CurrentPrimaryChannel | Denotes the location of the primary TVHT_W channel. Valid range is 1 to 200. See Equation (22-11). |

Given $\text{dot11CurrentTVHTChannelCenterFrequencyIndex0}$ and $\text{dot11CurrentTVHTChannelCenterFrequencyIndex1}$, the respective center frequency is given by Equation (22-10).

$$\begin{aligned} \text{Channel center frequency [MHz]} &= \text{Channel starting frequency} && (22-10) \\ &+ \text{TVHT_W} \times \text{dot11CurrentChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} \end{aligned}$$

where

Channel starting frequency is given by the Operating Class (E.1) and $\text{dot11CurrentTVHTChannelCenterFrequencyIndex}$ is either $\text{dot11CurrentTVHTChannelCenterFrequencyIndex0}$ or $\text{dot11CurrentTVHTChannelCenterFrequencyIndex1}$ and $\text{ChannelCenterFrequencyCorrection}$ is

- 0 for TVHT_MODE_1 and TVHT_MODE_2N,
- $0.5 \times \text{TVHT_W}$ for TVHT_MODE_2C and TVHT_MODE_4N ,
- $1.5 \times \text{TVHT_W}$ for TVHT_MODE_4C.

NOTE—Channel starting frequency is the frequency that results in the regulatory domain's channel number being the RLAN channel number, i.e., the center frequency of the channel for index 0. For example, the center frequency of U.S. TV channel 2 is 57 MHz. The center frequency of U.S. TV channel 2 is obtained by Equation (22-10) as follows:
 $\text{Channel center frequency [MHz]} = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentTVHTChannelCenterFrequencyIndex} + \text{ChannelCenterFrequencyCorrection} = (0.045 \times 1000) + 6 \times 2 + 0 = 57 \text{ MHz.}$

The center frequency of the primary TVHT_W channel is given by Equation (22-11).

$$\begin{aligned} & \text{Primary channel center frequency [MHz]} \\ & = \text{Channel starting frequency} + \text{TVHT_W} \times \text{dot11CurrentPrimaryChannel} \end{aligned} \quad (22-11)$$

The channel starting frequency is given by the Operating Class (see E.1).

For TVHT_MODE_2N operation, any two non-identical channels may be used.

For TVHT_MODE_4N operation, any two channels that would each be allowed as TVHT_2W channels and whose center frequencies are separated by greater than TVHT_2W (difference between dot11CurrentTVHTChannelCenterFrequencyIndex0 and dot11CurrentTVHTChannelCenterFrequencyIndex1 corresponds to a frequency difference greater than 2) may be used.

For example, in the United States, a channel specified by

```
dot11CurrentTVHTChannelWidth = TVHT_2W (12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentPrimaryChannel = 16
```

is a 12 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 485 MHz.

A channel specified by

```
dot11CurrentTVHTChannelWidth = TVHT_4W (24 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 14
dot11CurrentPrimaryChannel = 17
```

is a 24 MHz channel with a center frequency of 482 MHz and the primary 6 MHz channel centered at 491 MHz.

A channel specified by

```
dot11CurrentTVHTChannelWidth = TVHT_2W+2W (12+12 MHz)
dot11CurrentTVHTChannelCenterFrequencyIndex0 = 15
dot11CurrentTVHTChannelCenterFrequencyIndex1 = 40
dot11CurrentPrimaryChannel = 16
```

is an 12+12 MHz channel in which frequency segment 0 has 12 MHz bandwidth and center frequency of 482 MHz. Frequency segment 1 also has 12 MHz bandwidth and center frequency of 632 MHz. The primary 6 MHz channel is centered at 485 MHz.

22.3.15 Slot time

The slot time for the TVHT PHY shall be 24 μ s for 6 MHz and 7 MHz channel units and 20 μ s for 8 MHz channel units.

22.3.16 Transmit and receive port impedance

Transmit and receive antenna connector impedance for each transmit and receive antenna is defined in 17.3.8.7.

22.3.17 TVHT transmit specification

22.3.17.1 Transmit spectrum mask

For transmission in TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C, the transmit spectral mask shall be as described for 40 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-18.

Table 22-18—Spectral mask frequency scaling factor for contiguous transmission

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|--------------|----------------------------|----------------------------|----------------------------|
| TVHT_MODE_1 | 6 / 40 | 7 / 40 | 8 / 40 |
| TVHT_MODE_2C | 12 / 40 | 14 / 40 | 16 / 40 |
| TVHT_MODE_4C | 24 / 40 | 28 / 40 | 32 / 40 |

For transmission in mode TVHT_MODE_4N, the transmit spectral mask shall be as described for 80+80 MHz mask PPDU in 21.3.17.1 with the frequency axis multiplied by the frequency scaling factor as defined in Table 22-19.

Table 22-19—Spectral mask frequency scaling factor for TVHT_MODE_4N

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|--------------|----------------------------|----------------------------|----------------------------|
| TVHT_MODE_4N | 12 / 80 | 14 / 80 | 16 / 80 |

NOTE 1—In the presence of additional regulatory restrictions, the device has to meet both the regulatory requirements (measured as defined in the relevant regulation) and the mask defined in this subclause.

NOTE 2—For rules regarding TX center frequency leakage levels, see 22.3.17.4.2.

For a TVHT_W+W mask PPDU of VHT or non-HT duplicate format, the overall transmit spectral mask is constructed in the following manner. First, the 40 MHz interim transmit spectral mask shall have a 0 dB_r (dB relative to the maximum spectral density of the signal) bandwidth of 38 MHz, -20 dB_r at 21 MHz frequency offset, -28 dB_r at 40 MHz frequency offset, and -40 dB_r at 60 MHz frequency offset and above. The 40 MHz interim transmit spectral mask for frequency offsets in between 19 MHz and 21 MHz, 21 MHz and 40 MHz, and 40 MHz and 60 MHz shall be linearly interpolated in dB domain from the requirements for 19 MHz, 21 MHz, 40 MHz, and 60 MHz frequency offsets. Then the 40 MHz interim spectral mask frequency points are scaled as defined in Table 22-20 to produce a TVHT_W interim spectral mask. Then, the TVHT_W interim spectral mask is placed on each of the two segments to produce the TVHT_W+W interim spectral mask. Then, for each frequency at which both of the TVHT_W interim spectral masks have values greater than -40 dB_r and less than -20 dB_r, the sum of the two TVHT_W interim mask values (summed in linear domain) shall be taken as the overall TVHT_W+W interim spectral mask value. Next, for each frequency at which neither of the two TVHT_W interim masks has values greater than or equal to -20 dB_r and less than or equal to 0 dB_r, the higher value of the two interim masks shall be taken as the overall TVHT_W+W interim mask spectral value. Finally, for any frequency region where the TVHT_W+W interim mask value has not been defined yet, linear interpolation (in dB domain) between the nearest two frequency points with the TVHT_W+W interim spectral mask value defined shall be used to define the

TVHT_W+W interim spectral mask value. The transmit spectrum shall not exceed the maximum of the TVHT_W+W interim transmit spectrum mask and -59 dBm/MHz at any frequency offset.

Table 22-20—Spectral mask frequency scaling factor for TVHT_MODE_2N

| Mode | Scaling for 6 MHz channels | Scaling for 7 MHz channels | Scaling for 8 MHz channels |
|--------------|----------------------------|----------------------------|----------------------------|
| TVHT_MODE_2N | 6 / 40 | 7 / 40 | 8 / 40 |

Example transmit spectral mask for a TVHT_W+W mask PPDU for BCU of 6 MHz and spacing of 12 MHz is shown in Figure 22-4.

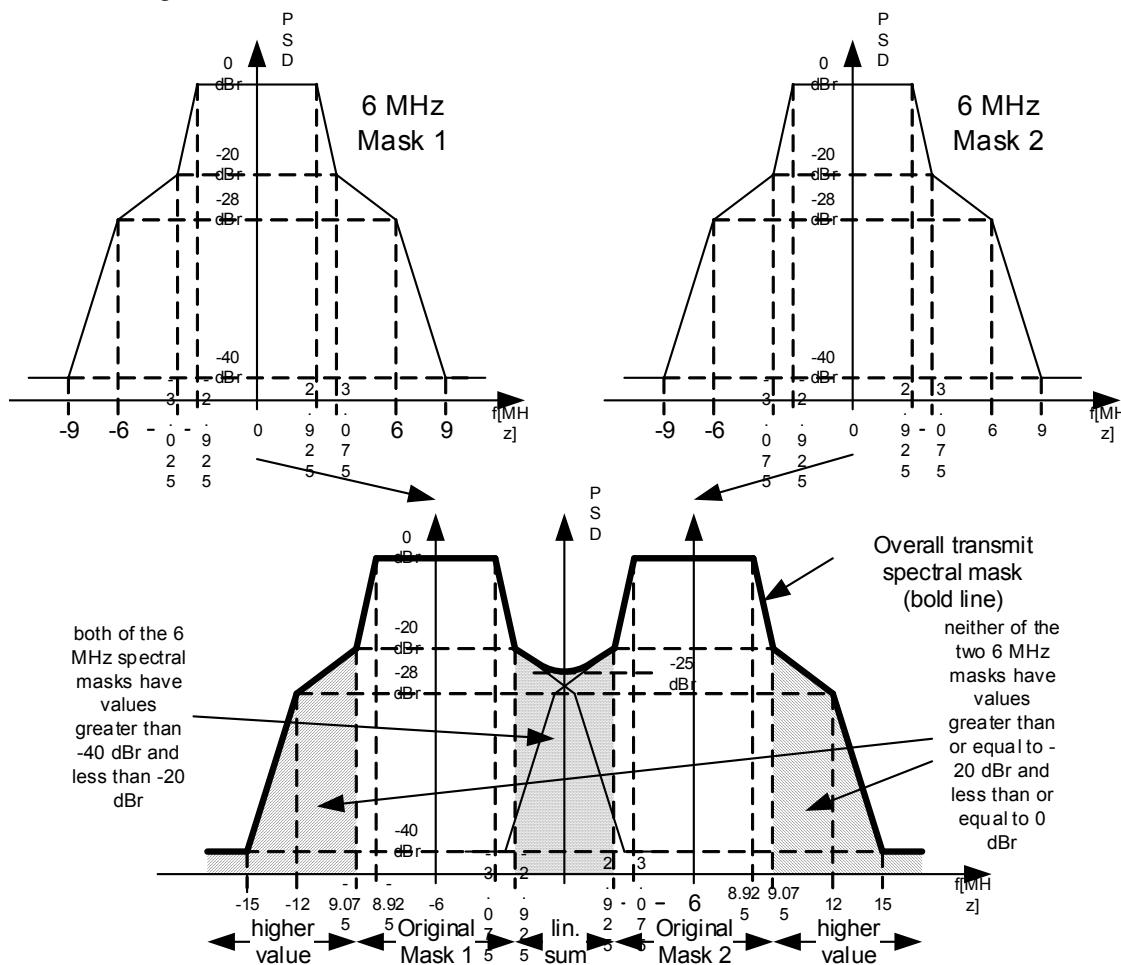

Figure 22-4—Example transmit spectral mask for an 6+6 MHz mask PPDU

22.3.17.2 Spectral flatness

Spectral flatness measurements shall be conducted using BPSK modulated PPDUs. See 22.3.17.4.4 for the demodulation procedure of the PPDUs as well as the number of PPDUs and OFDM symbols to be used for testing.

Let $E_{i,\text{avg}}$ denote the average constellation energy of a BPSK modulated subcarrier i in a TVHT data symbol.

For TVHT_MODE_1 contiguous non-HT duplicate or TVHT transmission having a bandwidth listed in Table 22-21, $E_{i,\text{avg}}$ of each of the subcarriers with indices listed as tested subcarrier indices shall not deviate by more than the specified maximum deviation in Table 22-21 from the average of $E_{i,\text{avg}}$ over subcarrier indices listed as averaging subcarrier indices. Averaging of $E_{i,\text{avg}}$ is done in the linear domain.

Table 22-21—Maximum transmit spectral flatness deviations

| Format | Bandwidth of transmission (MHz) | Averaging subcarrier indices (inclusive) | Tested subcarrier indices (inclusive) | Maximum deviation (dB) |
|------------------|---------------------------------|--|--|------------------------|
| VHT | TVHT_W | −42 to −2 and +2 to +42 | −42 to −2 and +2 to +42 | ±4 |
| | | | −58 to −43 and +43 to +58 | +4/−6 |
| non-HT duplicate | TVHT_W | −42 to −33, −31 to −6, +6 to +31, and +33 to +42 | −42 to −33, −31 to −6, +6 to +31, and +33 to +42 | ±4 |
| | | | −43 to −58 and +43 to +58 | +4/−6 |

For transmissions consisting of multiple contiguous or noncontiguous BCUs, each BCU shall meet the spectral flatness requirement for TVHT_MODE_1 transmission.

For the spectral flatness test, the transmitting STA shall be configured to use a spatial mapping matrix Q_k (see 22.3.10.11) with flat frequency response. Each output port under test of the transmitting STA shall be connected through a cable to one input port of the testing instrumentation.

22.3.17.3 Transmit center frequency and symbol clock frequency tolerance

The transmitter center frequency maximum allowable deviation shall be ±25 ppm. Carrier (LO) and symbol clock frequencies for the all transmit chains and BCUs shall be derived from the same reference oscillator.

NOTE—For multi-channel operation, the signal phase of each BCU might be uncorrelated.

The symbol clock frequency tolerance shall be maximum ±25 ppm. The transmit center frequency and the symbol clock frequency for all transmit antennas and contiguous BCUs shall be derived from the same reference oscillator.

22.3.17.4 Modulation accuracy

22.3.17.4.1 Introduction to modulation accuracy tests

Transmit modulation accuracy specifications are defined in 22.3.17.4.2 and 22.3.17.4.3. The test method is described in 21.3.17.4.4.

22.3.17.4.2 Transmit center frequency leakage

For transmissions using all formats except noncontiguous where the RF LO falls outside both BCUs, TX LO leakage shall meet the following requirements:

- When the RF LO is in the center of the transmitted PPDU BW, the power measured at the center of transmission BW using resolution BW (6/144 or 8/144) MHz shall not exceed the average power per subcarrier of the transmitted PPDU, or equivalently $(P - 10\log_{10}(N_{ST}))$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8.
- When the RF LO is not at the center of the transmitted PPDU BW, the power measured at the location of the RF LO using resolution BW (6/144 or 8/144) MHz shall not exceed the maximum of -32 dB relative to the total transmit power and -20 dBm, or equivalently $\max(P - 32, -20)$, where P is the transmit power per antenna in dBm and N_{ST} is defined in Table 22-8.

For transmissions using TVHT_MODE_2N and TVHT_MODE_4N, where the RF LO falls outside both BCUs, the RF LO shall follow the spectral mask requirements as defined in 22.3.17.1.

22.3.17.4.3 Transmitter constellation error

For all modes defined in TVHT PHY, the requirements for transmit constellation RMS error are same as defined in 21.3.17.4.3.

For non-HT duplicate transmissions, requirements defined in 17.3.9.7.4 apply to all parts of the channel bandwidth. The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.4.4 Transmitter modulation accuracy (EVM) test

For the transmit modulation accuracy test, the same methodology as that defined in 21.3.17.4.4 shall be applied per BCU (termed frequency segment in Clause 21). The channel bandwidth is determined by the TXVECTOR parameter CH_BANDWIDTH.

22.3.17.5 Time of Departure accuracy

For Time of Departure accuracy test, the test parameters defined in 21.3.17.5 shall be used for evaluation of TOD except the channel bandwidth, TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH. The channel bandwidth is determined by TXVECTOR parameter CH_BANDWIDTH in 22.2.2. TTR and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH shall be multiplied by the corresponding scaling factor for the 6 MHz, 7 MHz, and 8 MHz channels, where the scaling factor is defined in 22.3.8.2.1.

22.3.18 TVHT receiver specification

22.3.18.1 General

See 21.3.18.

22.3.18.2 Receiver minimum input sensitivity

The packet error ratio (PER) shall be less than 10% for a PSDU length of 4096 octets with the rate-dependent input levels listed in Table 22-22. The test in this subclause and the minimum sensitivity levels specified in Table 22-22 apply only to non-STBC modes, long GI, BCC, and VHT PPDU in TVWS bands.

Table 22-22—Receiver minimum input level sensitivity

| Modulation | Rate (R) | Minimum sensitivity (dBm) | | | | | |
|------------|----------|---------------------------|--|---|---------------------|---|---|
| | | 6 or 7 MHz (TVHT_MODE_1) | 12/14 MHz (TVHT_MODE_2C) or 6+6/7+7 MHz (TVHT_MODE_2N) | 24/28 MHz (TVHT_MODE_4C or 12+12/14+14 MHz (TVHT_MODE_4N) | 8 MHz (TVHT_MODE_1) | 16 MHz (TVHT_MODE_2C) or 8+8 MHz (TVHT_MODE_2N) | 32 MHz (TVHT_MODE_4C) or 16+16/16+16 MHz (TVHT_MODE_4N) |
| BPSK | 1/2 | -88 | -85 | -82 | -87 | -84 | -81 |
| QPSK | 1/2 | -85 | -82 | -79 | -84 | -81 | -78 |
| QPSK | 3/4 | -83 | -80 | -77 | -82 | -79 | -76 |
| 16-QAM | 1/2 | -80 | -77 | -74 | -79 | -76 | -73 |
| 16-QAM | 3/4 | -76 | -73 | -70 | -75 | -72 | -69 |
| 64-QAM | 2/3 | -72 | -69 | -66 | -71 | -68 | -65 |
| 64-QAM | 3/4 | -71 | -68 | -65 | -70 | -67 | -64 |
| 64-QAM | 5/6 | -70 | -67 | -64 | -69 | -66 | -63 |
| 256-QAM | 3/4 | -65 | -62 | -59 | -64 | -61 | -58 |
| 256-QAM | 5/6 | -63 | -60 | -57 | -62 | -59 | -56 |

22.3.18.3 Adjacent channel rejection

Adjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C follow the definition in the first paragraph of 21.3.18.2 and use the values in Table 22-23.

Adjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.2, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

The definitions in the rest of 21.3.18.2 apply to Clause 22 using the values in Table 22-23.

22.3.18.4 Nonadjacent channel rejection

Nonadjacent channel rejection for TVHT_MODE_1, TVHT_MODE_2C, and TVHT_MODE_4C channels follows the definition in the first paragraph of 21.3.18.3 and use the values in Table 22-23.

Nonadjacent channel rejection for TVHT_MODE_2N (TVHT_W+W) and TVHT_MODE_4N (TVWT_2W+2W) follows the definition in the second paragraph of 21.3.18.3, where “80 MHz” is replaced by “TVHT_W” for TVHT_MODE_2N and “TVHT_2W” for TVHT_MODE_4N, and uses the values in Table 22-23.

Table 22-23—Minimum required adjacent and nonadjacent channel rejection levels

| Modulation | Rate (R) | Adjacent channel rejection (dB) | | Nonadjacent channel rejection (dB) | |
|------------|----------|--|--|---|--|
| | | 6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (TVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C) | 6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N) | 6 MHz, 7 MHz, 8 MHz, 12 MHz (TVHT_MODE_2C), 14 MHz (TVHT_MODE_2C), 16 MHz (MTVHT_MODE_2C), 24 MHz (TVHT_MODE_4C), 28 MHz (TVHT_MODE_4C), 32 MHz (TVHT_MODE_4C) | 6+6 MHz (TVHT_MODE_2N), 7+7 MHz (TVHT_MODE_2N), 8+8 MHz (TVHT_MODE_2N), 12+12 MHz (TVHT_MODE_4N), 14+14 MHz (TVHT_MODE_4N), 16+16 MHz (TVHT_MODE_4N) |
| BPSK | 1/2 | 16 | 13 | 32 | 29 |
| QPSK | 1/2 | 13 | 10 | 29 | 26 |
| QPSK | 3/4 | 11 | 8 | 27 | 24 |
| 16-QAM | 1/2 | 8 | 5 | 24 | 21 |
| 16-QAM | 3/4 | 4 | 1 | 20 | 17 |
| 64-QAM | 2/3 | 0 | -3 | 16 | 13 |
| 64-QAM | 3/4 | -1 | -4 | 15 | 12 |
| 64-QAM | 5/6 | -2 | -5 | 14 | 11 |
| 256-QAM | 3/4 | -7 | -10 | 9 | 6 |
| 256-QAM | 5/6 | -9 | -12 | 7 | 4 |

The definitions in the rest of 21.3.18.3 apply to Clause 22 using the values in Table 22-23.

22.3.18.5 Receiver maximum input level

The receiver shall provide a maximum PER of 10% at a PSDU length of 4096 octets, for a maximum input level of -20 dBm, measured at each antenna for any baseband TVHT modulation.

22.3.18.6 CCA sensitivity

22.3.18.6.1 General

The thresholds in this subclause are compared with the signal level at each receiving antenna.

22.3.18.6.2 CCA sensitivity for operating classes requiring CCA-ED

For the operating classes requiring CCA-Energy Detect (CCA-ED), the PHY shall also indicate a medium busy condition when CCA-ED detects a channel busy condition.

For improved spectrum sharing, CCA-ED is required in some bands. The behavior class indicating CCA-ED is given in Table D-2. The operating classes requiring the corresponding CCA-ED behavior class are given in E.1. The PHY of a STA that is operating within an operating class that requires CCA-ED shall operate with CCA-ED.

CCA-ED shall detect a channel busy condition when the received signal strength exceeds the CCA-ED threshold as given by dot11OFDMEDThreshold for the primary TVHT_W channel, dot11OFDMEDThreshold for the secondary TVHT_W channel (if present) and dot11OFDMEDThreshold + 3 dB for the secondary TVHT_2W channel (if present). The CCA-ED thresholds for the operating classes requiring CCA-ED are subject to the criteria in D.2.5.

NOTE—The requirement to detect a channel busy condition as stated in 22.3.18.6.3 and 22.3.18.6.4 is a mandatory energy detect requirement on all Clause 22 receivers. Support for CCA-ED is an additional requirement that relates specifically to the sensitivities described in D.2.5.

22.3.18.6.3 CCA sensitivity for signals occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {primary}) primitive if one of the conditions listed in Table 22-24 is met in an otherwise idle TVHT_W (TVHT_MODE_1), TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width. With >90% probability, the PHY shall detect the start of a PPDU that occupies at least the primary TVHT_W channel under the conditions listed in Table 22-24 within a period of aCCATime (see 22.4.4) and hold the CCA signal busy (PHY-CCA.indication(BUSY, channel-list)) for the duration of the PPDU.

Table 22-24—Conditions for CCA BUSY on the primary channel

| Frequency segment width | Conditions |
|-------------------------|---|
| 6 MHz | The start of a 6 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 6 MHz channel at or above -88 dBm. |
| 7 MHz | The start of a 7 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 7 MHz channel at or above -88 dBm. |
| 8 MHz | The start of a 8 MHz non-HT duplicate or VHT PPDU in TVWS bands in the primary 8 MHz channel at or above -87 dBm. |

The receiver shall issue a PHY-CCA.indication(BUSY, {primary}) primitive for any signal that exceeds a threshold equal to 20 dB above the minimum modulation and coding rate sensitivity ($-88 + 20 = -68$ dBm in the case of 6 MHz channel) in the primary TVHT_W channel within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the receiver shall not issue a PHY-CCA.indication(BUSY, {secondary}), PHY-CCA.indication(BUSY, {secondaryTVHT_2W}), or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.

22.3.18.6.4 CCA sensitivity for signals not occupying the primary channel

The PHY shall issue a PHY-CCA.indication(BUSY, {secondary}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_2W (TVHT_MODE_2C), TVHT_4W (TVHT_MODE_4C), TVHT_W+W (TVHT_MODE_2N), and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

- Any signal within the secondary channel at or above a threshold (-68 dBm for 6 MHz, -68 dBm for 7 MHz, and -67 dBm for 8 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(BUSY,{secondaryTVHT_2W}) or PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
- A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary channel at or above a threshold (-81 dBm for 6 MHz, -81 dBm for 7 MHz, and -80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).

The PHY shall issue a PHY-CCA.indication(BUSY, {secondaryTVHT_2W}) primitive if the conditions for issuing a PHY-CCA.indication(BUSY, {primary}) primitive and a PHY-CCA.indication(BUSY, {secondary}) primitive are not present and one of the following conditions is present in an otherwise idle TVHT_4W (TVHT_MODE_4C) and TVHT_2W+2W (TVHT_MODE_4N) operating channel width:

- Any signal within the secondary TVHT_2W channel at or above a threshold (-65 dBm for 12 MHz, -65 dBm for 14 MHz, and -64 dBm for 16 MHz) within a period of aCCATime after the signal arrives at the receiver's antenna(s); then the PHY shall not issue a PHY-CCA.indication(IDLE) primitive while the threshold continues to be exceeded.
- A TVHT_2W non-HT duplicate or VHT PPDU in TVWS bands detected in the secondary TVHT_2W channel at or above a threshold (-78 dBm for 6+6 MHz, -78 dBm for 7+7 MHz, and -77 dBm for 8+8 MHz or 16 MHz) with >90% probability within a period aCCAMidTime (see 22.4.4).
- A TVHT_W non-HT duplicate or VHT PPDU in TVWS bands detected in any TVHT_W subchannel of the secondary TVHT_2W channel at or above a threshold (-81 dBm for 6 MHz, -81 dBm for 7 MHz, and -80 dBm for 8 MHz) with >90% probability within a period aCCAMidTime.

22.4 TVHT PLME

22.4.1 PLME SAP sublayer management primitives

See 21.4.1 with “TVHT” replacing “VHT”.

22.4.2 PHY MIB

See 21.4.2 with “tvht(10)” replacing “vht(9)”, “TVHT” replacing “VHT”, and “In4W” replacing “In80” and with the removal of “dot11VHTShortGIOptionIn160and80p80Implemented” and “dot11VHTShortGIOptionIn160and80p80Activated”.

22.4.3 TXTIME and PSDU_LENGTH calculation

See 21.4.3 with “TVHT” replacing “VHT”.

22.4.4 TVHT PHY

The static TVHT PHY characteristics, provided through the PLME-CHARACTERISTICS service primitive, shall be as shown in Table 19-25 except parameters listed in Table 22-25 and aPreambleLength, aSTFOneLength, aSTFTwoLength, aLTFOneLength, aLTFTwoLength, aPHYHeaderLength, and aPHYSigTwoLength, which are multiplied by 7.5 for 6 MHz and 7 MHz unit channels and by 5.625 for 8 MHz unit channels. The definitions for these characteristics are given in 6.5.

Table 22-25—TVHT PHY characteristics

| Characteristics | Value |
|---|---|
| aSlotTime | 24 μ s (BCUs: 6 MHz or 7 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) 20 μ s (BCUs: 8 MHz) plus any coverage-class-dependent aAirPropagationTime (see Table 9-79) |
| aSIFSTime | 120 μ s (BCUs: 6 MHz or 7 MHz) 90 μ s (BCUs: 8 MHz) |
| aSignalExtension | 0 μ s |
| aCCATime | < 15 μ s (6 MHz or 7 MHz) < 11.25 μ s (8 MHz) |
| aCCAMidTime | < 94 μ s (6 MHz or 7 MHz) < 70 μ s (8 MHz) |
| aAirPropagationTime | As indicated by the coverage class (see 10.21.5) |
| aPPDUMaxTime | 20 ms |
| aPSDUMaxLength | 1 401 120 octets (see NOTE 1) |
| aRxPHYStartDelay | (36 + 4 \times the maximum possible value for $N_{VHT-LTF}$ supported + 4) \times 7.5 (6 and 7 MHz channels) or 5.625 (8 MHz channels) (see NOTE 2) |
| NOTE 1—This is the maximum length in octets for SU PPDUs with a bandwidth of 32 MHz or 16+16 MHz, MCS9 and 4 spatial streams, limited by 973 possible Short GI data symbols in aPPDUMaxTime. | |
| NOTE 2—This value arises from the time to the end of TVHT-SIG-B (see Figure 22-1) plus the need to decode the first symbol of the Data field in order to extract the SERVICE field and check the CRC it contains. | |

22.5 Parameters for TVHT MCSs

The rate-dependent parameters for one BCU mode (6 MHz, 7 MHz, and/or 8 MHz) and corresponding two and four BCU modes with $N_{SS} = 1, \dots, 4$ are given in Table 22-26 through Table 22-37. Support for MCS 8 and 9 (when valid) is optional in all cases. A TVHT STA shall support single spatial stream MCSs within the range MCS 0 to MCS 7 for all channel widths for which it has indicated support regardless of the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field. When more than one spatial stream is supported, the Tx or Rx Highest Supported Data Rate subfield values in the TVHT Supported MCS Set field may result in a reduced MCS range (cut-off) for $N_{SS} = 2, \dots, 4$. Support for 6 MHz, 7 MHz, or 8 MHz with $N_{SS} = 1$ is mandatory. Support for 6 MHz, 7 MHz, and 8 MHz with $N_{SS} = 2, \dots, 4$ is optional. Support for two BCU modes with 12 MHz, 14 MHz, and 16 MHz or with 6+6 MHz, 7+7 MHz, and 8+8 MHz with $N_{SS} = 1, \dots, 4$ is optional. Support for four BCU modes with 24 MHz, 28 MHz, and 32 MHz or with 12+12 MHz, 14+14 MHz, and 16+16 MHz with $N_{SS} = 1, \dots, 4$ is optional. N_{ES} values were chosen to yield an integer number of punctured blocks per OFDM symbol. Note that N_{ES} values are 1 for all Clause 22 modulations.

Table 22-26 through Table 22-37 define TVHT MCSs not only for SU transmission but also for user u of MU transmission. In the case of TVHT MCSs for MU transmission, the parameters, N_{SS} , R , N_{BPSCS} , N_{CBPS} , and N_{DBPS} are replaced with $N_{SS,u}$, R_u , $N_{BPSCS,u}$, $N_{CBPS,u}$, and $N_{DBPS,u}$, respectively.

In the MCS parameter tables that follow, data rates for a 400 ns GI are rounded to 1 decimal place.

Table 22-26—TVHT MCSs for TVHT_MODE_1, $N_{SS} = 1$

| MCS Index | Modulation | R | N_{BPSCS} | N_{SD} | N_{SP} | N_{CBPS} | N_{DBPS} | Data rate (Mb/s) for 6 MHz or 7 MHz | | Data rate (Mb/s) for 8 MHz | |
|-----------|------------|-----|-------------|----------|----------|------------|------------|-------------------------------------|----------------|----------------------------|-----------------|
| | | | | | | | | 6.0 μ s GI | 3.0 μ s GI | 4.5 μ s GI | 2.25 μ s GI |
| 0 | BPSK | 1/2 | 1 | 108 | 6 | 108 | 54 | 1.8 | 2.0 | 2.4 | 2.7 |
| 1 | QPSK | 1/2 | 2 | 108 | 6 | 216 | 108 | 3.6 | 4.0 | 4.8 | 5.3 |
| 2 | QPSK | 3/4 | 2 | 108 | 6 | 216 | 162 | 5.4 | 6.0 | 7.2 | 8.0 |
| 3 | 16-QAM | 1/2 | 4 | 108 | 6 | 432 | 216 | 7.2 | 8.0 | 9.6 | 10.7 |
| 4 | 16-QAM | 3/4 | 4 | 108 | 6 | 432 | 324 | 10.8 | 12.0 | 14.4 | 16.0 |
| 5 | 64-QAM | 2/3 | 6 | 108 | 6 | 648 | 432 | 14.4 | 16.0 | 19.2 | 21.3 |

Annex B

(normative)

Protocol Implementation Conformance Statement (PICS) proforma

B.1 Introduction

The supplier of a protocol implementation that is claimed to comply with IEEE Std 802.11-2016 shall complete the following protocol implementation conformance statement (PICS) proforma.

A completed PICS proforma is the PICS for the implementation in question. The PICS is a statement of which capabilities and options of the protocol have been implemented. This annex might not be compatible with operation in any Regulatory Domain or describe combinations of usable features in any Regulatory Domain. The PICS has a number of uses, including use:

- a) By the protocol implementer, as a checklist to reduce the risk of failure to comply with the standard through oversight;
- b) By the supplier and acquirer, or potential acquirer, of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard PICS proforma;
- c) By the user, or potential user, of the implementation, as a basis for initially checking the possibility of interworking with another implementation (note that, while interworking is not guaranteed, failure to interwork can often be predicted from incompatible PICS proformas);
- d) By a protocol tester, as the basis for selecting appropriate tests against which to assess the claim for compliance of the implementation.

B.2 Abbreviations and special symbols

B.2.1 Symbols for Status column

M mandatory

O optional

O.<n> optional — Support of at least one of the group of options labeled by the same numeral <n> is required. The scope of the group of options is limited to a single table (i.e., subclause) within the PICS.

pred: predicate identification

B.2.2 General abbreviations for Item and Support columns

N/A not applicable

AD address function

AVT audio video transport

CF implementation under test (IUT) configuration

DMG-M directional multi-gigabit (DMG) medium access control (MAC) features

DMG-P directional multi-gigabit (DMG) physical layer (PHY) features

DS direct sequence

DSE dynamic station enablement

| | |
|-------|--|
| ERP | extended rate physical layer (PHY) |
| FR | frame reception |
| FS | frame exchange sequence |
| FT | frame transmission |
| HRDS | high rate direct sequence |
| HTM | high-throughput (HT) medium access control (MAC) features |
| HTP | high-throughput (HT) physical layer (PHY) features |
| HWM | hybrid wireless mesh protocol (HWMP) path selection protocol capability |
| IW | interworking with external networks |
| MD | multidomain |
| MP | mesh protocol |
| OC | operating classes |
| OF | orthogonal frequency division multiplexing (OFDM) |
| PC | protocol capability |
| RM | radio management |
| QB | quality-of-service (QoS) base functionality |
| QD | quality-of-service (QoS) enhanced distributed channel access (EDCA) |
| QMF | quality-of-service Management frame |
| QP | quality-of-service (QoS) hybrid coordination function (HCF) controlled channel access (HCCA) |
| SM | spectrum management |
| TDLS | tunneled direct-link setup |
| TVHTM | television very high throughput medium access control (MAC) features |
| TVHTP | television very high throughput physical layer (PHY) features |
| TVWS | television white spaces |
| VHTM | Very high throughput MAC |
| VHTP | Very high throughput PHY |
| WNM | wireless network management |
| WS | white spaces |

B.3 Instructions for completing the PICS proforma

B.3.1 General structure of the PICS proforma

The first parts of the PICS proforma, Implementation identification and Protocol summary, are to be completed as indicated with the information necessary to identify fully both the supplier and the implementation.

The main part of the PICS proforma is a fixed questionnaire, divided into subclauses, each containing a number of individual items. Answers to the questionnaire items are to be provided in the rightmost column, either by simply marking an answer to indicate a restricted choice (usually Yes or No) or by entering a value or a set or a range of values. (Note that there are some items where two or more choices from a set of possible answers may apply. All relevant choices are to be marked in these cases.)

Each item is identified by an item reference in the first column. The second column contains the question to be answered. The third column contains the reference or references to the material that specifies the item in the main body of this standard. The remaining columns record the status of each item, i.e., whether support is mandatory, optional, or conditional, and provide the space for the answers (see also B.3.4). Marking an item as supported is to be interpreted as a statement that all relevant requirements of the subclauses and normative annexes, cited in the References column for the item, are met by the implementation.

A supplier may also provide, or be required to provide, further information, categorized as either Additional Information or Exception Information. When present, each kind of further information is to be provided in a further subclause of items labeled A<I> or X<I>, respectively, for cross-referencing purposes, where <I> is any unambiguous identification for the item (e.g., simply a numeral). There are no other restrictions on its format or presentation.

A completed PICS proforma, including any Additional Information and Exception Information, is the PICS for the implementation in question.

NOTE—Where an implementation is capable of being configured in more than one way, a single PICS might be able to describe all such configurations. However, the supplier has the choice of providing more than one PICS, each covering some subset of the implementation’s capabilities, if this makes for easier and clearer presentation of the information.

B.3.2 Additional information

Items of Additional Information allow a supplier to provide further information intended to assist in the interpretation of the PICS. It is not intended or expected that a large quantity of information will be supplied, and a PICS can be considered complete without any such information. Examples of such Additional Information might be an outline of the ways in which an (single) implementation can be set up to operate in a variety of environments and configurations, or information about aspects of the implementation that are outside the scope of this standard but have a bearing upon the answers to some items.

References to items of Additional Information may be entered next to any answer in the questionnaire, and may be included in items of Exception Information.

B.3.3 Exception information

It may happen occasionally that a supplier wishes to answer an item with mandatory status (after any conditions have been applied) in a way that conflicts with the indicated requirement. No preprinted answer is found in the Support column for this. Instead, the supplier shall write the missing answer into the Support column, together with an X<I> reference to an item of Exception Information, and shall provide the appropriate rationale in the Exception Information item itself.

An implementation for which an Exception Information item is required in this way does not comply with this standard.

NOTE—A possible reason for the situation described above is that a defect in this standard has been reported, a correction for which is expected to change the requirement not met by the implementation.

B.3.4 Conditional status

The PICS proforma contains a number of conditional items. These are items for which both the applicability of the item itself, and its status if it does apply, mandatory or optional, are dependent upon whether certain other items are supported.

Where a group of items is subject to the same condition for applicability, a separate preliminary question about the condition appears at the head of the group, with an instruction to skip to a later point in the questionnaire if the N/A answer is selected. Otherwise, individual conditional items are indicated by a conditional symbol in the Status column.

A conditional symbol is of the form “<pred>:<S>” or “O” (or “O.<n>”), where “<pred>” is a predicate as described below, and “<S>” is one of the status symbols “M” or “O” (or “O.<n>”).

If the value of a predicate is true, the conditional symbol is applicable, and yields the status given by S. If any applicable conditional symbol yields mandatory status, the conditional item has mandatory status. Otherwise, if any applicable conditional symbol (including one of the form “O” (or “O.<n>”)) yields optional status, the conditional item has optional status. In either case, the support column is to be completed in the usual way. If no conditional symbol is applicable, the conditional item is not relevant and the N/A answer is to be marked.

A predicate is one of the following:

- a) An item-reference for an item in the PICS proforma: the value of the predicate is true if the item is marked as supported and is false otherwise.
- b) An expression constructed by combining item-references using the boolean operators (in decreasing order of precedence) “NOT”, “AND”, and “OR”, with or without the use of parenthetical groupings: the value of the predicate is true if the expression evaluates to true and is false otherwise.

NOTE—If optional feature F1 requires features F2 and F3, this can be represented in the PICS in one of two ways:

- The status for conditional items F2 and F3 is “F1:M” and the status for conditional item F1 is “O”, or
- The status for conditional item F1 is “F2 AND F3:O”.

If feature F1 is required if feature F2 or F3 is supported, and is optional otherwise, this can be represented in the PICS in one way:

- The status for conditional item F1 is “F2 OR F3:M” and “O”.

If feature F1 is required if feature F2 or F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

- The status for conditional item F1 is “F2 OR F3:M”.

If feature F1 is required if feature F2 is supported, is optional if feature F3 is supported, and is not relevant otherwise, this can be represented in the PICS in one way:

- The status for conditional item F1 is “F2:M” and “F3:O”.

Conditional symbols can be given in any order.

Each item referenced in a predicate, or in a preliminary question for grouped conditional items, is indicated by an asterisk in the Item column.

B.4 PICS proforma—IEEE Std 802.11-2016⁶¹

B.4.1 Implementation identification

| | |
|--|--|
| Supplier | |
| Contact point for queries about the PICS | |
| Implementation Name(s) and Version(s) | |
| Other information necessary for full identification, e.g., name(s) and version(s) of the machines and/or operating system(s), system names | |

NOTE 1—Only the first three items are required for all implementations. Other information might be completed as appropriate in meeting the requirement for full identification.

NOTE 2—The terms Name and Version need to be interpreted appropriately to correspond with a supplier's terminology (e.g., Type, Series, Model).

B.4.2 Protocol summary

| | |
|---|--|
| Identification of protocol standard | IEEE Std 802.11-2016 |
| Identification of amendments and corrigenda to this PICS proforma that have been completed as part of this PICS | Amd. : Corr. : Amd. : Corr. : |
| Have any exception items been required? (See B.3.3; the answer Yes means that the implementation does not comply with IEEE Std 802.11-2016.) | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| Date of statement (yyyy-mm-dd) | |

⁶¹*Copyright release for PICS proforma:* Users of this standard may freely reproduce the PICS proforma in this annex so that it can be used for its intended purpose and may further publish the completed PICS.

B.4.3 IUT configuration

| Item | IUT configuration | References | Status | Support |
|---|---|---|----------------------------------|---|
| | What is the configuration of the IUT? | | | |
| * CFAP | Access point (AP) | 4.3 | O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| * CFIndepSTA | Independent station (neither an AP, nor a mesh STA, nor a STA operating outside the context of a BSS) | 4.3 | O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| *CFSTAofA P | Operation in an infrastructure BSS | 4.3 | CFIndepSTA: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

| Item | Protocol capability | References | Status | Support |
|-----------|---|------------------------|--------------------------------------|---|
| PC35.7 | Fast basic service set (BSS) Transition (FT) key management based on preshared keys (PSKs) | 9.4.2.25, 12.7.1.7 | PC35 AND PC34:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.8 | Fast basic service set (BSS) Transition (FT) key hierarchy | 12.7.1.7 | PC35 AND PC34:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.9 | FT initial mobility domain association | 13.4 | PC35 AND PC34:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.10 | Fast Basic Service Set (BSS) Transition (FT) Protocol | 13.5 | PC35:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.10.1 | Fast Basic Service Set (BSS) Transition (FT) Protocol in robust security network (RSN) | 13.5.2, 13.5.3, 13.7.1 | PC35 AND PC34:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.10.2 | Fast Basic Service Set (BSS) Transition (FT) Protocol in nonrobust security network (non-RSN) | 13.5.4, 13.5.5, 13.7.2 | PC35:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC35.11 | Fast Basic Service Set (BSS) transition (FT) resource request protocol | 13.6 | PC35:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.11.1 | Resource Request protocol over the air | 13.6.2 | PC35.11:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.11.2 | Resource Request protocol over the distribution system (DS) | 13.6.3, 13.10 | PC35.11:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.12 | QoS procedures for fast basic service set (BSS) transition | 13.11 | (CFQoS AND PC35 or CFDMG AND PC35):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC35.13 | Resource Information Container (RIC) Data element (RDE) | 9.4.2.50, 13.11 | PC35:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.13.1 | Resource Request Procedures at the fast basic service set (BSS) transition originator (FTO) | 13.11.3.1 | PC35.13:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.13.2 | Resource Request Procedures at the target access point (AP) | 13.11.3.2 | PC35.13:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC35.14 | Remote Request Procedures at the current access point (AP) | 13.10 | PC35:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.14.1 | Remote Request/Response frame support | 13.10.3 | PC35.14:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC35.14.2 | Vendor-specific remote request broker (RRB) mechanism | 13.10.3 | PC35.14:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC36 | SA Query Procedure | 9.6.10, 11.14 | PC34.1.10:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC37 | Power save multi-poll (PSMP) | 9.6.12.4, 10.29 | not CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| *PC37.1 | Scheduled PSMP | 9.4.2.30, 11.4.6 | PC37:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.1.1 | PSMP additions to TSPEC | 9.4.2.30 | PC37.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.1.2 | AP role in scheduled PSMP sequence | 10.29.2.2, 10.29.2.3 | (PC37.1 AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.4.1 MAC protocol capabilities (continued)

| Item | Protocol capability | References | Status | Support |
|----------|--|---|---|---|
| PC37.1.3 | STA role in scheduled PSMP sequence | 10.29.2.2, 10.29.2.3 | (PC37.1 AND CFIndepSTA) :M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC37.2 | Unscheduled PSMP | 10.29.4 | PC37:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.2.1 | PSMP additions to TSPEC | 9.4.2.30 | (CFAP AND PC37.2):M (CFIndepSTA AND PC37.2):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.3 | Creation, scheduling, and transmission of PSMP frame | 9.6.12.4, 10.29.2.1 | (PC37 AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.4 | Reception and interpretation of PSMP frame | 9.6.12.4 | (PC37 AND CFIndepSTA) :M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.5 | Multi-TID block ack rules in PSMP sequence | 9.3.1.8.5, 9.3.1.9.4, 10.29.2.7, 11.17.2 | PC37:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC37.6 | Multi-phase PSMP | 10.29.2.5 | PC37:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC38 | dot11OCBActivated is false when STA is a BSS member | 11.21 | (CFSTAofAP OR CFIBSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC39 | Simultaneous authentication of equals (SAE) | 12.4 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC40 | Multi-band Operation | 11.33 | CFMBO:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *PC40.1 | FST Setup | 9.4.2.138, 9.4.2.151, 9.4.2.152, 9.6.21.2, 9.6.21.3, 9.6.21.5, 9.6.21.6, 11.33.2.1, 11.33.2.2 | PC40:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC40.2 | FST TS switching | 9.4.2.30, 9.4.2.141, 9.6.3.2.2, 9.6.3.3.2, 9.6.3.4, 9.6.5.2, 9.6.5.3, 9.6.5.4, 11.33.2.3 | PC40.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC40.3 | FST Teardown | | | |
| PC40.3.1 | Transmission of FST Teardown | 9.6.21.4, 11.33.3 | PC40.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC40.3.2 | Reception of FST Teardown | 9.6.21.4, 11.33.3 | PC40.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC41 | MMSL cluster operation | 11.34 | O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC42 | Quieting adjacent BSS operation | 11.37 | O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC43 | Beacon RSSI | 11.45 | O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| PC44 | Estimated throughput | 11.46 | O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.4.2 MAC frames

| Item | MAC frame | References | Status | Support |
|------|--|---|---|---------|
| | Is transmission of the following MAC frames supported? | 9 | | |
| FT1 | Association Request | 9 CFSTAofAP:M CFPBSSnotPC P:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> | |

B.4.4.3 Frame exchange sequences

| Item | Frame exchange sequence | References | Status | Support |
|------|---|--|----------------|---|
| | Are the following frame exchange sequences supported? | | | |
| FS1 | Basic frame exchange sequences | 10.3.2.5, 10.3.2.7, 10.3.2.9, 10.3.5, 10.3.6, 10.4.3 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| FS2 | CF-frame exchange sequences | 10.4.3, 10.4.4 | (PC4 OR PC5):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.4.4 MAC addressing functions

| Item | MAC Address function | References | Status | Support |
|------|---|---|----------|---|
| | Are the following MAC Addressing functions supported? | | | |
| AD1 | STA universal individual IEEE 802 address | 9.2.4.3 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| AD2 | BSS identification (BSSID) generation | 9.2.4.3, 11.1.4 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| AD3 | Receive address matching | 9.2.4.3, 9.3.2.1 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| AD4 | Wildcard BSSID | 9.2.4.3.4, 9.3.2 | CFOCB:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD5 | MAC and PHY operation resumes with appropriate MIB attributes in less than 2 TU | 11.21 | CFOCB:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD6 | Group addressed mesh Data frame addressing (3 address frame) | 9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD7 | Individually addressed mesh Data frame addressing (4 address frame) | 9.2.3, 9.2.4.1, 9.2.4.3, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD8 | Proxied group addressed mesh Data frame addressing (4 address frame) | 9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD9 | Proxied individually addressed mesh Data frame addressing (6 address frame) | 9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD10 | Multihop Action frame addressing (4 address frame) | 9.2.3, 9.2.4.1, 9.2.4.3, 9.2.4.7.3, 9.6.18, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AD11 | TA filtering for mesh STA | 9.2.4.3, 9.3.2.1, 9.3.5 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.5 Direct sequence PHY functions

| Item | PHY feature | References | Status | Support |
|----------|-----------------------------------|------------------|---------|---|
| DS1 | PHY sublayer procedures | 15.3 | | |
| | Preamble prepend on transmit (TX) | 15.3.1 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |

| SM12 | Adaptation of transmit power | | | |
| SM12.1 | TPC report in Beacon and Probe Response frames | 11.8.7 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM13.1 | Dynamic transmit power adaptation | 11.8.7 | CFSM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM13 | Testing channels for radar | 11.9.4 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM14 | Detecting and discontinuing operations after detection of radar | 11.9.5 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM15 | Requesting and reporting of measurements | 11.9.7 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM16 | Autonomous reporting of radar | 11.9.7 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM17 | IBSS dynamic frequency selection (DFS) element including channel map | 9.4.2.24 | ((CFIBSS AND CFSM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM18 | DFS owner function | 11.9.8 | ((CFIBSS AND CFSM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM19 | DFS owner recovery procedure | 11.9.8 | ((CFIBSS AND CFSM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20 | Channel switching procedure | | | |
| SM20.1 | Transmission of channel switch announcement and channel switching procedure by an AP | 11.9.8 | ((CFAP AND CFSM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.2 | Transmission of channel switch announcement and channel switching procedure by a STA | 11.9.8 | ((CFSTAofAP AND CFSM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.3 | Reception of channel switch announcement and channel switching procedure by a STA | 11.9.8 | CFSM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.4 | Transmission of Wide Bandwidth Channel Switch element in Channel Announcement frame and transmission of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by an AP | 11.40.4 | ((CFAP AND CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.10 Spectrum management extensions *(continued)*

| Item | IUT configuration | References | Status | Support |
|---------|--|------------|-------------------------------|---|
| SM20.5 | Transmission of Wide Bandwidth Channel Switch element in Channel Announcement frame and transmission of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by a STA. | 11.40.4 | (CFIBSS AND CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.6 | Reception of Wide Bandwidth Channel Switch element in Channel Announcement frame and reception of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by a STA. | 11.40.4 | (CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.7 | Transmission of New Transmit Power Envelope element in Channel Announcement frame and transmission of New Transmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by an AP. | 11.40.4 | (CFAP AND CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.8 | Transmission of New Transmit Power Envelope element in Channel Announcement frame and transmission of New Transmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by a STA. | 11.40.4 | (CFIBSS AND CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.9 | Reception of New Transmit Power Envelope element in Channel Announcement frame and reception of New Transmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated channel switching procedure by a STA. | 11.40.4 | (CFSM AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.10 | Transmission of Future Channel Guidance element by a STA. | 11.9.10 | CFSM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| SM20.11 | Reception of Future Channel Guidance element procedure by a STA. | 11.9.10 | CFSM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.11 Operating classes extensions

| Item | Protocol capability | References | Status | Support |
|------|---|------------------------|---------------------------|--|
| OC1 | Operating and coverage classes | 9.4.2.9 | CFMD AND CFOC:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC2 | Operating and coverage classes (20 MHz channel spacing) | 9.4.2.9, 17.3.8.6 | CFMD AND CFOC:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC3 | Operating and coverage classes (10 MHz channel spacing) | 9.4.2.9, 17.3.8.6 | CFMD AND CFOC AND OF1.7:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC4 | Operating and coverage classes (5 MHz channel spacing) | 9.4.2.9, 17.3.8.6 | CFMD AND CFOC AND OF1.8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC5 | Coverage classes 0–31 Coverage class operation when not associated | 10.21.5 10.21.5 | CF3G6:M CF3G6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC6 | Power level, equivalent maximum transmit power level and operating class Power level operation when not associated | 10.21.5 10.21.5 | CF3G6:M CF3G6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC7 | Power level, different maximum transmit power level and operating class Power level operation when not associated | 10.21.5 10.21.5 | CF3G6:M CF3G6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| OC 8 | Operation with multiple country elements | — | OC1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.12 QoS base functionality

| Item | Protocol capability | References | Status | Support |
|-------|---|---|-----------------------|---|
| QB1 | QoS frame format | | | |
| QB1.1 | QoS frame format | 9.3.1.2–9.3.1.4, 9.3.2.1, 9.3.3.3, 9.3.3.6–9.3.3.9, 9.3.3.11, 9.3.3.14 | not CFDMG AND CFQoS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB1.2 | QoS frame format | 9.3.1.2, 9.3.1.4, 9.3.1.8, 9.3.1.9, 9.3.1.11–9.3.1.19, 9.3.2.1, 9.3.4.2, 9.3.3.6–9.3.3.9, 9.3.3.11, 9.3.3.14 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB2 | Per traffic identifier (TID) duplicate detection | 9.2.4.4, 9.2.4.5, 10.3.2.11 | CFQoS OR CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB3 | Decode of no-acknowledgment policy in QoS Data frames | 9.2.4.5.4, 10.22.2.7, 10.22.2.11, 10.22.4.2, 10.22.4.3 | CFQoS OR CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.12 QoS base functionality (*continued*)

| Item | Protocol capability | References | Status | Support |
|---------|---|---|--|---|
| QB4 | Block acknowledgments (block ack) | | | |
| QB4.1 | Immediate block ack Non-HT block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard. | 9.3.1.8.1, 9.3.1.8.2, 9.3.1.9.1, 9.3.1.9.2, 9.6.5, 10.24 (except 10.24.7 and 10.24.8), 11.5 | CFQoS:O CFHT OR CFDMG OR CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *QB4.2 | Delayed block ack Non-HT block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard. | 9.3.1.8.1, 9.3.1.8.2, 9.3.1.9.1, 9.3.1.9.2, 9.6.5, 10.24 (except 10.24.7 and 10.24.8), 11.5 | CFQoS:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB4.3 | Compressed Block Ack | | | |
| QB4.3.1 | Compressed Block Ack | 9.3.1.8.3 | CFQoS:O CFHT OR CFDMG OR CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB4.3.2 | Extended Compressed Block Ack | 9.3.1.8.4 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB4.4 | Multi-TID Block Ack | 9.3.1.9.4 | CFQoS:O CFHT OR CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB5 | Automatic power save delivery (APSD) | 9.6.3, 11.2.3 | (CFAP and CFQoS):O (CFIndepSTA and CFQoS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QB6 | Direct-link setup (DLS) | 6.3.14, 9.4.2.19, 9.6.4, 11.7 | (CFAP AND CFQoS):M (CFSTAofAP AND CFQoS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.13 QoS enhanced distributed channel access (EDCA)

| Item | Protocol capability | References | Status | Support |
|------|--|--|--------------------------|---|
| QD1 | Support for four transmit queues with a separate channel access entity associated with each | 10.2.4.2, 10.22.2.1 | not CFDMG AND CFQoS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD2 | Per-channel access function differentiated channel access | 10.22.2.2, 10.22.2.4, 10.22.2.11 | not CFDMG AND CFQoS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD3 | Multiple frame transmission support | 10.22.2.7 | CFQoS OR CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD4 | Maintenance of within-queue ordering, exhaustive retransmission when sending non-QoS Data frames | 10.22.2.11 | CFQoS OR CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.13 QoS enhanced distributed channel access (EDCA) (continued)

| Item | Protocol capability | References | Status | Support |
|------|---|--|---|---|
| QD5 | Interpretation of admission control mandatory (ACM) bit in EDCA Parameter Set element | 9.4.2.13, 10.22.4.2 | (CFSTAofAP AND (CFQoS OR CFDMG)):M (CFPBSSnotPCP AND CFDMG): | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD6 | Contention based admission control | 9.4.2.14, 9.4.2.15, 9.6.3.2–9.6.3.4, 10.22.4.2, 11.4 | (CFAP AND (CFQoS OR CFDMG)):O (CFSTAofAP AND (CFQoS OR CFDMG)):O (CFPCP AND CFDMG):O (CFPBSSnotPCP AND CFDMG):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD7 | Power management in an infrastructure BSS or in an IBSS | 11.2 | (CFAP AND CFQoS):O (CFIndepSTA AND CFQoS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD8 | Default EDCA parameters for communications outside context of BSS | 9.4.2.29, 10.22.2.2 | CFOCB:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QD9 | Duration/ID rules for QoS STA | 9.2.5 | CFQoS | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA)

| Item | Protocol Capability | References | Status | Support |
|------|--|--|---|---|
| QP1 | Traffic specification (TSPEC) and associated frame formats | 9.6.3 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QP2 | HCCA rules | 10.2.4.3, 10.22.3, 10.22.3.2–10.22.3.5 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QP3 | HCCA schedule generation and management | 10.22.4 | (CFAP AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QP4 | HCF frame exchange sequences | 10.4.3, 10.22.2 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QP5 | Traffic stream (TS) management | 11.4 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.14 QoS hybrid coordination function (HCF) controlled channel access (HCCA) (continued)

| Item | Protocol Capability | References | Status | Support |
|------|---|--|--|---|
| QP6 | Minimum TSPEC parameter set | 10.22.4 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QP7 | Power management in an infrastructure BSS | 11.2.3.5, 11.2.3.6, 11.2.3.7, 11.2.3.8, 11.2.3.9, 11.2.3.10, 11.2.3.11 | (CFAP AND CFQoS):M (CFIndepSTA AND CFQoS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.15 Radio management extensions

| Item | Protocol Capability | References | Status | Support |
|---------|---|--------------------------------------|------------------------|---|
| | Are the following Radio Measurement capabilities supported? | | | |
| RM1 | Radio Measurement Capability | 9.4.1.4 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2 | Action frame protocol for measurements | 9.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.1 | Radio Measurement Request frame | 9.6.7.2 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.2 | Radio Measurement Report frame | 9.6.7.3 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.3 | Link Measurement Request frame | 9.6.7.4 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.4 | Link Measurement Report frame | 9.6.7.5 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.4.1 | Link Measurement Report frame | 9.6.7.5 | not CF DMG AND CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.4.2 | Link Measurement Report frame | 9.6.7.5, 9.4.2.149, 9.4.2.150, 10.39 | CFDMG AND CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.5 | Neighbor Report Request | | | |
| RM2.5.1 | Generate and transmit Neighbor Report Request | 9.6.7.6 | (CFRM AND CFSTAofAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.5.2 | Receive and process Neighbor Report Request | 9.6.7.6 | (CFRM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.6 | Neighbor Report Response | | | |

B.4.15 Radio management extensions (continued)

| Item | Protocol Capability | References | Status | Support |
|---------|--|------------------------------------|------------------------|---|
| RM2.6.1 | Generate and transmit Neighbor Report Response | 9.4.2.37, 9.6.7.7 | (CFRM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM2.6.2 | Receive and process Neighbor Report Response | 9.4.2.37, 9.6.7.7 | (CFRM AND CFSTAofAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3 | General protocol for requesting and reporting of measurements | 9.4.2.21, 9.4.2.22, 11.11, 11.11.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.1 | Parallel Measurements | 9.4.2.21, 9.4.2.22, 11.11.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.2 | Use of Enable, Request and Report bits to enable/disable measurement requests and triggered autonomous reports Measurement Requests | 9.4.2.21, 11.11.6, 11.11.8 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.3 | Enable Autonomous Report | 9.4.2.21, 11.11.8 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.4 | Duration Mandatory | 9.4.2.21, 11.11.4 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.5 | Incapable Indication | 9.4.2.22 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.6 | Refused Indication | 9.4.2.22, 11.11.5 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.7 | Repeated Measurement | 9.6.7.2, 11.11.7 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM3.8 | Measurement Pause | 9.4.2.21.12, 11.11.9.7 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4 | Beacon Measurement Type | 11.11, 11.11.9.1 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.1 | Beacon request | 9.4.2.21.7 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.2 | Passive Measurement mode | 9.4.2.21.7, 11.11.9.1 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.3 | Active Measurement mode | 9.4.2.21.7, 11.11.9.1 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.4 | Beacon table mode | 9.4.2.21.7, 11.11.9.1 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.5 | Reporting Conditions | 9.4.2.21.7 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.6 | Beacon report | 9.4.2.21.7 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM4.7 | Reporting Detail | 9.4.2.21.7, 9.4.2.22.7, 9.4.2.36 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| * RM5 | Frame Measurement Type | 11.11, 11.11.9.2 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM5.1 | Frame request | 9.4.2.21.8 | (CFRM AND RM5):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.15 Radio management extensions (*continued*)

| Item | Protocol Capability | References | Status | Support |
|-----------|---|------------------------|-------------------------------|---|
| RM5.2 | Frame report | 9.4.2.22.8 | (CFRM AND RM5):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM6 | Channel Load Measurement Type | 11.11, 11.11.9.3 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM6.1 | Channel Load request | 9.4.2.21.5 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM6.2 | Channel Load report | 9.4.2.22.5 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM7 | Noise Histogram Measurement Type | 11.11, 11.11.9.4 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM7.1 | Noise Histogram request | 9.4.2.21.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM7.2 | Noise Histogram report | 9.4.2.22.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM8 | STA Statistics Measurement Type | 11.11, 11.11.9.5 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM8.1 | STA Statistics request | 9.4.2.21.9 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM8.2 | STA Statistics report | 9.4.2.22.9 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9 | LCI Measurement Type | 11.11, 11.11.9.6 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.1 | LCI request | 9.4.2.21.10 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.1.1 | Location Subject | 9.4.2.21.10 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.1.1.1 | Location Subject third party | 9.4.2.21.10 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.2 | LCI report | 9.4.2.22.10 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.3 | Azimuth | 11.11, 11.11.9.6 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.3.1 | Azimuth Request | 9.4.2.21.10 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM9.3.2 | Azimuth Response | 9.4.2.22.10 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *RM10 | Transmit Stream/Category Measurement Type | 11.11, 11.11.9.8 | (CFRM AND (CFQoS OR CFDMG)):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM10.1 | Transmit Stream/Category Measurement request | 9.4.2.21.11 | RM10:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM10.2 | Transmit Stream/Category Measurement report | 9.4.2.22.11 | RM10:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM10.3 | Triggered Transmit Stream/Category Measurement report | 9.4.2.22.11, 11.11.9.8 | RM10:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM11 | AP Channel report | 9.4.2.9, 9.4.2.36 | (CFRM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.15 Radio management extensions (continued)

| Item | Protocol Capability | References | Status | Support |
|--------|---|-----------------------------|--|---|
| RM11.1 | Generate and transmit AP Channel report | 9.3.3.3, 9.3.3.11, 9.4.2.36 | (CFRM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM11.2 | Receive and process AP Channel report | 9.3.3.3, 9.3.3.11, 9.4.2.36 | (CFRM AND CFSTAofAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM12 | Neighbor report procedure | 11.11, 11.11.10 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM12.1 | Neighbor report procedure | 11.11.10.2, 11.11.10.3 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM12.2 | TSF Offset in Neighbor report | 9.4.2.37, 11.11.10.3 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM13 | RCPI Measurement | | | |
| RM13.1 | RCPI Measurement for DSSS PHY at 2.4 GHz | 15.4.6.6 | (CFRM AND CFDSSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM13.2 | RCPI Measurement for OFDM PHY at 5 GHz | 17.2.3.6, 17.3.10.7 | (CFRM AND CFOFDM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM13.3 | RCPI Measurement for HR DSSS PHY at 2.4 GHz | 16.3.8.6 | (CFRM AND CFHRDSSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM13.4 | RCPI Measurement for Extended Rate PHY at 2.4 GHz | 18.2 | (CFRM AND CFERP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM14 | RCPI Measurement during Active Scanning | | | |
| RM14.1 | Respond with RCPI element when requested | 11.1.4.3.2 | (CFRM AND (CFQoS OR CFDMG) AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM14.2 | Measurement of RCPI on Probe Request frames | 11.1.4.3.2 | (CFRM AND (CFQoS OR CFDMG) AND CFAP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM15 | RSNI Measurement | 9.4.2.41 | (CFRM AND RM13):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM16 | TPC Information in Beacon and Probe Response frames | | | |

B.4.15 Radio management extensions (*continued*)

| Item | Protocol Capability | References | Status | Support |
|--------|--|--|------------------------|---|
| RM16.1 | Country and TPC Report elements included in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.9, 9.4.2.17, 11.8 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM16.2 | Power Constraint element included in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.14 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM17 | Power Capability elements in (Re)Association frames | 9.3.3.6, 9.3.3.7, 11.9.2 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM18 | Management Information Base | | | |
| RM18.1 | dot11RadioMeasurement | Annex C | (CFRM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM18.2 | dot11SMTRMRequest | Annex C | (CFRM AND CFAP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM18.3 | dot11SMTRMReport | Annex C | (CFRM AND CFAP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM18.4 | dot11SMTRMConfig | Annex C | (CFRM AND CFAP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM19 | Measurement Pilot frame | 6.3.3.2, 9.4.1.18, 9.4.2.46, 11.8, 11.11.14, 11.11.5 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM20 | BSS Average Access Delay elements included in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.39 | (CFAP AND CFRM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM21 | Antenna elements included in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.40 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM22 | Measurement Pilot Transmission element and Multiple BSSID element, if required, included in Probe Response frame | 9.3.3.11, 9.4.2.42, 9.4.2.46 | CFRM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM23 | Quiet interval | | | |
| RM23.1 | AP-defined Quiet Interval | 9.3.3.3, 9.3.3.11, 9.4.2.23, 11.9.3 | (CFAP AND CFRM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM23.2 | STA-defined Quiet Interval | 9.3.3.3, 9.3.3.11, 9.4.2.23, 11.9.3 | (CFSTAoFAP AND CFRM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM23.3 | STA support for Quiet Interval | 9.3.3.3, 9.3.3.11, 9.4.2.23, 11.9.3 | CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.15 Radio management extensions (*continued*)

| Item | Protocol Capability | References | Status | Support |
|--------|---|-----------------------------|---|---|
| RM24 | BSS Available Admission Capacity | 9.4.2.43 | (CFAP AND (CFQoS OR CFDMG) AND CFRM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM25 | BSS AC Access Delay | 9.3.3.3, 9.3.3.11, 9.4.2.44 | not CFDMG AND (CFAP AND CFQoS AND CFRM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM26 | BSS AC Access Delay | 9.3.3.3, 9.3.3.11, 9.4.2.44 | CFDMG AND CFAP AND CFRM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM27 | Directional channel quality measurement | 11.11, 11.32 | | |
| RM27.1 | Directional Channel Quality request | 8.4.2.23.16, 11.32 | (CFRM AND DMG-M19):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM27.2 | Directional Channel Quality report | 8.4.2.24.15, 11.32 | (CFRM AND DMG-M19):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM28 | Directional measurement type | 11.11 | | |
| RM28.1 | Directional Measurement request | 9.4.2.21.17 | (CFRM AND CFDMG):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM28.2 | Directional Measurement report | 9.4.2.22.16 | (CFRM AND CFDMG):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM29 | Directional statistics measurement type | 11.11 | | |
| RM29.1 | Directional Statistics Measurement Type | 9.4.2.21.18 | (CFRM AND CFDMG):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| RM29.2 | Directional Statistics Measurement Type | 9.4.2.22.17 | (CFRM AND CFDMG):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.16 DSE functions

| Item | Protocol capability | References | Status | Support |
|--------|--|-----------------------------------|---|--|
| *DSE1 | Fixed STA operation with RegLoc | 11.12.3 | CF3G6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DSE2 | Enabling STA operation with RegLoc | 11.12.3 | CF3G6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE2.1 | Enabling STA creation of DSE service area | 11.12.4 | DSE2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE2.2 | Enabling STA operation with DSE | 11.12.3 | DSE2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DSE3 | Dependent STA operation with DSE | 11.12.5 | CF3G6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.1 | Dependent STA enablement | 11.12.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.2 | Dependent STA DSE time to enablement | 11.12.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.3 | Dependent STA DSE time to not transmit | 11.12.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.4 | Dependent STA DSE Registered Location Announcement frame | 11.12.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.5 | Dependent STA MLME-ASSOCIATE.response primitive DSE | 6.3.7.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE3.6 | Dependent STA MLME-REASSOCIATE.response primitive DSE | 6.3.8.5 | DSE3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE4 | DSE request report procedure Transmission of DSE measurement request by an AP Transmission of DSE measurement report by a STA | 11.12.5 11.12.5 | (CF3G6 AND CFAP):M (CF3G6 AND CFSTAofAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE5 | STA association procedure Transmission of Association Request frame with Supported Operating Classes element by a STA Transmission of Association Response frame with Supported Operating Classes element by an AP | 10.21.3, 11.3.5.2, 11.3.5.3 | (CF3G6 AND CFSTAofAP):M (CF3G6 AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE6 | STA reassociation procedure Transmission of Reassociation Request frame with Supported Operating Classes element by a STA Transmission of Reassociation Response frame with Supported Operating Classes element by an AP | 11.3.5.4, 11.3.5.5 | (CF3G6 AND CFSTAofAP):M (CF3G6 AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE7 | Probe request procedure Transmission of Probe Request frame with Supported Operating Classes element by a STA | 11.10.1 | CF3G6 AND CFSTAofAP:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE8 | Probe response procedure Transmission of Probe Response frame with Supported Operating Classes element by an AP | 11.10.1 | CF3G6 AND CFAP:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9 | Extended channel switching procedure | 11.10.1 | | |

B.4.16 DSE functions (*continued*)

| Item | Protocol capability | References | Status | Support |
|--------|--|------------|---|---|
| DSE9.1 | Transmission of extended channel switch announcement frame/element and extended channel switching procedure by an AP. | 11.10.3 | (CF3G6 AND CFAP):M (CFAP AND CFVHT):M (CFAP AND CFTVHT):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.2 | Transmission of extended channel switch announcement frame/element and extended channel switching procedure by a STA. | 11.10.3 | (CF3G6 AND CFIBSS):M (CFIBSS AND CFVHT):M (CFIBSS AND CFTVHT):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.3 | Reception of extended channel switch announcement frame/element and extended channel switching procedure by a STA. | 11.10.3 | CF3G6:M CFVHT:M CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.4 | Transmission of Wide Bandwidth Channel Switch element in Extended Channel Announcement frame and transmission of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by an AP. | 11.40.4 | (CFAP AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.5 | Transmission of Wide Bandwidth Channel Switch element in Extended Channel Announcement frame and transmission of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | (CFIBSS AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.6 | Reception of Wide Bandwidth Channel Switch element in Extended Channel Announcement frame and reception of Wide Bandwidth Channel Switch subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | CFESM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.7 | Transmission of New Transmit Power Envelope element in Extended Channel Announcement frame and transmission of New Transmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by an AP. | 11.40.4 | (CFAP AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.16 DSE functions (*continued*)

| Item | Protocol capability | References | Status | Support |
|---------|---|------------------------|-----------------------------------|--|
| DSE9.8 | Transmission of New Transmit Power Envelope element in Extended Channel Announcement frame and transmission of NewTransmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | (CFIBSS AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.9 | Reception of New Transmit Power Envelope element in Extended Channel Announcement frame and reception of New Transmit Power Envelope subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | CFESM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.10 | Transmission of New Country element in Extended Channel Announcement frame and transmission of New Country subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by an AP. | 11.40.4 | (CFAP AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.11 | Transmission of New Country element in Extended Channel Announcement frame and transmission of New Country subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | (CFIBSS AND CFESM):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE9.12 | Reception of New Country element in Extended Channel Announcement frame and reception of New Country subelement in Channel Switch Wrapper element in Beacon/Probe Response frames, and associated extended channel switching procedure by a STA. | 11.40.4 | CFESM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DSE10 | DSE power constraint procedure Transmission of DSE power constraint announcement by an enabling STA Reception of DSE power constraint announcement by a dependent STA | 11.12.5 11.12.5 | (CF3G6 AND CFAP):M CF3G6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17 High-throughput (HT) features

B.4.17.1 HT MAC features

| Item | Protocol capability | References | Status | Support |
|--------|--|--|---|---|
| | Are the following MAC protocol features supported? | | | |
| HTM1 | HT capabilities signaling | | | |
| HTM1.1 | HT Capabilities element | 9.4.2.56.1 | CFHT:M CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM1.2 | Signaling of STA capabilities in Probe Request, (Re)Association Request frames | 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.56 | (CFHT AND CFIndepSTA): M (CFTVHT AND CFIndepSTA): M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM1.3 | Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames | 9.3.3.3, 9.3.3.7, 9.3.3.9, 9.3.3.11, 9.4.2.56 | (CFHT AND CFAP):M (CFTVHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM2 | Signaling of HT operation | 9.4.2.57 | (CFHT AND CFAP):M (CFTVHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM3 | MPDU aggregation | | | |
| HTM3.1 | Reception of A-MPDU | 9.4.2.56.3, 10.13.2, 12.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM3.2 | A-MPDU format | 9.7.1 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM3.3 | A-MPDU contents | 9.7.3 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM3.4 | A-MPDU frame exchange sequences | 10.22.2.7 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM3.5 | Transmission of A-MPDU | 9.4.2.56.3, 12.5 | CFHT:O CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM4 | MSDU aggregation | | | |
| HTM4.1 | Reception of A-MSDUs | 9.2.4.5, 9.3.2.2 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM4.2 | A-MSDU format | 9.3.2.2 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM4.3 | A-MSDU content | 9.3.2.2 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM4.4 | Transmission of A-MSDUs | 9.2.4.5, 9.3.2.2 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM5 | Block Ack | | | |
| HTM5.1 | Block ack mechanism | 9.3.1.8, 9.3.1.9, 9.4.1.14, 10.24, 11.16 | CFHT:M CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM5.2 | Use of compressed bitmap between HT STAs | 9.3.1.9.3, 10.24.6 | CFHT:M CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM5.3 | HT-immediate block ack extensions | 10.24.7 | CFHT:M CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.1 HT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-----------|---|---------------------------------------|--|---|
| HTM5.4 | HT-delayed block ack extensions HT-delayed block ack is obsolete. Support for this mechanism might be removed in a later revision of the standard. | 10.24.8 | CFHT AND QB4.2:O CFTVHT AND QB4.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM5.5 | Multiple TID Block Ack | 9.3.1.8.5, 9.3.1.9.4, 10.29.2.7 | PC37:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM6 | Protection mechanisms for different HT PHY options | | | |
| HTM6.1 | Protection of RIFS PPDUs in the presence of non-HT STAs | 10.26.3.3 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM6.2 | Protection of RIFS PPDUs in an IBSS | 10.26.3.3 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM6.3 | Protection of HT-greenfield PPDUs in the presence of non-HT STAs | 10.26.3.1 | HTP1.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM6.4 | Protection of HT-greenfield PPDUs in an IBSS | 10.26.3.1 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM7 | L-SIG TXOP protection mechanism The L-SIG TXOP protection mechanism is obsolete. Consequently, the L-SIG TXOP protection mechanism might be removed in a later revision of this standard. | 10.26.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM7.1 | Update NAV according to L-SIG | 10.26.5.4 | HTM7:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM8 | Duration/ID rules for A-MPDU | 9.7.3 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM9 | Truncation of TXOP as TXOP holder | 10.22.2.9 | CFHT:O CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM10 | Reception of +HTC frames | 9.2.4.1.10, 9.4.2.56.5, 10.9 | CFHT:O CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM11 | Reverse direction (RD) aggregation exchanges | 10.28 | CFHT:O CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM11.1 | Constraints regarding responses | 10.28.4 | HTM11:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM12 | Link adaptation | | | |
| HTM12.1 | Use of the HT Control field for link adaptation in immediate response exchange | 9.2.4.6, 9.3.3.15, 10.31.2 | CFHT:O CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM12.2 | Link adaptation using explicit feedback mechanism | 9.3.3.15, 10.32.3 | CFHT:O CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13 | Transmit beamforming | | | |
| *HTM13.1 | Transmission of beamformed PPDUs | 10.32 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM13.2 | Reception of beamformed PPDUs | 10.32 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM13.3 | Initiate transmit beamforming frame exchange with implicit feedback | 10.32.2 | HTM13.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.3.1 | Reception of sounding PPDUs | 10.32.2 | HTM13.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.1 HT MAC features (continued)

| Item | Protocol capability | References | Status | Support |
|-----------|---|--|--|---|
| *HTM13.4 | Response to transmit beamforming frame exchange with implicit feedback | 10.32.2 | HTM13.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.4.1 | Transmission of sounding PPDUs | 10.32.2 | HTM13.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM13.5 | Initiate transmit beamforming frame exchange with explicit feedback | 9.6.12.6, 10.32.3 | HTM13.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.5.1 | Transmission of sounding PPDUs | 10.32.3 | HTM13.5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM13.6 | Respond to transmit beamforming frame exchange with explicit feedback | 10.32.3 | HTM13.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.6.1 | Transmission of Action No Ack +HTC frame including Action payload of type CSI | 9.6.12.6, 10.32.3 | HTM13.6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.6.2 | Transmission of Action No Ack +HTC frame including Action payload of type “Noncompressed beamforming” | 9.6.12.7, 10.32.3 | HTM13.6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM13.6.3 | Transmission of Action No Ack +HTC frame including Action payload of type “Compressed beamforming” | 9.6.12.8, 10.32.3 | HTM13.6:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM13.7 | Calibration procedure | 9.3.3.15, 10.32.2.4 | HTM13:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM14 | Antenna selection (ASEL) | 9.2.4.6, 9.4.2.56.7, 9.6.12.9, 10.33 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM15 | Null data packet (NDP) | 10.34 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM16 | Space-time block coding (STBC) support | | | |
| HTM16.1 | STBC beacon transmission The use of the STBC beacon transmission mechanism is deprecated. | 11.1.3.2 | HTP2.11:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM16.2 | Dual CTS protection The use of the dual CTS mechanism is deprecated. | 10.3.2.8 | HTP2.11:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM17 | SM power save support | | | |
| *HTM17.1 | AP support for non-AP STA dynamic and static SM power save mode | 11.2.6 | (CFHT AND CFAP):M (CFTVHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM17.2 | STA support for local dynamic and static SM power save mode | 11.2.6 | (CFHT AND CFIndepSTA): O (CFTVHT AND CFIndepSTA): O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.1 HT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-----------|---|----------------------|--------------------------|---|
| HTM17.3 | Transmit SM power save state information using HT Capabilities element, or SM Power Save frame | 9.6.12.3, 11.2.6 | HTM17.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM17.4 | Receive SM power save state information and support frame exchanges with STAs in SM power save mode | 11.2.6 | HTM17.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM18 | Mechanisms for coexistence of 20 MHz and 40 MHz channels | 11.16 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM19 | Channel selection methods for 20/40 MHz operation | 11.16.3 | (HTP2.3.4 AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM20 | 20/40 MHz operation | 11.16 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM21 | Phased coexistence operation (PCO) The PCO mechanism is obsolete. Consequently, the PCO mechanism might be removed in a later revision of this standard. | | | |
| *HTM21.1 | PCO capability at AP | 11.17 | (CFHT AND CFAP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM21.1.1 | Rules for operation at a PCO active AP | 9.6.12.5, 11.17.2 | HTM21.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTM21.2 | STA support for PCO mode | 11.17 | (CFHT AND CFIndepSTA): O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM21.2.1 | Rules for operation at PCO active STA | 9.6.12.5, 11.17.3 | HTM21.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM22 | Management information base (MIB) | | | |
| HTM22.1 | dot11PhyHTComplianceGroup | Annex C | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTM22.2 | dot11PhyMCSGroup | Annex C | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.2 HT PHY features

| Item | Protocol capability | References | Status | Support |
|---------|--|------------|--------|---|
| | Are the following PHY protocol features supported? | | | |
| HTP1 | PHY operating modes | | | |
| HTP1.1 | Operation according to 18 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 19 (Extended Rate PHY (ERP) specification) | 19.1.4 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP1.2 | HT-mixed format | 19.1.4 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTP1.3 | HT-greenfield format | 19.1.4 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2 | PHY frame format | | | |

B.4.17.2 HT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|------------|--|--------------|-------------------|---|
| HTP2.1 | HT-mixed format PPDU format | 19.3.2 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.2 | HT-greenfield PPDU format | 19.3.2 | HTP1.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3 | Modulation and coding schemes (MCS) | | | |
| HTP2.3.1 | MCS 0 to MCS 7 in 20 MHz with 800 ns guard interval (GI) | | | |
| HTP2.3.1.1 | Support for 20 MHz with 800 ns GI MCS index 0 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.2 | Support for 20 MHz with 800 ns GI MCS index 1 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.3 | Support for 20 MHz with 800 ns GI MCS index 2 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.4 | Support for 20 MHz with 800 ns GI MCS index 3 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.5 | Support for 20 MHz with 800 ns GI MCS index 4 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.6 | Support for 20 MHz with 800 ns GI MCS index 5 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.7 | Support for 20 MHz with 800 ns GI MCS index 6 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.1.8 | Support for 20 MHz with 800 ns GI MCS index 7 | 19.3.5, 19.5 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2 | MCS 8 to MCS 15 in 20 MHz with 800 ns GI | | | |
| HTP2.3.2.1 | Support for 20 MHz with 800 ns GI MCS index 8 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.2 | Support for 20 MHz with 800 ns GI MCS index 9 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.3 | Support for 20 MHz with 800 ns GI MCS index 10 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.4 | Support for 20 MHz with 800 ns GI MCS index 11 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.5 | Support for 20 MHz with 800 ns GI MCS index 12 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.6 | Support for 20 MHz with 800 ns GI MCS index 13 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.7 | Support for 20 MHz with 800 ns GI MCS index 14 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.2.8 | Support for 20 MHz with 800 ns GI MCS index 15 | 19.3.5, 19.5 | (CFHT AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.3 | Transmit and receive support for 400 ns GI | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTP2.3.4 | Operation at 40 MHz | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5 | Support for MCS with indices 16 to 76 | | | |
| HTP2.3.5.1 | Support for MCS with index 16 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.2 | Support for MCS with index 17 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.2 HT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-------------|-------------------------------|--------------|--------|---|
| HTP2.3.5.3 | Support for MCS with index 18 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.4 | Support for MCS with index 19 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.5 | Support for MCS with index 20 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.6 | Support for MCS with index 21 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.7 | Support for MCS with index 22 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.8 | Support for MCS with index 23 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.9 | Support for MCS with index 24 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.10 | Support for MCS with index 25 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.11 | Support for MCS with index 26 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.12 | Support for MCS with index 27 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.13 | Support for MCS with index 28 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.14 | Support for MCS with index 29 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.15 | Support for MCS with index 30 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.16 | Support for MCS with index 31 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.17 | Support for MCS with index 32 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.18 | Support for MCS with index 33 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.19 | Support for MCS with index 34 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.20 | Support for MCS with index 35 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.21 | Support for MCS with index 36 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.22 | Support for MCS with index 37 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.23 | Support for MCS with index 38 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.24 | Support for MCS with index 39 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.25 | Support for MCS with index 40 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.26 | Support for MCS with index 41 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.27 | Support for MCS with index 42 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.28 | Support for MCS with index 43 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.29 | Support for MCS with index 44 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.30 | Support for MCS with index 45 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.31 | Support for MCS with index 46 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.32 | Support for MCS with index 47 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.33 | Support for MCS with index 48 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.34 | Support for MCS with index 49 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.35 | Support for MCS with index 50 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.36 | Support for MCS with index 51 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.37 | Support for MCS with index 52 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.38 | Support for MCS with index 53 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.39 | Support for MCS with index 54 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.40 | Support for MCS with index 55 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.41 | Support for MCS with index 56 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.42 | Support for MCS with index 57 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.2 HT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-------------|---|--------------|------------|---|
| HTP2.3.5.43 | Support for MCS with index 58 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.44 | Support for MCS with index 59 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.45 | Support for MCS with index 60 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.46 | Support for MCS with index 61 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.47 | Support for MCS with index 62 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.48 | Support for MCS with index 63 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.49 | Support for MCS with index 64 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.50 | Support for MCS with index 65 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.51 | Support for MCS with index 66 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.52 | Support for MCS with index 67 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.53 | Support for MCS with index 68 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.54 | Support for MCS with index 69 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.55 | Support for MCS with index 70 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.56 | Support for MCS with index 71 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.57 | Support for MCS with index 72 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.58 | Support for MCS with index 73 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.59 | Support for MCS with index 74 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.60 | Support for MCS with index 75 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.3.5.61 | Support for MCS with index 76 | 19.3.5, 19.5 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.4 | PHY timing parameters | | | |
| HTP2.4.1 | Values in non-HT 20 MHz channel | 19.3.6 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.4.2 | Values in 20 MHz HT channel | 19.3.6 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.4.3 | Values in 40 MHz channel | 19.3.6 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.5 | HT Preamble field definition and coding | | | |
| HTP2.5.1 | HT-mixed format preamble | 19.3.9.2 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.5.2 | HT-greenfield preamble | 19.3.9.5 | HTP1.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.5.3 | Extension HT Long Training fields (HT-ELTFs) | 19.3.9.4.6 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.6 | HT Data field definition and coding | 19.3.11 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.17.2 HT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-----------|---|-------------|------------|---|
| HTP2.9.2 | Channel allocation for 20 MHz channels at 2.4 GHz | 18.4.3 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.9.3 | Channel allocation for 40 MHz channels at 5 GHz | 19.3.15.3 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.9.4 | Channel allocation for 40 MHz channels at 2.4 GHz | 19.3.15.2 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.10 | PHY transmit specification | | | |
| HTP2.10.1 | PHY transmit specification for 20 MHz channel | 19.3.18 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.10.2 | PHY transmit specification for 40 MHz channel | 19.3.18 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HTP2.11 | Space-time block coding (STBC) | 19.3.11.9.2 | CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.12 | PHY receive specification | EMPTY | | |
| HTP2.12.1 | PHY receive specification for 20 MHz channel | 19.3.19 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.12.2 | PHY receive specification for 40 MHz channel | 19.3.19 | HTP2.3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HTP2.13 | PPDU reception with RIFS | 19.3.19.7 | CFHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.18 Tunneled direct-link setup extensions

| Item | Protocol capability | References | Status | Support |
|----------|----------------------------|---|-------------------------|---|
| TDLS1 | Tunneled direct-link setup | 9.6.13, 11.23 | CFIndepSTA AND CFTDLS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS1.1 | TDLS setup | 9.4.2.62, 9.6.13.2, 9.6.13.3, 9.6.13.4, 11.23.4 | CFIndepSTA AND CFTDLS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS1.2 | TDLS teardown | 9.4.2.62, 9.6.13.5, 11.23.5 | CFIndepSTA AND CFTDLS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS1.3 | TPK handshake | 12.7.9 | CFIndepSTA AND CFTDLS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS1.4 | TDLS peer PSM | 9.4.2.62, 9.4.2.63, 9.6.13.9, 9.6.13.10, 11.2.3.14 | CFIndepSTA AND CFTDLS:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS 1.5 | TPU | 9.4.2.62, 9.4.2.65, 9.4.2.66, 9.6.13.6, 9.6.13.11, 11.2.3.15 | CFIndepSTA AND CFTDLS:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.18 Tunneled direct-link setup extensions (*continued*)

| Item | Protocol capability | References | Status | Support |
|----------|------------------------|---|---|---|
| TDLS 1.6 | TDLS Channel Switching | 9.4.2.62, 9.4.2.64, 9.6.13.7, 9.6.13.8, 11.23.6 | CFIndepSTA AND CFMD AND CFOC AND CFTDLS:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TDLS1.7 | TDLS Discovery | 9.4.2.62, 9.6.8.16, 9.6.13.12, 11.23.3 | CFIndepSTA AND CFMD AND CFOC AND CFTDLS:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.19 WNM extensions

| Item | Protocol capability | References | Status | Support |
|--------|--|--|------------------------------------|---|
| WNM1 | Extended Capabilities element | 9.4.2.27 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM2 | STA Statistics (Triggered) and Multicast Diagnostics | 11.11.8 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM2.1 | Protocol for Triggered Measurements | 11.11.8 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM2.2 | Triggered STA Statistics | 9.4.2.21.9, 9.4.2.22.9, 9.6.7.2, 9.6.7.3, 11.11.9.5 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM2.3 | Multicast Diagnostics | 9.4.2.21.13, 9.4.2.22.12, 9.6.7.2, 9.6.7.3, 11.11.19 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM3 | Event | 11.24.2 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM3.1 | Event Request frame | 9.4.2.67, 9.6.14.2 | (CFWNM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM3.2 | Event Report frame | 9.4.2.68, 9.6.14.3 | (CFWNM AND CFIndepSTA) :M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4 | Diagnostic | 11.24.3 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4.1 | Diagnostic Request frame | 9.4.2.69, 9.6.14.4 | (CFWNM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4.2 | Diagnostic Report frame | 9.4.2.70, 9.6.14.5 | (CFWNM AND CFIndepSTA) :M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4.3 | Configuration Profile Diagnostic Type | 9.4.2.70.3, 11.24.3.2 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.19 WNM extensions (*continued*)

| Item | Protocol capability | References | Status | Support |
|----------|---|---|--------------------------|---|
| WNM4.4 | Manufacturer Information STA Report Diagnostic Type | 9.4.2.70.2, 11.24.3.3 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4.5 | Association Diagnostic Type | 9.4.2.69.2, 9.4.2.70.4, 11.24.3.4 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM4.6 | IEEE 802.1X Authentication Diagnostic Type | 9.4.2.69.3, 9.4.2.70.5, 11.24.3.5 | (CFWNM AND PC34):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5 | Location | 9.4.2.71, 11.24.4 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.1 | Location Civic request/report | 11.11.9.9 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.2 | Location Identifier request/report | 11.11.9.10 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.3 | Location Track Notification | 9.6.8.17, 11.24.4 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.3.1 | Time of Departure Notifications | 9.4.2.71, 11.24.4 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.3.2 | Motion Detection Notifications | 9.4.2.71, 11.24.4 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.4 | Location Configuration Request frame | 9.4.2.71, 9.6.14.6 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.4.1 | Normal Indication | 9.4.2.71, 9.6.14.6 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.4.2 | Motion Indication | 9.4.2.71, 9.6.14.6 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM5.5 | Location Configuration Response frame | 9.4.2.71, 9.6.14.7 | CFWNM:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *WNM6 | Multiple BSSID Support | 11.1.3.8, 11.1.4, 11.11.14 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM6.1 | Multiple BSSID element | 9.4.2.46 | WNM6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM6.2 | Multiple BSSID-index element | 9.4.2.74 | WNM6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM7 | BSS transition management | 11.24.7 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM7.1 | Neighbor Report element | 9.4.2.37 | (CFWNM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM7.2 | BSS Transition Management Query frame | 9.6.14.8 | (CFWNM AND CFAP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM7.3 | BSS Transition Management Request frame | 9.6.14.9 | (CFWNM AND CFIndepSTA):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WNM7.4 | BSS Transition Management Response frame | 9.6.14.10 | (CFWNM AND CFIndepSTA):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.19 WNM extensions (*continued*)

| Item | Protocol capability | References | Status | Support |
|---------|--|------------------------|--|---|
| *WNM8 | FMS | 11.2.3.16 | CFWNM:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.21 Mesh protocol capabilities

B.4.21.1 General mesh support

| Item | Protocol capability | Reference | Status | Support |
|---------|--|----------------|--------------|---|
| *MP1 | Support of mesh capability | 4.3.20, 14.1 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.1 | Mesh BSS scanning | 14.2.2, 14.2.6 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.2 | Candidate peer mesh STA determination | 14.2.7 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.3 | Active mesh profile determination | 14.2.3, 14.2.4 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.4 | Establishing a mesh BSS | 14.2.8 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.5 | Becoming a member of a mesh BSS | 14.2.8 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP1.6 | Announcement of mesh profile and supplemental information for the mesh discovery | 14.2.3, 14.2.5 | MP1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP2 | Mesh peering management (MPM) framework | 14.3 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP2.1 | Mesh peering management (MPM) protocol | 14.3 | MP2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.1.1 | Processing of Mesh Peering Open frame | 14.3.6 | MP2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.1.2 | Processing of Mesh Peering Confirm frame | 14.3.7 | MP2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.1.3 | Processing of Mesh Peering Close frame | 14.3.8 | MP2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.1.4 | MPM finite state machine | 14.4 | MP2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP2.2 | Authenticated mesh peering exchange (AMPE) | 14.5 | MP2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.1 | Mesh authentication using SAE | 12.4, 14.3.3 | MP2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.2 | Mesh authentication using IEEE Std 802.1X | 4.10, 14.3.3 | MP2.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.3 | Protected mesh peering Management frame processing | 14.5.3, 14.5.3 | MP2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.4 | Mesh pairwise master key security association (PMKSA) caching | 12.6.12 | MP2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.5 | AMPE finite state machine | 14.5.6 | MP2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.6 | MGTK distribution | 14.5.4 | MP2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP2.2.7 | MGTK update | 14.6 | MP2.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP3 | Mesh STA beaconing | 14.13.3 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP4 | Mesh STA synchronization | 14.13.2 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP4.1 | Neighbor offset synchronization method | 14.13.2 | MP4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.1.1 | Calculation of TSF offset | 14.13.2.2.2 | MP4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.21.1 General mesh support (*continued*)

| Item | Protocol capability | Reference | Status | Support |
|---------|---|----------------------|-----------|---|
| MP4.1.2 | Clock drift adjustment | 14.13.2.2.3 | MP4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP4.2 | Mesh beacon collision avoidance (MBCA) | 14.13.4 | MP4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.2.1 | Beacon timing advertisement | 14.13.4.2 | MP4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.2.2 | TBTT selection | 14.13.4.3 | MP4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.2.3 | TBTT adjustment | 14.13.4.4 | MP4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.2.4 | Frame transmission across reported TBTT | 14.13.4.5 | MP4.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP4.2.5 | Delayed beacon transmission | 14.13.4.6 | MP4.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP5 | MCCA | 10.23.3 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP5.1 | MCCAOP Advertisement | 10.23.3.7 | MP5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP5.2 | Neighbor MCCAOP Recognition | 10.23.3.4, 10.23.3.5 | MP5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP5.3 | MCCAOP Setup | 10.23.3.6 | MP5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP5.4 | Access during MCCAOPs | 10.23.3.9 | MP5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP5.5 | MCCAOP teardown | 10.23.3.8 | MP5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP6 | Intra mesh congestion control | 14.12 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP6.1 | Local congestion monitoring and detection | 14.12 | MP6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP6.2 | Congestion control signaling | 14.12 | MP6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP6.3 | Local rate control | 14.12 | MP6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP7 | MBSS channel switching procedure | 11.9.8, 11.10.3 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP7.1 | Transmission of channel switch advertisement | 11.9.8, 11.10.3 | MP7:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP7.2 | Propagation of channel switch advertisement | 11.9.8, 11.10.3 | MP7:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP8 | Mesh power save operation (operation in light or deep sleep mode) | 14.14 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.1 | Link-specific mesh power management mode setting | 14.14.2.2, 14.14.8 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.2 | Nonpeer mesh power management mode setting | 14.14.2.3 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.3 | Light sleep mode operation | 14.14.8.4 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.4 | Deep sleep mode operation | 14.14.8.5 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.5 | STA power state transitions | 14.14.3 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP8.6 | Mesh awake window operation | 14.14.6 | MP8:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP9 | Mesh power save support | 14.14 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP9.1 | TIM transmission | 14.14.4 | MP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.21.1 General mesh support (*continued*)

| Item | Protocol capability | Reference | Status | Support |
|--------|--|---|-----------|---|
| MP9.2 | Link-specific mesh power management modes determination | 14.14.2 | MP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP9.3 | Group addressed frame transmission | 14.14.7 | MP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP9.4 | Frame transmission to a mesh STA in light sleep mode | 14.14.7, 14.14.9 | MP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP9.5 | Frame transmission to a mesh STA in deep sleep mode | 14.14.7, 14.14.9 | MP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP10 | Airtime link metric computation | 14.9 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP11 | Link metric reporting | 14.8.3 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP11.1 | Autonomous link metric reporting | 14.8.3 | MP11:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP11.2 | Link metric reporting upon request | 14.8.3 | MP11:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP12 | Proxy operation | 14.11.4 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP12.1 | Data forwarding at proxy mesh gate | 14.11.3 | MP12:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP12.2 | Maintenance of proxy information | 14.11.4.2 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP12.3 | Proxy update using Proxy Update and Proxy Update Confirmation frames | 14.11.4 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP12.4 | Proxy update using HWMP Mesh Path Selection frames | 14.10.9, 14.10.10, 14.10.11 | HWM1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP13 | Gate announcement | 14.11.2 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP13.1 | GANN transmission | 14.11.2 | MP13:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP13.2 | GANN reception and propagation | 14.11.2 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP14 | Mesh Control field handling | 9.2.4.7.3 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP14.1 | Address Extension recognition | 9.2.4.7.3, 9.3.5 | MP14:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP14.2 | Mesh TTL handling | 9.2.4.7.3, 10.35.3, 10.35.4, 10.35.5 | MP14:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP14.3 | Mesh Sequence Number handling | 9.2.4.7.3, 10.35.3, 10.35.4, 10.35.5, 10.35.6 | MP14:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *MP15 | MSDU/MMPDU forwarding | 10.35 | CFMBSS: O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP15.1 | Individually addressed MSDU forwarding | 10.35.3 | MP15:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP15.2 | Group addressed MSDU forwarding | 10.35.4 | MP15:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.21.1 General mesh support (*continued*)

| Item | Protocol capability | Reference | Status | Support |
|--------|---|-----------|--------------|---|
| MP15.3 | MMPDU forwarding | 10.35.5 | MP15:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP15.4 | Detection of duplicate MSDUs/ MMPDUs | 10.35.6 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| MP15.5 | Treatment of unknown destination | 10.35.8 | CFMBSS: M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.21.2 HWMP path selection protocol capabilities

| Item | Protocol capability | Reference | Status | Support |
|----------|---|--------------------|----------|---|
| *HWM1 | Hybrid wireless mesh protocol (HWMP) | 14.10 | CFMBSS:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HWM1.1 | On-demand path selection | 14.10.3 | HWM1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.1.1 | PREQ processing for on-demand path selection | 14.10.9 | HWM1.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.1.2 | PREP processing for on-demand path selection | 14.10.10 | HWM1.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.1.3 | PERR processing for on-demand path selection | 14.10.11 | HWM1.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *HWM1.2 | Proactive tree building | 14.10.4 | HWM1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.2.1 | PREQ processing for proactive tree building | 14.10.9 | HWM1.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.2.2 | PREP processing for proactive tree building | 14.10.10 | HWM1.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.2.3 | PERR processing for proactive tree building | 14.10.11 | HWM1.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM1.2.4 | RANN processing | 14.10.12 | HWM1.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| HWM2 | Maintenance of forwarding information | 10.35.2, 14.10.8.4 | MP15:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.22 QMF extensions

| Item | Protocol capability | References | Status | Support |
|------|--|------------|----------------------------|---|
| QMF1 | Extended Capabilities element | 9.4.2.27 | CFQMF:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QMF2 | Channel access procedures for QMFs | 10.2.4.2 | CFQMF:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QMF3 | Duplicate detection and recovery for QMFs | 10.3.2.11 | CFQMF:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QMF4 | QMF policy Configuration | 11.26.2 | CFQMF:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QMF5 | Interpreting QMF priority | 11.26.3 | CFQMF:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| QMF6 | CCMP cryptographic encapsulation for QMFs | 12.5.3.3 | (CFQMF AND PC34.1.10):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.23 RobustAVT extensions

| Item | Protocol capability | References | Status | Support |
|----------|---|--|---|---|
| AVT1 | Extended Capabilities element | 9.4.2.27 | CFAVT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AVT2 | Groupcast with Retries (GCR) | 11.24.16.3.2, 11.24.16.3.3, 11.24.16.3.4, 11.24.16.3.5, 11.24.16.3.6 | (CFHT AND CFAVT AND WNM19):M (CFTVHT AND CFAVT AND WNM19):M (CFAP AND CFAVT AND WNM19 AND HTM4.4):M (CFAVT AND QB5):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AVT2.1 | Advanced GCR | 9.4.2.27, 10.24.10, 11.24.16.3.7, 11.24.16.3.8 | (CFAVT AND QB5):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AVT3 | Alternate EDCA transmit queues | 10.2.4.2 | CFAVT AND CFHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| AVT4 | Stream Classification Service (SCS) | 11.27.2 | CFAVT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.23 RobustAVT extensions (continued)

| Item | Protocol capability | References | Status | Support |
|------|---------------------|---|--------|---|
| AVT6 | GCR for Mesh | 9.4.2.27, 10.24.10, 11.24.16.3.6, 11.24.16.3.7 (WNM19 AND HTM4.4 AND CFHT AND CFAVT AND CFMBSS):O (WNM19 AND HTM4.4 AND CFTVHT AND CFAVT and CFMBSS):O | | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24 DMG features

B.4.24.1 DMG MAC features

| Item | Protocol capability | References | Status | Support |
|-----------|--|--|--|--|
| | Are the following MAC protocol features supported? | | | |
| DMG-M1 | DMG capabilities signaling | | | |
| DMG-M1.1 | DMG Capabilities element | 9.4.2.128 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M1.2 | Signaling of STA capabilities in Probe Request, (Re)Association Request frames | 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.128 | (CFDMG AND (CFSTAofAP OR CFIBSS OR CFPBSSnotPC P)):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M1.3 | Signaling of STA and BSS capabilities in DMG Beacon, Probe Response, (Re)Association Response frames | 9.3.3.7, 9.3.3.9, 9.3.3.11, 9.3.4.2, 9.4.2.128 | (CFDMG AND (CFAP OR CFPCP)):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M2 | Signaling of DMG operation | 9.4.2.129 | (CFDMG AND (CFAP OR CFPCP)):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3 | MSDU aggregation | | | |
| DMG-M3.1 | Reception of Basic A-MSDUs | 9.2.4.5, 9.3.2.2.2 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3.2 | Basic A-MSDU format | 9.3.2.2.2 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3.3 | Basic A-MSDU content | 9.3.2.2.2 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3.4 | Transmission of Basic A-MSDUs | 9.2.4.5, 9.3.2.2.2 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M3.5 | Reception of Short A-MSDU | 9.2.4.5, 9.3.2.2.2 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|------------|---|-------------------------------|---|--|
| DMG-M3.6 | Short A-MSDU format | 9.3.2.2.3 | (DMG-M3.5 OR DMG-M3.8):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3.7 | Short A-MSDU content | 9.3.2.2.3 | (DMG-M3.5 OR DMG-M3.8):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M3.8 | Transmission of Short A-MSDU | 9.2.4.5, 9.3.2.2.3 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M3.9 | Negotiation of Short A-MSDU usage | 9.4.2.30 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M4 | MPDU aggregation | | | |
| DMG-M4.1 | Reception of A-MPDU | 9.4.2.128.2, 10.13.2, 11.3 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M4.2 | A-MPDU format | 9.7.1 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M4.3 | A-MPDU content | 9.7.3 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M4.4 | Transmission of A-MPDU | 9.4.2.128.2, 10.13.2 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M5 | A-PPDU aggregation | 10.13-10.15 | | |
| *DMG-M5.1 | Reception of A-PPDU | 9.4.2.128.2 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M5.2 | A-PPDU format | 20.5.2, 20.6.2 | (DMG-M5.1 OR DMG-M5.3):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M5.3 | Transmission of A-PPDU | 9.4.2.128.2 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M6 | Reverse direction aggregation exchanges | 9.4.2.128.2, 10.28 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M6.1 | Constraints regarding responses | 10.28.3 | DMG-M6:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7 | DMG channel access | | | |
| DMG-M7.1 | ATI transmission | | | |
| DMG-M7.1.1 | Transmission of Request | 10.36.3 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.1.2 | Reception of Request | 10.36.3 | CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|--------------|---|---|---|--|
| DMG-M7.1.3 | Transmission of Response | 10.36.3 | CFDMG AND (CFSTAofAP OR CFPBSSnotPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.1.4 | Reception of Response | 10.36.3 | CFDMG AND (CFAP OR CFPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.2 | DTI transmission | 10.36.4 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.3 | Time allocation | | | |
| *DMG-M7.3.1 | Service period (SP) allocation | 9.4.2.132, 9.4.2.134, 9.4.2.137, 10.36.6.2 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M7.3.2 | CBAP allocation | 9.4.2.132, 9.4.2.137, 10.36.6.2 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.3.3 | Interpretation of allocation | 9.4.2.132, 9.4.2.137, 10.36.5, 10.36.6.2 | CFDMG AND (CFInfraSTA OR CFIBSS OR CFPCP OR CFPBSSnotPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M7.4 | Contention based access period | 10.36.5, 10.36.6.2 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1 | Distributed coordination function (DCF) | | | |
| DMG-M7.4.1.1 | Network allocation vector (NAV) function | 10.3.2.2, 10.3.4, 10.36.10 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.2 | Interframe space usage and timing | 10.3.2.4, 10.3.4, 10.3.7 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.3 | Random Backoff function | 10.3.3 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.4 | DCF Access procedure | 10.3, 10.3.4.2, 10.3.4.5 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.5 | Random Backoff procedure | 10.3, 10.3.4.3 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.6 | Recovery procedures and retransmit limits | 10.3.4.4 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.7 | Request to send (RTS)/DMG clear to send (DMG CTS) procedure | 10.3.2.5, 10.3.2.7, 10.3.2.8, 10.36.10 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|---------------|---|---|--|--|
| DMG-M7.4.1.8 | Individually addressed MAC protocol data unit (MPDU) transfer | 10.3.5 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.9 | Group addressed MPDU transfer | 10.3.6 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.10 | MAC-level acknowledgment | 10.3.2.3, 10.3.2.9 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.1.11 | Duplicate detection and recovery | 10.3.2.11 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.2 | Enhanced DCF (EDCA) | | | |
| *DMG-M7.4.2.1 | Support for one transmit queue with AC_BE access category | 10.2.4.2, 10.22.2.1 | DMG-M7.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.2.2 | Support for four transmit queues with a separate channel access entity associated with each | 10.2.4.2, 10.22.2.1 | DMG-M7.4.2.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.4.2.3 | AC_BE access category and differentiated channel access | 10.22.2.2, 10.22.2.4, 10.22.2.11 | DMG-M7.4.2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.5 | Pseudo-static allocation | | | |
| DMG-M7.5.1 | Scheduling of pseudo-static allocation | 9.4.2.113, 9.4.2.141, 10.36.6.2, 10.36.6.5, 11.4.13.2 | DMG-M7.3.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.5.2 | Operation within pseudo-static allocation | 9.4.2.139, 9.4.2.141, 10.36.6.2, 10.36.6.4 | CFDMG AND (CFAP OR CFSTAofAP OR CFPCP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.6 | Guard time | 10.36.6.5 | DMG-M7.3.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.7 | DMG protected period | | | |
| *DMG-M7.7.1 | Establishment of DMG protected period with RTS at source DMG STA | 10.36.6.6 | DMG-M7.3.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-M7.7.2 | Establishment of DMG protected period using a DMG CTS frame at destination DMG STA | 10.36.6.6 | DMG-M7.3.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.7.3 | Transmission of DMG DTS frame at destination DMG STA | 10.36.6.6 | DMG-M7.7.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.7.4 | Reception of DMG DTS frame at source DMG STA | 10.36.6.6 | DMG-M7.7.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.8 | Service period recovery | 10.36.6.7 | DMG-M7.3.1 AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|--------------|--------------------------------------|-------------------------|--|--|
| DMG-M7.9 | Dynamic allocation of service period | 10.36.7 | | |
| DMG-M7.9.1 | Polling period (PP) | 9.4.2.143, 10.36.7.2 | | |
| DMG-M7.9.1.1 | Transmission of Poll | 9.3.1.11 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.9.1.2 | Reception of Poll | 9.3.1.11 | CFDMG AND (CFSTAofAP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.9.1.3 | Transmission of SPR | 9.3.1.12 | CFDMG AND (CFSTAofAP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.9.1.4 | Reception of SPR | 9.3.1.12 | CFDMG AND (CFAP OR CFPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.9.2 | Grant period (GP) | 10.36.7.3 | | |
| DMG-M7.9.2.1 | Transmission of Grant | 9.3.1.13 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.9.2.2 | Reception of Grant | 9.3.1.13 | CFDMG AND (CFSTAofAP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.10 | Dynamic truncation of service period | 10.36.8 | | |
| DMG-M7.10.1 | Transmission of CF-End | 9.3.1.16 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.10.2 | Reception of CF-End | 9.3.1.16 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.11 | Dynamic extension of service period | 10.36.9 | | |
| DMG-M7.11.1 | Transmission of SPR | 9.3.1.12 | CFDMG AND (CFSTAofAP OR CFPBSSnotPC P):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.11.2 | Reception of SPR | 9.3.1.12 | CFDMG AND (CFAP OR CFPCP):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.11.3 | Transmission of Grant | 9.3.1.13 | CFDMG AND (CFAP OR CFPCP):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-------------|---|--|---|--|
| DMG-M7.11.4 | Reception of Grant | 9.3.1.13 | CFD MG AND (CFSTAofAP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.12 | Isochronous and Asynchronous TS support | | | |
| DMG-M7.12.1 | Isochronous operation | 9.4.2.132, 9.4.2.134, 9.4.2.137, 11.4.13.2 | DMG-M7.3.1 AND (CFInfraSTA OR CFPCP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M7.12.2 | Asynchronous operation | 9.3.1.12, 9.4.2.132, 9.4.2.134, 9.4.2.137, 11.4.13.2 | DMG-M7.3.1 AND (CFInfraSTA OR CFPCP OR CFPBSSnotPC P):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M8 | AP or PCP clustering | | | |
| DMG-M8.1 | S-AP in centralized AP or PCP cluster | 10.37 | CFD MG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M8.2 | Except when centralized AP or PCP clusters on all channels supported by the AP or PCP in the operating class, join a centralized AP or PCP cluster or cease activity on channel | 10.37.2.2 | CFD MG AND (CFAP OR CFPCP) AND NOT DMG-M8.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M8.3 | Other AP or PCP clustering | 10.37 | CFD MG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9 | DMG beamforming | | | |
| DMG-M9.1 | Sector-level sweep | 10.38.2, 10.38.6.2 | CFD MG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.2 | Beamforming in BTI | 10.38.4 | CFD MG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.3 | Beamforming in A-BFT | 10.38.5 | CFD MG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.4 | BRP setup | 10.38.3.2 | CFD MG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.5 | MID | 10.38.6.3.3 | CFD MG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.6 | BC | 10.38.6.3.4 | CFD MG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.7 | BRP | | | |
| *DMG-M9.7.1 | BRP with BS-FBCK | 10.38.3, 10.38.6.4 | CFD MG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M9.7.2 | BRP with channel measurement | 10.38.3, 10.38.6.4 | DMG-M9.7.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.1 DMG MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|--------------|---|---|--|--|
| DMG-M9.8 | Beam tracking | 10.38.7 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M10 | DMG block ack with flow control | 9.4.2.128.2, 10.39 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M11 | DMG link adaptation | 10.39 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M12 | DMG dynamic tone pairing (DTP) | 9.4.2.128.2, 10.40 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M13 | Timing synchronization function (TSF) in a PBSS | | | |
| DMG-M13.1 | Timing in a PBSS | 11.1.2.1, 11.1.5 | CFPCP AND CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M13.2 | PBSS initialization | 11.1.4 | CFPCP AND CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M14 | Power management | | | |
| DMG-M14.1 | STA power management without wakeup schedule | 11.2.7.2.2, 11.2.7.2.4 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M14.2 | STA power management with wakeup schedule | 9.4.2.138, 11.2.7.2.3, 11.2.7.2.4 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M14.3 | PCP power management | 9.4.2.138, 11.2.7.2.3 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M15 | Authentication and association | | | |
| DMG-M15.1 | Association state | 11.3.1 | M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| DMG-M15.2 | STA association procedure | 11.3.5.2 | CFSTAofAP AND CFDMG:M CFPBSSnotPC P AND CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

| DMG-M22.5 | BRP | 9.6.22.3 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M22.6 | Handover | 9.6.20.6, 9.6.20.7 | DMG-M16.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M22.7 | DTP | 9.6.20.8, 9.6.20.9 | DMG-M12:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M22.8 | DMG relay | 9.6.20.10– 9.6.20.24 | DMG-M23:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-M23 | DMG relay | 10.40, 11.36 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.24.2 DMG PHY features

| Item | Protocol capability | References | Status | Support |
|----------|--|------------|---------|--|
| | Are the following PHY protocol features supported? | | | |
| DMG-P1 | PHY operating modes | | | |
| DMG-P1.1 | Operation according to Clause 20 | 20 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2 | PHY frame format | | | |

B.4.24.2 DMG PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|--------------|-------------------------------------|------------|------------|--|
| *DMG-P2.1 | DMG control mode format | 20.4 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-P2.2 | DMG SC mode format | 20.6 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-P2.3 | DMG OFDM mode format | 20.5 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *DMG-P2.4 | DMG low-power SC mode format | 20.7 | CFDMG:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5 | Modulation and coding schemes (MCS) | | | |
| DMG-P2.5.1 | MCS 0 of DMG control mode | | DMG-P2.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5.2 | MCS 1-12 of DMG SC mode | | DMG-P2.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> |
| DMG-P2.5.2.1 | MCS 1-4 | | DMG-P2.2:M | N/A <input type="checkbox"/> |
| DMG-P2.5.2.2 | MCS 5-12 | | DMG-P2.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5.3 | MCS 13-24 of DMG OFDM mode | | DMG-P2.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5.3.1 | MCS 13-17 | | DMG-P2.3:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5.3.2 | MCS 18-24 | | DMG-P2.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.5.4 | MCS 25-31 of DMG low-power SC mode | | DMG-P2.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.6 | Common preamble format | 20.3.6 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| DMG-P2.7 | Use of LDPC codes | 20.3.8 | CFDMG:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.25 Very high throughput (VHT) features

B.4.25.1 VHT MAC features

| Item | Protocol capability | References | Status | Support |
|---------|--|---|---|---|
| | Are the following MAC protocol features supported? | | | |
| VHTM1 | VHT capabilities signaling | | | |
| VHTM1.1 | VHT Capabilities element | 9.4.2.158.1 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM1.2 | Signaling of STA capabilities in Probe Request, (Re)Association Request frames | 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.158.1 | (CFVHT AND CFIIndepSTA): M (CFVHT AND CFMBSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.25.1 VHT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|----------|--|--|--|---|
| VHTM1.3 | Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames | 9.3.3.3, 9.3.3.7, 9.3.3.9, 9.3.3.11, 9.4.2.158 | (CFVHT AND CFAP):M (CFVHT AND CFMBSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM2 | Signaling of VHT operation | 9.4.2.159 | (CFVHT AND CFAP):M (CFVHT AND CFMBSS):M (CFVHT AND CFIBSS):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM3 | Link adaptation | | | |
| VHTM3.1 | Use of the VHT variant HT Control field for link adaptation in immediate response exchange. | 9.2.4.6, 9.3.3.15, 10.31.3 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM4 | Transmit beamforming | | | |
| *VHTM4.1 | SU Beamformer Capable | 9.4.2.158 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *VHTM4.2 | SU Beamformee Capable | 9.4.2.158 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *VHTM4.3 | MU Beamformer Capable | 9.4.2.158 | CFAP AND VHTM4.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *VHTM4.4 | MU Beamformee Capable | 9.4.2.158 | CFIndepSTA AND VHTM4.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM4.5 | Transmission of null data packet | 10.34 | VHTM4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM4.6 | Reception of null data packet | 10.34 | VHTM4.2:M | |
| VHTM5 | VHT Sounding Protocol | | | |
| VHTM5.1 | VHT sounding protocol as SU beamformer | 10.34.5 | VHTM4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM5.2 | VHT sounding protocol as SU beamformee | 10.34.5 | VHTM4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM5.3 | VHT sounding protocol as MU beamformer | 10.34.5 | VHTM4.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM5.4 | VHT sounding protocol as MU beamformee | 10.34.5 | VHTM4.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM6 | TXOP Sharing | | | |
| VHTM6.1 | Sharing of EDCA TXOP | 10.22.2.6 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM6.2 | Use of Primary and Secondary AC | 10.22.2.6 | VHTM6.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM7 | VHT TXOP power saving | 11.2.3.19 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM8 | BSS Operation | | | |
| VHTM8.1 | Use of primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels | 10.3.2.6, 10.3.2.7 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM8.2 | Use of secondary 80 MHz channels for 160 MHz and 80+80 MHz | 11.40.1 | (VHTP3.4 OR VHTP3.5):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM8.3 | CCA on primary 20 MHz, secondary 20 MHz, and secondary 40 MHz channels | 11.40.5 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.25.1 VHT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|----------|---|---|--|---|
| VHTM8.4 | CCA on secondary 80 MHz channels for 160 MHz and 80+80 MHz | 11.40.5 | (VHTP3.4 OR VHTP3.5):M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM9 | Group ID | | | |
| VHTM9.1 | Transmission of Group ID Management frame | 9.6.23.3 | VHTM4.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM9.2 | Reception of Group ID Management frame | 9.6.23.3 | VHTM4.4:M | |
| VHTM10 | Bandwidth signaling | | | |
| VHTM10.1 | Support for non-HT bandwidth signaling and static operation | 10.3.2.6 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM10.2 | Support for non-HT bandwidth signaling and dynamic operation | 10.3.2.6 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM11 | VHT single MPDU format | 10.13.7 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM12 | Partial AID in VHT PPDU | 10.20 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM13 | Extended BSS Load element | 9.4.2.160 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM13.1 | Transmission of the Extended BSS Load element | 9.4.2.160 | CFAP AND CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM14 | Quiet Channel element | | | |
| VHTM14.1 | Transmission of Quiet Channel element by an AP or mesh station in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFAP OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM14.2 | Transmission of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT AND VHTP3.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM14.3 | Reception of Quiet Channel element by an independent station or mesh station in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFIndepSTA OR CFMBSS) AND CFSM AND CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15 | Space-time block coding (STBC) | | | |
| VHTM15.1 | STBC operation | 9.4.2.158, 10.17 | VHTP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15.2 | Transmission of at least 2x1 STBC | 9.4.2.158.2 | VHTP9:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15.3 | Reception of 1 STBC spatial stream | 9.4.2.158.2 | VHTP9:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15.4 | Reception of 2 STBC spatial streams | 9.4.2.158.2 | VHTM15.3:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15.5 | Reception of 3 STBC spatial streams | 9.4.2.158.2 | VHTM15.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM15.6 | Reception of 4 STBC spatial streams | 9.4.2.158.2 | VHTM15.5:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM16 | Highest Supported Long GI Data Rate | | | |

B.4.25.1 VHT MAC features (continued)

| Item | Protocol capability | References | Status | Support |
|--|--|-------------|---------|---|
| VHTM16.1 | Tx Highest Supported Long GI Data Rate | 9.4.2.158.3 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTM16.2 | Rx Highest Supported Long GI Data Rate | 9.4.2.158.3 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates. | | | | |

B.4.25.2 VHT PHY features

| Item | Protocol capability | References | Status | Support |
|-----------|---|-------------|----------------------|---|
| | Are the following PHY protocol features supported? | | | |
| VHTP1 | PHY operating modes | | | |
| VHTP1.1 | Operation according to Clause 17 (Orthogonal frequency division multiplexing (OFDM) PHY specification) and/or Clause 19 (high throughput) | 21.1.4 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP2 | VHT format | 21.3.2 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP3 | BSS bandwidth | | | |
| VHTP3.1 | 20 MHz operation | 11.40.1 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP3.2 | 40 MHz operation | 11.40.1 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP3.3 | 80 MHz operation | 11.40.1 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP3.4 | 160 MHz operation | 11.40.1 | CFVHT:O VHTP3.5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP3.5 | 80+80 MHz operation | 11.40.1 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP4 | Bandwidth indication | 17.3.5.5 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP5 | PHY timing parameters | | | |
| VHTP5.1 | Values in 20 MHz channel | 21.3.6 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP5.2 | Values in 40 MHz channel | 21.3.6 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP5.3 | Values in 80 MHz channel | 21.3.6 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP5.4 | Values in 160 MHz channel | 21.3.6 | VHTP3.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP5.5 | Values in 80+80 MHz channel | 21.3.6 | VHTP3.5:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP6 | VHT preamble | 21.3.8 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP7 | Use of LDPC Code | 21.3.10.5.4 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8 | Modulation and coding schemes (MCS) | | | |
| VHTP8.1 | CBW20, CBW40, and CBW80 | 21.5 | | |
| VHTP8.1.1 | VHT-MCS with Index 0-7 and $N_{SS} = 1$ | 21.5 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.2 | VHT-MCS with Index 0-8 and $N_{SS} = 1$ | 21.5 | VHTP8.1.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.25.2 VHT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|------------|---|------------|--------------|---|
| VHTP8.1.3 | VHT-MCS with Index 0-9 and $N_{SS} = 1$ | 21.5 | VHTP8.1.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.4 | VHT-MCS with Index 0-7 and $N_{SS} = 2$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.5 | VHT-MCS with Index 0-8 and $N_{SS} = 2$ | 21.5 | VHTP8.1.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.6 | VHT-MCS with Index 0-9 and $N_{SS} = 2$ | 21.5 | VHTP8.1.5:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.7 | VHT-MCS with Index 0-7 and $N_{SS} = 3$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.8 | VHT-MCS with Index 0-8 and $N_{SS} = 3$ | 21.5 | VHTP8.1.7:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.9 | VHT-MCS with Index 0-9 and $N_{SS} = 3$ | 21.5 | VHTP8.1.7:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.10 | VHT-MCS with Index 0-7 and $N_{SS} = 4$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.11 | VHT-MCS with Index 0-8 and $N_{SS} = 4$ | 21.5 | VHTP8.1.10:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.12 | VHT-MCS with Index 0-9 and $N_{SS} = 4$ | 21.5 | VHTP8.1.11:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.13 | VHT-MCS with Index 0-7 and $N_{SS} = 5$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.14 | VHT-MCS with Index 0-8 and $N_{SS} = 5$ | 21.5 | VHTP8.1.13:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.15 | VHT-MCS with Index 0-9 and $N_{SS} = 5$ | 21.5 | VHTP8.1.14:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.16 | VHT-MCS with Index 0-7 and $N_{SS} = 6$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.17 | VHT-MCS with Index 0-8 and $N_{SS} = 6$ | 21.5 | VHTP8.1.16:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.18 | VHT-MCS with Index 0-9 and $N_{SS} = 6$ | 21.5 | VHTP8.1.17:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.19 | VHT-MCS with Index 0-7 and $N_{SS} = 7$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.20 | VHT-MCS with Index 0-8 and $N_{SS} = 7$ | 21.5 | VHTP8.1.19:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.1.21 | VHT-MCS with Index 0-9 and $N_{SS} = 7$ | 21.5 | VHTP8.1.20:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

| VHTP8.3.17 | VHT-MCS with Index 0-8 and $N_{SS} = 6$ | 21.5 | VHTP8.3.16:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.18 | VHT-MCS with Index 0-9 and $N_{SS} = 6$ | 21.5 | VHTP8.3.17:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.19 | VHT-MCS with Index 0-7 and $N_{SS} = 7$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.20 | VHT-MCS with Index 0-8 and $N_{SS} = 7$ | 21.5 | VHTP8.3.19:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.21 | VHT-MCS with Index 0-9 and $N_{SS} = 7$ | 21.5 | VHTP8.3.20:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.22 | VHT-MCS with Index 0-7 and $N_{SS} = 8$ | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.23 | VHT-MCS with Index 0-8 and $N_{SS} = 8$ | 21.5 | VHTP8.3.22:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP8.3.24 | VHT-MCS with Index 0-9 and $N_{SS} = 8$ | 21.5 | VHTP8.3.23:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.25.2 VHT PHY features (*continued*)

| Item | Protocol capability | References | Status | Support |
|---------|--|-------------|---------|---|
| VHTP8.4 | Transmit and receive support for 400 ns GI | 21.5 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP9 | Space-time block coding (STBC) | 21.3.10.9.4 | CFVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| VHTP10 | Non-HT duplicate format | 21.3.10.12 | CFVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.26 TVWS functions

| Item | Protocol capability | References | Status | Support |
|-------|---------------------------------|-------------------------------------|----------|---|
| WS1 | Fixed STA TVWS operation | 11.44, Annex D, E.2.5 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS2 | Master STA TVWS operation | 11.44, 11.44.2, Annex D, E.2.5 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *WS3 | Client STA TVWS operation | 11.44.3, Annex D, E.2.5 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS3.1 | GDD dependent STA TVWS behavior | 11.44.3, Annex D, E.2.5 | WS3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS4 | Channel Availability Query | 9.4.5.2, 9.6.8.25, 11.44.4 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS5 | Channel Schedule Management | 9.4.5.3, 9.6.8.26, 11.44.5 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS6 | Contact Verification Signal | 9.6.8.27, 11.44.6 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *WS7 | Network Channel Control | 6.3.101, 9.4.5.4, 9.6.8.30, 11.44.7 | CFTVHT:M | |
| WS7.1 | NCC Requesting STA | 11.44.7.2 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS7.2 | NCC Responding STA | 11.44.7.3 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| WS8 | White Space Map Announcement | 9.4.2.170, 9.6.8.31, 11.44.9 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.26.1 TVHT MAC features

| Item | Protocol capability | References | Status | Support |
|----------|--|-------------|----------|---|
| | Are the following MAC protocol features supported? | | | |
| TVHTM1 | TVHT Capabilities element | | | |
| TVHTM1.1 | VHT Capabilities element | 9.4.2.158.1 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.26.1 TVHT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-----------|--|---|--|---|
| TVHTM1.2 | Signaling of STA capabilities in Probe Request, (Re)Association Request frames | 9.3.3.6, 9.3.3.8, 9.3.3.10, 9.4.2.158.1 | (CFTVHT AND CFIndepSTA): O (CFTVHT AND CFMBSS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM1.3 | Signaling of STA and BSS capabilities in Beacon, Probe Response, (Re)Association Response frames | 9.3.3.3, 9.3.3.7, 9.3.3.9, 9.3.3.11, 9.4.2.158 | (CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM2 | Signaling of VHT operation | 9.4.2.159 | (CFTVHT AND CFAP):O (CFTVHT AND CFMBSS):O (CFTVHT AND CFIBSS):O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM3 | Link adaptation | | | |
| TVHTM3.1 | Use of the VHT variant HT Control field for link adaptation in immediate response exchange | 9.2.4.6, 9.3.3.15, 10.28.3 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM4 | Transmit beamforming | | | |
| *TVHTM4.1 | SU Beamformer Capable | 9.4.2.158 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *TVHTM4.2 | SU Beamformee Capable | 9.4.2.158 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *TVHTM4.3 | MU Beamformer Capable | 9.4.2.158 | CFAP AND TVHTM4.1:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| *TVHTM4.4 | MU Beamformee Capable | 9.4.2.158 | CFIndepSTA AND TVHTM4.2:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM4.5 | Transmission of null data packet | 10.31 | TVHTM4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM4.6 | Reception of null data packet | 10.31 | TVHTM4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM5 | VHT sounding protocol | | | |
| TVHTM5.1 | VHT sounding protocol as SU beamformer | 10.34.5 | TVHTM4.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM5.2 | VHT sounding protocol as SU beamformee | 10.34.5 | TVHTM4.2:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM5.3 | VHT sounding protocol as MU beamformer | 10.34.5 | TVHTM4.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM5.4 | VHT sounding protocol as MU beamformee | 10.34.5 | TVHTM4.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM6 | TXOP Sharing | | | |

B.4.26.1 TVHT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|-----------|---|---|--|---|
| TVHTM6.1 | Sharing of EDCA TXOP | 9.19.2.3a | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM6.2 | Use of Primary and Secondary AC | 9.19.2.3a | TVHTM6.1:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM7 | VHT TXOP power saving | 10.2.1.4a | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM8 | BSS Operation | | | |
| TVHTM8.1 | Use of primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels | 11.43 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM8.2 | CCA on primary TVHT_W, secondary TVHT_W, and secondary TVHT_2W channels | 11.43 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM9 | Group ID | | | |
| TVHTM9.1 | Transmission of Group ID Management frame | 9.6.23.3 | TVHTM4.3:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM9.2 | Reception of Group ID Management frame | 9.6.23.3 | TVHTM4.4:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM10 | Bandwidth signaling | | | |
| TVHTM10.1 | Support for non-HT bandwidth signaling and static operation | 9.3.2.5a | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM10.2 | Support for non-HT bandwidth signaling and dynamic operation | 9.3.2.5a | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM11 | VHT single MPDU format | 10.13.8 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM12 | Partial AID in VHT PPDU | 10.20 | CFTVHT:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM13 | Extended BSS Load element | 9.4.2.160 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM13.1 | Transmission of the Extended BSS Load element | 9.4.2.160 | CFAP AND CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM14 | Quiet Channel element | | | |
| TVHTM14.1 | Transmission of Quiet Channel element by an AP or mesh STA in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFAP OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM14.2 | Transmission of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT AND TVHTP3.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM14.3 | Reception of Quiet Channel element by an independent STA or mesh STA in Beacon and Probe Response frames | 9.3.3.3, 9.3.3.11, 9.4.2.165, 11.9.3 | (CFIndepSTA OR CFMBSS) AND CFSM AND CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

B.4.26.1 TVHT MAC features (*continued*)

| Item | Protocol capability | References | Status | Support |
|--|--|---------------------|-------------|---|
| TVHTM15 | Space-time block coding (STBC) | | | |
| TVHTM15.1 | STBC operation | 9.4.2.158, 10.15 | TVHTP9:M | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM15.2 | Transmission of at least 2x1 STBC | 9.4.2.158 | TVHTP9:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM15.3 | Reception of 1 STBC spatial stream | 9.4.2.158 | TVHTP9:O.1 | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM15.4 | Reception of 2 STBC spatial stream | 9.4.2.158 | TVHTM15.3:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM15.5 | Reception of 3 STBC spatial stream | 9.4.2.158 | TVHTM15.4:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM15.6 | Reception of 4 STBC spatial stream | 9.4.2.158 | TVHTM15.5:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM16 | Highest Supported Long GI Data Rate | | | |
| TVHTM16.1 | Tx Highest Supported Long GI Data Rate | 9.4.2.158.3 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| TVHTM16.2 | Rx Highest Supported Long GI Data Rate | 9.4.2.158.3 | CFTVHT:O | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |
| NOTE—Required support for MCS might be limited by the declaration of Tx and Rx Highest Supported Long GI Data Rates. | | | | |

B.4.26.2 TVHT PHY features

| Item | Protocol capability | References | Status | Support |
|----------|--|------------|----------|---|
| | Are the following PHY protocol features supported? | | | |
| TVHTP1 | PHY operating modes | | | Yes <input type="checkbox"/> No <input type="checkbox"/> N/A <input type="checkbox"/> |

Annex C

(normative)

ASN.1 encoding of the MAC and PHY MIB

C.1 General

The MIB for the current revision of IEEE Std 802.11 is available online at the following URL: <http://www.ieee802.org/11/802.11mib.txt>. The MAC and PHY MIBs are described in Abstract Syntax Notation One (ASN.1), defined in ISO/IEC 8824-1:1995, ISO/IEC 8824-2:1995, ISO/IEC 8824-3:1995 and ISO/IEC 8824-4:1995.

C.2 Guidelines for IEEE 802.11 MIB authors/editors

The MIB may be compiled using the "smiitools" package from the Institute of Operating Systems and Computer Networks at the Technical University of Braunschweig, Germany. These tools may be accessed online using the following URL: <http://www.ibr.cs.tu-bs.de/bin/smiitools.cgi>.

Using this tool, the MIB should compile without generating warnings of severity 3 or lower.

Specific points that authors and editors should pay attention to:

- The MIB should compile as specified above prior to submission to IEEE-SA RevCom.
- Use only the 7-bit US-ASCII character-set. In particular, use only straight single and double quotes.
- Do not use symbols such as <greek-mu> in units, instead spell out the units fully, i.e., "microseconds."
- Follow the guidelines for writing MIB modules in <http://www.rfc-editor.org/rfc/rfc4181.txt> (including any updates thereto).
- Pay attention to IETF recommendations on object types.
- When adding a lot of new objects, consider adding a new module.
- Consider seeking advice from an IETF MIB Doctor when creating significant new material. The IEEE has an arrangement with the IETF whereby the IEEE may ask for a MIB Advisor from the IETF MIB Doctors.
- When an object is deprecated, add a line to the Description indicating why (IETF convention).

dot11StationConfigEntry OBJECT-TYPE
    SYNTAX Dot11StationConfigEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "An entry in the dot11StationConfigTable. It is possible for there to be
        multiple IEEE 802.11 interfaces on one agent, each with its unique MAC
        address. The relationship between an IEEE 802.11 interface and an

```

interface in the context of the Internet-standard MIB is one-to-one. As such, the value of an ifIndex object instance can be directly used to identify corresponding instances of the objects defined herein.

```
ifIndex - Each IEEE 802.11 interface is represented by an ifEntry.  

Interface tables in this MIB module are indexed by ifIndex."

SYNTAX OCTET STRING (SIZE(1..126))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This is a status variable.
It is written by the SME when joining or establishing a BSS.

This attribute specifies the set of non-HT data rates at which the station is able to receive data. Each octet contains a value representing a rate. Each rate is within the range 2 to 127, corresponding to data rates in increments of 500 kb/s from 1 Mb/s to 63.5 Mb/s, and is supported (as indicated in the supported rates table) for receiving data. This value is reported in transmitted Beacon, Probe Request, Probe Response, Association Request, Association Response, Reassociation Request, and Reassociation Response frames, and is used to determine whether a BSS with which the station might synchronize is suitable. It is also used when starting a BSS, as specified in 6.3.4."

```

This attribute identifies the country or noncountry entity in which the station is operating. If it is a country, the first two octets of this string is the two character country code as described in document ISO 3166-1. The third octet is one of the following:

1. an ASCII space character, if the regulations under which the station is operating encompass all environments for the current frequency band in the country,
 2. an ASCII 'O' character, if the regulations under which the station is operating are for an outdoor environment only, or
 3. an ASCII 'I' character, if the regulations under which the station is operating are for an indoor environment only.
 4. an ASCII 'X' character, if the station is operating under a noncountry entity. The first two octets of the noncountry entity is two ASCII 'XX' characters.
 5. the hexadecimal representation of the Operating Class table number currently in use, from the set of tables defined in Annex E, e.g., Table E-1 is represented as x'01'."

This attribute specifies the type of STA mode for the purpose of channel
availability query requirements. This value is used to set the desired
channel availability query request parameters in using GAS frames carrying
Channel Availability Query element of RLQP. When set to gddap, the STA
indicates that it operates as a personal/portable AP STA after channel
availability query.
```

When set to gddnonapsta, the STA indicates that it operates as a personal/portable non-AP STA after channel availability query. When set to gddfixedsta, the STA indicates that it operates as a fixed STA after channel availability query. When set to any other values, its use is reserved, and remains unspecified."

-- * End of dot11WirelessMGTEvent TABLE  
-- ****
```

```

-- ****
-- * IEEE 802.11 RM and WNM Interface MIB
-- ****

-- * The primary interface to the radio measurements and Wireless
-- Network Management functions is meant to be real-time information
-- obtained through the request/response mechanisms of RM and WNM.
-- * A secondary interface to the measurements and management functions
-- is through retention of information in this MIB. Non-SNMP requests
-- for information are obtained via object IDs (OIDs) through the NDIS
-- or wireless interfaces in the operating systems. SNMP requests for
-- information are obtained via SNMP SETs and GETs (see [B26]).

-- * dot11RMRequest and dot11RMReport Usage
-- *
-- * The dot11RMRequest and dot11RMReport portions of the RM MIB
-- provide access to the Radio Measurement service. By performing
-- SET operations on the various dot11RMRequest MIB objects,
-- radio measurements may be initiated directly on the local STA or
-- on any peer station within the same BSS. Subsequently, by
-- performing GET operations on the various dot11RMReport MIB
-- objects the results of the requested measurements may be
-- retrieved.
-- *
-- * In the diagram below, a radio measurement could be initiated
-- for STA x by performing a MIB.set operation on the RM MIB of
-- STA x and specifying the MAC address of STA x in
-- dot11RMReqstTargetAdd. Additionally, it is possible to have STA x
-- request a measurement from STA y by performing a MIB.set operation
-- on the SME MIB of STA x and specifying the MAC address of STA y in
-- dot11RMReqstTargetAdd. In both cases the result of the measurements
-- can be retrieved by performing a MIB.get operation on the RM MIB
-- of STA x upon completion of the measurement.
-- *
-- *
-- *          MIB.Set                                MIB.Set

-- *          | MREPORT |     |
-- *          |     \ /   |
-- *          |     MEASURE |     |
-- *          |           |     <==Measurement Request==>
-- *          |           |     <==Measurement Report==>
-- *          | MLME   |     |
-- *          +=====+=====+
-- *          STA y
-- *
-- * Each STA maintains a single dot11RMRequestTable in the SME MIB
-- used to initiate RM Measurement Requests. Each dot11RMRequestEntry
-- in the table represents an individual Measurement Request that
-- makes up a complete Measurement Request frame.
-- Multiple Measurement Requests may be concatenated into a single

```

```

-- * Measurement Request frame by setting the same
-- * dot11RMRqstToken value into multiple dot11RMRequestEntries.
-- *
-- * Each row, dot11RMRequestEntry, of the dot11RMRequestTable
-- * provides read-create access for the initiation of a measurement
-- * request. The dot11RMRequestNextIndex object can be used to
-- * determine which is the next available row. Each row corresponding to
-- * one measurement in the sequence is created with a dot11RMRowStatus
-- * equal to notInService. Once the dot11RMRequestEntry(s) have been
-- * created for a desired measurement sequence the corresponding
-- * dot11RMRowStatus(s) objects are set to active to indicate that
-- * the SME can trigger the appropriate MLME primitives. Upon processing
-- * the request, the SME returns the corresponding dot11RMRowStatus(s)
-- * object to notInService and are now available for additional
-- * measurement requests.
-- *
-- * After a radio measurement is complete the RM populates the RMReport
-- * objects with the results of the measurement. Each STA maintains a set
-- * of RMReport tables, one corresponding to each measurement type. The
-- * results of the entire measurement sequence are spread across the tables
-- * based on the type of measurements requested. Each xxxReportEntry
-- * within a xxxReportTable contains a xxxRprtRqstToken that corresponds
-- * to the original dot11RMRowStatus in the measurement request. So the
-- * results of the measurement can be collected by searching the appropriate
-- * xxxReportTables and retrieve any reports with the matching request
-- * token.
-- *
-- * Similar structures and mechanisms are used for WNM
-- * Request and Reports. The WNM MIB definitions follow the RM MIB definitions
-- * in this Annex.

dot11RMRequestNextIndex OBJECT-TYPE
    SYNTAX Unsigned32(0..65535)
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when able to accept a new request.

        Identifies a hint for the next value of dot11RMRowStatusIndex to be used in a
        row creation attempt for dot11RMRequestTable. If no new rows can be
        created for some reason, such as memory, processing requirements, etc.,
        the SME sets this attribute to 0. It updates this attribute to a proper
        value other than 0 as soon as it is capable of receiving new measurement
        requests. The nextIndex is not necessarily sequential nor monotonically
        increasing."
    ::= { dot11RMRequest 1 }

dot11RMRequestTable OBJECT-TYPE

```

```

SYNTAX SEQUENCE OF Dot11RMRequestEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
    "This group contains the current list of requests for RM reports to be
     issued and have been issued until removed. A network manager adds an RM
     request by creating a row with createAndWait row status and then filling
     in the request parameters/attributes. The request becomes active to be
     issued when the row status is set to Active. The columnar objects or
     attributes other than the rowStatus are not written if the rowStatus is
     Active. The request rows can be deleted, if commanded by a network manager
     via changing the value of dot11RMReqstRowStatus to Destroy. This may leave
     orphaned rows if a manager crashes and forgets which rows are being used
     by it. One recommended way to manage orphaned or finished rows is to
     delete rows if their dot11RMReqstRowStatus remains other than Active for
     longer than a period (recommend at least 5 minutes, IETF RFC 2579). Or
     another recommended way is to delete older rows as needed based on their
     dot11RMReqstTimeStamp values. This can be done by the agent as well as the
     manager."

STATUS current
DESCRIPTION
    "This is a control variable.
    It is written by an external management entity when requesting a
    measurement, and by the SME when accepting a measurement request.

```

The Row Status column of the current row, used for tracking status of an

individual request. When this attribute is set to Active, AND a measurement request can be unambiguously created based on the parameters in the row, then the MLME may proceed to issue the request to its intended targets when appropriate. If not, this attribute may be set to Not-ready immediately to indicate parametric errors. However, it is the network managers responsibility to correct the error. If the request is successfully issued to the target STA, then the rowStatus is set to notInService."

   This attribute indicates the Average Noise Power Indicator (ANPI) for this
   Noise Histogram measurement. The ANPI value represents the average noise
   plus interference power on the measured channel at the antenna connector
   during the measurement duration. To calculate ANPI, the STA measures and
   uses IPI in the indicated channel when NAV is equal to 0 (when virtual CS
   mechanism indicates idle channel) except during frame transmission or
   reception."

    ratio derived from the RCPI for the received frame and from the most
    recent ANPI value measured on the channel used to receive the frame. RSNI
    may be calculated by the ratio of the received signal power (RCPI - ANPI)
    over the noise plus interference power (ANPI) where RSNI = [(ratio(dB) +
    10) * 2], for ratios in the range -10 dB to +118 dB. Other measurement
    techniques are allowed."

  DESCRIPTION
    "This is a status variable.
    It is written by the SME when a measurement report is completed.
```

This attribute indicates the received channel power of the most recently measured frame in this frame report entry as defined 9.4.2.38.
RCPIval = Floor((RCPIpower in dBm + 110)*2), for RCPI in the range -110 dBm to 0 dBm. RCPIval = 220 for RCPI > 0 dBm. RCPIval = 255 when RCPI is not available."

::= { dot11FrameReportEntry 13 }

dot11FrameRprtAntennaID OBJECT-TYPE
SYNTAX Unsigned32(0..255)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This is a status variable.
It is written by the SME when a measurement report is completed.

This attribute indicates the identifying number for the antenna used for this measurement. The value 0 indicates that the antenna identifier is unknown. The value 255 indicates that this measurement was made with multiple antennas. The value 1 is used for a STA with only one antenna. STAs with more than one antenna assign Antenna IDs to each antenna as consecutive, ascending numbers. Each Antenna ID number represents a unique antenna characterized by a fixed relative position, a fixed relative direction, and a peak gain for that position and direction."

DESCRIPTION
"Identifies the next available index for managing the neighbor report table. If this attribute is 0, it indicates that the neighbor report feature is not configurable via SNMP, or the table is full and new rows cannot be accepted."
`::= { dot11RMConfig 2 }`

`dot11RMNeighborReportTable OBJECT-TYPE`
SYNTAX SEQUENCE OF Dot11RMNeighborReportEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
"This table contains pertinent information on a collection of BSSIDs that are candidates to which STAs can roam. The rows are created using createAndWait method and fill in the attributes. When the rowStatus is set to active, the row can be included in Neighbor Report elements. If there is an error, the rowStatus is set to notReady by SME. Since this table contains all Neighbor Report element entries for all interfaces enabled with the neighbor report feature, it is possible to have too many entries for one interface, while still remaining under the MaxTableSize. In that situation, SME includes neighbor report entries only with lower dot11RMNeighborReportIFIIndex up to the maximum possible number of entries for a particular interface identified by ifIndex. SME sets the rowStatus to notInService for those rows that cannot be included in the Neighbor Report element for that interface."

    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This is a status variable.
        It is written by the SME when able to accept a new request.

        Identifies a hint for the next value of dot11WNMRqstIndex to be used in a
        row creation attempt for dot11WNMRequestTable. If no new rows can be
        created for some reason, such as memory, processing requirements, etc, the
        SME shall set this attribute to 0. It shall update this attribute to a
        proper value other than 0 as soon as it is capable of receiving new
        measurement requests. The nextIndex is not necessarily sequential nor
        monotonically increasing."
    ::= { dot11WNMRequest 1 }

dot11WNMRequestTable OBJECT-TYPE
    SYNTAX SEQUENCE OF Dot11WNMRequestEntry
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
        "This group contains the current list of requests for WNM reports to be
        issued and have been issued until removed. A network manager adds a WNM
        request by creating a row with createAndWait row status and then filling
        in the request parameters/attributes. The request becomes active to be
        issued when the row status is set to Active. The columnar objects or
        attributes other than the rowStatus shall not be written if the rowStatus
        is Active. The request rows can be deleted, if commanded by a network
        manager via changing the value of dot11WNMRqstRowStatus to Destroy. This
        may leave orphaned rows if a manager crashes and forgets which rows are
        being used by it. One recommended way to manage orphaned or finished rows
        is to delete rows if their dot11WNMRqstRowStatus remains other than Active
        for longer than a period (recommend at least 5 minutes, IETF RFC 2579). Or
        another recommended way is to delete older rows as needed based on their
        dot11WNMRqstTimeStamp values. This can be done by the agent as well as the
        manager."

```

It is written by an external management entity when requesting a measurement, and by the SME when accepting a management request.

The Row Status column of the current row, used for tracking status of an individual request. When this attribute is set to Active, AND a measurement request can be unambiguously created based on the parameters in the row, then the MLME may proceed to issue the request to its intended targets when appropriate. If not, this attribute may be set to Not-ready immediately to indicate parametric errors. However, it is the network managers

responsibility to correct the error. If the request is successfully issued to the target STA, then the rowStatus is set to notInService."

`dot11WNMColocInterfRprtInterfLevel OBJECT-TYPE`
SYNTAX Integer32(-128..127)
UNITS "dBm"
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This is a status variable.
It is written by the SME when a management report is completed.

This attribute indicates the maximum level of the collocated interference power in units of dBm over all receive chains averaged over a 4 s period during an interference period and across interference bandwidth. When the interference level is unknown, the field is set to +127 dBm. When the interference level is equal or greater than 126 dBm, the field is set to +126 dBm. If no collocated interference is present the field is set to -128 dBm. When the interference level is equal or lower than -127 dBm, the field is set to -127 dBm. The interference level is referenced to the antenna connector (see definition in Clause 3) used for reception, like RCPI."

STATUS current
DESCRIPTION
"This is a status variable.
It is written by the SME when a management report is completed.

This attribute indicates the duration of each period of interference. When the duration of each period of interference is variable the field is set to 2**32-1). When the duration of each period of interference is equal or greater than 2**32-2, the field is set to 2**32-2. If no collocated interference is present the field is set to 0."
`::= { dot11WNMColocInterfReportEntry 9 }`

`dot11WNMColocInterfRprtInterfStartTime` OBJECT-TYPE
SYNTAX Integer32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
"This is a status variable.
It is written by the SME when a management report is completed.

This attribute contains the least significant 4 octets (i.e., B0-B31) of the TSF timer at the start of the interference burst. When either the

Interference Interval or the Interference Burst Length fields are set to 2^{**32-1} , this field indicates the average duty cycle. The average duty cycle value is defined as $\text{Floor}((2^{**32-2}) * [\text{average interference burst length (microsecond)}] / [\text{average interference interval (microsecond)}] + 0.5)$. When the interference is nonperiodic the Interference Start Time field is set to 0. If no collocated interference is present the field is set to 0."

DESCRIPTION
    "This is a control variable.
    It is written by an external management entity.
    Changes take effect as soon as practical in the implementation.

    This attribute indicates the number of octets in a PSDU, below which an
    RTS/CTS handshake is not performed, except as RTS/CTS is used as a cross
    modulation protection mechanism as defined in 10.26. An RTS/CTS handshake
    is performed at the beginning of any frame exchange sequence where the
    PSDU is with the Type subfield equal to Data or Management, the PSDU has

```

an individual address in the Address 1 field, and the length of the PSDU is greater than this threshold. Setting this attribute to be larger than the maximum PSDU size has the effect of turning off the RTS/CTS handshake for frames of Data or Management type transmitted by this STA. Setting this attribute to 0 has the effect of turning on the RTS/CTS handshake for all frames of Data or Management type transmitted by this STA."

later revision of the standard.  
This is a status variable.  
It is written by the PHY.  
  
There are different operating temperature requirements dependent on the  
anticipated environmental conditions. This attribute describes the current  
PHY's operating temperature range capability. Currently defined values and  
their corresponding temperature ranges are:
```

```

        Type 1 = X'01'-Commercial range of 0 to 40 degrees C,
        Type 2 = X'02'-Industrial range of -30 to 70 degrees C."

DESCRIPTION
"Superseded by subband-specific supported operating classes.
This is a capability variable.
Its value is determined by device capabilities.

The capability of the OFDM PHY implementation to operate in the 4.9 GHz and 5 GHz bands. Coded as an integer value with bit 0 LSB as follows:
bit 0 .. capable of operating in the 5.15-5.25 GHz band
bit 1 .. capable of operating in the 5.25-5.35 GHz band
bit 2 .. capable of operating in the 5.725-5.825 GHz band
bit 3 .. capable of operating in the 5.47-5.725 GHz band
bit 4 .. capable of operating in the lower Japanese (5.15-5.25 GHz) band
bit 5 .. capable of operating in the 5.03-5.091 GHz band
bit 6 .. capable of operating in the 4.94-4.99 GHz band
For example, for an implementation capable of operating in the 5.15-5.35 GHz bands this attribute would take the value 3."

SYNTAX Unsigned32 (1..4294967295)

UNITS "kb/s"

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"This is a control variable.

It is written by the SME after the AP receives the permissions for the non-AP STA from the SSPN Interface.

This attribute indicates the maximum authorized data rate the non-AP STA may use, either transmitting to an AP or receiving from an AP via HCCA or HEMM. The value '4294967295', which is the default value, means that the SSP is not requesting the AP to limit the data rate used by the non-AP STA. Local configuration of the AP, however, may cause the rate to be otherwise limited."

```

dot11NonAPStationAuthHCCAHEMMDelay OBJECT-TYPE

SYNTAX Unsigned32 (1..4294967295)

UNITS "microseconds"

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"This is a control variable.

It is written by the SME after the AP receives the permissions for the non-AP STA from the SSPN Interface.

This attribute indicates the delay bound for frames queued at an AP to a non-AP STA in the HCCA or HEMM queue. An AP should deliver frames to the non-AP STA within the time period specified in this attribute. When a non-AP STA requests admission control to the HCCA or HEMM queue, the requested delay will be equal to or higher than this value. The value '4294967295', which is the default value, means that the SSP is not requesting the AP limit the delay bound in this queue for transmissions to the non-AP STA."

SYNTAX TruthValue

MAX-ACCESS read-only

STATUS current

DESCRIPTION

"This is a control variable.

It is written by the SME after the AP receives the permissions for the non-AP STA from the SSPN Interface.

This attribute, when true, indicates that the AP's MAC sublayer shall perform rate limiting to enforce the resource utilization limit in dot11NonAPStationAuthMaxSourceMulticastRate in the dot11InterworkingEntry identified by the source MAC address of the received frame. If this attribute is false, at an AP for which dot11SSPNInterfaceActivated is true, upon receipt of a frame with the Type subfield equal to Data with group DA, then the AP's MAC sublayer shall discard the frame."

DESCRIPTION  
"This is a control variable.  
  
It is written by an external management entity or the SME.  
Changes take effect as soon as practical in the implementation.  
  
This attribute contains the national subdivisions (state, Region,  
province, prefecture). Example: California. The A1 element is used for the  
top level subdivision within a country. In the absence of a country-  
specific guide on how to use the A-series of elements, the second part of  
the ISO 3166-2 code for a country subdivision SHOULD be used. The ISO  
3166-2 code is formed of a country code and hyphen plus a code of one,  
two or three characters or numerals. For the A1 element, the leading  
country code and hyphen are omitted and only the subdivision code is  
included.  
  
For example, the codes for Canada include CA-BC, CA-ON, CA-QC; Luxembourg  
has just three single character codes: LU-D, LU-G And LU-L; Australia uses  
both two and three character codes: AU-ACT, AU-NSW, AU-NT; France uses  
numerical codes for mainland France and letters for territories: FR-75,  
FR-NC."

This attribute is used only by the responding STA in a GAS exchange. When
true, it indicates that the responding STA does not transmit a GAS Initial
Response frame until it receives the query response from the Advertisement
Server or a timeout occurs. When false, the STA does not wait for a
response from the Advertisement Server before transmitting the GAS Initial
Response frame. The setting of this MIB object is outside the scope of
this standard."

Annex D

(normative)

Regulatory references

D.1 External regulatory references

This annex and Annex E provide information and specifications for operation in many regulatory domains.

WLANs implemented in accordance with this standard and the specifications and definitions referenced in it are subject to equipment certification and operating requirements established by regional and national regulatory administrations. The specification establishes minimum technical requirements for interoperability, based upon established regulations at the time this standard was issued. These regional and national regulations are subject to revision or may be superseded. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Table D-1 for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

The documents listed in Table D-1 specify current regulatory requirements for various frequency bands and geographic areas at the time this standard was developed. They are provided for information only and are subject to change or revision at any time.

Table D-1—Regulatory requirement list

| Geographic area | Approval standards | Documents | Approval authority |
|-----------------|--|---|--------------------|
| Canada | Minister of Industry | RSS-210 — License-exempt Radio Apparatus (All Frequency Bands): Category I Equipment | Industry Canada |
| China | Ministry of Industry and Information Technology (MIIT) | Xin Bu Wu [2002] #353, Xin Bu Wu [2002] #277, Gong Xin Bu Wu Han [2012] #620 | MIIT |
| Europe | European Conference of Postal and Telecommunications (CEPT) Administrations and its Electronic Communications Committee (ECC). Also, European Radiocommunications Office, European Telecommunications Standards Institute (ETSI) | ECC DEC (04) 08, ETSI EN 300 328 [B13], ETSI EN 301 893, ETSI ES 202 663 [B15], ETSI EN 302 571 [B14], Clause 5 | CEPT |
| Japan | Ministry of Internal Affairs and Communications (MIC) | MIC Equipment Ordinance (EO) for Regulating Radio Equipment Articles 7, 49.20, 49.21 ^a | MIC |

Table D-1—Regulatory requirement list (continued)

| Geographic area | Approval standards | Documents | Approval authority |
|------------------------|---|--|---------------------------|
| United States | Federal Communications Commission (FCC) | 47 CFR [B9], Part 15, Sections 15.205, 15.209, 15.247 and 15.255; and Subpart E, Sections 15.401–15.407, and Subpart H, Sections 15.701–15.716, Section 90.210, Sections 90.371–383, Sections 90.1201–90.1217, Sections 90.1301–90.1337, Section 95.639, Sections 95.1501–1511 | FCC |

^aFrequency planning for licensed STAs in Japan is performed by the regulatory authority and the licensees, addressing the coexistence among STAs operating with a variety of air propagation times and the coexistence between STAs using 20 MHz channel spacing, STAs operating with 10 MHz channel spacing, and STAs operating with 5 MHz channel spacing. Note also the CCA mechanism is preserved in licensed operation.

Behavior limits are listed in Table D-2.

Table D-2—Behavior limits

| Behavior limit | Description |
|--|---|
| NomadicBehavior | The location of the station may change but is stationary while in use. The nomadic use EIRP power limits apply if the country allows more than one transmit power limit in the band. This behavior is specified only in bands where behavior 10 License Exempt bands is also allowed. |
| LicenseExemptBehavior | Frequency bands where some fixed stations can be operated without a license at a higher radiated transmit power than permitted for nomadic use. This behavior is specified only in bands where behavior 1 nomadic use is also allowed. |
| PrimaryChannelLowerBehavior ^a | 20/40 MHz BSS primary channel with secondary channel above the primary channel or 20 MHz BSS primary channel operated by a 40MC HT AP and also 20 MHz operational channel for a non-AP STA when the non-AP STA is associated with a 40MC HT AP. See NOTE. |
| PrimaryChannelUpperBehavior ^a | 14 20/40 MHz BSS primary channel with secondary channel below the primary channel or 20 MHz BSS primary channel operated by a 40MC HT AP and also 20 MHz operational channel for a non-AP STA when the non-AP STA is associated with a 40MC HT AP. See NOTE. |
| CCA-EDBehavior ^b | The PHY shall also indicate a medium busy condition when CCA-EnergyDetect detects a channel busy condition. |
| DFS_50_100_Behavior | A station operating in a band where radiolocation radar is primary, and station operation has in-service monitoring requirements for 50-100 µs radar pulses. |
| ITS_nonmobile_operations | Operations related to an ITS station operating at a fixed location registered with regulatory authorities, e.g., a Dedicated Short Range Communication Services (DSRCS) Roadside Unit (RSU). |

Table D-2—Behavior limits (*continued*)

| Behavior limit | Description |
|--|---|
| ITS_mobile_operations | Operations related to an ITS mobile station, e.g., a vehicle's DSRCS On-board Unit (OBU). |
| 80+ | In a channel width that contains two or more frequency segments, the frequency segment that does not contain the primary 80 MHz channel (see NOTE 2) |
| UseEirpForVHTTxPowEnv | A STA that sends one or more Transmit Power Envelope elements shall indicate EIRP in the Local Maximum Transmit Power Unit Interpretation subfield in one of the Transmit Power Envelope elements |
| GeoDB | A STA operating in a TVWS band where broadcast TV operation is primary and STA operation has GDB requirements. When operating in TVWS, channel numbers are as assigned in regulation. |
| NOTE 1—The fields that specify the 40 MHz channels are described in 19.3.15.4. NOTE 2—for an example using an operating class with an 80+ Behavior limit, see 9.4.2.9. The maximum number of frequency segments is PHY dependent. | |

^aFor 20 MHz operation where the operating class signifies 40 MHz channel spacing, the 20 MHz channel corresponds to the channel number indicated.

^bProcedures that may be used to improve sharing spectrum in addition to explicit regulatory requirements.

D.2 Radio performance specifications

D.2.1 Transmit and receive in-band and out-of-band spurious emissions

Spurious transmissions shall comply with national regulations.

D.2.2 Transmit power levels

The maximum allowable output power is measured in accordance with practices specified by the appropriate regulatory bodies.

The maximum allowable STA transmit power classifications for ITS nonmobile operations in the U.S. 5.85–5.925 GHz band are shown in Table D-3.

Table D-3—Maximum STA transmit power classification for the 5.85–5.925 GHz band in the United States

| STA transmit power classification | Maximum STA transmit power (mW) | Maximum permitted EIRP (dBm) |
|-----------------------------------|---|---|
| A | 1 | 23 |
| B | 10 | 23 |
| C | 100 | 33 |
| D | 760 <small>Note that for this class higher power is permitted as long as the power level is reduced to this level at the antenna input and the emission mask specifications are met.</small> | 33 for nongovernment 44.8 for government |

D.2.3 Transmit spectrum mask

Transmit spectrum masks defined in regulation are subject to change or revision at any time.

For operation in the 5.85–5.925 GHz band the transmitted spectrum shall be as follows:

- a) For any STA using 5 MHz channel spacing, the transmitted spectral density shall have a 0 dBr bandwidth not exceeding 4.5 MHz and shall not exceed the spectrum mask created using the permitted power spectral density levels listed in Table D-4 for the transmit power class of the STA.
- b) For any STA using 10 MHz channel spacing, the transmitted spectral density shall have a 0 dBr bandwidth not exceeding 9 MHz and shall not exceed the spectrum mask created using the permitted power spectral density levels listed in Table D-5 for the transmit power class of the STA.
- c) For any STA using 20 MHz channel spacing, the transmitted spectral density shall have a 0 dBr bandwidth not exceeding 18 MHz and shall not exceed the spectrum mask created using the permitted power spectral density levels listed in Table D-6 for the transmit power class of the STA.

Table D-4—Spectrum mask data for 5 MHz channel spacing

| STA transmit power class | Permitted power spectral density, dBr | | | | |
|--------------------------|---------------------------------------|------------------------|-------------------------|----------------------|------------------------|
| | ± 2.25 MHz offset (±f1) | ± 2.5 MHz offset (±f2) | ± 2.75 MHz offset (±f3) | ± 5 MHz offset (±f4) | ± 7.5 MHz offset (±f5) |
| Class A | 0 | -10 | -20 | -28 | -40 |
| Class B | 0 | -16 | -20 | -28 | -40 |
| Class C | 0 | -26 | -32 | -40 | -50 |
| Class D | 0 | -35 | -45 | -55 | -65 |

Table D-5—Spectrum mask data for 10 MHz channel spacing

| STA transmit power class | Permitted power spectral density, dBr | | | | |
|--------------------------|---------------------------------------|------------------------|------------------------|-----------------------|-----------------------|
| | ± 4.5 MHz offset (±f1) | ± 5.0 MHz offset (±f2) | ± 5.5 MHz offset (±f3) | ± 10 MHz offset (±f4) | ± 15 MHz offset (±f5) |
| Class A | 0 | -10 | -20 | -28 | -40 |
| Class B | 0 | -16 | -20 | -28 | -40 |
| Class C | 0 | -26 | -32 | -40 | -50 |
| Class D | 0 | -35 | -45 | -55 | -65 |

Table D-6—Spectrum mask data for 20 MHz channel spacing

| STA transmit power class | Permitted power spectral density, dBr | | | | |
|--------------------------|---------------------------------------|-------------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|
| | ± 9 MHz offset ($\pm f_1$) | ± 10.0 MHz offset ($\pm f_2$) | ± 11 MHz offset ($\pm f_3$) | ± 20 MHz offset ($\pm f_4$) | ± 30 MHz offset ($\pm f_5$) |
| Class A | 0 | -10 | -20 | -28 | -40 |
| Class B | 0 | -16 | -20 | -28 | -40 |
| Class C | 0 | -26 | -32 | -40 | -50 |
| Class D | 0 | -35 | -45 | -55 | -65 |

The transmit spectral mask is created and applied as shown in Figure D-1 about the channel center frequency (F_c) defined by the channel starting frequency and channel number from the operating class. The 0 dBr level is the maximum power spectral density measured in the channel. The measurements of transmit spectral density are made using a 100 kHz resolution bandwidth and a 30 kHz video bandwidth.

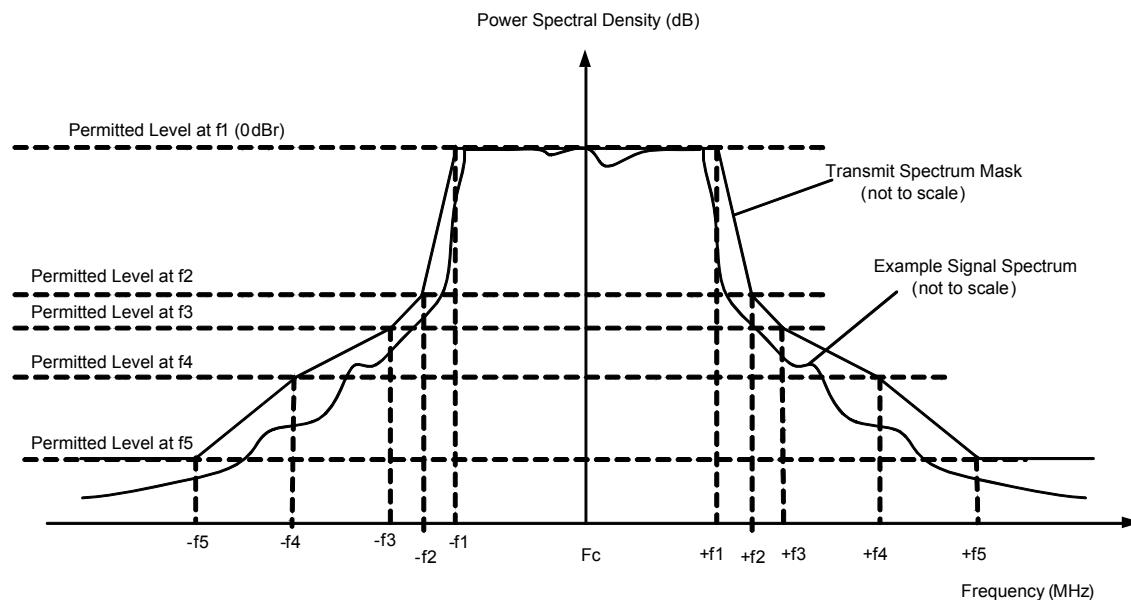

Figure D-1—Transmit spectrum mask and application

D.2.4 Transmit Mask M

This subclause defines the characteristics of transmit mask M.

The power spectral density of the emissions shall be attenuated below the output power of the transmitter as follows:

- a) On any frequency removed from the center frequency between 0-45% of the channel bandwidth (BW): 0 dB.
- b) On any frequency removed from the center frequency between 45-50% of the channel bandwidth: $568 \log (\%) \text{ of (BW)/45}$ dB.

- c) On any frequency removed from the center frequency between 50-55% of the channel bandwidth: $26 + 145 \log (\%) \text{ of } (\text{BW}/50)$ dB.
- d) On any frequency removed from the center frequency between 55-100% of the channel bandwidth: $32 + 31 \log (\%) \text{ of } (\text{BW}/55)$ dB.
- e) On any frequency removed from the center frequency between 100-150% of the channel bandwidth: $40 + 57 \log (\%) \text{ of } (\text{BW}/100)$ dB.
- f) On any frequency removed from the center frequency between above 150% of the channel bandwidth: 50 dB or $55 + 10 \log (P)$ dB, whichever is the lesser attenuation.
- g) The 0 dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of 100 kHz and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.

D.2.5 CCA-ED threshold

CCA-ED thresholds for operation in specific bands are given in E.2.

Annex E

(normative)

Country elements and operating classes

E.1 Country information and operating classes

WLANS implemented in accordance with this standard and the specifications and definitions referenced in it may be subject to equipment certification and operating requirements established by regional and national regulatory administrations. The specification establishes minimum technical requirements for interoperability, taking into consideration established regulations at the time this standard was issued. These regional and national regulations may be revised or may be superseded. Regulatory requirements that do not affect interoperability are not addressed in this standard. Implementers are referred to the regulatory sources in Table D-1 and their successors for further information. Operation in countries within defined regulatory domains may be subject to additional or alternative national regulations.

The Country element (see 9.4.2.9) allows a STA to configure its PHY and MAC for operation when the Operating Triplet field is present. The Operating Triplet field indicates both PHY and MAC configuration characteristics and operational characteristics. The First Channel Number field of subsequent Subband Triplet fields is based on the dot11ChannelStartingFactor that is indicated by the Operating Class field.

The operating class is an index into a set of values for radio operation in a regulatory domain. The operating class tables also contain pointers to behaviors and signal detection limits in Annex D where further operational requirements may be found.

The channel starting frequency variable is a frequency, used together with an operating class number and a channel number, to calculate a channel center frequency. A “—” in the Channel starting frequency column of the operating classes tables (Table E-1 through Table E-5) indicates the channel starting frequency is not defined by the operating class and is derived from regulation.

Channel spacing is the frequency difference between nonoverlapping adjacent channel center frequencies when using the maximum bandwidth of one frequency segment allowed for this operating class.

The channel set is the list of integer channel numbers that are legal for a regulatory domain and class. A “—” in the Channel set column of the operating classes tables (Table E-1 through Table E-5) indicates either that the values in the channel center frequency index field apply for calculating channel center frequencies of this operating class, or where both the channel set field and the channel center frequency index field are “—” indicates that the channel set is not defined by the operating class and is derived from regulation.

The channel center frequency index is the set of integer channel numbers that correspond to frequency segments and that are allowed for the operating class. A “—” in the Channel center frequency index column of the operating classes tables (Table E-1 through Table E-5) indicates either that the values in the channel set field apply for calculating channel center frequencies of this operating class or, when both the Channel set and the Channel center frequency index column of the operating classes tables (Table E-1 through Table E-5) are “—”, indicates that the channel center frequency index is not defined by the operating class and is derived from regulation.

A behavior limits set is an enumerated list, each element of which points to a row in Table D-2 containing behavior limits in various regulatory domains.

Operating classes for operation in the United States are enumerated in Table E-1.

Table E-1—Operating classes in the United States

| Operating class | Global operating class (see Table E-4) | Channel starting frequency (GHz) | Channel spacing (MHz) | Channel set | Channel center frequency index | Behavior limits set |
|--------------------|--|----------------------------------|-----------------------|--|--------------------------------|---|
| 1 | 115 | 5 | 20 | 36, 40, 44, 48 | — | |
| 2 | 118 | 5 | 20 | 52, 56, 60, 64 | — | DFS_50_100_Behavior |
| 3 | 124 | 5 | 20 | 149, 153, 157, 161 | — | NomadicBehavior |
| 4 | 121 | 5 | 20 | 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144 | — | DFS_50_100_Behavior, UseEirpForVHTTxPowEnv |
| 5 | 125 | 5 | 20 | 149, 153, 157, 161, 165 | — | LicenseExemptBehavior |
| 6 | 103 | 4.9375 | 5 | 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 | — | |

NOTE 1—The channel spacing for operating classes 22 to 33 specifies the maximum radio bandwidth of one frequency segment. In these operating classes, the AP operating in a 20/40 MHz BSS, and the operating channel width for a non-AP STA is either 20 MHz or 40 MHz.

NOTE 2—The channel spacing for operating classes 128, 129, and 130 specifies the maximum radio bandwidth of one frequency segment.

^aThis operating class specifies a list of channels in the 5.9 GHz band. Current regulations may only permit a subset of these channels.

^bIt is the responsibility of management layers outside the scope of this standard to ensure that channels in use at any location are nonoverlapping.

Operating classes for operation in Europe are enumerated in Table E-2.

Table E-2—Operating classes in Europe

| Operating class | Global operating class (see Table E-4) | Channel starting frequency (GHz) | Channel spacing (MHz) | Channel set | Channel center frequency index | Behavior limits set |

NOTE 1—The channel spacing for operating classes 34–55 specifies the maximum radio bandwidth of one frequency segment. In these regulatory domains, the AP operates in a 20/40 MHz BSS, and the operating channel width of a non-AP STA is either

NOTE 2—The channel spacing for operating classes 128, 129, and 130 specifies the maximum radio bandwidth of one frequency segment.

*The use of channels 34, 38, 42, and 46 was included in the initial 5 GHz rules in May, 2005 and cannot be used after May 2012.

Operating classes for operation anywhere in the world are enumerated in Table E-4, and are used in addition to the operating classes enumerated in Table E-1, Table E-2, Table E-3 and (see 9.4.2.54). Where a BSS includes STAs that do not support global operating classes, then all requests and Action frames to those STAs that convey elements containing operating classes shall use nonglobal operating class values.

Table E-4—Global operating classes (continued)

| Operating class | Nonglobal operating class(es) | Channel starting frequency (GHz) | Channel spacing (MHz) | Channel set | Channel center frequency index | Behavior limits set |
|------------------------|--------------------------------------|---|------------------------------|--------------------|---------------------------------------|----------------------------|
| 192–254 | — | Vendor specific | Vendor specific | Vendor specific | — | Vendor specific |
| 255 | — | Reserved | Reserved | Reserved | — | Reserved |

NOTE 1—The channel spacing for operating classes 116, 117, 119, 120, 122, 123, 126, and 127 specifies the maximum radio bandwidth of one frequency segment. In these operating classes, the AP operates in a 20/40 MHz BSS, and the operating channel width for a non-AP STA is either 20 MHz or 40 MHz.

NOTE 2—The channel spacing for operating classes 128, 129, and 130 specifies the maximum radio bandwidth of one frequency segment.

For Behavior limit GeoDB, the channel starting frequency shall be the frequency that results in the regulatory domain's channel number being the RLAN channel number.

Operating classes for operation in China are enumerated in Table E-5.

Table E-5—Operating classes in China

| Operating class | Global operating class (see Table E-4) | Channel starting frequency (GHz) | Channel spacing (MHz) | Channel set | Channel center frequency index | Behavior limits set |
|------------------------|---|---|------------------------------|--|---------------------------------------|---|
| 1 | 115 | 5 | 20 | 36, 40, 44, 48 | — | UseEirpForVHTTxPowEnv |

| 8 | 83 | 2.407 | 40 | 1-9 | — | LicenseExemptBehavior, PrimaryChannelLowerBeha vior |

Table E-5—Operating classes in China (continued)

| Operating class | Global operating class (see Table E-4) | Channel starting frequency (GHz) | Channel spacing (MHz) | Channel set | Channel center frequency index | Behavior limits set |
|-----------------|--|----------------------------------|-----------------------|-------------|--------------------------------|--|
| 9 | 84 | 2.407 | 40 | 5-13 | — | LicenseExemptBehavior, PrimaryChannelUpperBehavior |
| 10–127 | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved |
| 128 | 128 | 5 | 80 | — | 42, 58, 155 | UseEirpForVHTTxPowEnv |
| 129 | 129 | 5 | 160 | — | 50 | UseEirpForVHTTxPowEnv |
| 130 | 130 | 5 | 80 | — | 42, 58, 155 | 80+ UseEirpForVHTTxPowEnv |
| 131–255 | Reserved | Reserved | Reserved | Reserved | Reserved | Reserved |

NOTE 1—The channel spacing for operating classes 4 to 6 specifies the maximum radio bandwidth of one frequency segment. In these operating classes, the AP operates in a 20/40 MHz BSS, and the operating channel width for a non-AP STA is either 20 MHz or 40 MHz.

NOTE 2—The channel spacing for operating classes 128, 129, and 130 specifies the maximum radio bandwidth of one frequency segment.

Nonglobal operating classes refer to the operating classes enumerated in the leftmost column of Table E-1, Table E-2, Table E-3, and Table E-5 (see 9.4.2.54).

NOTE 1—The following example Country element (see Figure 9-130) describes U.S. operation ('55', '53') using both Table E-1 class 12 (nonglobal) and Table E-4 class 81 (global) for the 2.4 GHz band, 11 channels at 20 dBm limit (in hexadecimal): '07', '0F', '55', '53', '04', 'C9', '0C', '0', '01', '0B', '14', 'C9', '51', '0', '01', '0B', '14'.

NOTE 2—The following example Country element describes U.S. operation for an 80+80 MHz BSS using Table E-4 classes 116, 128 and 130 at a 100 mW limit for 40 MHz. The contents (in decimal) are '07' [Country element ID], '18' [Length], '85', '83', '04' [Country string indicating United States and Table E-4], '201', '116', '0' [Operating Triplet field for 20/40 MHz with the primary 20 MHz channel on the lower 20 MHz], '36', '1', '20' [Subband triplet field indicating 20 dBm on the 40 MHz channel 36+40], '201', '128', '0' [Operating Triplet field for 80 MHz], '201', '130', '0', '201', '128', '0' [Pair of Operating Triplet field indicating 80+80 MHz]. Although the Operating Triplet fields for 80 MHz and 80+80 MHz only express BSS bandwidths rather than specific regulatory permissions (so are optional), they are included in this example.

Vendor Specific operating classes are used to carry information not defined in this standard within a single defined format, so that reserved operating classes are not usurped for nonstandard purposes and so that interoperability is more easily achieved in the presence of nonstandard information.

E.2 Band-specific operating requirements

E.2.1 General

Subclause E.2 contains requirements specific to particular bands and regulatory domains.

E.2.2 3650–3700 MHz in the United States

The registration authority is the FCC's Universal Licensing System (ULS).

Regulations specify the following:

- Certified mobile and portable STAs do not need to be registered, but they “must” operate under the control of an enabling STA (using DSE procedures).
- A registered STA “must” be a fixed STA.
- A registered STA “must” not operate as an enabling STA until the licensee has registered it as a “base station” in ULS.

Enabling STAs and fixed STAs are registered STAs. Dependent non-AP STAs and dependent APs are dependent STAs.

A STA shall use the following:

- CCA-ED
- CS/CCA
- TPC
- DFS

For OFDM PHY operation in this specific band, the CCA-ED thresholds shall be less than or equal to -72 dBm for 20 MHz channel widths, -75 dBm for 10 MHz channel widths, and -78 dBm for 5 MHz channel widths (minimum sensitivity for BPSK, $R=1/2 + 10 \text{ dB}$ in Table 17-18).

No STA shall use channel switch announcement.

No station may transmit for more than 4 ms without carrier sensing, whether transmitting fragments or frames, unless it is controlled by another STA.

A STA shall have the following equal to true:

- dot11LCIDSERequired
- dot11SpectrumManagementRequired
- dot11MultiDomainCapabilityActivated
- dot11ExtendedChannelSwitchActivated

A STA shall be capable of receiving all channels associated with operating classes 13–15.

A STA shall be capable of transmitting on all channels associated with operating class 15.

A STA shall set the value of dot11DSETransmitDivisor to 256 and the other dot11DSE timer values as shown in Table E-6.

Table E-6—DSE timer limits

| Parameter | Seconds |
|--------------------------------|---------|
| dot11DSEEnablementTimeLimit | 32 |
| dot11DSEEnablementFailHoldTime | 512 |
| dot11DSERenewalTime | 60 |

E.2.3 5.9 GHz band in the United States (5.850–5.925 GHz)

STAs operating with a behavior limit of ITS_nonmobile_operations in Table D-2 are required to be registered with the FCC ULS. The registration includes the following:

- Classification by coverage size, which is defined by EIRP, and
- Identification of channels the STA is permitted to use.

A STA shall be classified for operation in this band by their maximum transmit power capability, as listed in Table D-3 in D.2.2. A STA shall be compliant with the spectral emission requirements for their class listed in D.2.3.

A STA shall have dot11OCBActivated equal to true.

EPD as defined in IEEE Std 802-2014 shall be used for transmission of all MSDUs.

E.2.4 5.9 GHz band in Europe (5.855–5.925 GHz)

A STA shall have dot11OCBActivated equal to true.

EPD as defined in IEEE Std 802-2014 shall be used for transmission of all MSDUs.

E.2.5 TVWS band in the United States and Canada (54 MHz to 698 MHz)

Each GDD enabling STA and AP in TVWS determines the available TV channels at its location using its own geographic location identification and TV bands database access capabilities. Each GDD dependent STA in TVWS receives an available TV channel list from the STA that enables its operation.

The registration authorities are FCC designated TV bands administrators (FCC 47 CFR [B9], sections 15.713–715).

NOTE—IEEE 802.11 terms differ from FCC 47 CFR [B9], section 15.703, in many particulars. However, generally, a GDD enabling STA is Fixed or Mode II TVBD, and each GDD dependent STA has only one GDD enabling STA at any time. Generally, GDD dependent STAs are Mode I TVBDs. Each Fixed or Mode II TVBD is required to contact an authorized TV bands device database and operate based on the information received from that TV bands database. Fixed and Mode II TVBDs are certified to operate with specific TV bands databases using protocols specified by TV bands database administrators. FCC regulations require an encrypted Contact Verification Signal be received by Mode I TVBD to verify the integrity of the list of available channels FCC 47 CFR, section 15.711. Canadian regulation RSS-196 allows Remote Rural Broadband operation at transmit powers to 125 W in 6 MHz. The Canadian Minister of Industry held a consultation documented in SMSE-012-12, wherein a decision to act in concert with FCC license-exempt low power regulations was taken. It is expected that Canadian RSS-210 will be revised to align with FCC 47 CFR, Part 15, Subpart H—Television Band Devices.

STAs operating in TVWS shall use

- CS/CCA
- DFS

No STA operating in TVWS shall use Channel Switch Announcement.

STAs operating in TVWS shall have the following equal to true

- dot11GDDActivated
- dot11OperatingClassesRequired
- dot11SpectrumManagementRequired

- dot11MultiDomainCapabilityActivated
- dot11ContactVerificationSignalActivated

For GDD dependent STA operation in TVWS, the GDD enabling signal (see 11.44.2) is received directly from a GDD enabling STA and is a Beacon frame or Probe Response frame containing a Geodatabase Inband Enabling Signal field indicating that enablement in the frequency band is possible.

All GDD dependent STAs shall set the dot11GDD timer values as shown in Table E-7.

Table E-7—TVWS GDD timer limits

| Parameter | Seconds |
|--|---------|
| dot11GDDEnablementTimeLimit | 32 |
| dot11GDDEnablementFailHoldTime | 512 |
| dot11ContactVerificationSignalInterval | 60 |
| dot11GDDEnablementValidityTimer | 60 |

NOTE—Be aware that most protocols above the MAC operate in the opposite endianness from what is used in Table E-8 and Table E-9.

The Device Identification Information format is shown in Table E-8.

Table E-8—Device Identification Information Value fields

| Name | Type | Length (octets) | Value | Scope/ Country code |
|----------------------|------|-----------------|---|------------------------|
| FCC ID | 4 | 14 | The device identification contains the 14-octet FCC ID of the device. | US |
| Industry Canada ID | 5 | 11 | The device identification contains the 11-octet Industry Canada ID of the device. This value not present in the United States. | CA |
| Device Serial Number | 6 | 4 | The Device Serial Number field contains the manufacturer's serial number. This field is present only if the Device Class field (Table 9-264) is equal to 2 (GDD AP) or 3 (GDD fixed STA); otherwise, this field is not present. | US |

The WSM Information Value fields format is shown in Table E-9. In some regulatory domains, an AP can retrieve the WSM information from the GDB through the upper layer protocol (e.g., IETF Protocol to Access WS database ‘paws-protocol’). When the AP retrieves the WSM information from the upper layer, it may translate it to the WSM Information field format shown in Table E-9, which is the link-layer-specific information.

NOTE—In the United States, an example of full Map 1 for a U.S. GDD non-AP STA describing two available channels with power limits of 100 mW and 40 mW is shown as 85, 0x06, 0x00, 0x03, 0x15, 0x28, 0x33, 0x20. Type is 85, Length is 0x06, Device Class is 0x00, a full map with MapID 1 is 0x03, TV channel 21 is 0x15, 20 dBm Maximum Power Level is 0x28, TV channel 51 is 0x33, 16 dBm Maximum Power Level is 0x20.

Table E-9—WSM Information Value fields

| Name | Length (octets) | Value | Scope/ Country code |
|---------------------|-----------------|---|------------------------|
| Device Class | 1 | Single octet TLV comprising fields in Table 9-264. | WSM |
| Map ID | 1 | Bit 0: The Type bit, which indicates whether the following channel list is a full channel list or a partial channel list. If the Type bit is 1, the following channel list is a full channel list; and if the Type bit is 0, the following channel list is a partial channel list. Bits 1–7: The Map version field, which identifies the version of the WSM. | WSM |
| Channel Number | 1 | The Channel Number field is a positive integer value as defined in E.1 that indicates the available TV channel for WLAN operation. When the Channel Number field and Maximum Power Level field pairs are repeated, they are listed in ascending TV channel order. | WSM, US |
| Maximum Power Level | 1 | The Maximum Power Level field indicates the maximum power, in units of 0.5 dBm, allowed to be transmitted on the channel indicated in the Channel Number field. | WSM, US |

E.2.6 TVWS band in Europe

Each GDD enabling STA and AP in TVWS determines the available TV channels at its location using its own geographic location identification and TV bands database access capabilities. Each GDD dependent STA in TVWS receives an available TV channel list from the STA that enables its operation.

The Harmonized Standard for unlicensed device operation in TVWS is EN 301 598.

STAs operating in TVWS shall use:

- CS/CCA
- DFS

No STA operating in TVWS shall use Channel Switch Announcement.

STAs operating in TVWS shall have the following equal to true

- dot11GDDActivated
- dot11OperatingClassesRequired
- dot11SpectrumManagementRequired
- dot11MultiDomainCapabilityActivated
- dot11ContactVerificationSignalActivated

For GDD dependent STA operation in TVWS, the GDD enabling signal (see 11.44.2) is received directly from a GDD enabling STA and is a Beacon frame or Probe Response frame containing a Geodatabase Inband Enabling Signal field indicating that enablement in the frequency band is possible.

All GDD dependent STAs shall set the dot11GDD timer values as shown in Table E-10.

Table E-10—TVWS GDD timer limits

| Parameter | Seconds |
|--|---------|
| dot11GDDEnablementTimeLimit | 32 |
| dot11GDDEnablementFailHoldTime | 512 |
| dot11ContactVerificationSignalInterval | 60 |
| dot11GDDEnablementValidityTimer | 60 |

Annex F

(normative)

HT LDPC matrix definitions

Table F-1 defines the matrix prototypes of the parity-check matrices for a codeword block length $n = 648$ bits, with a subblock size $Z = 27$ bits.

**Table F-1—Matrix prototypes for codeword block length $n = 648$ bits,
 subblock size is $Z = 27$ bits**

Annex G

(normative)

Frame exchange sequences

G.1 General

The allowable frame exchange sequences are defined using an extension of the EBNF format as defined in ISO/IEC 14977:1996 [B49]. The elements of this syntax that are used here are as follows:

- $[a]$ = a is optional.
- $\{a\}$ = a is repeated zero or more times.
- $n\{a\}$ = a is repeated n or more times. For example, $3\{a\}$ requires 3 or more " a ". This notation is an extension to ISO/IEC 14977 and equivalent to $n*a\{a\}$ as defined in that standard.
- $a|b|c|...$ = selection between mutually exclusive alternatives, a , b , c
- $()$ = grouping, e.g., " $a (b|c)$ " is equivalent to " $a b | a c$ ".
- $(* a *)$ = " a " is a comment. Comments are placed before the text they relate to.
- $<>$ = order of frames not relevant. For example, $<a b>$ is either " $a b$ " or " $b a$ ".
- A rule is terminated by a semicolon ";"
- The meaning of whitespace is changed from ISO/IEC 14977. The name of terminals do not contain whitespace, and the concatenate-symbol (comma in ISO/IEC 14977) is replaced by white space. Whitespace appearing between the names of terminals indicates concatenation. Otherwise, whitespace is not significant and is used to highlight the nesting of grouped terms.

Two types of terminals are defined:

- **Frames.** The name of a frame is shown in **bold** and identified by its type/subtype (e.g., **Beacon**, **Data**). Frames are shown with an initial capital letter.
- **Attributes.** The name of attributes are shown in *italic*. An attribute is introduced by the "+" character. The attribute specifies a condition that applies to the frame (or alternatively, for the attributes that start +mu, the A-MPDU) that precedes it. Where there are multiple attributes applied, they are generally ordered in the same order of the fields in the frame to which they refer. The syntax $a+(b|c)$ where b and c are attributes is equivalent to $(a+b) | (a+c)$.

In this syntax the names of nonterminals are shown in a normal font, i.e., a sequence of words joined by hyphens (e.g., cf-frame-exchange-sequence).

The attributes are defined in Table G-1.

Table G-1—Attributes applicable to frame exchange sequence definition

| Attribute | Description |
|-------------------|---|
| <i>a-mpdu</i> | Frame is part of an A-MPDU aggregate. See NOTE 2. |
| <i>a-mpdu-end</i> | Frame is the last frame in an A-MPDU aggregate. See NOTE 2. |
| <i>block-ack</i> | QoS Data frame has ack policy equal to Block Ack. |
| <i>broadcast</i> | Frame RA is the broadcast address. |

Table G-1—Attributes applicable to frame exchange sequence definition (continued)

| Attribute | Description |
|----------------------------|--|
| <i>CF</i> | Beacon contains a CFP element. |
| <i>CF-Ack</i> | Data type CF-Ack subtype bit (Frame Control field B4) equal to 1 or CF-End +CF-Ack frame. |
| <i>CF-Poll</i> | Data type CF-Poll subtype bit (Frame Control field B5) equal to 1. |
| <i>csi</i> | An Action frame carrying channel state feedback (i.e., CSI, uncompressed beamforming, or compressed beamforming feedback matrices). |
| <i>csi-request</i> | A +HTC frame with the Feedback Request field equal to a value > 0. |
| <i>delayed</i> | BlockAck or BlockAckReq frame under a delayed policy. |
| <i>delayed-no-ack</i> | BlockAck or BlockAckReq frame has the BA Ack Policy or BAR Ack Policy field, respectively, equal to No Acknowledgement. |
| <i>DTIM</i> | Beacon is a DTIM. |
| <i>frag</i> | Frame has its More Fragments subfield equal to 1. |
| <i>group</i> | Frame RA has i/g bit equal to 1. |
| <i>HTC</i> | +HTC frame, i.e., a frame that contains the HT Control field, including the Control Wrapper frame. See NOTE. |
| <i>implicit-bar</i> | QoS Data frame in an A-MPDU with Normal Ack policy. |
| <i>individual</i> | Frame RA has i/g bit equal to 0. |
| <i>last</i> | Frame has its More Fragments subfield equal to 0. |
| <i>L-sig</i> | L-sig duration not equal to PPDU duration. |
| <i>action-no-ack</i> | Management frame of subtype Action No Ack. |
| <i>mfb</i> | A +HTC frame with the MFB field is not equal to all 1s. |
| <i>more-psmp</i> | A PSMP frame with the More PSMP field equal to 1. |
| <i>mrq</i> | A +HTC frame with the MRQ subfield equal to 1. |
| <i>mu-ppdu-end</i> | This attribute delineates the end of a VHT MU PPDU. See NOTE 3 and NOTE 4. |
| <i>mu-user-respond</i> | The preceding frame or A-MPDU is part of a VHT MU PPDU and is addressed to a user from which an immediate response is expected. See NOTE 3 and NOTE 4. |
| <i>mu-user-not-respond</i> | The preceding frame or A-MPDU is part of a VHT MU PPDU and is addressed to a user from which no immediate response is expected. See NOTE 3 and NOTE 4. |
| <i>ndp-announce</i> | A +HTC frame with the HT NDP Announcement subfield equal to 1. |
| <i>no-ack</i> | QoS Data frame with the Ack Policy subfield equal to No Ack. |
| <i>no-more-psmp</i> | A PSMP frame with the More PSMP field equal to 0. |
| <i>normal-ack</i> | QoS Data frame with the Ack Policy subfield equal to Normal Ack. |
| <i>non-QAP</i> | Frame is transmitted by a non-AP QoS STA. |
| <i>non-stbc</i> | PPDU TXVECTOR STBC parameter is equal to 0. |
| <i>null</i> | Data type Null Data subtype bit (Frame Control field B6) equal to 1. |
| <i>pifs</i> | Frame is transmitted following a PIFS. |
| <i>psmp-ack</i> | Ack Policy field of QoS Data frame is equal to PSMP Ack. |

Table G-1—Attributes applicable to frame exchange sequence definition (continued)

| Attribute | Description |
|--|---|
| <i>QAP</i> | Frame is transmitted by a QoS AP. |
| <i>QoS</i> | Data type QoS subtype bit (Frame Control field B7) equal to 1. |
| <i>RD</i> | Frame includes an HT Control field in which the RDG/More PPDU subfield is equal to 1. |
| <i>self</i> | Frame RA = TA. |
| <i>sounding</i> | PPDU TXVECTOR SOUNDING parameter is present and equal to SOUNDING. |
| <i>stbc</i> | PPDU TXVECTOR STBC parameter is equal to a value >0. |
| <i>to-ap</i> | Frame is addressed to the AP. |
| <i>trq</i> | Frame is a +HTC frame with the TRQ field equal to 1. |
| <p>NOTE 1—A Control frame that contains the HT Control field is always transmitted using the Control Wrapper frame.</p> <p>NOTE 2—In the case of VHT single MPDU, a single MPDU is carried in a A-MPDU, but the attributes <i>+a-mpdu</i> and <i>+a-mpdu-end</i> are not used.</p> <p>NOTE 3—<i>+mu-ppdu-end</i>, <i>+mu-user-respond</i> and <i>+mu-user-other</i> are used in productions that generate VHT MU PPDUs, according to the pattern: ["an A-MPDU (which might contain a VHT single MPDU) needing a response" <i>+mu-user-respond</i>] {"an A-MPDU (which might contain a VHT single MPDU) not needing a response" <i>+mu-user-not-respond</i>} <i>+mu-ppdu-end</i>. There is at least one of <i>+mu-user-respond</i> or <i>+mu-user-not-respond</i> in a VHT MU PPDU.</p> <p>NOTE 4—In the sequence A<i>+mu-user-respond</i> B<i>+mu-user-not-respond</i> ... <i>+mu-ppdu-end</i>, although the terms A, B ... (which represent one or more frames) are listed sequentially in these productions, the per-user sequence of frames represented by A, B, ... are transmitted simultaneously per-user using a VHT MU PPDU.</p> | |

G.2 Basic sequences

An allowable frame exchange sequence is defined by the rule frame-exchange-sequence. Except where modified by the *pifs* attribute, frames are separated by a SIFS or RIFS.

(* This rule defines all of the allowable frame exchange sequences *)
frame-exchange-sequence =

```
( [CTS] (Management +broadcast | Data +group) ) |
( [CTS | RTS CTS | PS-Poll] {frag-frame Ack} last-frame Ack ) |
(PS-Poll Ack) |
( [Beacon +DTIM] {cf-sequence} [CF-End [+CF-Ack] ] )|
    hcf-sequence |
    mcf-sequence;
```

(* A frag-frame is a nonfinal part of an individually addressed MSDU or MMPDU *)
frag-frame = (Data | Management) +individual +frag;

(* This is the last (or only) part of an individually addressed MSDU or MMPDU *)
last-frame = (Data | Management) +individual +last;

(* A cf-sequence expresses all of the sequences that may be generated within a contention free period. The first frame in this sequence is sent by the AP. *)
cf-sequence =

(*Broadcast *)

Beacon | **Management** +*broadcast* | **Data** +*group* [+*QoS*] |

(* CF poll with data *)

(**Data**+*individual* +*CF-Poll* [+*CF-Ack*]

(**Data** +*individual* +*CF-Ack* [**Data** +*null* +*CF-Ack*] |
Data +*null* +*CF-Ack*)) |

(* CF poll without data *)

Data +*individual* +*null* +*CF-Poll* [+*CF-Ack*]

(**Data** +*null* |

(**Data** +*individual* (**Data** +*null* +*CF-Ack* | **Ack**))) |

(* individual management *)

(**Management** +*individual* **Ack**) |

(* All of the sequences initiated by an HC *)

hcf-sequence;

G.3 EDCA and HCCA sequences

(* An hcf-sequence represents all of the sequences that may be generated under HCCA. The sequence may be initiated by an HC within a CFP, or it may be initiated by a STA using EDCA channel access. *)
 hcf-sequence =

([CTS] 1{(**Data** +*group* [+*QoS*]) | **Management** +*broadcast*} +*pifs* } |
 ([CTS] 1{txop-sequence}) |

(* HC only, polled TXOP delivery *)

([RTS CTS] non-cf-ack-piggybacked-qos-poll-sequence) |

(* HC only, polled TXOP delivery *)

cf-ack-piggybacked-qos-poll-sequence |

(* HC only, self TXOP delivery or termination *)

Data +*self*+*null* +*CF-Poll* +*QoS*;

(* A cf-ack-piggybacked-qos-poll-sequence is the start of a polled TXOP that also delivers a CF-Ack. There are two main variants, polls that deliver data and, therefore, need acknowledgment and polls that do not. *)

Annex H

(normative)

Usage of Ethertype 89-0d

The Ethertype 89-0d frame body is specified in Figure H-1, omitting any possible security header and trailer.

| Octets: | LLC | SNAP | Payload Type | Payload |
|---------|-----|------|--------------|----------|
| | 3 | 5 | 1 | variable |

Figure H-1—Ethertype 89-0d frame body

LLC is defined in ISO/IEC 8802-2:1998.

SNAP is defined in IEEE Std 802-2014. The formatting of the SNAP header is according to IETF RFC 1042. The Ethertype is set to 89-0d.

The Payload Type field is set to one of the values in Table H-1.

Table H-1—Payload Type field values

| Protocol name | Payload type | Subclause |
|-------------------------|--------------|-----------|
| Remote Request/Response | 1 | 13.10.3 |
| TDLS | 2 | 11.23.2 |
| FST | 3 | 11.33.5 |
| RLQP | 4 | 11.25.3.4 |
| Reserved | 5–255 | |

The Payload depends on the value inside the Payload Type field and is defined in the subclauses listed in Table H-1.

Annex I

(informative)

Examples of encoding a frame for OFDM PHYs and DMG PHYs

I.1 Example 1 - BCC encoding

I.1.1 Introduction

The purpose of this annex is to show an example of encoding a frame for the OFDM PHY, as described in Clause 17. This example covers all of the encoding details defined by this standard.

The encoding illustration goes through the following stages:

- a) Generating the short training sequence section of the preamble;
- b) Generating the long preamble sequence section of the preamble;
- c) Generating the SIGNAL field bits;
- d) Coding and interleaving the SIGNAL field bits;
- e) Mapping the SIGNAL field into frequency domain;
- f) Pilot insertion;
- g) Transforming into time domain;
- h) Delineating the data octet stream into a bit stream;
- i) Prepending the SERVICE field and adding the pad bits, thus forming the DATA;
- j) Scrambling and zeroing the tail bits;
- k) Encoding the DATA with a convolutional encoder and puncturing;
- l) Mapping into complex 16-QAM symbols;
- m) Pilot insertion;
- n) Transforming from frequency to time and adding a circular prefix;
- o) Concatenating the OFDM symbols into a single, time-domain signal.

In the description of time domain waveforms, a complex baseband signal at 20 Msample/s shall be used.

This example uses the 36 Mb/s data rate and a message of 100 octets. These parameters are chosen in order to illustrate as many nontrivial aspects of the processing as possible:

- Use of several bits per symbol (4 in this case);
- Puncturing of the convolutional code;
- Interleaving, which uses the LSB–MSB swapping stage;
- Scrambling of the pilot subcarriers.

In each Annex I table that has “Binary value” columns, the bit positions of the binary values are specified in the header of the table.

I.1.2 The message for the BCC example

The message being encoded consists of the first 72 characters (shown in **bold** and including line breaks) of the well-known “Ode to Joy” by F. Schiller:

**Joy, bright spark of divinity,
 Daughter of Elysium,
 Fire-inspired we tread
 Thy sanctuary.
 Thy magic power re-unites
 All that custom has divided,
 All men become brothers
 Under the sway of thy gentle wings.**

The message is converted to ASCII; then it is prepended with an appropriate MAC header and an FCS is added. The resulting 100 octet PSDU is shown in Table I-1.

Table I-1—The message for the BCC example

| Octet # | Val | Val | Val | Val | Val |
|----------|------|------|------|------|------|

The single period of the short training sequence is extended periodically for 161 samples (about 8 μs), and then multiplied by the window function:

$$W(k) = \begin{cases} 0.5 & k = 0 \\ 1 & 1 \leq k \leq 159 \\ 0.5 & k = 160 \end{cases}$$

The last sample serves as an overlap with the following OFDM symbol. The 161 samples vector is shown in Table I-4. The time-windowing feature illustrated here is not part of the normative specifications.

Table I-4—Time domain representation of the short sequence

The time domain representation is derived by performing IFFT on the contents of Table I-5, cyclically extending the result to get the cyclic prefix, and then multiplying with the window function given in I.1.3.1. The resulting 161 points vector is shown in Table I-6. The samples are appended to the short sequence section by overlapping and adding element 160 of Table I-4 to element 0 of Table I-6.

Table I-6—Time domain representation of the long sequence

I.1.4 Generation of the SIGNAL field

I.1.4.1 SIGNAL field bit assignment

The SIGNAL field bit assignment follows 17.3.4 and Figure 17-5. The transmitted bits are shown in Table I-7, where bit 0 is transmitted first.

Table I-7—Bit assignment for SIGNAL field

| ## | Bit | Meaning | ## | Bit | Meaning |
|-----------|------------|----------------|-----------|------------|----------------|
| 0 | 1 | RATE: R1 | 12 | 0 | — |
| 1 | 0 | RATE: R2 | 13 | 0 | — |
| 2 | 1 | RATE: R3 | 14 | 0 | — |
| 3 | 1 | RATE: R4 | 15 | 0 | — |
| 4 | 0 | Reserved | 16 | 0 | LENGTH (MSB) |
| 5 | 0 | LENGTH (LSB) | 17 | 0 | Parity |
| 6 | 0 | — | 18 | 0 | SIGNAL TAIL |
| 7 | 1 | — | 19 | 0 | SIGNAL TAIL |
| 8 | 0 | — | 20 | 0 | SIGNAL TAIL |
| 9 | 0 | — | 21 | 0 | SIGNAL TAIL |
| 10 | 1 | — | 22 | 0 | SIGNAL TAIL |
| 11 | 1 | — | 23 | 0 | SIGNAL TAIL |

I.1.4.2 Coding the SIGNAL field bits

The bits are encoded by the rate 1/2 convolutional encoder to yield the 48 bits given in Table I-8.

Table I-8—SIGNAL field bits after encoding

| ## | Bit |
|----|-----|----|-----|----|-----|----|-----|----|-----|----|-----|----|-----|
| 0 | 1 | 8 | 1 | 16 | 0 | 24 | 0 | 32 | 0 | 40 | 0 | | |
| 1 | 1 | 9 | 0 | 17 | 0 | 25 | 0 | 33 | 1 | 41 | 0 | | |
| 2 | 0 | 10 | 1 | 18 | 0 | 26 | 1 | 34 | 1 | 42 | 0 | | |
| 3 | 1 | 11 | 0 | 19 | 0 | 27 | 1 | 35 | 1 | 43 | 0 | | |
| 4 | 0 | 12 | 0 | 20 | 0 | 28 | 1 | 36 | 0 | 44 | 0 | | |
| 5 | 0 | 13 | 0 | 21 | 0 | 29 | 1 | 37 | 0 | 45 | 0 | | |
| 6 | 0 | 14 | 0 | 22 | 1 | 30 | 1 | 38 | 0 | 46 | 0 | | |
| 7 | 1 | 15 | 1 | 23 | 0 | 31 | 0 | 39 | 0 | 47 | 0 | | |

I.1.4.3 Interleaving the SIGNAL field bits

The encoded bits are interleaved according to the interleaver of 17.3.5.7. A detailed breakdown of the interleaving operation is described in I.1.6.2. The interleaved SIGNAL field bits are shown in Table I-9.

Table I-9—SIGNAL field bits after interleaving

| ## | Bit |
|----|-----|----|-----|----|-----|----|-----|----|-----|----|-----|----|-----|
| 0 | 1 | 8 | 1 | 16 | 0 | 24 | 1 | 32 | 0 | 40 | 1 | | |
| 1 | 0 | 9 | 1 | 17 | 0 | 25 | 0 | 33 | 0 | 41 | 0 | | |
| 2 | 0 | 10 | 0 | 18 | 0 | 26 | 0 | 34 | 1 | 42 | 0 | | |
| 3 | 1 | 11 | 1 | 19 | 1 | 27 | 0 | 35 | 0 | 43 | 1 | | |
| 4 | 0 | 12 | 0 | 20 | 0 | 28 | 0 | 36 | 0 | 44 | 0 | | |
| 5 | 1 | 13 | 0 | 21 | 1 | 29 | 0 | 37 | 1 | 45 | 1 | | |
| 6 | 0 | 14 | 0 | 22 | 0 | 30 | 1 | 38 | 0 | 46 | 0 | | |
| 7 | 0 | 15 | 0 | 23 | 0 | 31 | 1 | 39 | 0 | 47 | 0 | | |

I.1.4.4 SIGNAL field frequency domain

The encoded and interleaved bits are BPSK modulated to yield the frequency domain representation given in Table I-10. Locations -21, -7, 7, and 21 are skipped and are used for pilot insertion.

Table I-10—Frequency domain representation of SIGNAL field

Four pilot subcarriers are added by taking the values {1.0,1.0,1.0,-1.0}, multiplying them by the first element of sequence $p_{0\dots 126}$, given in Equation (17-22) (in 17.3.5.10), and inserting them into location {-21, -7, 7, 21}, respectively. The resulting frequency domain values are given in Table I-11.

Table I-11—Frequency domain representation of SIGNAL field with pilots inserted

I.1.4.5 SIGNAL field time domain

The time domain representation is derived by performing IFFT on the contents of Table I-11, extending cyclically, and multiplying by the window function

$$W(k) = \begin{cases} 0.5 & k = 0 \\ 1 & 1 \leq k \leq 79 \\ 0.5 & k = 80 \end{cases}$$

The resulting 81 samples vector is shown in Table I-12. Note that the time-windowing feature illustrated here is not a part of the normative specifications.

Table I-12—Time domain representation of SIGNAL field

The SIGNAL field samples are appended with one sample overlap to the preamble, given in Table I-6.

I.1.5 Generating the DATA bits for the BCC example

I.1.5.1 Delineating, SERVICE field prepending, and zero padding

The transmitted message shown in Table I-1 contains 100 octets or, equivalently, 800 bits. The bits are prepended by the 16 SERVICE field bits and are appended by 6 tail bits. The resulting 822 bits are appended by some number of bits with value 0 to yield an integer number of OFDM symbols. For the 36 Mb/s mode, there are 144 data bits per OFDM symbol; the overall number of bits is $\lceil 822/144 \rceil \times 144 = 864$. Hence, $864 - 822 = 42$ zero bits are appended.

The DATA bits are shown in Table I-13.

I.1.5.2 Scrambling the BCC example

The 864 bits are scrambled by the scrambler defined in 17.3.5.5. The initial state of the scrambler is the state 1011101. The generated scrambling sequence is given in Table I-14.

Table I-14—Scrambling sequence for seed 1011101

| ## | Bit |
|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|-----------|------------|
| 0 | 0 | 16 | 1 | 32 | 0 | 48 | 1 | 64 | 0 | 80 | 0 | 96 | 0 | 112 | 1 | | |

I.1.6.2 Interleaving the DATA bits

The interleaver is defined as a two-permutation process. The index of the coded bit before the first permutation shall be denoted by k ; i shall be the index after the first and before the second permutation; and j shall be the index after the second permutation, just prior to modulation mapping. The mapping from k to i is shown in Table I-17, and the mapping from i to j is shown in Table I-18.

As a specific example, consider the case of $k = 17$ (the 18th bit after encoding and puncturing). It is mapped by the first permutation to $i = 13$ and by the second permutation to $j = 12$ (the 13th bit before mapping).

The interleaved bits are shown in Table I-19.

Table I-17—First permutation

| <i>k</i> | <i>i</i> |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|

I.1.6.3 Mapping into symbols

The frequency domain symbols are generated by grouping 4 coded bits and mapping into complex 16-QAM symbols according to Table 17-14 (in 17.3.5.8). For instance, the first 4 bits (0 1 1 1) are mapped to the complex value, $-0.316 + 0.316j$, inserted at subcarrier #26.

Four pilot subcarriers are added by taking the values $\{1.0, 1.0, 1.0, -1.0\}$, multiplying them by the second element of sequence p , given in Equation (17-22) (in 17.3.5.10), and inserting them into location $\{-21, -7, 7, 21\}$, respectively.

The frequency domain is shown in Table I-20.

The time domain samples are produced by performing IFFT, cyclically extending, and multiplying with the window function in the same manner as described in I.1.4.5. The time domain samples are appended with one sample overlap to the SIGNAL field symbol.

Table I-20—Frequency domain of first DATA symbol

| ## | Re | Im |

I.1.7 Generating the additional DATA symbols

The generation of the additional five data symbols follows the same procedure as described in Clause 4. Special attention should be paid to the scrambling of the pilot subcarriers. Table I-21 lists the polarity of the pilot subcarriers and the elements of the sequence $p_0 \dots p_{126}$ for the DATA symbols. For completeness, the pilots in the SIGNAL are included as well. The symbols are appended one after the other with a one-sample overlap.

Table I-21—Polarity of the pilot subcarriers

| i | OFDM symbol | Element of p_i | Pilot at #−21 | Pilot at #−7 | Pilot at #7 | Pilot at #21 |
|----------|--------------------|------------------------------------|----------------------|---------------------|--------------------|---------------------|
| 0 | SIGNAL | 1 | 1.0 +0 j | 1.0 +0 j | 1.0 +0 j | -1.0 +0 j |
| 1 | DATA 1 | 1 | 1.0 +0 j | 1.0 +0 j | 1.0 +0 j | -1.0 +0 j |
| 2 | DATA 2 | 1 | 1.0 +0 j | 1.0 +0 j | 1.0 +0 j | -1.0 +0 j |
| 3 | DATA 3 | 1 | 1.0 +0 j | 1.0 +0 j | 1.0 +0 j | -1.0 +0 j |
| 4 | DATA 4 | -1 | -1.0 +0 j | -1.0 +0 j | -1.0 +0 j | 1.0 +0 j |
| 5 | DATA 5 | -1 | -1.0 +0 j | -1.0 +0 j | -1.0 +0 j | 1.0 +0 j |
| 6 | DATA 6 | -1 | -1.0 +0 j | -1.0 +0 j | -1.0 +0 j | 1.0 +0 j |

I.1.8 The entire packet for the BCC example

The packet in its entirety is shown in the tables in this subclause. These tables illustrate the short training sequence section (Table I-22), the long training sequence section (Table I-23), the SIGNAL field (Table I-24), and the six DATA symbols (Table I-25 to Table I-30).

I.2 Generating encoded DATA bits—LDPC example 1

LDPC example 1 is similar to the BCC example. This example illustrates LDPC shortening, encoding, and puncturing of a single codeword.

Input TXVECTOR parameters for LDPC example 1:

- FEC_CODING = LDPC_CODING = 1 (LDPC encoder; not BCC)
- CH_BANDWIDTH = HT_CBW20 = 0 (CH_BANDWIDTH = 0 => 20 MHz)
- MCS = 4 (MCS = 4; QAM 16; Coding rate = 3/4)
- Coding rate R = 3/4
- LENGTH = 100 octets (with 16-bit SERVICE field becomes 102 Octets = 816 bits to scramble and encode)
- STBC = 0 (STBC = 0 => OFF; m_STBC=1)

I.2.1 The message for LDPC example 1

The message being encoded consists of the first 72 characters (shown in **bold** and including line breaks) of the well-known “Ode to Joy” by F. Schiller:

Joy, bright spark of divinity,
Daughter of Elysium,
Fire-inspired we tread
 Thy sanctuary.
 Thy magic power re-unites
 All that custom has divided,
 All men become brothers
 Under the sway of thy gentle wings.

The message is converted to ASCII; then it is prepended with an appropriate MAC header, and an FCS is added. The resulting 100 octet PSDU is shown in Table I-31.

NOTE 1—The message for LDPC example 1 is identical to the message for the BCC example; in other words, the FCS field (octets 97–100) has the same value.

NOTE 2—The DurationID field (i.e., octets 3 and 4) remains 0x02E = 46 µs.

Table I-31—Message for LDPC example 1

| Octet # | Value | Value | Value | Value | Value |
|---------|-------|-------|-------|-------|-------|
| 1...5 | 0x04 | 0x02 | 0x00 | 0x2E | 0x00 |

| 96...100 | 0x61 | 0x67 | 0x33 | 0x21 | 0xB6 |

I.2.2 Prepending the SERVICE field for LDPC example 1

The transmitted message shown in Table I-31 contains 100 octets, or equivalently, 800 bits. The bits are prepended by the 16 SERVICE field bits (bits 0–15 in Table I-32), as defined in 19.3.11.2, but tail bits and padding bits are not appended as in the BCC example. The resulting 816 bits are shown in Table I-32.

Table I-32—DATA bits for LDPC example 1 before scrambling

| Bit ## | Binary value B7 B0 | Binary value B15 B8 | Binary value B23 B16 | Hexadecimal value | Hexadecimal value | Hexadecimal value |

I.2.3 Scrambling LDPC example 1

The 816 bits are scrambled by the scrambler defined in 17.3.5.5. The initial state of the scrambler is the state 1011101 binary (0x5D). The scrambled sequence is given in Table I-33.

NOTE—The scrambled entries for the correct FCS field value are given in bits 784–815.

Table I-33—DATA bits for LDPC example 1 after scrambling

| Bit # | Binary value B0 B7 | Binary value B8 B15 | Binary value B16 B23 | Hexadecimal value | Hexadecimal value | Hexadecimal value |

I.2.4 Inserting shortening bits for LDPC example 1

The equations of 19.3.11.7.5 are solved to calculate the following derived parameters for LDPC example 1 from the input TXVECTOR parameters:

- $N_{CW} = 1$ (number of codewords)
- $L_{LDPC} = 1944$ (size of codeword)
- $N_{CBPS} = 208$ (number of coded bits per symbol)
- $N_{avbits} = 1248$ (number of available bits)
- $N_{shrt} = 642$ (number of bits to be shortened)
- $N_{punc} = 54$ (number of bits to be punctured)
- $N_{SYM} = 6$ (number of OFDM symbols)
- $N_{rep} = 0$ (number of bits to be repeated)

The results of applying shortening bits, as prescribed in paragraph (c) of 19.3.11.7.5, is given in Table I-34.

NOTE— $N_{shrt} = 642$ shortening bits have been inserted as 0s in bits 816–1457.

Table I-34—DATA bits for LDPC example 1 after insertion of shortening bits

I.2.5 Encoding data for LDPC example 1

The DATA with shortening bits are LDPC encoded as a single ($N_{CW}=1$) codeword ($L_{LDPC}=944$; $R=3/4$) as prescribed by paragraph (c) of 19.3.11.7.5. The results are given in Table I-35.

NOTE—The LDPC encoder appends 486 bits (i.e., bits 1458–1943) after the shortening bits.

Table I-35—DATA bits for LDPC example 1 after LDPC encoding

I.2.6 Removing shortening bits and puncturing for LDPC example 1

The shortening bits, applied before LDPC encoding, are now removed as prescribed in paragraph (c) of 19.3.11.7.5. Finally, either puncturing is applied as described in paragraph (d) of the same subclause, or the copying of repeated bits is applied as described in paragraph (e) of the same subclause. In LDPC example 1, because $N_{punc} = 54$ is nonzero and $N_{rep} = 0$, puncturing is prescribed and completes the LDPC encoding process.

The results are given in Table I-36.

NOTE—The $N_{shrt} = 642$ shortening bits have been removed, and the $N_{punc} = 54$ bits have been punctured from Table I-35 to produce bits 816–1247 of Table I-36.

Table I-36—DATA bits after puncturing and removal of shortening bits

| Bit # | Binary value B0 B7 | Binary value B8 B15 | Binary value B16 B23 | Hexadecimal value | Hexadecimal value | Hexadecimal value |

I.3 Generating encoded DATA bits—LDPC example 2

LDPC example 2 exercises the alternative branches of the LDPC encoding procedure not exercised in LDPC example 1. Example 2 also exhibits LDPC shortening, encoding, and padding by repetition and employs multiple codewords and diversifies the TXVECTOR parameters—all without making the length of this example cumbersome.

The length of the text of the message is increased by 40 octets, from 72 characters to 112 characters, in order to illustrate padding (rather than puncturing) and encoding of multiple codewords.

Input TXVECTOR parameters for LDPC example 2:

- FEC_CODING = LDPC_CODING = 1 (LDPC encoder; not BCC)
 - CH_BANDWIDTH = HT_CBW40 = 1 (CH_BANDWIDTH = 1 => 40 MHz)
 - MCS = 1 (MCS = 1; QPSK; coding rate = 1/2)
 - Coding rate R = 1/2
 - LENGTH = 140 octets (with 16-bit SERVICE field becomes 142 octets = 1136 bits to scramble and encode)
 - STBC = 1 (STBC = 1 => ON; m_STBC = 2)

I.3.1 The message for LDPC example 2

The message being encoded consists of the first 112 characters (shown in **bold** and including line breaks) of the well-known “Ode to Joy” by F. Schiller:

**Joy, bright spark of divinity,
Daughter of Elysium,
Fire-inspired we tread
Thy sanctuary.**

Thy magic power re-unites
 All that custom has divided,
 All men become brothers
 Under the sway of thy gentle wings.

The message is converted to ASCII; then it is prepended with an appropriate MAC header and an FCS is added. The resulting 140 octet PSDU is shown in Table I-37.

Because of the additional 40 characters, note that the message for LDPC example 2 has a different FCS field (octets 137–140) than the previous examples and that the DurationID field (i.e., octets 3 and 4) changes to 0x036 = 54 µs.

Table I-37—Message for LDPC example 2

| Octet ## | Value | Value | Value | Value | Value |
|-----------|-------|-------|-------|-------|-------|
| 1...5 | 0x04 | 0x02 | 0x00 | 0x36 | 0x00 |

I.3.2 Prepending the SERVICE field for LDPC example 2

The transmitted message shown in Table I-37 contains 140 octets, or equivalently, 1120 bits. The bits are prepended by the 16 SERVICE field bits (bits 0–15 in Table I-38), as defined by 19.3.11.2, but tail bits and padding bits are not appended as in the BCC example. The resulting 1136 bits are shown in Table I-38.

I.3.3 Scrambling LDPC example 2

The 1136 bits are scrambled by the scrambler defined in 17.3.5.5. The initial state of the scrambler is the state 1011101 binary (0x5D). The scrambled sequence is given in Table I-39.

Table I-39—DATA bits for LDPC example 2 after scrambling

| Bit # | Binary value B0 B7 | Binary value B8 B15 | Binary value B16 B23 | Hexadecimal value | Hexadecimal value | Hexadecimal value |

I.3.4 Inserting the shortening bits for LDPC example 2

The equations of 19.3.11.7.5 are solved to calculate the following derived parameters for LDPC example 2 from the input TXVECTOR parameters:

- $N_{CW} = 2$ (number of codewords)
- $L_{LDPC} = 1296$ (size of codeword)
- $N_{CBPS} = 216$ (number of coded bits per symbol)
- $N_{avbits} = 2592$ (number of available bits)
- $N_{shrt} = 160$ (number of bits to be shortened)
- $N_{punc} = 0$ (number of bits to be punctured)
- $N_{SYM} = 12$ (number of OFDM symbols)
- $N_{rep} = 160$ (number of bits to be repeated)

The results of applying shortening bits, as prescribed in paragraph (c) of 19.3.11.7.5, is given in Table I-40.

NOTE— $N_{shrt} = 160$ shortening bits have been inserted as 0s: 80 0s at bits 568–647 and 80 0s at bits 1216–1295; this order equally distributes the shortening bits across the $N_{CW} = 2$ codewords.

Table I-40—DATA bits for LDPC example 2 after insertion of shortening bits

| Bit # | Binary value B0 B7 | Binary value B8 B15 | Binary value B16 B23 | Hexadecimal value | Hexadecimal value | Hexadecimal value |
|-----------|----------------------------|-----------------------------|------------------------------|-------------------|-------------------|-------------------|

I.3.5 Encoding the data for LDPC example 2

The DATA with shortening bits are LDPC encoded as two ($N_{CW} = 2$) codewords ($L_{LDPC} = 1296$; $R = 1/2$) as prescribed by paragraph (c) of 19.3.11.7.5. The results are given in Table I-41.

NOTE—The LDPC encoder appends 648 bits as follows: bits 648–1295 after the first shortened codeword and another 648 bits (bits 1944–2591) after the second shortened codeword.

Table I-41—DATA bits for LDPC example 2 after LDPC encoding

| Bit # | Binary value B0 B7 | Binary value B8 B15 | Binary value B16 B23 | Hexadecimal value | Hexadecimal value | Hexadecimal value |

I.3.6 Removing shortening bits and repetition for LDPC example 2

The shortening bits, applied before LDPC encoding, are now removed as prescribed in paragraph (c) of 19.3.11.7.5. Finally, either puncturing is applied as described in paragraph (d) of the same subclause, or the copying of repeated bits is applied as described in paragraph (e) of the same subclause. In LDPC example 2, because $N_{punc} = 0$ and $N_{rep} = 160$ are nonzero, repetition is prescribed and completes the LDPC encoding process.

The results are given in Table I-42.

NOTE—The first 80 shortening bits (bits 568–647 from Table I-41) have been removed from the first codeword between bits 567 and 568 of Table I-42, and the second 80 shortening bits (bits 1864–1943 of Table I-41) have been removed between bits 1215 and 1216 of Table I-42. Also, 80 bits have been repeated from the beginning of the first codeword (bits 0–79) to the end of the first codeword (bits 1216–1295), and 80 bits have been repeated from the beginning of the second codeword (bits 1296–1375) to end of the second codeword (bits 2512–2591) in Table I-42.

I.4 DMG example data vectors

Subclauses I.5 to I.8 contain example data vectors for the DMG PHY (see Clause 20).

For each described node, there is a cross-reference in this annex that is of the form

Reference: <filename.txt>

where the named file is one of the text files contained in the DMGEncodingExamples.zip file embedded in the IEEE 802.11 Working Group document 11-12/0751r0, located at <https://mentor.ieee.org/802.11/dcn/12/11-12-0751-00-00ad-dmg-encoding-examples.docx>.

Depending on the node being illustrated, the text file might represent bit data, symbol data, or sample data:

- For bit data, the text file contains a time ordered sequence of 1 and 0 characters, separated by spaces and without any carriage control characters.
- For symbol data, the text file contains a time ordered sequence of signed integers, separated by spaces and without any carriage control characters.
- For sample data, the text file contains a time ordered sequence of complex values, formatted as $\pm<\text{real}>\pm<\text{imag}>j$, separated by spaces and without any carriage control characters.

When referencing specific bits, symbols, or samples in the files, they are considered to be numbered starting from 1.

This formatting of the text files has been chosen to facilitate import into other tools. For example, the files can be read using the MATLAB `dlmread('filename')` command.

For DMG control mode, SC mode and low-power (LP) SC mode modulation samples, no spectrum shaping has been applied to the data because the implementation of spectrum shaping is not defined in this standard. For DMG OFDM mode modulation samples, no symbol shaping has been applied to the data because the implementation of OFDM symbol shaping is not defined in this standard.

I.5 DMG Example 1 – DMG control mode encoding

I.5.1 DMG control mode preamble

The DMG control mode preamble Short Training field (STF) and Channel Estimation field (CEF) are each constructed from a concatenation of real valued bipolar Golay sequences that is $\pi/2$ -BPSK modulated, as shown in Figure I-1.

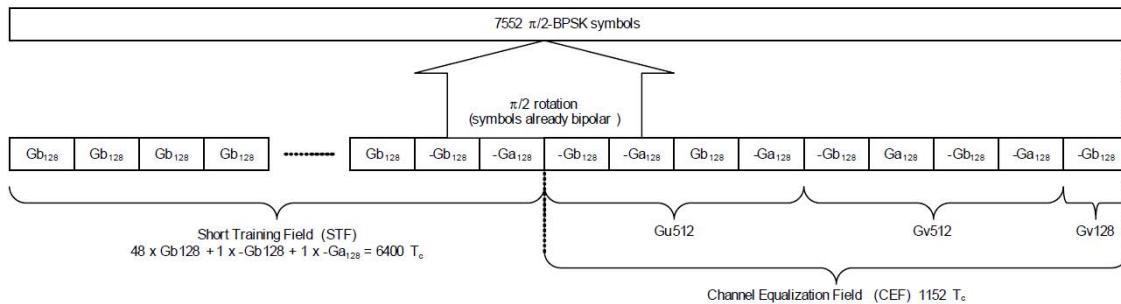

Figure I-1—DMG control mode preamble expressed in Ga_{128} and Gb_{128} sequences

The DMG control mode preamble is 7552 samples long.

Reference: [CPHY_Preamble Samples.txt](#)

I.5.2 Control mode header

The DMG control mode header coding and modulation are shown in Figure I-2.

I.5.2.1 DMG control mode header and payload bits

Figure I-2 node ①. The 5 octets of header data followed by the payload data. The first 6 octets of the data payload are used to complete the construction of the single LDPC codeword of the DMG control mode header. For this example, the DMG control mode header bit fields are set as listed in Table I-43.

Table I-43—DMG control mode header settings

| Field | Value |
|--------------------------|-------|
| Scrambler Initialization | 2 |
| Length | 120 |
| Packet Type | 0 |
| Training Length | 0 |
| Turnaround | 0 |
| Reserved bits | 0 |

The data payload octets are provided by a count, modulo 256, starting at 0. The resulting header and payload sequence is 1000 bits long, of which the first 88 bits are encoded in the header modulation block. For this example, with a payload of 120 octets, $L_{DPFCW} = 88$, $L_{DPCW} = 152$ and $L_{DPLCW} = 152$.

These numbers illustrate that the payload is not simply packed 168 bits at a time into the LDPC encoding, with the last few bits (modulo 168) in the last packet getting disproportionate coding gain. The specified calculation spreads the excess coding gain evenly across all of the packets, so the number of payload bits in each packet varies between approximately 120 and the maximum 168.

Reference: Bits 1 to 88 of the file [CPHY_Header and Payload bits.txt](#)

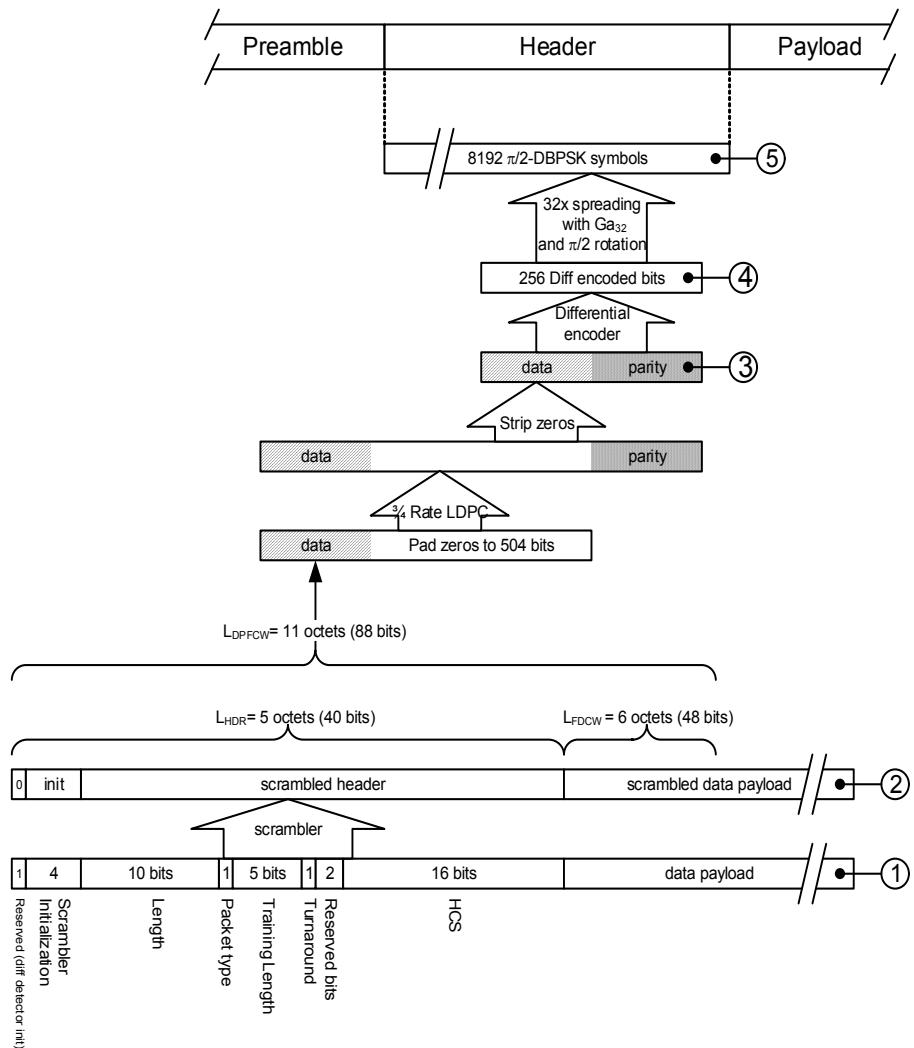

Figure I-2—DMG control mode header coding and modulation

I.5.2.2 DMG control mode scrambled header and payload bits

Figure I-2 node ②. The 5 header plus 6 data = 11 octets after scrambling.

Reference: Bits 1 to 88 of the file **CPHY_Scrambled Header and Payload bits.txt**

I.5.2.3 DMG control mode LDPC encoded header bits

Figure I-2 node ③. In this example there are 7 LDPC codewords. The number of bits produced by the first codeword after zero stripping is $88 + 168 = 256$, and the number of bits produced by each of the remaining 6 codewords is $152 + 168 = 320$. The total number of bits after LDPC encoding is $256 + 6 \times 320 = 2176$, of which the first 256 bits correspond to the LDPC encoded header.

Reference: Bits 1 to 256 of the file **CPHY_LDPC Encoded Header and Payload bits.txt**

I.5.2.4 DMG control mode differentially encoded header symbols

Figure I-2 node ④. The 256 LDPC encoded header bits are differentially encoded.

Reference: Symbols 1 to 256 of the file **CPHY_Diff Encoded Header and Payload symbols.txt**

I.5.2.5 DMG control mode header samples

Figure I-2 node ⑤. The 256 differentially encoded bipolar symbol values are spread using the Ga_{32} Golay sequence, then $\pi/2$ rotated to produce 8192 chips at $F_c = 1760$ MHz.

Reference: Samples 1 to 8192 of the file **CPHY_Header and Payload samples.txt**

I.5.3 DMG control mode payload

The DMG control mode payload coding and modulation are shown in Figure I-3.

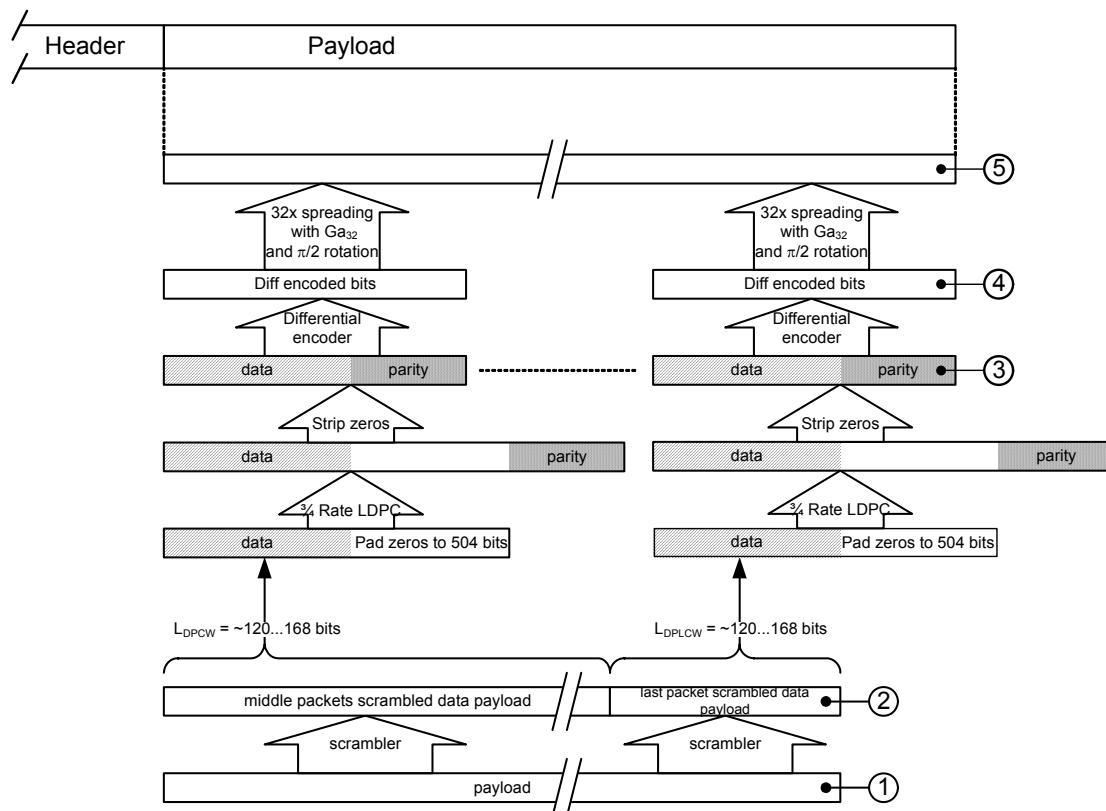

Figure I-3—DMG control mode payload coding and modulation

I.5.3.1 DMG control mode payload bits

Figure I-3 node ①.

Reference: Bits 89 to 1000 of the file **CPHY_Header and Payload bits.txt**

I.5.3.2 DMG control mode scrambled payload bits

Figure I-3 node ②.

Reference: Bits 89 to 1000 of the file **CPHY_Scrambled Header and Payload bits.txt**

I.5.3.3 DMG control mode LDPC encoded payload bits

Figure I-3 node ③.

Reference: Bits 257 to 2176 of the file **CPHY_LDPC Encoded Header and Payload bits.txt**

I.5.3.4 DMG control mode differentially encoded payload symbols

Figure I-3 node ④.

Reference: Symbols 257 to 2176 of the file **CPHY_Diff Encoded Header and Data symbols.txt**

I.5.3.5 DMG control mode payload samples

Figure I-3 node ⑤.

In this example, the 320 differentially encoded bipolar symbol values from each of the 6 payload bearing LDPC codewords, including the last one, gives a total of $6 \times 320 = 1920$ symbols which are then spread using the Ga_{32} Golay sequence and $\pi/2$ rotated to produce 61 440 chips at $F_c = 1.76$ GHz.

Reference: Samples 8193 to 69 632 of the file **CPHY_Header and Payload samples.txt**

I.6 DMG Example 2 – DMG SC mode encoding

I.6.1 DMG SC mode preamble

The DMG SC mode preamble Short Training field (STF) and Channel Estimation field (CEF) are each constructed from a concatenation of real valued bipolar Golay sequences that is $\pi/2$ -BPSK modulated, as shown in Figure I-4.

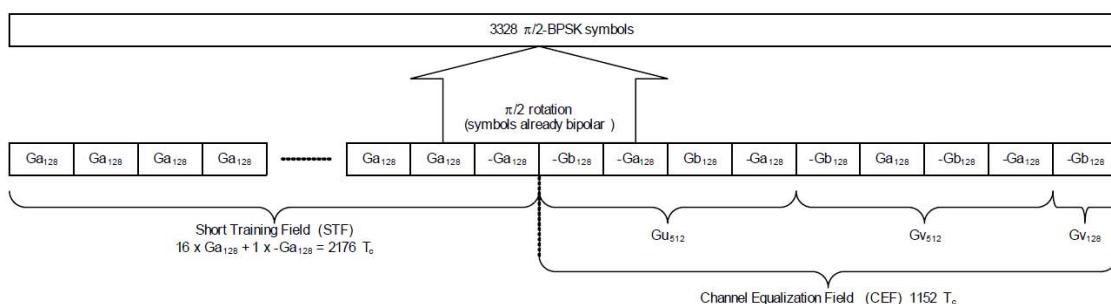

Figure I-4—DMG SC mode preamble expressed in Ga_{128} and Gb_{128} sequences

The preamble is 3328 samples long.

Reference: **SCPHY_Preamble Samples.txt**

I.6.2 DMG SC mode header

The DMG SC mode header coding and modulation are shown in Figure I-5.

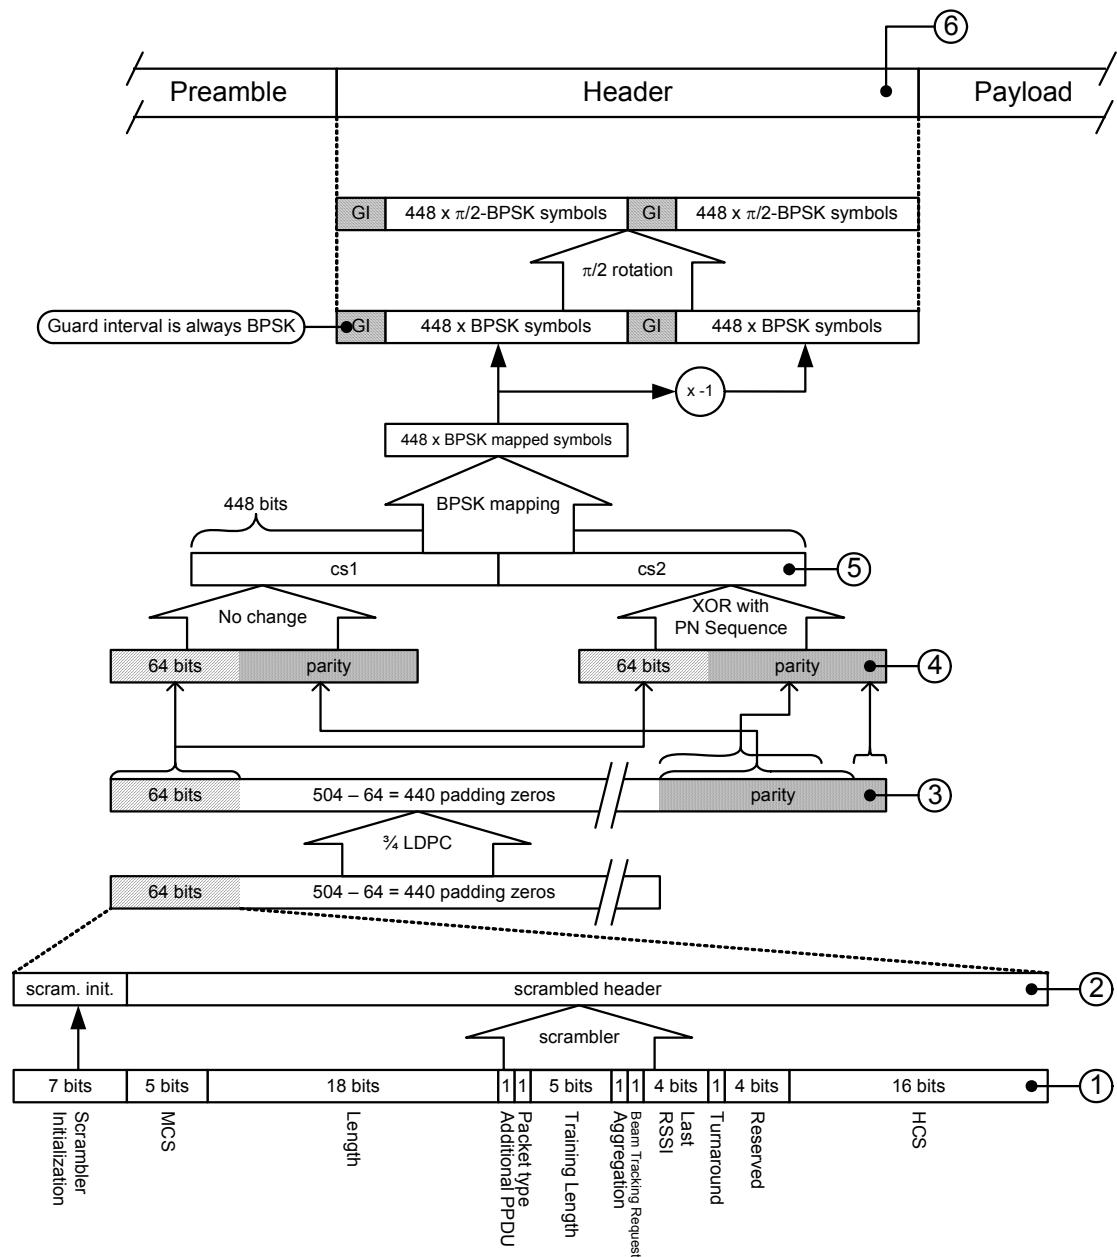

Figure I-5—DMG SC mode header coding and modulation

I.6.2.1 DMG SC control header bits

Figure I-5 node ①. The 8 octets of header data. For this example, the control SC mode header bit fields are set as listed in Table I-44.

Table I-44—DMG SC control header settings

| Field | Value |
|--------------------------|-------|
| Scrambler Initialization | 66 |
| MCS | 2 |
| Length | 1000 |
| Additional PPDU | 0 |
| Packet Type | 0 |
| Training Length | 0 |
| Aggregation | 0 |
| Beam Tracking Request | 0 |
| Last RSSI | 0 |
| Turnaround | 0 |
| Reserved bits | 0 |

Reference: [SCPHY_MCS2_Header bits.txt](#)

I.6.2.2 DMG SC mode scrambled header bits

Figure I-5 node ②. The header bits after scrambling bits 8 to 64 of the header using the seed 66 (0x42).

Reference: [SCPHY_MCS2_Scrambled Header bits.txt](#)

I.6.2.3 DMG SC mode LDPC encoded header bits

Figure I-5 node ③. The scrambled header data after LDPC encoding but prior to zero stripping.

Reference: [SCPHY_MCS2_LDPC Encoded Header bits.txt](#)

I.6.2.4 DMG SC mode LDPC data shortened bits

Figure I-5 node ④. The dimension of DMG SC mode modulation blocks requires that the CS1 and CS2 sequences are each 224 bits long; this in turn requires that, in addition to the zeros, some of the parity bits are discarded in order to shorten the LDPC codewords to 224 bits.

The data for the second shortened LDPC codeword is given as they are before they are scrambled to provide CS2.

Reference: [SCPHY_MCS2_Shortened LDPC for CS1 bits.txt](#)

Reference: [SCPHY_MCS2_Shortened LDPC for CS2 bits.txt](#)

I.6.2.5 DMG SC mode CS1/CS2 sequence bits

Figure I-5 node ⑤. The 448 bit concatenated CS1/CS2 sequence including the PN scrambling of CS2.

Reference: [SCPHY_MCS2_Final CS1 CS2 Sequence bits.txt](#)

I.6.2.6 DMG SC mode header samples

Figure I-5 node ⑥. The fully modulated signal after BPSK mapping, duplication (with negation), guard interval addition and $\pi/2$ rotation are applied.

The 448 header bits are BPSK mapped to 448 modulation symbols and increased to 512 symbols by the addition of a 64 symbol guard interval. A second, negated, copy of the 448 modulation symbols is also increased to 512 symbols by the addition of a 64 symbol guard interval. The two 512 symbol blocks are concatenated and $\pi/2$ rotated to create 1024 samples.

Reference: [SCPHY_MCS2_Header Samples.txt](#)

I.6.3 DMG SC mode payload

The DMG SC mode payload coding and modulation are shown in Figure I-6 (for MCS1) and Figure I-7 (for MCS2–MCS12).

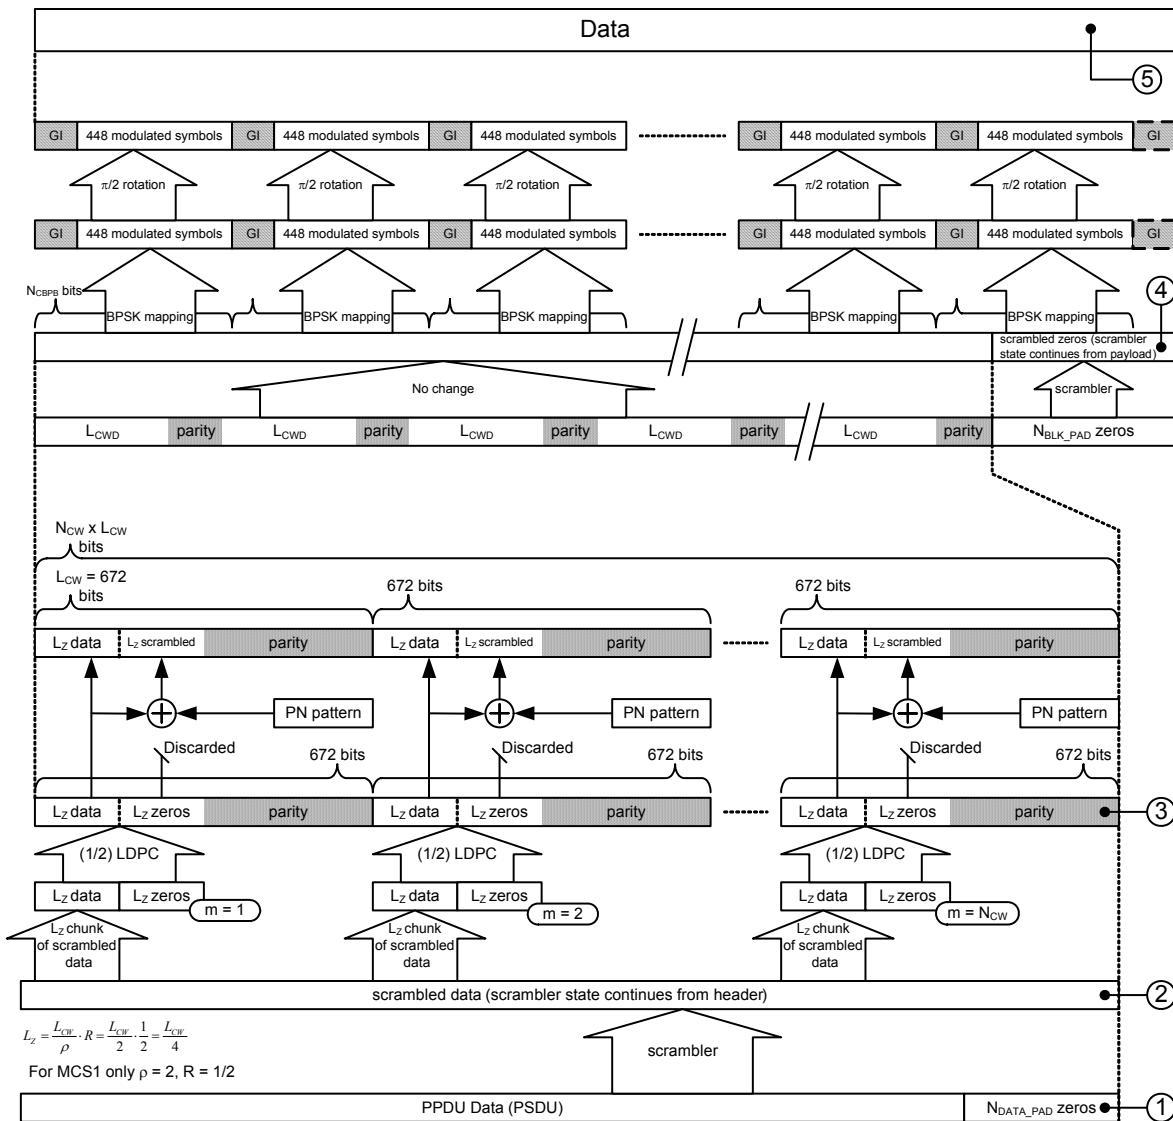

Figure I-6—DMG SC mode MCS1 payload coding and modulation

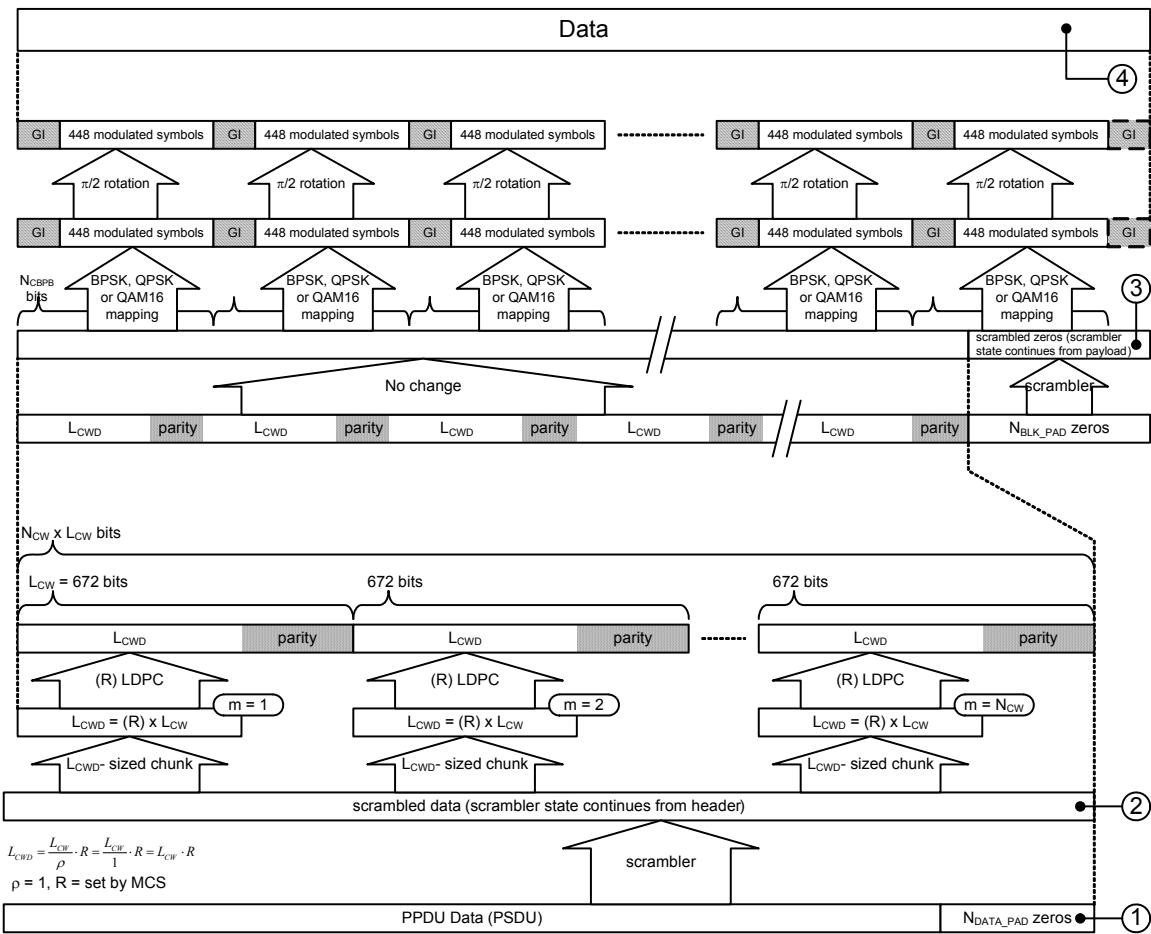

Figure I-7—DMG SC mode MCS2—MCS12 payload coding and modulation

I.6.3.1 DMG SC mode MCS1 payload

I.6.3.1.1 Payload bits

Figure I-6 node ①. The payload at node ① is a count, modulo 256, starting at 0.

For MCS1 each rate 1/2 LDPC codeword encodes 168 bits (with $\rho = 2$ repetition) so the payload padding calculation gives $N_{CW} = 48$ and $N_{DATA_PAD} = 64$.

There are $1000 \times 8 = 8000$ payload bits plus 64 padding bits giving a total of 8 064 bits.

Reference: [SCPHY_MCS1_Payload bits.txt](#)

I.6.3.1.2 Scrambled payload bits

Figure I-6 node ②. All 8 064 bits are scrambled according to a scrambler initialization value of 66.

Reference: [SCPHY_MCS1_Scrambled Payload bits.txt](#)

I.6.3.1.3 Rate 1/2 LDPC encoded bits before scrambled duplication

Figure I-6 node ③. The rate 1/2 LDPC encoding of each block of $L_z = 168$ scrambled payload bits plus $L_z = 168$ padding zero bits. In this example, the 8064 actual payload bits are doubled, by repetition, to an effective payload of 16 128 bits, then doubled again to 32 256 bits by LDPC encoding.

This node, unique to MCS1, is the raw LDPC encoded payload bits before scrambled duplication.

Reference: [SCPHY_MCS1_LDPC Encoder Output bits.txt](#)

I.6.3.1.4 Rate 1/2 LDPC encoded bits after scrambled duplication

Figure I-6 node ④. The LDPC codewords after the $L_z = 168$ zeros have been replaced by the $L_z = 168$ re-scrambled data octets. The data at this node also includes the appended N_{BLK_PAD} scrambled zeros; however, in this example, $N_{BLK_PAD} = 0$, so there are still 32 256 bits.

Each 448 bits in the reference file is the $N_{CBPB} = 448$ bits required to build a modulation block of the MCS1 payload.

Reference: [SCPHY_MCS1_LDPC Encoded Payload Bits.txt](#)

I.6.3.1.5 Payload samples

Figure I-6 node ⑤. The modulated signal after BPSK mapping, guard interval addition and $\pi/2$ rotation has been applied.

In this example, the 32 256 encoded bits are divided into 72×448 bit blocks. BPSK mapping converts this to 72×448 modulation symbols which the guard interval increases to 72×512 modulation symbols. When the closing 64-symbol guard interval is added, it results in a total of $72 \times 512 + 64 = 36\,928$ payload samples.

Reference: [SCPHY_MCS1_Payload Samples.txt](#)

I.6.3.2 DMG SC mode MCS5 payload

I.6.3.2.1 Payload bits

Figure I-7 node ①. The payload at node ① is a count, modulo 256, starting at 0.

For MCS5 each rate 13/16 LDPC codeword encodes 546 bits so the payload padding calculation gives $N_{CW} = 15$ and $N_{DATA_PAD} = 190$.

There are $1000 \times 8 = 8000$ payload bits plus 190 padding bits giving a total of 8 190 bits.

Reference: [SCPHY_MCS5_Payload bits.txt](#)

I.6.3.2.2 Scrambled payload bits

Figure I-7 node ②. All 8 190 bits are scrambled according to a scrambler initialization value of 66.

Reference: [SCPHY_MCS5_Scrambled Payload bits.txt](#)

I.6.3.2.3 Rate 13/16 LDPC encoded payload bits

Figure I-6 node ③. The rate 13/16 LDPC encoding of each block of $L_{CWD} = 546$ scrambled payload bits. In this example, the 8 190 payload bits are increased to 10 080 bits by the LDPC encoding.

The data at this node also includes the appended N_{BLK_PAD} scrambled zeros. In this example, $N_{BLK_PAD} = 224$, so the total number of bits is $10\ 080 + 224 = 10\ 304$.

Reference: [SCPHY_MCS5_LDPC Encoded Payload Bits.txt](#)

I.6.3.2.4 Payload samples

Figure I-7 node ④. The modulated signal after BPSK mapping, guard interval addition and $\pi/2$ rotation has been applied.

In this example, the 10 304 encoded bits are divided into 23×448 bit blocks. BPSK mapping converts this to 23×448 modulation symbols which the guard interval increases to 23×512 modulation symbols. When the closing 64-symbol guard interval is added, it results in a total of $23 \times 512 + 64 = 11\ 840$ payload samples.

Reference: [SCPHY_MCS5_Payload Samples.txt](#)

I.6.3.3 DMG SC mode MCS7 payload

I.6.3.3.1 Payload bits

Figure I-7 node ①. The payload at node ① is a count, modulo 256, starting at 0.

For MCS7 each rate 5/8 LDPC codeword encodes 420 bits so the payload padding calculation gives $N_{CW} = 20$ and $N_{DATA_PAD} = 400$.

There are $1000 \times 8 = 8000$ payload bits plus 400 padding bits giving a total of 8 400 bits.

Reference: [SCPHY_MCS7_Payload bits.txt](#)

I.6.3.3.2 Scrambled payload bits

Figure I-6 node ②. All 8 400 bits are scrambled according to a scrambler initialization value of 66.

Reference: [SCPHY_MCS7_Scrambled Payload bits.txt](#)

I.6.3.3.3 Rate 5/8 LDPC encoded payload bits

Figure I-7 node ③. The rate 5/8 LDPC encoding of each block of $L_{CWD} = 420$ scrambled payload bits. In this example, the 8 400 payload bits are increased to 13 440 bits by the LDPC encoding.

The data at this node also includes the appended N_{BLK_PAD} scrambled zeros. In this example, $N_{BLK_PAD} = 0$, so there are still a total of 13 440 bits.

Reference: [SCPHY_MCS7_LDPC Encoded Payload Bits.txt](#)

I.6.3.3.4 Payload samples

Figure I-7 node ④. The modulated signal after QPSK mapping, guard interval addition and $\pi/2$ rotation has been applied.

In this example, the 13 440 encoded bits are divided into 15×896 bit blocks. QPSK mapping converts this to 15×448 modulation symbols which the guard interval increases to 15×512 modulation symbols. When the closing 64-symbol guard interval is added, it results in a total of $15 \times 512 + 64 = 7\,744$ payload samples.

Reference: [SCPHY_MCS7_Payload Samples.txt](#)

I.6.3.4 DMG SC mode MCS12 payload

I.6.3.4.1 Payload bits

Figure I-7 node ①. The payload at node ① is a count, modulo 256, starting at 0.

For MCS12 each rate 3/4 LDPC codeword encodes 504 bits so the payload padding calculation gives $N_{CW} = 16$ and $N_{DATA_PAD} = 64$.

There are $1000 \times 8 = 8000$ payload bits plus 64 padding bits giving a total of 8 064 bits.

Reference: [SCPHY_MCS12_Payload bits.txt](#)

I.6.3.4.2 Scrambled payload bits

Figure I-7 node ②. All 8 064 bits are scrambled according to a scrambler initialization value of 66.

Reference: [SCPHY_MCS12_Scrambled Payload bits.txt](#)

I.6.3.4.3 Rate 3/4 LDPC encoded payload bits

Figure I-7 node ③. The rate 3/4 LDPC encoding of each block of $L_{CWD} = 504$ scrambled payload bits. In this example, the 8 064 payload bits are increased to 10 752 bits by the LDPC encoding.

The data at this node also includes the appended N_{BLK_PAD} scrambled zeros. In this example, $N_{BLK_PAD} = 0$, so there are still a total of 10 752 bits.

Reference: [SCPHY_MCS12_LDPC Encoded Payload Bits.txt](#)

I.6.3.4.4 Payload samples

Figure I-7 node ④. The modulated signal after 16-QAM mapping, guard interval addition and $\pi/2$ rotation has been applied.

In this example, the 10 752 encoded bits are divided into $6 \times 1\,792$ bit blocks. 16-QAM mapping converts this to 6×448 modulation symbols which the guard interval increases to 6×512 modulation symbols. When the closing 64-symbol guard interval is added, it results in a total of $6 \times 512 + 64 = 3\,136$ payload samples.

Reference: [SCPHY_MCS12_Payload Samples.txt](#)

I.7 DMG Example 3 – DMG OFDM mode encoding

I.7.1 DMG OFDM mode preamble

Figure I-8 illustrates that the DMG OFDM mode preamble is similar to the DMG SC mode preamble, but with the Gu_{512} and Gv_{512} parts of the CEF reversed. It is also resampled from 1.76 GSa/s to 2.64 GSa/s using the specified process of interpolation, resampling, and decimation.

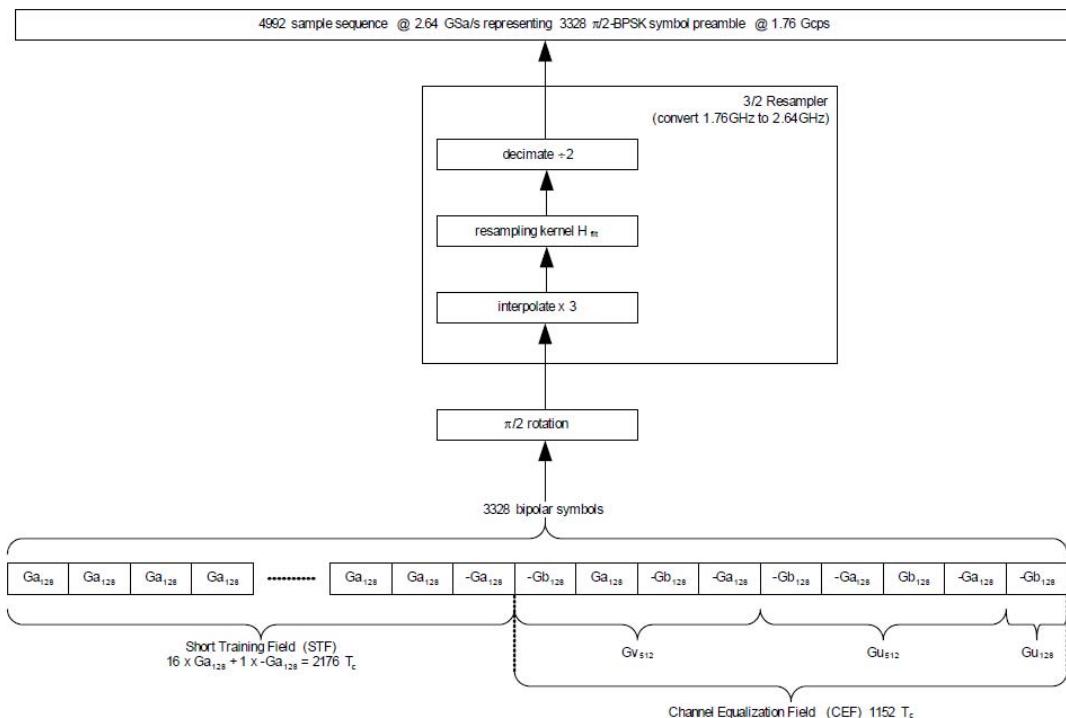

Figure I-8—DMG OFDM mode preamble

Thus the DMG OFDM mode preamble sample count increases from 3 328 to 4 992.

Reference: **OFDMPHY_Preamble Samples.txt**

I.7.2 DMG OFDM mode header

The DMG OFDM mode header coding is shown in Figure I-9.

I.7.2.1 DMG OFDM mode header bits

Figure I-9 node ①. The 8 octets of header data.

For this example, the DMG OFDM mode header bit fields are set as listed in Table I-45.

I.7.2.5 DMG OFDM mode CS1/CS2/CS3 sequence bits

Figure I-9 node ⑤. The 672 bit concatenated CS1/CS2/CS3 sequence including the PN scrambling of CS2 and CS3.

Reference: **OFDMPHY_MCS13_Final CS1 CS2 CS3 Sequence bits.txt**

I.7.3 DMG OFDM mode header modulation

The DMG OFDM mode header modulation is shown in Figure I-10.

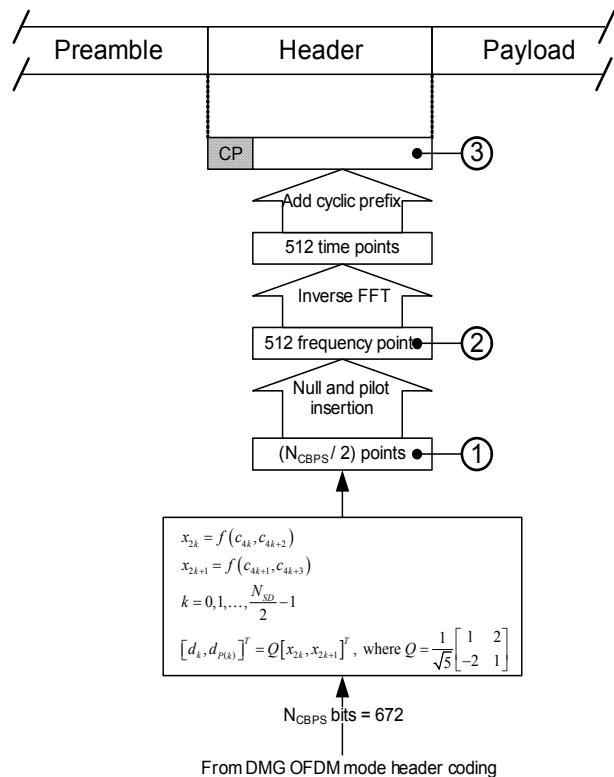

Figure I-10—DMG OFDM mode header modulation

I.7.3.1 Constellation mapped data points

Figure I-10 node ①. The LDPC encoded data is converted in the specified manner to 336 QPSK constellation point values prior to assignment to data carriers (in the same order as the data they were derived from). Note that because of the action of the Q matrix, these points look like 16-QAM when plotted.

Reference: Samples 1 to 336 of the file **OFDMPHY_MCS13_Constellation Mapped Data Points.txt**

I.7.3.2 IFFT input samples including data, pilot, DC and null carriers

Figure I-10 node ②. At this node the data points have been mapped to the data carriers, the pilots, DC and null carriers have been assigned, and the resulting 512 point frequency domain vector is in the correct order for input to the inverse Fourier transform, i.e., with positive frequencies in the first 256 locations and negative frequencies in the second 256 locations.

Reference: Samples 1 to 512 of the file **OFDMPHY_MCS13_FFT Input Samples.txt**

I.7.3.3 Header samples

Figure I-10 node ③. At this node the signal has been inverse Fourier transformed to produce a time record and the cyclic prefix has been appended to create the 640 sample OFDM symbol.

Reference: [OFDMPHY_MCS13_Header Samples.txt](#)

I.7.4 DMG OFDM mode payload coding

As illustrated in Figure I-11, the LDPC encoding for the DMG OFDM mode case is identical to the DMG SC mode case, so no additional LDPC vectors are strictly necessary. However, the equations for computing the zero padding at the end of the payload are different from the DMG SC mode case so bit vectors for nodes 1, 2, and 3 are provided.

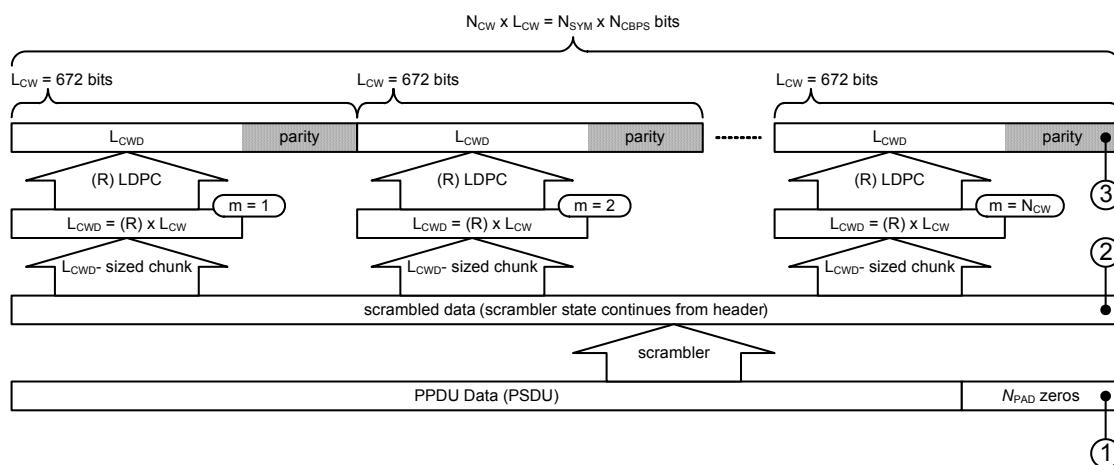

Figure I-11—DMG OFDM mode payload coding

I.7.5 DMG OFDM mode MCS14 payload modulation

The DMG OFDM mode SQPSK payload modulation is shown in Figure I-12.

I.7.5.1 Payload bits

Figure I-11 node ①. The payload comprises 1000×8 bits. With $N_{CBPS} = 336$ and rate 5/8 LDPC coding the DMG OFDM mode zero padding $N_{PAD} = 400$, so the padded payload comprises 8 400 bits.

Reference: [OFDMPHY_MCS14_Payload bits.txt](#)

I.7.5.2 Scrambled payload bits

Figure I-11 node ②. All 8 400 bits are scrambled according to a scrambler initialization value of 66.

Reference: [OFDMPHY_MCS14_Scrambled Payload bits.txt](#)

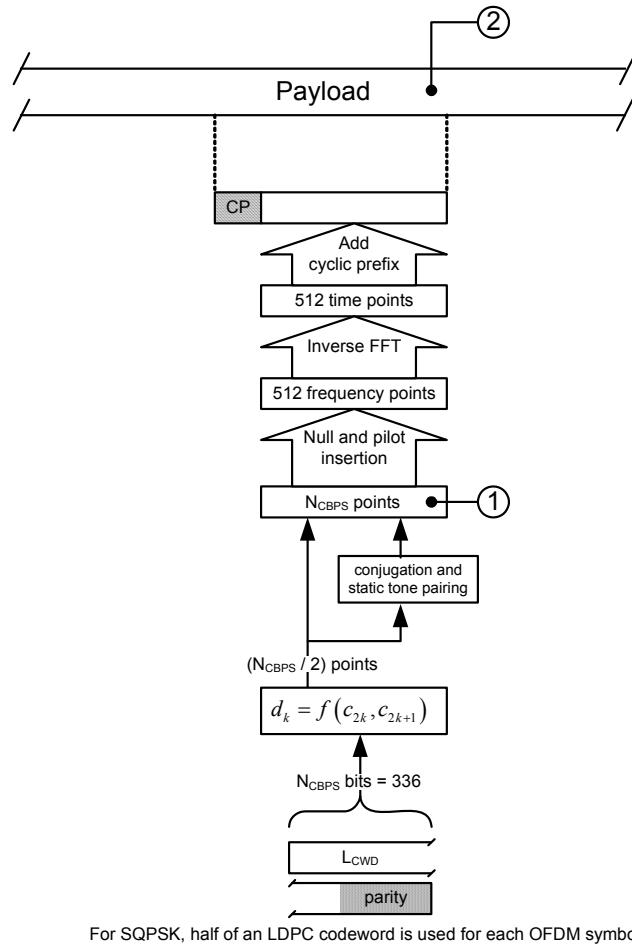

Figure I-12—DMG OFDM mode SQPSK payload modulation

I.7.5.3 LDPC encoded payload bits

Figure I-11 node ③. For this example, with $N_{CBPS} = 336$ and rate 5/8 LDPC coding there are 20 LDPC codewords or $20 \times 672 = 13\,440$ bits at this node.

Reference: [OFDMPHY_MCS14_LDPC Encoded Payload bits.txt](#)

I.7.5.4 SQPSK constellation mapped data points

Figure I-12 node ①. For SQPSK modulation, each block of $N_{CBPS} = 336$ LDPC encoded bits is converted in the specified manner to 168 QPSK constellation point values and their complex conjugates prior to assignment to data carriers, in the same order as the data they were derived from.

There are 336 constellation points for each block of 336 LDPC encoded bits, so there are 40 sets of 336 constellation points (13 440 point in total) at this node.

Reference:

Samples 337 to 13 776 of the file [OFDMPHY_MCS14_Constellation Mapped Data Points.txt](#)

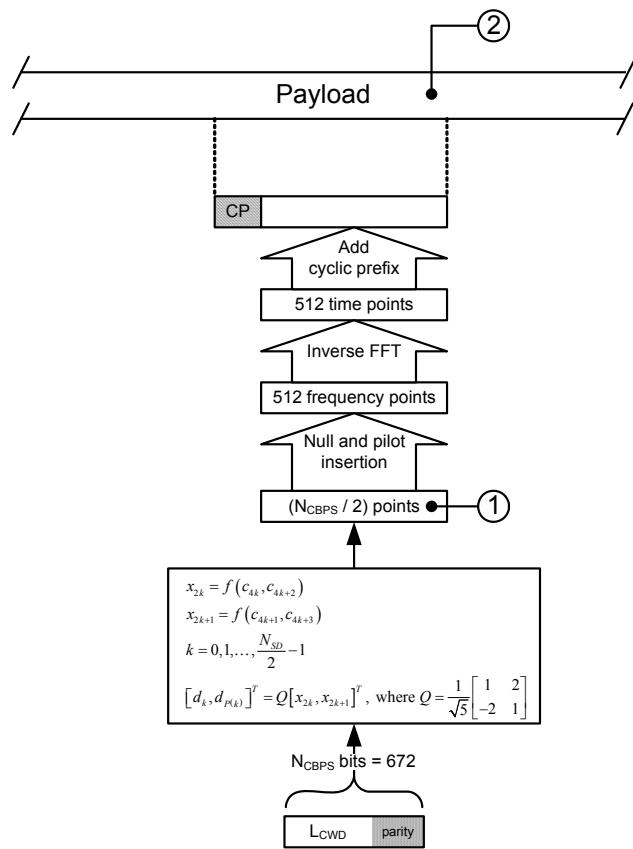

I.7.5.5 Payload samples

Figure I-12 node ②. Each set of 336 constellation points is mapped to 512 frequency domain points then inverse Fourier transformed to 512 time domain points; adding the cyclic prefix creates a 640 sample OFDM symbol. There are 40 OFDM symbols in this example payload, giving a total of $40 \times 640 = 25\,600$ samples.

Reference: **OFDMPHY_MCS14_Payload Samples.txt**

I.7.6 DMG OFDM mode MCS17 payload modulation

The DMG OFDM mode QPSK payload modulation is shown in Figure I-13.

For QPSK, 1 LDPC codeword is used for each OFDM symbol

Figure I-13—DMG OFDM mode QPSK payload modulation

I.7.6.1 Payload bits

Figure I-11 node ①. The payload comprises 1000×8 bits. With $N_{CBPS} = 672$ and rate 3/4 LDPC coding the DMG OFDM mode zero padding $N_{PAD} = 64$, so the padded payload comprises 8 064 bits.

Reference: **OFDMPHY_MCS17_Payload bits.txt**

I.7.6.2 Scrambled payload bits

Figure I-11 node ②. All 8 064 bits are scrambled according to a scrambler initialization value of 66.

Reference: **OFDMPHY_MCS17_Scrambled Payload bits.txt**

I.7.6.3 LDPC encoded payload bits

Figure I-11 node ③. For this example, with $N_{CBPS} = 672$ and rate 3/4 LDPC coding there are 16 LDPC codewords or $16 \times 672 = 10\,752$ bits at this node.

Reference: **OFDMPHY_MCS17_LDPC Encoded Payload bits.txt**

I.7.6.4 QPSK constellation mapped data points

Figure I-13 node ①. For QPSK modulation, each block of $N_{CBPS} = 672$ LDPC encoded bits is converted in the specified manner to 336 QPSK constellation point values prior to assignment to data carriers, in the same order as the data they were derived from.

There are 336 constellation points for each block of 672 LDPC encoded bits, so there are 16 sets of 336 constellation points (5 376 point in total) at this node.

Reference:

Samples 337 to 5 712 of the file **OFDMPHY_MCS17_Constellation Mapped Data Points.txt**

I.7.6.5 Payload samples

Figure I-13 node ②. Each set of 336 constellation points is mapped to 512 frequency domain points then inverse Fourier transformed to 512 time domain points; adding the cyclic prefix creates a 640 sample OFDM symbol. There are 16 OFDM symbols in this example payload giving a total of $16 \times 640 = 10\,240$ samples.

Reference: **OFDMPHY_MCS17_Payload Samples.txt**

I.7.7 DMG OFDM mode MCS19 payload modulation

The DMG OFDM mode 16-QAM payload modulation is shown in Figure I-14.

I.7.7.1 Payload bits

Figure I-11 node ①. The payload comprises 1000×8 bits. With $N_{CBPS} = 1\,344$ and rate 5/8 LDPC coding the DMG OFDM mode zero padding $N_{PAD} = 400$, so the padded payload comprises 8 400 bits.

Reference: **OFDMPHY_MCS19_Payload bits.txt**

I.7.7.2 Scrambled payload bits

Figure I-11 node ②. All 8 400 bits are scrambled according to a scrambler initialization value of 66.

Reference: **OFDMPHY_MCS19_Scrambled Payload bits.txt**

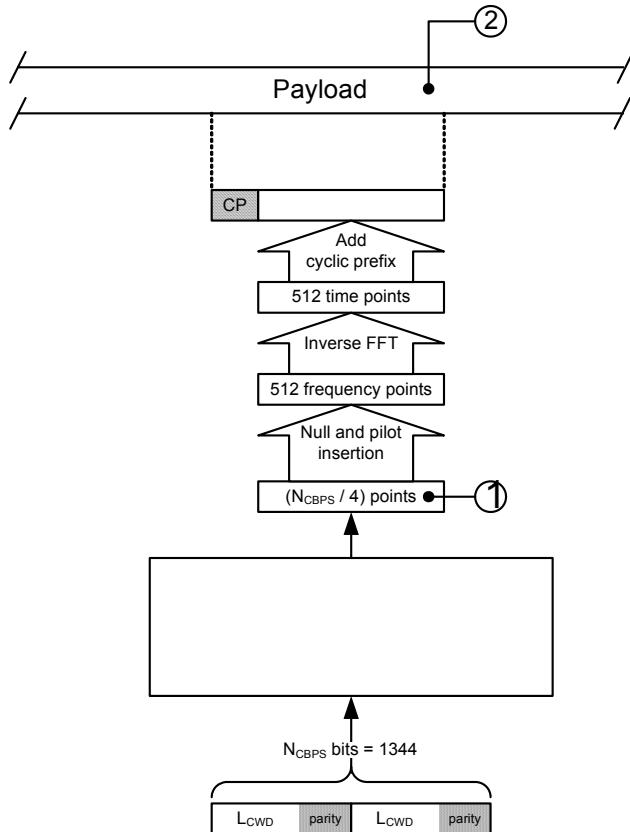

Figure I-14—DMG OFDM mode 16-QAM payload modulation

I.7.7.3 LDPC encoded payload bits

Figure I-11 node ③. For this example, with $N_{CBPS} = 1\,344$ and rate 5/8 LDPC coding there are 20 LDPC codewords or $20 \times 672 = 13\,440$ bits at this node.

Reference: **OFDMPHY_MCS19_LDPC Encoded Payload bits.txt**

I.7.7.4 16-QAM constellation mapped data points

Figure I-14 node ①. For 16-QAM modulation, each block of $N_{CBPS} = 1\,344$ LDPC encoded bits is converted in the specified manner to 336 16-QAM constellation point values prior to assignment to data carriers, in the same order as the data they were derived from.

There are 336 constellation points for each block of 1 344 LDPC encoded bits, so there are 10 sets of 336 constellation points (3360 points in total) at this node.

Reference:

Samples 337 to 3 696 of the file **OFDMPHY_MCS19_Constellation Mapped Data Points.txt**

I.7.7.5 Payload samples

Figure I-14 node ②. Each set of 336 constellation points is mapped to 512 frequency domain points then inverse Fourier transformed to 512 time domain points; adding the cyclic prefix creates a 640 sample OFDM symbol. There are 10 OFDM symbols in this example payload giving a total of $10 \times 640 = 6\,400$ samples.

Reference: **OFDMPHY_MCS19_Payload Samples.txt**

I.7.8 DMG OFDM mode MCS23 payload modulation

The DMG OFDM mode 64-QAM payload modulation is shown in Figure I-15.

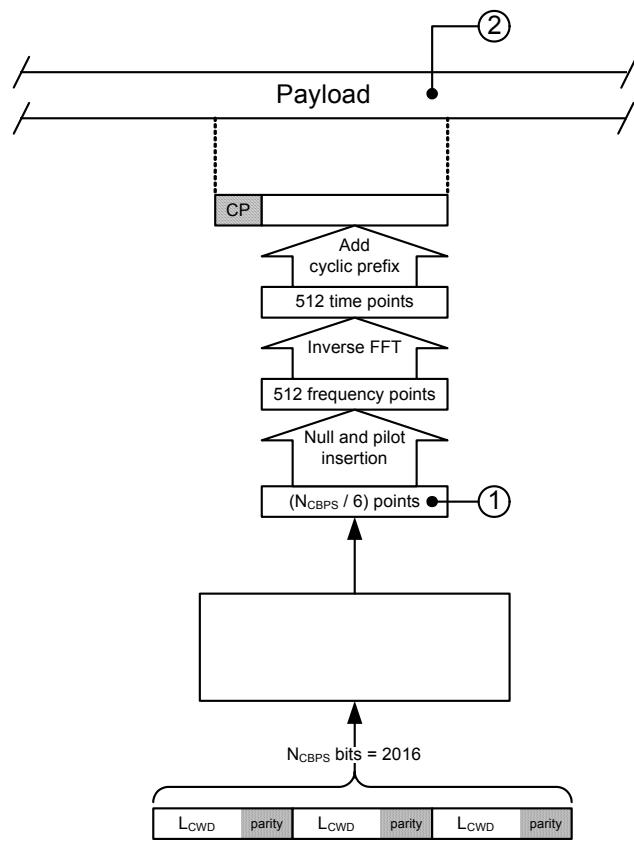

Figure I-15—DMG OFDM mode 64-QAM payload modulation

I.7.8.1 Payload bits

Figure I-11 node ①. The payload comprises 1000×8 bits. With $N_{CBPS} = 2\,016$ and rate 3/4 LDPC coding the DMG OFDM mode zero padding $N_{PAD} = 1\,072$, so the padded payload comprises 9 072 bits.

Reference: **OFDMPHY_MCS23_Payload bits.txt**

I.7.8.2 Scrambled payload bits

Figure I-11 node ②. All 9 072 bits are scrambled according to a scrambler initialization value of 66.

Reference: **OFDMPHY_MCS23_Scrambled Payload bits.txt**

I.7.8.3 LDPC encoded bits

Figure I-11 node ③. For this example, with $N_{CBPS} = 2\,016$ and rate 3/4 LDPC coding there are 18 LDPC codewords or $18 \times 672 = 12\,096$ bits at this node.

Reference: **OFDMPHY_MCS23_LDPC Encoded Payload bits.txt**

I.7.8.4 64-QAM constellation mapped data points

Figure I-15 node ①. For 64-QAM modulation, each block of $N_{CBPS} = 2\,016$ LDPC encoded bits is converted in the specified manner to 336 64-QAM constellation point values prior to assignment to data carriers, in the same order as the data they were derived from.

There are 336 constellation points for each block of 2 016 LDPC encoded bits, so there are 6 sets of 336 constellation points (2 016 points in total) at this node.

Reference:

Samples 337 to 2352 of the file **OFDMPHY_MCS23_Constellation Mapped Data Points.txt**

I.7.8.5 Payload samples

Figure I-15 node ②. Each set of 336 constellation points is mapped to 512 frequency domain points then inverse Fourier transformed to 512 time domain points; adding the cyclic prefix creates a 640 sample OFDM symbol. There are 6 OFDM symbols in this example payload giving a total of $6 \times 640 = 3\,840$ samples.

Reference: **OFDMPHY_MCS23_Payload Samples.txt**

I.8 DMG Example 4 – DMG low-power SC mode encoding

I.8.1 DMG low-power SC mode preamble

The DMG low-power SC mode preamble is identical to the DMG SC mode preamble.

I.8.2 DMG low-power SC mode header

The DMG low-power SC mode header fields are the same as the DMG SC mode header fields. The DMG low-power SC mode header is encoded and modulated in the same way as the DMG SC mode header.

I.8.3 DMG low-power SC mode MCS26 payload

The DMG low-power SC mode payload coding and modulation are shown in Figure I-16.

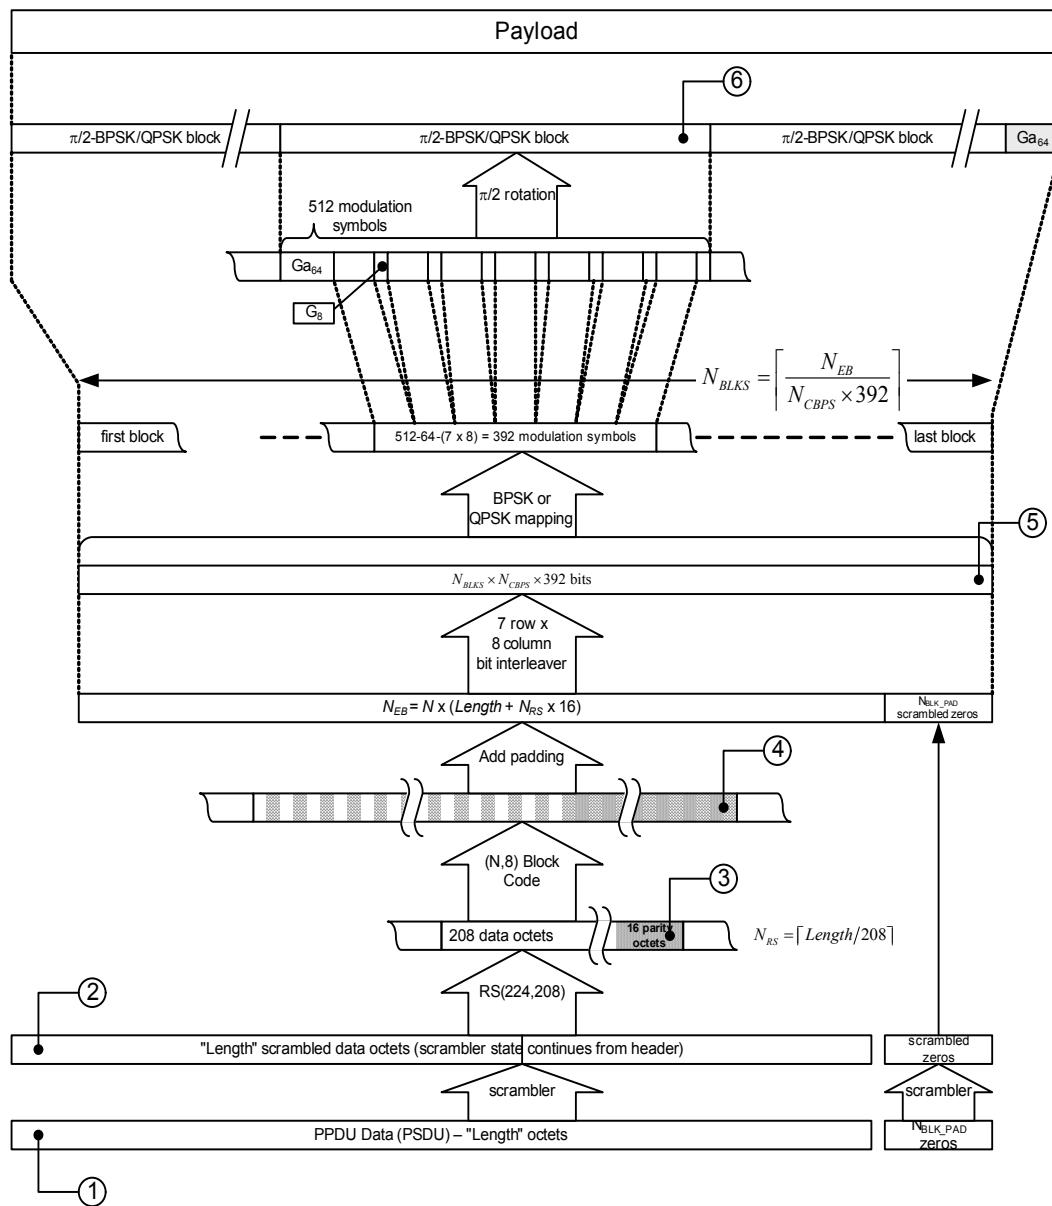

Figure I-16—DMG low-power SC mode payload coding and modulation

I.8.3.1 Payload bits

Figure I-16 node ①. The payload at node is a count, modulo 256, starting at 0.

For MCS26, the DMG low-power SC mode payload padding calculation gives $N_{DATA_PAD} = 368$; however, unlike the other modes, this padding data is not appended before FEC computation.

So there are just $1000 \times 8 = 8000$ payload bits.

Reference: [LPSCPHY_MCS26_Payload bits.txt](#)

I.8.3.2 Scrambled payload bits

Figure I-16 node ②. All 8000 bits are scrambled according to a scrambler initialization value of 66.

Reference: [LPSCPHY_MCS26_Scrambled Payload bits.txt](#)

I.8.3.3 RS(224,208) encoded payload bits

Figure I-16 node ③. In this example, there are 4 RS(224,208) codewords and one shortened RS(184,168) codeword, giving a total of $(4 \times 224 + 1 \times 184) \times 8 = 8\,640$ bits at this node.

Reference: [LPSCPHY_MCS26_RS\(224,208\) Output bits.txt](#)

I.8.3.4 (12,8) block coded payload bits

Figure I-16 node ④. The (12,8) block coder increases the effective bits from 8 640 to 12 960.

Reference: [LPSCPHY_MCS26_Block Coded Payload bits.txt](#)

I.8.3.5 Interleaved payload bits

Figure I-16 node ⑤. Before interleaving the block coder output is padded with $N_{DATA_PAD} = 368$ scrambled zeros to give 13 328 bits (34 x 392). The interleaver then redistributes these bits in time, as specified.

Reference: [LPSCPHY_MCS26_RS Encoded and Interleaved Payload bits.txt](#)

I.8.3.6 Payload samples

Figure I-16 node ⑥. Each block of 392 bits from the interleaver output is BPSK mapped to 392 modulation symbols, prepended with a Ga_{64} sequence as a guard interval and punctuated by G_8 (last 8 samples of Ga_{64}) guard intervals, then $\pi/2$ rotated, thus resulting in a 512 symbol $\pi/2$ -BPSK modulation block.

In this example, there are 34 modulation blocks and, as specified, the last one is followed by a terminating Ga_{64} guard interval sequence, so there are $34 \times 512 + 64 = 17\,472$ samples at this node.

Reference: [LPSCPHY_MCS26_Payload Samples.txt](#)

I.8.4 DMG low-power SC mode MCS30 payload

I.8.4.1 Payload bits

Figure I-16 node ①. The payload at node is a count, modulo 256, starting at 0.

For MCS30, the DMG low-power SC mode payload padding calculation gives $N_{DATA_PAD} = 472$; however, unlike the other modes, this padding data is not appended before FEC computation.

So there are just $1000 \times 8 = 8000$ payload bits.

Reference: [LPSCPHY_MCS30_Payload bits.txt](#)

I.8.4.2 Scrambled payload bits

Figure I-16 node ②. All 8000 bits are scrambled according to a scrambler initialization value of 66.

Reference: [LPSCPHY_MCS30_Scrambled Payload bits.txt](#)

I.8.4.3 RS(224,208) encoded payload bits

Figure I-16 node ③. In this example, there are 4 RS(224,208) codewords and one shortened RS(184,168) codeword, giving a total of $(4 \times 224 + 1 \times 184) \times 8 = 8\,640$ bits at this node.

Reference: [LPSCPHY_MCS30_RS\(224,208\) Output bits.txt](#)

I.8.4.4 Spc(9,8) block coded payload bits

Figure I-16 node ④. The (9,8) block coder increases the effective bits from 8 640 to 9 720.

Reference: [LPSCPHY_MCS30_Block Coded Payload bits.txt](#)

I.8.4.5 Interleaved payload bits

Figure I-16 node ⑤. Before interleaving the block coder output is padded with $N_{DATA_PAD} = 472$ scrambled zeros to give 10 192 bits (26×392). The interleaver then redistributes these bits in time, as specified.

Reference: [LPSCPHY_MCS30_RS Encoded and Interleaved Payload bits.txt](#)

I.8.4.6 Payload samples

Figure I-16 node ⑥. Each block of 784 bits from the interleaver output is QPSK mapped to 392 modulation symbols, prepended with a Ga_{64} sequence as a guard interval and punctuated by G_8 (last 8 samples of Ga_{64}) guard intervals, then $\pi/2$ rotated, thus resulting in a 512 symbol $\pi/2$ -BPSK modulation block.

In this example, there are 13 modulation blocks and, as specified, the last one is followed by a terminating Ga_{64} guard interval sequence, so there are $13 \times 512 + 64 = 6\,720$ samples at this node.

Reference: [LPSCPHY_MCS30_Payload Samples.txt](#)

Annex J

(informative)

RSNA reference implementations and test vectors

J.1 TKIP temporal key mixing function reference implementation and test vector

J.1.1 TKIP temporal key mixing function reference implementation

This clause provides a C-language reference implementation of the temporal key mixing function.

* Routine: SanityCheckTable -- verify Sbox properties
*
* Inputs: Sbox
* Output: None, but an assertion fails if the tables are wrong
* Notes:
*   The purpose of this routine is solely to illustrate and
```

```
*   verify the following properties of the Sbox table:  
*       - the Sbox is a "2x2" subset of the AES table:  
*           Sbox + affine transform + MDS.  
*       - the Sbox table can be easily designed to fit in a  
*           512-byte table, using a byte swap  
*       - the Sbox table can be easily designed to fit in a  
*           256-byte table, using some shifts and a byte swap  
*****

J.2 Michael reference implementation and test vectors

J.2.1 Michael test vectors

J.2.1.1 Introduction

Test vectors are provided below in order to support correct implementation of michael. These test vectors still have to be confirmed by an independent implementation.

J.2.1.2 Block function

Table J-1 gives some test vectors for the block function.

Table J-1—Test vectors for block function

| Input | # times | Output |
|----------------------|----------------|----------------------|
| (00000000, 00000000) | 1 | (00000000, 00000000) |
| (00000000, 00000001) | 1 | (c00015a8, c0000b95) |
| (00000001, 00000000) | 1 | (6b519593, 572b8b8a) |
| (01234567, 83659326) | 1 | (441492c2, 1d8427ed) |
| (00000001, 00000000) | 1000 | (9f04c4ad, 2ec6c2bf) |

The first four rows give test vectors for a single application of the block function b . The last row gives a test vector for 1000 repeated applications of the block function. Together these should provide adequate test coverage.

J.2.1.3 Michael

Table J-2 gives some test vectors for michael.

Table J-2—Test vectors for michael

| Key | Message | Output |
|------------------|----------------|------------------|
| 0000000000000000 | "" | 82925c1ca1d130b8 |
| 82925c1ca1d130b8 | "M" | 434721ca40639b3f |
| 434721ca40639b3f | "Mi " | e8f9becae97e5d29 |
| E8f9becae97e5d29 | "Mic" | 90038fc6cf13c1db |

Table J-2—Test vectors for michael

| Key | Message | Output |
|------------------|-----------|------------------|
| 90038fc6cf13c1db | "Mich" | D55e100510128986 |
| D55e100510128986 | "Michael" | 0a942b124ecaa546 |

Note that each key is the result of the previous line, which makes it easy to construct a single test out of all of these test cases.

J.2.2 Sample code for michael

```

//  

// Michael.h      Reference implementation for michael  

//  

// A michael object implements the computation of the MIC.  

//  

// Conceptually, the object stores the message to be authenticated.  

// At construction the message is empty.  

// The append() method appends bytes to the message.  

// The getMic() method computes the MIC over the message and returns the  

// result.  

// As a side-effect it also resets the stored message  

// to the empty message so that the object can be reused  

// for another MIC computation.  

//  

class Michael  

{  

public:  

    // Constructor requires a pointer to 8 bytes of key  

    Michael( Byte * key );  

    // Destructor  

    ~Michael();  

    // Clear the internal message,  

    // resets the object to the state just after construction.  

    void clear();  

    // Set the key to a new value  

    void setKey( Byte * key );  

    // Append bytes to the message to be MICed

```

```
void append( Byte * src, int nBytes );

// Get the MIC result. Destination should accept 8 bytes of result.
// This also resets the message to empty.
void getMIC( Byte * dst );

// Run the test plan to verify proper operations

                    &output[currentindex]);
    }
}

```

```
    currentindex += 20; /* next concatenation location */
    input[total_len-1]++; /* increment octet count */
}
}
```

J.3.2 PRF test vectors

J.4 Suggested pass-phrase-to-PSK mapping

J.4.1 Introduction

The RSNA PSK consists of 256 bits, or 64 octets when represented in hexadecimal. It is difficult for a user to correctly enter 64 hexadecimal characters. Most users, however, are familiar with passwords and pass-phrases and feel more comfortable entering them than entering keys. A user is more likely to be able to enter an ASCII password or pass-phrase, even though doing so limits the set of possible keys. This suggests that the best that can be done is to introduce a pass-phrase to PSK mapping.

This subclause defines a pass-phrase-to-PSK mapping that is the recommended practice for use with RSNAs. This pass-phrase mapping was introduced to encourage users unfamiliar with cryptographic concepts to enable the security features of their WLAN.

Keys derived from the pass-phrase provide relatively low levels of security, especially with keys generated from short passwords, since they are subject to dictionary attack. Use of the key hash is recommended only where it is impractical to make use of a stronger form of user authentication. A key generated from a pass-phrase of less than about 20 characters is unlikely to deter attacks.

The pass-phrase mapping defined in this subclause uses the PBKDF2 as defined in IETF RFC 2898 section 5.2.

$PSK = \text{PBKDF2}(passPhrase, ssid, 4096, 256/8)$

Here, the following assumptions apply:

- `passPhrase` is a sequence of between 8 and 63 ASCII-encoded characters. The limit of 63 comes from the need to distinguish between a pass-phrase and a PSK displayed as 64 hexadecimal characters.
 - Each character in the pass-phrase has an encoding in the range 32 to 126 (decimal).
 - `ssid` is the SSID of the ESS or IBSS where this pass-phrase is in use, encoded as an octet string used in the Beacon and Probe Response frames for the ESS or IBSS.
 - 4096 is the number of times the pass-phrase is hashed.
 - 256 is the number of bits output by the pass-phrase mapping.

J.4.2 Test vectors

Note that the passPhrase does not have a terminating null.

J.5 Suggestions for random number generation

J.5.1 General

In order to properly implement cryptographic protocols, every platform needs the ability to generate cryptographic-quality random numbers. IETF RFC 4086 explains the notion of cryptographic-quality random numbers and provides advice on ways to harvest suitable randomness. It recommends sampling multiple sources, each of which contains some randomness, and by passing the complete set of samples through a PRF. By following this advice, an implementation can usually collect enough randomness to distill into a seed for a PRNG whose output is unpredictable.

This clause suggests two sample techniques that can be combined with the other recommendations of IETF RFC 4086 to harvest randomness. The first method is a software solution that can be implemented on most

hardware; the second is a hardware-assisted solution. These solutions are expository only, to demonstrate that it is feasible to harvest randomness on any IEEE 802.11 platform. They are not mutually exclusive, and they do not preclude the use of other sources of randomness when available, such as a noisy diode in a power circuit; in this case, the more the merrier. As many sources of randomness as possible should be gathered into a buffer, and then hashed, to obtain a seed for the PRNG.

J.5.2 Software sampling

Due to the nature of clock circuits in modern electronics, there is some lack of correlation between two clocks in two different pieces of equipment, even when high-quality crystals are used—crystal clocks are subject to jitter, noise, drift, and frequency mismatch. This randomness might be as little as the placement of the clock waveform edges. Even if one entity were to attempt to synchronize itself to another entity's clock, the correlation cannot be perfect due to noise and uncertainties of the synchronization.

Two clock circuits in the same piece of equipment might synchronize in frequency, but again the correlation is not perfect due to the noise and jitter of the circuits.

The randomness between the two clocks might not be much per sample—a tenth of a bit or less—but enough samples might be collected to gather enough randomness to form a seed.

A device can use software methods to take advantage of this lack of synchronization, to collect randomness from different sources. As an example, an AP might measure the frame arrival times on Ethernet wireless ports. There is always some amount of traffic on modern Ethernets: ARPs, DHCP requests, NetBIOS advertisements, etc. The sample algorithm in this subclause uses this traffic. In the example, an AP obtains randomness from the available traffic. If Ethernet traffic is available, the AP utilizes that for a source of randomness. Otherwise, it waits for the first association and creates traffic from which it can obtain randomness.

The clocks used to time the frames should be the highest resolution available, preferably 1 ms resolution or better. The clock used to time frame arrival should not be related to the clock used for frame serialization.

```
Initialize result to empty array
LoopCounter = 0
Wait until Ethernet traffic or association
Repeat until global key counter "random enough" or 32 times {
    result = PRF-256(0, "Init Counter",
        Local Mac Address || Time || result || LoopCounter)
    LoopCounter++
    Repeat 32 times {
        If Ethernet traffic available then {
            Take least significant octet of the timestamp when Ethernet packet is received
            Concatenate this octet onto result
        } else {
            Start 4-way handshake; after receipt of message 2, deauthenticate
            Take least significant octet of the timestamp of when message 1 is sent
            Take least significant octet of the timestamp of when message 2 is received
            Take the least significant octet of RSSI from message 2
            Take SNonce from message 2
            Concatenate the sent time, received time, RSSI and SNonce octets onto result
        }
    }
```

```

        }
    }

Global key counter = result = PRF-256(0, "Init Counter",
    Local Mac Address || Time || result || LoopCounter)

```

NOTE—The Time is set to 0 if it is not available.

J.5.3 Hardware-assisted solution

The sample implementation in this subclause uses hardware ring oscillators to generate randomness, as depicted in Figure J-1.

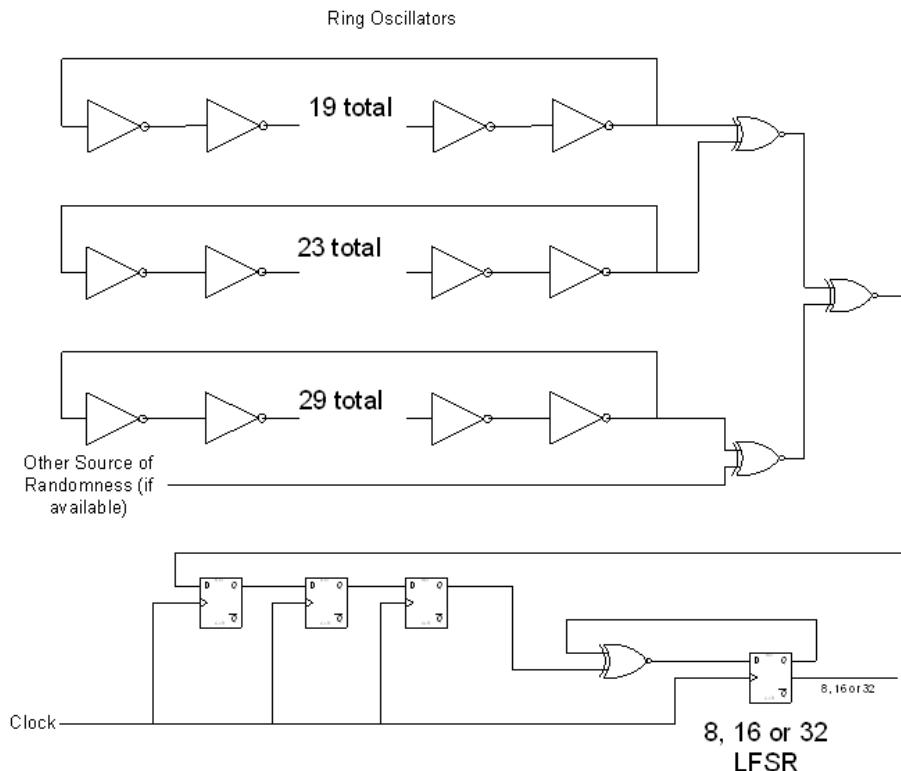

Figure J-1—Randomness generating circuit

The circuit in Figure J-1 generates randomness. The clock input should be about the same frequency as the ring oscillator's natural frequencies. The LFSR should be chosen to be one that is maximal length. Sample LFSRs can be found in Arazi [B6].

The three ring oscillators should be isolated from each other as much as possible to avoid harmonic locking between them. In addition, the three ring oscillators should not be near any other clock circuitry within the system to avoid these ring oscillators' locking to system clocks. The oscillators should be tested to verify that their output is not correlated.

The output of the LFSR is read by software and concatenated until enough randomness is collected. As a rule of thumb, reading from the LFSR 8 to 16 times the number of bits as the desired number of random bits is sufficient.

Initialize result to empty array

```

Repeat 1024 times {
    Read LFSR
    result = result | LFSR
    Wait a time period
}
Global key counter = PRF-256(0, "Init Counter", result)
    
```

J.6 Additional test vectors

J.6.1 Notation

In the examples that follow in J.6, frames are represented as a stream of octets, each octet in hexadecimal notation, sometimes with text annotation. The order of transmission for octets is left to right, top to bottom. For example, consider the following representation of a frame in Table J-3.

Table J-3—Notation example

| | |
|----------------|-------------------|
| Description #1 | 00 01 02 03 04 05 |
| Description #2 | 06 07 08 |

The frame consists of 9 octets, represented in hexadecimal notation as “00”, “01”, ..., “08”. The octet represented by “00” is transmitted first, and the octet represented by “08” is transmitted last. Similar tables are used for other purposes, such as describing a cryptographic operation.

J.6.2 WEP cryptographic encapsulation

The discussion in this subclause represents an ARC4 encryption using a table that shows the key, plaintext input, and cipher text output. The MPDU data, prior to WEP cryptographic encapsulation, is shown in Table J-4.

Table J-4—Sample plaintext MPDU

| | |
|-----------|---|
| MPDU data | aa aa 03 00 00 00 08 00 45 00 00 4e 66 1a 00 00 80 11 be 64 0a 00 01 22 0a ff ff ff 00 89 00 89 00 3a 00 00 80 a6 01 10 00 01 00 00 00 00 00 00 20 45 43 45 4a 45 48 45 43 46 43 45 50 46 45 45 49 45 46 46 43 43 41 43 41 43 41 43 41 43 41 41 41 41 00 00 20 00 01 |
|-----------|---|

ARC4 encryption is performed as shown in Table J-5.

The plaintext consists of the MPDU data, followed by a 4-octet CRC-32 calculated over the MPDU data.

The expanded MPDU, after WEP cryptographic encapsulation, is shown in Table J-6.

The IV consists of the first 3 octets of the ARC4 key, followed by an octet containing the Key ID value in the upper 2 bits. In this example, the Key ID value is 2. The MPDU data consists of the cipher text,

Table J-5—ARC4 encryption

J.6.5 PRF test vectors

A set of test vectors are provided for each size of PRF function used in this subclause. See Table J-9 to Table J-12. The inputs to the PRF function are strings for key, prefix, and data. The length can be any multiple of 8, but the values 192, 256, 384, and 512 are used in this subclause. The test vectors were taken from IETF RFC 2202 [B28] with additional vectors added to test larger key and data sizes.

Table J-9—RSN PRF Test Vector 1

J.7 Key hierarchy test vectors for pairwise keys

J.7.1 General

The test vectors in this subclause provide an example of PTK derivation for both CCMP-128 and TKIP.

Pairwise keys are derived from the PMK, AA, SPA, SNonce, and ANonce. The values in Table J-13 are used as input to the pairwise key derivation test vectors.

Table J-13—Sample values for pairwise key derivations

Annex K

(informative)

TSPECs and Admission control

K.1 Example use of TSPEC for admission control

Admission control, in general, depends on vendors' implementations of schedulers, available channel capacity, link conditions, retransmission limits, and the scheduling requirements of a given TSPEC. However, for any given channel capacity, link conditions, and retransmission limits, some TSPEC constructions might be categorically rejected because a scheduler cannot create a meaningful schedule for that TSPEC. There needs to be, for example, be a minimum number of specified fields in the TSPEC in order for the admission control mechanism to create a valid TSPEC. Table K-1 below lists the valid TSPEC fields that need to be present for all admission control algorithms to admit a TSPEC. This represents a set of necessary parameters in order for TSPEC to be admitted; it is not sufficient in and of itself to guarantee TSPEC admittance, which depends upon channel conditions and other factors. Such TSPECs are said to be *admissible*. In the table, S means specified, X means unspecified, and Opt means “optional.”

Table K-1—Admissible TSPECs

| TSPEC parameter | Continuous time QoS traffic (HCCA) | Controlled-access CBR traffic (HCCA) | Bursty traffic (HCCA) | Contention based traffic (EDCA) |
|--------------------------|--|---|---|--|
| Nominal MSDU Size | S | S | X | S |
| Minimum Service Interval | S | Nominal MSDU size/mean data rate, if specified (VoIP typically uses this) | S Usually set to 0 or a small number (e.g., 1) | X |
| Maximum Service Interval | S | Same as Minimum SI | S | Opt (Used to indicate aggregation limit) |
| Inactivity Interval | Always specified | | | X |
| Suspension Interval | Opt | | | |
| Minimum Data Rate | Specified if peak data rate is specified | Equal to mean data rate | X | Specified if peak data rate is specified |
| Mean Data Rate | S | S | Opt | S |
| Burst Size | X | X | S | Opt |
| Minimum PHY Rate | Always specified | | | |
| Peak Data Rate | Opt Should be specified if Minimum Data Rate is specified | Equal to Mean Data Rate | Opt | Opt Should be specified if Minimum Data Rate is specified |

Table K-1—Admissible TSPECs (continued)

| TSPEC parameter | Continuous time QoS traffic (HCCA) | Controlled-access CBR traffic (HCCA) | Bursty traffic (HCCA) | Contention based traffic (EDCA) |
|-----------------------------|---|--------------------------------------|-----------------------|---------------------------------|
| Delay Bound | S | S | Opt | Opt |
| Surplus Bandwidth Allowance | Is specified if the delay bound is present | | | S |
| Medium Time | (not specified by non-AP STA; only an output from the HC) | | | |

K.2 Recommendation for implementation of contention based admission control

K.2.1 Use of ACM (admission control mandatory) subfield

It is recommended that admission control not be required for the access categories AC_BE and AC_BK. The ACM subfield for these categories should be set to 0. The AC parameters chosen by the AP should account for unadmitted traffic in these ACs.

When dot11SSPNInterfaceActivated is true, it is recommended that any STA authenticated through an SSPN interface use admission control to access categories AC_VO and AC_VI to produce network utilization consistent with the policy imposed by the SSPN for admission. AC parameters chosen by the AP should further account for any unadmitted traffic in AC_VO and AC_VI that might be reserved for users of a particular SSPN.

K.2.2 Deriving medium time

An AP should use the following procedure to derive the value of the Medium Time field in its ADDTS Response frame.

There are two requirements to consider: 1) the traffic requirements of the application, and 2) the expected error performance of the medium.

The application requirements are captured by the following TSPEC fields: Nominal MSDU Size and Mean Data Rate. Note that the Nominal MSDU Size field is the nominal A-MSDU size, where A-MSDU aggregation is employed.

The medium requirements are captured by the following TSPEC fields: Surplus Bandwidth Allowance and Minimum PHY Rate.

The following formula describes how Medium Time, in units of 32 µs periods per second, can be calculated:

$$\text{Medium Time} = \left\lceil \frac{\text{Surplus Bandwidth Allowance} \times \text{Packets Per Second} \times \text{Frame Exchange Time}}{0x2000 \times 32} \right\rceil$$

where

- a) if A-MPDU aggregation is not employed (i.e., TS Info Ack Policy = 00 (Normal Acknowledgment)):

$$\text{Packets Per Second} = \frac{\text{Mean Data Size}}{8 \times \text{Nominal MSDU Size}}$$

$$\begin{aligned}\text{Frame Exchange Time} &= \\ &\quad \text{duration (Nominal MPDU Size, Minimum PHY Rate)} \\ &\quad + \text{SIFS} \\ &\quad + \text{duration (Ack Size, Ack Rate)}\end{aligned}$$

$$\begin{aligned}\text{Nominal MPDU Size} &= \\ &\quad \text{MAC Header Size} \\ &\quad + \text{Nominal MSDU Size} \\ &\quad + \text{Security Encapsulation Size} \\ &\quad + \text{FCS Size}\end{aligned}$$

- b) if A-MPDU aggregation is employed (i.e., TS Info Ack Policy = 11 (Block Ack)):

$$\text{Packets Per Second} = \left\lceil \frac{\text{Mean Data Rate}}{8 \times \text{Nominal MSDU Size} \times \text{Nominal MSDU Aggregation}} \right\rceil$$

$$\begin{aligned}\text{Frame Exchange Time} &= \\ &\quad \text{duration (Nominal A-MPDU Size, Minimum PHY Rate)} \\ &\quad + \text{SIFS} \\ &\quad + \text{duration (BlockAck Size, BlockAck Rate)}\end{aligned}$$

$$\begin{aligned}\text{Nominal A-MPDU Size} &= \\ &\quad \text{Nominal MSDU Aggregation} \\ &\quad \times \text{Nominal A-MPDU Subframe Size} \\ &\quad - \text{Padding Size}\end{aligned}$$

$$\begin{aligned}\text{Nominal A-MPDU Subframe Size} &= \\ &\quad \text{MPDU Delimiter Size} \\ &\quad + \text{MAC Header Size} \\ &\quad + \text{Nominal MSDU Size} \\ &\quad + \text{Security Encapsulation Size} \\ &\quad + \text{FCS Size} \\ &\quad + \text{Padding Size}\end{aligned}$$

$$\begin{aligned}\text{Padding Size} &= \\ &\quad 3 \\ &\quad - (\text{MAC Header Size} \\ &\quad + \text{Nominal MSDU Size} \\ &\quad + \text{Security Encapsulation Size} \\ &\quad + 3) \\ &\quad \text{mod } 4\end{aligned}$$

and where

Sizes are in octets; Rates are in b/s; durations and Times are in μ s; Surplus Bandwidth Allowance is the unsigned integer value passed

MAC Header Size = 26

MPDU Delimiter Size = 4

Security Encapsulation Size = 16 (CCMP), 20 (GCMP and TKIP), 8 (WEP) or 0 (open system)

Ack Size = 14

BlockAck Size = 32

FCS Size = 4

SIFSIFS = 10 when operating in the 2.4 GHz band, 16 when operating in the 5 GHz band, 3 when operating in the 60 GHz band

Ack/BlockAck Rate is the rate used for the Ack/BlockAck frame, given the Minimum PHY Rate, subject to the corresponding multirate rules

duration () is the PLME-TXTIME primitive defined in clauses 6.5.5 and 6.5.6 that returns the duration of a PPDU based on the PSDU size and the PHY data rate and PHY employed, e.g., clauses 16.3.4, 17.4.3, 18.5.3.2, 19.4.3 and 20.12.3

Notes:

- Division does not truncate.
- Any signal extension is included, even for the acknowledgment frame which ends the frame exchange.
- If protection frames are used, then they are included in the Frame Exchange Time too. Each frame contributes an additional term:
Frame Exchange Time +=
duration (Protection Frame Size, Protection Frame Rate)
+ SIFS

where

RTS Protection Frame Size = 20

CTS Protection Frame Size = 14

Protection Frame Rate is the rate used for the protection frame, given the Minimum PHY Rate, subject to the corresponding multirate and protection rules

An AP assumes that a STA will use CTS-to-self protection if an ERP element directs use of protection.

- The assumption is made that HT Control headers and beamforming frames are not normally used and so their contribution to Medium Time is negligible.
- The Nominal A-MPDU Subframe Size can be increased by the AP where necessary to account for the Minimum MPDU Start Spacing. For example, if the Minimum PHY Rate is 65 Mb/s and the Minimum MPDU Start Spacing is 16 μ s then the minimum Nominal A-MPDU Subframe Size is 132 octets (including 2 octets of pad).
- A STA might request TSPEC fields that would result in violation of other applicable constraints such as the receiver's maximum A-MSDU or A-MPDU size, any maximum PPDU duration, or, for uplink or bidirectional TSPECs, any nonzero TXOP limit. An AP receiving such a request is likely to reject it. An AP might also reject requests that cannot be satisfied for reasons that the STA is not always aware of, such as, for uplink or bidirectional TSPECs, the AP's maximum Block Ack Buffer Size.
- Where A-MPDU aggregation is employed, HT-immediate Block Ack is assumed.

K.3 Guidelines and reference design for sample scheduler and admission control unit

K.3.1 Guidelines for deriving service schedule parameters

The HC establishes the SI for each admitted TS for a STA to derive the aggregate minimum SI contained in the STA's service schedule. The SI for each TS is equal to the maximum SI contained in the TSPEC, if it

exists; otherwise, it is the nominal MSDU size divided by the mean data rate. The SI contained in the service schedule is equal to the smallest SI for any TSPEC.

The HC can use an aggregate “token bucket specification” to police a STA’s admitted flows. The HC derives the aggregate mean data rate and aggregate burst size to establish the aggregate token bucket specification. The aggregate mean data rate is equal to the sum of the mean data rates of all of the STA’s admitted TSs. The aggregate burst size is equal to the sum of the burst size of all of the STA’s admitted TSs. An aggregate token bucket is initialized with the aggregate burst size. Tokens are added to the token bucket at the aggregate mean data rate. Alternatively the method of summing TSPECs for statistical multiplexing, as described in T.2.3, can be used.

When `dot11SSPNInterfaceActivated` is true, the HC polices all traffic flows from a non-AP STA authenticated against the maximum authorized data rates stored in the `dot11InterworkingTable`. Each SSPN-authenticated STA is given a maximum bandwidth allowance by the SSPN for each access category as well as scheduled access. The AP polices the SSPN-authenticated STA traffic flows to the maximum bandwidth allowance provided by the SSPN.

K.3.2 Reference design for sample scheduler and admission control unit

K.3.2.1 General

This subclause provides the guidelines for the design of a simple scheduler and admission control unit (the unit that administers admission policy in the HC’s SME) that meet the minimum performance requirements as specified in 10.22.4.3. The scheduler and admission control unit use the minimum set of mandatory TSPEC fields as specified in 10.22.4.3.

K.3.2.2 Sample scheduler

This subclause includes the reference design for a sample scheduler. This scheduler uses the mandatory set of TSPEC fields to generate a schedule: Mean Data Rate, Nominal MSDU Size, and Maximum Service Interval or Delay Bound. If both Maximum Service Interval and Delay Bound parameters are specified in the TSPEC, the scheduler uses the Maximum Service Interval parameter for the calculation of the schedule.

The schedule generated by the scheduler satisfies the requirements specified in 10.22.4.3. The schedule for an admitted stream is calculated in two steps. The first step is the calculation of the scheduled SI. In the second step, the TXOP duration for a given SI is calculated for the stream.

The calculation of the scheduled service interval is done as follows: First, the scheduler calculates the minimum of all maximum SIs for all admitted streams. Let this minimum be m . Second, the scheduler chooses a number lower than m that is a submultiple of the beacon interval. This value is the scheduled SI for all STAs with admitted streams. See Figure K-1.

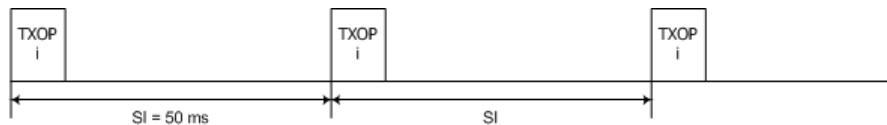

Figure K-1—Schedule for stream from STA *i*

For the calculation of the TXOP duration for an admitted stream, the scheduler uses the following parameters: Mean Data Rate and Nominal MSDU Size; and from the negotiated TSPEC, the Scheduled Service Interval calculated above, Physical Transmission Rate, Maximum Allowable Size of MSDU, and

Overhead. The Physical Transmission Rate is the minimum PHY rate negotiated in the TSPEC. If the minimum PHY rate is not committed in the ADDTS Response frame, the scheduler can use the observed PHY rate as the Physical Transmission Rate. The Overhead includes IFSs, Ack frames and CF-Poll frames. For simplicity, details for the Overhead calculation are omitted in this description. The TXOP duration is calculated as follows: First, the scheduler calculates the number of MSDUs that can arrive at the Mean Data Rate during the SI:

$$N_i = \left\lceil \frac{SI \times \rho_i}{L_i} \right\rceil$$

where

- SI is the Scheduled Service Interval
- ρ is the Mean Data Rate
- L is the Nominal MSDU Size

Then the scheduler calculates the TXOP duration as the maximum of

- Time to transmit N_i frames at R_i and
- Time to transmit one maximum size MSDU at R_i (plus overhead):

$$TXOP_i = \max\left(\frac{N_i \times L_i}{R_i} + O, \frac{M}{R_i} + O\right)$$

where

- R is the Physical Transmission Rate
- M is the maximum possible size of MSDU
- O is the Overhead in time units

An example is shown in Figure K-1. Stream from STA i is admitted. The beacon interval is 100 ms and the maximum SI for the stream is 60 ms. The scheduler calculates a scheduled SI (SI) equal to 50 ms using the steps explained above in this annex.

The same process is repeated continuously while the maximum SI for the admitted stream is larger than the current SI. An example is shown in Figure K-2.

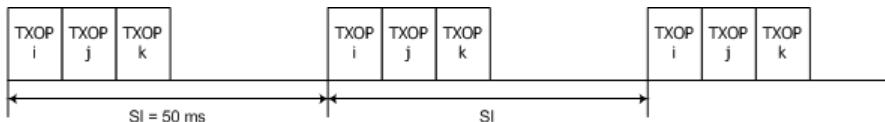

Figure K-2—Schedule for streams from STAs i to k

If a new stream is admitted with a maximum SI smaller than the current SI, the scheduler needs to change the current SI to a smaller number than the maximum SI of the newly admitted stream. Therefore, the TXOP duration for the current admitted streams needs also to be recalculated with the new SI.

If a stream is dropped, the scheduler might use the time available to resume contention. The scheduler might also choose to move the TXOPs for the STAs following the STA dropped to use the unused time. An example is shown in Figure K-3, when the stream for STA j is removed. However, this option might require the announcement of a new schedule to all STAs.

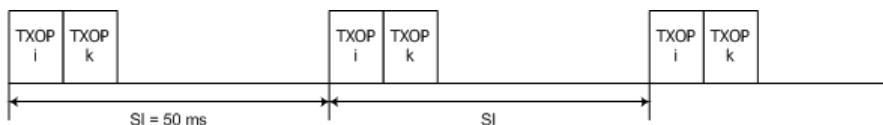

Figure K-3—Reallocation of TXOPs when a stream is dropped

Different modifications can be implemented to improve the performance of the minimum scheduler. For example, a scheduler might generate different scheduled SIs (*SI*) for different STAs, and/or a scheduler might consider accommodating retransmissions while allocating TXOP durations.

K.3.2.3 Admission control unit

This subclause describes a reference design for an admission control unit (ACU) that administers admission of TS. The ACU uses the same set of parameters that the scheduler uses in K.3.2.2.

When a new stream requests admission, the admission control process is done in three steps. First, the ACU calculates the number of MSDUs that arrive at the mean data rate during the scheduled SI. The scheduled SI (*SI*) is the one that the scheduler calculates for the stream as specified in K.3.2.2. For the calculation of the number of MSDUs, the ACU uses the equation for N_i shown in K.3.2.2. Second, the ACU calculates the TXOP duration that needs to be allocated for the stream. The ACU uses the equation for $TXOP_i$ shown in K.3.2.2. Finally, the ACU determines that the stream can be admitted when the following inequality is satisfied:

$$\frac{TXOP_{k+1}}{SI} + \sum_{i=1}^k \frac{TXOP_i}{SI} \leq \frac{T - T_{CP}}{T}$$

where

- k is the number of existing streams
- $k + 1$ is used as index for the newly arriving stream
- T indicates the beacon interval
- T_{CP} is the time used for EDCA traffic

Subclause 10.22.3.3 requires that the ACU complies with the dot11CAPlimit, i.e., the scheduler does not allocate TXOPs that exceed dot11CAPlimit. The ACU might also consider additional time to allow for retransmissions.

The ACU allows admitted streams to have an allocated access to the channel. Any modification can be implemented for the design of the ACU. For example, UP-based ACU is possible by examining the UP field in TSPEC to decide whether to admit, retain, or drop a stream. If the UP is not specified, a default value of 0 is used. If a higher UP stream needs to be serviced, an ACU might drop lower UP streams.

K.4 TSPEC construction

TSPECS are constructed at the SME from application requirements supplied via the SME and with information specific to the MAC layer. However, in this subclause a description is given of how and where certain parameters can be chosen. The following parameters typically arise from the application: Nominal MSDU Size, Maximum MSDU Size, Minimum Service Interval, Maximum Service Interval, Inactivity Interval, Minimum Data Rate, Mean Data Rate, Burst Size, Peak Data Rate, and Delay Bound. The

following parameters are generated locally within the MAC: Minimum PHY Rate and Surplus Bandwidth Allowance, although the Maximum Service Interval and Minimum Service Intervals can be generated within the MLME as well. This subclause describes how the parameters that are typically generated within the MAC can be derived.

Note that a TSPEC can also be generated autonomously by the MAC without any initiation by the SME. However, if a TSPEC is generated subsequently by the SME, the TSPEC generated autonomously by the MAC might be overridden (see 11.4.4.5).

Typically, TSPEC fields not determined by the application are built upon the assumption that the following exist:

- A probability p of not transmitting the frame (because it would have exceeded its delay bound)
- An MSDU length (which can be considered fixed for constant-bit-rate applications)
- Application throughput and delay requirements
- A channel model of error, in particular a channel error probability for the (fixed) frame length
- Possibly country-specific limits on TXOP limits

K.4.1 Surplus Bandwidth Allocation

Typically, it can be assumed that the scheduler would attempt to schedule TXOPs distributed throughout a small multiple of beacon intervals (if not a single beacon interval). In addition, TXOP limits would typically be chosen to be as short as possible (within the constraints of the minimum PHY rate, acknowledgment policy, and so forth), consistent with the goal of maximizing throughput. In other words, because of overhead, not to mention the requirements for transmitting a single Poll frame, MPDU, and possibly Ack frame, the TXOPs need to be at least of a certain duration.

The channel model implies an error ratio and an assumption about dependency (joint probability distribution of channel errors sequentially, i.e., burst error probabilities).

For example, if the channel causes errors independently from frame to frame and the error probability is the same for all frames of the same length at all times, this channel would be said to be an independent, identically distributed error channel. With p as the probability of dropping the frame, and p_e as the probability of the frame not being transmitted successfully (i.e., either the Data frame or the Ack frame associated with it is in error), let N_p be the number of retries required to maintain the probability of dropping the frame to be p .

The probability of any given packet being dropped in such a channel after N_p retries is given by

$$p_{\text{drop}} = (p_e)^{N_p + 1}$$

For example, in such a channel, if $p_e = 0.1$ and $p_{\text{drop}} = 10^{-8}$, then up to seven retries within the delay bound are required, and the scheduler should consider these retransmissions in the cumulative TXOP allocations.

The Surplus Bandwidth Allowance (SBA) parameter causes the requesting STA to be allocated a minimum amount of excess time by the scheduler so that the application dropped packet rates are bounded.

The probability of not successfully transmitting k packets is given by the cumulative distribution function of the Binomial Distribution.

The binomial probability mass function is

$$b(k, n, p) = \frac{n!}{k!(n-k)!} p^k (1-p)^{n-k}$$

where

- n is the number of trials
- p is the probability of success for each trial.

The binomial cumulative distribution function is

$$B(k, n, p) = \sum_{y=0}^n b(y, n, p)$$

Assuming a certain packet error ratio (PER), P_e , the number of extra packets, N , that are required in order to have a probability, P_{ns} , of not successfully transmitting S packets is given:

$$B(S, S+N, 1-P_e) = \sum_{y=0}^n b(y, S+N, 1-P_e)$$

Then

$$SBA = (S+N)/S$$

Now, if just one packet is lost, then the lost packet ratio, L_{PR} , is $L_{PR} = 1/(S+N)$

The condition where $P_{ns} < L_{PR}$ represents a practical point for determining the value of N .

Medium Time used for EDCA Admission Control is based upon one second periods and HCCA Medium time, used to aggregate TSPECs (see T.2.3) also uses the one second period. Hence, for each application, S is the number of packets that are desired to be sent in each one second period.

For example, consider a voice application:

$$\text{PER, } P_e = 0.1 \quad \text{or probability of success is } 1 - P_e = 0.9$$

$$\text{Number of packets per second, } S = 50$$

Probability of not having 50 successful packets, $P_{ns} = 0.87\%$ for $N = 13$

Lost packet ratio for 1 lost packet, $L_{PR} = 1.59\%$

$$SBA = 1.26$$

Take the example of a video stream at 380 packets per second (about 4 Mb/s):

$$\text{Number of packets per second, } S = 380$$

Probability of not having 380 successful packets, $P_{ns} = 0.2\%$ for $N = 64$

Lost packet ratio for 1 lost packet, $L_{PR} = 0.23\%$

$$SBA = 1.168$$

It can be seen that the value for SBA varies with S , the number of required packets per second.

A reasonable estimate for SBA is given by

$$SBA = -0.033 \ln(S) + 1.37$$

Table K-2 is a table of SBA for various values of S , and the SBA estimate derived by using the formula above.

Table K-2—SBA vs Packets/s

| S Packets/s | SBA | Estimated SBA |
|---------------------------------|-------------------------|-----------------------------------|
| 50 | 1.26 | 1.241 |
| 95 | 1.221 | 1.220 |
| 190 | 1.189 | 1.197 |
| 285 | 1.179 | 1.183 |
| 380 | 1.168 | 1.174 |
| 475 | 1.164 | 1.167 |
| 570 | 1.160 | 1.161 |
| 665 | 1.156 | 1.156 |
| 760 | 1.154 | 1.151 |
| 855 | 1.151 | 1.147 |
| 950 | 1.151 | 1.144 |
| 1900 | 1.139 | 1.121 |

The values for SBA as shown in Table K-2 are based upon a one second time period and hence are what should be used in the TSEC for EDCA Admission Control. The value used in an HCCA TSPEC might be different, as will now be explained.

In an HCCA TSPEC the SBA relates the overhead required in each scheduled period. A voice stream, for example, only sends one packet every 20 ms. Obviously an SBA of 1.26 is meaningless as it does not allow even one retry. To allow just one retry, the minimum SBA is 2.0. Similarly for a video example of say 6 packets per schedule period, to allow at least one retry would require an SBA of $(6+1)/6 = 1.167$

Hence, for an HCCA TSPEC:

Calculate packets per SI:

$$PPSI = \frac{R_m}{S_n \times 8 \times SI}$$

where

R_m is the mean data rate (b/s)

S_n is the nominal MDSU size (octets)

SI is the service interval (seconds)

Then Minimum HCCA $SBA = \text{MAX}\left(SBA, \frac{PPSI + 1}{PPSI}\right)$.

Table K-3 shows the recommended SBA values for HCCA TSPECs for various video streams.

Table K-3—Table HCCA SBA for video streams

| Video, Mb/s | Pkts per SI | Min HCCA SBA | SBA, (1 sec) | HCCA SBA |
|-------------|-------------|--------------|--------------|----------|
| 1 | 1 | 2.000 | 1.221 | 2.000 |
| 2 | 3 | 1.333 | 1.189 | 1.333 |
| 3 | 4 | 1.250 | 1.179 | 1.250 |
| 4 | 6 | 1.167 | 1.168 | 1.168 |
| 5 | 7 | 1.143 | 1.164 | 1.164 |
| 6 | 9 | 1.111 | 1.160 | 1.160 |
| 7 | 10 | 1.100 | 1.156 | 1.156 |
| 8 | 12 | 1.083 | 1.154 | 1.154 |
| 9 | 13 | 1.077 | 1.151 | 1.151 |
| 10 | 15 | 1.067 | 1.151 | 1.151 |
| 20 | 30 | 1.033 | 1.139 | 1.139 |

In summary, the suggested value for SBA is derived as follows:

- Calculate Packets per sec, PPS

$$PPS = \frac{R_m}{S_n \times 8}$$

where

R_m is the mean data rate (b/s)

S_n is the nominal MDSU size (octets)

NOTE—Nominal MSDU = MDSU or A-MSDU

- Calculate SBA

$$SBA = -0.033 \ln(PPS) + 1.37$$

EDCA Admission Control TSPEC and Medium Time calculation uses SBA.

For HCCA TSPEC:

- Calculate packets per SI, $PPSI$

$$PPSI = \frac{R_m}{S_n \times 8 \times SI}$$

where

- R_m is the mean data rate (b/s)
- S_n is the nominal MDSU size (octets)
- SI is the service interval (seconds)

$$— \quad \text{HCCA } SBA = \text{MAX}\left(SBA, \frac{PPSI+1}{PPSI}\right)$$

HCCA Medium Time uses SBA in place of HCCA SBA, if different.

K.4.2 Minimum and Maximum Service Interval

K.4.2.1 Scheduled traffic

The HC uses the Maximum Service Interval for the calculation of the schedule.

The value of the Minimum Service Interval is an indication that the traffic is CBR or VBR.

For CBR traffic the minimum and maximum Service Intervals should be set to the same value. For example, most voice traffic requires a minimum and maximum service interval value of 20 ms.

In the case of VBR traffic, such as video, Minimum Service Interval should be set to 0 and the Maximum Service Interval set to the service interval required by the application, e.g., to correspond to the codec that is to be used. For example, Maximum Service Interval is set to 16 ms for many real time video applications.

K.4.2.2 Use of Maximum Service Interval with Aggregation of Packets

Aggregation of MPDUs or MSDUs introduces delay to the packets, but the use of aggregated packets is to be encouraged because of the increased efficiency. In the case of scheduled traffic, the aggregation of packets is such that the number of MSDUs that are aggregated into a single packet (A-MSDU or A-MPDU) does not exceed the scheduling service interval. Consider the following example:

- Video packet = 1316B (7*188 MPEG2-TS)
- Nominal MSDU Size = 1364 (octets)
- Mean Data Rate = 4 Mb/s
- Maximum Service Interval = 16 ms

$$\text{Nominal MSDUs per SI} = \left\lfloor \frac{4 \times 10^6}{1364 \times 8} \right\rfloor = 3$$

Hence, to comply with the 16 ms SI, the limit for aggregation is 3, (an A-MSDU of 3 MSDUs, or an A-MPDU consisting of 3 MSDUs).

In the case of EDCA Admission Control, where regular scheduling is not used, the value of the Maximum Service Interval is used to indicate the limit of aggregation of nominal MSDUs and the acceptable latency between packets. Using aggregation reduces the Medium Time and Used Time required.

For example, assuming a minimum PHY Rate of 39 Mb/s for the example used above, the accurate Medium Time returned by the AP would be 13 783 μ s. If the AP assumed that A-MPDUs were to be used, then the accurate Medium Time would be 11 681 μ s, a 15% reduction. Hence, an AP could ‘force’ a STA to use aggregation, or alternatively could assume aggregation when it is considering the total traffic as part of its admittance policy.

The Nominal MSDU Size is the size of the MSDU or A-MSDU belonging to the TS.

Consider another example:

- Video packet = 1316B (7*188 MPEG2-TS)
- Nominal MSDU Size = 4137 (A-MSDU of 3 MSDUs)
- Mean Data Rate = 10 Mb/s
- Maximum Service Interval = 16 ms

$$\text{Nominal MSDUs per SI} = \left\lfloor \frac{10 \times 10^6}{4137 \times 8} \right\rfloor = 4$$

Hence, further aggregation is possible and an A-MPDU consisting of 4 A-MSDUs could be sent and still comply with the latency or SI requirement.

Note that the TSPEC is invalid if the Nominal MSDUs per Maximum Service Interval is less than 1.

K.4.3 Minimum, Mean, and Peak Data Rate

In an HCCA TSPEC, for CBR traffic the Minimum, Mean and Maximum Data Rate fields should contain the same value but it is allowable to just specify the Mean Data Rate noting that the Minimum and Maximum Service Intervals are the same.

In an EDCA TSPEC, for CBR traffic the Minimum, Mean and Maximum Data Rate fields should contain the same value but it is allowable to just specify the Mean Data Rate.

For VBR traffic it is desirable to populate the Minimum, Mean and Peak data rate fields.

If a TSPEC has the Minimum Data Rate (R_{min}) and Peak Data Rate (R_{max}) fields populated, then the standard deviation of that stream, σ , can be estimated as:

$$\sigma = 0.25(R_{max} - R_{min})$$

If a TSPEC has the Mean Data Rate (R_{mean}) and Peak Data Rate fields populated, then the standard deviation of that stream, σ , can be estimated as:

$$\sigma = 0.5(R_{max} - R_{mean})$$

If there are n streams, the values of the mean μ and standard deviation σ , of the total stream traffic should be calculated using:

$$\mu = \sum \mu_n$$

$$\sigma_{tot} = \sqrt{\sum \sigma_n^2}$$

This is of particular use to EDCA admission control policy. When summing streams for EDCA Admission Control, the EDCA Overhead Factor needs to be taken into account; see T.2.7.

Annex L

(informative)

Examples and sample code for encoding a TIM Partial Virtual Bitmap

L.1 Introduction

The purpose of this annex is to show examples of encoding a Partial Virtual Bitmap field of the TIM element, as described in 9.4.2.6. Sample C code is provided in L.3.

L.2 Examples

The following examples help clarify the use of TIM values, both with and without the multiple BSSID capability.

The first example is one in which there are no group addressed MSDUs buffered in the AP but there is traffic for two STAs queued in the AP. STAs with AID 2 and AID 7 have data buffered in the AP. Figure L-1 shows the values of the Bitmap Control and Partial Virtual Bitmap fields that would be part of the TIM element for this example.

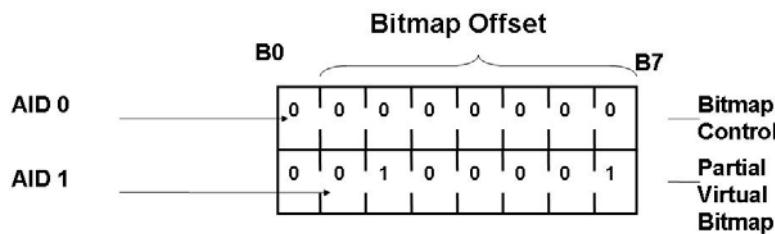

Figure L-1—Partial Virtual Bitmap example #1

The next example is one in which group addressed MSDUs are buffered in the AP as well as traffic for STAs. The DTIM Count field in the TIM element equals 0. STAs with AID 2, AID 7, AID 22 and AID 24 have data buffered in the AP. Figure L-2 shows the values of the Bitmap Control and Partial Virtual Bitmap fields.

Another example is one in which group addressed MSDUs are buffered in the AP as well as traffic for STAs. The DTIM Count field in the TIM element equals 0. Only the node with AID 24 has data buffered in the AP. In this example, the Bitmap Offset is used to start the Partial Virtual Bitmap at the third octet. Figure L-3 shows the values of the Bitmap Control and Partial Virtual Bitmap fields.

The three examples listed above describe the construction of the Partial Virtual Bitmap when multiple BSSID operation is not supported. The following three examples demonstrate how to construct the Partial Virtual Bitmap, when multiple BSSID operation is supported.

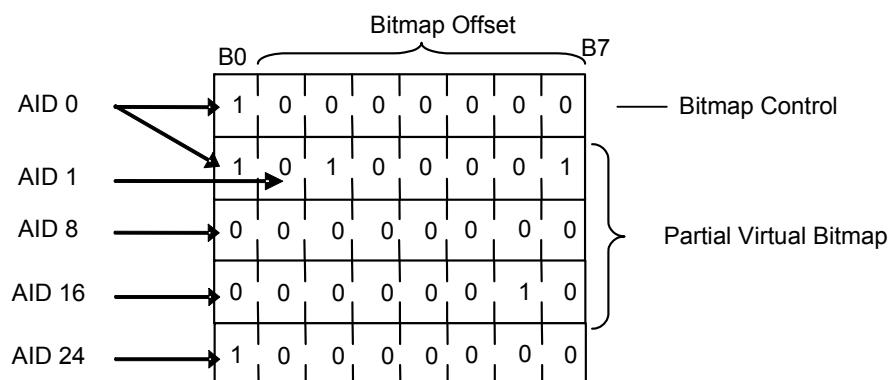

Figure L-2—Partial Virtual Bitmap example #2

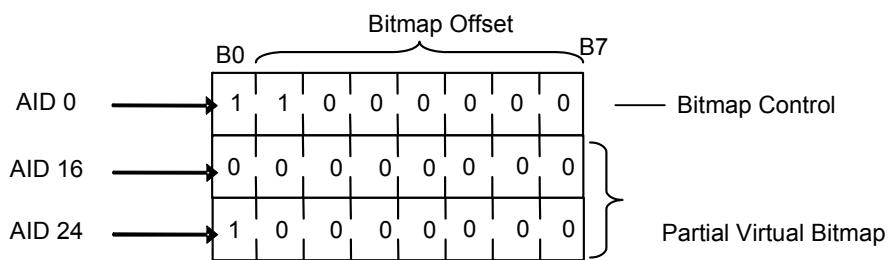

Figure L-3—Partial Virtual Bitmap example #3

The first example showing multiple BSSID operation is one in which there are eight BSSIDs and the lowest possible AID that can be assigned to any STA in this example is 8. There are no group addressed frames buffered in the AP for any of the eight BSSIDs. However, STAs with AID 9 and AID 11 have an individually addressed frames buffered in the AP. Figure L-4 shows the values of the Bitmap Control and Partial Virtual Bitmap fields that would be part of the TIM element for this example when either Method A or Method B is used. It is noted that Method B reduces to Method A in this example.

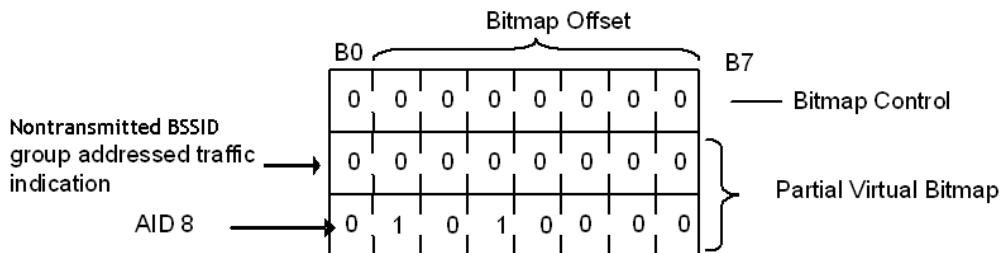

Figure L-4—Partial Virtual Bitmap example #4, Method A and Method B

In the next example, there are eight BSSIDs and the lowest possible AID that can be assigned to any STA in this example is 8. There are group addressed frames buffered at the AP for the transmitted BSSID, and the DTIM Count field in the TIM element of the transmitted BSSID is 0. The nontransmitted BSSID with BSSID Index 3 also has the DTIM Count field set to 0 and has buffered group addressed frames. All other nontransmitted BSSIDs have no buffered group addressed frames. In addition, STAs with AID 12, AID 17,

AID 22 and AID 24 have data buffered at the AP. Figure L-5 shows the values of the Bitmap Control and Partial Virtual Bitmap fields that would be part of the TIM element for this example when either Method A or Method B is used. It is noted that Method B reduces to Method A in this example.

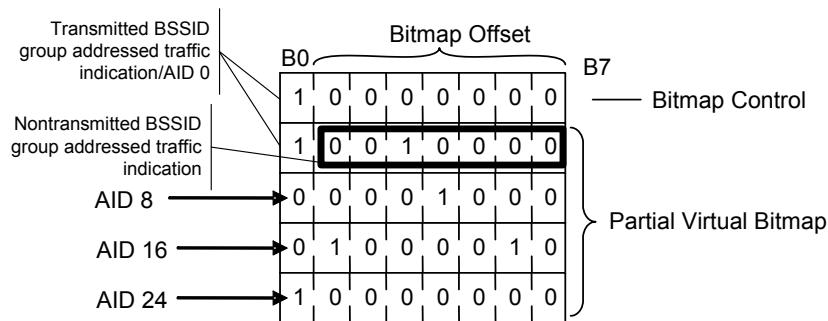

Figure L-5—Partial Virtual Bitmap example #5, Method A or Method B

In the third example, there are sixteen BSSIDs and the lowest possible AID that can be assigned to any STA is 16 ($n=4$, $k=15$, see 9.4.2.6). There are no group addressed frames buffered at the AP for the transmitted BSSID, and the DTIM Count field in the TIM element of the transmitted BSSID is 0. The nontransmitted BSSID Index 3 also has the DTIM Count field set to 0 and has group addressed frames buffered at the AP. All other nontransmitted BSSIDs have no buffered group addressed frames. In addition, the STA with AID 39 has individually addressed frames buffered at the AP. Figure L-6 and Figure L-7 show the values of the Bitmap Control and Partial Virtual Bitmap fields that would be part of the TIM element for this example when Method A ($N_2=4$, see 9.4.2.6) and Method B ($N_0=2$, $N_1=4$, $N_2=4$, see 9.4.2.6) are used, respectively.

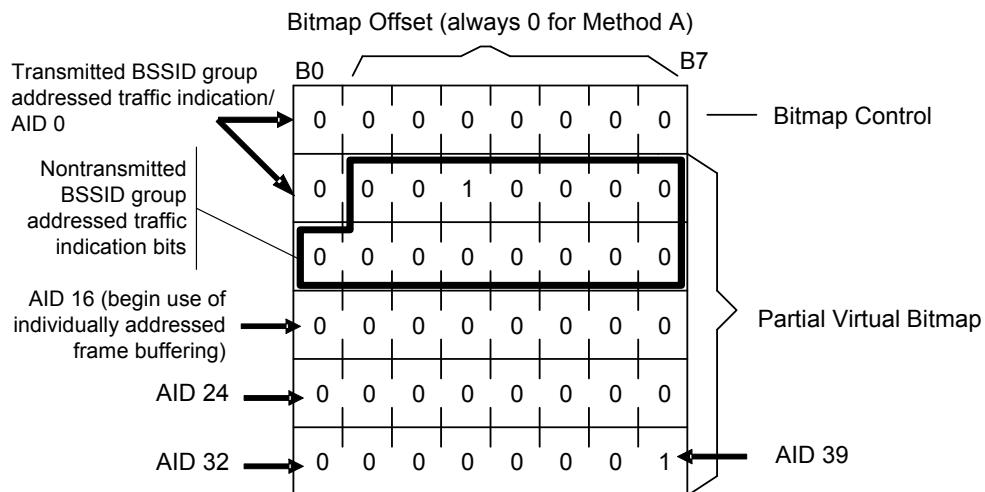

Figure L-6—Partial Virtual Bitmap example #6, Method A

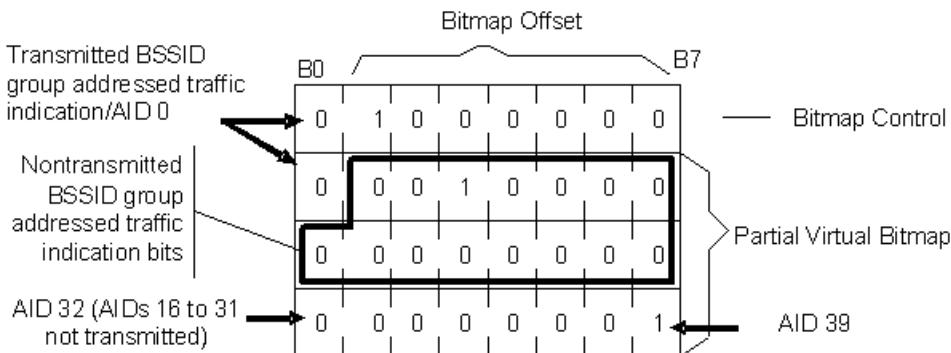

Figure L-7—Partial Virtual Bitmap example #6, Method B

L.3 Sample C code

The following C source code illustrates how to construct the Partial Virtual Bitmap. Because this is an illustration, no efficiency or appropriateness for actual implementation is implied.

```
#include <stdio.h>
#include <limits.h>

#define ADD_TIM_BIT      0
#define REMOVE_TIM_BIT   1

#define TIM_ELEMENT_ID   5
#define TIM_BASE_SIZE    3      /* size of TIM fixed fields */

#define AID_SIZE          2008   /* valid AIDs are numBssids thru 2007 */
#define VBM_SIZE          251    /* size of VBM array = 2008/8 = 251 */
#define MAX_BSSIDS        128    /* maximum possible number of BSSIDs per AP,
                                is a power of 2 */

typedef unsigned char UINT8;

Annex M

(informative)

Integration function

M.1 Introduction

The purpose of this annex is to guide the implementor of an ESS's infrastructure that includes a portal that integrates the ESS's infrastructure with a wired LAN.

M.2 Ethernet V2.0/IEEE 802.3 LAN integration function

It is recommended that any ESS's infrastructure that logically incorporates a portal that integrates the ESS's infrastructure with an Ethernet V2.0/IEEE 802.3 LAN use the procedures defined in ISO/IEC Technical Report 11802-5:1997 (previously known as IEEE Std 802.1H-1997), with the two-entry selective translation table (STT) shown in Table M-1, to perform the integration service. Note that the majority of such IEEE 802.11 implementations currently use this STT, rather than the single-entry STT recommended in Annex A of IEEE Std 802.1H-1997 [B24].

Table M-1—IEEE 802.11 integration service STT

| Protocol use | Ethernet type value | Encoding in Type field | |
|---|---------------------|------------------------|--------------|
| | | First octet | Second octet |
| AppleTalk Address Resolution Protocol | 0x80F3 | 80 | F3 |
| Novell NetWare Internetwork Packet exchange (IPX) | 0x8137 | 81 | 37 |

M.3 Example

The tables below illustrate the translations performed by the integration service using the encapsulation/decapsulation procedures defined in ISO/IEC Technical Report 11802-5:1997 with the IEEE 802.11 integration service STT. These tables show how the octets in an IEEE 802.11 MSDU correspond to the octets in the Ethernet/IEEE 802.3 MSDU that represents the same LLC SDU on the integrated Ethernet/IEEE 802.3 LAN. Table M-2 shows the encapsulation example, and Table M-3 shows the decapsulation example.

In the tables below the rows that have a 81-00 Type/Length field value represent bridging between an Ethernet/IEEE 802.3 LAN and an IEEE 802.11 LAN. Both LANs are carrying VLAN-tagged MSDUs (User Priority=4, DEI=0, VLAN ID=1893).

Table M-2—Ethernet/IEEE 802.3 to IEEE 802.11 translation

| Protocol | Type / Length | LLC header | IEEE 802.11 LLC header |
|------------------------|----------------------|-------------------------|--|
| IP | 08-00 | — | AA-AA-03-00-00-00-08-00 |
| IP 802.3 ^a | length | AA-AA-03-00-00-00-08-00 | AA-AA-03-00-00-00-08-00 |
| IP ARP | 08-06 | — | AA-AA-03-00-00-00-08-06 |
| AppleTalk (1) | 80-9B | — | AA-AA-03-00-00-00-80-9B |
| AppleTalk (2) | length | AA-AA-03-08-00-07-80-9B | AA-AA-03-08-00-07-80-9B |
| AppleTalk AARP (1) | 80-F3 | — | AA-AA-03-00-00-F8-80-F3 |
| AppleTalk AARP (2) | length | AA-AA-03-00-00-00-80-F3 | AA-AA-03-00-00-00-80-F3 |
| IPX Ethernet II | 81-37 | — | AA-AA-03-00-00-F8-81-37 |
| IPX SNAP | length | AA-AA-03-00-00-00-81-37 | AA-AA-03-00-00-00-81-37 |
| IPX 802.2 | length | E0-E0-03 | E0-E0-03 |
| IPX 802.3 ^b | length | FF-FF | FF-FF |
| VLAN-tagged IP | 81-00 | 87-65-08-00 | AA-AA-03-00-00-00-81-00-87-65- AA-AA-03-00-00-00-08-00 ^c |

^aThis format of IP packet over IEEE Std 802.3 is deprecated, and the change to the canonical Ethernet IP format is not considered harmful.

^bThe use of this nonstandard format happens to work with these rules, even though the FF-FF is not actually a valid LLC header value. (The broadcast LSAP is not valid as a source SAP in LLC. See IEEE Std 802.2.)

^cThe sequence of octets AA-AA-03-00-00-00-81-00-87-65 represents the SNAP-encoded VLAN header. The sequence of octets AA-AA-03-00-00-00-08-00 represents the IEEE 802.1H™-translated Type/Length field, using the same translation as the untagged IP MSDU on the first line of Table M-2.

Table M-3—IEEE 802.11 to Ethernet/IEEE 802.3 translation

| Protocol | IEEE 802.11 LLC header | Type / Length | LLC header |
|-----------------------|-------------------------------|----------------------|-------------------------|
| IP | AA-AA-03-00-00-00-08-00 | 08-00 | — |
| IP 802.3 ^a | AA-AA-03-00-00-00-08-00 | length | — |
| IP ARP | AA-AA-03-00-00-00-08-06 | 08-06 | — |
| AppleTalk (1) | AA-AA-03-00-00-00-80-9B | 80-9B | — |
| AppleTalk (2) | AA-AA-03-08-00-07-80-9B | length | AA-AA-03-08-00-07-80-9B |
| AppleTalk AARP (1) | AA-AA-03-00-00-F8-80-F3 | 80-F3 | — |
| AppleTalk AARP (2) | AA-AA-03-00-00-00-80-F3 | length | AA-AA-03-00-00-00-80-F3 |
| IPX Ethernet II | AA-AA-03-00-00-F8-81-37 | 81-37 | — |

Table M-3—IEEE 802.11 to Ethernet/IEEE 802.3 translation (continued)

| Protocol | IEEE 802.11 LLC header | Type / Length | LLC header |
|--------------------|---|---------------|-------------------------|
| IPX SNAP | AA-AA-03-00-00-00-81-37 | length | AA-AA-03-00-00-00-81-37 |
| IPX 802.2 | E0-E0-03 | length | E0-E0-03 |
| IPX 802.3 | FF-FF | length | FF-FF |
| VLAN-tagged IP ARP | AA-AA-03-00-00-00-81-00-87-65- AA-AA-03-00-00-00-08-06 | 81-00 | 87-65-08-06 |

^aThis format of IP packet does not survive the trip across the non-IEEE-802.3 LAN intact.

M.4 Integration service versus bridging

There are a number of differences between the IEEE 802.11 integration service and the service provided by an IEEE 802.1D bridge [B23]. In the IEEE 802.11 architecture a portal provides the minimum connectivity between an IEEE 802.11 WLAN and a non-IEEE-802.11 LAN. Requiring an IEEE 802.1D bridge in order to be compliant with IEEE Std 802.11 would unnecessarily render some implementations noncompliant.

The most important distinction is that a portal has only one “port” (in the sense of IEEE Std 802.1D, for example) through which it accesses the DS. This renders it unnecessary to update bridging tables inside a portal each time a STA changes its association status. In other words, the details of distributing MSDUs inside the IEEE 802.11 WLAN need not be exposed to the portal.

Another difference is that the DS is not an IEEE 802 LAN (although it carries IEEE 802 LLC SDUs). Requiring that the DS implements all behaviors of an IEEE 802 LAN places an undue burden on the architecture.

Finally, it is an explicit intent of this standard to permit transparent integration of an IEEE 802.11 WLAN into another non-IEEE-802.11 LAN, including passing bridge PDUs through a portal. While an implementer might wish to attach an IEEE 802.1D bridge to the portal (note that the non-IEEE-802.11 LAN interface on the bridge need not be any particular type of LAN), it is not an architectural requirement of this standard to do so.

Annex N

(informative)

AP functional description

N.1 Introduction

This informative annex seeks to clarify the AP functional description. At times there is some confusion surrounding the term *AP* and the relation of that term to the AP functions and common implementations of AP devices. The core IEEE 802.11 conceptual definitions that surround the AP (refer to Clause 4) are abstract (and can sometimes cause confusion), but Clause 4 definitions are crafted to be flexible and hence serve to allow the adaptation and extension of this standard in a wide variety of ways.

In this annex a wireless local area network (WLAN) system is a system that includes the distribution system (DS), access point (AP), and portal entities. It is also the logical location of distribution and integration service functions of an extended service set (ESS). A WLAN system contains an optional portal and one or more APs in addition to the DS.

N.2 Terminology

An enhanced description of these access entities begins with clarification of several terms.

This standard defines an entity called a *STA*. STAs can operate in different modes. The possible operational modes of a STA are:

- a) Infrastructure mobile STAs
- b) Independent mobile STAs
- c) Access control mode STAs
- d) Mesh STAs

The mobile STAs are the STA entities that are ordinarily moving around, but might also be in a fixed location. The mobile adjective prefix often helps in visualizing the type of STA under discussion.

Infrastructure mobile STAs operate in infrastructure BSS mode, i.e., they are the users of an AP. Devices that incorporate an infrastructure mobile STA are referred to in this annex by the term mobile unit. A mobile unit device might consist of just a mobile STA implementation, but also likely includes an SME and a client. The exact configuration of the mobile unit it is not relevant to the descriptions in this annex.

Independent mobile STAs operate in IBSS mode. Independent mobile STAs form autonomous networks that do not require an AP.

A STA can also form an integral part of an AP. To do so, the STA operates in access control mode. This type of STA is called an *access control mode STA* (ACM_STA).

The primary function of an AP is to provide the mobile units with access to the DS, as shown in the Unified Modeling Language (UML) use case diagram in Figure N-1. Complete UML specifications can be found in Rumbaugh [B57]. The UML diagram shows a system boundary box containing a single use case (ellipse). Entities that are outside the system boundary box are shown as stick people. These external entities represent the actors (formal term), or users, of the system. Since the actors are outside the system boundary, their

internal behavior is not described (i.e., it is out of scope for the current view). Instead, references to the external entities are limited to descriptions of their interactions with, and expectations of, the system, which is accomplished by describing the use cases and scenarios (i.e., functions) of the system and later (in Figure N-4) a decomposition of the entities (objects and behaviors) within the system that provide that functionality. The use case diagram employs connecting lines to indicate relationships between the various artifacts present in the diagram. Relationship lines lacking arrows on both ends indicate that there is a bidirectional relationship between the artifacts.

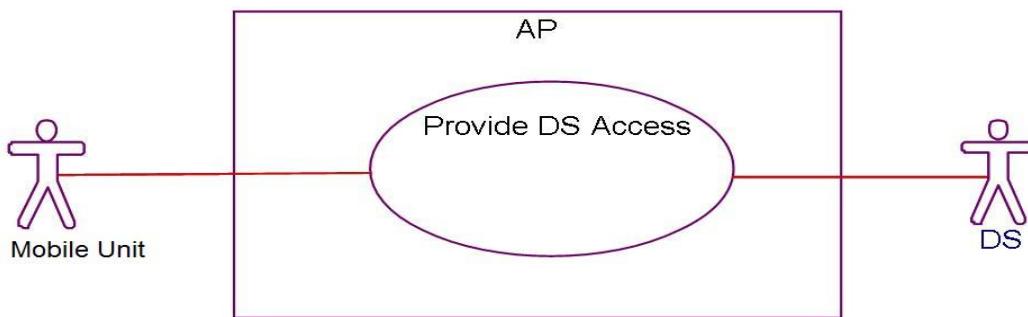

Figure N-1—Very high level UML use case diagram for the AP

The DS enables communication between mobile units and the construction of collections of APs. To enable communication between mobile units and a non-IEEE-802.11 LAN entity requires the presence of a (logical) portal from the DS to the non-IEEE-802.11 LAN.

Often the functions of an AP (which includes an ACM_STA), a DS, and a portal, are combined into a single device, referred to in this annex as an *access unit* (AU). While reference to that basic implementation is commonplace, it is helpful to discuss the abstract case: a WLAN system. The WLAN system includes the DS, an optional portal, APs, and the AP's STAs. It is also the logical location of distribution and integration service functions of an ESS. An infrastructure WLAN system contains one or more APs and zero or one portal in addition to the DS.

The primary function of a WLAN system is to provide the mobile units with access to the non-IEEE-802.11 LAN, as shown in Figure N-2. A secondary function is to provide the mobile units with access to each other.

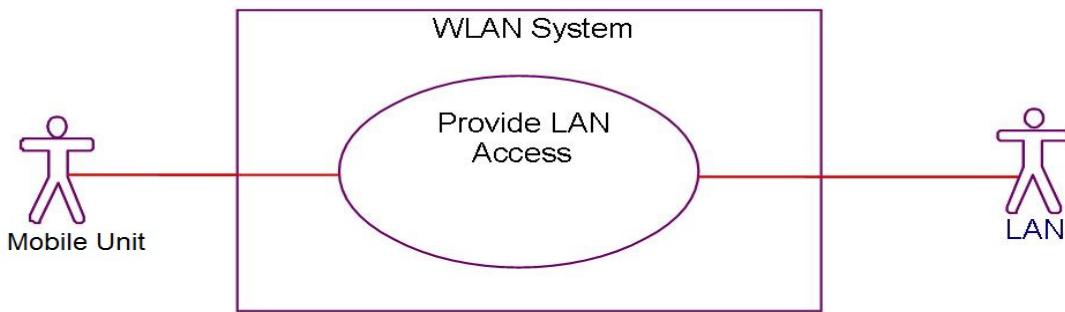

Figure N-2—Very high level UML use case diagram for the WLAN system

The primary functions of the WLAN system can be further characterized as follows:

- a) Provide non-IEEE-802.11 LAN access.
 - 1) Includes mobile unit validation.
 - 2) Includes moving data between the mobile units and the non-IEEE-802.11 LAN.
 - i) Uses a special data movement function called *filtering data*.
- b) Configure the system.

Those high-level use cases of the WLAN system are shown in the UML use case diagram in Figure N-3. The UML diagram shows multiple use cases with two types of relationships between those use cases: include and generalization. The include relationship “includes” functionality in one use case that is described by another use case. The “provide LAN Access” use case includes the functionality of the “Validate mobile unit” use case. The generalization relationship indicates that one use case is a more general form of another use case. The relationship line with a hollow triangle at the end indicates that the “Move Data” use case is a more generalized form of the “Filter Data” use case. Or, equivalently, “Filter Data” is a more specialized form of “Move Data.” The constraint artifact (in the lower left corner of the diagram) requires the WLAN system and the mobile units to be set to the same SSID.

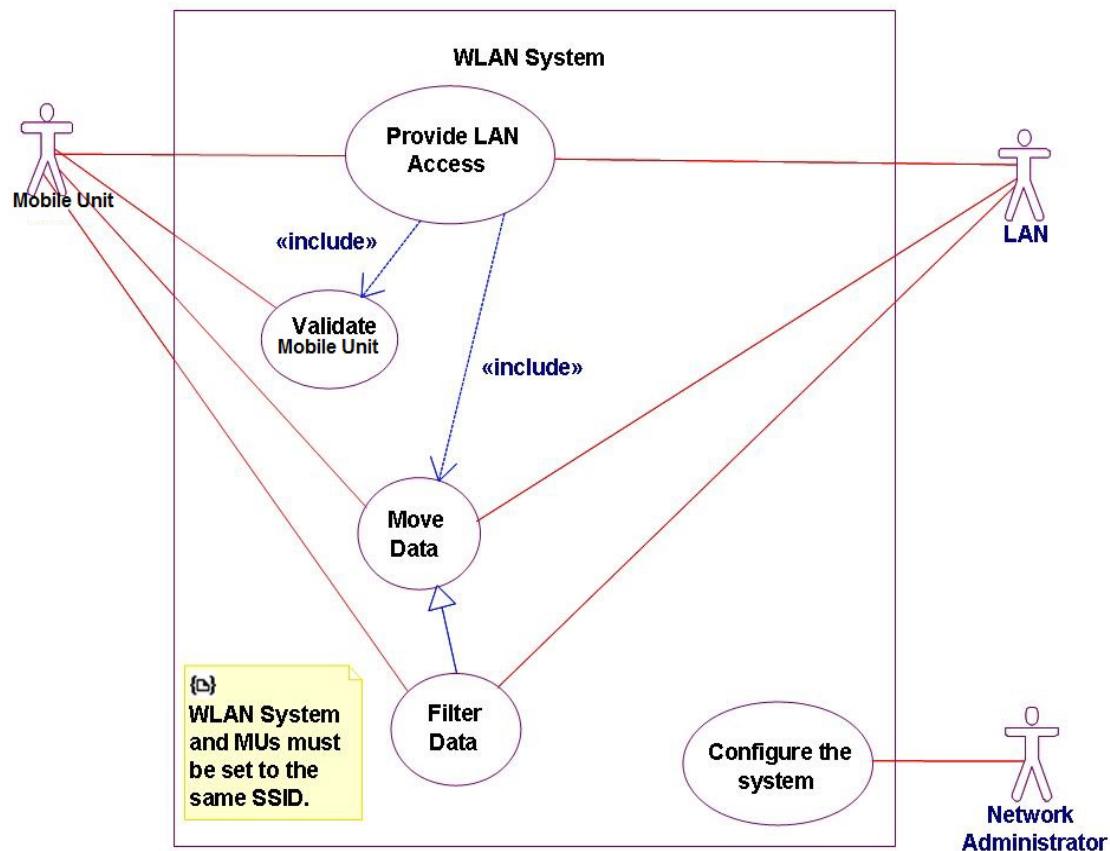

Figure N-3—High-level UML use case diagram for the WLAN system

The primary functions of the WLAN system, depicted in the UML object model diagram in Figure N-4, are provided by the AP, and DS entities, the latter via the DSSs. The portal is merely a conceptual link from the DS to the non-IEEE-802.11 LAN. The UML object model diagram shows a package containing a set of object classes. References to the actors (external entities) are limited to descriptions of their interactions

with, and expectations of, the object classes, which is accomplished by describing the attributes and behaviors of the class entities. The object model diagram uses connecting lines to indicate interfaces (called *associations* in UML terminology) between the various artifacts present in the diagram. UML association lines lacking arrows on both ends indicate that there is a bidirectional interface between the artifacts. The UML association lines are annotated with multiplicity counts to indicate the how many entities might fill the position at that end of the association.

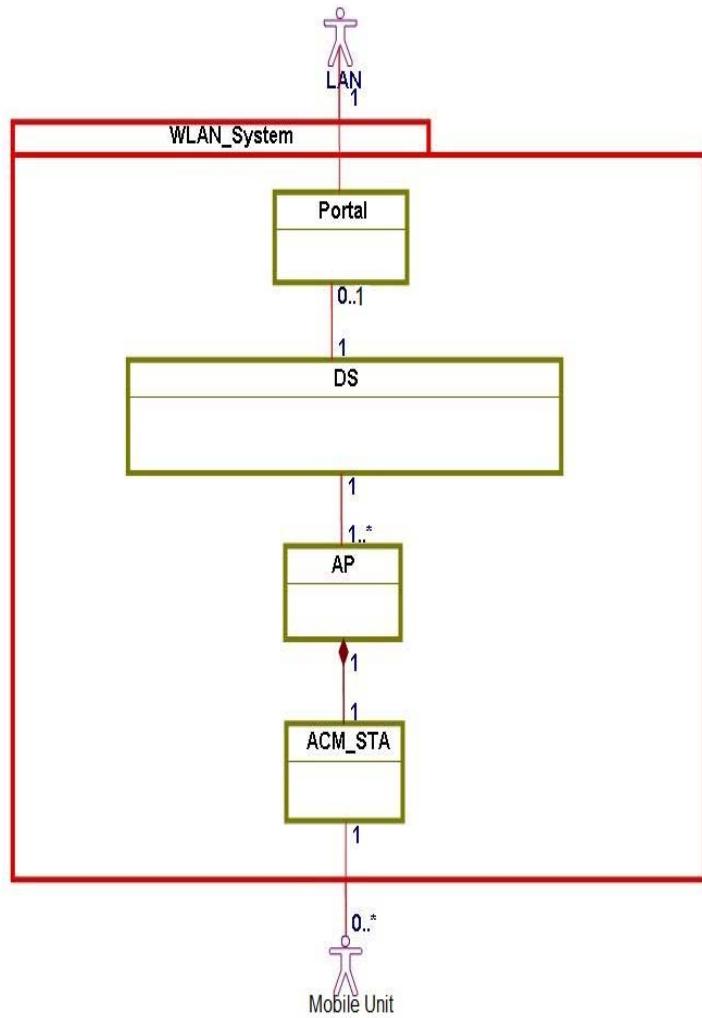

Figure N-4—High-level UML entity diagram for the WLAN system

Figure N-4 also shows the relationships between the WLAN system entities. There exists a bidirectional association between zero or more [0..*] mobile units and a single (given) ACM_STA. The solid diamond terminated line indicates that there is a composition relationship between the ACM_STA and the AP, i.e., the AP is composed of (or always has an) ACM_STA. Hence there is a one-to-one mapping between APs and ACM_STAs. This composition and one-to-one relationship can also be drawn as shown in Figure N-5. These two forms are equivalent. There are one or more [1..*] APs connected to a single DS. The DS in turn connects to zero or one [0..1] portal. The portal connects to a single non-IEEE-802.11 LAN.

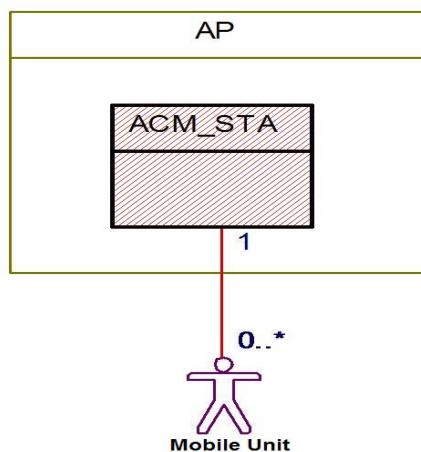

Figure N-5—AP UML composition diagram (alternate syntax)

N.3 Primary ACM_STA functions

The primary functions of an ACM_STA are as follows:

- a) Instantiate the infrastructure BSS.
- b) Move data between the mobile units and the AP.

Instantiating the infrastructure BSS consists of advertising the BSS and defining timing for the entire BSS (i.e., infrastructure mode TSF). Advertising the BSS includes creating an infrastructure mode Beacon frame, transmitting that Beacon frame, and replying to mobile unit probe requests with corresponding probe response transmissions. Beacon frames and probe responses provide a way for the mobile units to find, join with the ACM_STA, and (subsequently) associate with the AP. This includes, for example, the AP providing channel, regulatory, and country information to the mobile units.

Moving data between the mobile units and the AP consists of translating between MSDUs and MPDUs, buffering data, and transmitting/receiving MPDUs via an IEEE 802.11 PHY.

N.4 Primary AP functions

The primary functions of an AP are as follows:

- a) Provide DS access for the mobile units.
 - 1) Includes mobile unit validation and extends (in some cases) to notifying the DS.
 - 2) Includes moving data between the mobile units and the DS.
 - i) Uses a special data movement function called *data filtering*.
- b) Configure the AP (both the AP itself and the included ACM_STA).

Those high-level use cases of the AP are shown in the UML use case diagram in Figure N-6. The UML extend relationship “extends” a use case with optional functions provided by another use case that are applied only in some scenarios. In Figure N-6, the “Notify the DS” use case extends the “Validate mobile unit” use case in some scenarios.

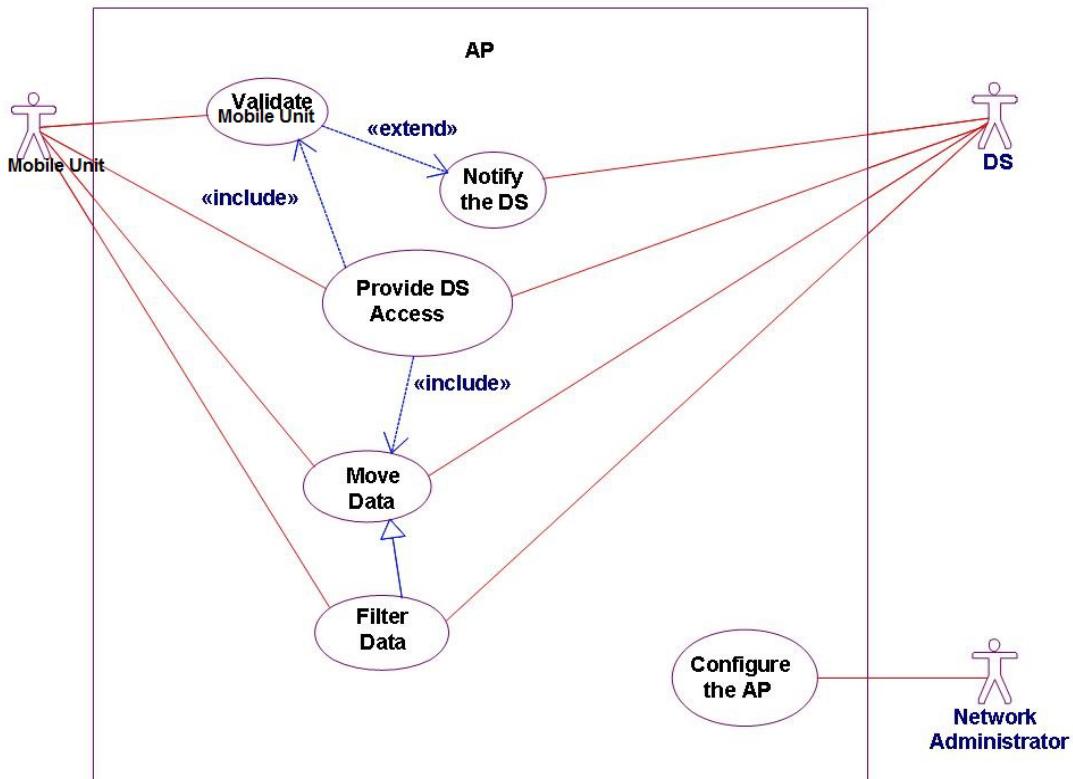

Figure N-6—High-level UML use case diagram for the AP

The AP provides DS access for the mobile units, including validating the mobile units (e.g., via STA and/or client authentication) and providing access and admission control (e.g., via the association process). An AP is literally a point of access to the DS (and, by extension, to the non-IEEE-802.11 LAN beyond). Upon validating a mobile unit, the AP updates the DS mapping of the mobile unit to the AP. DS mapping updates can, for example, be based on (re)association requests (received from the ACM_STA) or aging of inactive links (based on session timers). An AP might also receive access control updates directly from other APs, via a protocol outside the scope of this standard, in the form of inter-AP notifications of mobile unit association events and transitions. In this way, mobile unit validation and subsequent changes in mobile unit access control lead to adjustments in how data are allowed to move through the AP (i.e., between the mobile units and the DS).

Providing DS access for the mobile units also includes moving data between the mobile units and the DS, which is accomplished by moving MSDUs between the ACM_STA and the DS (bidirectionally).

The moving data function includes “filtering data.” The filtering data function controls which MSDUs (if any) are moved between the DS and the mobile units. For example, filtering of data to and from a particular mobile unit is adjusted based on the various stages of validation of that mobile unit.

The AP also provides a function for configuration. Configuring the AP includes configuring the AP itself as well as the included ACM_STA. For example, configuration might include setting the local values of the SSID, PHY channel, beacon interval, and so on.

N.5 Primary DS functions

The primary functions of the DS (i.e., the DSSs) are as follows:

- a) Map mobile unit to AP (for DS-to-mobile unit traffic delivery).
- b) Move data.

The DS's mobile unit-to-AP map determines which AP is to be used for a given mobile unit's data delivery. This function includes mapping update adjustments, which are based on notification from the APs, of changes in mobile unit access control.

Moving data consists of moving MSDUs among the APs (including returning MSDUs to the source AP for mobile unit-to-mobile unit communications) and between the APs and the portal.

N.6 Primary portal function

The primary function of a portal is as follows:

- a) Move data with a special data movement function called *data transformation*.

Moving data consists of moving MSDUs between the DS and the external non-IEEE-802.11 LAN. Moving data through the portal transforms the MSDUs using the integration function. The integration function translates external non-IEEE-802.11-LAN MSDUs to and from IEEE 802.11 MSDUs using, for example, the procedures defined in Annex M.

Annex O

(informative)

Additional VHT and HT information

O.1 VHT and HT waveform generator tool

As an informative extension to this standard, waveform generator tools have been written to model the PHY transmission process described in Clause 17, Clause 18, Clause 19, and Clause 21.

The waveform generator can be downloaded from the public IEEE 802.11 document website. The waveform generator code that includes Clause 17, Clause 18, and Clause 19 is contained in document 11-06/1715, and the waveform generator description is contained in document 11-06/1714 (HT code). A description of the waveform generator that includes Clause 17, Clause 19, and Clause 21 and the waveform generator code itself may be found in document 11-11/0517 (VHT code).

The purpose of these tools is to promote common understanding of complex PHY algorithms, facilitate device interoperability by providing reference test vectors, and assist researchers in industry and academia to develop next generation wireless solutions.

The code is written in the MATLAB computing language and can be configured to generate test vectors for most PHY configurations, defined by this standard. Instructions on how to configure and run the tools are specified in the referenced documents.

A command line interface is used to configure the VHT code tool. For consistency with this standard, the configuration interface is made very similar to the TXVECTOR parameters defined in 21.2.2.

A command line interface and graphic user interface (GUI) exist to configure the HT code tool. For consistency with this standard, the configuration interface is made very similar to the TXVECTOR parameters defined in 19.2.2.

The waveform generator tool produces test vectors for all transmitter blocks, defined in Figure 19-2 and Figure 19-3, generating reference samples in both frequency and time domains. Outputs of the tool are time domain samples for all transmitting chains.

O.2 A-MPDU deaggregation

This subclause contains a description of the deaggregation process. Other implementations are also possible.

The receiver checks the MPDU delimiter for validity based on the CRC. It can also check that the length indicated is within the value of the LENGTH parameter indicated in RXVECTOR.

If the MPDU delimiter is valid, the MPDU is extracted from the A-MPDU. The next MPDU delimiter is expected at the first multiple of 4 octets immediately after the current MPDU. This process is continued until the end of the PPDU is reached.

If the MPDU delimiter is not valid, the deaggregation process skips forward 4 octets and checks to see whether the new location contains a valid MPDU delimiter. It continues searching until either a valid delimiter is found or the end of the PSDU is reached based on the value of the LENGTH parameter indicated in the RXVECTOR.⁶²

An A-MPDU parsing (deaggregation) algorithm is expressed (as a C programming language snippet) in Figure O-1.

```
void Parse_A_MPDU (int length)
{
    int offset = 0; /* Octet offset from start of PSDU */
    while (offset+4 < length)
    {
        if (valid_MPDU_delimiter(offset) &&
            get_MPDU_length(offset) <= (length -(offset+4)))
        { /* Valid delimiter */

            /* Receive the MPDU */
            Receive_MPDU(offset+4, get_MPDU_length(offset));

            /* advance by MPDU length rounded up to a multiple of 4 */
            offset += 4 + 4*((get_MPDU_length(offset)+3)/4);
        }
        else /* Invalid delimiter */
        {
            /* Advance 4 octets and try again */
            offset += 4;
        }
    }
}
```

NOTE 1—This algorithm is not optimized for efficiency.

NOTE 2—The delimiter signature can be used to reduce the amount of computation required while scanning for a valid delimiter. In this case, the receiver tests each possible delimiter for a matching Delimiter Signature field. Only when a match is discovered does it then check the CRC.

Figure O-1—A-MPDU parsing

⁶² This procedure occasionally wrongly interprets a random bit-pattern as a valid delimiter. When this happens, the MAC attempts to interpret a random MPDU. The MAC discards it with a high probability based on a check of the FCS field.

O.3 Example of an RD exchange sequence

Figure O-2 shows an example of the operation of the RD rules, defined in 10.28.

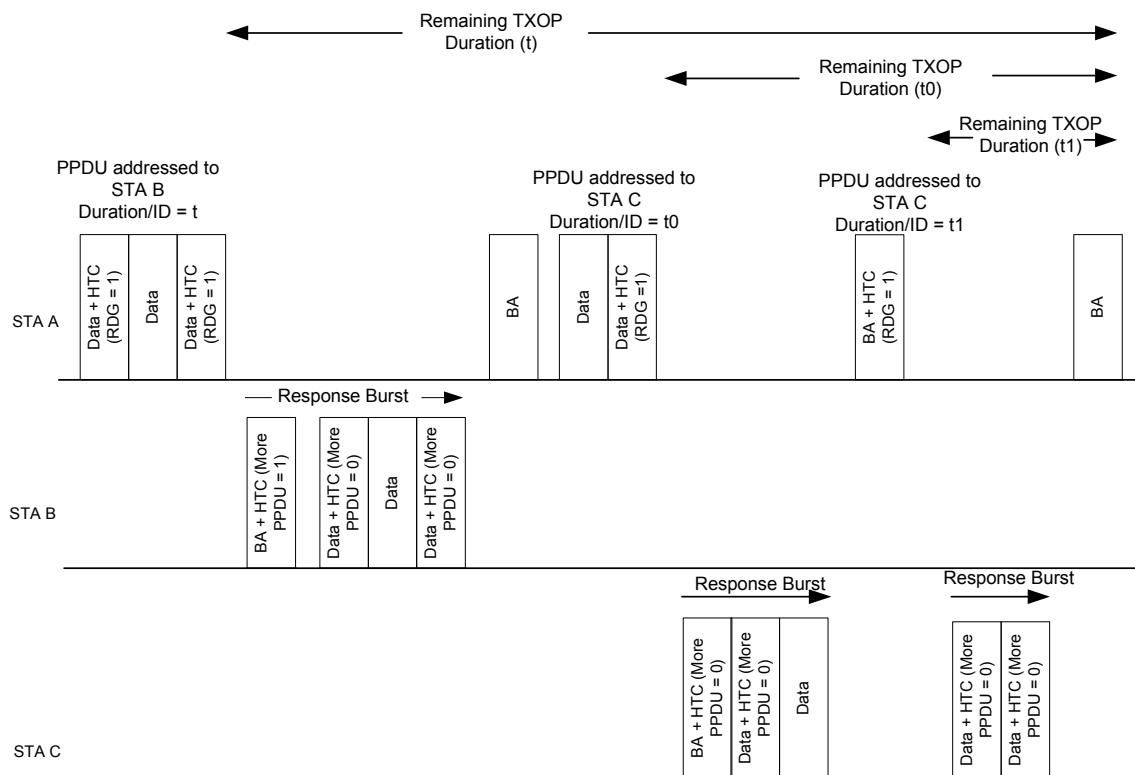

Figure O-2—Example of RD exchange sequence showing response burst

The following is a summary of Figure O-2:

- STA A (acting as RD initiator) transmits a PPDU containing MPDUs addressed to STA B (acting as RD responder). The Ack Policy field of the QoS Data frames in this PPDU is set to Implicit Block Ack Request. One or more MPDUs within this PPDU include an HT Control field with the RDG/More PPDU subfield set to 1, indicating an RDG. The Duration/ID field of MPDUs within the PPDU contains the remaining duration of the TXOP, $t \mu\text{s}$.
- STA B (the RD responder) responds with the transmission of a +HTC BlockAck frame in which the RDG/More PPDU subfield is set to 1, indicating that another PPDU will follow a SIFS or RIFS after the end of the PPDU containing the BlockAck frame.
- STA B transmits a PPDU (the second PPDU of an RD response burst) to STA A, with the Ack Policy field of its QoS Data frames set to Implicit Block Ack Request and containing one or more +HTC MPDUs in which the RDG/More PPDU subfield is set to 0, indicating that this is the last PPDU in the response burst.
- STA A (the RD initiator) regains control of the TXOP and transmits a BlockAck frame addressed to STA B to acknowledge the MPDUs transmitted by STA B in the RD response burst.
- STA A (the RD initiator) transmits a PPDU containing MPDUs addressed to STA C (acting as RD responder). The Ack Policy field of the QoS Data frames in this PPDU is set to Implicit Block Ack. This PPDU includes one or more +HTC MPDUs in which the RDG/More PPDU subfield is set to 1, indicating an RDG. The Duration/ID field of MPDUs in the PPDU contains the remaining duration of the TXOP, $t_0 \mu\text{s}$.

- f) STA C (the RD responder) transmits a PPDU to STA A, containing one or more +HTC MPDUs with the RDG/More PPDU subfield set to 0, indicating that this is the last PPDU in the response burst. This PPDU contains a BlockAck frame that is a response to the implicit block ack request of the previous PPDU, plus QoS Data frames with the Ack Policy field set to Implicit Block Ack.
- g) STA A (the RD initiator) regains control of the TXOP and transmits a BlockAck frame to STA C that acknowledges the MPDUs transmitted by STA C. This PPDU contains one or more +HTC MPDUs with the RDG/More PPDU subfield set to 1, indicating an RDG. The Duration/ID field of MPDUs in the PPDU contains the remaining duration of the TXOP, $t_1 \mu\text{s}$.
- h) STA C (the RD responder) transmits a PPDU to STA A, containing QoS data +HTC MPDUs with the Ack Policy field set to Implicit Block Ack Request and the RDG/More PPDU subfield set to 0. This is the only PPDU in the RD response burst.
- i) STA A transmits a BlockAck frame to STA C that acknowledges the MPDUs transmitted by STA C in the RD response burst.

O.4 Illustration of determination of NDP addresses

Determination of NDP SA and DA are illustrated in Figure O-3 and Figure O-4.

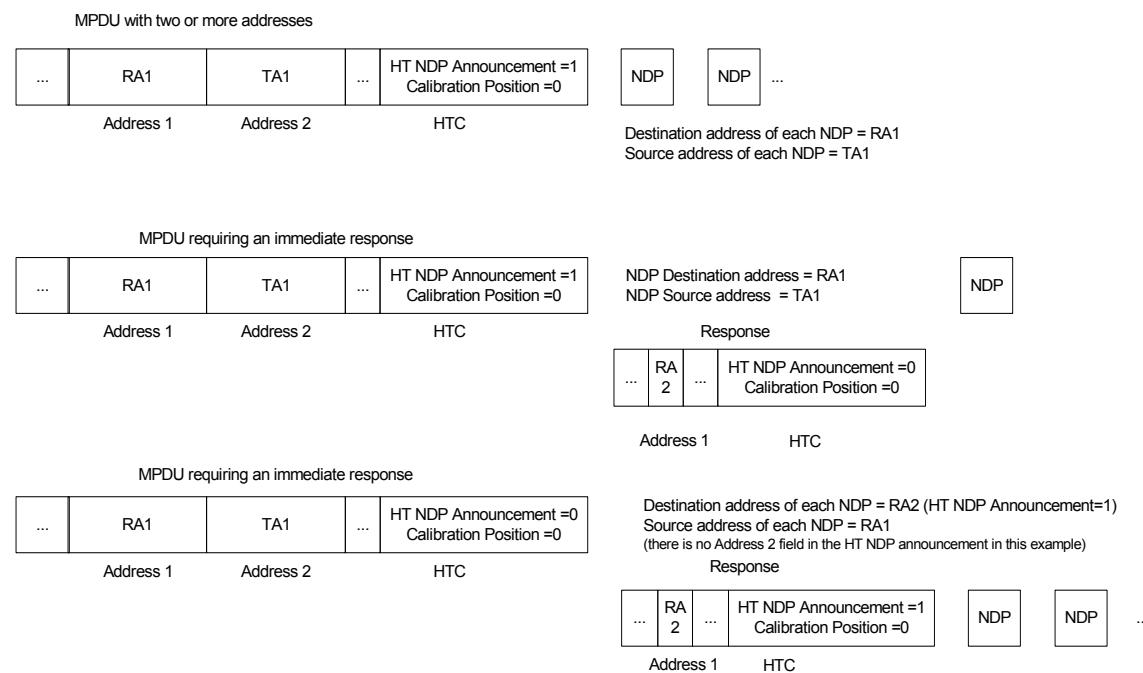

Figure O-3—Determination of NDP source and destination for unidirectional NDP sequences

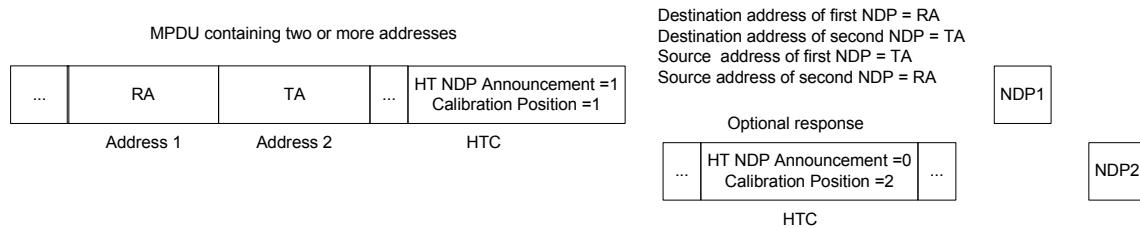

Figure O-4—Determination of NDP source and destination for bidirectional NDP sequence

O.5 20/40 MHz BSS establishment and maintenance

O.5.1 Signaling 20/40 MHz BSS capability and operation

A BSS that occupies 40 MHz of bandwidth and that is administered by an HT AP is called a *20/40 MHz BSS*.

An HT AP that has `dot11FortyMHzOperationImplemented` equal to true sets the Supported Channel Width Set subfield of the HT Capabilities element to a nonzero value. The AP might also operate a 20/40 MHz BSS. The Supported Channel Width Set subfield of the HT Capabilities element that is transmitted by the AP indicates the possible operating mode of the BSS and of the AP, but the value in this field is not an indication of the current BSS bandwidth of either the AP or the BSS.

An HT AP signals the operating width of the BSS through the Secondary Channel offset field of the HT Operation element. A nonzero value in this field indicates that a secondary channel exists; in other words, the BSS is a 20/40 MHz BSS. A value of 0 in this field indicates that the BSS is operating as a 20 MHz BSS.

An HT AP that has `dot11FortyMHzOperationActivated` equal to true sets its STA Channel Width field of the HT Operation element to a nonzero value. This field signals the current operating mode of the AP, not the BSS. An HT AP might operate a 20/40 MHz BSS while it is operating as a 20 MHz device. Such a situation would support, for example, 40 MHz bandwidth DLS traffic among associated STAs, but only 20 MHz bandwidth traffic between STAs and the AP.

O.5.2 Establishing a 20/40 MHz BSS

Before starting a 20/40 MHz BSS, a 40MC HT AP is required by the rules defined in 11.16.5 to examine the channels of the current regulatory domain to determine whether the operation of a 20/40 MHz BSS might unfairly interfere with the operation of existing 20 MHz BSSs. The AP (or some of its associated HT STAs) is required to scan all of the channels of the current regulatory domain in order to ascertain the operating channels of any existing 20 MHz BSSs and 20/40 MHz BSSs. This type of scanning is called *OBSS scanning*. The particulars of OBSS scanning are controlled by the following MIB attributes:

- `dot11FortyMHzOptionImplemented`
- `dot112040BSSCoexistenceManagementSupport`
- `dot11FortyMHzIntolerant`
- `dot11BSSWidthTriggerScanInterval`
- `dot11BSSWidthChannelTransitionDelayFactor`
- `dot11OBSSScanPassiveDwell`
- `dot11OBSSScanActiveDwell`

- dot11OBSSScanPassiveTotalPerChannel
- dot11OBSSScanActiveTotalPerChannel
- dot11OBSSScanActivityThreshold

Specific values for these MIB attributes are provided to set minimum scan times for passive scanning of each channel, and a separate minimum time is provided for active scanning of each channel. A total minimum amount of scanning per channel is required before a determination can be made to allow the operation of a 20/40 MHz BSS.

The rules that are applied when determining whether a 20/40 MHz BSS can be established are intended to avoid a full or partial overlap of the secondary channel of the 20/40 MHz BSS with an existing primary channel of either a 20 MHz BSS or a 20/40 MHz BSS. The lack of partially overlapping channels in the 5 GHz band allows these rules to be written as recommendations, while in the 2.4 GHz band, they are requirements.

An additional constraint on establishing a 20/40 MHz BSS includes the allowance for any IEEE 802.11 device to explicitly prohibit the operation of the 20/40 BSS mode due to other considerations. For example, if an IEEE 802.15.1™ WPAN device is operating in the area, that device is likely to be unable to communicate successfully with a paired receiver if the number of available IEEE 802.15.1 WPAN channels falls below a given threshold. Operation of a 20/40 MHz BSS in the 2.4 GHz band can contribute to the reduction of the number of available IEEE 802.15.1 WPAN channels, possibly pushing the available channels below that threshold.

To promote sharing of the spectrum resource under such circumstances, it might be desirable to prohibit the operation of a 20/40 MHz BSS. As such, the 20/40 BSS coexistence mechanism allows a STA to transmit Management frames containing a value of 1 for the Forty MHz Intolerant field. (The MIB attribute dot11FortyMHzIntolerant determines the setting of the value of the Forty MHz Intolerant field in transmitted frames, and the setting of the value of the MIB attribute is beyond the scope of this standard.) Receivers of such frames on any channel in the band are not allowed to establish a 20/40 MHz BSS anywhere in the band for a duration of $\text{dot11BSSWidthChannelTransitionDelayFactor} \times \text{dot11BSSWidthTriggerScanInterval}$ seconds. To effect this requirement, monitoring STAs and APs maintain a countdown timer to indicate that a prohibition is in force. The countdown timer is reloaded with the value $\text{dot11BSSWidthChannelTransitionDelayFactor} \times \text{dot11BSSWidthTriggerScanInterval}$ seconds each time that the STA or AP observes a Management frame containing a value of 1 for the Forty MHz Intolerant field. STAs communicate changes in their countdown counter (i.e., transitions between a zero value and a nonzero value) to their associated AP through the 20 MHz BSS Width Request field of the 20/40 BSS Coexistence Management frame.

O.5.3 Monitoring channels for other BSS operation

Some of the STAs that are associated with a 20/40 MHz BSS perform monitoring so that the conditions which allowed the establishment of the 20/40 MHz BSS do not change to conditions that would disallow the existence of the 20/40 MHz BSS.

Monitoring STAs keep a local record of channels that are in use by other BSSs. STAs that receive Beacon frames determine the primary channel by examining the DSSS Parameter Set element. Secondary channel existence and channel information are determined by examining the Secondary Channel Offset field of the 20/40 BSS Coexistence element. Monitoring STAs also record receptions of frames that contain a value of 1 for the Forty MHz Intolerant field. Any changes to the local record that would create a prohibition against 20/40 MHz BSS operation are immediately reported to the associated AP through the transmission of a 20/40 BSS Coexistence Management frame (i.e., with the 20 MHz BSS Width Request field set to 1). The reception of a 20 MHz BSS Width Request field equal to 1 at the AP causes the AP to switch the BSS to 20 MHz operation immediately.

Any change of a channel in use that had not previously been in use is also reported immediately within a 20/40 BSS Coexistence Management frame. The AP examines the new in-use channel information to determine whether any changes in BSS width operation are required (i.e., to see if any changes have occurred that indicate an overlap of the secondary channel). If a change to 20 MHz BSS operation is required, the change occurs immediately.

Conditions that prevent the operation of a 20/40 MHz BSS might be transient. If the number of channels in use is reduced or all STA signaling 40 MHz intolerance leave the area, an AP might choose to revert to 20/40 MHz operation, if allowed to do so. However, the conditions that allow 20/40 MHz BSS operation have to persist for a period of $\text{dot11BSSWidthChannelTransitionDelayFactor} \times \text{dot11BSSWidthTriggerScanInterval}$ seconds before a STA can signal that the conditions have changed, and the same period of time has elapsed before an AP can resume 20/40 MHz BSS operation.

STAs that do not monitor channels through OBSS scanning and do not report any channel information or received Forty MHz Intolerant field information to their associated AP are listed here:

- Non-HT STAs
- HT STAs that are exempt from scanning as specified in 11.16.6
- HT APs, once the 20/40 MHz BSS is established
- HT STAs that are associated with an AP whose BSS is operating on a channel that is not in the 2.4 GHz band
- HT STAs that are associated with an HT AP that is not 40-MHz-capable (as indicated by a value of 0 in the Supported Channel Width Set subfield of the HT Capabilities element)

All other HT STAs that are associated with a 40-MHz-capable HT AP whose BSS is operating on a channel in the 2.4 GHz band monitor channels through OBSS scanning and report any channel information or received Forty MHz Intolerant field information to their associated AP.

All MIB attributes that are employed by the 20/40 BSS Coexistence mechanism are maintained by the AP, which has the ability to provide updates to the MIB attribute values to the associated STA by transmitting an OBSS Scan Parameters element.

Annex P

(informative)

Location and Time Difference accuracy test

P.1 Location via Time Difference of arrival

The location of a device might be determined using multiple methods, including:

- Signal strength at different sensors
- Time of flight between the device and different sensors
- Time difference of arrival between the device and pairs of sensors

A typical implementation of the time difference of arrival method requires that the sensors are co-channel, have synchronized clocks, and receive the same transmission from the device. The sensor's time of arrival measurements are shared, and the device location is determined via multilateration, i.e., each pair of sensor measurements provides a time difference of arrival measurement that represents a hyperbola in 2D space of most likely candidate locations, and the overlap of the multiple hyperbola from multiple pairs of sensors leads to the location estimate. The single time of departure is not relevant in this typical multilateration implementation as it is canceled out when time differences of arrival are computed.

When the sensors are on different channels, such as APs in a typical multi-channel deployment, the device transmits on each channel and thus with multiple times of departure. In this environment it is necessary for the device to advertise each time of departure so that it can be subtracted from the times of arrivals measured by sensors on different channels. Furthermore, the device's clock frequency typically does not match the clock frequency of the synchronized sensors, and so the device should transmit on the same channel multiple widely spaced times in order for the sensors to estimate the device's clock frequency relative to themselves and to be able to suitably scale the device's advertised times of departure.

An example transmission sequence comprises frames transmitted on channels 1, 6, 11, 1 at 2.4 GHz. From this, the device's clock frequency can be determined relative to the synchronized APs on channel 1, and all APs on channels 1, 6, and 11 can measure a time of arrival. These four transmissions enable a single location calculation. The Time of Departure Accuracy test in P.2 is designed to measure errors within such a transmission sequence that would degrade a multi-channel time difference of arrival location scheme.

P.2 Time Difference of departure accuracy test

The Time Difference of Departure accuracy test is an informative description of how time difference of departure accuracy can be measured for any parameterizable PHY waveform. This accuracy test does not apply when the Time of Departure timestamps are exclusively used for timing measurement (see 11.24.5).

The Time Difference of Departure accuracy test is parameterized by the following test parameters:

- TIME_OF_DEPARTURE(j, i), $1 \leq j \leq 500, 1 \leq i \leq I$ (scalar entries)
- MULTICHANNEL_SAMPLING_RATE (scalar)
- FIRST_TRANSITION_FIELD(j, i), $1 \leq j \leq 500, 1 \leq i \leq I$ (waveform entries)
- SECOND_TRANSITION_FIELD(j, i), $1 \leq j \leq 500, 1 \leq i \leq I$ (waveform entries)
- TRAINING_FIELD(j, i), $1 \leq j \leq 500, 1 \leq i \leq I$ (waveform entries)
- TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH (scalar)

TIME_OF_DEPARTURE(j,i) is exposed externally through the TOD Timestamp field in the Time of Departure subelement in Location Track Notification frames.

The Time Difference of Departure accuracy test is performed as follows or in an equivalent or more accurate manner.

The Time Difference of Departure accuracy test is performed by instrumentation capable of converting signals transmitted on one or more channels into a stream of complex samples at f_s sample/s or more, with sufficient accuracy in terms of I/Q arm amplitude and phase balance, dc offsets, phase noise, etc, and at a fixed delay from the transmitter. The minimum sampling rate is MULTICHANNEL_SAMPLING_RATE sample/s respectively. A possible embodiment of such a setup is converting the signal to a low IF frequency with a cabled microwave synthesizer, sampling the signal with a digital oscilloscope and decomposing it digitally into quadrature components. The sampled signal is processed in a manner similar to an actual time of arrival processor, according to the following steps:

- a) Repeat steps b) to j) indexed by $j = 1, \dots, 500$
- b) Repeat steps c) to i) indexed by $i = 1, \dots, I$
- c) Start of frame is detected.
- d) Channel number, coarse and fine frequency offsets are estimated.
- e) The packet is derotated according to estimated frequency offsets.
- f) The transition from FIRST_TRANSITION_FIELD(j,i) to SECOND_TRANSITION_FIELD(j,i) is detected; and fine timing (with one sample resolution) is established.
- g) The TRAINING_FIELD(j,i) of the derotated signal is up-sampled to meet the TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH requirement. For example, a TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH of 1 ns requires up-sampling of at least 1 GHz.
- h) The up-sampled signal is cross-correlated with a reference waveform of the TRAINING_FIELD(j,i)
- i) The measured time of departure $x_{j,i}$ is determined from the time of the peak of the magnitude of the cross-correlation.

NOTE—The time of the peak of the magnitude of the cross-correlation is actually a time of arrival measurement that equals the time of departure up to a fixed delay. Since the fixed delay is removed within step j), the fixed need not be known or explicitly compensated for.

- j) Having repeated steps c) to i) I times, the (j,i)th time of departure error $e_{j,i}$ is calculated as TIME_OF_DEPARTURE(j,i) minus the synchronized time of departure. Defining $x_j = [x_{j,1}, \dots, x_{j,I}]^T$ as the I measured times of departure, $y = [\text{TIME_OF_DEPARTURE}(j,1), \dots, \text{TIME_OF_DEPARTURE}(j,I)]^T$, $e_j = [e_{j,1}, e_{j,I}]^T$ are the I time of departure errors and $X_j = [1_{I \times 1}, x_j]$, where $1_{I \times 1}$ is an $I \times 1$ matrix of 1s, then the relative clock intercept, rci_j , and slope, rcs_j , between device and instrumentation are determined as the linear least squares line of best fit: i.e., $[rci_j, rcs_j]^T = (X_j^T X_j)^{-1} X_j^T y^j$. With these definitions and calculations, the synchronized time of departure $s_j = [s_{j,1}, \dots, s_{j,I}]^T$ equals $rcs_j \times x_j + rci_j \times 1_{I \times 1}$, and so the I time of departure errors equal $e_j = y_j - s_j$.
- k) Having repeated steps b) to j) 500 times, there are $500 \times I$ values of the time of departure errors $e = [e_{1,1}, e_{500,I}]$
- l) The Time Difference of Departure accuracy test is passed if both of the following conditions are met:
 - 1) The RMS value of e is less than aTxPHYTxStartRMS.
 - 2) aTxPHYTxStartRMS is less than TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH, where the units of e , aTxPHYTxStartRMS, and TIME_OF_DEPARTURE_ACCURACY_TEST_THRESH are properly accounted for.

NOTE 1—One possible implementation of a time of departure measurement system is a free-running oscillator clocking (a) the digital-to-analog converter(s) used to transmit the packet, (b) a 32-bit continuously counting counter and (c) a hardware finite state machine such that PHY-TXSTART.request primitive causes a transition within the finite state machine that in turn causes frame transmission at the DACs a fixed number of cycles later; where the time of departure is recorded as the value of the counter at that transition minus aTxPHYTxStartRFDelay (using TIME_OF_DEPARTURE_ClockRate), where aTxPHYTxStartRFDelay can vary by channel. In this implementation, the principal source of time of departure error is short-term oscillator imperfection (e.g., phase noise) and RF group delay variation across channels uncompensated by aTxPHYTxStartRFDelay.

NOTE 2—1 ns of time of departure error corresponds to approximately 0.3 m of distance error, so high location accuracy depends upon a tight time of departure standard deviation.

P.3 Differential Distance Computation using Fine Timing Measurement frames

In Figure P-1 the Observing STA is able to listen to the Fine Timing Measurement frame exchange between the Sending and Receiving STAs. The time of flight of a line of sight transmission between the Sending and Receiving STAs is denoted as T . At the Observing STA, the time of Arrival (ToA) of message M and its Ack frame are respectively t_{c1} and t_{c2} . At the Sending STA, the time of departure (ToD) of message M and the ToA of its Ack frame are t_1 and t_4 respectively.

The differential distance between the Observing STA and each of the Sending and Receiving STAs, denoted as D_{SR} , is defined as:

$$D_{SR} = c \times (T_{SO} - T_{RO})$$

where

c is speed of the light.

T_{SO} is the time of flight between the Sending STA and the Observing STA

T_{RO} is the time of flight between the Receiving STA and the Observing STA

D_{SR} can now be computed as:

$$D_{SR} = c \times (t_{c1} - t_{c2} - T - (t_1 - t_4))$$

An Observing STA can use the ToA and the time stamps (t_1 and t_4) received in the following messages in the message exchange to refine its computation of the differential distance to the Sending and Receiving STAs.

In Figure P-1 the Receiving and Sending STAs can be APs. The APs can learn about neighboring APs that support the FTM protocol and an AP can initiate a FTM message exchange on a periodic basis (e.g., the beacon interval or a multiple of the beacon interval) with its neighbor APs. Monitoring and receiving these messages can enable Observing STAs to estimate their differential distance with the AP pairs. An Observing STA that is able to determine its differential distance to at least three pairs of Sending and Receiving STAs can determine its location using the principle of hyperbolic navigation. An Observing STA can potentially determine its location by monitoring the FTM exchanges of a single AP (Sending STA) if there are three or more neighbor APs of the Sending STA that support FTM.

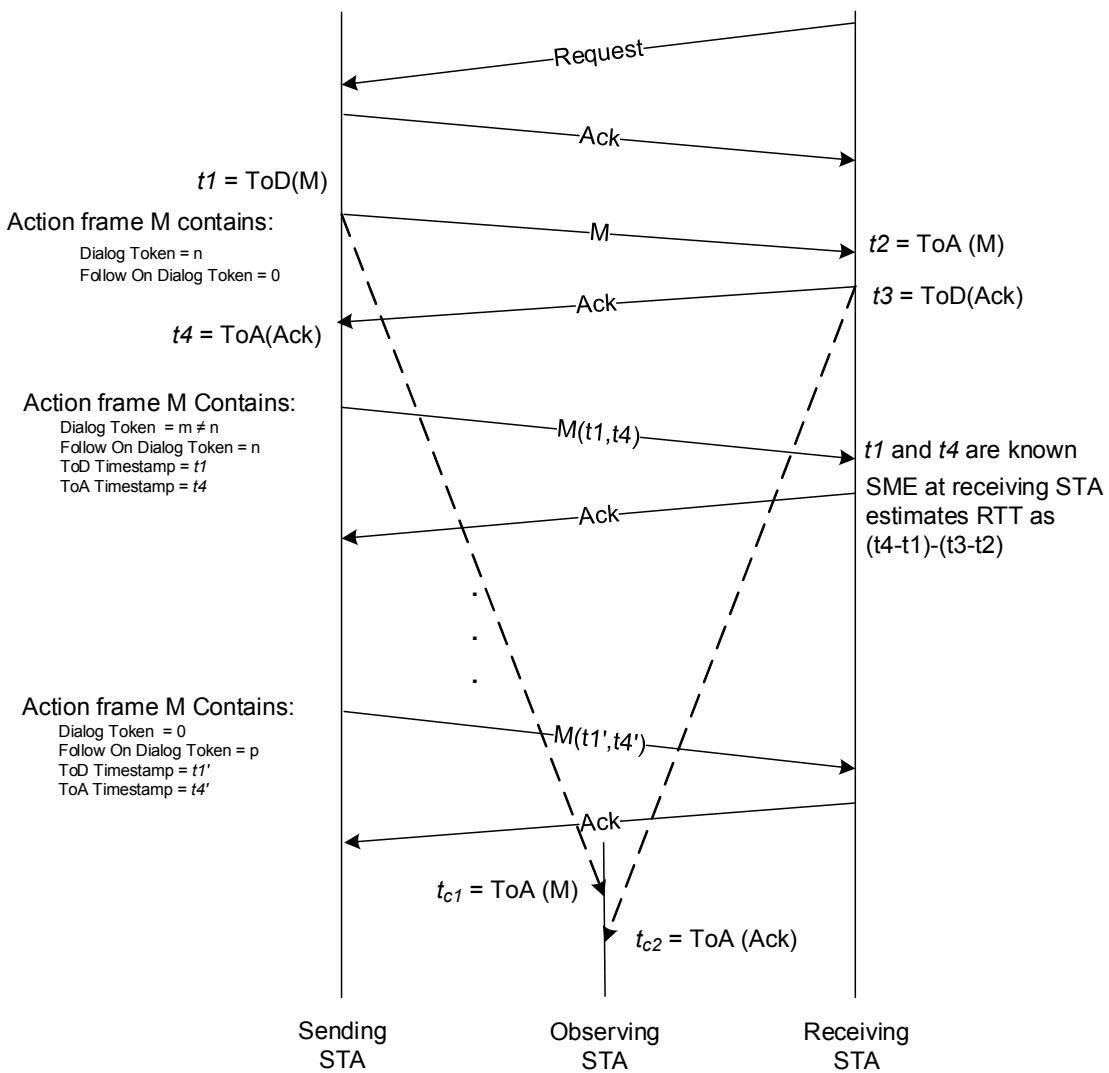

Figure P-1—Parameters recorded by Observing STA when monitoring an FTM message exchange

Annex Q

(informative)

Example use of the Destination URI for Event and Diagnostic Reports

Q.1 Destination URI payload

An example of the payload used to transmit Event and Diagnostic reports shown in Table Q-1. The protocol used to transport the Destination URI payload is beyond the scope of this standard. An example use of the Destination URI is given in Q.2.

Table Q-1—Destination URI payload

| Size (octets) | Information |
|---------------|---|
| 6 | BSSID |
| 6 | Reporting STA Address |
| variable | Event or Diagnostic Report frame contents |

Q.2 Use of HTTP (or HTTPS) for Destination URI of Event and Diagnostic Reports

Under certain conditions a non-AP STA might need to send Event and Diagnostic reports to an AP using the Destination URI advertised by the AP in the request frame. A suitable higher layer protocol that could be used to transport the Event or Diagnostic report is HTTP or HTTPS.

For example, consider the following:

- 1) IT is investigating a WLAN coverage problem and uses a non-AP STA with a WLAN and Ethernet adapters to collect some additional information.
- 2) The non-AP STA with MAC 00-ff-fd-00-00-01 has received a request for a Diagnostic report from AP 00-ff-fe-00-00-10 and is in fringe coverage. The non-AP STA has an Ethernet adapter that is connected.
- 3) The AP includes an Alternate Destination URI of <http://www.myserver.mycompany.com> in the Diagnostic Report frame.
- 4) The non-AP STA loses WLAN connectivity while trying to transmit a Diagnostic Report frame to the AP and the non-AP STA's SME determines that it can use the Alternate Destination URI to send the Diagnostic Report frame using the Ethernet link.
- 5) The non-AP STA POSTs the Diagnostic report as follows:
POST /wnm/msg/00-ff-fd-00-00-01/msg1 HTTP/1.1
Host: <http://www.myserver.mycompany.com>
Content-Type: application/octet-stream
Content-Encoding-Type: base64

Content-Length: i (length of data as specified in Figure 9-697 in 9.6.14.5)

<encoded data = 00 ff fe 00 00 10 00 ff fd 00 00 01 ...>

In the HTTPS case, the non-AP STA would need to be provisioned with credentials to establish the TLS connection prior to posting the message over HTTP. The HTTP post would work as described previously.

Interworking with external networks

R.1 General

The purpose of this informative annex is to describe and clarify the support for interworking with external networks including the support for network discovery and selection, QoS mapping, SSPN interface, and emergency services and to provide some background information and recommended practices.

R.2 Network discovery and selection

R.2.1 General

Interworking service provides features to support the network discovery and selection process a STA uses to choose the network with which to associate. GAS provides a non-AP STA access to an advertisement server (e.g., an access network server or an IEEE 802.21 information server), which can provide a rich set of information to aid the network discovery and selection process. In addition, interworking service provides lightweight features that also facilitate this process. The following subclauses describe several use cases illustrating how these features can be used to aid in network discovery and selection:

- **Airport:** A traveling businesswoman needs to connect via an airport hotspot to her enterprise network to download email and information from the customer database.
- **Shopping:** A shopper visits a shopping mall and wants to use a smartphone to discover items on sale.
- **Sales meeting:** A salesman visiting a customer accesses his guest network.
- **Museum:** A visitor to a museum uses a smartphone to obtain virtual docent service.
- **Emergency call:** A traveler needs to make an emergency call while in another country.
- **Emergency alert:** A traveler, having enabled the display of emergency alerts, arrives at a new destination.

R.2.2 Airport

A traveling businesswoman arrives for the first time at an airport having a WLAN. This user wants to download email onto her laptop utilizing the airport's hotspot, a chargeable network. Once associated, the woman needs to connect via VPN connection back to her company's servers to access email and information from the customer database. This is performed as follows:

- a) The laptop's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to "Chargeable Public Network." In response, it receives Probe Response frames from several of the airport's APs, in the immediate neighborhood, for the SSID "Narita Hotspot."
- b) The Probe Response frame received by the laptop indicated the following capabilities:
 - 1) Extended Capabilities element indicates: AP provides interworking service.

- 2) Interworking element indicates: venue group = 1 (Assembly) and venue type = 3 (passenger terminal), Internet = 1 (Internet access available), ASRA = 1 (there is an additional step required for network access).
 - 3) Advertisement Protocol element including the Advertisement Protocol ID set to MIH Information Service.
 - 4) Roaming Consortium element present containing an OI for “Hotspot Roaming International.”
 - 5) There is no RSNE present in the received Beacon frame.
- c) Since the laptop’s SME does not recognize the Roaming Consortium OI, it invokes the GAS protocol to query the network’s IEEE 802.21 IS. The IEEE 802.21 IS’s response indicates the roaming partners for “Narita Hotspot” and the laptop have security credentials for one of them.
 - d) Since the AP indicated ASRA = 1, the SME again invokes the GAS protocol to retrieve the Network Authentication Type ANQP-element. The response indicates that https redirection is in use and provides the Redirect URL of hotspot.narita.co.jp. Note that this is helpful since some networks use conditional redirection—that is, access to a walled garden is provided for free, but a subscription fee is required to access the Internet.
 - e) Since the laptop’s SME now knows it should be able to successfully authenticate with the network, the STA associates to the AP.
 - f) The following operations are then carried out by higher layers operating within the laptop:
 - 1) The laptop’s SME autonomously launches an http client and provides to it the URL of hotspot.narita.co.jp, which provides the proper security credentials to the network and thereby successfully authenticates it to the network.
 - 2) The VPN client is autonomously launched and a secure session to the user’s corporate network is established. Then the user launches the email application to download email and other required information.

R.2.3 Shopping

A shopper visits a shopping mall and wants to use a smartphone to discover items on sale. In this mall, the mall’s IT department is providing WLAN facilities for all of the stores in the mall; therefore, there is only one SSID for shoppers (i.e., there is not a different SSID for each store in the mall). The user arrives at the mall and taps an icon on the screen to put the smartphone in “shopping mode.” The smartphone’s shopping application causes the non-AP STA to carry out the following steps:

- a) The smartphone’s non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to “Free Public Network.” In response, it receives Probe Response frames from several of the mall’s APs, but only one SSID is provided, which is “Silicon Valley Mall.” The mall’s APs did not transmit Probe Response frames for the SSIDs “Engineering,” “Deliveries,” and “Janitorial” since their access network type is “Private network.”
- b) The Probe Response frame received by the smartphone indicated the following capabilities:
 - 1) Extended Capabilities element indicates: AP provides interworking service.
 - 2) Interworking element indicates: venue group = 6 (mercantile) and venue type = 4 (shopping mall), Internet = 0 (unspecified).
 - 3) RSNE indicates: IEEE 802.1X authentication.
- c) Since the AP indicated Interworking service is available, the smartphone’s non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the Capability List ANQP-element (see 9.4.5.3). In the Capability List ANQP-element, the AP has indicated support for Venue Name and Domain Name. Subsequent to receipt of the Capability List ANQP-element, the non-AP STA invokes the MLME-GAS.request primitive to retrieve the other two lists.

- d) Next, the non-AP STA's supplicant searches the received Domain Name list to determine whether it has any stored credentials for these domains. If so,
 - 1) The smartphone autonomously associates to the “Silicon Valley Mall Shopping” SSID and displays the following information:
 - i) Venue name: Silicon Valley Mall, 1234 Main Street, Rownhams, CA 98765-1234
 - ii) SSID: Silicon Valley Mall
 - iii) Venue type: Shopping Mall
 - 2) The supplicant autonomously provides the security credentials for the selected domain.
- e) Higher layer protocols then download discount coupons being offered for items on sale.

R.2.4 Sales meeting

A salesman travels across town to a meeting at ACME Manufacturing. While there, this user needs to send email to get a document from engineering. On his laptop, he requests the WLAN via the laptop’s UI to search for guest networks. The laptop performs the following steps:

- a) The laptop’s non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to “Private Network with Guest Access.” In response, it receives Probe Response frames from several of ACME Manufacturing’s APs, but only one SSID is provided, which is “Guest.” ACME Manufacturing’s APs did not transmit Probe Responses for the SSIDs “Engineering” and “Finance” since their access network type is “Private network.”
- b) The Probe Response frame received by the laptop indicated the following capabilities:
 - 1) Extended Capabilities element indicates: AP provides interworking service.
 - 2) Interworking element indicates: Internet is available, venue group = 2 (Business) and venue type = 8 (Research and Development Facility).
 - 3) RSNE indicates: IEEE 802.1X authentication with CCMP-128 pairwise and group cipher suites.
- c) Since the AP indicated interworking service is available, the laptop’s non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the Capability List ANQP-element (see 9.4.5.3). In the Capability List ANQP-element, the AP has indicated support for venue name. Upon receipt of the Capability List ANQP-element, the non-AP STA again invokes the MLME-GAS.request primitive to retrieve the venue name.
- d) The laptop’s UI displays the following information and automatically associates to the network:
 - 1) SSID: Guest (Type: Private network with Guest access)
 - 2) Venue name: ACME Manufacturing, 1234 Main Street, Rownhams, CA 98765-1234
 - 3) Venue type: Research and Development Facility
 - 4) Internet is available
- e) Upon prompt, the user enters the username and password supplied by his point of contact from ACME Manufacturing and is then able to send and receive email.

R.2.5 Museum

A visitor enters a museum that is advertising virtual docent service (audio tracks describing each of the major exhibits). The visitor taps an icon on a smartphone and requests it to search for free networks. The smartphone then carries out the following:

- a) The smartphone’s non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element with Access Network Type subfield set to “Free Public Network.” In response, it receives Probe Response frames from several of the

museum's APs, but only one SSID is provided, which is "Visitors." The museum's APs did not transmit Probe Response frames for the SSID "Maintenance" since its access network type is "Private network."

- b) The Probe Response frame received by the smartphone indicated the following capabilities:
 - 1) Extended Capabilities element indicates: AP provides interworking service.
 - 2) Interworking element indicates: venue group = 1 (assembly), venue type = 9 (museum), and ASRA = 0 (no additional steps are required for access).
- c) Since the AP indicated interworking service is available, the smartphone's non-AP STA uses the MLME-GAS.request primitive to invoke GAS to request the Capability List ANQP-element (see 9.4.5.3). In the Capability List ANQP-element, the AP has indicated support for venue name. Upon receipt of the Capability List ANQP-element, the non-AP STA again invokes the MLME-GAS.request primitive to retrieve the venue name.
- d) The smartphone's UI displays the following information, asking the user whether they wish to connect to the network:
 - 1) Venue name: Museum of Modern Art (MOMA)
 - 2) SSID: Visitors
 - 3) Venue type: Museum
 - 4) No authentication required
- e) The user taps the "Connect" icon on the smartphone's display. Note that the smartphone's non-AP STA knows that the network uses Open System authentication since there is no RSNE present in the beacon and ASRA = 0.

R.2.6 Emergency call

A traveler needs to make an emergency call while in another country. The traveler might not be aware of the emergency call numbers that are used in that country. Being in this new location for the first time, the traveler is not aware of which local access points provide access for emergency calling. (Note that emergency calling requires higher layer application(s) that are outside the scope of this standard.) This is performed as follows:

- a) The traveler's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID and an Interworking element. (If the non-AP STA is already associated with an AP that has indicated support for emergency service in its beacon, the probe request would not be necessary.)
- b) In response, it receives Probe Response frames from one or more APs indicating support for emergency service in the Access Network Options field of the Interworking element.
 - 1) Extended Capabilities element indicates: AP provides interworking service.
 - 2) Emergency services reachability is indicated by the ESR and UESA fields in the Access Network Options field in the Interworking element.
 - 3) A dedicated emergency services network is indicated by the Access Network Type field in the Interworking element.
- c) The traveler's non-AP STA then requests the Emergency Call Number ANQP-element with a GAS Initial Request frame.
- d) The GAS Initial Response frame from the AP provides the Emergency Call Number, for example the sequence of digits "911" or an emergency service URN label, URI pair "urn:service:sos.fire, tel:112;sip:+15555551002@fire.com" [B46].
- e) This information is passed to the higher layer application in the traveler's non-AP STA.
- f) The traveler's non-AP STA then associates with the AP.

- g) The traveler's non-AP STA then places the emergency call, with an expedited bandwidth request (EBR) in an ADDTS frame to provide priority to the emergency call.

R.2.7 Emergency alert

A traveler has enabled the display of emergency alerts on a wireless device (non-AP STA) by appropriately setting the higher layer emergency alert application on the device. The traveler arrives at a new destination and turns on the device. The device, when switched on, will perform a search and then associate with an AP to which the traveler has a subscription or associate with an open AP (if the traveler has enabled the device to do that). During the steps leading up to association, the device, when it becomes aware of an emergency alert, will obtain and display it. The emergency alert will likely be obtained from the AP that has the service to which the traveler has subscribed, but the device might also obtain the emergency alert from other APs, if an AP to which the traveler has a subscription is not available. This is performed as follows:

- a) The traveler's non-AP STA performs an active scan by transmitting a Probe Request frame containing the wildcard SSID. If it is associated with an AP, it checks the beacon.
- b) In response, it receives Probe Response frames from one or more APs, which it checks (or, alternately, checks the beacon) for the subscription and also whether the Emergency Alert element indicates that there are emergency alert message(s).
- c) If there are one or more emergency alert messages to be downloaded, the Emergency Alert Identifier element provides an Alert Identifier Hash value.
- d) The device uses the hash of each of the available emergency message(s) to determine whether that message has already been received or whether it is a new message that needs to be downloaded.
- e) If there are one or more emergency alert messages to be downloaded, the device forms the EAS Message URI by concatenating the Emergency Alert URI with the hexadecimal numerals of the Alert Identifier Hash, using the specified method.
- f) Should the device be unassociated with an AP when it determines that a new emergency alert is available, it retrieves the EAS message using either GAS procedures with Advertisement Protocol ID field set to the value for EAS. If the device is associated with the AP, it retrieves the EAS message using either GAS procedures with Advertisement Protocol ID field set to the value for EAS or, for example, using HTTP.

R.3 QoS mapping guidelines for interworking with external networks

R.3.1 General

The EDCA and HCCA mechanism defined in 10.22 provide QoS control at the MAC layer. However, the QoS control parameters used by the EDCA and HCCA cannot match directly with other QoS control parameters of the interworked external networks, e.g., SSPN. For example, the SSPN could have different metrics for defining the QoS levels. Destination Network 1 (DN1) and DN2 can use DSCP values differently, in which case, STA1 and STA2 would require different QoS mapping information. Therefore, mapping from these external QoS control parameters to the QoS parameters of this standard is necessary.

The QoS parameters mapping can be used for both uplink and downlink data transmission:

- For uplink: at the non-AP STA, external QoS parameters are mapped to IEEE 802.11 QoS parameters, e.g., DSCP to IEEE 802.11 User Priority and in turn to EDCA ACs. This mapping helps the non-AP STA to construct correct QoS requests to the AP, e.g., the ADDTS Request frame and to transmit frames at the correct priority.
- For downlink: at the AP, DSCP values are mapped to EDCA UPs. Optionally, the non-AP STA can use TSPEC and TCLAS elements in an ADDTS Request frame to set up a traffic stream in the BSS.

In this method, the User Priority is specified in the TCLAS element. The policy used by the AP to choose a specific method to map frames to user priorities is outside the scope of this standard.

Different external networks can use different DSCP sets for the same services as described in R.3.3. For example, a 3GPP network can use different code points from that of an enterprise network. The QoS Map distribution mechanism defined in 11.25.9 provides means to communicate to the STA's mapping information from the network.

R.3.2 Determination of the mapping for a STA

The QoS mapping to be applied depends upon the network the non-AP STA is accessing. In an interworking IEEE 802.11 infrastructure setting, the same physical AP can serve non-AP STAs from different SSPNs on different BSSIDs. As such, these STAs are separated into different BSSs. Figure R-1 presents an example of the scenario using authentication, authorization, and accounting (AAA). In Figure R-1, AAA Server 1 controls access to DN-1 and AAA Server 2 controls access to DN-2.

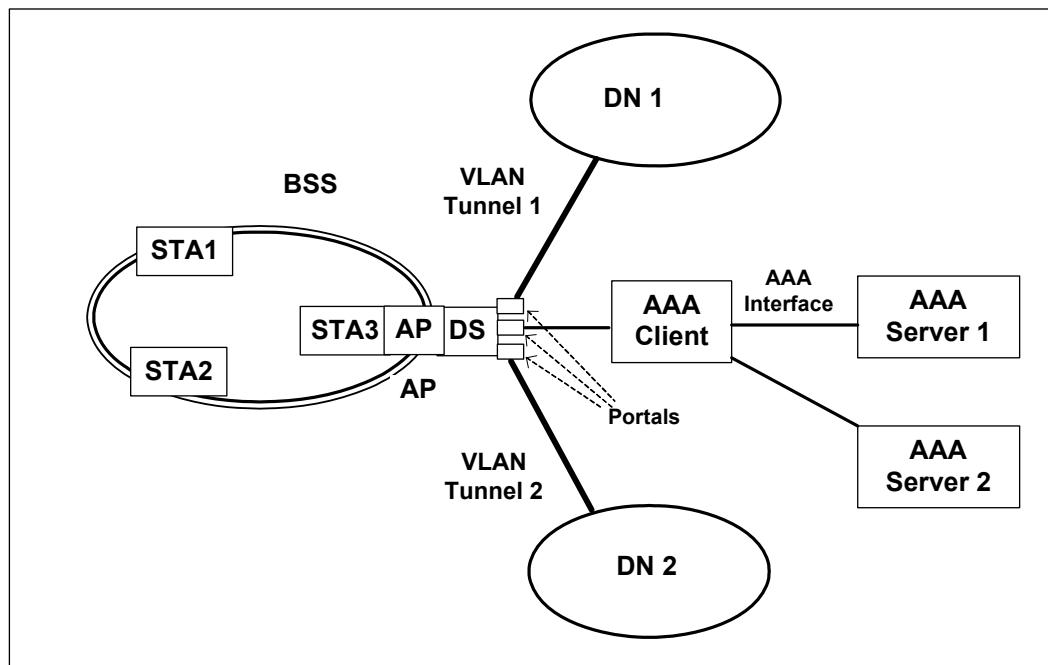

Figure R-1—Interworking IEEE 802.11 infrastructure supporting multiple SSPNs

R.3.3 Example of QoS mapping from different networks

IEEE 802.1D UPs map to EDCA ACs, as described in Table 10-1. The use of DSCP sets differs from network to network. Table R-1 shows examples of DCSP mappings.

NOTE—The mapping of the DSCP to 3GPP Traffic Class is available in GSMA, IR.34 v4.6 [B16] (similar to that of GSMA IREG34). See TR 21.905 [B2] for definition of general packet radio service (GPRS) roaming exchange. Table R-1 is extended to cover the EDCA ACs mapping. This mapping can also apply to other networks that adopt the 3GPP QoS definitions, e.g., 3GPP2.

Table R-1—Mapping table of DSCP to 3GPP QoS information and EDCA ACs

| 3GPP QoS Information | | DiffServ PHB | DSCP | QoS Requirement on GPRS Roaming Exchange | | | | EDCA Access Category | UP (as in IEEE Std 802.1D) |
|----------------------|-----|------------------|--------|--|------------|-----------|------------------|----------------------|----------------------------|
| Traffic Class | THP | | | Max Delay | Max Jitter | MSDU Loss | MSDU Error Ratio | | |
| Conversational | N/A | EF | 101110 | 20 ms | 5 ms | 0.5% | 10^{-6} | AC_VO | 7, 6 |
| Streaming | N/A | AF4 ₁ | 100010 | 40 ms | 5 ms | 0.5% | 10^{-6} | AV_VI | 5, 4 |
| Interactive | 1 | AF3 ₁ | 011010 | 250 ms | N/A | 0.1% | 10^{-8} | AC_BE | 3 |
| | 2 | AF2 ₁ | 010010 | 300 ms | N/A | 0.1% | 10^{-8} | AC_BE | 3 |
| | 3 | AF1 ₁ | 001010 | 350 ms | N/A | 0.1% | 10^{-8} | AC_BE | 0 |
| Background | N/A | BE | 000000 | 400 ms | N/A | 0.1% | 10^{-8} | AC_BK | 2,1 |

Table R-2 shows an example mapping based on application classes defined in IETF RFC 4594. Mapping between DSCP and UP can be done using Exception fields or by range. The use of DSCP Exception fields will map a DSCP to a UP according to Table R-2. Mapping by range will require the setting of DSCP ranges as shown in Table R-3.

Table R-2—Example Enterprise DSCP to UP/AC mapping

| Application Class | Per-hop behavior (PHB) | IEEE 802.1D) User Priority | Access Category |
|-------------------------|------------------------|----------------------------|-----------------|
| Network Control | CS6 | 7 | AC_VO |
| Telephony | EF | 6 | AC_VO |
| RT Interactive | CS4 | 6 | AC_VO |
| Multimedia Conference | AF4x | 5 | AC_VI |
| Signaling | CS5 | 5 | AC_VI |
| Broadcast Video | CS3 | 4 | AC_VI |
| Multimedia Stream | AF3x | 4 | AC_VI |
| Low Latency Data | AF2x | 3 | AC_BE |
| High Throughput Data | AF1x | 2 | AC_BK |
| OAM | CS2 | 3 | AC_BE |
| Standard | DF | 0 | AC_BE |
| Low Priority/Background | CS1 | 1 | AC_BK |

Table R-3—UP to DSCP range mapping example

| UP Range | DSCP Low | DSCP High |
|-----------------|-----------------|------------------|
| UP 0 Range | 0 | 0 |
| UP 1 Range | 1 | 9 |
| UP 2 Range | 10 | 16 |
| UP 3 Range | 17 | 23 |
| UP 4 Range | 24 | 31 |
| UP 5 Range | 32 | 40 |
| UP 6 Range | 41 | 47 |
| UP 7 Range | 48 | 63 |

Furthermore mapping by range will require an additional exceptional element to map DSCP 32 to UP 6.

NOTE—Twenty-one DSCP Exception fields are provided to give more flexibility in defining the QoS mapping. This number is equal to the number of FIBs (Forwarding Information Bases) defined by IETF RFC 3222.

R.4 Interworking and SSPN interface support

R.4.1 General

The interworking service architecture defines the scope of the SSPN interface. This interface is provided by the IEEE 802.11 MAC to support the interworking service. In an interworking scenario, the IEEE 802.11 infrastructure is operating in infrastructure mode.

Figure R-2 shows an example implementation of the control aspect of the Interworking Interface. As shown in the figure, the Interworking Interface consists of two parts: the generic SSPN Interface between the AP and the AAA Client; and the AAA Interface between the AAA Client and the corresponding AAA Server in the SSPN. Depending on the implementation the AAA Client can be collocated with the AP or stand alone serving as a proxy or translation agent between the SSPN Interface and AAA Interface. The AAA Interface serves as a transparent carrier of the SSPN interface.

The possible interactions over the SSPN interface are defined in 11.25.5. The information transferred over the SSPN Interface is defined in R.4.2. This interface results in parameters being set in the dot11InterworkingTable MIB. The AP's SME thereafter uses these parameters to permit or deny, as appropriate, services to non-AP STAs.

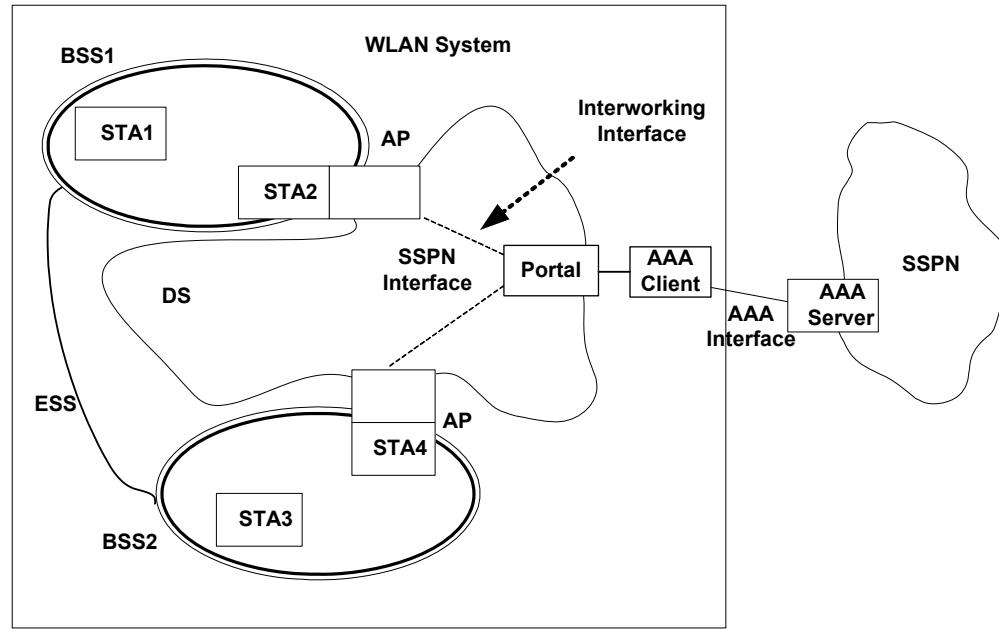

Figure R-2—Basic architecture of the interworking service

R.4.2 SSPN interface parameters

The parameters for each associated non-AP STA defined in this clause cross the SSPN Interface, i.e., between AP and AAA Client as shown in Table R-4.

Table R-4—SSPN Interface information or permission parameters

| Information or permission name | From AN to SSPN | From SSPN to AN | Per non-AP STA entry |
|---------------------------------------|-----------------|-----------------|----------------------|
| Non-AP STA MAC | + | | + |
| Non-AP STA User ID | + | + | + |
| Non-AP STA Interworking Capability | + | | + |
| Link Layer Encryption Method | + | | + |
| Authorized Priority | | + | + |
| Authorized Rate | | + | + |
| Authorized Delay | | + | + |
| Authorized Service Access Type | | + | + |
| Authorized Service Access Information | | + | + |
| Non-AP STA Transmission Count | + | | + |
| Non-AP STA Location Information | + | | + |
| Non-AP STA State Information | + | | + |

The SSPN Interface parameters are stored in the AP with corresponding MIB attributes as defined in Annex C, and are used by the Interworking Service Management function in the SME. The MIB variables themselves, which are used by the AP SME, are read only.

R.4.2.1 Non-AP STA MAC

This parameter is the MAC address of the non-AP STA accessing the interworking service through the AP. It can be requested by the external network, e.g., a 3GPP network, for fraud prevention. The non-AP STA MAC address is normally available through MLME SAP, e.g., MLME-ASSOCIATE.indication primitive, and should be forwarded by the AS to the AAA Server entity in the SSPN through the AAA Interface.

The following MIB attribute is used:

- dot11NonAPStationMacAddress

R.4.2.2 Non-AP STA User ID

This parameter contains the subscriber information of the non-AP STA for the interworking service. It is provided by the non-AP STA through the RSNA establishment process to the AAA Server; in turn, the AAA Server provides it back to the AP via the SSPN interface. It is in the form of an NAI, i.e., it contains both the user’s identity and its SSP information.

NOTE—The reason the AAA Server provides the user identity back to the AP is that some EAP methods use encrypted tunnels to maintain confidentiality of the user and thus the AP might not otherwise be able to learn the user’s identity.

The following MIB attribute is used:

- dot11NonAPStationUserIdentity

R.4.2.3 Non-AP STA Interworking Capability

This parameter is derived from the non-AP STA’s Extended Capabilities element, which is included in (Re)Association Request frames. The AP SME obtains this information from the MLME SAP, e.g., MLME-ASSOCIATE.indication primitive. This information needs to be passed over the SSPN interface since the service authorization decisions can depend on the non-AP STA capabilities.

The following MIB attribute is used:

- dot11NonAPStationInterworkingCapability

R.4.2.4 Link Layer Encryption Method

This parameter indicates the link layer encryption method selected during the RSNA establishment process for protecting the unicast communication between the non-AP STA and the AP. The cipher suite format of this parameter is drawn from the RSNE defined in 9.4.2.25. The AP obtains this information about the STA via the MLME SAP.

In the interworking service, the SSPN also participates in the selection of the cipher suite selection, as described in 11.25.5. Therefore, the link layer encryption method selected will meet or exceed the security requirement of the SSPN.

NOTE—In interworking, the SSPN can require visibility and configurability of the STA access.

With this information available to the SSPN, the operator would be able to have better control, e.g., barring access to IEEE 802.11 networks if null encryption is used. This is also related to the operator network’s configuration, e.g., if preauthentication should be supported.

The following MIB attribute is used:

- dot11NonAPStationUnicastCipherSuite

R.4.2.5 Authorized Priority

This parameter is used for admission control and user-priority policing at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. The Authorized Priority specifies the authorized User Priorities that the non-AP STA is allowed to use during the Interworking access. It also specifies whether the non-AP STA can use HCCA.

For EDCA operation, the following MIB attribute is used:

- dot11NonAPStationAuthAccessCategories MIB attribute after mapping the priority according to Table 10-1.

For HCCA operation, the following MIB attribute is used:

- dot11NonAPStationAuthHCCAHEMM

R.4.2.6 Authorized Maximum Rate

This parameter is used for admission control decisions or policing actions at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. For EDCA operation, this parameter contains a list of four MaxRate values indicating the maximum rate allowed for each of the access categories. For HCCA operation, there is one MaxRate value. Each of the MaxRate values is an unsigned integer and in the unit of kilobits per second. An additional value provides the maximum rate at which a non-AP STA can source group addressed frames.

The following MIB attributes are used:

- dot11NonAPStationAuthMaxVoiceRate,
- dot11NonAPStationAuthMaxVideoRate,
- dot11NonAPStationAuthMaxBestEffortRate,
- dot11NonAPStationAuthMaxBackgroundRate,
- dot11NonAPStationAuthMaxHCCAHEMMRate
- dot11NonAPStationAuthMaxSourceMulticastRate.

R.4.2.7 Authorized Service Access Type

This per-non-AP STA parameter indicates the access type allowed for the non-AP STA based on the SSPN decision. The AP will use this information for authorization requests from the STA, e.g., allow or disallow direct link operation and group addressed services. The parameter uses truth values to indicate the service type authorized.

The following MIB attributes are used:

- dot11NonAPStationAuthDls is to authorize a non-AP STA to use DLS
- dot11NonAPStationAuthMaxSourceMulticastRate is to authorize a non-AP STA to source group addressed stream(s) to toward the network

R.4.2.8 Authorized Delay

This parameter is used for admission control decisions at the AP. It is based on the Infrastructure Authorization Information delivered from the SSPN during the AAA procedure. This parameter is used only for HCCA operation, and contains one value. An AP should deliver frames to a non-AP STA within the time

period specified in this attribute. Furthermore, when a non-AP STA requests admission control, the requested delay is approved only if it is greater than or equal to the value stored in the corresponding parameter. Each parameter is an unsigned integer that measures delay in units of microseconds.

The following MIB attribute is used:

- dot11NonAPStationAuthHCCAHEMMDelay

R.4.2.9 Authorized Service Access Information

This parameter contains the relevant information for the AP to enforce the authorized service access type indicated in the Authorized Service Access Type parameter. The Authorized Service Access parameters provide the VLAN assignment (VLAN ID and VLAN Name) to which frames to or from the non-AP STA are bridged.

The following MIB attributes are used:

- dot11NonAPStationVLANId
- dot11NonAPStationVLANName

R.4.2.10 Non-AP STA Transmission Count

This parameter indicates the count of the data traffic transmitted to and received from a non-AP STA. Such information would be used by the on-line charging and accounting function, especially for the IEEE 802.11 WLAN local service, where the data traffic does not necessarily go through the SSPN network. In such cases, Layer 3 accounting/charging information is not reliable since addresses could be spoofed. Layer 2 would be a better place to collect such information since due to the cryptographic security association that exists between the non-AP STA and AP.

The following MIB attributes are used:

- dot11NonAPStationVoiceMSDUCount,
- dot11NonAPStationVideoMSDUCount,
- dot11NonAPStation-BestEffortMSDUCount,
- dot11NonAPStationBackgroundMSDUCount,
- dot11NonAPStationHCCAHEMMMSDUCount,
- dot11NonAPStationMulticastMSDUCount,
- dot11NonAPStationVoiceOctetCount,
- dot11NonAPStationVideoOctetCount,
- dot11NonAPStationBestEffortOctetCount,
- dot11NonAPStationBackgroundOctetCount,
- dot11NonAPStationHCCAHEMMOctetCount,
- dot11NonAPStationMulticastOctetCount MIB attributes

R.4.2.11 Non-AP STA Location Information

This parameter provides information about the STA's location to the SSPN. It is required by the SSPN applying location based service control. In the IEEE 802.11 network, the non-AP STA location is approximated using the AP's location information. This parameter includes two type of formats, Geospatial and Civic Location.

The following MIB attributes are used:

- dot11APLCITable,
- dot11APCivicLocationTable

R.4.2.12 Non-AP STA State Information

This parameter indicates whether the power management mode of the non-AP STA is either active mode or PS mode.

The following MIB attributes are used:

- dot11NonAPStationPowerManagementMode

R.5 Interworking with external networks and emergency call support

R.5.1 General

Emergency services define the IEEE 802.11 functionality to support an emergency call (e.g., E911) service as part of an overall multi-layer solution, specifically capability advertisement and access to emergency services by STAs not having proper security credentials. “Multi-layer” indicates that emergency services will be provided by protocols developed in part by other standards bodies; see IETF ECRIT [B25], 3GPP TS 23.167 [B1], and 3GPP TS 22.067 [B3]. Three features of interworking with external networks support emergency call services.

The first feature is a mechanism for a non-AP STA to signal to an AP that a call is an emergency call. This is useful in the case where the access category to be used to carry the emergency call traffic (typically AC_VO) is configured for mandatory admission control. If the WLAN is congested, then the AP can deny the TSPEC request for bandwidth to carry the call. However, if the AP is able to determine that the call is an emergency call, then it can invoke other options to admit the TSPEC request.

The second and third features provide the means for a client without proper security credentials to be able to place an emergency call. The second feature makes use of the Interworking element, which can be included in Association Request frames in order to bypass the IEEE 802.1X port at an AP for unauthenticated access to emergency services. This is described further in R.5.5. The third feature makes use of an SSID configured for Open Authentication to provide emergency services and is described in R.5.3.

The STA has the burden to confirm the availability of emergency services from the IEEE 802.11 network, including that the network is authorized for emergency services. The time it takes for a client to find an authorized emergency services network is related to the speed of forward progress the authorized network can make over the air with the STA, relative to all of the other networks (attackers as well), and is inversely related to the number of false advertisements. A STA can confirm the availability of emergency services by observing the value of the access network type, ESR and UESA fields in the Interworking element of any received Beacon or Probe Response frame.

R.5.2 Background on emergency call support over IEEE 802.11 infrastructure

Special handling for emergency service calls is required over IEEE Std 802.11. To use a public hotspot a user will go typically through an authentication process (e.g., EAP-based, or http/https redirect or DNS redirection) before being able to use it for emergency calls.

There is a need to support these emergency services both when the user has a relationship with the IEEE 802.11 network (credentials to access the network) and when it does not have any relationship with the IEEE 802.11 network.

The former case requires no changes to the authentication process—the user, having already been authenticated to and associated with the WLAN, simply dials the emergency number thereby placing the call.

In the latter case, the non-AP STA will be able to gain access to the network without using security credentials and make an emergency call.

Another difficulty is that once the user gains access to the network, there is no mechanism to prioritize their emergency traffic in the IEEE 802.11 MAC over that of other users, even with IEEE 802.11 QoS capability.

Supporting emergency services, such as E911 calling, requires a multi-layer solution with support at various protocol layers. Apart from MAC level access and support for transfer of data between non-AP STA and AP with appropriate QoS at layer 2, there is a clear need, above this layer, to set up the call, conduct call control and management, and use an appropriate audio codec.

One specific example is when a user arrives in a new country and needs to make an emergency call in a public hotspot where there is no prior relationship with the available WLAN network or WLAN hotspot operator.

NOTE—The callback feature, if required in a regulatory domain, is dealt with at a higher layer.

R.5.3 System aspects for emergency call support

An IEEE 802.11 infrastructure by itself cannot ensure that all factors are compatible for an emergency service call to actually take place. The client device might have to register with a call manager (SIP agent or some other signaling endpoint) for the call to be placed successfully. Different signaling systems such as SIP, H.323, etc., can be deployed for supporting emergency service calling. Higher layers can also verify an emergency service call is being placed so that appropriate level of resources can be granted to the emergency call. Voice endpoints (e.g., non-AP STAs) can use different codecs such as G.711, AMR, and iLBC. All these functionalities are outside the scope of this standard.

IEEE Std 802.11 can provide priority for emergency traffic both for the initial call establishment and during an ongoing emergency call, which assumes advertisement of this functionality supported in the BSS.

This subclause describes general design assumptions to support emergency services with IEEE Std 802.11:

- a) It is assumed that there is a higher layer (above IEEE 802.11 Layer 2) protocol (or protocol suite) for making emergency calls or using any other emergency services.
- b) In order to make the emergency call procedure work properly, the non-AP STA has the following responsibilities:
 - 1) Recognize the user's request to make an emergency call.
 - 2) Select an AP that supports QoS and EBR capability.
 - 3) Non-AP STA will associate with the AP if it is not already done so. In an RSN, if the user does not have valid authentication credentials for network access then non-AP STA can bypass the RSN that will provide access to the network to make emergency calls.
 - 4) If location information is required in a particular regulatory domain, request location information from the WLAN. If the STA cannot determine its own location by its own means, then Location information should be obtained from the network prior to initiating the

emergency call request. There are two methods a non-AP STA can use to obtain location services from the IEEE 802.11 network:

- i) If the non-AP STA can use location information in geospatial format (i.e., latitude, longitude and altitude), then the LCI report procedures (11.11.9.6) can be used to obtain this information. The AP advertises its capability for the LCI report procedures by setting the LCI Measurement Capability Enabled field to 1 in the RM Enabled Capabilities field in the RM Enabled Capabilities element, and the non-AP STA transmits an LCI request to the AP.

NOTE—The non-AP STA can receive an LCI report with the incapable field set. According to the procedures in 11.11.9.6, the non-AP STA can resubmit an LCI request with a location subject of “remote.” If the AP still responds with incapable, then location services are not available from the AP via the LCI report procedures.

- ii) If the non-AP STA requires location information in Civic or geospatial formats, then an AP’s wireless network management capability can be used. In this case, an AP advertises its ability to provide its location in Civic or geospatial format by setting the Civic Location or Geospatial Location field in the Extended Capabilities element to 1 respectively in the Beacon frame. A non-AP STA can also request its location using the procedures in 11.25.7. An AP that advertises its ability to provide its location in civic or geospatial format does not return an “incapable” response if a requesting STA requests the “remote” location.
- 5) Selects one of possibly several SSPNs advertising support for emergency services and VoIP service.
- c) There are two methods described in this annex by which a user lacking security credentials can gain access to the network. The method selected in any particular deployment is at the discretion of the IEEE 802.11 infrastructure provider, SSPN or system administrator as appropriate. The AP and non-AP STA should permit users lacking security credentials to gain access to a network using one of two methods:
 - 1) Using an emergency services association (see 9.4.2.92) in a BSS configured for RSNA. Using this type of association means the AP and non-AP STA will exchange unprotected frames for emergency service access only during the lifetime of the association. In this situation, cryptographic keys are not exchanged, the IEEE 802.1X uncontrolled port is bypassed without invoking the IEEE 802.1X state machine. Since protection is used for authenticated STAs, their traffic is protected.
 - 2) Using an SSID configured for Open System authentication. Network elements necessary to complete an emergency call are reachable via this SSID. How to reach these network elements (e.g., a call manager) and which protocol to use (e.g., SIP) are outside the scope of this standard.
- d) The AP can separate the backhaul of emergency services traffic from other traffic, typically via a dedicated VLAN.

To ease burden of implementation on the network side, some basic means should exist to allow easy filtering, routing and basic access control of “regular” BSS traffic and emergency-type BSS traffic. This can be assisted by the downloading of emergency call number information, as described in 9.4.5.5.

R.5.4 Description of the Expedited Bandwidth Request element

For access categories configured for mandatory admission control, a non-AP STA requests bandwidth using a TSPEC element in an ADDTS Request frame. The TSPEC Request includes parameters describing the characteristics of the traffic stream, but no information on the use of the traffic stream. The Expedited Bandwidth Request (EBR) element describes the “use” of a traffic stream. To use this element, it is the responsibility of the station to transmit this element in response to certain call signaling messages. How this

is done is outside the scope for the interworking service. The following bandwidth uses are provided in the EBR element:

- Emergency call, defined in NENA 08-002 [B56]
- Public first responder (e.g., fire department)
- Private first responder (e.g., enterprise security guard)
- Multi-level precedence and preemption (MLPP)

MLPP services are provided by other voice networking technologies such as 3GPP (see 3GPP TS 22.067 [B3]), H.323 (see ITU-T H4.60.14) and other proprietary signaling protocols. MLPP is used as a subscription service to provide differentiated levels of consumer service; it is also used by military organizations so that commanding officers will not get a network busy signal.

If the AP is provided additional information regarding the nature of the Traffic Stream, it can invoke additional policy that can be configured on the AP to accept the TSPEC request when it would be otherwise denied. Policy configured at AP defines how bandwidth is allocated. Specification of these policies is outside the scope of interworking with external networks. Policy examples include the following:

- No action
- Preemptive action: delete a TS of lower priority if necessary to make room for new TS
- Use capacity allocated for nonvoice services if priority is above a certain value (assuming TSPEC is for AC_VO)
- Interpret MLPP codes as defined 3GPP specification
- Interpret MLPP codes as defined in proprietary specification

R.5.5 Access to emergency services in an RSN

If an infrastructure BSS requires authentication and encryption with RSN, a non-AP STA placing an emergency call associates and authenticate to the network by using an emergency services association (see 9.4.2.92). If the non-AP STA has user credentials that allow it to use a particular network, the non-AP STA can use its credentials to authenticate to the SSPN through the IEEE 802.11 infrastructure.

When a mesh STA has an emergency services association, and it receives a Mesh Peering Open frame that includes the Interworking element, with ASRA bit equal to 1 and UESA bit equal to 0, and the Authenticated Mesh Peering Exchange element (see 9.4.2.118) it allows access to emergency services. If the mesh STA has user credentials that allow the accessing mesh STA to use the mesh network, the mesh STA can use its credentials to authenticate with the accessing mesh peer.

In order to use an emergency services association in an infrastructure BSS, a STA lacking security credentials can associate with a BSS in which emergency services are accessible by including an Interworking element with the UESA field set to 1 in a (Re)Association Request frame. An AP receiving this type of (re)association request recognizes this as a request for unauthenticated emergency access. The AP can look up the VLAN ID to use with a AAA Server, or it can have an emergency services VLAN configured. The STA can either have, policies configured locally for quality-of-service parameters and network access restrictions, or it can look them up through external policy servers. When a mesh STA has an emergency services association, and it receives a Mesh Peering Open frame, from a mesh STA lacking security credentials, that includes the Interworking element, with ASRA bit equal to 1 and UESA bit equal to 1, and the Mesh Peering Management element (see 9.4.2.102) it allows access to emergency services.

When an emergency services association is used, an infrastructure BSS or an MBSS should be designed to restrict access to emergency services only (or alternatively prioritize the emergency services to the highest level of access). Methods of such restriction are beyond the scope of this standard, but can include an isolated VLAN for emergency services, filtering rules in the AP or network entity (e.g., router) in an

external network to limit network access to only network elements involved in emergency calls, and per-session bandwidth control to place an upper limit on resource utilization.

R.6 Peer information

Peer information allows TDLS peer STAs to discover their capabilities. An example of peer information could be expressed in an XML format as follows:

```

<Peer information>
    <mode> tdls </mode>

    <wireless info>
        <mac address> 00-01-02-03-04-05 </mac address>
        <bssid> 00-0a-0b-0c-0d-0e </bssid>
    </wireless info>

    < network info>
        < DHCP> No</DHCP>
        < IP address>192.168.2.1 </IP address>
        < Subnet> 255.255.255.0 </subnet>
        <Hostname> myphone </Hostname>
    </network info>
</Peer information>
```

The minimum required peer information for TDLS is contained in “wireless info.” The “mac address” field contains the MAC address of the transmitting STA and the “bssid” identifies the BSS in which the STA is a member. The “network info” could optionally be used to aid the peer devices in establishing a TDLS link.

R.7 Calculating Estimated Throughput

In response to the receipt of MLME-ESTIMATED-THROUGHPUT.request, ESP STAs can determine values for EstimatedThroughputInbound and EstimatedThroughputOutbound for each AC of a current or potential link to another STA using Equation (R-1):

$$EstimatedThroughput = \frac{EST_{AirtimeFraction} \times MPDU_{pPPDU} \times A_MSDU_B \times 8}{PPDU_{Dur}} \quad (R-1)$$

where

| | |
|--|--|
| $EstimatedThroughput$ | is in bits/second |
| $PPDU_{Dur}$ | is the expected duration of a single PPDU, in seconds |
| $EST_{AirtimeFraction}$ | is dimensionless. It is the estimated portion of airtime that is available for outbound transmissions for this link as indicated in the Estimated Service Parameters element received from the STA with the MAC address that matches the PeerMACAddress in the MLME-ESTIMATED-THROUGHPUT.request primitive |
| $\min(x,y)$ | is the minimum of x and y |
| $\max(x,y)$ | is the maximum of x and y |
| $MPDU_{pPPDU} = \min(BA_WIN_Size, \max(1, MPDU_pA_MPDU))$ | |
| $BA_WIN_Size = \min(BA_WIN_Size_{TX}, BA_WIN_Size_{RX})$ | |

| | |
|--|--|
| $BA_WIN_Size_{TX}$ | is the expected block ack window size of the transmitter of the PPDUs containing MPDUs with the Type field equal to Data |
| $BA_WIN_Size_{RX}$ | is the expected block ack window size of the receiver of the PPDUs containing MPDUs with the Type field equal to Data |
| $MPDU_pA_MPDU = \min\left(\left\lceil \frac{PPDUR}{MPDU_{SS}} \right\rceil, \left\lceil \frac{PPDUR \times DataRate}{(MAC_{HdR} + A_MSDU_B) \times 8} \right\rceil\right)$ | |
| $MPDU_pA_MPDU$ | is dimensionless |
| $PPDUR = DPDUR - PHDUR$ | |
| $PPDUR$ | is the PPDU payload duration, in seconds |
| $DPDUR$ | is the Data PPDU duration target of the transmitter of the PPDUs containing MPDUs with the Type subfield equal to Data, in seconds |
| $PHDUR$ | is the PHY header duration, estimated based on the expected PPDU format of the PPDUs containing MPDUs with the Type subfield equal to Data, in seconds |
| $MPDU_{SS}$ | is the minimum MPDU start spacing of the receiver of the PPDUs containing MPDUs with the Type subfield equal to Data, in seconds |
| MAC_{HdR} | is the number of octets of MAC header information for an A-MSDU |
| $A_MSDU_B = \min(A_MSDU_B_{TX}, A_MSDU_B_{RX})$ | |
| $A_MSDU_B_{TX}$ | is the maximum A-MSDU size of the transmitter of the PPDUs containing MPDUs with the Type subfield equal to Data, in octets |
| $A_MSDU_B_{RX}$ | is the maximum A-MSDU size of the receiver of the PPDUs containing MPDUs with the Type subfield equal to Data, in octets |
| $PPDUD_{ur} = \left\lceil \frac{(MAC_{HdR} + A_MSDU_B) \times MPDU_{pPPDU} \times 8}{DataRate \times DSym_{DUR}} \right\rceil \times DSym_{DUR} + PHDUR$ | |
| $DSym_{DUR}$ | is the duration of one PPDU payload symbol for the expected PHY format of the PPDUs containing MPDUs with the Type subfield equal to Data, in seconds. If multiple symbol durations are possible, then the shortest symbol duration is assumed |
| $DataRate$ | is calculated using equation Equation (R-2), in b/s |

$$DataRate = \min(\log_2(1 + SNR_tone), MaxBitsPerSc) \times \frac{NSS_max \times Ntone}{DSym_{DUR}} \quad (R-2)$$

where

| | |
|---|--|
| $SNR_tone = 10^{\frac{RSSI + P_{adjust}}{10}}$ | |
| $RSSI$ | is the RSSI of Beacon or Probe Response frames received from the STA with the MAC address that matches the PeerMACAddress in the MLME-ESTIMATED-THROUGHPUT.request primitive, in dBm |
| P_{adjust} | is the implementation specific power adjustment parameter used to convert RSSI into SNR, as well as take into account potential transmit power differences between Beacon/Probe Response frames to data frames, in dBm. |
| NSS_max | is the maximum number of spatial streams allowed in the link based on the capabilities of the two STAs |
| $Ntone$ | is $N_SD \times N_Seg$ if the expected PPDU format is VHT, and N_SD otherwise, where N_SD is defined as number of subcarriers in Table 17-16 for non-HT format, NSD in Table 19-6 for HT format and NSD in Table 21-5 for VHT format. If multiple PPDU bandwidths are available, the N_SD of the widest |

possible PPDU bandwidth allowed between the two STAs based on capabilities is assumed.

$$MaxBitsPerSc = \begin{cases} \frac{40}{6}, & \text{if 256-QAM } 5/6 \text{ modulation is allowed in the link} \\ 6, & \text{if 256-QAM } 3/4 \text{ modulation is allowed in the link} \\ & \quad \text{but 256-QAM } 5/6 \text{ modulation is not} \\ 5, & \text{otherwise} \end{cases}$$

Note that some of the parameters of Equation (R-2) have values that are AC dependent.

Annex S

(informative)

Mesh BSS operation

S.1 Clarification of mesh Data frame format

A mesh Data frame consists of MAC header, frame body, and the FCS. The fields in the MAC header are described in 9.2.3.

In a mesh Data frame containing a single MSDU, the Mesh Control field is placed immediately before the Data (PDU) in the encrypted Frame Body. The Data (PDU) comprises the LLC/SNAP headers and the higher layer data. This is shown in the example frame format for a CCMP-128-encrypted mesh Data frame containing a single MSDU in Figure S-1.

When the mesh Data frame is fragmented, only the first fragment contains the Mesh Control field.

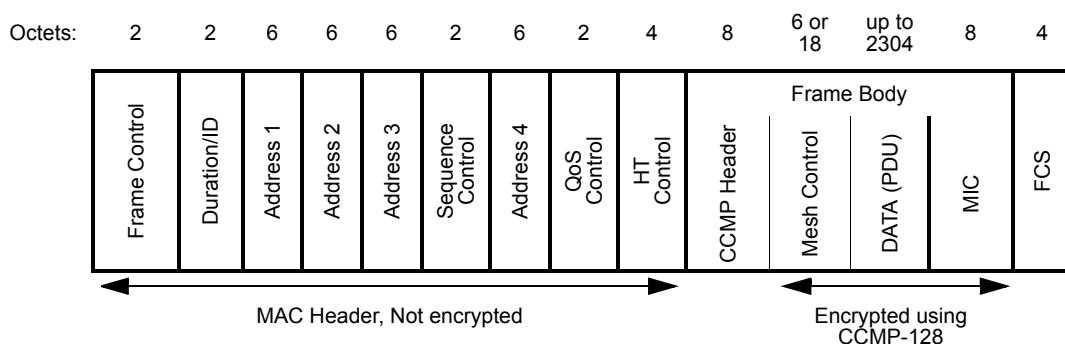

Figure S-1—Format of a CCMP-128-encrypted mesh Data frame containing a single MSDU

NOTE—A DMG STA does not send mesh Data frames, and all other STAs have a maximum MSDU size of 2304 octets (see Table 9-19).

S.2 Operational considerations for interworking

S.2.1 Formation and maintenance of the IEEE 802.1D spanning tree

No special action is required to support formation of the IEEE 802.1D spanning tree. Spanning tree control messages are typically delivered to bridges in group addressed frames. These messages are Data frames from the point of view of the mesh BSS.

S.3 Power save parameters selection

S.3.1 General

Power save mechanisms enable mesh STA operation in doze state. In doze state a mesh STA might set the transceivers off. The power save mechanism might adjust the mesh power management mode of a mesh STA for various reasons that are beyond the scope of the standard, including but not limited to traffic load or scanning and network maintenance needs.

This annex specifies recommendations on how a mesh STA selects mesh power management modes based on traffic load, recommendations on how to do scanning in mesh BSSs that might contain mesh STAs in light or deep sleep mode, and recommended default values for power save related parameters.

S.3.2 Selecting the mesh power management mode based on traffic load

A mesh STA might adjust its mesh power management mode based on the traffic load or the QoS requirements of the forwarded traffic. If a mesh STA has high traffic load or if a mesh STA is congested, the mesh STA should operate in active mode on the corresponding mesh peering to reduce delays or overhead that might be created by the operation in light or deep sleep mode.

A mesh STA might consider staying in active mode for all peer mesh STAs, even if only a single link is congested. When mesh STA operates in active mode, the mesh STA might receive frames at any time and mesh peer service periods might be triggered on demand, as in case of an AP that receives a trigger frame at times controlled by a non-AP STA.

If traffic load is moderate or low and best effort data is transmitted, a mesh STA might consider staying in light sleep mode for all or some mesh peerings. The mesh STA in light sleep mode for a mesh peering receives beacons from the peer mesh STA with periodic indication of buffered traffic.

If traffic load is low or no traffic is transmitted, a mesh STA might consider staying in deep sleep mode for a mesh peering. The mesh STA does not need to wake up to receive a beacon from the peer mesh STA to which it is in deep sleep mode.

The mesh STA might use deep sleep mode to control the number of times it enters the awake state to receive Beacon frame from a peer mesh STA. If the mesh STA is in deep sleep mode for all of its mesh peering, the mesh STA needs only to remain in awake state during its own beacon transmission and mesh awake window.

The mesh STA that forwards real time traffic (AC3 or AC2 with EDCA) should be in active mode for the corresponding link. A mesh STA forwarding real time traffic with EDCA might stay in light or deep sleep mode for the corresponding link, if the mesh STA is capable of initiating mesh peer service periods frequently and the other forwarding peer mesh STAs are in active mode. Poor handling of the mesh power management modes might result to delays and inappropriate QoS of the forwarded MSDUs.

S.3.3 Scanning of mesh BSSs

A mesh BSS might have mesh STAs that alternate awake state and doze state. With active scanning only devices in awake state at the transmission time of Probe Request frame might be found. However, with passive scanning also mesh STAs in light or deep sleep mode for a mesh peering can be found.

Since mesh STAs in light or deep sleep mode might transmit beacons at long intervals, a mesh STA seeking for candidate mesh STAs for a new mesh peerings should perform passive scanning relatively for a longer

time compared to passive scanning in BSS infrastructure mode. Mesh STAs in light or deep sleep mode with long DTIM interval might not be discovered with short scanning durations. Mesh STAs that operate in light or deep sleep mode for a mesh peering might use a short DTIM interval, if they intend to establish new mesh peerings.

S.3.4 Default parameters

The following are the recommended default values for power save related parameters for mesh STAs:

Table S-1—Default parameters for mesh STAs that intend to operate in light or deep sleep mode for mesh peerings

| | For moderate power save | For aggressive power save |
|-------------------|-------------------------|---------------------------|
| Beacon period | 200 TU | 800 TU |
| DTIM Period | 4 | 1 |
| Mesh awake window | 10 TU | 10 TU |

A mesh STA that is eager to conserve power and likely to remain in deep sleep mode with most of the mesh peerings should utilize the value from aggressive power save parameters.

Although mesh STAs might utilize individual parameters regardless of the parameters used by neighbor mesh STAs or peer mesh STAs, each implementer should recognize balance between the power save efficiency and delay in the service initiation.

S.3.5 MSDU forwarding in an MBSS containing mesh STAs in light or deep sleep mode

The battery powered mesh STAs should avoid forwarding MSDUs, to avoid power consumption and possible additional delays and inefficiencies that power save mechanisms might cause. If a light or deep sleep mode mesh STA forwards MSDUs, it should select its mesh power management mode based on the traffic load and the traffic type as described in S.3.2.

A mesh STA might save power by selecting the light or deep sleep mode for a mesh peering as follows:

- A mesh STA that is “mains powered” might apply light or deep sleep mode if it does not have MSDUs to forward
- A mesh STA that is “battery powered” might freely use all mesh power management modes

Mesh STAs that are in light or deep sleep mode for a mesh peering might degrade the corresponding link metric value. The use of worse metric values reduces the probability of a link being used for MSDU forwarding. If the mesh STA will operate in active mode for the link in forwarding path, it should apply the link metric value without degradation.

S.3.6 Synchronization maintenance of mesh STAs in deep sleep mode

A mesh STA in deep sleep mode for a mesh peering might not receive Beacon frames from the corresponding peer mesh STA, but the mesh STA is required to maintain synchronization with the neighbor peer mesh STAs. Neighbor offset synchronization method imposes the maintenance of TSF offset values

between neighbor peer mesh STAs, which generally requires the reception of Beacon frame or Probe Response frame. The simplest way to maintain the synchronization is that the mesh STA in deep sleep mode for a mesh peering listens to the corresponding peer mesh STA's Beacon frame for certain periods and check the TSF offset value.

S.4 SIV key wrapping test vector

This test vector is from the appendix of IETF RFC 5297.

S.5 Airtime link metric usage example

The airtime cost constants (Table 14-4) and estimates of the average data rate and frame error rate will vary from one implementation and configuration of the IEEE 802.11 PHY and MAC to the other. While no mechanism is defined to measure the average data rate and the frame error rate, numeric values are not expected to exhibit large variations in amplitude over the lifetime of a path. Unstable measurements might cause path selection instabilities.

An example of an airtime link metric is provided to illustrate how it might be calculated.

Assume a DSSS PHY with an average data rate of 1 Mb/s to a given neighbor and a frame size of 8192 bits.

The overhead O for the Data frame comprises the PHY preamble (144 µs) and the PHY header (48 µs). The payload Bit is 8192 bits at an r of 1 Mb/s, or 8192 µs. The data transmission time is therefore 8416 µs. Other transmission times for different frame types are calculated in the same way (based on their size, rate, and overhead).

If RTS/CTS is used, the data transmission time (including PHY preamble and header) is 8416 µs, the RTS transmission time (including PHY preamble and header) is 352 µs, the CTS frame transmission time (including PHY preamble and header) is 304 µs, the Ack frame transmission time (including PHY preamble and header) is 304 µs and the interframe spacing overhead is 390 µs. The total time, including overhead, is 9766 µs.

This airtime and overhead value is converted to units of 0.01 TU (10.24 µs), i.e., 953.71 (rounded to 954).

If the frame error rate to the neighbor is 0%, the metric is 954. If the frame error rate is 80%, the metric is 4769 (i.e., 953.71/(1-0.8), rounded).

S.6 Generation of proactive PREP elements in the proactive PREQ mechanism of HWMP

S.6.1 General

In the proactive PREQ mechanism of HWMP, the generation of a proactive PREP element in response to the receipt of a proactive PREQ element depends on the value of the Proactive PREP subfield in the received proactive PREQ element (see 14.10.4.2). Furthermore, if the Proactive PREP subfield is 0, the mesh STA

might respond with the proactive PREP element in case it needs a bidirectional path between the root mesh STA and itself. This is usually the case if the mesh STA has data to be sent to the root mesh STA. This clause provides a unified mechanism that controls the generation of proactive PREP elements in the proactive PREQ mechanism of HWMP.

A proactive PREQ element is defined by all of the following:

- The Target Address is set to all 1s; and
- The TO subfield in the Per Target Flags field is 1.

S.6.2 Additions to forwarding information

The forwarding information to a root mesh STA contains two additional Boolean information fields. The Proactive PREP field indicates whether the mesh STA will generate a proactive PREP element to the root mesh STA in response to a proactive PREQ element (Proactive PREP = 1) or not (Proactive PREP = 0). The Proactive PREP Sent field indicates whether the mesh STA has sent a proactive PREP element to the root mesh STA (Proactive PREP Sent = 1) or not (Proactive PREP Sent = 0). Both fields are initialized with 0.

S.6.3 Actions when sending Data frames as source mesh STA

If a mesh STA receives proactive PREQ elements with the Proactive PREP subfield set to 0, the recipient mesh STA sends a proactive PREP element before sending a Data frame as source mesh STA only if the mesh STA has data to send to the root mesh STA, which requires establishing a bidirectional path with the root mesh STA and the field Proactive PREP Sent of the forwarding information to the root mesh STA is not set (=0).

If the mesh STA sends a Data frame as source mesh STA to the root mesh STA, the mesh STA sets the field Proactive PREP of the forwarding information to 1.

S.6.4 Actions on receipt of a proactive PREQ element

If the mesh STA receives a proactive PREQ element, the field Proactive PREP Sent of the forwarding information to the root mesh STA is set to 0. If the field Proactive PREP of the forwarding information to the root mesh STA is 1, the mesh STA generates a proactive PREP element to the root mesh STA (see 14.10.10.3 Case D), sets the field Proactive PREP of the forwarding information to 0, and sets the field Proactive PREP Sent of the forwarding information to 1.

If the Proactive PREP subfield of the Flags field of the received proactive PREQ element is 1, the mesh STA sets the field Proactive PREP of the forwarding information to the root mesh STA to 1.

S.6.5 Generation of proactive PREP elements

A mesh STA will generate a proactive PREP element according to 14.10.10.3 Case D if one of the following applies:

- [The mesh STA has received a proactive PREQ element] AND [in the forwarding information to the root mesh STA of the proactive PREQ element, field Proactive PREP is set to 1 AND field Proactive PREP Sent is set to 0].
- [The mesh STA has data to send to the root mesh STA, which requires establishing a bidirectional path with the root mesh STA] AND [the field Proactive PREP Sent of the forwarding information to the root mesh STA is not set (=0)].

If the mesh STA generates a proactive PREP to the root mesh STA, the field Proactive PREP Sent of the forwarding information is set to 1 and the field Proactive PREP of the forwarding information is set to 0.

S.7 Generation of PREQ elements in proactive RANN mechanism of HWMP

S.7.1 General

In the proactive RANN mechanism of HWMP, the generation of a PREQ element for root path confirmation in response to the receipt of a RANN element depends on the path metric from the mesh STA to the root mesh STA as computed by the RANN element propagation. However, the RANN mechanism does not set up the necessary forwarding information. This is done with individually addressed PREQ elements. This clause provides further details to the generation of individually addressed PREQ elements in the proactive RANN mechanism of HWMP.

An individually addressed PREQ element is defined by the following:

- The Addressing Mode subfield in the Flags field is 1 (individually addressed).

S.7.2 Additions to forwarding information

The forwarding information to a root mesh STA contains an additional address field. The RANN element Sender Address field contains the MAC address of the neighbor peer mesh STA that has sent the RANN element with the best metric.

S.7.3 Actions when sending Data frames as source mesh STA

If the mesh STA sends a Data frame as source mesh STA to the root mesh STA, the mesh STA uses the forwarding information to the root mesh STA. The RANN element Sender Address is not used for forwarding mesh Data frames to the root mesh STA.

S.7.4 Actions on receipt of proactive RANN element

If the mesh STA receives a proactive RANN element, the field RANN element Sender Address of the forwarding information to the root mesh STA is set to the sender of the RANN element if the metric to the root mesh STA is better than the path metric of the existing mesh path in the forwarding information.

In this case, the mesh STA generates an individually addressed PREQ element to the root mesh STA—see 14.10.10.3 Case D (Root Path Confirmation (Original Transmission)). This individually addressed PREQ element is not sent according to the general forwarding information. Instead, it is sent to the neighbor peer mesh STA indicated in the RANN element Sender Address field.

Since all mesh STAs between the mesh STA and the root mesh STA have already a value in the RANN element Sender Address field, the individually address PREQ element will eventually reach the root mesh STA. Since the TO subfield in the Per Target Flags field is 1, only the root mesh STA will generate a PREQ element as reply to the individually addressed PREQ element.

The individually addressed PREQ elements will set up forwarding information (that can be used for forwarding mesh Data frames) from the root mesh STA toward the mesh STA that initiated the root path confirmation in all intermediate mesh STAs according to the normal HWMP procedures.

Note, since the PREQ element is sent in an individually addressed frame, every sender of the individually addressed PREQ element will be able to determine whether the next mesh STA toward the root mesh STA has received the PREQ element.

The root mesh STA will generate a PREP element according to the normal HWMP procedures—see 14.10.10.3 Case A (Original Transmission).

S.7.5 Actions on receipt of a PREP element

The PREP element generated by the root mesh STA will be forwarded on the mesh path from the root mesh STA to the mesh STA as set up by the individually addressed PREQ element. The PREP element will be propagated and will eventually reach the mesh STA. The PREP element will set up forwarding information (that can be used for forwarding mesh Data frames) toward the root mesh STA in the mesh STA that initiated the root path confirmation and in all intermediate mesh STAs on this path according to the normal HWMP procedures.

After establishing the forwarding information (mesh path) toward the root mesh STA, the path to the root mesh STA is updated to the better one.

Note that since the PREP element is sent in an individually addressed frame, every sender of the PREP element will be able to determine whether the next mesh STA has received the PREP element.

Annex T

(informative)

Overlapping BSS (OBSS) management

T.1 Introduction

When two or more BSSs overlap, the available bandwidth is shared and hence reduced for each BSS. The basic access mechanism, such as DCF, is able to work across OBSSs. Similarly, if EDCA is used, the OBSS might be considered a larger network, and access to the WM is basically shared according to the EDCA access mechanism. Note that for both DCF and EDCA overlapping networks, the sharing is affected by the relative traffic; and if more than two APs are sharing, the problem of “neighbor capture” might occur. The neighbor capture effect might occur when a BSS is in the middle of two other BSSs that are hidden from each other, where it might suffer a disproportionate degradation in throughput, relative to the total traffic in all three BSSs. A particular problem arises when there is some expectation of QoS. If EDCA admission control is in use, then it can be used to regulate the QoS traffic on its own BSS, but it might not take into account the EDCA admitted traffic on an OBSS. The result is that the QoS is compromised if each BSS admits traffic up to its local maximum. Similarly a BSS using HCCA might schedule traffic in its own BSS, to “guarantee” a service, but, if not controlled, this might suppress overlapping EDCA admission control BSS. Furthermore, if two HCCA BSSs overlap and they do not coordinate their scheduled TXOPs, then a degradation of QoS might result. The features described in this annex have been introduced in order to allow a degree of management for OBSSs and for mitigation of the basic problems outlined above.

T.2 QLoad Report element

T.2.1 General

The fields and their uses in the QLoad Report element are as follows:

- Potential Traffic Self field value represents the potential QoS traffic load that this AP is expecting and is provided as an indication to other APs that might be considering selecting the same channel and for sharing when an OBSS situation occurs. The Potential Traffic Self field also includes the peak number of AC_VO and AC_VI EDCA streams.
- Allocated Traffic Self field value represents the total QoS traffic and the numbers of AC_VI and AC_VO streams that are active at that time. This field is provided to enable an on-demand sharing scheme. It might be used by the other APs in OBSSs to determine if the AP has either overallocated in a proportional sharing scheme or is using an on-demand sharing scheme.
- Allocated Traffic Shared field contains the sum of the Allocated Traffic Self field values for OBSSs and is used to protect an AP from the neighbor capture effect where an AP that has neighbors that are hidden from each other. It indicates to other APs in OBSSs if this AP has either overallocated in a proportional sharing scheme, or might be using an on-demand sharing scheme.
- EDCA Access Factor field value represents the total QoS traffic bandwidth requirement for all of the APs in OBSSs and is used to indicate potential overallocation. It also enables a proportional sharing scheme. The Potential Traffic Self fields from QLoad Report elements of nearby co-channel APs are used for estimating the overhead bandwidth required due to EDCA contention and is used in the determination of the EDCA Access Factor.
- HCCA Peak field value represents the total peak HCCA TXOP requirement for the BSS and is provided so that other overlapping APs can determine whether the AP has overallocated.

- HCCA Access Factor field contains the sum of all of the HCCA Peak field values in all of the QLoad Reports of all of the overlapping APs, including its own. This value is used when HCCA APs are sharing as defined in 11.28.2.
- Overlap field value is the number of other APs that are on the same channel and from which Beacon frames are being regularly received. It might be used to aid the channel selection process.

T.2.2 Calculating medium time

This annex uses the function defined in Equation (T-1) for calculating and estimating medium times in both ACM and non-ACM QoS modes:

$$\text{mediumTime}(s,d,m,p) = s \times pps \times MPDUExchangeTime \quad (\text{T-1})$$

where

$$pps = \left\lceil \frac{d}{8 \times m} \right\rceil \quad (\text{T-2})$$

$$MPDUExchangeTime = \text{duration}(m,p) + SIFS + \text{duration}(14,p) \quad (\text{T-3})$$

`duration()` is the PLME-TXTIME primitive that returns the duration of a frame based on its payload size and the PHY data rate employed.

s, d, m and *p* are parameters that are passed in to the `mediumTime` function

(Also see the definition of `MPDUExchangeTime` in 10.22.4.2.3.)

T.2.3 Calculation of potential traffic self

The Potential Traffic Self field value represents the sum of all of the streams derived from all of the potential EDCA admission control and HCCA QoS traffic. The individual TSPEC elements provided by the non-AP STAs are used by the AP to calculate mean, maximum, and minimum values for

- Medium time, in multiples of 32 μ s per second, in the case of EDCA admission control
- HCCA medium time, in the case of HCCA; where HCCA medium time is the TXOP time scheduled by the HC converted to multiples of 32 μ s over a 1 s period, by dividing the scheduled TXOP time by the SI that the HC has allocated

The AP maintains a <mean, standard deviation, AC_VO, AC_VI> tuple that contains the maximum values from Allocated Traffic Self field. The values of this tuple are calculated using

- a) The mean and standard deviation from the Allocated Traffic Self field that had the largest value of the Mean subfield
- b) The AC_VO Streams subfield from the Allocated Traffic Self field that had the largest value
- c) The AC_VI Streams subfield from the Allocated Traffic Self field that had the largest value

This <mean, standard deviation, AC_VO, AC_VI> tuple is calculated over fixed, consecutive seven-day periods and is reset at the start of each new period. If, at any time, any of the maximum values in the tuple are greater than those in the corresponding subfields of the Potential Traffic Self field, then those fields in the Potential Traffic Self field are set to the value(s) in the tuple. If the AP refuses an ADDTS request due to a perceived overallocation (for example, step b) 4) in the proportional sharing scheme described in T.4.2.2), then the AP adds the TSPEC values of the rejected request to the tuple.

At the end of each seven-day period, if any of the maximum values in the tuple are less than those in the corresponding subfields of the Potential Traffic Self field, then those subfields in the Potential Traffic Self fields are set to the value(s) in the tuple.

NOTE—It is not required that the start and end of the seven-day periods be synchronized across OBSSs. After the first seven-day period, each AP advertises its correct potential load irrespective of its start time.

TSPECs provide for mean, maximum, and minimum bit rate values, which allow for statistical multiplexing of streams. The result of summing multiple streams is a composite stream, which should be reported in the Potential Traffic Self field. The summing of streams to produce a composite stream is achieved by using the mean and standard deviation of each stream.

The mean (MEAN), maximum (MAX), and minimum (MIN) values of the medium time or HCCA medium time should be calculated using the values provided in the individual TSPECs, as follows:

For a TSPEC for stream, i , the mean value, μ , is:

$$MIN_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Minimum Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-4})$$

$$MEAN_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Mean Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-5})$$

$$MAX_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Peak Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-6})$$

$$\mu_i = MEAN_i \quad (\text{T-7})$$

If the Minimum Data Rate and Peak Data Rate fields were provided in the TSPEC element, σ is:

$$\sigma_i = 0.25(MAX_i - MIN_i) \quad (\text{T-8})$$

Else if the Peak Data Rate field was provided in the TSPEC element, σ is:

$$\sigma_i = \frac{MAX_i - MIN_i}{2} \quad (\text{T-9})$$

Otherwise:

$$\sigma_i = 0 \quad (\text{T-10})$$

When the non-AP STA does not have any active TSPECs, the should AP monitor the mean and maximum frame reception and transmission rates for AC_VI and AC_VO (for example, by regular sampling of changes to `dot11QosMPDUsReceivedCount` and `dot11QosTransmittedFrameCount` of each AC) to calculate the potential load information as follows:

For a QoS traffic capability, the mean value, μ , is:

$$\begin{aligned} \mu_0 = & \text{mediumTime}(\text{dot11DefaultSurplusBandwidthAllowance}/100, \\ & \text{dot11STAStatisticsAverageMSDUSizeVideo}, \\ & MAXt[VI], \text{dot11STAStatisticsAverageBitrateVideo}) \end{aligned} \quad (\text{T-11})$$

$$\mu_1 = \text{mediumTime}(\text{dot11DefaultSurplusBandwidthAllowance}/100, \text{dot11STAStatisticsAverageMSDUSizeVoice}, \text{MAXt[VO]}, \text{dot11STAStatisticsAverageBitrateVoice}) \quad (\text{T-12})$$

and the standard deviation, σ , is:

$$\sigma_0 = 0 \quad (\text{T-13})$$

$$\sigma_1 = 0 \quad (\text{T-14})$$

The values reported in the Potential Traffic Self field represent the composite stream of all of the individual streams of all associated STAs, and this composite stream should be calculated as follows:

Potential traffic self mean is:

$$\mu_{tot} = \sum \mu_i \quad (\text{T-15})$$

Potential traffic self standard deviation:

$$\sigma_{tot} = \sqrt{\sum \sigma_i^2} \quad (\text{T-16})$$

T.2.4 Calculation of allocated traffic self

The Allocated Traffic Self field value represents the total BSS load of all streams that the AP has allocated at any one time and the number of AC_VI and AC_VO streams that make up that total. The AP should calculate the mean and standard deviation using the Minimum Data Rate, Mean Data Rate, and Peak Data Rate fields of admitted TSPECs and to recalculate the Allocated Traffic Self field value as each TS is added or deleted. The values of the Mean and Standard Deviation subfields placed in the Allocated Traffic Self field for i allocated streams should be calculated using Equation (T-17) to Equation (T-24).

$$MIN_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Minimum Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-17})$$

$$MEAN_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Mean Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-18})$$

$$MAX_i = \text{mediumTime}(\text{Surplus Bandwidth Allowance}, \text{Nominal MSDU Size}, \text{Peak Data Rate}, \text{Minimum PHY Rate}) \quad (\text{T-19})$$

If TSPEC $_i$ has the Minimum Data Rate and Peak Data Rate fields populated, σ is:

$$\sigma_i = 0.25(MAX_i - MIN_i) \quad (\text{T-20})$$

Else if TSPEC $_i$ has the Mean Data Rate and Peak Data Rate fields populated, σ is:

$$\sigma_i = \frac{MAX_i - MEAN_i}{2} \quad (\text{T-21})$$

Otherwise:

$$\sigma_i = 0 \quad (\text{T-22})$$

$$\text{Mean} = \sum \mu_i \quad (\text{T-23})$$

$$\text{Standard deviation} = \sqrt{\sum \sigma_i^2} \quad (\text{T-24})$$

When admission control is not used, the AP should monitor the mean and maximum frame reception and transmission rates for AC_VI and AC_VO (for example, by regular sampling of changes to dot11QosMPDUsReceivedCount and dot11QosTransmittedFrameCount of each AC). The MAX, MEAN, and standard deviation (STDEV) at time t for access category AC are as given in Equation (T-25), Equation (T-26), and Equation (T-27).

$$MEAN_t = o (\text{duration}(s, b) + \text{SIFS} + \text{duration}(14, b)) p_t \quad (\text{T-25})$$

MAX_t is the maximum value of $MEAN_t$ since MLME-START.confirm

$$STDEV_t = \frac{MAX_t - MEAN_t}{2} \quad (\text{T-26})$$

where

$$p_t = \frac{d}{dt} (\text{dot11QosMPDUsReceivedCount}[AC] + \\ \text{dot11QosTransmittedFrameCount}[AC] - \\ \text{dot11QosFrameDuplicateCount}[AC]) \quad (\text{T-27})$$

$o = \text{dot11DefaultSurplusBandwidthAllowance}$

$s = \text{dot11STAStatisticsAverageMSDUSizeVideo}$

$b = \text{dot11STAStatisticsAverageBitrateVideo}$

$\text{duration}()$ is the PLME-TXTIME primitive that returns the duration of a packet based on its payload size and the PHY data rate employed

NOTE—The differentiation above calculates the frames per second for the given AC.

T.2.5 Calculation of allocated traffic shared

The Allocated Traffic Shared field value is the sum of the values expressed in the Allocated Traffic Self fields of all APs in OBSSs, including in its own Allocated Traffic Self field. The values of the mean μ and standard deviation σ , placed in the Allocated Traffic Shared field, for n OBSSs should be calculated using Equation (T-28) and Equation (T-29).

$$\mu = \sum \mu_n \quad (\text{T-28})$$

$$\sigma = \sqrt{\sum \sigma_n^2} \quad (\text{T-29})$$

T.2.6 Calculation of EDCA Access Factor

The EDCA Access Factor is the total traffic requirement for all of the OBSSs. The value of EDCA Access Factor might be greater than 1. The EDCA Access Factor should be calculated from the addition of all of the Potential Traffic Self fields of the APs that are overlapping as follows:

First calculate the overlap traffic for all of the APs in OBSSs. Each AP notes the reported Potential Traffic Self fields for every OBSS, including the AP's own Potential Traffic Self field, and calculates the maximum traffic of the composite stream, using Equation (T-30), Equation (T-31), and Equation (T-32).

$$\text{Overlap traffic} = \mu_{tot} + 2 \sigma_{tot} \quad (\text{T-30})$$

where, for i Potential Traffic Self fields

$$\mu_{tot} = \sum \mu_i \quad (\text{T-31})$$

$$\sigma_{tot} = \sqrt{\sum \sigma_i^2} \quad (\text{T-32})$$

This overlap traffic value is in multiples of 32 μs per second.

The following procedure should be used to calculate the EDCA Access Factor:

- Sum the AC_VI and AC_VO priority streams reported in the Potential Traffic Self fields of its own QLoad report and all of the QLoad reports of APs in OBSSs, and determine the EDCA Overhead Factor as recommended in T.2.7.
- Multiply the overlap traffic and the resulting EDCA Overhead Factor together. This value represents the total overlap traffic requirement for the OBSSs in multiples of 32 μs per second.
- Convert the total overlap traffic to a fraction (seconds per second) by multiplying by 32×10^{-6} .
- Round the resulting fraction value rounded down to a multiple of 1/64.

For example, if the total overlap traffic is 74 268 (32 $\mu\text{s}/\text{s}$), this is 2.376 576 (seconds/second). Now $2.376\ 576 \times 64 = 152.1$ rounded to 152. Hence, the EDCA Access Factor octet, in this case, would be 1001100 (152 in decimal, representing the fraction 152/64).

T.2.7 EDCA Overhead Factor

The Potential Traffic Self field also includes the number of AC_VI and AC_VO streams that make up the composite stream. The recommended calculation for medium time for an admitted EDCA is given in K.2.2. This value includes the duration of the packet plus SIFS and Ack frame times. The medium time, therefore, does not include the access time. For example, for a single stream, between each transmitted packet, there is a time period due to SIFS, AIFSN, and contention window, and for two or more streams, there is also the time when each packet is delayed while another packet is being transmitted. Hence, in order to calculate the total time or bandwidth required to service multiple EDCA streams, an overhead is present.

A fixed value of 1.34 should be used for EDCA Overhead Factor. The value of the EDCA Overhead Factor is dependent upon many factors, including

- Number and mix of streams, voice and video
- Mixture of PHY rates and PHYs
- Mixture of streams' data rates
- Use and mix of aggregated MSDUs
- Choice of EDCA parameters including different settings in OBSSs

Based on a range of simulations, the value of EDCA Overhead Factor is normally in the range 1.26 to 1.43. These simulations, however, were not exhaustive and did not include the effects of hidden nodes and non-IEEE 802.11 interference.

T.2.8 Calculation of HCCA Access Factor

The HCCA Access Factor should be calculated as follows:

- a) Sum the HCCA Peak field values in all of the QLoad reports of all of the APs in OBSSs, including its own.
- b) Convert the total peak traffic to a fraction (seconds per second) by multiplying by 32×10^{-6} .
- c) Round the resulting fraction value to the nearest 1/64 and enter the result into the HCCA Access Factor field.

For example, if the total overlap traffic is 74 268 (32 μ s/s), this is 2.376 576 (seconds/second). Now $2.376\ 576 \times 64 = 152.1$ rounded to 152. Hence, the HCCA Access Factor octet, in this case, would be 152 (representing the fraction 152/64).

T.3 Channel selection using QLoad report

T.3.1 General

In addition to the channel selection described below, it is advised that other factors such as traffic from IBSSs, energy from non-IEEE-802.11 systems, and device constraints on the AP or STAs anticipated within the BSS be considered, and regulatory constraints need to be complied with.

The most effective mitigation to OBSS is for an AP to operate on channels that are free or that are occupied by another AP that is not fully loaded with QoS traffic. In the absence of a centralized channel assignment algorithm, an AP should use the Overlap and Potential Traffic Self fields of the QLoad Report element as part of its channel selection procedure. An AP might use the Overlap field and Potential Traffic Self field information when deciding the best channel to select. If there are sufficient channels for an AP to find a channel with no other APs within range, then an AP is advised to select one of them.

When selecting a channel, the AP should scan to see whether there is a free channel taking account of BSS channel width and channel spacing. If a free channel is not available, then it is advised to select channels that have the least number of QoS APs present. There might be more than one channel with the same number of QoS APs present. At this point, the AP is advised to select, in turn, the candidate channels and send a QLoad Request frame to each AP on that channel. The AP is advised to examine the Overlap and Potential Traffic Self fields of the QLoad Report element to make its final selection.

T.3.2 AP with admission control mandatory

If no “empty” channels are available, then an AP with the ACM (admission control mandatory) bit in the EDCA Parameter Set element set for AC_VI or AC_VO should implement a channel selection procedure to share with one or more APs, in the following preference order:

- a) Non-QoS AP where the EDCA Parameter Set element is not present in the Beacon frame
- b) QoS AP with the ACM bit set for AC_VI or AC_VO and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element)
- c) QoS AP with an HC and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element)
- d) QoS AP with an HC and with no indication of support for QLoad reporting
- e) QoS AP with the ACM bit set for AC_VI or AC_VO and with no indication of support for QLoad reporting

- f) QoS AP where the EDCA Parameter Set element is present in the Beacon frame and the ACM bit is not set for AC_VI or AC_VO

T.3.3 AP with an HC

If no “empty” channels are available, then an AP with an HC should implement a channel selection procedure to share with one or more APs, in the following preference order:

- a) Non-QoS AP where the EDCA Parameter Set element is not present in the Beacon frame
- b) QoS AP where the EDCA Parameter Set element is present in the Beacon frame and the ACM bit is not set for AC_VI or AC_VO
- c) QoS AP with the ACM bit set for AC_VI or AC_VO and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element)
- d) QoS AP with an HC and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element)
- e) QoS AP with the ACM bit set for AC_VI or AC_VO and with no indication of support for QLoad reporting
- f) QoS AP with an HC and with no indication of support for QLoad reporting

T.3.4 Channel selection procedures

Channel selection should be performed as follows:

- a) Create a list of the available channels. Typically this is the list of channels allowed by regulation in the operating regulatory domain; however, this list might be modified by management policy (e.g., removing overlapping channels, avoiding radar detect channels).
- b) Create an array for each available channel that allows the recording of the QoS AP count, ACM bit count, HC count, overlap count, and potential load for that channel.
- c) Step through the list of available channels, listening for beacons for at least dot11OBSSScanPassiveTotalPerChannel TUs per channel.
- d) Upon completion of the scan of a channel, process the beacons received on that channel, filtered to the set of unique BSSIDs:
 - 1) Using the capabilities signaled in the beacon, modify the QoS AP count, ACM bit count, HC count, overlap count, and potential load of the channel array for the primary channel indicated in the received beacon.
 - 2) If the AP is using a channel bandwidth that is greater than the channel spacing (e.g., when using the 2.4 GHz band or when the overlapping AP allows 40 MHz HT PPDUs in its BSS), also update the channel array for channels that are affected by this OBSS. For example, a beacon received on channel 2 indicating a 20 MHz BSS also affects channels 1, 3, and 4.
- e) Upon completion of scanning all of the channels, the AP has information on the number of APs and the potential load of each channel, including co-channel BSSs.
- f) If the channel array indicates that there are channels with no other APs, one of these “empty” channels should be chosen randomly.
- g) Otherwise, create a list of candidate channels by selecting only the channels with the lowest number of QoS APs. For example, if the channel scan procedure indicated that there were two QoS APs on channel 3, three QoS APs on channel 6, and two QoS APs on channel 11, the list of candidate channels would contain 3 and 11.
 - 1) If this list contains one or more channels with non-QoS APs, then filter the list for the least number of APs.
 - 2) If this list contains more than one channel, one of these channels should be chosen randomly.

- h) If this list contains more than one channel and the AP has been configured to set the ACM bit for AC_VI or AC_VO:
 - 1) Filter the list for the minimum count of QoS AP where the EDCA Parameter Set element is present in the Beacon frame and the ACM bit is not set for AC_VI or AC_VO.
 - 2) If this list contains more than one channel, filter the list for the minimum count of QoS AP with the ACM bit set for AC_VI or AC_VO and with no indication of support for QLoad reporting.
 - 3) If this list contains more than one channel, filter the list for the minimum count of QoS AP with an HC and with no indication of support for QLoad reporting.
 - 4) If this list contains more than one channel, filter the list for the minimum count of QoS AP with an HC and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element).
 - 5) If this list contains more than one channel, filter the list for the minimum count of QoS AP with the ACM bit set for AC_VI or AC_VO and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element).
- i) If this list contains more than one channel and the AP has an HC:
 - 1) Filter the list for the minimum count of QoS AP with an HC and with no indication of support for QLoad reporting.
 - 2) If this list contains more than one channel, filter the list for the minimum count of QoS AP with the ACM bit set for AC_VI or AC_VO and with no indication of support for QLoad reporting.
 - 3) If this list contains more than one channel, filter the list for the minimum count of QoS AP with an HC and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element).
 - 4) If this list contains more than one channel, filter the list for the minimum count of QoS AP with the ACM bit set for AC_VI or AC_VO and with an indication of support for QLoad reporting (i.e., the QLoad Report field equal to 1 in the Extended Capabilities element).
 - 5) If this list contains more than one channel, filter the list for the minimum count of QoS AP where the EDCA Parameter Set element is present in the Beacon frame and the ACM bit is not set for AC_VI or AC_VO.
- j) If this list contains more than one channel, filter the list to the set of channels with the minimum overlap count.
- k) If this list contains more than one channel, filter the list to the set of channels with the minimum potential load.
- l) From the remaining channels in this list, randomly choose one of these channels.

T.4 Sharing in an OBSS situation

T.4.1 General

If the EDCA Access Factor is greater than one, then there is a potential overallocation of the WM. APs should avoid overallocation in the channel selection process, but if overallocation exists, then a sharing scheme should be used to provide each AP with a fair share of the bandwidth, but more importantly, so that any already admitted or scheduled QoS streams are not impaired by the addition of streams from any OBSS. The EDCA Access Factor, HCCA Access Factor, and Potential Traffic Self fields in the QLoad Report element are provided to enable sharing schemes to be used.

The sharing scheme also protects an AP from the neighbor capture effect where it has neighbors that are hidden from each other. A major objective of an OBSS sharing scheme is that if a QoS stream is allocated or scheduled, then it is not compromised by the addition of further streams from any OBSS that would cause the medium to be overallocated. This objective is achieved if the APs in OBSSs cooperate.

T.4.2 Sharing schemes

T.4.2.1 General

Two sharing schemes are suggested: proportional sharing and on-demand sharing. In each sharing scheme, the purpose is to keep the total allocated traffic to a value where overallocation does not occur. The absolute maximum allocation is 1 s/s (100%). In the following descriptions of the two suggested sharing schemes, this value is referred to as the *maximum allocation value (MAV)*. It is suggested that in order to provide some protection to non-QoS traffic, each AP select a value for MAV:

$$MAV = (M + 1)/(M + N + 1) \text{ s/s} \quad (\text{T-33})$$

where

- M is the number of overlapping APs that are robust AV streaming STAs
- N is the number of overlapping APs that are not robust AV streaming STAs

There is no requirement that each AP select the same MAV.

T.4.2.2 Proportional sharing scheme

The proportional sharing scheme described in this subclause is an example of a static sharing policy, as described in Table 9-226 and 11.28.2.2.

When using the proportional sharing scheme, the AP examines the sum of the EDCA Access Factors and HCCA Access Factors in the QLoad reports from each OBSS, including its own Qload report, and determines the maximum. This maximum value is termed the *combined access factor*. If the maximum value from the combined access factor is less than or equal to MAV, the AP is advised to allocate only up to its advertised potential traffic self traffic. If the maximum value from the combined access factor is greater than MAV, then the AP is advised to allocate only up to a value of its potential traffic self divided by the combined access factor, multiplied by MAV.

In the proportional sharing scheme, before an AP allocates a new medium time or schedules a new TXOP in response to an ADDTS Request frame, it checks that this addition does not exceed its sharing limit, as follows:

- a) If the EDCA Access Factor is less than or equal to MAV, then the AP allocates up to its advertised potential traffic self, with the composite stream (MAX traffic) calculated as shown in Equation (T-34).

$$\text{MAX traffic} = \mu_{tot} + 2 \sigma_{tot} \quad (\text{T-34})$$

- b) If the EDCA Access Factor is greater than MAV, the AP carries out the following:
 - 1) Calculate the peak traffic value of the potential traffic self using Equation (T-35).

$$\text{Peak} = \mu_{tot} + 2 \sigma_{tot} \quad (\text{T-35})$$

- 2) Divide this value by the combined access factor and multiply by MAV. This value is termed the *maximum allowable potential traffic self traffic*.
- 3) Calculate the resulting value of the allocated traffic self if the new TSPEC is accepted, as explained in Equation (T.2.4), and then calculate the resulting peak value using Equation (T-36).

$$\text{Peak} = \mu_{tot} + 2 \sigma_{tot} \quad (\text{T-36})$$

- 4) If the resulting peak value, calculated in step 3), is greater than the maximum allowable potential traffic self traffic, then the AP is advised to reject the ADDTS Request frame.
- 5) If the resulting peak value, calculated in step 3), is less than the maximum allowable potential traffic self traffic and the ADDTS Request frame is set for EDCA admission, then the AP is advised to accept the request.
- 6) The AP then checks that it is possible to schedule TXOPs using the HCCA TXOP advertisement as described in Equation (11.28.3).

If the new stream is allocated, then the AP updates the appropriate fields in its QLoad Report element.

T.4.2.3 On-demand sharing scheme

The on-demand sharing scheme described in this subclause is an example of a dynamic sharing policy, as described in Table 9-226 and 11.28.2.2.

The on-demand sharing scheme is as follows:

- a) Before allocating a new stream, the AP examines the Allocated Traffic Shared field values in the QLoad reports from each OBSS, including its own Qload report, and selects the maximum Allocated Traffic Shared field value that has the highest peak value, using Equation (T-37).

$$Peak = \mu_{tot} + 2 \sigma_{tot} \quad (\text{T-37})$$

The AP also notes the number of AC_VI and AC_VO streams in this maximum Allocated Traffic Shared field.

- b) The AP adds the requested new stream (*new*) to the selected maximum Allocated Traffic Shared field value (*max*) determined in step a), using Equation (T-38) and Equation (T-38).

$$\mu = \mu_{new} + Peak \quad (\text{T-38})$$

$$\sigma = \sqrt{\sigma_{new}^2 + \sigma_{max}^2} \quad (\text{T-39})$$

- c) The AP then calculates the peak value for the new composite stream calculated in step b), using Equation (T-40).

$$Peak = \mu + 2\sigma \quad (\text{T-40})$$

- d) Using the values of the AC_VI and AC_VO streams noted in step a), plus the stream represented by the new stream, the AP determines the new EDCA Access Factor and then the combined access factor, as described in T.4.2.2.
- e) Multiply the peak value calculated in step c) by the EDCA Access Factor, determined in step d). This value is the new peak traffic requirement.
- f) If this peak traffic requirement value calculated in step e) is greater than MAV, then the AP is advised to refuse to allocate the new stream.
- g) If the peak value calculated in step e) is less than or equal to MAV and the new allocation is for an EDCA admission ADDTS, then the AP allocates that new traffic.
- h) If the peak value calculated in step d) is less than or equal to MAV and the new allocation is for an HCCA ADDTS, the AP checks that it is possible to schedule TXOPs using the HCCA TXOP advertisement as described in 11.28.3.

If the new stream is allocated, then the AP updates the appropriate fields in its QLoad Report element.

The Allocated Traffic Self field in the QLoad Report element of a particular AP can be used by other APs as an indication of whether an AP has overallocated or is using an on-demand sharing scheme.

If, using either the proportional or on-demand sharing schemes, an AP determines that the acceptance of a TSPEC would exceed the available allocation, or if a non-AP STA has a TSPEC refused, the non-AP STA could always request a new TSPEC that represents a lower medium time or TXOP. This request might be used, for example, where the non-AP STA or AP has the ability to send a more compressed stream.

An AP might choose to use the on-demand sharing scheme until the maximum value of any access factor field in the QLoad Report elements from each OBSS reaches MAV. Once this condition has occurred, the AP could then use the proportional sharing for subsequent ADDTS requests.

T.5 Mitigating consequences of OBSS sharing in presence of noncollaborating devices

The performance of the channel selection and HCAA TXOP negotiation procedures described in this annex and 11.28 might become degraded by the presence of devices that willfully or accidentally behave in an uncooperative manner.

It is suggested that implementations use additional heuristics (e.g., a history of collaboration, traffic monitoring, device configuration, or a combination of such) to assess the accuracy of the information they receive from neighboring APs in order to determine an appropriate collaboration strategy.

An AP that maintains historical information of collaboration results with its neighboring APs could use this information to control its collaboration behavior. For example, an AP might choose to share a channel with an AP that had a history of successful collaboration. In another example, an AP might choose to avoid transmissions only during the HCCA TXOPs of neighboring APs with which it has a history of successful HCCA TXOP negotiation.

When using HCCA TXOP negotiation, it is suggested that an AP perform some monitoring of the channel to assess whether the HCCA AP with which it is collaborating is using its advertised HCCA TXOPs. If the monitoring AP does not detect HCCA traffic during these advertised HCCA TXOPs, such a lack of traffic might indicate that the neighboring AP is willfully or accidentally behaving in an uncooperative manner by advertising HCCA TXOPs that it is not using, possibly as a method to suppress traffic in neighboring BSSs. The monitoring AP might wish to ignore the HCCA TXOP advertisements from APs that do not appear to be collaborating.

Some of the OBSS procedures use unauthenticated Beacon frames and Public Action frames, which are susceptible to impersonation. If unauthenticated Beacon frames and Public Action frames are used, an AP might suffer a denial of service attack by another device impersonating the AP. This denial of service attack, due to the actions of the impersonating device, might cause neighboring APs to falsely ascertain the AP is not collaborating.

An AP could enable protected HCCA TXOP negotiation and protected QLoad reporting to provide protection against impersonation. The AP PeerKey protocol is used in the generation of the PMK to prove that an AP has the private key that corresponds to its public key. Impersonation of protected HCCA TXOP negotiation and protected QLoad report management from an AP is prevented while the AP maintains possession of this private key and this private key is not possessed by any other devices.

Annex U

(informative)

Functions of the centralized coordination service root (CCSR)

Via unspecified means over the DS, a centralized coordination service root (CCSR) performs the following functions:

- Allows APs to enroll or unenroll from the CCSS.
- Provides a directory service, wherein the CCSR responds to a directory service request that includes a MAC address with an indication of whether the MAC address is an S-AP within the CCSS.
- Configures the beacon interval, ClusterMaxMem, Beacon SP duration, TXSS offset, TXSS CBAP duration, and TXSS CBAP MaxMem (see 10.37.2.2) of each S-AP.
- Aligns the rate of increment of TSFs of S-APs within the CCSS.
- Configures the individual TSF offsets of each S-AP in order to minimize the temporal, spatial, and frequency overlap of BHIs of the BSSs in the same CCSS.
- Provides to each S-AP the cluster time offset availability information from nearby co-channel S-APs.
- Configures each S-AP with certain medium access policies for its centralized AP or PCP cluster (see 10.37.3.4). The CCSR is permitted to configure different S-APs with different medium access policies.
- Configures each S-AP with a list of one or more channels in an operating class that the S-AP is excluded from operating upon and that the S-AP advertises via the Channel Usage procedures (see 11.24.15). The excluded channels are available to STAs that are operating in the area covered by the ECAPC, yet are not within the ECAPC.

Annex V

(informative)

TSPEC aggregation for DMG BSSs

Examples of TSPEC aggregation include, but are not limited to, the following:

- Traffic streams between DMG STA A and DMG STA B, having an access policy of SPCA, even if they flow in opposite directions, sharing an SP allocation created with DMG STA A as Source AID and DMG STA B as Destination AID.
- Traffic streams between DMG STA A and other DMG STAs, having an access policy of EDCA, even if they flow in opposite directions (some having DMG STA A as source and some having DMG STA A as destination), sharing a CBAP allocation created with DMG STA A as Source AID and broadcast Destination AID.

Figure V-1 and Figure V-2 show examples of TSPEC aggregation in a DMG BSS. Note that TSPEC 3 in Figure V-1 (for both SPCA and EDCA cases) can flow only through an RD grant.

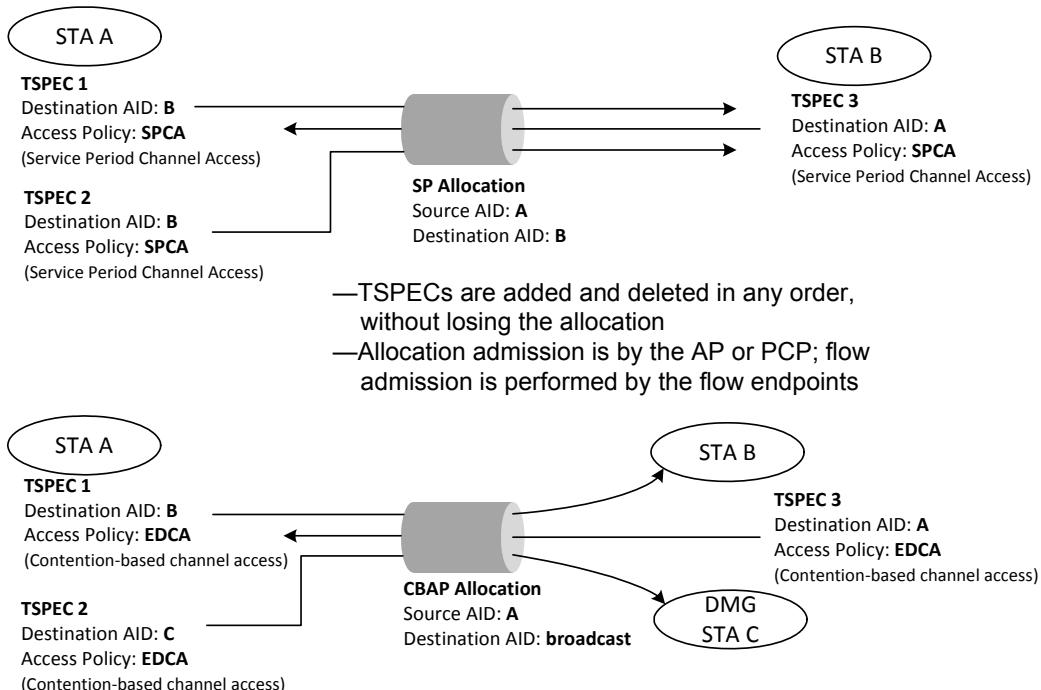

Figure V-1—Example of TSPEC aggregation (SPCA and EDCA access policies)

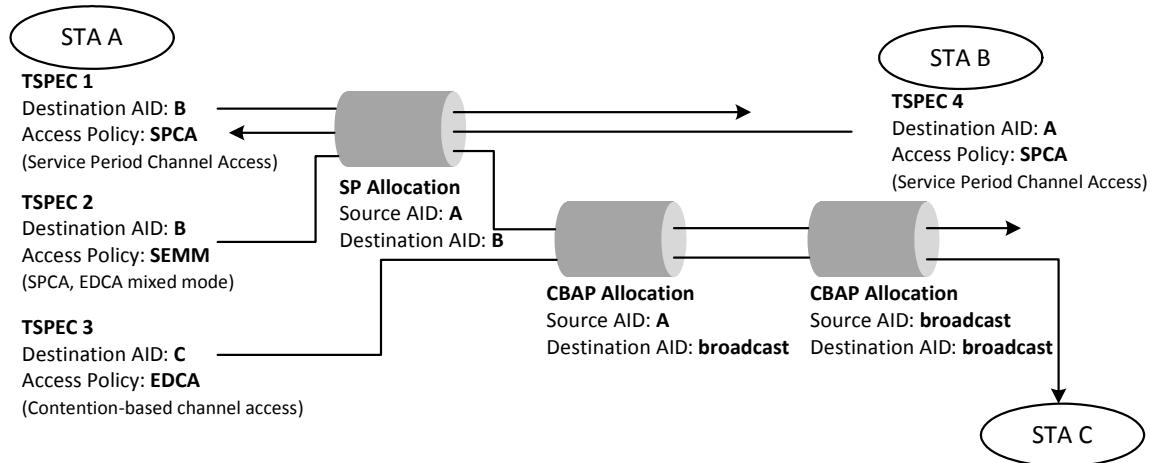

Figure V-2—Example of TSPEC aggregation (SPCA, EDCA, and SEMM access policies)
